	<p>NSSA area. This option takes effect only on an NSSA ABR or ASBR.</p> <p><b>metric value:</b> Specifies the metric of the generated default LSA. The value ranges from 0 to 16,777,214. The default value is 1.</p> <p><b>metric-type type:</b> Specifies the route type of the generated default LSA. The values include 1 and 2. 1 represents N-1, and 2 represents N-2. The default value is 2.</p> <p><b>no-summary:</b> Prohibits the ABR in the NSSA area from sending summary LSAs (Type-3 LSA).</p> <p><b>translator:</b> Indicates that the NSSA ABR is a translator.</p> <p><b>stability-interval seconds:</b> Indicates the stability interval after the NSSA ABR is changed from a translator to a non-translator. The unit is second. The default value is 40. The value ranges from 0 to 2,147,483,647.</p> <p><b>always:</b> Indicates that the current NSSA ABR always acts as a translator. The default value is the standby translator.</p>
<p><b>Command Mode</b></p>	<p>OSPF routing process configuration mode</p>
<p><b>Usage Guide</b></p>	<p>The <b>default-information-originate</b> parameter is used to generate a default Type 7 LSA. This parameter has different functions on the ABR and the ASBR in the NSSA area. On the ABR, a Type 7 LSA default route is generated regardless of whether the default route exists in the routing table. On the ASBR (not an ABR), a Type 7 LSA default route is generated only when the default route exists in the routing table.</p> <p>If the <b>no-redistribution</b> parameter is configured on the ASBR, other external routes introduced by OSPF through the <b>redistribute</b> command cannot be advertised to the NSSA area. This parameter is generally used when a router in the NSSA area acts both as the ASBR and the ABR. It prevents external routing information from entering the NSSA area.</p> <p>To further reduce the number of LSAs sent to the NSSA area, you can configure the <b>no-summary</b> parameter on the ABR to prevent the ABR from sending the summary LSAs (Type 3 LSA) to the NSSA area.</p> <p><b>area default-cost</b> is used on an ABR or ASBR connected to the NSSA area. This command configures the cost of the default route sent from the ABR/ASBR to the NSSA area. By default, the cost of the default route sent to the NSSA area is 1.</p> <p>If an NSSA area has two or more ABRs, the ABR with the largest router ID is elected by default as the translator for converting Type 7 LSAs into Type 5 LSAs. If the current device is always the translator ABR for converting Type 7 LSAs into Type 5 LSAs, use the <b>translator always</b> parameter.</p> <p>If the translator role of the current device is replaced by another ABR, the conversion capability is retained during the time specified by <b>stability-interval</b>. If the router does not become a translator again during <b>stability-interval</b>, LSAs that are converted from Type 7 to Type 5 will be deleted from the AS after <b>stability-interval</b> expires.</p> <p>To prevent a routing loop, LSAs that are converted from Type 7 to Type 5 will be deleted from the AS immediately after the current device loses the translator role even if <b>stability-interval</b> does not expire.</p> <p>In the same NSSA area, it is recommended that <b>translator always</b> be configured on only one ABR.</p>

**Configuration Example**

↳ **Configuring a Stub Area**

<p><b>Scenario</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Introduce an external static route to Router D.</li> <li>● Configure area 1 as the stub area on Router A and Router C.</li> </ul>
<p><b>D</b></p>	<pre>D#configure terminal D(config)#ipv6 router ospf 1 D(config-router)#redistribute static</pre>
<p><b>A</b></p>	<pre>A# configure terminal A(config)#ipv6 router ospf 1 A(config-router)#area 1 stubno-summary</pre>
<p><b>C</b></p>	<pre>C#configure terminal C(config)#ipv6 router ospf 1 C(config-router)#area 1 stub</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router C, run the <b>show ipv6 route ospf</b> command to display the routing table. Verify that there is only one default inter-area route, and no external static route is introduced from Router D.</li> </ul>

<b>C</b>	<pre> C#show ipv6route ospf  IPv6 routing table name - Default - 0 entries  Codes: C - Connected, L - Local, S - Static  R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route  N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2  E1 - OSPF external type 1, E2 - OSPF external type 2  SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2  IA - Inter area  0 IA::/0 [110/3] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/2                 </pre>
----------	--

📌 **Configuring an NSSA Area**

<b>Scenario</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Introduce an external static route to Router D.</li> <li>● Configure area 1 as the NSSA area on Router B and Router D.</li> </ul>
<b>D</b>	<pre> D#configure terminal D(config)#ipv6 router ospf 1 D(config-router)#area 1 nssa D(config-router)#redistribute static                 </pre>
<b>B</b>	<pre> B#configure terminal B(config)#ipv6 router ospf 1 B(config-router)#area 1 nssa                 </pre>

<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router D, run the <b>show ipv6 ospf database</b> command to display the database information and verify that Type 7 LSAs are generated.</li> <li>● On Router A, run the <b>show ipv6 route ospf</b> command to display the routing table and verify that an external static route is introduced by Router D.</li> </ul>
<p><b>D</b></p>	<pre> D#show ipv6 ospf database nssa-external        OSPFv3 Router with ID (1.1.1.1) (Process 1)        NSSA-external-LSA (Area 0.0.0.1)  LS age: 1196  LS Type: NSSA-external-LSA  Link State ID: 0.0.0.3  Advertising Router: 1.1.1.1  LS Seq Number: 0x80000004  Checksum: 0x1F25  Length: 52  Metric Type: 2 (Larger than any link state path)  Metric: 20  Prefix: 2001:10::/64  Prefix Options: 8 (P - - -)  Forwarding Address: 4000::1         </pre>
<p><b>A</b></p>	<pre> A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries  Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area  0 N2 2001:10::/64 [110/20] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1         </pre>

**Common Errors**

- Configurations of the area type are inconsistent on routers in the same area.

- External routes cannot be introduced because route redistribution is configured on a router in the stub area.

### 5.4.5 Configuring Route Summarization

#### Configuration Effect

- Summarize routes to reduce interaction of routing information and the size of routing table, and enhance stability of routes.
- Shield or filter routes.

#### Notes

- The OSPF basic functions must be configured.
- The address range of the summarize route may exceed the actual network range in the routing table. If data is sent to a network beyond the summarization range, a routing loop may be formed and the router processing load may increase. To prevent these problems, a discard route must be added to the routing table or shield or filter routes.

#### Configuration Steps

##### ▾ Configuring Inter-Area Route Summarization

- (Optional) Perform this configuration when routes of the OSPF area need to be summarized.
- Unless otherwise required, perform this configuration on an ABR in the area where routes to be summarized are located.

##### ▾ Configuring External Route Summarization

- (Optional) Perform this configuration when routes external to the OSPF domain need to be summarized.
- Unless otherwise required, perform this configuration on an ASBR, to which routes that need to be summarized are introduced.

#### Verification

- Run the **show ipv6 route ospf** command to verify that individual routes do not exist and only the summarized route exists.

#### Related Commands

##### ▾ Configuring Inter-Area Route Summarization

<b>Command</b>	<code>area area-id range ipv6-prefix/prefix-length [advertise not-advertise]</code>
<b>Parameter Description</b>	<p><i>area-id</i>: Specifies the ID of the OSPF area to which the summarized route should be injected. The value can be an integer or an IPv4 prefix.</p> <p><i>ipv6-prefix/prefix-length</i>: Indicates the range of IP addresses to be summarized.</p> <p><b>advertise</b>   <b>not-advertise</b>: Specifies whether the summarized route should be advertised.</p>
<b>Command</b>	OSPF routing process configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>This command takes effect only on an ABR, and is used to summarize multiple routes in an area into a route and advertise this route to other areas. Combination of the routing information occurs only on the boundary of an area. Routers inside the area can learn specific routing information, whereas routers in other areas can learn only one summarized route. In addition, you can set <b>advertise</b> or <b>not-advertise</b> to determine whether to advertise the summarized route to shield and filter routes. By default, the summarized route is advertised. You can use the <b>cost</b> parameter to set the metric of the summarized route.</p> <p>You can configure route summarization commands for multiple areas. This simplifies routes in the entire OSPF routing domain, and improves the network forwarding performance, especially for a large-sized network.</p> <p>When multiple route summarization commands are configured and have the inclusive relationship with each other, the area range to be summarized is determined based on the maximum match principle.</p>

### ↘ Configuring External Route Summarization

<b>Command</b>	<b>summary-prefix</b> <i>ipv6-prefix/prefix-length</i> [ <b>not-advertise</b>   <b>tag number</b> ]
<b>Parameter Description</b>	<p><i>ipv6-prefix/prefix-length</i>: Indicates the range of IP addresses to be summarized.</p> <p><b>not-advertise</b>: Indicates that the summarized route is not advertised. If this parameter is not specified, the summarized route is advertised.</p> <p><b>tag number</b>: Specifies the tag value of the route that is redistributed into the OSPFv3 routing domain. The value ranges from 0 to 4,294,967,295.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>When routes are redistributed from other routing processes and injected to the OSPFv3 routing process, each route is advertised to the OSPFv3 routers using an external LSA. If the injected routes are a continuous address space, the ABR can advertise only one summarized route to significantly reduce the size of the routing table.</p> <p><b>area range</b> summarizes the routes between OSPFv3 areas, whereas <b>summary-prefix</b> summarizes external routes of the OSPFv3 routing domain.</p> <p>When configured on the NSSA ABR translator, <b>summary-prefix</b> summarizes redistributed routes and routes obtained based on the LSAs that are converted from Type 7 to Type 5. When configured on the ASBR (not an NSSA ABR translator), <b>summary-prefix</b> summarizes only redistributed routes.</p>

### Configuration Example

<p><b>Scenario</b></p>	 <p><b>Remarks</b> The interface IPv6 addresses are as follows:                  B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64                  C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64                  D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Summarize routes of area 2 on Router B.</li> </ul>
<p><b>B</b></p>	<pre>B#configure terminal B(config)#ipv6 router ospf 1 B(config-router)#area 2 range 2001:16::/64</pre>
<p><b>Verification</b></p>	<p>On Router A, check the routing table and verify that the entry 2001:16::/64 is generated and other routes do not exist.</p>
<p><b>A</b></p>	<pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  0 IA 2001:16::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre>

**Common Errors**

- Inter-area route summarization cannot be implemented because the **area range** command is configured on a non-ABR device.

## 5.4.6 Configuring Route Filtering

### Configuration Effect

- Routes that do not meet filtering conditions cannot be loaded to the routing table, or advertised to neighbors. Network users cannot access specified destination network.

### Notes

- The OSPF basic functions must be configured.
- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the **area filter-list** or **area range** (containing the **not-advertise** parameter) command on the ABR to prevent generation of black-hole routes.

### Configuration Steps

#### ↘ Configuring Inter-Area Route Filtering

- (Optional) This configuration is recommended if users need to be restricted from accessing the network in a certain OSPF area.
- Unless otherwise required, perform this configuration on an ABR in the area where filtered routes are located.

#### ↘ Configuring Redistributed Route Filtering

- (Optional) Perform this configuration if external routes introduced by the ASBR need to be filtered.
- Unless otherwise required, perform this configuration on an ASBR to which filtered routes are introduced.

#### ↘ Configuring Learned Route Filtering

- (Optional) Perform this configuration if users need to be restricted from accessing a specified destination network.
- Unless otherwise required, perform this configuration on a router that requires route filtering.

### Verification

- Run the **show ipv6 route** command to verify that the router is not loaded with routes that have been filtered out.
- Run the **ping** command to verify that the specified destination network cannot be accessed.

### Related Commands

#### ↘ Configuring a Passive Interface

Command	<code>passive-interface {default   interface-type interface-number }</code>
---------	---

<b>Parameter</b>	<i>interface-type interface-number</i> : Indicates the interface that should be configured as a passive interface.
<b>Description</b>	<b>default</b> : Indicates that all interfaces will be configured as passive interfaces.
<b>Command</b>	OSPF routing process configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	When an interface is configured as a passive interface, it no longer sends or receives Hello packets. This command takes effect only on an OSPFv3-enabled interface, and not on a virtual link.

### ▾ Configuring Redistributed Route Filtering

<b>Command</b>	<b>distribute-list</b> { <i>name</i>   <b>prefix-list</b> <i>prefix-list-name</i> } <b>out</b> [ <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]] <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>static</b> ]
<b>Parameter</b>	<i>name</i> : Uses the ACL for filtering.
<b>Description</b>	<b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list for filtering. <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>static</b> : Indicates the source of routes to be filtered.
<b>Command</b>	OSPF routing process configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	<b>distribute-list out</b> is similar to <b>redistribute route-map</b> , and is used to filter routes that are redistributed from other protocols to OSPFv3. The <b>distribute-list out</b> command itself does not redistribute routes, and is generally used together with the <b>redistribute</b> command. The ACL and the prefix list filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes coming from a certain source, the prefix list cannot be configured to filter the same routes.

### ▾ Configuring Learned Route Filtering

<b>Command</b>	<b>distribute-list</b> { <i>name</i>   <b>prefix-list</b> <i>prefix-list-name</i> } <b>in</b> [ <i>interface-type</i> <i>interface-number</i> ]
<b>Parameter</b>	<i>name</i> : Uses the ACL for filtering.
<b>Description</b>	<b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list for filtering. <i>interface-type interface-number</i> : Specifies the interface for which LSA routes are filtered.
<b>Command</b>	OSPF routing process configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Filter routes that are computed based on received LSAs. Only routes meeting the filtering conditions can be forwarded. The command does not affect the LSDB or the routing tables of neighbors. The ACL and the prefix list filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes on a specified interface, the prefix list cannot be configured to filter routes on the same interface. Filtering routes by using the <b>distribute-list in</b> command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the <b>area range</b> (containing the <b>not-advertise</b> parameter) command on the ABR to prevent generation of black-hole routes.

### Configuration Example

<p><b>Scenario</b></p>	 <p><b>Remarks</b> The interface IPv6 addresses are as follows:          B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64          C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64          D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, configure route filtering.</li> </ul>
<p><b>A</b></p>	<pre>A#configure terminal A(config)#ipv6 access-list test A (config-ipv6-acl)#permit ipv6 2001:16:5::/64 any A(config)#ipv6 router ospf 1 A(config-router)#distribute-list test in GigabitEthernet0/1</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A, check the routing table. Verify that only the entry 2001:16:5::/64 is loaded.</li> </ul>
<p><b>A</b></p>	<pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area  O IA 2001:16:5::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre>

**Common Errors**

- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated.

## 5.4.7 Modifying the Route Cost and AD

### Configuration Effect

- Change the OSPF routes so that the traffic passes through specified nodes or bypasses specified nodes.
- Change the sequence that a router selects routes so as to change the priorities of OSPF routes.

### Notes

- The OSPF basic functions must be configured.
- If you run the **ipv6 ospf cost** command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

### Configuration Steps

#### ▾ Configuring the Reference Bandwidth

- Optional.
- A router is connected with lines with different bandwidths. This configuration is recommended if you wish to preferentially select the line with a larger bandwidth.

#### ▾ Configuring the Cost of an Interface

- Optional.
- A router is connected with multiple lines. This configuration is recommended if you wish to manually specify a preferential line.

#### ▾ Configuring the Default Metric for Redistribution

- Optional.
- This configuration is mandatory if the cost of external routes of the OSPF domain should be specified when external routes are introduced to an ASBR.

#### ▾ Configuring the Maximum Metric

- Optional.
- A router may be unstable during the restart process or a period of time after the router is restarted, and users do not want to forward data through this router. In this case, this configuration is recommended.

#### ▾ Configuring the AD

- Optional.

- Perform this configuration if you wish to change the priorities of OSPF routes on a router that runs multiple unicast routing protocols.

## Verification

- Run the **show ipv6 ospf interface** command to verify that the costs of interfaces are correct.
- Run the **show ipv6 route** command to verify that the costs of external routes introduced by the ASBR are correct.
- Restart the router. Within a specified period of time, data is not forwarded through the restarted router.

## Related Commands

### ↳ Configuring the Reference Bandwidth

<b>Command</b>	<b>auto-costreference-bandwidth</b> <i>ref-bw</i>
<b>Parameter Description</b>	<i>ref-bw</i> : Indicates the reference bandwidth. The unit is Mbps. The value ranges from 1 to 4, 294, 967.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	You can run the <b>ipv6 ospf cost</b> command in interface configuration mode to specify the cost of the interface. The priority of this cost is higher than that of the metric computed based on the reference bandwidth.

### ↳ Configuring the Cost of an Interface

<b>Command</b>	<b>ipv6 ospf cost</b> <i>cost</i> [ <i>instance</i> <i>instance-id</i> ]
<b>Parameter Description</b>	<i>cost</i> : Indicates the cost of an OSPF interface. The value ranges from 0 to 65,535. <i>instance</i> <i>instance-id</i> : Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, the cost of an OSPFv3 interface is equal to 100 Mbps/Bandwidth, where Bandwidth is the bandwidth of the interface and configured by the <b>bandwidth</b> command in interface configuration mode. The costs of OSPF interfaces on several typical lines are as follows: <ul style="list-style-type: none"> <li>● 64 Kbps serial line: The cost is 1562.</li> <li>● E1 line: The cost is 48.</li> <li>● 10M Ethernet: The cost is 10.</li> <li>● 100M Ethernet: The cost is 1.</li> </ul> If you run the <b>ipv6 ospf cost</b> command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

### ↳ Configuring the Cost of the Default Route in a Stub or an NSSA Area

<b>Command</b>	<b>area</b> <i>area-id</i> <b>default-cost</b> <i>cost</i>
<b>Parameter</b>	<i>area-id</i> : Indicates the ID of the stub or NSSA area.

<b>Description</b>	<i>cost</i> : Indicates the cost of the default summarized route injected to the stub or NSSA area. The value ranges from 0 to 16, 777, 215.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	This command takes effect only on an ABR in a stub area or an ABR/ASBR in an NSSA area.

### ↘ Configuring the Default Metric for Redistribution

<b>Command</b>	<b>default-metric</b> <i>metric</i>
<b>Parameter Description</b>	<i>metric</i> : Indicates the default metric of the OSPF redistributed route. The value ranges from 1 to 16,777,214.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	The <b>default-metric</b> command must be used together with the <b>redistribute</b> command to modify the initial metrics of all redistributed routes. The <b>default-metric</b> command does not take effect on external routes that are injected to the OSPF routing domain by the <b>default-information originate</b> command. The default metric of a redistributed direct route is always 20.

### ↘ Configuring the AD

<b>Command</b>	<b>distance</b> { <i>distance</i>   <b>ospf</b> { [ <b>intra-area</b> <i>distance</i> ] [ <b>inter-area</b> <i>distance</i> ] [ <b>external</b> <i>distance</i> ]} }
<b>Parameter Description</b>	<i>distance</i> : Indicates the AD of a route. The value ranges from 1 to 255. <b>intra-area</b> <i>distance</i> : Indicates the AD of an intra-area route. The value ranges from 1 to 255. <b>inter-area</b> <i>distance</i> : Indicates the AD of an inter-area route. The value ranges from 1 to 255. <b>external</b> <i>distance</i> : Indicates the AD of an external route. The value ranges from 1 to 255.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	Use this command to specify different ADs for different types of OSPF routes. The AD allows different routing protocols to compare route priorities. A smaller AD indicates a higher route priority. The priorities of routes generated by different OSPFv3 processes must be compared based on ADs. If the AD of a route entry is set to 255, the route entry is not trustworthy and does not participate in packet forwarding.

### Configuration Example

<p><b>Scenario</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, configure the cost of each interface.</li> </ul>
<p><b>A</b></p>	<pre>A#configure terminal A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ipv6 ospf cost 10 A(config)#interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)#ipv6 ospf cost 20</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A, check the routing table. The next hop of the optimum path to 2001:16:1::/64 is Router B.</li> </ul>
<p><b>A</b></p>	<pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  0 E2 2001:16:1::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre>

**Common Errors**

- If the cost of an interface is set to 0 in the **ipv6 ospf cost** command, a route computation error may occur. For example, a routing loop is obtained.

## 5.4.8 Enabling Authentication

### Configuration Effect

- All routers connected to the OSPF network must be authenticated to ensure stability of OSPF and protect OSPF against intrusions.

### Notes

- The OSPF basic functions must be configured.
- If authentication is configured for an area, the configuration takes effect on all interfaces that belong to this area.
- If authentication is configured for both an interface and the area to which the interface belongs, the configuration for the interface takes effect preferentially.

### Configuration Steps

#### ▾ Configuring Authentication

- Optional.
- Perform this configuration if a router accesses a network that requires authentication.

#### ▾ Configuring Encryption

- Optional.
- Perform this configuration if a router accesses a network that requires encryption.

#### ▾ Configuring Virtual Link Authentication

- Optional.
- Perform this configuration if a router accesses a network that requires authentication.

#### ▾ Configuring Virtual Link Encryption

- Optional.
- Perform this configuration if a router accesses a network that requires encryption.

### Verification

- If routers are configured with different authentication keys, run the **show ipv6 ospf neighbor** command to verify that there is no OSPF neighbor.
- If routers are configured with the same authentication key, run the **show ipv6 ospf neighbor** command to verify that there are OSPF neighbors.

### Related Commands

#### ▾ Configuring Area-based Authentication

Command	<code>area <i>area-id</i> authentication ipsec spi <i>spi</i> [md5 sha1] [0   7 ] key</code>
---------	--

<b>Parameter Description</b>	<p><i>area-id</i>: Indicates the area ID. The value can be an integer or an IPv4 prefix.</p> <p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p> <p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The RGOS supports three authentication types:</p> <ul style="list-style-type: none"> <li>● No authentication</li> <li>● MD5 authentication</li> <li>● SHA1 authentication</li> </ul> <p>Configuration of area-based authentication for OSPFv3 takes effect on all interfaces (except virtual links) in the area, but the interface-based authentication configuration takes precedence over the area-based configuration.</p>

📌 **Configuring Area-based Encryption and Authentication**

<b>Command</b>	<b>area</b> <i>area-id</i> <b>encryption ipsec spi</b> <i>spi</i> <b>esp</b> [ <b>null</b>   [ <b>des</b>   <b>3des</b> ] [ <b>0</b>   <b>7</b> ] <i>des-key</i> ] [ <b>md5</b>   <b>sha1</b> ] [ <b>0</b>   <b>7</b> ] <i>key</i>
<b>Parameter Description</b>	<p><i>area-id</i>: Indicates the area ID. The value can be an integer or an IPv4 prefix.</p> <p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>null</b>: Indicates that no encryption mode is used.</p> <p><b>des</b>: Indicates that the Data Encryption Standard (DES) mode is used.</p> <p><b>3des</b>: Indicates that the Triple DES (3DES) mode is used.</p> <p><i>des-key</i>: Indicates the encryption key.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p> <p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The RGOS supports two encryption modes and two authentication modes.</p> <p>The two encryption modes are as follows:</p> <ul style="list-style-type: none"> <li>● DES</li> <li>● 3DES</li> </ul> <p>The two authentication modes are as follows:</p> <ul style="list-style-type: none"> <li>● MD5</li> <li>● SHA1</li> </ul> <p>Configuration of area-based encryption and authentication for OSPFv3 takes effect on all interfaces (except virtual links) in the area, but the interface-based encryption and authentication configuration takes</p>

	precedence over the area-based configuration.
--	---

↘ **Configuring Interface-based Authentication**

<b>Command</b>	<code>ipv6 ospfauthentication[ null   ipsec spi spi [md5 sha1] [0 7]key][instance instance-id]</code>
<b>Parameter Description</b>	<p><i>area-id</i>: Indicates the area ID. The value can be an integer or an IPv4 prefix.</p> <p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p> <p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p> <p><b>instance instance-id</b>: Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The RGOS supports three authentication types:</p> <ul style="list-style-type: none"> <li>● No authentication</li> <li>● MD5 authentication</li> <li>● SHA1 authentication</li> </ul> <p>OSPFv3 authentication parameters configured on interconnected interfaces must be consistent.</p>

↘ **Configuring Interface-based Encryption and Authentication**

<b>Command</b>	<code>ipv6 ospfencryption ipsec spi spi esp[ null [ des   3des ] [ 0   7 ] des-key][md5 sha1] [0 7]key[instance instance-id]</code>
<b>Parameter Description</b>	<p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>null</b>: Indicates that no encryption mode is used.</p> <p><b>des</b>: Indicates that the DES mode is used.</p> <p><b>3des</b>: Indicates that the 3DES mode is used.</p> <p><i>des-key</i>: Indicates the encryption key.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p> <p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p> <p><b>instance instance-id</b>: Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The RGOS supports two encryption modes and two authentication modes.</p> <p>The two encryption modes are as follows:</p> <ul style="list-style-type: none"> <li>● DES</li> </ul>

	<ul style="list-style-type: none"> <li>● 3DES</li> </ul> <p>The two authentication modes are as follows:</p> <ul style="list-style-type: none"> <li>● MD5</li> <li>● SHA1</li> </ul> <p>OSPFv3 encryption and authentication parameters configured on the local interface must be consistent with those configured on the interconnected interfaces.</p>
--	--

### Configuration Example

<b>Scenario</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure MD5 authentication for interfaces of all routers.</li> </ul>
<b>A</b>	<pre>A#configure terminal A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ipv6 ospf authentication ipsec spi 256 md5 01234567890123456789012345678912</pre>
<b>B</b>	<pre>B# configure terminal B(config)#interface GigabitEthernet 0/3 B(config-if-GigabitEthernet 0/3)#ipv6 ospf authentication ipsec spi 256 md5 01234567890123456789012345678912</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router A and Router B, verify that the OSPF neighbor status is correct.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri   State           Dead Time   Instance ID  Interface 2.2.2.2        1    Full/DR         00:00:38   0            GigabitEthernet 0/1</pre>
<b>B</b>	<pre>B# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri   State           Dead Time   Instance ID  Interface 1.1.1.1        1    Full/BDR        00:00:38   0            GigabitEthernet 0/1</pre>

### Common Errors

- The configured authentication modes are inconsistent.
- The configured authentication keys are inconsistent.

## 5.4.9 Modifying the Maximum Number of Concurrent Neighbors

### Configuration Effect

- Control the maximum number of concurrent neighbors on the OSPF process to ease the pressure on the device.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Configuring the Maximum Number of Concurrent Neighbors on the OSPF Process

- (Optional) This configuration is recommended if you wish to set up the OSPF adjacency more quickly when a router is connected with a lot of other routers.
- Perform this configuration on a core router.

### Verification

- Run the **show ipv6 ospf neighbor** command to display the number of neighbors that are concurrently interacting with the OSPF process.

