Related Documents

Documents	Description
Command Reference	Describes the related configuration commands, including command modes, parameter descriptions, usage guides, and related examples.
Hardware Installation and Reference Guide	Describes the functional and physical features and provides the device installation steps, hardware troubleshooting, module technical specifications, and specifications and usage guidelines for cables and connectors.

Conventions

This manual uses the following conventions:

Convention	Description
boldface font	Commands, command options, and keywords are in boldface .
<i>italic font</i>	Arguments for which you supply values are in <i>italics</i> .
[]	Elements in square brackets are optional.
{ x y z }	Alternative keywords are grouped in braces and separated by vertical bars.
[x y z]	Optional alternative keywords are grouped in brackets and separated by vertical bars.

1 Overview

eWeb is a Web-based network management system that manages or configures devices. You can access eWeb via browsers such as Google Chrome.

Web-based management involves a Web server and a Web client. The Web server is integrated in a device, and is used to receive and process requests from the client, and return processing results to the client. The Web client usually refers to a browser, such as Google Chrome IE, or Firefox.

1.1 Conventions

In this document, texts in bold are names of buttons (for example, **OK**) or other graphical user interface (GUI) elements (for example, **DHCP Security**).

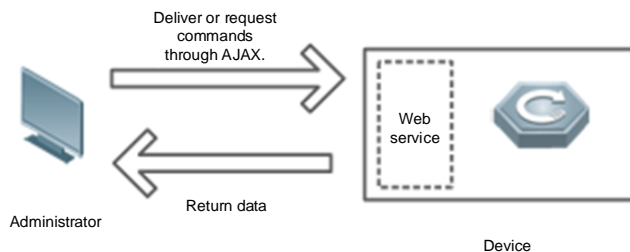

2 Configuration Guide

2.1 Preparation

Scenario

As shown in the figure below, an administrator can access the device from a browser and configure the device through the eWeb management system.

Figure 2-1 Data Exchange Principle

Remarks	The eWeb management system combines various device commands and then delivers them to the device through AJAX requests. The device then returns data based on the commands. A Web service is available on the device to process basic HTTP protocol requests.
----------------	---

Deployment

Configuration Environment Requirements

Client requirements:

- An administrator can log into the eWeb management system from a Web browser to manage devices. The client refers to a PC or some other mobile endpoints such as laptops or tablets.
- Google Chrome, Firefox, IE10.0 and later versions, and some Chromium-based browsers (such as 360 Extreme Explorer) are supported. Exceptions such as garble or format error may occur if an unsupported browser is used.
- 1024 x 768 or a higher resolution is recommended. If other resolutions are used, the page fonts and formats may not be aligned and the GUI is less artistic, or other exceptions may occur.
- The client IP address is set in the same LAN network as the device IP address, such as 192.168.110.X. The subnet mask is 255.255.255.0. The default management address is 192.168.110.1. Alternatively, you can set the IP assignment mode to **Obtain an IP address automatically**.