### Related Commands

#### ▾ Configuring the Maximum Number of Concurrent Neighbors on the Current Process

<b>Command</b>	<b>max-concurrent-dd</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	When the performance of a router is affected because the router exchanges data with multiple neighbors, you can configure this command to restrict the maximum of neighbors with which each OSPF process can concurrently initiate or accept interaction.

#### ▾ Configuring the Maximum Number of Concurrent Neighbors on All Processes

<b>Command</b>	<b>ipv6 router ospf max-concurrent-dd</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When the performance of a router is affected because the router exchanges data with multiple neighbors,

you can configure this command to restrict the maximum of neighbors with which all OSPF processes can concurrently initiate or accept interaction.

### Configuration Example

<p><b>Scenario</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On the Router Core, set the maximum number of concurrent neighbors to 4.</li> </ul>
<p><b>Core</b></p>	<pre>Core# configure terminal Core(config)# ipv6 router ospf max-concurrent-dd 4</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On the Router Core, check the neighbor status and verify that at most eight neighbors concurrently interact with the OSPF process.</li> </ul>

### Common Errors

N/A

## 5.4.10 Disabling MTU Verification

### Configuration Effect

- The unicast routing service can be provided even if the MTUs of interfaces on neighbor routers are different.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Disabling MTU Verification

- (Optional) MTU verification is disabled by default. You are advised to retain the default configuration.

- Perform this configuration on two routers with different interface MTUs.

### Verification

- The adjacency can be set up between routers with different MTUs.

### Related Commands

#### Disabling MTU Verification

<b>Command</b>	<b>ipv6 ospf mtu-ignore</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	On receiving the database description packet, OSPF checks whether the MTU of the interface on the neighbor is the same as the MTU of its own interface. If the interface MTU specified in the received database description packet is greater than the MTU of the local interface, the adjacency cannot be set up. To resolve this problem, you can disable MTU verification.

### Configuration Example

<b>Scenario</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure different MTUs for interfaces on two routers.</li> <li>● Disable MTU verification on all routers. (By default, the function of disabling MTU verification is enabled.)</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 mtu 1400 A(config-if-GigabitEthernet 0/1)#ipv6 ospf mtu-ignore</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 mtu 1600 B(config-if-GigabitEthernet 0/1)# ipv6 ospf mtu-ignore</pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>On Router A, verify that the OSPF neighbor information is correct.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospf neighbor  OSPFv3 Process (1), 1 Neighbors, 1 is Full:  Neighbor ID    Pri   State           Dead Time   Instance ID  Interface 2.2.2.2        1    Full/DR         00:00:38   0            GigabitEthernet 0/1</pre>

### Common Errors

N/A

## 5.4.11 Enabling Two-Way Maintenance

### Configuration Effect

- Non-Hello packets can also be used to maintain the adjacency.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Enabling Two-Way Maintenance

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on all routers.

### Verification

- Non-Hello packets can also be used to maintain the adjacency.

### Related Commands

#### ▾ Enabling Two-Way Maintenance

<b>Command</b>	<b>two-way-maintain</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	On a large network, a lot of packets may be sent or received, occupying too much CPU and memory. As a result, some packets are delayed or discarded. If the processing time of Hello packets exceeds the dead interval, the adjacency will be destroyed due to timeout. If the two-way maintenance function is enabled, in addition to the Hello packets, the DD, LSU, LSR, and LSack packets can also be used to maintain the bidirectional communication between neighbors when a large number of packets exist on the network. This prevents termination of the adjacency caused by delayed or discarded Hello packets.

### Configuration Example

<b>Scenario</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, enable the two-way maintenance function. (This function is enabled by default.)</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ipv6 routerospf 1 A(config-router)#two-way-maintain</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● When the adjacency is being set up, Router A checks the neighbor dead interval and updates the dead interval without waiting for Router B to send a Hello packet.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospfneighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri  State           Dead Time   Instance ID  Interface 2.2.2.2        1   Full/DR         00:00:38   0            GigabitEthernet 0/1</pre>

### Common Errors

N/A

## 5.4.12 Correlating OSPF with BFD

### Configuration Effect

- Once a link is faulty, OSPF can quickly detect the failure of the route. This configuration helps shorten the traffic interruption time.

### Notes

- The OSPF basic functions must be configured.
- The BFD parameters must be configured for the interface in advance.
- If BFD is configured for both a process and an interface, the interface-based configuration takes effect preferentially.

### Configuration Steps

#### ↘ Correlating OSPF with BFD

- (Optional) Perform this configuration if you wish to accelerate OSPF network convergence.

- Perform this configuration on routers at both ends of the link.

### Verification

- Run the **show bfd neighbor** command to verify that the BFD neighbors are normal.

### Related Commands

#### ↘ Correlating an OSPF Interface with BFD

<b>Command</b>	<b>ipv6 ospf bfd [ disable ]</b>
<b>Parameter Description</b>	<b>disable:</b> Disables BFD for link detection on a specified OSPF-enabled interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The interface-based configuration takes precedence over the <b>bfd all-interfaces</b> command used in process configuration mode. Based on the actual environment, you can run the <b>ipv6 ospf bfd</b> command to enable BFD on a specified interface for link detection, or run the <b>bfd all-interfaces</b> command in OSPF process configuration mode to enable BFD on all interface of the OSPF process, or run the <b>ipv6 ospf bfd disable</b> command to disable BFD on a specified interface.

#### ↘ Correlating an OSPF Process with BFD

<b>Command</b>	<b>bfd all-interfaces</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	OSPF process configuration mode
<b>Usage Guide</b>	OSPF dynamically discovers neighbors through the Hello packets. After OSPF enables the BFD function, a BFD session will be set up to achieve the full adjacency, and use the BFD mechanism to detect the neighbor status. Once a neighbor failure is detected through BFD, OSPF performs network convergence immediately. You can also run the <b>ipv6 ospf bfd [disable]</b> command in interface configuration mode to enable or disable the BFD function on a specified interface, and this configuration takes precedence over the <b>bfd all-interfaces</b> command used in OSPF process configuration mode.

### Configuration Example

<p><b>Scenario</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the BFD parameters for interfaces of all routers.</li> <li>● Correlate OSPF with BFD on all routers.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)#bfd interval 200 min_rx 200 multiplier 5 A(config)# ipv6 router ospf 1 A(config-router)#bfd all-interfaces</pre>
<p><b>B</b></p>	<pre>B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 2/1)#bfd interval 200 min_rx 200 multiplier 5 B(config)# ipv6 router ospf 1 B(config-router)#bfd all-interfaces</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A and Router B, verify that the BFD state is Up.</li> <li>● Disconnect Router B from the switch. On Router A, verify that a neighbor is found disconnected during BFD, and the corresponding OSPF route is deleted.</li> </ul>
<p><b>A</b></p>	<pre>A# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri  State      BFD State  Dead Time  Instance ID  Interface 2.2.2.2        1    Full/BDR   Up          00:00:35   0            GigabitEthernet 0/1</pre>
<p><b>B</b></p>	<pre>B# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri  State      BFD State  Dead Time  Instance ID  Interface 1.1.1.1        1    Full/DR    Up          00:00:35   0            GigabitEthernet 0/1</pre>

**Common Errors**

N/A

## 5.4.13 Enabling GR

### Configuration Effect

- When a distributed route switches services from the active board to the standby board, traffic forwarding continues and is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and is not interrupted.

### Notes

- The OSPF basic functions must be configured.
- The neighbor router must support the GR helper function.
- The grace period cannot be shorter than the neighbor dead time of the neighbor router.

### Configuration Steps

#### ▾ Configuring the OSPF GR Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on routers where hot standby switchover is triggered or the OSPF process is restarted.

#### ▾ Configuring the OSPF GR Helper Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on a router if hot standby switchover is triggered or the OSPF process is restarted on a neighbor of this router.

### Verification

- When a distributed router switches services from the active board to the standby board, data forwarding continues and the traffic is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and the traffic is not interrupted.

### Related Commands

#### ▾ Configuring the OSPF GR Function

<b>Command</b>	<b>graceful-restart [ <i>grace-period</i><i>grace-period</i> <i>inconsistent-lsa-checking</i> ]</b>
<b>Parameter Description</b>	<p><b>grace-period</b> <i>grace-period</i>: Indicates the grace period, which is the maximum time from occurrence of an OSPF failure to completion of the OSPF GR. The value of the grace period varies from 1s to 1800s. The default value is 120s.</p> <p><b>inconsistent-lsa-checking</b>: Enables topological change detection. If any topological change is detected, OSPF exits the GR process to complete convergence. After GR is enabled, topological change detection is enabled by default.</p>
<b>Command Mode</b>	OSPF routing process configuration mode

<b>Usage Guide</b>	<p>The GR function is configured based on the OSPF process. You can configure different parameters for different OSPF processes based on the actual conditions. This command is used to configure the GR restarter capability of a device. The grace period is the maximum time of the entire GR process, during which link status is rebuilt so that the original state of the OSPF process is restored. After the grace period expires, OSPF exits the GR state and performs common OSPF operations.</p> <p>Run the <b>graceful-restart</b> command to set the grace period to 120s. The <b>graceful-restart grace-period</b> command allows you to modify the grace period explicitly.</p> <p>The precondition for successful execution of GR and uninterrupted forwarding is that the topology remains stable. If the topology changes, OSPF quickly converges without waiting for further execution of GR, thus avoiding long-time forwarding black-hole.</p> <ul style="list-style-type: none"> <li>● Disabling topology detection: If OSPF cannot converge in time when the topology changes during the hot standby process, forwarding black-hole may appear in a long time.</li> <li>● Enabling topology detection: Forwarding may be interrupted when topology detection is enabled, but the interruption time is far shorter than that when topology detection is disabled.</li> </ul> <p>In most cases, it is recommended that topology detection be enabled. In special scenarios, topology detection can be disabled if the topology changes after the hot standby process, but it can be ensured that the forwarding black-hole will not appear in a long time. This can minimize the forwarding interruption time during the hot standby process.</p>
--------------------	---

### ▾ Configuring the OSPF GR Helper Function

<b>Command</b>	<b>graceful-restart helper { disable  strict-lsa-checking   internal-lsa-checking}</b>
<b>Parameter Description</b>	<p><b>disable:</b> Prohibits a device from acting as a GR helper for another device.</p> <p><b>strict-lsa-checking:</b> Indicates that changes in Type 1 to Type 5 and Type 7 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p> <p><b>internal-lsa-checking:</b> Indicates that changes in Type 1 to Type 3 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>This command is used to configure the GR helper capability of a router. When a neighbor router implements GR, it sends a Grace-LSA to notify all neighbor routers. If the GR helper function is enabled on the local router, the local router becomes the GR helper on receiving the Grace-LSA, and helps the neighbor to complete GR. The <b>disable</b> option indicates that GR helper is not provided for any device that implements GR.</p> <p>After a device becomes the GR helper, the network changes are not detected by default. If any change takes place on the network, the network topology converges after GR is completed. If you wish that network changes can be quickly detected during the GR process, you can configure <b>strict-lsa-checking</b> to check Type 1 to 5 and Type 7 LSAs that indicate the network information or <b>internal-lsa-checking</b> to check Type 1 to 3 LSAs that indicate internal routes of the AS domain. When the network scale is large, it is</p>

recommended that you disable the LSA checking options (**strict-lsa-checking** and **internal-lsa-checking**) because regional network changes may trigger termination of GR and consequently reduce the convergence of the entire network.

### Configuration Example

<p><b>Scenario</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, Router C, and Router D, enable the GR helper function. (This function is enabled by default.)</li> <li>● On Router B, enable the GR function.</li> </ul>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# ipv6 router ospf1 B(config-router)# graceful-restart</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Trigger a hot standby switchover on Router B, and verify that the routing tables of destination Network 1 and Network 2 remain unchanged on Router A during the switchover.</li> <li>● Trigger a hot standby switchover on Router B, ping destination Network 1 from Router A, and verify that traffic forwarding is not interrupted during the switchover.</li> </ul>

### Common Errors

- Traffic forwarding is interrupted during the GR process because the configured grace period is shorter than the neighbor dead time of the neighbor router.

## 5.4.14 Configuring Network Management Functions

### Configuration Effect

- Use the network management software to manage OSPF parameters and monitor the OSPF running status.

### Notes

- The OSPF basic functions must be configured.

- You must enable the MIB function of the SNMP server before enabling the OSPF MIB function.
- You must enable the trap function of the SNMP server before enabling the OSPF trap function.
- You must enable the logging function of the device before outputting the OSPF logs.

## Configuration Steps

### ↘ Binding the MIB with the OSPF Process

- (Optional) This configuration is required if you want to use the network management software to manage parameters of a specified OSPF process.
- Perform this configuration on all routers.

### ↘ Enabling the Trap Function

- (Optional) This configuration is required if you want to use the network management software to monitor the OSPF running status.
- Perform this configuration on all routers.

### ↘ Configuring the Logging Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration. If you want to reduce the log output, disable this function.
- Perform this configuration on all routers.

## Verification

- Use the network management software to manage the OSPF parameters.
- Use the network management software to monitor the OSPF running status.

## Related Commands

### ↘ Binding the MIB with the OSPF Process

<b>Command</b>	<b>enable mib-binding</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	The OSPFv2 MIB does not have the OSPFv3 process information. Therefore, you can perform operations only on a single OSPFv2 process through SNMP. By default, the OSPFv3 MIB is bound with the OSPFv3 process with the smallest process ID, and all user operations take effect on this process. If you wish to perform operations on a specified OSPFv3 process through SNMP, run this command to bind the MIB with the process.

### ↘ Enabling the Trap Function

<b>Command</b>	<code>enable traps[error [IfConfigError  IfRxBadPacket   VirtIfConfigError   VirtIfRxBadPacket]   state-change[IfStateChange   NbrStateChange   NssaTranslatorStatusChange   VirtIfStateChange   VirtNbrStateChange   RestartStatusChange   NbrRestartHelperStatusChange   VirtNbrRestartHelperStatusChange] ]</code>
<b>Parameter Description</b>	<p><b>IfConfigError:</b> Indicates that an interface parameter configuration error occurs.</p> <p><b>IfRxBadPacket:</b> Indicates that the interface receives a bad packet.</p> <p><b>VirtIfConfigError:</b> Indicates that a virtual interface parameter configuration error occurs.</p> <p><b>VirtIfRxBadPacket:</b> Indicates that the virtual interface receives a bad packet.</p> <p><b>IfStateChange:</b> Indicates that interface state changes.</p> <p><b>NbrStateChange:</b> Indicates that the neighbor state changes.</p> <p><b>NssaTranslatorStatusChange:</b> Indicates that the NSSA translation state changes.</p> <p><b>VirtIfStateChange:</b> Indicates that the virtual interface state changes.</p> <p><b>VirtNbrStateChange:</b> Indicates that the virtual neighbor state changes.</p> <p><b>RestartStatusChange:</b> Indicates that the GR state of the local device changes.</p> <p><b>NbrRestartHelperStatusChange:</b> Indicates that the state of the neighbor GR process changes.</p> <p><b>VirtNbrRestartHelperStatusChange:</b> Indicates that the GR state of the virtual neighbor changes.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The function configured by this command is restricted by the <code>snmp-server</code> command. You can configure <code>snmp-server enable traps ospf</code> and then <code>enable traps</code> command before the corresponding OSPF traps can be correctly sent out.</p> <p>This command is not restricted by the MIB bound with the process. The trap function can be enabled concurrently for different processes.</p>

📌 **Configuring the Logging Function**

<b>Command</b>	<code>log-adj-changes[ detail]</code>
<b>Parameter Description</b>	<b>detail:</b> Records all status change information.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

<b>Scenario</b>	<p>The diagram illustrates a network scenario with two routers, A and B, connected via their GE 0/1 interfaces. They are part of Area 0. Router A has IP 2001:1::1/64 and Router B has IP 2001:1::2/64.</p>
-----------------	---

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Bind the MIB with the OSPF process on Router A.</li> <li>● Enable the trap function on Router A.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)#snmp-server host 192.168.2.2 traps version 2c public A(config)#snmp-server community public rw A(config)#snmp-server enable traps A(config)# A(config)# ipv6 routerospf 10 A(config-router)# enable mib-binding A(config-router)# enable traps</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Use the MIB tool to read and set the OSPF parameters and display the OSPF running status.</li> </ul>

### Common Errors

N/A

## 5.4.15 Modifying Protocol Control Parameters

### Configuration Effect

- Modify protocol control parameters to change the protocol running status.

### Notes

- The OSPF basic functions must be configured.
- The neighbor dead time cannot be shorter than the Hello interval.

### Configuration Steps

#### ▾ Configuring the Hello Interval

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on routers at both end of a link.

#### ▾ Configuring the Dead Interval

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if you wish to accelerate OSPF convergence when a link fails.
- Perform this configuration on routers at both end of a link.

#### ▾ Configuring the LSU Retransmission Interval

- (Optional) You are advised to adjust this configuration if a lot of routes exist in the user environment and network congestion is serious.

#### ↘ Configuring the LSA Generation Time

- (Optional) You are advised to retain the default configuration.

#### ↘ Configuring the LSA Group Refresh Time

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if a lot of routes exist in the user environment.

- Perform this configuration on an ASBR or ABR.

#### ↘ Configuring LSA Repeated Receiving Delay

- (Optional) You are advised to retain the default configuration.

#### ↘ Configuring the SPF Computation Delay

- (Optional) This configuration can be adjusted if network flapping frequently occurs.

#### ↘ Configuring the Inter-Area Route Computation Delay

- (Optional) You are advised to retain the default configuration.

- Perform this configuration on all routers.

#### ↘ Configuring the Inter-Area Route Computation Delay

- (Optional) You are advised to retain the default configuration.

- Perform this configuration on all routers.

## Verification

- Run the **show ipv6 ospf** and **show ipv6 ospf neighbor** commands to display the protocol running parameters and status.

## Related Commands

### ↘ Configuring the Hello Interval

<b>Command</b>	<b>ipv6ospf hello-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the interval at which OSPF sends the Hello packet. The unit is second. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The Hello interval is contained in the Hello packet. A shorter Hello interval indicates that OSPF can detect topological changes more quickly, but the network traffic increases. The Hello interval must be the same on all routers in the same network segment. If you want to manually modify the neighbor dead interval, ensure

	that the neighbor dead interval is longer than the Hello interval.
--	--

### ↘ Configuring the Dead Interval

<b>Command</b>	<b>ipv6ospf dead-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the time that the neighbor is declared lost. The unit is second. The value ranges from 0 to 2,147,483,647.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>The OSPF dead interval is contained in the Hello packet. If OSPF does not receive a Hello packet from a neighbor within the dead interval, it declares that the neighbor is invalid and deletes this neighbor record from the neighbor list. By default, the dead interval is four times the Hello interval. If the Hello interval is modified, the dead interval is modified automatically.</p> <p>When using this command to manually modify the dead interval, pay attention to the following issues:</p> <ol style="list-style-type: none"> <li>1. The dead interval cannot be shorter than the Hello interval.</li> <li>2. The dead interval must be the same on all routers in the same network segment.</li> </ol>

### ↘ Configuring the LSU Transmission Delay

<b>Command</b>	<b>ipv6ospf transmit-delay</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSU transmission delay on the OSPF interface. The unit is second. The value ranges from 0 to 65,535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Before an LSU packet is transmitted, the Age fields in all LSAs in this packet will increase based on the amount specified by the <b>ip ospf transmit-delay</b> command. Considering the transmission delay and line propagation delay on the interface, you need to set the LSU transmission delay to a greater value for a low-speed line or interface. The LSU transmission delay of a virtual link is defined by the <b>transmit-delay</b> parameter in the <b>area virtual-link</b> command.</p> <p>If the value of the Age field of an LSA reaches 3600, the packet will be retransmitted or a retransmission will be requested. If the LSA is not updated in time, the expired LSA will be deleted from the LSDB.</p>

### ↘ Configuring the LSU Retransmission Interval

<b>Command</b>	<b>ipv6ospf retransmit-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSU retransmission interval. The unit is second. The value ranges from 0 to 65,535. This interval must be longer than the round-trip transmission delay of data packets between two neighbors.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>After a router finishes sending an LSU packet, this packet is still kept in the transmit buffer queue. If an acknowledgment from the neighbor is not received within the time defined by the <b>ip ospf retransmit-interval</b> command, the router retransmits the LSU packet.</p> <p>The retransmission delay can be set to a greater value on a serial line or virtual link to prevent unnecessary retransmission. The LSU retransmission delay of a virtual link is defined by the</p>

	<code>retransmit-interval</code> parameter in the <code>area virtual-link</code> command.
--	---

### ↘ Configuring the LSA Generation Time

<b>Command</b>	<code>timers throttle lsa all delay-time hold-time max-wait-time</code>
<b>Parameter Description</b>	<p><i>delay-time</i>: Indicates the minimum delay for LSA generation. The first LSA in the database is always generated instantly. The value ranges from 0 to 600,000. The unit is ms.</p> <p><i>hold-time</i>: Indicates the minimum interval between the first LSA update and the second LSA update. The value ranges from 1 to 600,000. The unit is ms.</p> <p><i>max-wait-time</i>: Indicates the maximum interval between two LSA updates when the LSA is updated continuously. This interval is also used to determine whether the LSA is updated continuously. The value ranges from 1 to 600,000. The unit is ms.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>If a high convergence requirement is raised when a link changes, you can set <b>delay-time</b> to a smaller value. You can also appropriately increase values of the preceding parameters to reduce the CPU usage.</p> <p>When configuring this command, the value of <b>hold-time</b> cannot be smaller than the value of <b>delay-time</b>, and the value of <b>max-wait-time</b> cannot be smaller than the value of <b>hold-time</b>.</p>

### ↘ Configuring the LSA Group Refresh Time

<b>Command</b>	<code>timers pacing lsa-group seconds</code>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSA group pacing interval. The value ranges from 10 to 1,800. The unit is second.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>Every LSA has a time to live (LSA age). When the LSA age reaches 1800s, a refreshment is needed to prevent LSAs from being cleared because their ages reaching the maximum. If LSA update and aging computation are performed for every LSA, the device will consume a lot of CPU resources. In order to use CPU resources effectively, you can refresh LSAs by group on the device. The interval of group refreshment is called group pacing interval. The group refreshment operation is to organize the LSAs generated within a group pacing interval into a group and refresh the group as a whole.</p> <p>If the total number of LSAs does not change, a larger group pacing interval indicates that more LSAs need to be processed after timeout. To maintain the CPU stability, the number of LSAs processes upon each timeout cannot be too large. If the number of LSAs is large, you are advised to reduce the group pacing interval. For example, if there are 1000 LSAs in the database, you can reduce the pacing interval; if there are 40 to 100 LSAs, you can set the pacing interval to 10-20 minutes.</p>

### ↘ Configuring the LSA Group Refresh Interval

<b>Command</b>	<code>timers pacing lsa-transmit transmit-time transmit-count</code>
<b>Parameter Description</b>	<p><i>transmit-time</i>: Indicates the LSA group transmission interval. The value ranges from 10 to 600,000. The unit is ms.</p> <p><i>transmit-count</i>: Indicates the number of LS-UPD packets in a group. The value ranges from 1 to 200.</p>

<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	If the number of LSAs is large and the device load is heavy in an environment, properly configuring <b>transimit-time</b> and <b>transimit-count</b> can limit the number of LS-UPD packets flooded on a network. If the CPU usage is not high and the network bandwidth load is not heavy, reducing the value of <b>transimit-time</b> and increasing the value of <b>transimit-count</b> can accelerate the environment convergence.

### ▾ Configuring LSA Repeated Receiving Delay

<b>Command</b>	<b>timers lsa arrival</b> <i>arrival-time</i>
<b>Parameter Description</b>	<i>arrival-time</i> : Indicates the delay after which the same LSA is received. The value ranges from 0 to 600,000. The unit is ms.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	No processing is performed if the same LSA is received within the specified time.

### ▾ Configuring the SPF Computation Delay

<b>Command</b>	<b>timers throttle spf</b> <i>spf-delay spf-holdtime spf-max-waittime</i>
<b>Parameter Description</b>	<p><i>spf-delay</i>: Indicates the SPF computation delay. The unit is ms. The value ranges from 1 to 600,000. When detecting a topological change, the OSPF routing process triggers the SPF computation at least after <b>spf-delay</b> elapses.</p> <p><i>spf-holdtime</i>: Indicates the minimum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p> <p><i>spf-max-waittime</i>: Indicates the maximum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p> <p><i>number</i>: Indicates the metric of the summarized route.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p><b>spf-delay</b> indicates the minimum time between the occurrence of the topological change and the start of SPF computation. <b>spf-holdtime</b> indicates the minimum interval between the first SPF computation and the second SPF computation. After that, the interval between two SPF computations must be at least twice of the previous interval. When the interval reaches <b>spf-max-waittime</b>, the interval cannot increase again. If the interval between two SPF computations already exceeds the required minimum value, the interval is computed by starting from <b>spf-holdtime</b>.</p> <p>You can set <b>spf-delay</b> and <b>spf-holdtime</b> to smaller values to accelerate topology convergence, and set <b>spf-max-waittime</b> to a larger value to reduce SPF computation. Flexible settings can be used based on stability of the network topology.</p> <p>Compared with the <b>timers spf</b> command, this command supports more flexible settings to accelerate the convergence speed of SPF computation and further reduce the system resources consumed by SPF computation when the topology continuously changes. Therefore, you are advised to use the <b>timers throttle spf</b> command for configuration.</p> <p>1. The value of <b>spf-holdtime</b> cannot be smaller than the value of <b>spf-delay</b>; otherwise, <b>spf-holdtime</b> will</p>

	<p>be automatically set to the value of <b>spf-delay</b>.</p> <ol style="list-style-type: none"> <li>The value of <b>spf-max-waittime</b> cannot be smaller than the value of <b>spf-holdtime</b>; otherwise, <b>spf-max-waittime</b> will be automatically set to the value of <b>spf-holdtime</b>.</li> <li>The configurations of <b>timers throttle spf</b> and <b>timers spf</b> are mutually overwritten.</li> <li>When both <b>timers throttle spf</b> and <b>timers spf</b> are not configured, the default values of <b>timers throttle spf</b> prevail.</li> </ol>
--	---

📌 **Configuring the Computation Delays of Inter-Area Routes and External Routes**

<b>Command</b>	<b>timers throttle route</b> {inter-area <i>ia-delay</i>  ase <i>ase-delay</i> }
<b>Parameter Description</b>	<b>inter-area</b> <i>ia-delay</i> : Indicates the inter-area route computation delay. The unit is ms. The value ranges from 0 to 600,000. <b>ase</b> <i>ase-delay</i> : Indicates the external route computation delay. The unit is ms. The value ranges from 0 to 600,000.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	If a strict requirement is raised for the network convergence time, use the default value. If a lot of inter-area or external routes exist on the network and the network is not stable, adjust the delays and optimize route computation to reduce the load on the device.

**Configuration Example**

📌 **Configuring the Hello Interval and Dead Interval**

<b>Scenario</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>Configure the OSPF basic functions on all routers. (Omitted)</li> <li>Configure the Hello interval and dead interval on all routers.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ipv6 ospf dead-interval 50</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ipv6 ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ipv6 ospf dead-interval 50</pre>

<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Check the interface parameters on Router A and Router B. Verify that the Hello interval is 10s and the dead interval is 50s.</li> <li>● On Router A and Router B, verify that the OSPF neighbor information is correct.</li> </ul>
<p><b>A</b></p>	<pre> A# show ipv6 ospf interface GigabitEthernet 0/1 is up, line protocol is up  Interface ID 2  IPv6 Prefixes      fe80::2d0:f8ff:fe22:3346/64 (Link-Local Address)  OSPFv3 Process (1), Area 0.0.0.0, Instance ID 0  Router ID 1.1.1.1, Network Type BROADCAST, Cost: 1  Transmit Delay is 1 sec, State DR, Priority 1  Timer interval configured, Hello 15, Dead 50, Wait 40, Retransmit 10      Hello due in 00:00:06  Neighbor Count is 1, Adjacent neighbor count is 1  Hello received 40 sent 40, DD received 17 sent 9  LS-Req received 1 sent 3, LS-Upd received 6 sent 5  LS-Ack received 3 sent 4, Discarded 1  A# show ipv6 ospf neighbor  OSPFv3 Process (1), 1 Neighbors, 1 is Full:  Neighbor ID    Pri  State           Dead Time   Instance ID  Interface 2.2.2.21     Full/BDR      00:00:30    0           GigabitEthernet 0/1                 </pre>

```

B
B# show ipv6 ospf interface

GigabitEthernet 0/1 is up, line protocol is up

  Interface ID 2

  IPv6 Prefixes

    fe80::2d0:f8ff:fe22:3446/64 (Link-Local Address)

  OSPFv3 Process (1), Area 0.0.0.0, Instance ID 0

    Router ID 2.2.2.2, Network Type BROADCAST, Cost: 1

    Transmit Delay is 1 sec, State BDR, Priority 1

    Timer interval configured, Hello 15, Dead 50, Wait 40, Retransmit 10

    Hello due in 00:00:06

    Neighbor Count is 1, Adjacent neighbor count is 1

    Hello received 40 sent 40, DD received 17 sent 9

```

### Common Errors

- The configured neighbor dead time is shorter than the Hello interval.

## 5.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears and resets an OSPF process.	<b>clear ipv6 ospf</b> [ <i>process-id</i> ] <b>process</b>

### Displaying

Description	Command
Displays the OSPF process configurations.	<b>show ipv6 ospf</b> [ <i>process-id</i> ]

Description	Command
Displays information about the OSPF LSDB.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>lsa-type</i> [ <b>adv-router</b> <i>router-id</i> ] ]
Displays OSPF-enabled interfaces.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>interface</b> [ <i>interface-type interface-number</i>   <b>brief</b> ]
Displays the OSPF neighbor list.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>neighbor</b> [ <i>interface-type interface-number</i> [ <b>detail</b> ]] <i>neighbor-id</i> [ <b>detail</b> ]
Displays the OSPF routing table.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>route</b> [ <i>count</i> ]
Displays the summarized route of OSPF redistributed routes.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>summary-prefix</b>
Displays the OSPF network topology information.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>topology</b> [ <i>area</i> <i>area-id</i> ]
Displays OSPF virtual links.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>virtual-links</b>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs OSPF events.	<b>debug ipv6 ospf events</b> [ <i>abr asbr os nssa router  vlink</i> ]
Debugs OSPF interfaces.	<b>debug ipv6 ospf ifsm</b> [ <i>events status timers</i> ]
Debugs OSPF neighbors.	<b>debug ipv6 ospf nfm</b> [ <i>events   status   timers</i> ]
Debugs the OSPF NSM.	<b>debug ipv6 ospf nsm</b> [ <i>interface   redistribute   route</i> ]
Debugs OSPF LSAs.	<b>debug ipv6 ospf lsa</b> [ <i>flooding   generate   install   maxage   refresh</i> ]
Debugs OSPF packets.	<b>debug ipv6 ospf packet</b> [ <i>dd detail hello ls-ack ls-request ls-update recv send</i> ]
Debugs OSPF routes.	<b>debug ipv6 ospf route</b> [ <i>ase   ia   install   spf   time</i> ]

## 6 Configuring IS-IS

### 6.1 Overview

Intermediate System to Intermediate System (IS-IS) is an extensible, robust, and easy-to-use Interior Gateway Protocol (IGP) for route selection and applicable to an IP-ISO CLNS dual environment network (ISO CLNS is short for International Organization for Standardization Connectionless Network Service).

IS-IS has the common characteristics of a link state protocol. It sends Hello packets to discover and maintain neighbor relationships, and sends Link State Protocol Data Units (LSPs) to neighbors to advertise its link state. IS-IS supports Level-1 routing and Level-2 routing. All devices at the same Level maintain the same Link State Database (LSDB), which stores the LSPs generated by the devices to notify each other of the Level's network topology. Each device uses the Dijkstra Shortest Path First (SPF) algorithm to perform best-route calculation, path selection, and fast convergence.

#### Protocols and Standards

- RFC1142: OSI IS-IS Intra-domain Routing Protocol
- RFC1195: Use of OSI IS-IS for routing in TCP/IP and dual environments
- RFC3786: Extending the Number of Intermediate System to Intermediate System (IS-IS) Link State PDU (LSP) Fragments Beyond the 256 Limit
- RFC3373: Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies
- RFC3358: Optional Checksums in Intermediate System to Intermediate System (ISIS)
- RFC3784: Intermediate System to Intermediate System (IS-IS) Extensions for Traffic Engineering (TE)
- RFC2763: Dynamic Hostname Exchange Mechanism for IS-IS
- RFC6119(draft-ietf-isis-ipv6-te-00): IPv6 Traffic Engineering in IS-IS
- RFC 2966: Domain-wide Prefix Distribution with Two-Level IS-IS

### 6.2 Applications

Application	Description
<a href="#">Planar Topology</a>	A planar topology is applicable to a small-scale network. At the initial stage of large-scale network construction, core devices are deployed to form an area based on a planar topology.
<a href="#">Hierarchical Topology</a>	A hierarchical topology is applicable to a large-scale network with frequent link flapping.

## 6.2.1 Planar Topology

### Scenario

A planar topology is formed by devices in the same area. See Figure 6-1.

Figure 6-1 Planar Topology

### Deployment

- To facilitate future extension and reduce device burden, configure the devices in a planar topology as Level-2 devices.

## 6.2.2 Hierarchical Topology

### Scenario

A hierarchical topology divides the network into the core layer, convergence layer, and access layer. See Figure 6-2.

- Route summarization at the convergence layer is facilitated by address planning.
- When primary and secondary routes exist, devices at the convergence layer leak Level-2 routes to Level-1 areas.

Figure 6-2 Hierarchical Topology

<b>Remarks</b>	Devices at the core layer must be connected consecutively.
----------------	--

## Deployment

- Design the network topology starting from the core layer.
- Configure devices at the core layer as Level-2 devices.
- Configure devices at the convergence layer as Level-1/Level-2 devices.
- Configure devices at the access layer as Level-1 devices.

## 6.3 Features

### Basic Concepts

#### ↘ End System (ES)

An ES is a non-router device, for example, a host.

#### ↘ Intermediate System (IS)

An IS is a router, which is the basic unit used to transmit routing information and generate routes in IS-IS.

#### ↘ End System to Intermediate System Routing Exchange Protocol (ES-IS)

ES-IS is the protocol used for communication between ESs and ISs in Open System Interconnection (OSI) to dynamically discover Level-2 neighbor relationships.

#### ↘ Domain

A set of ISs in the same routing domain (RD) use the same routing protocol to exchange routing information.

#### ↘ Area

An RD can be divided into multiple areas.

#### ↘ Complete Serial Number PDU (CSNP)

CSNPs are sent by a Designated Intermediate System (DIS) every 10s to synchronize link states in a broadcast network.

#### ↘ Partial Sequence Number PDU (PSNP)

PSNPs are sent by a point-to-point (P2P) link to confirm LSPs, or request LSPs in a broadcast network.

#### ↘ Connectionless Network Protocol (CLNP)

CLNP is an OSI protocol used to transmit data and error messages at the network layer. It is similar to the IP protocol.

#### ↘ Connectionless Network Service (CLNS)

The CLNS is a type of unreliable connection and requires no circuit setup before data transmission.

#### ↘ Designated Intermediate System (DIS)

Similar to a DIS router (DR) in Open Shortest Path First (OSPF), a DIS propagates LSPs to other machines in a Local Area Network (LAN). Neighbor relationships are established not only between DISs and other machines but also between those machines. This characteristic is not possessed by OSPF.

#### ↘ Hello Packet

Hello packets are used to establish and maintain neighbor relationships.

#### ↘ LSP

LSPs describe link states, similar to link-state advertisement (LSA) in OSPF, but the former do not depend on TCP/IP information. LSPs are classified into Level-1 LSPs and Level-2 LSPs, depending on different route types.

#### ↘ Network Selector (NSEL)

An NSEL (sometimes referred to as SEL) specifies the target network-layer protocol service. It is similar to the TCP/UDP port for the Upper Layer Service in the IP protocol. In IS-IS, SEL is typically set to 00 to indicate a device.

#### ↘ Network Service Access Point (NSAP)

An NSAP is the CLNS complete address, including the OSI address and high-layer processes. It consists of an area ID, a system ID, and SEL. When SEL is set to 00, the NSAP is a Network Entity Title (NET), similar to an IP address plus a protocol number.

#### ↘ Sub-Network Point of Attachment (SNPA)

An SNPA provides physical connections and network-layer services. It is similar to a MAC address used in the IP protocol, a Data Link Connection Identifier (DLCI) used by frame relay (FR), or High-Level Data Link Control (HDLC) in a wide area network (WAN).

#### ↘ Level-1 Route

A Level-1 route is an intra-area route that only receives relevant information within the area. To reach other areas, you need to store in Level-1 a default route destined for the closest Level-2.

#### ↘ Level-2 Route

A Level-2 route is an inter-area backbone route. Level-1 and Level-2 cannot be connected directly.

#### ↘ Level-1/Level-2 Route

A Level-1/Level-2 route is a border route connecting a Level-1 route and a Level-2 route. It maintains two databases for the Level-1 and Level-2 routes respectively. It is similar to an area border router (ABR) in OSPF.

#### ↘ Pseudonode

A pseudonode identifies a broadcast subnet (LAN) and allows a broadcast medium to work as a virtual device, which has a route as its interface. The route-pseudonode relationship is managed by a DIS.

#### ↘ Network Entity Title (NET)

A NET is part of an OSI address and describes the area ID and system ID, but it does not define the NSEL, which is contained in the NSAP of the specified system.

### ↘ Circuit

Circuit is an interface-related term used in IS-IS. Whereas NSAP and NET indicate whole devices, a circuit indicates an interface. The circuit ID of a P2P interface is one byte long. For example, the circuit ID of HDLC is 0x00. In a broadcast network (for example, a LAN), the circuit ID is seven bytes long, including the system ID, for example, 1921.6800.0001.01.

**i** For details about terms related to IS-IS, see ISO 10589 and RFC1195.

## Overview

Feature	Description
<a href="#">IS-IS Network Hierarchy</a>	An IS-IS network is divided into Level-1 and Level-2. The nodes on which devices exchange information in the same area form one Level (Level-1).
<a href="#">IS-IS Address Coding Mode</a>	An IS-IS address is called a NET, which consists of an area ID, a system ID, and an NSAP identifier.
<a href="#">IS-IS Packet Types</a>	There are three types of IS-IS packets: LSP, IS-IS Hello packet (IIH PDU), and serial number packet (SNP) classified into CSNP and PSNP.

<a href="#">IS-IS MTR</a>	Multi-Topology Routing (MTR) is mainly used to calculate IPv4 and IPv6 unicast routes in IS-IS based on different topologies.

### 6.3.1 IS-IS Network Hierarchy

An IS-IS network is divided into Level-1 and Level-2. The nodes on which devices exchange information in the same area form one Level (Level-1).

#### Working Principle

All devices in an area know the area's network topology and exchange data within the area. A Level-1/Level-2 device is a border device that belongs to different areas and provides inter-area connections. Areas are connected by Level-2 devices. The border devices in various areas form a Level-2 backbone network for inter-area data exchange.

Level-1 devices are only interested in the local area's topology, including all nodes in the local area and the next-hop devices destined for the nodes. Level-1 devices access other areas through Level-2 devices and forward packets from a target network outside of the local area to the closest Level-2 device.

Figure 6-3 IS-IS Network Topology

## Related Configuration

### Setting the Circuit Type of an IS-IS Interface

By default, **circuit-type** is set to Level-1/Level-2.

Run the **isis circuit-type** command to change the Level of an interface.

If **circuit-type** is set to Level-1 or Level-2-only, IS-IS will only send PDUs of the corresponding Level.

### Specifying the IS-IS Level

By default, **is-type** is set to Level-1/Level-2 if no IS-IS instance runs at Level-2 (including Level-1/Level-2). **is-type** is set to Level-1 if there are IS-IS instances running at Level-2 (including Level-1/Level-2).

Run the **is-type** command to specify the Level at which IS-IS will run.

Changing the **is-type** value will enable or disable the routes of a certain Level. A device can have only one instance running at Level-2 (including Level-1/Level-2).

## 6.3.2 IS-IS Address Coding Mode

An IS-IS address is called a NET, which consists of an area ID, a system ID, and an NSAP identifier, ranging from eight to 20 bytes.

## Working Principle

Figure 6-4 NET Address Format

- The area ID identifies the RD length in an area and is fixed relative to the RD. It ranges from one to 13 bytes.
- The system ID is unique in an autonomous system (AS).
- The NSAP is a network selector and sometimes called SEL. In IS-IS, SEL is typically set to 00 to indicate a device.

### Related Configuration

#### Configuring a NET Address in IS-IS

By default, no NET address is configured in IS-IS.

Run the **net** command to configure a NET address in IS-IS.

The command configures an area ID and a system ID in IS-IS. Different NET addresses must have the same system ID.

### 6.3.3 IS-IS Packet Types

There are three types of IS-IS packets:

- LSP
- IIH PDU
- SNP (classified into CSNP and PSNP)

#### Working Principle

There are three types of IS-IS packets:

- LSP

LSPs are used to transmit link state records within an area and are classified into Level-1 LSPs and Level-2 LSPs. LSPs are only flooded to the corresponding Level.

- IIH PDU

IIH PDUs are used to maintain neighbor relationships. They carry multicast MAC addresses used to determine whether other systems run IS-IS.

- SNP (classified into CSNP and PSNP)

CSNPs are used for LSDB synchronization. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established.

PSNPs are also used for LSDB synchronization.

## Related Configuration

### ▾ Configuring the LSP Interval on an IS-IS Interface

By default, the LSP interval is 33 ms. If no Level is specified, the interval takes effect for Level-1 and Level-2 LSPs.

Run the **isis lsp-interval** command to configure the LSP interval on an IS-IS interface, in the unit of seconds.

The command changes the LSP interval.

### ▾ Configuring the Hello Packet Interval on an IS-IS Interface

By default, the Hello packet interval is 10s for Level-1 and Level-2.

Run the **isis hello-interval** command to configure the Hello packet interval on an IS-IS interface, in the unit of seconds.

The command changes the Hello packet interval. A DIS sends Hello packets at a frequency three times that by non-DIS devices in a broadcast network. If an IS is elected as the DIS on the interface, by default, the interface sends a Hello packet every 3.3s.

### ▾ Configuring the Minimum PSNP Interval

By default, the minimum PSNP interval is not configured, and the default interval 2s takes effect for Level-1 and Level-2 PSNPs.

Run the **isis psnp-interval** command to configure the minimum PSNP interval, in the unit of seconds.

PSNPs are mainly used to request LSPs that are absent locally or respond to received LSPs (in a P2P network). The PSNP interval should be minimized. If many LSPs exist and the device performance is low, you can increase the PSNP interval and LSP retransmission interval to reduce the device burden.

### ▾ Configuring the CSNP Broadcast Interval on an IS-IS Interface

By default, CSNPs are sent at 10s intervals in a broadcast network. No CSNPs are sent in a P2P network. When you configure a new CSNP interval without Level-1 or Level-2 specified, the interval takes effect for Level-1 and Level-2 CSNPs.

Run the **isis csnp-interval** command to specify the CSNP broadcast interval on an IS-IS interface, in the unit of seconds.

The command changes the CSNP interval. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to **mesh-groups** can be configured to periodically send CSNPs. No CSNPs are sent if the CSNP interval is set to 0.

## 6.3.4 DIS Election

A DIS is a designated device in a broadcast network and works like a DR in OSPF.

A pseudonode is generated by a DIS and sets up a relationship with each device in the local network.

### Working Principle

A DIS simulates multiple access links as a pseudonode and generates LSPs for the pseudonode. The pseudonode sets up a relationship with each device in the local network and forbids direct communication between the devices. A broadcast subnet and a non-broadcast multiple access (NBMA) network are considered as pseudonodes externally. Non-DIS devices report their link states to the DIS in the same network, and the DIS maintains the link states reported by all ISs in the network. Like DR election in OSPF, a DIS is elected to reduce unnecessary neighbor relationships and route information exchanges.

DIS election in IS-IS is preemptive. The election result can be manually controlled through interface priority configuration. The device with a higher interface priority is more likely to be elected as the DIS.

### Related Configuration

#### ▾ Configuring the Priority for DIS Election in a LAN

By default, Priority 64 takes effect for Level-1 and Level-2.

Run the **isis priority** command to configure the priority for DIS election in a LAN.

The command changes the priority carried in Hello packets in a LAN. The device with a lower priority is less likely to be elected as the DIS.

The command is invalid on a P2P network interface. The **no isis priority** command, with or without parameters, restores the priority to its default value. To change the configured priority, run the **isis priority** command with the priority specified to overwrite the existing configuration, or you can first restore the priority to its default value and then configure a new priority.

## 6.3.5 IS-IS Supported TLV Types

IS-IS supports 26 types of TLV.

### Working Principle

The following table lists the IS-IS supported TLV types:

TLV Code	Description
Code = 1	Area ID
Code = 2	Priority of an IS neighbor
Code = 3	ES neighbor
Code = 6	MAC address of an IS neighbor
Code = 8	Filling field
Code = 9	LSP entity
Code = 10	Verification field
Code = 14	Size of the source LSP buffer
Code = 22	Extended IS reachability
Code = 128	IP internal reachability information
Code = 129	Supported protocol

TLV Code	Description
Code = 130	IP external reachability information
Code = 131	Inter-domain routing protocol information
Code = 132	IP interface address
Code = 133	Verification information
Code = 135	Extended IP reachability TLV
Code = 137	Dynamic host name
Code = 211	Graceful Restart (GR)
Code = 222	Multi-Topology (MT) IS reachability
Code = 229	MT TLV
Code = 211	GR
Code=232	IPv6 interface
Code = 235	IPv4 MT IP reachability TLV
Code =236	IPv6 IP reachability TLV
Code = 237	IPv6 MT IP reachability TLV
Code = 240	P2P three-way handshake TLV

## Related Configuration

### 📌 [Configuring the Neighbor Detection Protocol Carried in Hello Packets](#)

By default, neighbor detection is enabled.

Run the **adjacency-check** command to configure the neighbor detection protocol carried in Hello packets.

## 6.3.6 LSP Fragment Extension

IS-IS floods LSPs to advertise link states. The size of an LSP is limited by the MTU size of the link. When the content to be advertised exceeds one LSP, IS-IS will create LSP fragments to carry new link state information. According to ISO standards, an LSP fragment is identified by a one-byte LSP number. An IS-IS device can generate up to 256 LSP fragments.

### Working Principle

The 256 LSP fragments are insufficient in any of the following situations:

1. New applications (such as traffic engineering [TE]) extend new TLV or Sub-TLV.
2. The network is expanded continuously.
3. Routes with reduced granularity are advertised, or other routes are redistributed to IS-IS.

After LSP fragments are used up, new routing information and neighbor information will be discarded, causing network exceptions such as routing black holes or loops. LSP fragments must be extended to carry more link state information, thus ensuring normal network operation.

You can configure an additional system ID and enable fragment extension to allow IS-IS to advertise more link state information in extended LSP fragments. Each virtual system can be considered as a virtual device that establishes a

neighbor relationship (with the path value being 0) with the originating system. Extended LSPs are published by the neighbor of the originating system, that is, the virtual system.

The following terms are related to fragment extension:

#### ↳ Normal System ID

The system ID defined by ISO is used to establish neighbor relationships and learn routes. It is further defined as the normal system ID in order to be distinguished from the additional system ID introduced to fragment extension.

#### ↳ Additional System ID

The additional system ID is configured by an administrator to generate extended LSPs. The additional system ID shares the usage rules of the normal system ID (for example, the additional system ID must be unique in the entire area), except that the additional system ID is not carried in Hello packets for neighbor relationship establishment.

#### ↳ Originating System

An originating system is an IS-IS-enabled device and maps a virtual system identified by the additional system ID.

#### ↳ Virtual System (Virtual IS)

A virtual system is identified by the additional system ID and used to generate extended LSPs. The virtual system concept is proposed by RFC for distinguishing from the originating system concept. Each virtual system can generate up to 256 LSP fragments. The administrator can configure multiple additional system IDs (virtual systems) to generate more LSP fragments.

#### ↳ Original LSP

An original LSP is the LSP whose system ID contained in the LSP ID is a normal system ID. Original LSPs are generated by an originating system.

#### ↳ Extended LSP

An extended LSP is the LSP whose system ID contained in the LSP ID is an additional system ID. Extended LSPs are generated by a virtual system.

## Related Configuration

### ↳ Enabling Fragment Extension

By default, fragment extension is disabled. If you do not specify a Level when enabling fragment extension, it will take effect for Level-1 and Level-2 LSPs.

Run the **isp-fragments-extend** command to enable fragment extension.

There are up to 256 LSP fragments. When the fragments are used up, subsequent link state information, including neighbor information and IP route information, will be discarded, causing a network exception. To solve this problem, enable fragment extension at the specified Level and configure an additional system ID by using the **virtual-system** command.

### 6.3.7 IS-IS VRF

VRF is mainly used for local routing and packet separation. It avoids route conflict caused by use of the same prefix by multiple VPNs. IPv4 VPN and IPv6 VPN combine Multiprotocol Label Switching (MPLS) advantages in terms of Quality of Service (QoS) and security assurance, and are the primary solutions for interconnecting the geographically different office branches of an enterprise or industry user.

#### Working Principle

Figure 6-5 Separation of Different VPNs by VRF Tables Configured on Provider Edge (PE) Devices

In Figure 6-5, the following configuration requirements exist: Configure the two sites (CE1 and CE3) in VPN1 to access each other and the two sites (CE2 and CE4) in VPN2 to access each other, and forbid access between the sites in VPN1 and those in VPN2, because VPN1 and VPN2 belong to different customers or departments and may have identical IP addresses.

The customer edge (CE) devices connect the customer network to the PEs to exchange VPN routing information with the PEs, that is, advertise local routes to the PEs and learn remote routes from the PEs.

Each PE learns routes from directly connected CEs and exchanges the learned VPN routes with the other PE through the Border Gateway Protocol (BGP). The PEs provide access to the VPN service.

The Provider (P) device in the Service Provider (SP) network is not directly connected to the CEs. The P device only needs the MPLS forwarding capability and does not maintain VPN information.

The IS-IS protocol running between the PEs and CEs requires the VRF capability to separate routing information between VPN1 and VPN2. That is, IS-IS only learns routes through VRF.

#### Related Configuration

##### ↘ Binding an IS-IS Instance with a VRF Table

By default, an IS-IS instance is not bound with any VRF table.

Run the **VRF** command to bind an IS-IS instance with a VRF table.

Note the following constraints or conventions for the binding operation:

- The IS-IS instances bound with the same non-default VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same system ID.
- One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.
- When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the **ip** (or **ipv6**) **router isis** [ tag ] interface configuration and the redistribution configuration in routing process mode will be deleted.

### 6.3.8 IS-IS MTR

IS-IS MTR is an extended feature used to separate IPv4 unicast route calculation and IPv6 unicast route calculation based on topologies. It complies with the specification of IS-IS MT extension defined in RFC 5120. New TLV types are introduced to IIH PDUs and LSPs to transmit IPv6 unicast topology information. One physical network can be divided into an IPv4 unicast logical topology and an IPv6 unicast logical topology. The two topologies perform SPF calculation separately and maintain independent IPv4 and IPv6 unicast routing tables respectively. In this way, IPv4 unicast service traffic and IPv6 unicast service traffic are forwarded by different paths. The IS-IS MTR technique helps users deploy IPv6 unicast networks without the constraint on consistency between IPv4 and IPv6 unicast topology information.

IS-IS MTR is derived from IS-IS MT, which is used to separate IPv4 and IPv6 unicast topologies, unicast and multicast topologies, and topologies using different protocol stacks (such as IPv4 and Pv6). IS-IS MTR separates IPv4 and IPv6 unicast topologies based on IS-IS MT.

#### Working Principle

Figure 6-6 shows a typical networking application. The following implementation requirements exist: Deploy an IPv6 unicast topology in incremental mode, and upgrade some devices to support IPv4 and IPv6 dual protocol stacks while keeping other IPv4-enabled devices unchanged.