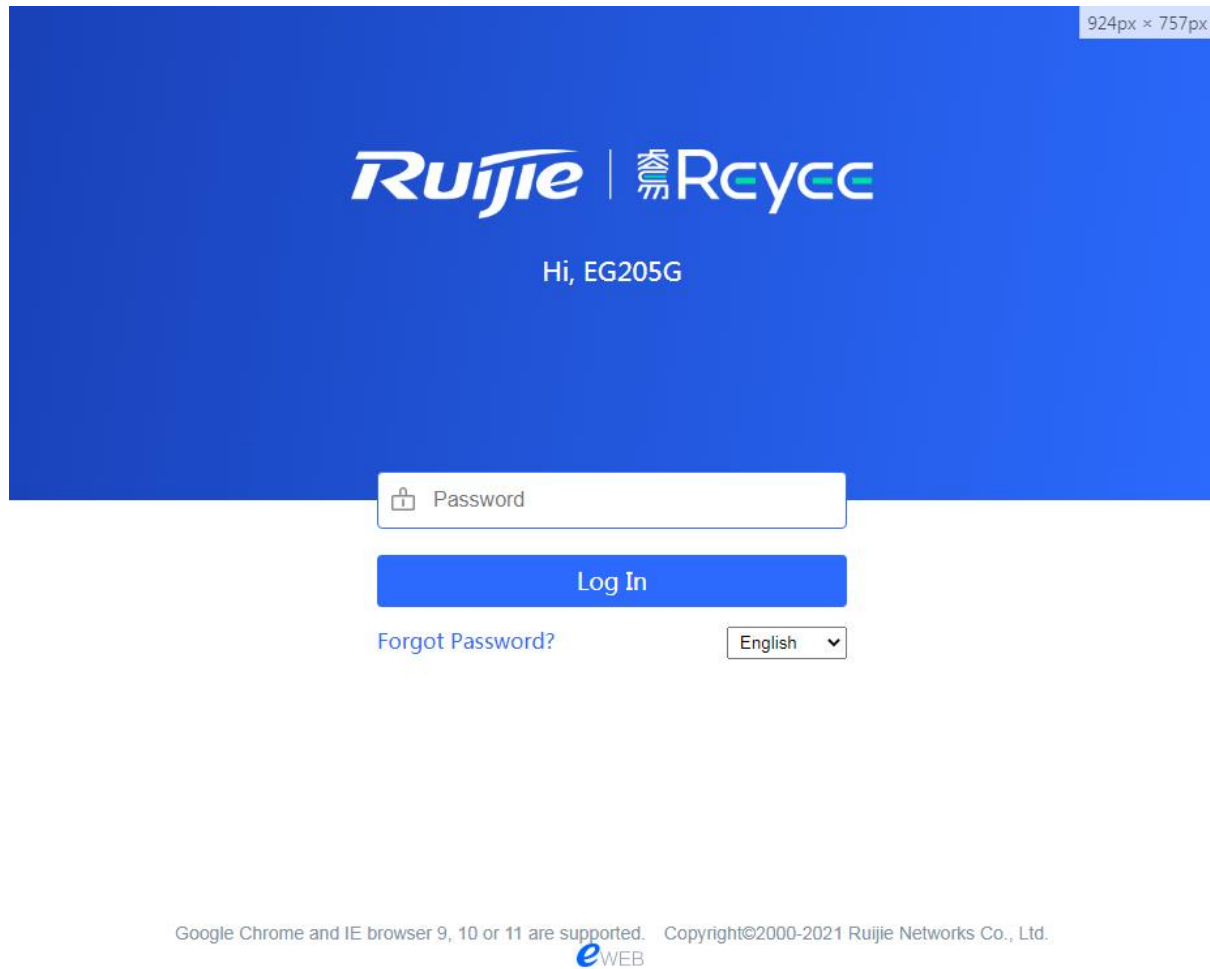

Server requirements:

- You can log into the eWeb management system through a LAN port or from Ruijie Cloud on an external network.
- The device is enabled with Web service (enabled by default).

- The device is enabled with login authentication (enabled by default).
- The default IP address of an EG device is 192.168.110.1. The default IP address of an AP is 10.44.77.254.

To log into the eWeb management system of an EG device, open the Google Chrome browser, and enter 192.168.110.1 into the address bar, and press **Enter**.

Figure 2-2 Login Page

Enter the password and click **Login**.

2.2 Network Setup

You will enter the **Network Setup** page without login at initial setup.

2.2.1 Discover Device

The page displays online device count and network status.

You can add the device to **My Network** before configuring the network. If the device works in the standalone mode, this feature is not supported.

Figure 2-3 Discover Device

2.2.3 Create Network & Connect

If the device is configured for the first time, the network name, management password and SSID are required. If the device is already configured, the management password will not be displayed here. You can navigate to **Network > Password** to change the management password.

If the device is detected disconnected to Ruijie Cloud, the Ruijie Cloud page will be embedded for you to bind your account after the device accesses the Internet successfully. If the device is already connected to Ruijie Cloud, the eWeb homepage will be displayed after this step.

Figure 2-5 Create Network

* Time Zone

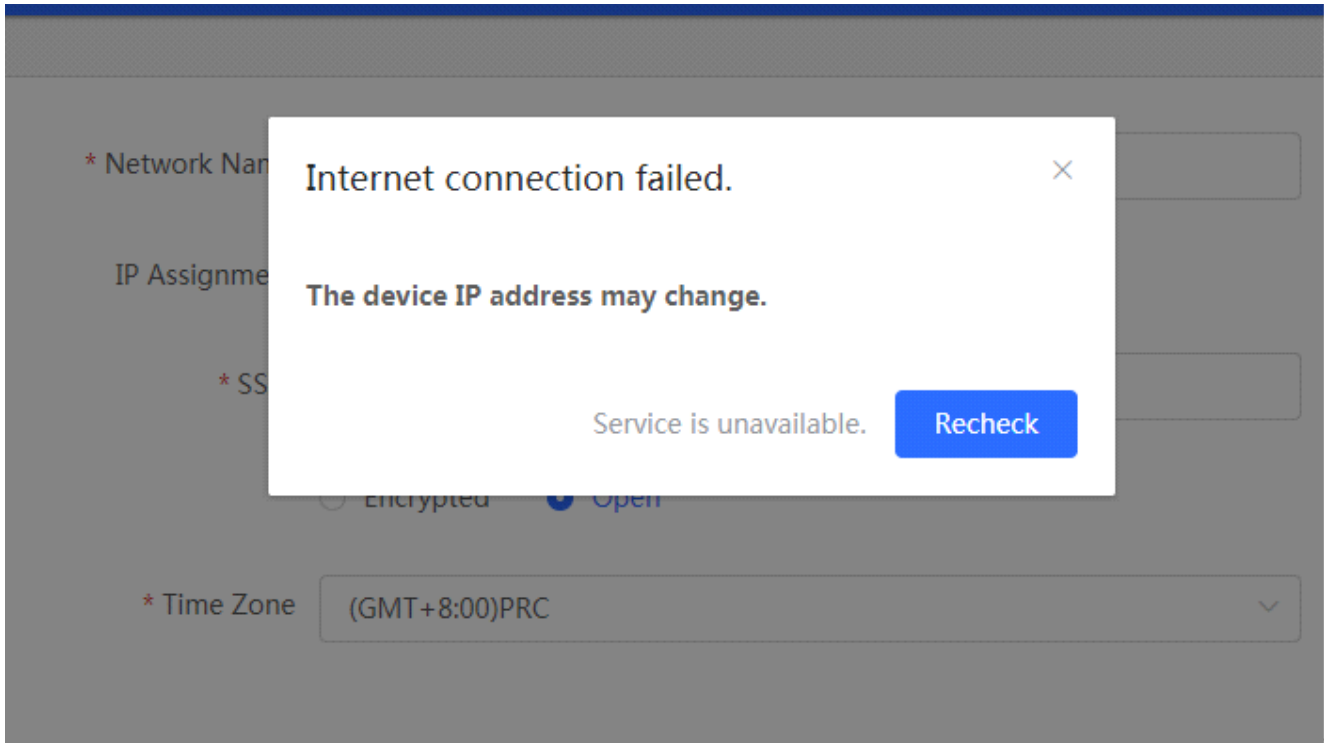

Click **Create Network & Connect**, and it takes about 60 seconds to deliver and activate settings. The following message will appear after Internet connection is set up.

Figure 2-6 Connect to Internet

If the Internet connection failed, please follow the instruction in the prompt message.

Figure 2-7 Failed Connection

2.2.4 Cloud Service

The **Network Setup** module requires a Ruijie Cloud account. If you are a new user, please register an account first at the [Ruijie Cloud](#) website.

Figure 2-8 Log In with Ruijie Cloud Account

Please enter your account to log in.

Please enter the username.

Please enter the password.

Login

I have read and agreed to [the Privacy Policy](#).