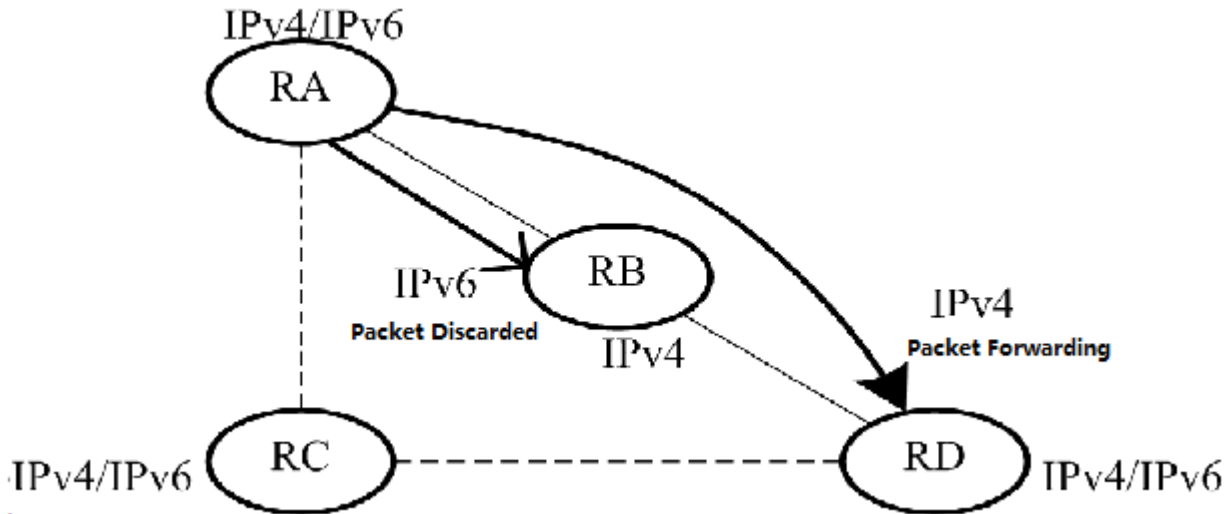

Figure 6-6 Physical Topology for IPv4-IPv6 Hybrid Deployment

In Figure 6-6, each link is marked by a number indicating its metric. RB only supports the IPv4 protocol stack, whereas other devices support IPv4 and IPv6 dual protocol stacks.

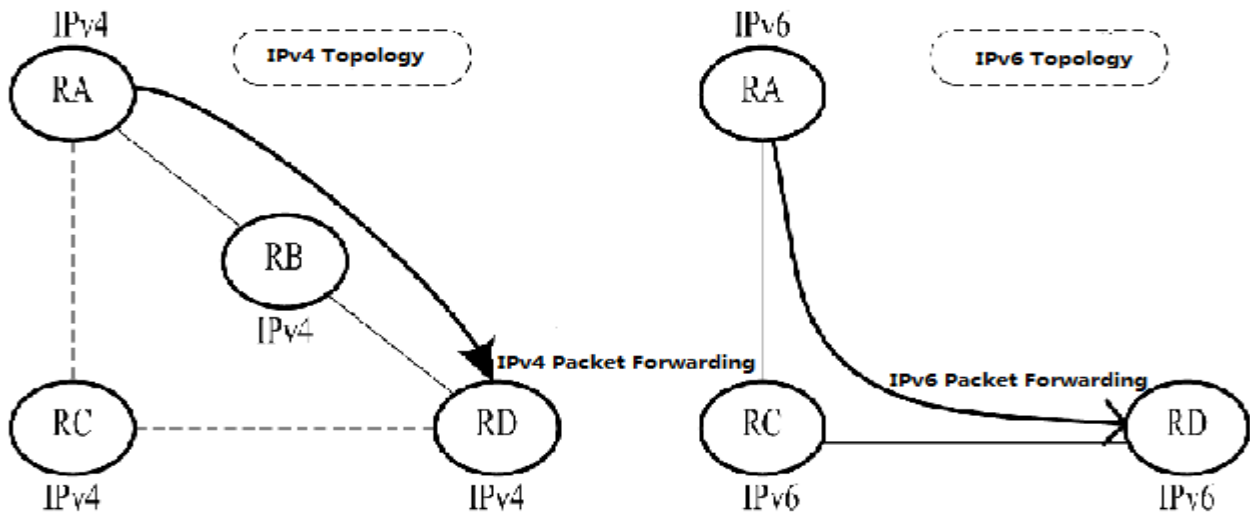

The networking constraint on consistency between IPv4 and IPv6 unicast topologies must be canceled to retain the use of RB; otherwise, RB cannot establish a neighbor relationship with RA or RD, which will cause new problems.

Figure 6-7 IPv4-IPv6 Hybrid Topology

In Figure 6-7, without IS-IS MTR support, the SPF calculations performed by RA, RB, RC, and RD only take into account the single hybrid topology. The calculated shortest path is RA -> RB -> RD, with the overhead being 20. RB will discard IPv6 packets because it does not support IPv6.

Figure 6-8 Separation of IPv4 and IPv6 Topologies

In Figure 6-8, the IS-IS MTR technique is used to separate IPv4 and IPv6 unicast topologies. RA, RB, RC, and RD establish neighbor relationships based on the IPv4 unicast topology and IPv6 unicast topology respectively. The left part shows the IPv4 topology formed by IPv4-enabled routers. The calculated IPv4 shortest path is RA -> RB -> RC, which realizes IPv4 packet forwarding. The right part shows the IPv6 topology formed by IPv6-enabled routers. The calculated IPv6 shortest path is RA -> RC -> RD, which realizes IPv6 packet forwarding.

IS-IS MTR must be deployed to avoid routing black holes when some devices support only one protocol. IS-IS MTR is not required when all devices support IPv4 and IPv6 dual protocol stacks.

- Deployment of a new network: IS-IS MTR is not required when devices only support the IPv4 protocol stack. For devices that only support the IPv6 protocol stack or devices that support IPv4 and IPv6 dual protocol stacks, enable the MT mode of IS-IS MTR. You are advised not to enable Multi-Topology Transition (MTT); otherwise, loops may occur.
- Reconstruction of an existing network with devices supporting only one protocol stack: Enable the MTT mode of IS-IS MTR on devices that support IPv4 and IPv6 dual protocol stacks in sequence (starting from the device closest to a device supporting only one protocol stack in the network topology). After the MTT mode is enabled on all new devices, switch the MTT mode to the MT mode on these devices in sequence (starting from the device farthest from a device supporting only one protocol stack in the network topology).

## Related Configuration

### ▾ Enabling MTR for IS-IS Instances

By default, IS-IS instances are not enabled with MTR.

Run the **multi-topology** command to configure IS-IS to support IPv6 unicast topologies. After that, IPv4 and IPv6 unicast routes in IS-IS will be calculated based on different topologies.

Note the following constraints or conventions when you use the **multi-topology** command:

1. Set **metric-style** to **Wide** or **Transition** before you run the command.
2. The MTR feature will be disabled if **metric-style** is set to **Narrow** or only one Level is configured to support the Wide or Transition mode.

## 6.3.9 IS-IS Neighbor

The following conditions must be met for two routing devices to establish a neighbor relationship when IS-IS MTR is not configured:

- The interface addresses on both routing devices are in the same network segment.
- The interface Levels on both routing devices match.
- The routing devices are authenticated by each other.
- The routing devices support the same protocol.

The following conditions must be met for routing devices to establish a neighbor relationship when IS-IS MTR is configured:

- The interface addresses on both routing devices are in the same network segments.
- The interface Levels on both routing devices match.
- The routing devices are authenticated by each other.
- The routing devices have at least one consistent MT ID when P2P links are configured.
- There are no constraints on the MT IDs that the routing devices support when LAN links are configured.

## 6.4 Configuration

Configuration	Description and Command	
<a href="#">Enabling IS-IS</a>	 (Mandatory) It is used to enable IS-IS on specified interfaces. You need to create an IS-IS routing process in advance.	
	<b>router isis</b> [ tag ]	Starts an IS-IS routing process. tag indicates the process name.
	<b>net</b> areaAddress.SystemId.00	Configures a NET address in IS-IS.
	<b>ip router isis</b> [ tag ]	Enables IS-IS on an interface. tag indicates the name of the IS-IS routing process.
<a href="#">Configuring IS-IS Hello Packets</a>	 (Optional) It is used to configure the IS-IS Hello packet holdtime.	
	<b>isis hello-interval</b> { interval   minimal } [ level-1   level-2 ]	Configures the Hello packet interval on an interface. The value range is 1 to 65,535, in the unit of seconds.
	<b>isis hello-multiplier</b> multiplier-number [ level-1   level-2 ]	Configures the Hello packet holdtime multiplier on an IS-IS interface. The value range is 2 to 100. The default value is 3.
<a href="#">Configuring IS-IS LSPs</a>	 (Optional) It is used to perform time-related LSP configuration, determine whether to ignore LSP checksum errors, and enable/disable LSP fragment extension.	
	<b>isis lsp-interval</b> interval [ level-1   level-2 ]	Configures the minimum LSP interval on an interface. The value range is 1 to 4,294,967,295, in the unit of milliseconds.
	<b>isis retransmit-interval</b> interval [ level-1   level-2 ]	Configures the LSP retransmission interval by P2P links on an interface. The value range is 0 to 65,535, in the unit of seconds.
	<b>lsp-refresh-interval</b> interval	Configures the LSP refresh interval. The value range is 1 to 65,535, in the unit of seconds.
	<b>max-lsp-lifetime</b> value	Configures the LSP lifetime. The value range is 1 to 65,535, in the unit of seconds.
	<b>ignore-lsp-errors</b>	Configures to ignore LSP checksum errors.
	<b>lsp-fragment-extend</b> [ level-1   level-2 ] [compatible rfc3786]	Enables fragment extension.
	<b>virtual-system</b> system-id	Configures an additional system ID.
<a href="#">Configuring IS-IS SNPs</a>	 (Optional) It is used to configure the CSNP broadcast interval.	

Configuration	Description and Command	
	<p><b>isis csnp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]</p>	<p>Configures the CSNP interval on an interface. The value range is 0 to 65,535, in the unit of seconds. The default value is 10s. No CSNPs are sent if the CSNP interval is set to 0.</p>
<p><a href="#">Configuring the IS-IS Level Type</a></p>	<p> (Optional) It is used to configure the system type or interface circuit type in IS-IS.</p>	
	<p><b>is-type</b> { <b>level-1</b>   <b>level-1-2</b>   <b>level-2-only</b> }</p>	<p>Configures the system type.</p>
	<p><b>isis circuit-type</b> { <b>level-1</b>   <b>level-1-2</b>   <b>level-2-only</b> [ <b>external</b> ] }</p>	<p>Configures the interface circuit type.</p>
<p><a href="#">Configuring IS-IS Authentication</a></p>	<p> (Optional) It is used to configure interface authentication, area authentication, and RD authentication.</p>	
	<p><b>isis password</b> [ <b>0</b>   <b>7</b> ] <i>password</i> [ <b>send-only</b> ] [ <b>level-1</b>   <b>level-2</b> ]</p>	<p>Configures the password for plaintext authentication of Hello packets on an interface.</p> <p>When <b>send-only</b> is included, the authentication password is only used to authenticate sent Hello packets. Received Hello packets are not authenticated.</p> <p>If no Level is specified, the configured authentication and password take effect for all Levels.</p> <p>This command does not take effect if the <b>isis authentication mode</b> command is executed. Both commands are used to configure IS-IS interface authentication, but the <b>isis password</b> command has a lower priority. Before you run the <b>isis password</b> command, delete the <b>isis authentication mode</b> command configuration.</p>

Configuration	Description and Command	
	<p><b>isis authentication mode</b> { <i>text</i>   <i>md5</i> } [ <i>level-1</i>   <i>level-2</i> ]</p>	<p>Specifies authentication as plaintext or MD5. If no Level is specified, the authentication mode takes effect for all Levels.</p> <p>If you use this command after the <b>isis password</b> <i>password</i> [ <i>level-1</i>   <i>level-2</i> ] command is executed, the previous command configuration will be overwritten. Both commands are used to configure IS-IS interface authentication, but the <b>isis authentication mode</b> command has a higher priority.</p>
	<p><b>isis authentication key-chain</b> <i>name-of-chain</i> [ <i>level-1</i>   <i>level-2</i> ]</p>	<p>Configures the password for interface authentication.</p> <p>If no Level is specified, the configured key chain takes effect for all Levels. This command must be used with the <b>isis authentication mode</b> command to configure IS-IS interface authentication.</p>
	<p><b>isis authentication send-only</b> [ <i>level-1</i>   <i>level-2</i> ]</p>	<p>(Optional) Specifies that interface authentication is performed only on sent packets. Received packets are not authenticated.</p> <p>If no Level is specified, the send-only authentication mode takes effect for all Levels.</p> <p>This command is used to avoid network flapping caused by a temporary authentication failure when IS-IS authentication is configured. Before you deploy IS-IS authentication in the entire network, run the <b>isis authentication mode</b> { <i>text</i>   <i>md5</i> } [ <i>level-1</i>   <i>level-2</i> ] and <b>isis authentication key-chain</b> <i>name-of-chain</i> [ <i>level-1</i>   <i>level-2</i> ] commands on each device. After that, run the <b>no isis authentication send-only</b> command to restore the authentication of received packets. This realizes smooth authentication deployment and avoids network flapping.</p>

Configuration	Description and Command	
	<p><b>area-password</b> [ 0   7 ] <i>password</i> [ <b>send-only</b> ]</p>	<p>Configures the password for area (Level-1) plaintext authentication.</p> <p>When <b>send-only</b> is included, the authentication password is only used to authenticate sent packets. Received packets are not authenticated.</p> <p>This command does not take effect if the <b>authentication mode</b> command is executed. Both commands are used to configure IS-IS area authentication, but the <b>area-password</b> command has a lower priority. Before you run the <b>area-password</b> command, delete the <b>authentication mode</b> command configuration.</p>
	<p><b>authentication mode</b> { <i>text</i>   <i>md5</i> } <b>level-1</b></p>	<p>Specifies the IS-IS area authentication mode.</p> <p>If you use this command after the <b>area-password</b> <i>password</i> command is executed, the previous command configuration will be overwritten. Both commands are used to configure IS-IS area authentication, but the <b>authentication mode</b> command has a higher priority.</p>
	<p><b>authentication key-chain</b> <i>name-of-chain</i> <b>level-1</b></p>	<p>Configures the key chain for IS-IS area authentication.</p> <p>This command must be used with the <b>authentication mode</b> command to configure IS-IS area authentication.</p>

Configuration	Description and Command	
	<p><b>authentication send-only level-1</b></p>	<p>(Optional) Specifies that IS-IS area authentication is performed only on sent packets. Received packets are not authenticated.</p> <p>This command is used to avoid network flapping caused by a temporary authentication failure when IS-IS authentication is configured. Before you deploy IS-IS authentication in the entire area, run the <b>authentication mode { text   md5 } level-1</b> and <b>authentication key-chain name-of-chain level-1</b> commands on each device. After that, run the <b>no authentication send-only</b> command to restore the authentication of received packets. This realizes smooth authentication deployment and avoids network flapping.</p>
	<p><b>domain-password [ 0   7 ] password [ send-only ]</b></p>	<p>Configures the password for RD (Level-2) plaintext authentication.</p> <p>When <b>send-only</b> is included, the authentication password is only used to authenticate sent packets. Received packets are not authenticated.</p> <p>This command does not take effect if the <b>authentication mode</b> command is executed. Both commands are used to configure IS-IS RD authentication, but the <b>domain-password</b> command has a lower priority. Before you run the <b>domain-password</b> command, delete the <b>authentication mode</b> command configuration.</p>
	<p><b>authentication mode { text   md5 } level-2</b></p>	<p>Specifies the IS-IS RD authentication mode. If you use this command after the <b>domain-password password</b> command is executed, the previous command configuration will be overwritten. Both commands are used to configure IS-IS RD authentication, but the <b>authentication mode</b> command has a higher priority.</p>

Configuration	Description and Command	
	<p><b>authentication key-chain</b> <i>name-of-chain</i> <b>level-2</b></p>	<p>Configures the password for IS-IS RD authentication. This command must be used with the <b>authentication mode</b> command to configure IS-IS RD authentication.</p>
	<p><b>authentication send-only level-2</b></p>	<p>(Optional) Specifies that IS-IS RD authentication is performed only on sent packets. Received packets are not authenticated. This command is used to avoid network flapping caused by a temporary authentication failure when IS-IS authentication is configured. Before you deploy IS-IS authentication in the entire RD, run the <b>authentication mode { text   md5 } level-2</b> and <b>authentication key-chain name-of-chain level-2</b> commands on each device. After that, run the <b>no authentication send-only</b> command to restore the authentication of received packets. This realizes smooth authentication deployment and avoids network flapping.</p>
<p><a href="#">Configuring IS-IS GR</a></p>	<p> (Optional) It is used to enable IS-IS GR.</p>	
	<p><b>graceful-restart</b></p>	<p>Enables the GR Restart capability on the device that works as a Restarter. By default, the GR Restart capability is enabled.</p>
	<p><b>graceful-restart grace-period</b> <i>seconds</i></p>	<p>(Optional) Configures the IS-IS GR time on the device that works as a Restarter. The default value is 300s.</p>
	<p><b>no graceful-restart helper disable</b></p>	<p>Enables the IS-IS GR Help capability on the device that works as a Helper. By default, the GR Help capability is enabled.</p>
<p><a href="#">Configuring BFD Support for IS-IS</a></p>	<p> (Optional) It is used to enable BFD support for IS-IS.</p>	
	<p><b>bfd all-interfaces</b> [<b>anti-congestion</b>]</p>	<p>Enables BFD support for IS-IS on all interfaces.</p>
	<p><b>isis bfd</b> [ <b>disable</b>   <b>anti-congestion</b> ]</p>	<p>Enables or disables BFD support for IS-IS on the current interface.</p>

Configuration	Description and Command	
<a href="#">Setting the IS-IS Overload Bit</a>	 (Optional) It is used to set the overload bit in LSPs.	
	<b>set-overload-bit</b> [ <b>on-startup</b> <i>seconds</i> ] [ <b>suppress</b> { [ <b>interlevel</b> ] [ <b>external</b> ] } ] [ <b>level-1</b>   <b>level-2</b> ]	Sets the overload bit.
<a href="#">Configuring IS-IS VRF</a>	 (Optional) It is used to bind an IS-IS instance with a VRF table.	
	<b>vrf</b> <i>vrf-name</i>	Binds an IS-IS instance with a VRF table.
<a href="#">Configuring IS-IS MTR</a>	 (Optional) It is used to calculate IPv4 and IPv6 unicast routes in IS-IS based on different topologies.	
	<b>multi-topology</b> [ <b>transition</b> ]	Configures IS-IS to support IPv6 unicast topologies.
<a href="#">Configuring Simple Network Management Protocol (SNMP) for IS-IS</a>	 (Optional) It is used to allow the SNMP software to perform Management Information Base (MIB) operations on IS-IS instances.	
	<b>enable mib-binding</b>	Performs MIB operations on the instance bound with Tag 1.
	<b>configure terminal</b>	Enters global configuration mode.
	<b>snmp-server enable traps isis</b>	Enables IS-IS trap globally.
	<b>snmp-server host</b> { <i>host-addr</i>   <b>ipv6</b> <i>ipv6-addr</i> } [ <b>vrf</b> <i>vrfname</i> ] [ <b>traps</b> ] [ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> { <b>auth</b>   <b>noauth</b>   <b>priv</b> } ] <i>community-string</i> [ <b>udp-port</b> <i>port-num</i> ]	Configures an SNMP host in global configuration mode to receive IS-IS trap messages.
	<b>router isis</b>	Enters IS-IS routing process configuration mode.
	<b>enable traps all</b>	Allows the sending of all IS-IS trap messages to the host with the IP address 10.1.1.1.
<a href="#">Configuring Other IS-IS Parameters</a>	 Optional.	
	<b>maximum-paths</b> <i>maximum</i>	Configures the maximum number of IS-IS IPv4/IPv6 equal-cost paths.
	<b>lsp-length</b> <i>receive size</i>	Configures the maximum length allowed for received LSPs.
	<b>lsp-length originate</b> <i>size</i> [ <b>level-1</b>   <b>level-2</b> ]	Configures the maximum length allowed for sent LSPs.
<b>passive-interface</b> [ <b>default</b> ] { <i>interface-type</i> <i>interface-number</i> }	Configures a passive interface.	

Configuration	Description and Command	
	<b>isis metric</b> <i>metric</i> [ <b>level-1</b>   <b>level-2</b> ]	Configures the interface metric, which is valid only when <b>metric-style</b> is set to <b>Narrow</b> .
	<b>isis wide-metric</b> <i>metric</i> [ <b>level-1</b>   <b>level-2</b> ]	Configures the interface wide-metric value, which is valid only when <b>metric-style</b> is set to <b>Wide</b> .
	<b>isis priority</b> <i>value</i> [ <b>level-1</b>   <b>level-2</b> ]	Configures the priority for DIS election on an interface.
	<b>default-information originate</b> [ <b>route-map</b> <i>map-name</i> ]	Generates a Level-2 default route, which will be advertised through LSPs. When the command includes the <b>route-map</b> option, a default route is generated only if the criteria in route-map are met.
	<b>summary-address</b> <i>ip-address net-mask</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ] [ <b>metric</b> <i>number</i> ]	Configures an IPv4 summary route.
	<b>summary-prefix</b> <i>ipv6-prefix/prefix-length</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ]	Configures an IPv6 summary route.
	<b>ignore-lsp-errors</b>	Configures to ignore LSP checksum errors.
	<b>log-adjacency-changes</b>	Activates logging of IS-IS neighbor relationship changes.
	<b>redistribute</b>	Configures route redistribution.

## 6.4.1 Enabling IS-IS

### Configuration Effect

- Before you run IS-IS, create an IS-IS routing process in global configuration mode. You can set the **tag** parameter after the **router isis** command to name the process. You can add different tags to configure different IS-IS routing processes. The setting of the **tag** parameter is optional.
- A system ID uniquely identifies an IS in a routing AS; therefore, the system ID must be unique across the AS. In IS-IS, each area may contain one or multiple area IDs. Normally, you only need to configure one area ID. You can configure multiple area IDs to realize area division. If an IS is configured with multiple area IDs, the system IDs must be the same.
- After an interface is added to the specified IS-IS routing process, the interface will establish a neighbor relationship.

### Notes

- The Level-1 IS devices in an area must be configured with the same area ID.
- The core routing table does not distinguish the routing entries generated by different IS-IS routing processes.
- The IP addresses of interfaces connected between neighbors must be in the same network segment.

- If the two IP addresses are in different network segments, a neighbor relationship cannot be established.
- If you need to add an interface to the specified IS-IS routing process, set the **tag** parameter after the **ip router isis** command to indicate the process name.
- If you run the **no ip routing** command in global configuration mode, IS-IS will disable IPv4 routing on all interfaces. That is, the **no ip router isis [ tag ]** command is automatically executed on all interfaces. Other IS-IS settings remain unchanged.
- By default, CPU protection is enabled on devices. For packets mapped to the destination group addresses (AllISSystems, AllL1ISSystems, and AllL2ISSystems) in IS-IS, there is a default limit (for example, 400 pps) on the number of packets sent to the CPU. If a device has many neighbor relationships or sends Hello packets at short intervals, the IS-IS packets that the device receives may exceed the default limit, causing frequent flapping of neighbor relationships. To solve the problem, you can use the CPU protection command in global configuration mode to increase the limit.

## Configuration Steps

### Starting an IS-IS Routing Process

- Mandatory.
- Perform this configuration in global configuration mode on each device, unless otherwise specified.

### Configuring a NET Address in IS-IS

- Mandatory.
- Perform this configuration in IS-IS routing process configuration mode on each device, unless otherwise specified.

### Enabling IS-IS on an Interfaces

- Mandatory.
- Perform this configuration in interface configuration mode on each device, unless otherwise specified.

## Verification

- Check whether devices send Hello packets.
- Check whether devices establish neighbor relationships.
- Check whether devices exchange LSPs.

## Related Commands

### Starting an IS-IS Routing Process

<b>Command</b>	<b>router isis [ tag ]</b>
<b>Parameter</b>	<i>tag</i> : Indicates the name of an IS-IS instance.
<b>Description</b>	
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>Use this command to initialize an IS-IS instance and enter IS-IS routing process configuration mode. An IS-IS instance will start running after a NET address is configured.</p> <p>If you set the <b>tag</b> parameter when you start an IS-IS routing process, you need to add the <b>tag</b> parameter when closing the IS-IS routing process.</p> <p>By default, CPU protection is enabled on devices. For packets mapped to the destination group addresses (AllISSystems, AllL1ISSystems, and AllL2ISSystems) in IS-IS, there is a default limit (for example, 400 pps) on the number of packets sent to the CPU. If a device has many neighbor relationships or sends Hello packets at short intervals, the IS-IS packets that the device receives may exceed the default limit, causing frequent flapping of neighbor relationships. To solve the problem, you can use the CPU protection command in global configuration mode to increase the limit.</p>

### 📌 Configuring a NET Address in IS-IS

<b>Command</b>	<b>net</b> <i>net-address</i>
<b>Parameter</b>	<i>net-address</i> :
<b>Description</b>	The NET address is in the format of XX.XXXX.YYYY.YYYY.YYYY.00. XX.XXXX indicates the area ID, and YYYY.YYYY.YYYY indicates the system ID.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to configure an area ID and a system ID in IS-IS. Different NET addresses must have the same system ID.