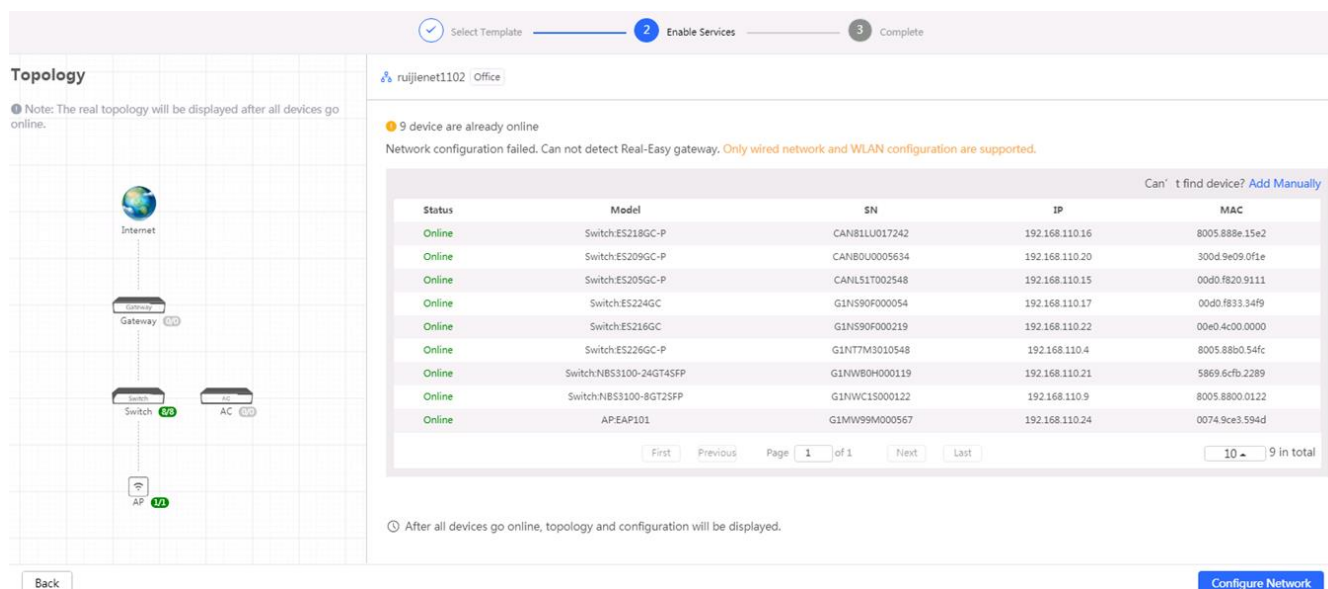

If the device works in the standalone mode, log in and the account will be binded with Ruijie Cloud automatically. If the device works in the self-organizing network mode, the following page will appear.

Figure 2-9 Select Template

Click **Apply Config**. The following page will appear after configuration is delivered successfully.

Figure 2-12 Complete

2.3 Work Mode

The eWeb menu varies with different work modes. The EG device works in the **Router** mode and the EAP device works in the **AP** mode by default. The work mode is displayed on the **Route > Overview** page.

Figure 2-13 Device Overview

The screenshot displays the configuration page for a Ruijie EG205G router. At the top, the device is identified as a Router (EG205G) with Hostname: Ruijie.abc, SN: H1LA0U100362A, and IP Address: 172.30.111.17. A Reboot button is visible in the top right corner. Below the header is a navigation menu with tabs for Overview, Basics, Security, Behavior, VPN, Advanced, Diagnostics, and System. The Overview section shows Memory Usage at 26%, 4 Online Clients, and a Status of Online with a duration of 7 days 23 hours 28 minutes 56 seconds. The Device Details section lists Model: EG205G, SN: H1LA0U100362A, Work Mode: Router, Hardware Ver: 1.00, Hostname: Ruijie.abc, MAC: 00:74:9C:87:6D:85, Role: Master AC, and Software Ver. The Interface Details section shows a legend for Connected (blue) and Disconnected (grey) states, with LAN0 and WAN interfaces connected and showing IP addresses 192.168.110.1 and 172.30.111.17 respectively.

Click the current work mode, and the following page will appear. You can switch over the work mode here.

Figure 2-14 Work Mode

Description:

1. The device IP address may change upon mode change.
2. Change the endpoint IP address and ping the device.
3. Enter the new IP address into the address bar of the browser to access EWEB.
4. The system menu varies with different work modes.
5. The device will be restored and rebooted upon mode change.

2.3.1 Router Mode

The **Router** mode indicates NAT forwarding.

The EG device in the **Router** mode contains networking, network setup and gateway features including VPN and behavior management.

The AP in the **Router** mode contains networking, network setup and some radio features.

2.3.2 AC/AP Mode

The device in the **AC** mode supports router-on-a-stick.

The **AP** mode refers to fit AP mode. All WAN ports are enabled with DHCP by default. You can configure a WAN port with a static IP address or enable PPPoE manually.

2.4 Self-Organizing Network

Click the current work mode, and the following page will appear. You can enable or disable self-organizing network here.

Figure 2-15 Self-Organizing Network

Description:

1. The device IP address may change upon mode change.
2. Change the endpoint IP address and ping the device.
3. Enter the new IP address into the address bar of the browser to access EWEB.
4. The system menu varies with different work modes.
5. The device will be restored and rebooted upon mode change.

3.3 Router

If there is a wireless router enabled with self-organizing network in the network, the **Gateway** module will appear in the menu on the left. Click **Router**, and a horizontal menu will be displayed.

3.3.1 Overview

If the EG device works in the **AC** mode, the **Router** module does not contain **Security**, **Behavior** and **VPN**.

Figure 3-3 Overview

This chapter describes the Web configuration process of an EG device in the **Router** mode.