### 📌 Enabling IS-IS on an Interface

<b>Command</b>	<b>ip router isis</b> [ <i>tag</i> ]
<b>Parameter</b>	<i>tag</i> : Indicates the name of an IS-IS instance.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to enable an interface to participate in IS-IS IPv4 routing. Use the <b>no</b> form of this command to disable the IS-IS routing process on the interface.</p> <p>If you run the <b>no ip routing</b> command in global configuration mode, IS-IS will disable IPv4 routing on all interfaces. That is, the <b>no ip router isis</b> [ <i>tag</i> ] command is automatically executed on all interfaces. Other IS-IS settings remain unchanged.</p>

## Configuration Example

### 📌 Establishing a Neighbor Relationship on an IS-IS P2P Link

<b>Scenario</b>	Router A and Router B are connected in P2P mode.
-----------------	--

<p><b>Figure 6-9</b> <b>P2P Link</b> <b>Topology</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Wide Area Network (WAN) interfaces.</li> </ul>
<p><b>A</b></p>	<pre>A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config)# interface Serial 1/0 A(config-if)# ip address 192.168.1.1 255.255.255.252 A(config-if)# ip router isis</pre>
<p><b>B</b></p>	<pre>B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00 B(config)# interface Serial 1/0 B(config-if)# ip address 192.168.1.2 255.255.255.252 B(config-if)# ip router isis</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Enable sending of Hello packets from the interface 192.168.1.1 on Router A to the interface 192.168.1.2 on Router B.</li> <li>● Establish an IS-IS neighbor relationship between Router A and Router B, with the neighbor state being Up.</li> <li>● Check the LSPs on Router A and Router B. The system IDs 0000.0000.0001 and 0000.0000.0002 should exist.</li> </ul>
<p><b>A</b></p>	<pre>A# show isis neighbors A# show isis database detail</pre>
<p><b>B</b></p>	<pre>B# show isis neighbors</pre>

📌 **Establishing a Neighbor Relationship on an IS-IS Broadcast Link**

<p><b>Scenario</b></p>	<p>Router A, Router B, and Router C are interconnected through the Ethernet.</p>
------------------------	--

<p><b>Figure 6-10</b> IS-IS Broadcast Link Topology</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> </ul>
<p><b>A</b></p>	<pre>A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config)# interface GigabitEthernet 0/0 A(config-if)# ip address 10.1.1.1 255.255.255.0 A(config-if)# ip router isis</pre>
<p><b>B</b></p>	<pre>B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00 B(config)# interface GigabitEthernet 0/0 B(config-if)# ip address 10.1.1.2 255.255.255.0 B(config-if)# ip router isis</pre>
<p><b>C</b></p>	<pre>C(config)# router isis C(config-router)# net 49.0001.0000.0000.0003.00 C(config)# interface GigabitEthernet 0/0 C(config-if)# ip address 10.1.1.3 255.255.255.0 C(config-if)# ip router isis</pre>
<p><b>Verification</b></p>	<p>Enable sending of Hello packets from the interface 10.1.1.1 on Router A to the interface 10.1.1.2 on Router B and the interface 10.1.1.3 on Router C.</p> <ul style="list-style-type: none"> <li>● Establish IS-IS neighbor relationships between Router A and Router B and between Router A and Router C, with the neighbor state being Up.</li> <li>● Check the LSPs on Router A, Router B, and Router C. The system IDs 0000.0000.0001,</li> </ul>

	0000.0000.0002, and 0000.0000.0003 should exist.
<b>A</b>	<pre>A# show isis neighbors A# show isis database detail</pre>
<b>B</b>	<pre>B# show isis neighbors</pre>
<b>C</b>	<pre>C# show isis neighbors</pre>

➤ **Performing Simple IS-ISv6 Configuration**

<b>Scenario</b>	Router A and Router B are connected through the Ethernet.
<b>Figure 6-11 IS-ISv6 Broadcast Link Topology</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> </ul>
<b>A</b>	<pre>A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config)# interface GigabitEthernet 0/0 A(config-if)# ipv6 address 1000 ::1/112 A(config-if)# ipv6 router isis</pre>
<b>B</b>	<pre>B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00 B(config)# interface GigabitEthernet 0/0 B(config-if)# ipv6 address 1000 ::2/112 B(config-if)# ipv6 router isis</pre>
<b>Verification</b>	<p>Enable sending of Hello packets from the interface 1000 ::1 on Router A to the interface 1000 ::2 on Router B.</p> <p>Establish an IS-IS neighbor relationship between Router A and Router B, with the neighbor state being Up.</p> <p>Check the LSPs on Router A and Router B. The system IDs 0000.0000.0001 and 0000.0000.0002 should exist.</p>

A	A# show isis neighbors A# show isis database detail
B	B# show isis neighbors

## Common Errors

- The IP addresses of the interfaces connected between neighbors are not in the same network segment.
- The **ip router isis** command is not executed on interfaces.
- No NET address is configured, or different NET addresses exist at Level-1.
- **max-area-addresses** is configured differently on both sides.
- **metric-style** is configured differently on both sides.
- The interface Levels on both sides are different. One side is Level-1, whereas the other side is Level-2.
- One side is configured with the P2P mode, whereas the other side is configured with the broadcast mode.
- One side is enabled with authentication, whereas the other side is not.

## 6.4.2 Configuring IS-IS Hello Packets

### Configuration Effect

- Configure the Hello packet interval on an interface. The value range is 1 to 65,535, in the unit of seconds.
- Configure the Hello packet holdtime multiplier on an IS-IS interface.

### Notes

- You can change the Hello packet holdtime by using the **isis hello-multiplier** command or **isis hello-interval** command or both.
- By default, CPU protection is enabled on devices. For packets mapped to the destination group addresses (AllISSystems, AllL1ISSystems, and AllL2ISSystems) in IS-IS, there is a default limit (for example, 400 pps) on the number of packets sent to the CPU. If a device has many neighbor relationships or sends Hello packets at short interval, the IS-IS packets that the device receives may exceed the default limit, causing frequent flapping of neighbor relationships. To solve the problem, you can use the CPU protection command in global mode to increase the limit.

### Configuration Steps

#### ↘ Configuring the Hello Packet Interval on an Interface

- Perform this configuration based on requirements.
- Run the **isis hello-interval** command in interface configuration mode on the desired device, unless otherwise specified.

#### ↘ Configuring the Hello Packet Holdtime Multiplier on an Interface

- Perform this configuration based on requirements.

- Run the **isis hello-multiplier** command in interface configuration mode on the desired device, unless otherwise specified.

## Verification

- Enable Router A to send Hello packets to Router B and Router C, and capture packets to check the packet interval.
- Make Router B or Router C down. After the holdtime has elapsed, check whether the corresponding neighbor relationship on Router A is invalid.

## Related Commands

### ▾ Configuring the Hello Packet Interval on an Interface

<b>Command</b>	<b>isis hello-interval</b> { <i>interval</i>   <b>minimal</b> } [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<p><i>interval</i>: Indicates the Hello packet interval. The value range is 1 to 65,535, in the unit of seconds. The default value is 10.</p> <p><b>minimal</b>: Indicates the minimum value of the holdtime, which is 1.</p> <p><b>level-1</b>: Applies the setting to Level-1 Hello packets.</p> <p><b>level-2</b>: Applies the setting to Level-2 Hello packets.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to change the Hello packet interval. The default interval is 10s. A DIS sends Hello packets at a frequency three times that by non-DIS devices in a broadcast network. If an IS is elected as the DIS on the interface, by default, the interface sends a Hello packet every 3.3s.</p> <p>If the keyword <b>minimal</b> is used, the Hello packet holdtime is set to 1. The Hello packet interval will be calculated based on the holdtime multiplier. If the holdtime multiplier is set to 4 and the <b>isis hello-interval minimal</b> command is executed, the Hello packet interval is equal to 1s divided by 4. The default Hello packet holdtime multiplier on an IS-IS interface is 3. The holdtime is equal to the holdtime multiplier multiplied by the packet interval. If the keyword <b>minimal</b> is used, the holdtime is set to 1. The packet interval is equal to 1 divided by the holdtime multiplier. If the holdtime multiplier is set to 4 and the <b>isis hello-interval minimal</b> command is executed, the packet interval is equal to 1 divided by 4s, which is 250 ms.</p>

### ▾ Configuring Hello Packet Holdtime Multiplier on an Interface

<b>Command</b>	<b>isis hello-multiplier</b> <i>multiplier-number</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<i>multiplier-number</i> : Indicates the Hello packet holdtime multiplier. The value range is 2 to 100. The default value is 3.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The Hello packet holdtime is equal to the Hello packet interval multiplied by the holdtime multiplier.

## Configuration Example

### ▾ Configuring the Hello Packet Interval and Holdtime on an IS-IS Interface

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the Hello packet interval on an IS-IS interface.</li> <li>● Configure the Hello packet holdtime multiplier on an IS-IS interface.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/0 A(config-if)# isis hello-interval 5 A(config-if)# isis hello-multiplier 5</pre>
<b>Verification</b>	<p>Enable Router A to send Hello packets to Router B and Router C, and capture packets to check the packet interval.</p> <p>Make Router B or Router C down. After the holdtime has elapsed, check whether the corresponding neighbor relationship on Router A is invalid.</p>
	<pre>A# show isis neighbor</pre>

### 6.4.3 Configuring IS-IS LSPs

#### Configuration Effect

- **isis lsp-interval:** Configures the LSP interval on an IS-IS interface.
- **lsp-gen-interval:** Configures the minimum LSP generational interval. The LSP generational interval is the interval between the new-version LSP generation time and the old-version LSP generation time.
- **isis retransmit-interval:** After a device at one end of a P2P link sends an LSP packet, if the device receives no response within a period of time, it determines that the LSP packet is lost or dropped due to an error. The device will resend the LSP packet.
- **lsp-refresh-interval:** All current LSPs are periodically retransmitted to enable each network node to maintain the latest LSPs. The retransmission period is called the LSP refresh interval, which aims to update and synchronize LSPs in the entire area.
- **max-lsp-lifetime:** An LSP contains a field to indicate its lifetime. When a device generates an LSP, the field is set to the maximum lifetime of the LSP. After the LSP is received by the peer device, its lifetime will decrease with time. The peer device will replace the old LSP with the newly received one. If the device receives no new LSP until the existing LSP's lifetime decreases to 0, the existing LSP is still maintained in the LSDB for another 60s. If the device still receives no new LSP during this period, the existing LSP will be deleted from the LSDB. This mechanism updates and synchronizes LSPs in the entire area.
- **ignore-lsp-errors:** After receiving an LSP, the local IS-IS neighbor calculates its checksum and compares it with the checksum contained in the LSP. By default, if the two checksums are inconsistent, the LSP will be discarded. If you run the **ignore-lsp-errors** command to configure to ignore checksum errors, the LSP will be processed normally despite checksum inconsistency.

- **lsp-fragment-extend**: Enables LSP fragment extension, which is used to generate an extended LSP when the 256 fragments of the original LSP are used up.

## Notes

---

- The LSP refresh interval must be smaller than the maximum LSP lifetime.
- The maximum LSP lifetime must be greater than the LSP refresh interval.

## Configuration Steps

---

### ↘ Configuring the Minimum LSP Interval

- Perform this configuration based on requirements.
- Run the **isis lsp-interval** command in interface configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the LSP Retransmission Interval

- Perform this configuration based on requirements.
- Run the **isis retransmit-interval** command in interface configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the LSP Refresh Interval

- Perform this configuration based on requirements.
- Run the **lsp-refresh-interval** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the LSP Lifetime

- Perform this configuration based on requirements.
- Run the **max-lsp-lifetime** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring to Ignore LSP Checksum Errors

- Perform this configuration based on requirements.
- Run the **ignore-lsp-errors** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring LSP Fragment Extension

- Perform this configuration based on requirements.
- Run the **lsp-fragment-extend** and **virtual-system** commands in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

---

- Update LSPs continuously and capture LSPs to check the minimum LSP interval.
- Disable neighboring routes and capture LSPs to check the LSP retransmission interval.
- Capture LSPs to check the refresh interval.
- Check the LSP lifetime.
- Send an LSP with an incorrect checksum and check whether the LSP is discarded.
- Reduce the **isp-length originate** command value, add routing information, and capture LSPs to check whether more than 256 LSP fragments are generated.

## Related Commands

### ↘ Configuring the Minimum LSP Interval

<b>Command</b>	<b>isis lsp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<i>milliseconds</i> : Indicates the LSP interval. The value range is 1 to 4,294,967,295, in the unit of milliseconds. <b>level-1</b> : Applies the setting only to Level-1 LSPs. <b>level-2</b> : Applies the setting only to Level-2 LSPs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the LSP Retransmission Interval

<b>Command</b>	<b>isis retransmit-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSP retransmission interval. The value range is 0 to 65,535, in the unit of seconds. <b>level-1</b> : Applies the setting only to Level-1 LSPs. <b>level-2</b> : Applies the setting only to Level-2 LSPs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure the LSP retransmission interval. In a P2P network, after a device sends an LSP, if the device receives no PSNP response within the time specified by this command, it will resend the LSP. If the retransmission interval is set to 0, the LSP will not be resent,

### ↘ Configuring the LSP Refresh Interval

<b>Command</b>	<b>isp-refresh-interval</b> <i>interval</i>
<b>Parameter Description</b>	<i>interval</i> : Indicates the LSP refresh interval. The value range is 1 to 65,535, in the unit of seconds. The default value is 900.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	After an LSP has remained stable for a period specified by this command, it will be refreshed and updated before being published. The LSP refresh interval must be smaller than the maximum LSP lifetime.

### ▾ Configuring the LSP Lifetime

<b>Command</b>	<b>max-lsp-lifetime</b> <i>value</i>
<b>Parameter Description</b>	<i>value</i> : Indicates the maximum time that LSPs keep alive. The value range is 1 to 65,535, in the unit of seconds. The default value is 1,200.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	The maximum LSP lifetime must be greater than LSP refresh interval.

### ▾ Configuring to Ignore LSP Checksum Errors

<b>Command</b>	<b>ignore-lsp-errors</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	After receiving an LSP, the local IS-IS neighbor calculates its checksum and compares it with the checksum contained in the LSP. By default, if the two checksums are inconsistent, the LSP will be discarded. If you run the <b>ignore-lsp-errors</b> command to configure to ignore checksum errors, the LSP will be processed normally despite checksum inconsistency.

### ▾ Configuring LSP Fragment Extension

<b>Command</b>	<b>lsp-fragment-extend</b> [ <b>level-1</b>   <b>level-2</b> ] [ <b>compatible rfc3786</b> ]
<b>Parameter Description</b>	<b>level-1</b> : Applies the setting only to Level-1 LSPs. <b>level-2</b> : Applies the setting only to Level-2 LSPs. <b>compatible</b> : Indicates compatibility with the RFC version of extended LSPs. <b>rfc3786</b> : Extends the LSP old version.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to enable LSP fragment extension.

### ▾ Configuring an Additional System ID

<b>Command</b>	<b>virtual-system</b> <i>system-id</i>
<b>Parameter Description</b>	<i>system-id</i> : Indicates an additional system ID (6-byte).
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to configure the additional system ID of an IS-IS routing process, which is used by the extended LSP that is generated after the 256 fragments of the original LSP are used up. To enable fragment extension, run the <b>lsp-fragment-extend</b> command.

## Configuration Example

### ↘ Configuring the Minimum LSP Interval

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the minimum LSP interval.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis lsp-interval 100 level-2</pre>
<b>Verification</b>	Run the <b>clear isis *</b> command to update LSPs continuously and capture LSPs to check the minimum LSP interval.

### ↘ Configuring the LSP Retransmission Interval

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors in P2P mode. (Omitted)</li> <li>● Configure the LSP retransmission interval.</li> </ul>
	<pre>A(config)# interface serial 0/1 A(config-if)# isis retransmit-interval 10 level-2</pre>
<b>Verification</b>	Disable neighboring routes and capture LSPs to check the LSP retransmission interval.

### ↘ Configuring the LSP Refresh Interval

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the LSP refresh interval.</li> </ul>
	<pre>A(config)# router isis A(config-router)# lsp-refresh-interval 600</pre>
<b>Verification</b>	Capture LSPs to check the refresh interval.

### ↘ Configuring the LSP Lifetime

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the LSP lifetime.</li> </ul>
	<pre>A(config)# router isis A(config-router)# max-lsp-lifetime 1500</pre>
<b>Verification</b>	Check the LSP lifetime ( <b>LSP Holdtime</b> field).

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the LSP lifetime.</li> </ul>
	<pre>A(config)# router isis A(config-router)# max-lsp-lifetime 1500</pre>
<b>Verification</b>	Check the LSP lifetime ( <b>LSP Holdtime</b> field).
	<pre>A# show isis database</pre>

#### ↘ Configuring to Ignore LSP Checksum Errors

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure to ignore LSP checksum errors.</li> </ul>
	<pre>A(config)# router isis A(config-router)# ignore-lsp-errors</pre>
<b>Verification</b>	Send an LSP with an incorrect checksum and check whether the LSP is discarded.

#### ↘ Configuring LSP Fragment Extension

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure LSP fragment extension.</li> <li>● Configure the additional system ID of the IS-IS routing process.</li> </ul>
	<pre>A(config)# router isis A(config-router)# lsp-fragment-extend A(config-router)# virtual-system 0000.0000.0034</pre>
<b>Verification</b>	Reduce the <b>lsp-length originate</b> command value, add routing information, and capture LSPs to check whether more than 256 LSP fragments are generated.

## 6.4.4 Configuring IS-IS SNPs

### Configuration Effect

- CSNPs are periodically broadcast by the DIS in a broadcast network for LSDB synchronization. In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to **mesh-groups** can be configured to periodically send CSNPs.

- When you need to set **mesh-group** on an IS-IS interface, run the **isis csnp-interval** command to configure the non-0 CSNP interval to ensure complete LSP synchronization between neighbors in the network. After that, CNSPs will be periodically sent to synchronize LSPs.

### Configuration Steps

- Perform this configuration based on requirements.
- Run the **isis csnp-interval interval [ level-1 | level-2 ]** command in interface configuration mode on the desired device, unless otherwise specified.

### Verification

Capture CNSPs in the broadcast network to check the CSNP interval.

### Related Commands

#### ▾ Configuring Source Registration Filter

<b>Command</b>	<b>isis csnp-interval interval [ level-1   level-2 ]</b>
<b>Parameter Description</b>	<i>interval</i> : Indicates the CSNP interval. The value range is 0 to 65,535, in the unit of seconds. <b>level-1</b> : Applies the setting only to Level-1 CNSPs. <b>level-2</b> : Applies the setting only to Level-2 CNSPs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to change the CSNP interval. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to <b>mesh-groups</b> can be configured to periodically send CNSPs. No CNSPs are sent if the CSNP interval is set to 0.

### Configuration Example

#### ▾ Configuring the CSNP Broadcast Interval

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the CSNP broadcast interval.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis csnp-interval 20</pre>
<b>Verification</b>	Capture packets to check the CSNP interval.

## 6.4.5 Configuring the IS-IS Level Type

### Configuration Effect

- IS-IS supports a two-Level system to realize routing management and extensible route selection in a large network. Each Level is only concerned about maintaining the topology of the corresponding area.
- You can run the **is-type** command in IS-IS routing process configuration mode to configure an IS-IS Level, or run the **isis circuit-type** command in interface configuration mode to configure the IS-IS Level of an interface. The default Levels specified by the **is-type** and **isis circuit-type** commands are Level-1/Level-2. If you run both commands, the interface only sends the PDUs of the same Level specified by the two commands.

## Notes

- If Level-1 or Level-2-only is configured using the **circuit-type** command, IS-IS will only send PDUs of the corresponding Level.
- If an interface is set to **external**, the interface will work as an external domain interface and IS-IS will not send PDUs of the corresponding Level.
- A device can have only one instance running at Level-2 (including Level-1/Level-2).

## Configuration Steps

### ▾ Configuring the System Type

- Perform this configuration based on requirements.
- Run the **is-type** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ▾ Configuring the Interface Circuit Type

- Perform this configuration based on requirements.
- Run the **isis circuit-type** command in interface configuration mode on the desired device, unless otherwise specified.

## Verification

- Check whether only the instances of the Level specified by the **is-type** command are processed, and neighbors of the corresponding Level are created.
- Check whether the interface only sends the PDUs of the same Level specified by the **is-type** and **circuit-type** commands.

## Related Commands

### ▾ Configuring the System Type

<b>Command</b>	<b>is-type</b> { <b>level-1</b>   <b>level-1-2</b>   <b>level-2-only</b> }
<b>Parameter</b>	<b>level-1</b> : Indicates that IS-IS only runs at Level-1.
<b>Description</b>	<b>level-1-2</b> : Indicates that IS-IS runs at Level-1 and Level-2. <b>level-2-only</b> : Indicates that IS-IS only runs at Level-2.
<b>Command Mode</b>	IS-IS routing process configuration mode

<b>Usage Guide</b>	Changing the <b>is-type</b> value will enable or disable the routes of the corresponding level.
--------------------	---

↘ **Configuring the Interface Circuit Type**

<b>Command</b>	<b>isis circuit-type { level-1   level-1-2   level-2-only [ external ] }</b>
<b>Parameter Description</b>	<p><b>level-1</b>: Establishes a Level-1 neighbor relationship.</p> <p><b>level-2-only</b>: Establishes a Level-2 neighbor relationship.</p> <p><b>level-1-2</b>: Establishes a Level-1/Level-2 neighbor relationship.</p> <p><b>external</b>: Uses the interface as an external domain interface.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>If the circuit type is set to Level-1 or Level-2-only, IS-IS will only send PDUs of the corresponding Level.</p> <p>If the system type is set to Level-1 or Level-2-only, IS-IS only processes the instances of the corresponding Level, and the interface only sends the PDUs of the same Level specified by the <b>is-type</b> and <b>circuit-type</b> commands.</p> <p>If the interface is set to <b>external</b>, the interface will work as an external domain interface and IS-IS will not send PDUs of the corresponding Level.</p>

**Configuration Example**

↘ **Configuring IS-IS Levels**

<b>Configuration Requirements</b>	Router A is connected to Router B and Router C by P2P serial links. Router B and Router C are connected by the Ethernet, and Router D and Router E are also connected by the Ethernet. On Router A, configure IS-IS area route summarization. Note that area route summarization can be configured only on border devices.
<b>Figure 6-12 IS-IS Level Configuration</b>	

**Configuration Steps**

- Configure IS-IS.
- Configure Ethernet interfaces.
- Configure the IS-IS Level structure.

**A**

Configure IS-IS.

```
A(config)# router isis
A(config-router)# net 50.0001.0000.0000.0001.00
A(config-router)# is-type level-2-only
```

Configure two serial link ports.

```
A(config)# interface Serial 1/0
A(config-if)# ip address 192.168.1.1 255.255.255.252
A(config-if)# ip router isis
A(config)# interface Serial 1/1
A(config-if)# ip address 192.168.2.1 255.255.255.252
A(config-if)# ip router isis
```

**B**

Configure IS-IS.

```
B(config)# router isis
B(config-router)# net 49.0001.0000.0000.0002.00
```

Configure an Ethernet interface.

	<pre>B(config)# interface GigabitEthernet 0/0 B(config-if)# ip address 192.168.10.1 255.255.255.0 B(config-if)# ip router isis</pre>
	<b>Configure a serial link port.</b>
	<pre>B(config)# interface Serial 1/0 B(config-if)# ip address 192.168.1.2 255.255.255.252 B(config-if)# ip router isis</pre>
<b>C</b>	<b>Configure IS-IS.</b>
	<pre>C(config)# router isis C(config-router)# net 49.0001.0000.0000.0003.00 C(config-router)# is-type level-1</pre>
	<b>Configure an Ethernet interface.</b>
	<pre>C(config)# interface GigabitEthernet 0/0 C(config-if)# ip address 192.168.10.2 255.255.255.0 C(config-if)# ip router isis</pre>
<b>D</b>	<b>Configure IS-IS.</b>
	<pre>D(config)# router isis D(config-router)# net 49.0002.0000.0000.0004.00</pre>
	<b>Configure an Ethernet interface.</b>
	<pre>D(config)# interface GigabitEthernet 0/0 D(config-if)# ip address 192.168.20.1 255.255.255.0 D(config-if)# ip router isis</pre>
	<b>Configure a serial link port.</b>
	<pre>D(config)# interface Serial 1/0 D(config-if)# ip address 192.168.2.2 255.255.255.252 D(config-if)# ip router isis</pre>
<b>E</b>	<b>Configure IS-IS.</b>
	<pre>E(config)# router isis E(config-router)# net 49.0002.0000.0000.0005.00 E(config-router)# is-type level-1</pre>
	<b>Configure an Ethernet interface.</b>

	<pre>E(config)# interface GigabitEthernet 0/0 E(config-if)# ip address 192.168.20.2 255.255.255.0 E(config-if)# ip router isis</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether neighbor relationships are established normally.</li> <li>● Capture packets to check whether Router A only sends and receives Level-2 packets.</li> <li>● Capture packets to check whether Router B and Router D only send and receive Level-1 and Level-2 packets.</li> <li>● Capture packets to check whether Router C and Router E only send and receive Level-1 packets.</li> </ul>
<b>A</b>	<pre>A# show isis neighbors A# show isis database detail</pre>

<b>D</b>	<pre>D# show isis neighbors D# show isis database detail</pre>
<b>E</b>	<pre>E# show isis neighbors E# show isis database detail</pre>

## 6.4.6 Configuring IS-IS Authentication

### Configuration Effect

- Interface authentication is intended for establishing and maintaining neighbor relationships. A neighbor relationship cannot be established between two IS-IS devices with different interface authentication passwords. This prevents unauthorized or unauthenticated IS-IS devices from joining an IS-IS network that requires authentication. Interface authentication passwords are encapsulated in Hello packets before being sent.
- Area authentication and RD authentication in IS-IS are performed to verify LSPs, CSNPs, and PSNPs to prevent unauthorized or unauthenticated routing information from being injected into the LSDB. Authentication passwords are encapsulated in LSPs, CSNPs, and PSNPs before being sent.

### Notes

- An interface authentication password is encapsulated in a Hello packet before being sent by an interface. When an interface receives a Hello packet, it checks the password in the packet against the existing one.

- Area authentication passwords are encapsulated in Level-1 LSPs, CSNPs, and PSNPs. When an interface receives an LSP, CSNP, or PSNP, it checks the password in the packet against the existing one.
- RD authentication passwords are encapsulated in Level-2 LSPs, CSNPs, and PSNPs. When an interface receives an LSP, CSNP, or PSNP, it checks the password in the packet against the existing one.

## Configuration Steps

### ▾ Configuring Interface Authentication

- Perform this configuration based on requirements.
- Configure **isis password** in interface configuration mode on the desired device, unless otherwise specified.

### ▾ Configuring Area Authentication

- Perform this configuration based on requirements.
- Run the **area-password** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ▾ Configuring RD Authentication

- Perform this configuration based on requirements.
- Run the **domain-password** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

- IS-IS plaintext authentication provides only limited security because the password transferred through a packet is visible.
- IS-IS MD5 authentication provides higher security because the password transferred through a packet is encrypted using the MD5 algorithm.

## Related Commands

### ▾ Configuring the Password for Plaintext Authentication of Hello Packets on an Interface

<b>Command</b>	<b>isis password [ 0   7 ] password [ send-only ] [ level-1   level-2 ]</b>
<b>Parameter</b>	<b>0:</b> Indicates that the key is displayed in plaintext.
<b>Description</b>	<p><b>7:</b> Indicates that the key is displayed in ciphertext.</p> <p><b>password-string:</b> Indicates the password string for plaintext authentication. The string can contain up to 126 characters.</p> <p><b>send-only:</b> Indicates that the plaintext authentication password is only used to authenticate sent packets. Received packets are not authenticated.</p> <p><b>level-1:</b> Applies the setting to the Level-1 circuit type.</p> <p><b>level-2:</b> Applies the setting to the Level-2 circuit type.</p>
<b>Command</b>	Interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>Use this command to configure the password for Hello packet authentication on an interface. Use the <b>no</b> form of this command to clear the password.</p> <p>If no Level is specified, by default, the password takes effect for Level-1 and Level-2 circuit types.</p> <p>This command does not take effect if the <b>isis authentication mode</b> command is executed. You need to first delete the previous command configuration.</p> <p>If you include the <b>send-only</b> parameter when deleting the <b>isis authentication mode</b> command configuration, only the parameter setting is canceled.</p>

### ↘ Specifying Interface Authentication as Plaintext or MD5

<b>Command</b>	<b>isis authentication mode</b> { <b>md5</b>   <b>text</b> } [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter</b>	<b>md5</b> : Uses MD5 authentication.
<b>Description</b>	<p><b>text</b>: Uses plaintext authentication.</p> <p><b>level-1</b>: Applies the setting to the Level-1 circuit type.</p> <p><b>level-2</b>: Applies the setting to the Level-2 circuit type.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to specify the authentication mode before you can make the key chain configured using the <b>isis authentication key-chain</b> command take effect.</p> <p>If no Level is specified, the authentication mode will take effect for Level-1 and Level-2 circuit types.</p> <p>If you use the <b>isis authentication mode</b> command after the <b>isis password</b> command is executed to configure plaintext authentication, the previous command configuration will be overwritten.</p> <p>The <b>isis password</b> command does not take effect if the <b>isis authentication mode</b> command is executed.</p> <p>To run the <b>isis password</b> command, delete the <b>isis authentication mode</b> command configuration first.</p>

### ↘ Configuring the Password for Interface Authentication

<b>Command</b>	<b>isis authentication key-chain</b> <i>name-of-chain</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter</b>	<i>name-of-chain</i> : Indicates the name of a key chain. The maximum length is 255.
<b>Description</b>	<p><b>level-1</b>: Indicates that the authentication key chain takes effect for Level-1.</p> <p><b>level-2</b>: Indicates that the authentication key chain takes effect for Level-2.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Authentication is not performed if no key chain is configured using the <b>key chain</b> command. In addition to the <b>key chain</b> command, you also need to run the <b>isis authentication mode</b> command to make IS-IS key chain authentication take effect.</p> <p>The key chain is applicable to plaintext authentication and MD5 authentication. Which authentication mode to use can be determined using the <b>isis authentication mode</b> command.</p> <p>For plaintext authentication, the key-string in the key chain cannot exceed 254 characters; otherwise, the key chain will be invalid.</p> <p>Only one key chain can be used at a time. After you configure a new key chain, it will replace the original one.</p>

	<p>If no Level is specified, the key chain takes effect for Level-1 and Level-2.</p> <p>The key chain is applicable to Hello packets. IS-IS will send or receive passwords that belong to the key chain.</p> <p>A key chain may contain multiple passwords. A password with a smaller SN is preferentially used for sending a packet. When the packet arrives at the peer device, the device will receive the packet if the packet-carried password is consistent with a password in the key chain.</p> <p>The authentication commands (for example, <b>authentication key-chain</b>) executed in IS-IS routing process configuration mode are intended for LSPs and SNPs. They do not take effect for IS-IS interfaces.</p>
--	--

📌 (Optional) Applying Interface Authentication Only to Sent Packets (Received Packets Are Not Authenticated)

<b>Command</b>	<b>isis authentication send-only [ level-1   level-2 ]</b>
<b>Parameter</b>	<b>level-1:</b> Sets <b>send-only</b> for Level-1 on an interface.
<b>Description</b>	<b>level-2:</b> Sets <b>send-only</b> for Level-2 on an interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to enable IS-IS to set an authentication password in the Hello packet sent by an interface. However, IS-IS does not authenticate the Hello packet received by the interface. You can use this command before you deploy IS-IS interface authentication on all devices in the network or before you change the authentication password or authentication mode. After you run the <b>isis authentication send-only</b> command, the devices will not authenticate received Hello packets to avoid network flapping when IS-IS interface authentication is deployed. After authentication is deployed in the entire network, run the <b>no isis authentication send-only</b> command to cancel the <b>send-only</b> setting.</p> <p>The <b>isis authentication send-only</b> command is applicable to plaintext authentication and MD5 authentication. You can run the <b>isis authentication mode</b> command to specify the authentication mode for an IS-IS interface.</p> <p>If no Level is specified, the authentication mode will take effect for Level-1 and Level-2 on the interface.</p>

📌 Configuring the Password for Area (Level-1) Plaintext Authentication

<b>Command</b>	<b>area-password [ 0   7 ] password [ send-only ]</b>
<b>Parameter</b>	<b>0:</b> Indicates that the key is displayed in plaintext.
<b>Description</b>	<p><b>7:</b> Indicates that the key is displayed in ciphertext.</p> <p><b>password-string:</b> Indicates the password string for plaintext authentication. The string can contain up to 126 characters.</p> <p><b>send-only:</b> Indicates that the plaintext authentication password is only used to authenticate sent Hello packets in Level-1 areas. Received Hello packets are not authenticate.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Run this command to enable authentication of received LSPs, CSNPs, and PSNPs in Level-1 areas and include authentication information in these packets before they are sent. All IS-IS devices in an area must be configured with the same password.</p> <p>This command does not take effect if the <b>authentication mode</b> command is executed. You need to first</p>

	<p>delete the previous command configuration.</p> <p>To delete the password, run the <b>no area-password</b> command. If you run the <b>no area-password send-only</b> command, only the <b>send-only</b> setting is canceled. If you run the <b>area-password psw send-only</b> and <b>no area-password send-only</b> commands in sequence, the configuration is changed to <b>area-password psw</b>.</p>
--	--

### ↘ Configuring the Password for RD (Level-2) Plaintext Authentication

<b>Command</b>	<b>domain-password [ 0   7 ] password [ send-only ]</b>
<b>Parameter Description</b>	<p><b>0</b>: Indicates that the key is displayed in plaintext.</p> <p><b>7</b>: Indicates that the key is displayed in ciphertext.</p> <p><b>password-string</b>: Indicates the password string for plaintext authentication. The string can contain up to 126 characters.</p> <p><b>send-only</b>: Indicates that the plaintext authentication password is only used to authenticate sent Hello packets in Level-1 areas. Received Hello packets are not authenticated.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Run this command to enable authentication of received LSPs, CSNPs, and PSNPs in Level-2 domains and include authentication information in these packets before they are sent. All IS-IS devices in a Level-2 domain must be configured with the same password.</p> <p>This command does not take effect if the <b>authentication mode</b> command is executed. You need to first delete the previous command configuration.</p> <p>To delete the password, run the <b>no domain-password</b> command. If you run the <b>no domain-password send-only</b> command, only the <b>send-only</b> setting is canceled. If you run the <b>domain-password psw send-only</b> and <b>no domain-password send-only</b> commands in sequence, the configuration is changed to <b>domain-password psw</b>.</p>

### ↘ Specifying the IS-IS RD Authentication Mode

<b>Command</b>	<b>authentication mode { md5   text } [ level-1   level-2 ]</b>
<b>Parameter Description</b>	<p><b>md5</b>: Uses MD5 authentication.</p> <p><b>text</b>: Uses plaintext authentication.</p> <p><b>level-1</b>: Indicates that the authentication mode takes effect for Level-1.</p> <p><b>level-2</b>: Indicates that the authentication mode takes effect for Level-2.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Use this command to specify the authentication mode before you can make the key chain configured using the <b>authentication key-chain</b> command take effect.</p> <p>If no Level is specified, the authentication mode will take effect for Level-1 and Level-2.</p> <p>If you use the <b>authentication mode</b> command after the <b>area-password</b> or <b>domain-password</b> command is executed to configure plaintext authentication, the previous command configuration will be overwritten.</p> <p>The <b>area-password</b> or <b>domain-password</b> command does not take effect if the <b>authentication mode</b> command is executed. To run the <b>area-password</b> or <b>domain-password</b> command, delete the <b>authentication mode</b> command configuration first.</p>

### ▾ Specifying the Key Chain for IS-IS Authentication

<b>Command</b>	<b>authentication key-chain</b> <i>name-of-chain</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter</b>	<i>name-of-chain</i> : Indicates the name of a key chain. The maximum length is 255.
<b>Description</b>	<b>level-1</b> : Indicates that the authentication key chain takes effect for Level-1. <b>level-2</b> : Indicates that the authentication key chain takes effect for Level-2.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Authentication is not performed if no key chain is configured using the <b>key chain</b> command. In addition to the <b>key chain</b> command, you also need to run the <b>authentication mode</b> command to make IS-IS key chain authentication take effect.</p> <p>The key chain is applicable to plaintext authentication and MD5 authentication. Which authentication mode to use can be determined using the <b>authentication mode</b> command.</p> <p>For plaintext authentication, the key-string in the key chain cannot exceed 254 characters; otherwise, the key chain will be invalid.</p> <p>Only one key chain can be used at a time. After you configure a new key chain, it will replace the original one.</p> <p>If no Level is specified, the key chain takes effect for Level-1 and Level-2.</p> <p>The key chain is applicable to LSPs, CSNPs, and PSNPs. IS-IS will send or receive passwords that belong to the key chain.</p> <p>A key chain may contain multiple passwords. A password with a SN is preferentially used for sending a packet. When the packet arrives at the peer device, the device will receive the packet if the packet-carried password is consistent with a password in the key chain.</p>

### ▾ Applying IS-IS Authentication Only to Sent Packets

<b>Command</b>	<b>authentication send-only</b> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter</b>	<b>level-1</b> : Applies the <b>send-only</b> setting to Level-1.
<b>Description</b>	<b>level-2</b> : Applies the <b>send-only</b> setting to Level-2.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Use this command to enable IS-IS to set an authentication password in the Hello packet to be sent. However, IS-IS does not authenticate received Hello packets. You can use this command before you deploy IS-IS authentication on all devices in the network or before you change the authentication password or authentication mode. After you run the <b>authentication send-only</b> command, the devices will not authenticate received packets to avoid network flapping when authentication passwords are deployed. After authentication is deployed in the entire network, run the <b>no isis authentication send-only</b> command to cancel the <b>send-only</b> setting.</p> <p>The <b>authentication send-only</b> command is applicable to plaintext authentication and MD5 authentication. You can run the <b>authentication mode</b> command to specify the authentication mode.</p> <p>If no Level is specified, the authentication mode will take effect for Level-1 and Level-2.</p>

### Configuration Example

➤ **Configuring IS-IS Authentication**

<p><b>Configuration Requirements</b></p>	<p>Router A, Router B, and Router C are connected through the Ethernet and run IS-IS. Router A is a Level-1 device, Router B is a Level-1/Level-2 device, and Router C is a Level-2 device. The following configuration requirements exist: Apply plaintext authentication to the Hello packets between Router A and Router B, as well as Level-1 LSPs and SNPs. Apply MD5 authentication to the Hello packets between Router B and Router C, as well as Level-2 LSPs and SNPs.</p>
<p><b>Figure 6-13 IS-IS Authentication Topology</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> <li>● Configure the password for IS-IS authentication.</li> </ul>
<p><b>A</b></p>	<p>Configure IS-IS.</p>
	<pre>A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config-router)# is-type level-1 A(config-router)# area-password aa</pre>
	<p><b>Configure an Ethernet interface.</b></p> <pre>A(config)# interface GigabitEthernet 0/0 A(config-if)# ip address 192.168.20.1 255.255.255.0 A(config-if)# ip router isis A(config-if)# isis password cc</pre>
<p><b>B</b></p>	<p>Configure the password for IS-IS authentication.</p>
	<pre>B(config)# key chain kc1 B(config-keychain)# key 1 B(config-keychain-key)# key-string aa B(config)# key chain kc2 B(config-keychain)# key 1 B(config-keychain-key)# key-string bb</pre>

### Common Errors

- Different authentication passwords are configured between neighbors.
- Different authentication modes are configured between neighbors.

## 6.4.7 Configuring IS-IS GR

### Configuration Effect

- IS-IS GR helps improve system reliability. On devices that separate the control plane from the forwarding plane, GR ensures that data forwarding is not interrupted during routing protocol restart.

#### 📌 IS-IS GR Working Mechanism

For GR to be successful, the following two conditions must be met: (1) The network topology is stable; (2) The device can ensure uninterrupted forwarding when it restarts IS-IS.

Two roles exist during the GR process: Restarter and Helper. Accordingly, IS-IS GR is divided into the IS-IS GR Restart capability and IS-IS GR Help capability. A device with the GR Restart capability can send a GR request and execute GR. A device with the GR Help capability can receive a GR request and help its neighbor with GR implementation. The GR process starts when the Restarter sends a GR request. After receiving the GR request, the neighboring device enters Help mode to help the Restarter reestablish its LSDB while maintaining the neighbor relationship with the Restarter. The main GR working mechanism is as follows:

When an IS-IS device needs to perform GR, it instructs its neighbor to maintain their neighbor relationship so that other devices in the network cannot sense the change in the topological relationship and the neighbor will not recalculate the route and update its forwarding table. The IS-IS device synchronizes and restores the LSDB to its pre-GR state with the help of the neighbor to ensure that the route and forwarding table remain unchanged before and after GR implementation and data forwarding is not interrupted.

The Restarter performs the following operations during the GR process:

1. The GR Restarter notifies the GR Helpers that it will be restarted.

Figure 6-14 Restart Notification by the GR Restarter

Switch A is a GR Restarter, and Switch B and Switch C are the GR Helpers for Switch A. Switch A sends a GR request instructing all its neighbors not to delete the neighbor relationships with Switch A when it is restarted. After receiving the GR request, the neighbors send GR responses to the GR Restarter, and will maintain their neighbor relationships with the GR Restarter during the GR time (specified by **GR grace-period**) notified by the GR Restarter.

2. The GR Restarter is restarted.

Figure 6-15 Restart Performed by the GR Restarter

When the GR Restarter is restarted, its IS-IS interface goes from Down to Up. Because the GR Helpers know that the GR Restarter is in IS-IS restart state, they maintain their neighbor relationships with the GR Restarter during the GR time and retain the routes from the GR Restarter.

3. The GR Restarter synchronizes topology and routing information from the GR Helpers.

Figure 6-16 LSDB Synchronization

After IS-IS restart, the GR Restarter synchronizes topology or routing information from the GR Helpers and recalculates its routing table. During this process, any change in the routing table is not updated to the forwarding table.

4. GR is completed when the GR Restarter finishes LSDB synchronization. Then all devices enter IS-IS interaction state.

Figure 6-17 GR Completion

After the GR Restarter synchronizes all required data, all devices enter IS-IS interaction state. The GR Restarter's routing table is updated to the forwarding table and invalid entries are cleared. Because the GR Restarter is completely restored to the pre-restart state under stable network conditions, its routing table and forwarding table remain unchanged before and after GR.

## Notes

- IS-IS GR is implemented based on RFC5306: Restart Signaling for IS-IS.

✔ All products support the IS-IS GR Helper capability.

## Configuration Steps

### ↘ Enabling the IS-IS GR Restart Capability

- Perform this configuration based on requirements.
- Run the **graceful-restart** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the Maximum GR Time

- Perform this configuration based on requirements.
- Run the **graceful-restart grace-period** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Enabling the IS-IS GR Help Capability

- Perform this configuration based on requirements.
- Run the **graceful-restart helper** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

- Check whether the routing table and forwarding table remain unchanged before and after GR.

## Related Commands

### ↘ Enabling the IS-IS GR Restart Capability

<b>Command</b>	<b>graceful-restart</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to enable the IS-IS GR Restart capability. As long as the network conditions remain unchanged, IS-IS can be restarted and restored to the pre-restart state without impact on data forwarding.

### ↘ Configuring the Maximum GR Time

<b>Command</b>	<b>graceful-restart grace-period</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the GR time. The value range is 1s to 65,535s. The default value is 300s.
<b>Command Mode</b>	IS-IS routing process configuration mode

<b>Usage Guide</b>	N/A
--------------------	-----

➤ **Enabling the IS-IS GR Help Capability**

<b>Command</b>	<b>graceful-restart helper disable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use the <b>graceful-restart helper disable</b> command to disable the IS-IS GR Help capability. The command enables IS-IS to ignore the GR request sent by the device to be restarted.

**Configuration Example**

➤ **Configuring IS-IS GR**

<b>Configuration Requirements</b>	<p>Two S8600 series high-end devices have the IS-IS GR Restart capability and are equipped with master/slave management boards for redundant backup at the control plane. IS-IS neighbor relationships are established between S86-1 and S3750/S3760 and between S86-2 and S3750/S3760. The system software of all devices supports the IS-IS GR Help capability.</p> <p>The following configuration requirements exist: Enable the IS-IS GR Restart capability with proper GR Time setting on S86-1 and S86-2 to realize uninterrupted forwarding and improve core device reliability.</p> <p>Disable the IS-IS GR Help capability on S3750 to exclude it from the Help process. By default, other device supports the IS-IS GR Help capability and require no additional configuration.</p>
-----------------------------------	---

<b>Configuration Steps</b>	<p>Configure IS-IS. (Omitted)</p> <p>Configure Ethernet interfaces. (Omitted)</p>
<b>S86-1</b>	<p>Configure IS-IS GR.</p> <pre>S86-1 (config)# router isis CS86-1(config-router)# graceful-restart CS86-1(config-router)# graceful-restart grace-period 60</pre>

<b>S3760</b>	<pre>S3760# show isis neighbors</pre>

## 6.4.8 Configuring BFD Support for IS-IS

### Configuration Effect

- IS-IS dynamically discovers neighbors through Hello packets. After IS-IS enables the BFD function, a BFD session will be set up with the neighbor in Up state. The BFD mechanism is used to detect the neighbor state. Once a neighbor failure is detected through BFD, IS-IS performs network convergence immediately. The convergence time can be reduced from 30s to less than 1s. By default, IS-IS Hello packets are sent at an interval of 10s in a P2P network, and the time required to detect a neighbor failure is three times the packet interval, that is 30s.

### Notes

- You must set BFD session parameters before you enable BFD support for IS-IS.
- When you run the **bfd up-dampening** command on an interface with BFD support for IS-IS, you need to run the **bfd all-interfaces** command with the *[anti-congestion]* option selected.
- When you run the **bfd all-interfaces** command with the *[anti-congestion]* option selected, run the **bfd up-dampening** command on the interface.
- IP routing may cause a neighbor's interface for BFD session setup to be inconsistent with the interface for outgoing BFD packets. If this happens, the BFD session cannot be set up.
- If a neighbor's interface for BFD session setup is inconsistent with the interface for outgoing BFD packets, the BFD session cannot be set up.

### Configuration Steps

### ↘ Enabling BFD Support for IS-IS on All Interfaces

- Perform this configuration based on requirements.
- Run the **bfd all-interfaces** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Enabling BFD Support for IS-IS on the Current Interface

- Perform this configuration based on requirements.
- Run the **isis bfd** command in interface configuration mode on the desired device, unless otherwise specified.

## Verification

- Build a topology with two parallel lines. Typically, IS-IS selects one line as the master line and the other as the backup line. Enable BFD on the master line.
- Make the master line fail. Check whether IS-IS performs route convergence based on the BFD monitoring state and starts the backup line.

## Related Commands

### ↘ Enabling BFD Support for IS-IS on the Current Interface

<b>Command</b>	<b>bfd all-interfaces</b> [ <i>anti-congestion</i> ]
<b>Parameter Description</b>	<i>anti-congestion</i> : Indicates the IS-IS BFD anti-congestion option.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	You can enable or disable BFD on an IS-IS interface by using any of the following two methods: Method 1: Run the <b>bfd all-interfaces</b> command in IS-IS routing process configuration mode to enable BFD on all IS-IS interfaces, and then run the <b>no bfd all-interfaces</b> command to disable BFD on all IS-IS interfaces. Method 2: Run the <b>isis bfd [ disable ]</b> command in interface configuration mode to enable BFD on the specified IS-IS interface, and then run the <b>isis bfd disable</b> command to disable BFD on the interface.

### ↘ Enabling BFD Support for IS-IS on the Current Interface

<b>Command</b>	<b>isis bfd</b> [ <i>disable</i>   <i>anti-congestion</i> ]
<b>Parameter Description</b>	<i>disable</i> : Disables BFD support for IS-IS on the current interface. <i>anti-congestion</i> : Indicates the IS-IS BFD anti-congestion option.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	You can enable or disable BFD on an IS-IS interface by using any of the following two methods: Method 1: Run the [ <b>no</b> ] <b>bfd all-interfaces [anti-congestion]</b> command in IS-IS routing process configuration mode to enable or disable BFD on all IS-IS interfaces. Method 2: Run the <b>isis bfd [disable   anti-congestion]</b> command in interface configuration mode to enable

or disable BFD on the specified interface.

Normally, BFD sends detection packets at millisecond intervals to detect the link state. When a link exception (such as a disconnected link) occurs, BFD can quickly detect it and instruct IS-IS to delete the neighbor relationship and the neighbor reachability information in LSPs. Then IS-IS recalculates and generates a new route to bypass the abnormal link, thus realizing fast convergence. With the introduction of new techniques such as the Multi-Service Transport Platform (MSTP), link congestion tends to occur during peak hours of data communication. BFD quickly detects the link exception and instructs IS-IS to delete the neighbor relationship and the neighbor reachability information in LSPs. Link switch is performed to bypass the congested link. A Hello packet for IS-IS neighbor detection is sent every 10s and its expiration time is 30s. The Hello packet can still be received normally when BFD detects an exception, and therefore an IS-IS neighbor relationship is reestablished quickly, causing the route to be restored to the congested link. Then BFD detects the abnormal link and link switch is performed again. This process is repeated, which makes the route be switched between the congested link and other links, causing repetitive flapping.

The **anti-congestion** option is used to avoid routing flapping in case of link congestion. After the option is configured, the IS-IS neighbor state is still kept alive when link congestion occurs, but the neighbor reachability information in LSPs is deleted. The route is switched to a normal link. When the congested link is restored, the neighbor reachability information in LSPs is recovered and the route is switched back, which avoids route flapping.

When you run the **bfd all-interfaces** [*anti-congestion*] command, run the **bfd up-dampening** command on the interface. The two commands must be used together. If you run only one command, the route flap dampening feature may not take effect or other network exceptions may occur.

### Configuration Example

#### ▾ Enabling BFD Support for IS-IS on the Current Interface

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Set BFD session parameters. (Omitted)</li> <li>● Enable BFD support for IS-IS on the current interface.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis bfd</pre>
<p><b>Verification</b></p>	<p>Enable S1 (192.168.1.10) and S2 (192.168.2.10) to send packets to G1 (229.1.1.1) and G2 (229.1.2.1). Add User to the G1 and G2 groups.</p> <ul style="list-style-type: none"> <li>● Check the multicast packet that User receives. User should only receive the (S1, G1) packet.</li> <li>● Check that the PIM-SM routing table does not have the (S1, G2), (S2, G1), and (S2, G2) entries.</li> </ul>
	<pre>A# show bfd neighbors detail</pre>

### Common Errors

- BFD support for IS-IS is not enabled on neighbors.

## 6.4.9 Setting the IS-IS Overload Bit

### Configuration Effect

The overload bit is used in the following three situations:

- Device overload

The local IS-IS node has overload issues, such as insufficient memory or full CPU load; as a result, its routing table has incomplete routes or does not have resource forwarding data. You can set the overload bit in an LSP to instruct the neighbor not to use the local node as a forwarding device.

To set the overload bit, run the **set-overload-bit** command without the **on-startup** keyword. The overload bit can be configured or canceled manually. When the local IS-IS node is restored, manually cancel the command configuration; otherwise, the node is always in overload state.

- Instantaneous black hole

In the scenario described by RFC3277, the IS-IS convergence speed is faster than the BGP speed; as a result, after an IS-IS node is restarted, a route may be instantaneously unreachable, which is called an instantaneous black hole. You can set the overload bit in an LSP to instruct the neighbor not to use the local node as a forwarding device until the specified time has elapsed.

To set the overload bit, run the **set-overload-bit** command with the **on-startup** keyword. The overload bit can be configured or canceled automatically by the IS-IS node based on the configuration. If the **on-startup** keyword is selected, the IS-IS node automatically enters instantaneous black hole state after restart. When a neighbor relationship is established, the IS-IS node sends an LSP with the overload bit to notify the neighbor that the local node enters instantaneous black hole (or overload) state and instruct the neighbor not to use the local node as a forwarding device. After the specified time has elapsed, the IS-IS node immediately sends an LSP with the overload bit canceled to notify the neighbor that the local node has exited instantaneous black hole (or overload) state and can work as a forwarding device.

- Disabling real data forwarding on the local IS-IS node

If you only need to connect the local IS-IS node to a production network for testing or to meet other functional requirements, but does not require the node to forward real data in the network, you can set the overload bit in an LSP to instruct the neighbor not to use the local node as a forwarding device.

To set the overload bit, run the **set-overload-bit** command without the **on-startup** keyword. The overload bit can be configured or canceled manually. You can set the **suppress** keyword based on requirements to limit the routing information carried in an LSP in case of overload. For example, internal and external routes can be suppressed, and only the local direct route is advertised.

## Notes

- At the same Level, the configuration with the **on-startup** keyword is mutually exclusive with the configuration without the **on-startup** keyword.

## Configuration Steps

- Perform this configuration based on requirements.
- Run the **set-overload-bit** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

- Capture packets and check that the neighbor does not forward LSPs from the local node.

## Related Commands

<b>Command</b>	<b>set-overload-bit [ on-startup <i>seconds</i> ] [ suppress { [ <i>interlevel</i> ] [ <i>external</i> ] } ] [ <i>level-1</i>   <i>level-2</i> ]</b>
<b>Parameter Description</b>	<p><b>on-startup <i>seconds</i></b>: Indicates the duration when an IS-IS node remains in overload state after restart. The value range is 5s to 86,400s.</p> <p><b>suppress</b>: Indicates not to advertise internal routes (intra-area and inter-area routes) or external routes to neighbors when the IS-IS node is in overload state.</p> <p><b>interlevel</b>: Indicates not to advertise intra-area and inter-area routes to neighbors when the IS-IS node is in overload state. It is used with the <b>suppress</b> keyword.</p> <p><b>external</b>: Indicates not to advertise external routes to neighbors when the IS-IS node is in overload state. <b>Verification</b>	<p>Capture packets to check LSPs.</p> <ul style="list-style-type: none"> <li>Verify that the IS-IS node automatically enters instantaneous black hole state after restart. Once a neighbor relationship is established, the IS-IS node sends an LSP with the overload bit.</li> <li>After the specified time has elapsed, the IS-IS node immediately sends an LSP with the overload bit canceled to notify its neighbors that the local node has exited instantaneous black hole (or overload) state.</li> </ul>
	<pre>A# show isis neighbors</pre>

▾ **Disabling Real Data Forwarding on the Local IS-IS Node**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure IS-IS neighbors. (Omitted)</li> <li>Connect the local IS-IS node as a test device to a production network. The node is not required to forward real data in the network to avoid impact on production.</li> </ul>
	<pre>A(config)# router isis A(config-router)#set-overload-bit suppress interlevel external</pre>
<b>Verification</b>	<p>Capture packets to check LSPs. Verify that the LSPs carry the overload bit and only advertise local direct routes.</p>
	<pre>A# show isis neighbors</pre>

### 6.4.10 Configuring IS-IS VRF

Configuration Effect

- Each VRF table can be seen as a virtual device or a dedicated PE device.
- The virtual device contains the following elements: an independent routing table, as well as an independent address space; a set of interfaces that belong to the VRF table; a set of routing protocols applicable only to the VRF table.
- Each device can maintain one or more VRF tables and a public-network routing table (also called a global routing table). Multiple VRF instances are separated from each other.