Figure 3-4 Router Mode

The screenshot displays the eWeb Configuration interface for a Ruijie EG205G router. At the top, it shows the device icon, Hostname (Ruijie.abc), SN (H1LA0U100362A), IP Address (172.30.111.17), and a Reboot button. Below this is a navigation menu with tabs for Overview, Basics, Security, Behavior, VPN, Advanced, Diagnostics, and System. The Overview section shows Memory Usage at 24%, 4 Online Clients, and Status as Online with a duration of 7 days 23 hours 34 minutes 30 seconds. The Device Details section lists Model (EG205G), SN (H1LA0U100362A), Work Mode (Router), Hardware Ver (1.00), Hostname (Ruijie.abc), MAC (00:74:9C:87:6D:85), Role (Master AC), and Software Ver. The Interface Details section shows a legend for Connected (blue) and Disconnected (grey) states, with LAN0, LAN1/WAN3, LAN2/WAN2, LAN3/WAN1, and WAN interfaces. LAN0 and WAN are connected, while the others are disconnected. IP addresses 192.168.110.1 and 172.30.111.17 are shown below the interface icons.

3.3.2 Basics

3.3.2.1 WAN

The **WAN** module allows you to configure WAN settings. There are three Internet types available: **Static IP Address**, **DHCP** and **PPPoE**. WAN settings support multiple lines (some models support only dual-line). If you select more than one line, you can configure each specific line, e.g., WAN and WAN1, and ISP/load settings.

Figure 3-5 WAN Settings

Load Balancing Settings

Traffic will be routed based on ISP settings preferentially. The remaining traffic will be managed according to load mode.

i 1. Balanced mode: The traffic will be spread across multiple links according to the weight of each WAN port. For example, if WAN and WAN1 weight are set to 3 and 2 respectively, 60% of the total traffic will be routed over WAN and 40% over WAN1.

2. Primary & secondary mode: All traffic is routed over the primary interface. Once the primary interface fails, traffic will be switched over to the secondary interface. If there are multiple primary and secondary interfaces, please configure their weight (See balanced mode).

3.3.5.2 L2TP

3.3.5.2.1 L2TP Settings

Layer 2 Tunneling Protocol (L2TP) is a computer networking protocol used by Internet service providers (ISPs) to enable virtual private network (VPN) operations. Because it does not provide any security for data such as encryption and confidentiality, an encryption protocol such as Internet Protocol security (IPsec) is often used with L2TP, namely, L2TP/IPsec.

3.3.5.4 OpenVPN

3.3.5.4.1 Overview

- Concepts

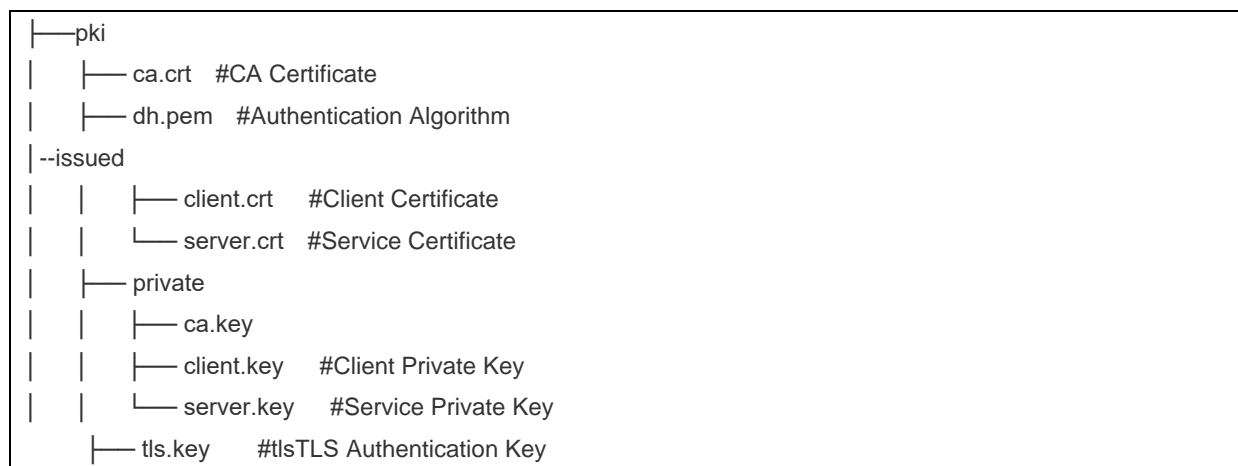

Virtual private tunnels are required between enterprises, individuals and companies due to security or cross-NAT concern. OpenVPN is an SSL/TLS based virtual private network solution. Compared with other VPNs, OpenVPN supports more flexible client authorization, including certificate and account authorization, and allows users to connect to the VPN's virtual interface through a firewall. OpenVPN runs on Linux, xBSD, Mac OS X and Windows2000/XP. The EG device supports VPN connection to PCs, Android/iOS-based mobile phones, routers and Linux-based devices, compatible with most OpenVPN devices on the market.

OpenVPN supports connections through most proxy servers and work well in NAT environments. The server can deliver certain configuration to the client, including IP address, routing and DNS configuration.

- Certificates

The advantage of OpenVPN lies in its own security, and OpenVPN security depends on certificate support.

The OpenVPN certificate system is as follows:

The client certificate includes ca.CRT, ca.key, client.CRT, client.key, and the server-side certificate includes ca.CRT, ca.key, server.CRT, server.key.

3.3.5.4.2 Configuration Tasks

The device supports OpenVPN server or client. The following describes the configuration parameters of the server and client.

1. Server Mode
2. Client Mode

3.3.5.4.3 Server Mode

▾ Basic Settings

Choose **Router > VPN > OpenVPN**.

Deliver Route 192.168.11.0 255.255.255.0 ? +

Expand

Client Config Export

Server Log Export

Save

- Server Mode

The EG device supports three authentication modes: **Account**, **Certificate**, and **Account & Certificate**. In the **Account** mode, the client needs to enter the correct account, including the username and password, and import the CA certificate. In the **Certificate** mode, the client needs to use the CA certificate, client certificate, and private key to connect to the server. The **Account & Certificate** mode requires all configuration mentioned above, mainly applied in security-demanding scenarios.

- Protocol

All OpenVPN communication is based on a single IP port. The UDP protocol is used by default and TCP is also supported. When selecting a protocol, please pay attention to the network conditions about the encrypted tunnels. If there is a high delay or a lot of packet loss, please select the TCP protocol as the underlying protocol.

- Server Address

The server address can be either an IP address or a domain name.

- Port ID

The official IANA (Internet assigned numbers Authority) assigned port number is 1194. If the port is occupied or disabled on the local network, the server log will prompt that port binding fails and remind you to change the port ID.

- IP Range

The OpenVPN address pool, except for the first address reserved for the server, is assigned to the clients. For example, if you set 10.80.12.0/24, the virtual IP address of the OpenVPN server is 10.80.12.1.

- Deliver Route

The server informs clients to access the intranet by a VPN tunnel. This is the only way to inform clients of the access method.

- Client Config

Export a tar package containing client configuration.

1. If you select the **Account** mode, the package includes the configuration file (client.ovpn), CA certificate (ca.CRT), CA private key (ca.key).
2. If you select the **Certificate** mode, the package includes the configuration file (client.ovpn), CA certificate (ca.CRT), CA key (ca.key), client certificate (client.crt) and client key (client.key).
3. If TLS authentication is enabled, the package includes a TLS authentication key (tls.key) in addition to the files mentioned above.

- Server Log

Export the service log, including the server startup time and client dial-up logs.

- Save

When the basic settings are complete, you can view the server tunnel information in **Tunnel List**.

▾ Advanced Settings

Click **Expand**.

TLS Authentication ?

Allow Data Compression Yes ▾ ?

Route All Traffic over VPN No ▾ ?

Cipher AES-128-CBC ▾ ?

Deliver DNS Example: 1.1.1.1 ? +

Auth SHA1

- TLS Authentication

The TLS key is used to enhance OpenVPN security by requiring both parties to have a shared key before the TLS handshake. After TLS authentication is enabled, the client must import a TLS key (The OpenVPN client version must be greater than 2.40).

- Allow Data Compression

This feature is used to compress the transmitted data by the LZO algorithm, which saves bandwidth, but consumes CPU resources. The configuration on the client side and on the server side must be consistent. Otherwise, the connection will not be set up.

- Route all Traffic over VPN

This feature is used to route all traffic over the VPN tunnel. The VPN tunnel will be used as the default route.

- Cipher

Encrypting the data before transmission will ensure that the information cannot be read even if the data packet is intercepted during transmission. If the server is set to the **Auto** mode, the client can configure any encryption algorithm and will use the default algorithm (AES-256-GCM) automatically. If the server is set to a specific encryption algorithm, the client must have the same configuration as the server. Otherwise, the connection will not be set up.