### Notes

- Note the following constraints or conventions when you bind IS-IS instances and VRF tables:
- The IS-IS instances bound with the same VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same system ID.
- One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.
- When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the **ip router isis [tag]** interface configuration and the redistribution configuration in routing process configuration mode will be deleted.

### Configuration Steps

- Perform this configuration based on requirements.
- Run the **vrf** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### Verification

- Check whether the local device establishes neighbor relationships with other devices specified in the VRF table.

### Related Commands

#### ↘ Configuring IS-IS VRF

<b>Command</b>	<b>vrf</b> <i>vrf-name</i>
<b>Parameter</b>	<i>vrf-name</i> : Indicates the name of an existing VRF table.
<b>Description</b>	
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Before you bind an IS-IS instance to a VRF table, ensure that the VRF table has been configured. If you need to establish an IS-ISv6 neighbor relationship, enable IPv6 and ensure that the table to be bound is a multiprotocol VRF table.</p> <p>Note the following constraints or conventions when you bind IS-IS instances and VRF tables:</p> <ul style="list-style-type: none"> <li>● The IS-IS instances bound with the same non-default VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same system ID.</li> <li>● One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.</li> <li>● When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the <b>ip</b> (or <b>ipv6</b>) <b>router isis [ tag ]</b> interface configuration and the redistribution configuration in routing process configuration mode will be deleted.</li> </ul>

### Configuration Example

#### ↘ Configuring IS-IS VRF

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Bind an IS-IS instance to a VRF table.</li> <li>● Add interfaces to the VRF table and IS-IS instance. (Omitted)</li> </ul>
	<pre>A(config)#vrf definition vrf_1 A(config-vrf)#address-family ipv4 A(config-vrf-af)#exit-address-family A(config)# router isis A(config-router)# vrf vrf_1</pre>
<b>Verification</b>	Check whether the local device establishes neighbor relationships with other devices specified in the VRF table.
	<pre>A# show isis neighbors</pre>

### Common Errors

- Interfaces are not added to the VRF table.
- The IP addresses of the interfaces connected between neighbors are not in the same network segment.
- The **ip router isis** command is not executed on interfaces.
- No NET address is configured, or different NET addresses exist at Level-1.
- **max-area-addresses** is configured differently on both sides.
- **metric-style** is configured differently on both sides.
- The interface Levels on both sides are different. One side is Level-1, whereas the other side is Level-2.
- One side is configured with the P2P mode, whereas the other side is configured with the broadcast mode.
- One side is enabled with authentication, whereas the other side is not.

## 6.4.11 Configuring IS-IS MTR

### Configuration Effect

- If the **multi-topology** command is not executed, IPv4 and IPv6 share one IS-IS physical topology, also called the default topology. If the **multi-topology** command is executed without the **transition** parameter, routing devices run in MT mode. IS-ISv4 runs in the default topology, and IS-ISv6 runs in the IPv6 unicast topology. If the **multi-topology** command is executed with the **transition** parameter, routing devices run in MTT mode. IS-ISv6 runs in the default topology and IPv6 unicast topology. The three configurations are mutually exclusive. The routing devices in MTT mode can transfer the MT TLV or the default topology TLV. The MTT mode is applicable to incremental deployment to ensure smooth network migration. The MTT mode can cause route leaking between the default topology and IPv6 unicast topology. If the MTT mode is configured improperly, network failures such as routing black holes and loops may occur.

## Notes

Note the following constraints or conventions when you configure the IS-IS MTR feature:

- Set **metric-style** to **Wide** or **Transition** before you run the **multi-topology** command.
- The MTR feature will be disabled if **metric-style** is set to **Narrow** or only one Level is configured to support the Wide or Transition mode.

## Configuration Steps

- Perform this configuration based on requirements.
- Configure the MTR feature in IS-IS address-family ipv6 configuration mode on the desired device, unless otherwise specified.

## Verification

- Check whether the local device establishes neighbor relationships with other devices.

## Related Commands

### ↘ Configuring IS-IS MTR

<b>Command</b>	<b>multi-topology</b> [ <i>transition</i> ]
<b>Parameter Description</b>	<i>transition</i> : Configures the MTT mode, which supports smooth migration from an IPv4-IPv6 hybrid topology to separate IPv4 and IPv6 topologies.
<b>Command Mode</b>	IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	<p>If the <b>multi-topology</b> command is not executed, IPv4 and IPv6 share one IS-IS physical topology, also called the default topology. If the <b>multi-topology</b> command is executed without the <b>transition</b> parameter, routing devices run in MT mode. IS-ISv4 runs in the default topology, and IS-ISv6 runs in the IPv6 unicast topology. If the <b>multi-topology</b> command is executed with the <b>transition</b> parameter, routing devices run in MTT mode. IS-ISv6 runs in the default topology and IPv6 unicast topology. The three configurations are mutually exclusive. The routing devices in MTT mode can transfer the MT TLV or the default topology TLV. The MTT mode is applicable to incremental deployment to ensure smooth network migration. The MTT mode can cause route leaking between the default topology and IPv6 unicast topology. If the MTT mode is configured improperly, network failures such as routing black holes and loops may occur.</p> <p>Set <b>metric-style</b> to <b>Wide</b> or <b>Transition</b> before you run the command. The MTR feature will be disabled if <b>metric-style</b> is set to <b>Narrow</b> or only one Level is configured to support the Wide or Transition mode.</p>

## Configuration Example

### ↘ Configuring IS-IS MTR

<b>Configuration Requirements</b>	The typical application scenario of MTR is to retain devices that only support IPv4 services in a network where IPv6 service extension will be performed.
-----------------------------------	---

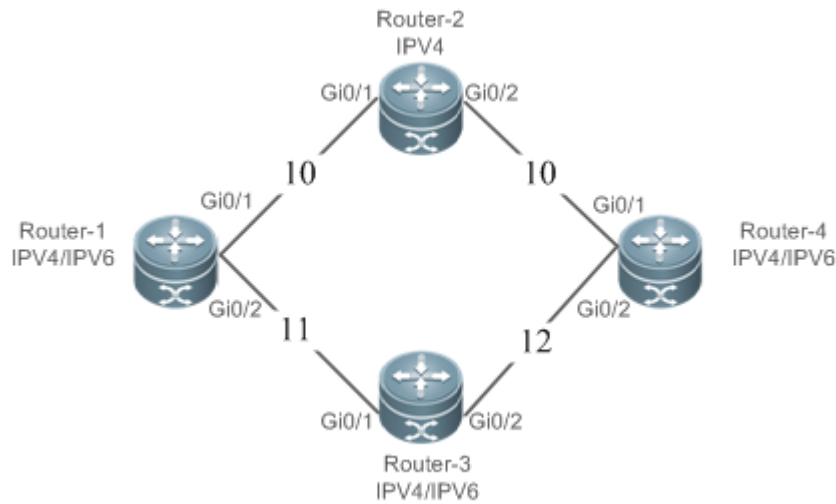

In Figure 6-19, Router 2 only supports the IPv4 protocol stack but does not support the MTR feature; therefore, it can only run IPv4 services. The network capacity needs to be scaled to support IPv6 services in order to meet service extension requirements. (Router 1, Router 3, and Router 4 that support the MTR feature will be added.) The device (Router 2) that supports only one protocol stack must be replaced to maintain the stability of the network running IPv4 and IPv6 dual protocol stacks; otherwise, IPv6 routing black holes may occur.

If you need to retain Router 2, you can configure the MTR feature on Router 1, Router 3, and Router 4. The MTR feature enables Router 2 to continue to run IPv4 services without interference on the IPv4 and IPv6 services on Router 1, Router 3, and Router 4. The MTR feature improves networking flexibility, indirectly prolongs the service life of old devices, and meets service extension requirements while maximizing the values of old devices.

The configuration requirements are as follows:

- Retain Router 2, which only supports IPv4 services.
- Add devices that support IPv4 and IPv6 dual topologies, and separate IPv4 route calculation and IPv6 route calculation based on different topologies.

**Figure 6-19**  
**IS-IS MTR**  
**Topology**

**Router 1**

Configure IS-IS and Ethernet interfaces.

Configure IS-IS:

```
Ruijie(config)# router isis
Ruijie(config-router)# net 49.0001.0000.0000.0001.00
Ruijie(config-router)# is-type level-1
Ruijie(config-router)# metric-style wide
Ruijie(config-router)# address-family ipv6
```