- Deliver DNS

The server pushes DNS information to the client, only the windows-based client.

- Auth

The server informs the client to use the default digest algorithm SHA1.

3.3.5.4.4 Client Mode

The EG device currently supports two client configuration modes: **Web Settings** and **Import Config**. **Web Settings** is typically used to connect to any server except the EG device. **Import Config** is mainly used to connect to an EG device because it working as a server supports exporting the client configuration file (client.ovpn).

Figure 3-3-57 Import Config

The screenshot shows the 'OpenVPN' configuration page. At the top, there are two tabs: 'OpenVPN' (active) and 'Tunnel List'. Below the tabs is a header bar with an information icon and the text 'OpenVPN'. The main configuration area includes an 'Enable' toggle switch which is turned on. Underneath, 'OpenVPN Type' is set to 'Client' (selected with a blue dot) over 'Server'. A red rectangular box highlights the 'Client Config' section, where 'Import Config' is selected with a blue dot, over 'Web Settings'. Below this, there are input fields for 'Username' (containing 'Username of OpenVpn user') and 'Password' (containing 'Password of OpenVpn user'), each with a help icon. The 'Client Config' field contains '.ovpn' and a 'Browse' button, with a blue message 'It already exists.' to the right. At the bottom, there is a 'Client Log' section with an 'Export' button and a large blue 'Save' button.

Server

- Use Explicit Signature for Server Certificate

This feature is enabled by default. If you want to connect to a Mikrotik router, please disable this feature.

- TLS Authentication

Please upload a TLS certificate for TLS authentication.

- Cipher

The configuration must be consistent with the server side.

- Auth

The following digest algorithms are available: SHA1, MD5, SHA256 and NULL. The configuration must be consistent with the server side.

- Allow Data Compression

Data compression is allowed, and the configuration must be consistent with the server side.

- Use Route pushed by Server

If this feature is disabled, the client will not receive the route delivered by the server. If you want to access the internal network of the server, please enable this feature.

3.3.5.4.5 Typical Applications

3.3.5.4.5.1 Networking Topology

Scenario 1. An EG device connects to another EG device.

Figure 3-3-61 Scenario 1

The client (192.168.11.1) wants to connect to the server (192.168.12.1) by OpenVPN and achieve mutual access between the client network and the server network.

Scenario 2. An EG device connects to a PC.

Figure 3-3-62 Scenario 2

3.3.5.4.5.2 Notes

1. OpenVPN allows a PC to dial in to the VPN as a client, and supports connection between a router and another router.

⚠ The client address pool cannot overlap with the internal network of the EG device.

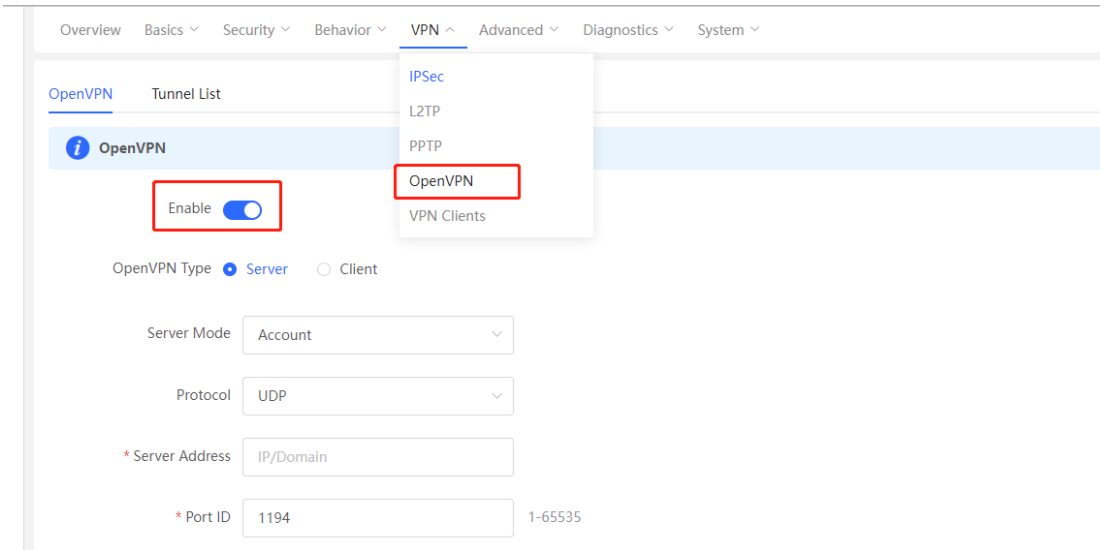

2. Enable **Deliver Router** on the server side and **Use Route Pushed by Server** on the client side. The client will be able to access the internal network of the server.
3. The external IP address of the EG device must be reachable from the client.
4. The configuration on the client side and the server side must be consistent.

3.3.5.4.5.3 Configuration Steps

📌 Server

1. Log in to the web management system. Choose **Router > VPN > OpenVPN**.

Figure 3-3-63 OpenVPN

2. Set **OpenVPN Type** to **Server**. Select a server mode and a protocol, enter a port ID (default: 1194), a server address (local address, reachable from the client) and an IP address range. For example:

Client Config

Server Log

- ⚠ The local address and IP address range cannot overlap with the internal network.
 - ⚠ The OpenVPN server assigns the IP address pool to the PC, and the server reserves the first address xx.xx.xx1 to itself. In the figure above, the virtual IP address of the OpenVPN server is 10.80.12.1.
 - ⚠ The port ID ranges from 1 to 65536 (Default: 1194). If the port is occupied, the connection will not be set up.
3. If the EG device connects to another EG device, it is recommended to use default configuration. If the EG device connects to a device from other vendors, please make sure that the configuration on the client side and the server side are consistent. If the client wants to access the internal network 192.168.110.x, please add the route.

Figure 3-3-65 Deliver Route

Deliver Route ? +

Enable **Deliver Router** on the server side and **Use Route Pushed by Server** on the client side. The client will be able to access the internal network of the server. Up to three routes can be added.

3.4.8 WIO

3.4.8.1 Network Optimization

Description:

This feature will optimize the self-organizing network to maximize the WLAN performance. Please make sure that all APs have been online.

Notes:

- 1. During network optimization, the APs will switch channels, forcing the clients to go offline. The process will last for a while, subject to the quantity of devices. It is recommended you enable network optimization at night.
- 2. If dynamic channel allocation is running in the backend, network optimization will fail. Please try again later.
- 3. The configuration cannot be rolled back once optimization starts.

I have read the notes.

3.6 System

3.6.1 Time

The **Time** module allows you to set the system time. The system time is synchronized with the NTP server by default.

Select a time zone and set at least one NTP server, and click **Save**.

Figure 3-6-1 System Time

System Time ?

Configure and view system time (The device has no RTC module. The time settings will not be saved upon reboot).

Network Management

Action

Option **Unbind Account** (The devices of this account will be removed from Ruiji Cloud and will not be managed by this account).

4 FAQs

Q1: I failed to log into the eWeb management system. What can I do?

Perform the following steps:

- (1) Check that the network cable is properly connected to the LAN port of the device and the corresponding LED indicator blinks or is steady on.
- (2) Before accessing the configuration GUI, set the IP assignment mode to **Obtain an IP address automatically** (recommended), so that the server with DHCP enabled can automatically assign an IP address to the PC. To designate a static IP address to the PC, set the IP address of the PC in the same network segment as the IP address of the management interface. For example, if the default IP address of the management interface is 192.168.110.1 and the subnet mask is 255.255.255.0, set the IP address of the PC to 192.168.110.X (X is any integer ranging from 2 to 254), and the subnet mask is 255.255.255.0.
- (3) Run the **ping** command to test the connectivity between the PC and the device.
- (4) If the login failure persists, restore the device to factory settings.

Q2: What can I do if I forget my username and password? How to restore the factory settings?

To restore the factory settings, power on the device, and press and hold the **Reset** button for 5s or more, and release the **Reset** button after the system LED indicator blinks. The device automatically restores the factory settings and restarts. The original configuration will be lost after the factory settings are restored. After the restoration, the default management address is http://10.44.77.200. You can set the username and password upon first login.

Q3: The subnet mask value needs to be specified to divide the address range for certain functions. What are the common subnet mask values?

A subnet mask is a 32-bit binary address that is used to differentiate between the network address and host address. The subnet and the quantity of hosts in the subnet vary with the subnet mask.

Common subnet mask values include 8 (default subnet mask 255.0.0.0 for class A networks), 16 (default subnet mask 255.255.0.0 for class B networks), 24 (default subnet mask 255.255.255.0 for class C networks), and 32 (default subnet mask 255.255.255.255 for a single IP address).