	<pre>Ruijie(config-router-af)# multi-topology  Configure Ethernet interfaces:  Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# ipv6 enable Ruijie(config-if-GigabitEthernet 0/1)# ipv6 address 1002: : 1/112 Ruijie(config-if-GigabitEthernet 0/1)# ipv6 router isis Ruijie(config-if-GigabitEthernet 0/1)# ip address 192.168.1.1 255.255.255.0 Ruijie(config-if-GigabitEthernet 0/1)# ip router isis Ruijie(config-if-GigabitEthernet 0/1)# interface gigabitEthernet 0/2 Ruijie(config-if-GigabitEthernet 0/2)# ipv6 enable Ruijie(config-if-GigabitEthernet 0/2)# ipv6 address 1003: : 1/112 Ruijie(config-if-GigabitEthernet 0/2)# ipv6 router isis Ruijie(config-if-GigabitEthernet 0/2)# ip address 192.168.2.1 255.255.255.0 Ruijie(config-if-GigabitEthernet 0/2)# ip router isis Ruijie(config-if-GigabitEthernet 0/2)#isis wide-metric 11</pre>
<b>Router 2</b>	<b>Configure IS-IS and Ethernet interfaces.</b>
	<pre>Configure IS-IS:  Ruijie(config)# router isis Ruijie(config-router)# net 49.0001. 0000.0000.0002.00 Ruijie(config-router)# is-type level-1 Ruijie(config-router)# metric-style wide Ruijie(config-router)#address-family ipv6 Ruijie(config-router-af)#no adjacency-check  Configure Ethernet interfaces:  Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# ip address 192.168.1.2 255.255.255.0 Ruijie(config-if-GigabitEthernet 0/1)# ip router isis Ruijie(config-if-GigabitEthernet 0/1)# interface gigabitEthernet 0/2 Ruijie(config-if-GigabitEthernet 0/2)# ip address 192.168.3.2 255.255.255.0 Ruijie(config-if-GigabitEthernet 0/2)# ip router isis</pre>

```

## Common Errors

- **metric-style** is not set to **Wide** or **Transition**.
- The protocol types used by two neighbors do not match; therefore, a neighbor relationship cannot be established.
- The IP addresses of the interfaces connected between neighbors are not in the same network segment.
- The **ip router isis** command is not executed on interfaces.
- No NET address is configured, or different NET addresses exist at Level 1.
- **max-area-addresses** is configured differently on both sides.
- **metric-style** is configured differently on both sides.
- The interface Levels on both sides are different. One side is Level-1, whereas the other side is Level-2.
- One side is configured with the P2P mode, whereas the other side is configured with the broadcast mode.

- One side is enabled with authentication, whereas the other side is not.

## 6.4.12 Configuring SNMP for IS-IS

### Configuration Effect

- By default, the SNMP software can perform the MIB operation on the first IS-IS instance. To perform the MIB operation on other instances, you need to manually specify these instances.

### Notes

- By default, the SNMP software can perform the MIB operation on the first displayed IS-IS instance.

### Configuration Steps

#### ↘ Binding the Instances on Which the IS-IS MIB Operation Will Be Performed

- Perform this configuration based on requirements.
- Run the **enable mib-binding** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ Enabling IS-IS Trap Globally

- Perform this configuration based on requirements.
- Run the **snmp-server enable traps isis** command in global configuration mode on the desired device, unless otherwise specified.

#### ↘ Configuring an SNMP Host Globally

- Perform this configuration based on requirements.
- Run the **snmp-server host** command in global configuration mode on the desired device, unless otherwise specified.

#### ↘ Allowing the Sending of all IS-IS Trap Messages to the SNMP Host

- Perform this configuration based on requirements.
- Run the **enable traps all** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### Verification

- Use the MIB tool to read and write IS-IS settings.

### Related Commands

#### ↘ Binding the Instances on Which the IS-IS MIB Operation Will Be Performed

Command	<b>enable mib-binding</b>
Parameter	N/A

<b>Description</b>	
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	The latest standards stipulate that the MIB operation can be performed on a single instance. By default, the MIB operation is performed on the first displayed IS-IS instance. Because multiple IS-IS instances can be configured, the administrator can use this command to specify the instances on which the MIB operation will be performed.

### ↳ Enabling IS-IS Trap Globally

<b>Command</b>	<b>snmp-server enable traps</b> [ <i>isis</i> ]
<b>Parameter Description</b>	<i>isis</i> : Enables IS-IS event trap.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command must be used with the <b>snmp-server host</b> command in global configuration mode so that trap messages can be sent.

### ↳ Configuring an SNMP Host Globally

<b>Command</b>	<b>snmp-server host</b> { <i>host-addr</i>   <b>ipv6</b> <i>ipv6-addr</i> } [ <b>vrf</b> <i>vrfname</i> ] [ <b>traps</b> ] [ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> { <b>auth</b>   <b>noauth</b>   <b>priv</b> } ] <i>community-string</i> [ <b>udp-port</b> <i>port-num</i> ] [ <i>notification-type</i> ]
<b>Parameter Description</b>	<p><i>host-addr</i>: Indicates the address of the SNMP host.</p> <p><i>ipv6-addr</i>: Indicates the IPv6 address of the SNMP host.</p> <p><i>vrfname</i>: Indicates the name of a VRF table.</p> <p><b>version</b>: Indicates the SNMP version, which can be set to <b>V1</b>, <b>V2C</b>, or <b>V3</b></p> <p><b>auth</b>   <b>noauth</b>   <b>priv</b>: Indicates the security level of V3 users.</p> <p><i>community-string</i>: Indicates the community string or user name (V3 version).</p> <p><i>port-num</i>: Indicates the port number of the SNMP host.</p> <p><i>notification-type</i>: Indicates the type of trap messages that are actively sent, for example, snmp.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used with the <b>snmp-server enable traps</b> command to actively send trap messages to a Network Management System (NMS). You can configure different SNMP hosts to receive trap messages. A host supports different trap types, ports, and VRF tables. For the same host (with the same port configuration and VRF configuration), the last configuration is combined with the previous configurations. That is, to send different trap messages to the same host, configure a type of trap messages each time. These configurations are finally combined.

### ↳ Allowing the Sending of Trap Messages

<b>Command</b>	<b>enable traps</b> { <b>all</b>   <i>traps set</i> }
----------------	---

<b>Parameter</b>	<b>all:</b> Indicates all trap messages.
<b>Description</b>	<i>traps set.</i> Indicates a trap message type in any set.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	IS-IS packets are classified into 18 types of trap messages, which are grouped into several sets, with each set containing several trap message types. To enable the sending of IS-IS trap messages, run the <b>snmp-server enable traps isis</b> command in global configuration mode and specify the recipient host and the type of trap messages that can be sent.

## Configuration Example

### Configuring IS-IS SNMP

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Bind the instances on which the IS-IS MIB operation will be performed.</li> <li>● Complete trap message-related settings.</li> </ul>
	<pre>A(config)# router isis A(config-router)# enable mib-binding A# configure terminal A(config)#snmp-server enable traps isis A(config)#snmp-server host 10.1.1.1 traps version 2c public A(config)#router isis A(config-router)# enable traps all</pre>
<b>Verification</b>	Run the MIB tool to read and write IS-IS settings.
	<pre>A# show running-config</pre>

## 6.4.13 Configuring Other IS-IS Parameters

### Configuration Effect

- **maximum-paths:** Configures the maximum number of IS-IS equal-cost paths to be installed to a routing table.
- **lsp-length receive:** Configures the maximum length allowed for received LSPs.
- **lsp-length originate:** Configures the maximum length allowed for sent LSPs.
- **passive-interface:** Prevents passive interfaces from receiving and sending IS-IS packets. That is, IS-IS neighbor relationships will not be established on passive interfaces. The IP addresses of passive interfaces are flooded through other interfaces.
- **isis metric:** Stores the metric, which is used in SPF calculation, in the IP reachability information TLV. The greater the metric, the greater the routing consumption of the interface and the longer the path obtained by SPF calculation.

- **isis priority:** In a broadcast network, IS-IS needs to elect a DIS among all devices. The DIS will generate a pseudonode and related LSPs. The device with the highest priority is elected as the DIS. You can configure different priorities for different Levels.
- **default-information originate:** Generates a Level-2 default route, which will be advertised through LSPs.
- **summary-address** and **summary-prefix:** Creates a summary route to represent a group of routes in a routing table. A summary route can include multiple routes of the specified Level. The interface metric of the summary route follows the smallest interface metric among all routes.
- **log-adjacency-changes:** Enables neighbor relationship event output to log IS-IS neighbor relationship changes.
- **redistribute:** Redistributes other routes to IS-IS; redistributes Level-1 routes to Level-2; redistributes Level-2 routes to Level-1.

## Configuration Steps

### ↘ Configuring the Maximum Number of Equal-Cost Paths

- Perform this configuration based on requirements.
- Run the **maximum-paths** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the Maximum Length Allowed for Received LSPs

- Perform this configuration based on requirements.
- Run the **lsp-length receive** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the Maximum Length Allowed for Sent LSPs

- Perform this configuration based on requirements.
- Run the **lsp-length originate** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring a Passive Interface

- Perform this configuration based on requirements.
- Run the **passive-interface** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the IS-IS Interface Metric

- Perform this configuration based on requirements.
- Run the **isis metric** command in interface configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the Priority of the DIS

- Perform this configuration based on requirements.

- Run the **isis priority** command in interface configuration mode on the desired device, unless otherwise specified.

#### ↘ Generating a Default Route

- Perform this configuration based on requirements.
- Run the **default-information originate** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ Configure a Summary Route

- Perform this configuration based on requirements.
- Run the **summary-address** and **summary-prefix** commands in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ Enabling Neighbor Relationship Event Output

- Perform this configuration based on requirements.
- Run the **log-adjacency-changes** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ Configuring Route Redistribution

- Perform this configuration based on requirements.
- Run the **redistribute** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

---

- **maximum-paths:** Check whether the maximum number of equal-cost paths displayed by routing entries is the same as the configuration.
- **isp-length receive:** Capture packets to check the length of LSPs.
- **isp-length originate:** Capture packets to check the length of LSPs.
- **passive-interface:** Capture packets to check whether the interface receives and sends IS-IS packets.
- **isis metric:** Check the database details of IS-IS.
- **isis priority:** Check whether the device with the changed priority setting is elected as the DIS.
- **default-information originate:** Check whether a default route is generated.
- **summary-address and summary-prefix:** Capture packets to check whether the summary route instead of detailed routes is advertised through LSPs.
- **log-adjacency-changes:** Change the neighbor state and verify that the change is recorded when debugging is disabled.
- **redistribute:** Check IS-IS routing entries.

## Related Commands

### ↘ Configuring the Maximum Number of Equal-Cost Paths

<b>Command</b>	<b>maximum-paths</b> <i>maximum</i>
<b>Parameter Description</b>	<i>maximum</i> : Indicates the maximum number of IS-IS equal-cost routes to be installed to a routing table. The value range is 1 to 32.
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	This command is used by IS-IS to control the number of IS-IS equal-cost paths to be installed to a routing table. The routing table also has a command used to control the number of equal-cost paths. The number of effective equal-cost paths is determined by either of the two command values, whichever is smaller.

### ↘ Configuring the Maximum Length Allowed for Received LSPs

<b>Command</b>	<b>lsp-length receive</b> <i>size</i>
<b>Parameter Description</b>	<i>size</i> : Indicates the maximum length allowed for received LSPs. According to RFC, the value range is 1,492 to 16,000, in the unit of bytes.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to control the maximum length allowed for LSPs received by the local device. Intermediate nodes with sufficient memory are required to receive LSPs whose maximum length is equal to the interface MTU in order to avoid a route convergence failure. From this perspective, the command is meaningless. The maximum length allowed for received LSPs cannot be smaller than that allowed for sent LSPs; otherwise, the former will be automatically adjusted to be equal to the latter.

### ↘ Configuring the Maximum Length Allowed for Sent LSPs

<b>Command</b>	<b>lsp-length originate</b> <i>size</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<i>size</i> : Indicates the maximum length allowed for sent LSPs. The value range is 512 to 16,000, in the unit of bytes. <b>level-1</b> : Applies the setting only to Level-1 LSPs. <b>level-2</b> : Applies the setting only to Level-2 LSPs.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	In principle, the maximum length of LSPs and SNPs cannot be greater than the interface MTU; otherwise, the packets will be discarded when being sent.

### ↘ Configuring a Passive Interface

<b>Command</b>	<b>passive-interface</b> [ <b>default</b> ] { <i>interface-type interface-number</i> }
<b>Parameter Description</b>	<b>default</b> : Configures all IS-IS interfaces that are not enabled as passive interfaces. <i>interface-type</i> : Indicates the interface type. <i>interface-number</i> : Indicates the interface number.
<b>Command</b>	IS-IS routing process configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>This command prevents the specified interface from receiving and sending IS-IS packets, but the IP address of the interface will be flooded by other interfaces.</p> <p>If the <b>default</b> option is selected and there are more than 255 IS-IS interfaces not enabled, only the first 255 interfaces will be configured as passive interfaces. The remaining interfaces are non-passive interfaces.</p>

### ↘ Configuring the IS-IS Interface Metric

<b>Command</b>	<b>isis metric</b> <i>metric</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter</b>	<i>metric</i> : Indicates the metric value. The value range is 1 to 63. The default value is 10.
<b>Description</b>	<p><b>level-1</b>: Applies the setting to Level-1 circuits.</p> <p><b>level-2</b>: Applies the setting to Level-2 circuits.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>The metric, which is used in SPF calculation, is stored in the IP reachability information TLV. The greater the metric, the greater the routing consumption of the interface and the longer the path obtained by SPF calculation.</p> <p>The metric belongs to the narrow type and is valid only when <b>metric-style</b> is set to <b>Narrow</b>.</p>

### ↘ Configuring the Wide Metric of an Interface

<b>Command</b>	<b>isis wide-metric</b> <i>metric</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter</b>	<i>metric</i> : Indicates the metric value. The value range is 1 to 16,777,214. The default value is 10.
<b>Description</b>	<p><b>level-1</b>: Applies the setting to Level-1 circuits.</p> <p><b>level-2</b>: Applies the setting to Level-2 circuits.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>The metric, which is used in SPF calculation, is stored in the IP reachability information TLV. The greater the metric, the greater the routing consumption of the interface and the longer the path obtained by SPF calculation.</p> <p>The metric is valid only when <b>metric-style</b> is set to <b>Wide</b>.</p>

### ↘ Configuring the Priority of the DIS

<b>Command</b>	<b>isis priority</b> <i>value</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter</b>	<i>value</i> : Indicates the priority. The value range is 0 to 127. The default value is 64.
<b>Description</b>	<p><b>level-1</b>: Applies the setting to Level-1 circuits.</p> <p><b>level-2</b>: Applies the setting to Level-2 circuits.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to change the priority carried in Hello packets in a LAN.</p> <p>The device with a lower priority is less likely to be elected as the DIS.</p> <p>The command is invalid on a P2P network interface.</p> <p>The <b>no isis priority</b> command, with or without parameters, restores the priority to its default value. To</p>

change the configured priority, run the **isis priority** command with the priority specified to overwrite the existing configuration, or you can first restore the priority to its default value and then configure a new priority.

### Generating a Default Route

<b>Command</b>	<b>default-information originate</b> [ <b>route-map</b> <i>map-name</i> ]
<b>Parameter</b>	<b>route-map</b> <i>map-name</i> : Associates with a route map.
<b>Description</b>	
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	Because Level-2 domains do not generate any default route, use this command to allow a default route to enter a Level-2 domain.

### Configuring an IPv4 Summary Route

<b>Command</b>	<b>summary-address</b> <i>ip-address net-mask</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ] [ <i>metric number</i> ]
<b>Parameter</b>	<i>ip-address</i> : Indicates the IP address of the summary route.
<b>Description</b>	<i>net-mask</i> : Indicates the subnet mask of the summary route. <b>level-1</b> : Applies the setting only to Level-1. <b>level-2</b> : Applies the setting only to Level-2. By default, the setting takes effect for Level-2. <b>level-1-2</b> : Applies the setting to Level-1 and Level-2. <i>number</i> : Indicates the metric of the summary route.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	If the configured summary route contains routing information about a reachable address or network segment, the summary route, instead of detailed routes, is advertised externally.

### Configuring an IPv6 Summary Route

<b>Command</b>	<b>summary-prefix</b> <i>ipv6-prefix/prefix-length</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ]
<b>Parameter</b>	<i>ipv6-prefix/prefix-length</i> : Indicates the network address of the summary route and its IPv6 prefix length. The address format is X:X:X:X::X/<0-128>.
<b>Description</b>	<b>level-1</b> : Applies the setting only to Level-1. <b>level-2</b> : Applies the setting only to Level-2. By default, the setting takes effect for Level-2. <b>level-1-2</b> : Applies the setting to Level-1 and Level-2.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	If the configured summary route contains routing information about a reachable address or network segment, the summary route, instead of detailed routes, is advertised externally.

### Enabling Neighbor Relationship Event Output

<b>Command</b>	<b>log-adjacency-changes</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command</b>	IS-IS routing process configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	You can also use the <b>debug</b> command to record IS neighbor state changes, but the command consumes many system resources.

↘ **Redistributing Other Routes to IS-IS**

<b>Command</b>	<b>redistribute</b> { <b>bgp</b>   <b>ospf</b> <i>process-id</i> [ <b>match</b> { <b>internal</b> [ <b>external</b> [ 1   2 ] ] [ <b>nssa-external</b> [ 1   2 ] ]   <b>external</b> [ 1   2 ] [ <b>internal</b> ] [ <b>nssa-external</b> [ 1   2 ] ]   <b>nssa-external</b> [ 1   2 ] [ <b>internal</b> ] [ <b>external</b> [ 1   2 ] ] } ]   <b>rip</b>   <b>connected</b>   <b>static</b> } [ <b>metric</b> <i>metric-value</i> ] [ <b>metric-type</b> <i>type-value</i> ] [ <b>route-map</b> <i>map-tag</i> ] [ <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<p><i>process-id</i>: Indicates the OSPF process ID. The range is 1 to 65,535.</p> <p><b>match</b> { <b>internal</b>   <b>external</b> [ 1   2 ]   <b>nssa-external</b> [ 1   2 ] }: When OSPF routes are redistributed, the routes are filtered by subtype. If the <b>match</b> option is not selected, routes of all OSPF types will be received. If <b>match external</b> is not followed by the number 1 or 2, OSPF routes specified by <b>external 1</b> and <b>external 2</b> will be redistributed. If <b>match nssa-external</b> is not followed by the number 1 or 2, OSPF routes specified by <b>nssa-external 1</b> and <b>nssa-external 2</b> will be redistributed.</p> <p><b>metric</b> <i>metric-value</i>: Indicates the metric of redistributed routes. The value range is 0 to 4,261,412,864. The metric of external routes is used when the <b>metric</b> option is not specified.</p> <p><b>metric-type</b> { <b>internal</b>   <b>external</b> }: Indicates the metric type of redistributed routes. <b>internal</b>: Indicates that the metric belongs to the internal type. <b>external</b>: Indicates that the metric belongs to the external type. If <b>metric-type</b> is not specified, the metric belongs to the internal type.</p> <p><b>route-map</b> <i>map-tag</i>: Indicates the route map used for external route redistribution. It is used to filter redistributed routes or configure the attributes of redistributed routes. The value of <i>map-tag</i> cannot exceed 32 characters. By default, <b>route-map</b> is not configured.</p> <p><b>level-1</b>   <b>level-1-2</b>   <b>level-2</b>: Indicates the Level of redistributed routes received by IS-IS. If no Level is specified, routes are redistributed to Level-2. <b>level-1</b>: Redistributes routes to Level-1. <b>level-1-2</b>: Redistributes routes to Level-1 and Level-2. <b>level-2</b>: Redistributes routes to Level-2.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	<p>The <b>no redistribute</b> { <b>bgp</b>   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>connected</b>   <b>static</b> } command is used to cancel the redistribution of routes mapped to the specified protocol. If <b>no redistribute</b> is followed by other parameters, the command will restore the default parameter settings, rather than cancel route redistribution. For example, <b>no redistribute bgp</b> cancels BGP route redistribution, whereas <b>no redistribute bgp route-map aa</b> cancels the route map named <b>aa</b> used for BGP route redistribution.</p> <p>When external routes are redistributed in IPv4 mode, the routing information is stored in LSPs' IP External Reachability Information TLV.</p> <p>When external routes are redistributed in IPv6 mode, the routing information is stored in LSPs' IPv6 Reachable TLV.</p> <p>In the old versions of some vendors, if <b>metric-type</b> is set to <b>external</b>, the metric of redistributed routes is added by 64 during route calculation and used to determine routing. This practice does not comply with the</p>

related protocol. In the actual application, external routes may be preferred over internal routes. If this happens during interworking with old versions of some vendors, you can modify the related setting (such as **metric** or **metric-type**) of each device to ensure that internal routes are preferred over external routes.

#### ↘ Redistributing the Level-1 Reachable Routing Information of the Specified IS-IS Instance to Level-2 of the Current Instance

<b>Command</b>	<b>redistribute isis</b> [ <i>tag</i> ] <b>level-1 into level-2</b> [ <b>route-map</b> <i>route-map-name</i>   <b>distribute-list</b> <i>access-list-name</i> ]
<b>Parameter Description</b>	<p><i>tag</i>: Indicates the name of the IS-IS instance whose routing information will be redistributed.</p> <p><b>route-map</b> <i>route-map-name</i>: Indicates the route map used for route redistribution. It is used to filter redistributed routes or configure the attributes of redistributed routes. The value of <i>route-map-name</i> cannot exceed 32 characters. By default, <b>route-map</b> is not configured.</p> <p><b>distribute-list</b> <i>access-list-name</i>: Filters redistributed routes by using <b>distribute-list</b>. <i>access-list-name</i> indicates the associated prefix list, which can be a standard prefix list, an extended prefix list, or a name prefix list. It is in the format of {&lt;1-99&gt;   &lt;100-199&gt;   &lt;1300-1999&gt;   &lt;2000-2699&gt;   <i>acl-name</i> }. When the IS-IS address-family ipv6 configuration mode is applied, only the name prefix list can be used, in the format of <i>acl-name</i>.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	<p>You can use the <b>route-map</b> or <b>distribute-list</b> parameter to filter the specified instance's Level-1 routes to be redistributed. Only the routes that meet specific criteria can be redistributed to Level-2 of the current instance. The <b>route-map</b> and <b>distribute-list</b> parameters cannot be used at the same time.</p> <p>The <b>no redistribute isis</b> [ <i>tag</i> ] <b>level-2 into level-1</b> command is used to cancel the redistribution of the specified instance's routes. If <b>no redistribute</b> is followed by other parameters, the command will restore the default parameter settings, rather than cancel route redistribution.</p> <p>For example, <b>no redistribute isis</b> <i>tag1</i> <b>level-1 into level-2</b> cancels the redistribution of the routes of the IS-IS instance name <i>tag1</i>. <b>no redistribute isis</b> <i>tag1</i> <b>level-1 into level-2 route-map</b> <i>aa</i> cancels the use of the route map named <i>aa</i> to filter redistributed routes.</p>

#### ↘ Redistributing the Level-2 Reachable Routing Information of the Specified IS-IS Instance to Level-1 of the Current Instance

<b>Command</b>	<b>redistribute isis</b> [ <i>tag</i> ] <b>level-2 into level-1</b> [ <b>route-map</b> <i>route-map-name</i>   <b>distribute-list</b> <i>access-list-name</i>   ( <b>prefix</b> <i>ip-address net-mask</i>   <i>ipv6-prefix ipv6-address/length</i> ) ]
<b>Parameter Description</b>	<p><i>tag</i>: Indicates the name of the IS-IS instance whose routing information will be redistributed.</p> <p><b>route-map</b> <i>route-map-name</i>: Indicates the route map used for route redistribution. It is used to filter redistributed routes or configure the attributes of redistributed routes. The value of <i>route-map-name</i> cannot exceed 32 characters. By default, <b>route-map</b> is not configured.</p> <p><b>Distribute-list</b> <i>access-list-name</i>: Filters redistributed routes by using <b>distribute-list</b>. <i>access-list-name</i> indicates the associated prefix list, which can be a standard prefix list, an extended prefix list, or a name prefix list. It is in the format of {&lt;1-99&gt;   &lt;100-199&gt;   &lt;1300-1999&gt;   &lt;2000-2699&gt;   <i>acl-name</i> }. When the IS-IS address-family ipv6 configuration mode is applied, only the name prefix list can be used, in the format</p>

	<p>of <i>acl-name</i>.</p> <p><b>prefix ip-address net-mask:</b> Determines the routes to be redistributed by address and prefix length.</p> <p><b>ipv6-prefix ipv6-address/length:</b> Determines the IPv6 routes to be redistributed by address and prefix length.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	<p>You can use the <b>route-map</b>, <b>distribute-list</b>, or <b>prefix</b> parameter to filter the specified instance's Level-2 routes to be redistributed. Only the routes that meet specific criteria can be redistributed to Level-1 of the current instance.</p> <p>The <b>no redistribue isis [ tag ] level-2 into level-1</b> command is used to cancel the redistribution of the specified instance's routes. If <b>no redistribute</b> is followed by other parameters, the command will restore the default parameter settings, rather than cancel route redistribution.</p> <p>For example:</p> <p><b>no redistribue isis tag1 level-2 into level-1</b> cancels the redistribution of the routes of the IS-IS instance name <b>tag1</b>. <b>no redistribue isis tag1 level-2 into level-1 route-map aa</b> cancels the use of the route map named <b>aa</b> to filter redistributed routes.</p>

### Configuration Example

#### Configuring the Maximum Number of Equal-Cost Paths

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure IS-IS neighbors. (Omitted)</li> <li>Configure the maximum number of equal-cost paths.</li> </ul>
	<pre>A(config)# router isis A(config-router)# maximum-paths 5</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the maximum number of equal-cost paths displayed by routing entries is the same as the configuration.</li> </ul>
	<pre>A# show ip route isis</pre>

#### Configuring the Maximum Length Allowed for Received LSPs

<b>Configuration</b>	<ul style="list-style-type: none"> <li>Configure IS-IS neighbors. (Omitted)</li> <li>Configure the maximum length allowed for received LSPs.</li> </ul>
	<pre>A(config)# router isis A(config-router)# lsp-length receive 512</pre>
<b>Verification</b>	Capture packets to check the length of received LSPs.

#### Configuring the Maximum Length Allowed for Sent LSPs

<b>Configurations</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the maximum length allowed for sent LSPs.</li> </ul>
	<pre>A# configure terminal A(config)# router isis 1 A(config-router)# lsp-length originate 512 level-2</pre>
<b>Verification</b>	Capture packets to check the length of sent LSPs.

### ↘ Configuring a Passive Interface

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure a passive interface.</li> </ul>
	<pre>A# configure terminal A(config)# router isis 1 A(config-router)# passive-interface GigabitEthernet 0/0</pre>
<b>Verification</b>	Capture packets to check whether the interface receives and sends IS-IS packets.

### ↘ Configuring the Metric of an IS-IS Interface

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure metric of the IS-IS interface.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)#isis metric 1</pre>
<b>Verification</b>	Check the database details of IS-IS.
	<pre>A# show isis database detail</pre>

### ↘ Configuring the Priority of the DIS

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the priority of the DIS.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis priority 127 level-1</pre>

<b>Verification</b>	Check whether the device with the changed priority setting is elected as the DIS.
	A# show isis database detail

↘ **Generating a Default Route**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Generate a default route.</li> </ul>
	<pre>A(config)# router isis A(config-router)# default-information originate</pre>
<b>Verification</b>	Capture packets to check whether the sent LSP contains a default route.

↘ **Configuring an IS-IS Summary Route**

<b>Configuration Requirements</b>	Router A and Router B are connected through the Ethernet and run IS-IS. Configure Router A to advertise only the 172.16.0.0/22 route instead of the 172.16.1.0/24 and 172.16.2.0/24 routes.
<b>Figure 6-20 IS-IS Route Summary Topology</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> <li>● Configure the password for IS-IS authentication.</li> </ul>
<b>A</b>	Configure IS-IS.
	<pre>A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config-router)# summary-address 172.16.0.0/16 level-1-2</pre>
	<p>Configure Ethernet interfaces.</p> <pre>A(config)# interface GigabitEthernet 0/0 A(config-if)# ip address 192.168.20.1 255.255.255.0 A(config-if)# ip router isis</pre>

	<pre>A(config)# interface GigabitEthernet 1/0 A(config-if)# ip address 172.16.1.1 255.255.255.0 A(config-if)# ip router isis A(config)# interface GigabitEthernet 1/1 A(config-if)# ip address 172.16.2.1 255.255.255.0 A(config-if)# ip router isis</pre>
<b>B</b>	<b>Configure IS-IS.</b>
	<pre>B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00</pre>
	<b>Configure an Ethernet interface.</b>
	<pre>B(config)# interface GigabitEthernet 0/0 B(config-if)# ip address 192.168.20.2 255.255.255.0 B(config-if)# ip router isis</pre>
<b>Verification</b>	<b>Run the <code>show ip route</code> command on Router B to check whether only one summary route exists.</b>
<b>B</b>	<pre>B(config)# show ip route i L1    172.16.0.0/16 [115/20] via 192.168.20.1, FastEthernet0/0</pre>

↘ **Configuring an IS-ISv6 Summary Route**

	Router A and Router B are connected through the Ethernet and run IS-ISv6. Configure Router A to advertise only the 2000::/96 route instead of the 2000::1111:0/112 and 2000::2222:0/112 routes.
<b>Figure 6-21 IS-ISv6 Route Summary Topology</b>	<p>The diagram shows two routers, Router A and Router B, connected via their Ethernet interfaces. Router A is on the left and has three interfaces: G1/1 (top), G1/0 (bottom), and E0 (right). Router B is on the right and has one interface: G0/0 (left). The connections are as follows: G1/1 of Router A is connected to E2:2000::2222:0000/112. G1/0 of Router A is connected to E1:2000::1111:0000/112. E0 of Router A is connected to G0/0 of Router B. The IP address for E0 is 5000::/64. The IP address for G0/0 on both Router A and Router B is not explicitly shown but is implied to be in the same network.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> <li>● Configure the password for IS-IS authentication.</li> </ul>
<b>A</b>	<b>Configure IS-IS.</b>

	<pre>A(config)# ipv6 unicast-routing A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config-router)# address-family ipv6 unicast A (config-router-af)# summary-prefix 2000::/96 level-1-2 A (config-router-af)# exit-address-family</pre>
	<p><b>Configure Ethernet interfaces.</b></p> <pre>A(config)# interface GigabitEthernet 0/0 A(config-if)# ipv6 address 5000::1/64 A(config-if)# ipv6 router isis A(config)# interface GigabitEthernet 1/0 A(config-if)# ipv6 address 2000::1111:0001/112 A(config-if)# ipv6 router isis A(config)# interface GigabitEthernet 1/1 A(config-if)# ipv6 address 2000::2222:0001/112 A(config-if)# ipv6 router isis</pre>
<b>B</b>	<p><b>Configure IS-IS.</b></p> <pre>B(config)# ipv6 unicast-routing B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00</pre>
	<p><b>Configure an Ethernet interface.</b></p> <pre>B(config)# interface GigabitEthernet 0/0 B(config-if)# ipv6 address 5000::2/64 B(config-if)# ipv6 router isis</pre>
<b>Verification</b>	<p>Run the <b>show ipv6 route</b> command on Router B to check whether only one summary route exists.</p>
<b>B</b>	<pre>B(config)# show ipv6 route I1 2000::/96 [115/20] via FE80::C800:1BFF:FEF8:1C, FastEthernet1/0</pre>

➤ **Enabling Neighbor Relationship Event Output**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Enable neighbor relationship event output.</li> </ul>
	<pre>A(config-router)# log-adjacency-changes</pre>
<b>Verification</b>	Change the neighbor state and verify that the change is recorded when debugging is disabled.

### ↘ Configuring Route Redistribution

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure OSPF routes. (Omitted)</li> <li>● Configure route redistribution</li> </ul>
	<pre>A(config)# router isis A(config-router)# redistribute ospf 1 metric 10 level-1</pre>
<b>Verification</b>	Check whether routing entries with redistributed routes exist.
	<pre>A# show ip route isis</pre>

## 6.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears all IS-IS neighbor relationship tables.	<b>clear clns neighbors</b>
Clears all IS-IS data structures.	<b>clear isis *</b>
Clears all IS-IS counters.	<b>clear isis [ tag ] counter</b>

### Displaying

Description	Command
Displays all IS neighbors and inter-device neighbor relationships.	<b>show clns [ tag ] is-neighbors [ interface-type interface-number ] [ detail ]</b>
Displays all IS neighbors and provides device information and information about the neighbor relationship with ESs.	<b>show clns [ tag ] neighbors [ interface-type interface-number ] [ detail ]</b>
Displays all IS-IS counters.	<b>show isis [ tag ] counter</b>

Displays the LSDB information.	<b>show isis [ tag ] database [ FLAGS ] [ LEVEL ] [ LSPID ]</b>
Displays the state information related to IS-IS GR.	<b>show isis [ tag ] graceful-restart</b>
Displays the relationship between the device name and system ID.	<b>show isis [ tag ] hostname</b>
Displays the details of an IS-IS interface.	<b>show isis [ tag ] interface [ interface-type interface-number ] [ counter ]</b>
Displays the mesh group configuration of all interfaces.	<b>show isis [ tag ] mesh-groups</b>
Displays IS-IS neighbor information.	<b>show isis [ tag ] neighbors [ detail ]</b>
Displays the neighbor information of virtual systems in IS-IS.	<b>show isis [ tag ] virtual-neighbors</b>
Displays IS-IS information.	<b>show isis [ tag ] protocol</b>
Displays the topology of IS-IS device connection.	<b>show isis [ tag ] topology [ I1   I2   level-1   level-2 ]</b>
Displays information of an IS-IS IPv6 unicast topology.	<b>show isis [ tag ] ipv6 topology [ I1   I2   level-1   level-2 ]</b>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Enables IS-IS debugging.	<b>debug isis { all   auth   events   gr   ifsm   lsp   mtr   nfsm   nsm   pdu   spf   warn }</b>

## 7 Configuring BGP

### 7.1 Overview

The Border Gateway Protocol (BGP) is an Exterior Gateway Protocol (EGP) used for communication between routers in different autonomous systems (ASs). BGP is used to exchange network accessibility information between different ASs and eliminate routing loops by using its own mechanism.

BGP uses TCP as the transmission protocol. The reliable transmission mechanism of TCP is used to ensure the transmission reliability of BGP.

Routers running BGP are called BGP speakers. BGP speakers between which a BGP session is established are called BGP peers.

Two modes can be used to establish peers between BGP speakers: Internal BGP (IBGP) and External BGP (EBGP).

- IBGP refers to a BGP connection established within an AS and completes transition of routing information within the AS.
- EBGP refers to a BGP connection established between different ASs and completes exchange of routing information between different ASs.

Rules for BGP to select an optimum route:

5. Invalid routing table entries are not involved in optimum route selection.

---

 Invalid entries include entries of inaccessible next hops and flapping entries.

---

6. Otherwise, select a route with a large value of **LOCAL\_PREF**.

7. Otherwise, select a route generated by a BGP speaker.

---

 Routes generated by a BGP speaker include routes generated by the **network**, **redistribute** and **aggregate** commands.

---

8. Otherwise, select a route with the shortest AS length.

9. Otherwise, select a route with a smaller value of **ORIGIN**.

10. Otherwise, select a route with the smallest value of **MED**.

11. Otherwise, EBGP routes have higher priorities than IBGP routes and routes in the AS alliance, and the IBGP routes have the same priorities as the routes in the AS alliance.

12. Otherwise, select a route with the smallest IGP metric value to the next hop.

13. Otherwise, select an EBGP route that is received first.

14. Otherwise, select a route advertised by a BGP speaker with a smaller router ID.

15. Otherwise, select a route with a large cluster length.

16. Otherwise, select a route with a large neighbor address.

**i** The preceding shows the route selection process under the default configurations. By using CLI commands, you can change the route selection process. For example, you can run the **bgp bestpath as-path ignore** command to make step 4 of the route selection process lose effect or run the **bgp bestpath compare-routerid** command to make step 9 lose effect.

### Protocols and Standards

- RFC4271: A Border Gateway Protocol 4 (BGP-4)
- RFC4273: Definitions of Managed Objects for BGP-4
- RFC4360: Proposed Standard: BGP Extended Communities Attribute
- RFC4364: Proposed Standard: BGP/MPLS IP Virtual Private Networks (VPNs)
- RFC4486: Proposed Standard: Subcodes for BGP Cease Notification Message
- RFC4724: Proposed Standard: Graceful Restart Mechanism for BGP
- RFC4760: Draft Standard: Multiprotocol Extensions for BGP-4
- RFC5492: Draft Standard: Capabilities Advertisement with BGP-4

## 7.2 Applications

Application	Description
<a href="#">Inter-AS Route Advertisement</a>	Implement inter-AS route advertisement by using BGP.
<a href="#">Intra-AS Route Reflection</a>	Set up a route reflection topology within an AS to reduce BGP connections.

### 7.2.1 Inter-AS Route Advertisement

#### Scenario

BGP implements route advertisement and maintenance across different ASs.

As shown in Figure 7-1, BGP transfers the route of AS 65536 to AS 65538 through AS 65537.

Figure 7-1

<b>Remarks</b>	<p>R1 is a device at the network edge of AS 65536.</p> <p>R2 and R3 are devices at the network edge of AS 65537.</p> <p>R4 is a device at the network edge of AS 65538.</p>
----------------	---

## Deployment

- Establish the EBGP neighborship between R1 and R2 to implement inter-AS route advertisement.
- Establish the IBGP neighborship between R2 and R3 to implement intra-AS route advertisement.
- The Internet runs OSPF to ensure network accessibility between R2 and R3.
- Establish the EBGP neighborship between R3 and R4 to implement inter-AS route advertisement.

## 7.2.2 Intra-AS Route Reflection

### Scenario

According to the BGP route advertisement principles, routes learned by an IBGP neighbor will not be advertised to the next IBGP neighbor by default. Therefore within an AS, a device running BGP must implement full-mesh. When there are many BGP devices within the AS, implementing full-mesh may cause large difficulties for network deployment. In this case, route reflection can be used to solve this problem.

As shown in Figure 7-2, route reflection is deployed to implement BGP full-mesh among R1 to R4 and RR.

Figure 7-2

<b>Remarks</b>	RR is a route reflector. R1 to R4 are route reflection clients.
----------------	--

## Deployment

- Establish IBGP neighborships between R1 to R4 and RR respectively.
- Configure R1 to R4 as the route reflection clients of RR.

## 7.3 Features

### Basic Concept

### ↘ BGP Speaker and AS Number

A router enabled with BGP is called a BGP speaker.

After a route is enabled with BGP, a local AS number must be specified for the router. An AS number is a globally unique number allocated by IANA, ranging from 1 to 4294967295.

### ↘ BGP Neighbor and Peer

Before a route is advertised between BGP speakers, a neighborhood must be established in advance. You need to manually configure BGP neighbors on both BGP speakers. That is, configure the peer as a neighbor on the two BGP speakers respectively. Therefore, BGP neighbors are also called BGP peers.

### ↘ Neighbor Type and Route Type

BGP neighborhoods are classified into the following types:

- **IBGP neighborhood:** The neighborhood between BGP speakers within an AS is called IBGP neighborhood. Routes learned from IBGP neighbors are called IBGP routes.
- **EBGP neighborhood:** The neighborhood between BGP speakers in different ASs is called EBGP neighborhood. Routes learned from EBGP neighbors are called EBGP routes.

### ↘ BGP route attribute

When a BGP speaker advertises routes to its neighbors, the BGP speaker also advertises the attributes carried by the routes.

Common BGP attributes are as follows:

- **ORIGIN:** Specifies the origin of a BGP route and can be set to **IGP**, **EGP**, or **INCOMPLETE**.
- **AS-PATH:** Lists the ASs passed by a route in a reverse order. The last AS is placed at the beginning of the list.
- **NEXT-HOP:** Specifies the IP address of the next hop to be reached by a BGP route.
- **MULTI-EXIT-DISC:** Distinguishes multiple output/input interfaces for reaching the same neighbor AS. A smaller value means a higher priority.
- **LOCAL-PREF:** Distinguishes the priorities of IBGP routes in an AS. A larger value means a higher priority.

## Overview

Feature	Description
<a href="#">Creating a BGP Neighbor</a>	Create a BGP neighbor.
<a href="#">Configuring a BGP Route Reflector</a>	Set up a BGP route reflection topology to simplify network deployment for BGP neighbor full-mesh.
<a href="#">Configuring a BGP Alliance</a>	Configure a BGP alliance to simplify network deployment for BGP neighbor full-mesh.
<a href="#">Re-distributing Local AS Network Information to BGP</a>	Re-distribute routing information to BGP and advertise local routes through BGP.

Feature	Description
<a href="#">Controlling Route Exchange Between BGP Peers</a>	Configure the route exchange policy for a BGP peer and control routes to be received by and to be advertised to this peer.
<a href="#">Obtaining Accessible Networks of Other ASs from BGP</a>	Re-distribute routing information in BGP into a core routing table or IGP.
<a href="#">Configuring Synchronization Between BGP and IGP</a>	Configure BGP to check whether BGP routes are synchronized with IGP routes.
<a href="#">Configuring BGP Soft Reset</a>	After a routing policy changes, use soft reset to apply a new policy.
<a href="#">Configuring the Route Attributes of BGP</a>	Configure the route selection algorithms and routing policy control of BGP.
<a href="#">Configuring BGP Route Aggregation</a>	Reduce routes by means of route aggregation.
<a href="#">Configuring BGP Route Dampening</a>	Reduce the impacts of route flapping on a network topology.
<a href="#">Configuring the Management Distance of BGP</a>	Change the priorities of BGP routes.
<a href="#">Configuring Multi-path Load Balancing of BGP</a>	Configure multi-path load balancing for BGP to enhance the network reliability and increase the network bandwidth.
<a href="#">Configuring BGP FRR</a>	Configure fast rerouting for BGP to enhance the network reliability.

### 7.3.1 Creating a BGP Neighbor

A BGP neighbor is manually configured by a user. Two connection modes are supported: IBGP and EBGP. You can identify the connection mode between BGP speakers based on the AS where the BGP peer resides and the AS where the BGP speaker resides.

- i** Generally, BGP speakers between which an EBGP connection is established are directly connected whereas BGP speakers between which an IBGP connection is established can be at any location within an AS.

#### Working Principle

A BGP speaker can initiate a TCP connection request to a BGP peer specified by a user. After the TCP connection is successfully created, the peers will exchange BGP packets to negotiate about connection parameters. The BGP neighborhood is successfully established after the negotiation succeeds.

##### ↳ Creating a TCP Connection

A BGP speaker initiates a TCP connection request to a neighbor. The destination IP address is the peer IP address specified by the user and the port number is fixed to 179.

The BGP speaker also listens on the port number 179 of the local TCP connection to receive connection requests from its peer.

##### ↳ Negotiating about Protocol Parameters

After the TCP connection is successfully created, the BGP speakers exchange OPEN packets to negotiate about BGP connection parameters. The parameters for negotiation include:

- Version: Indicates the BGP version number. At present, only version 4 is supported.
- Neighbor AS number: Determines whether the AS number of the neighbor is consistent with the local AS number. If not, the connection request will be denied.

- Hold Time: Negotiates about the timeout duration for the BGP connection. The default value is 180 seconds.
- Neighbor capability: Negotiates about various extended capabilities supported by the neighbor, including the address family, dynamic route update, and GR functions.

### ↘ Maintaining Neighborship

The Keepalive message is periodically sent between BGP speakers. If a new Keepalive packet is not received from the BGP neighbor after the Hold Time expires, the BGP speaker considers that the neighbor is not accessible, disconnects the TCP connection from the neighbor, and attempts to reconnect to it. The interval for a BGP speaker to send the Keepalive message is one third of the Hold Time determined through negotiation and is 60 seconds by default.

## Related Configuration

### ↘ Creating a BGP Neighbor

By default, a BGP speaker does not specify any neighbor. You can manually configure a BGP neighbor.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **remote-as** *as-number* command to manually create a BGP neighbor and specify the AS number of the neighbor.

### ↘ Setting the Neighbor TTL

By default, The TTL field in a TCP packet sent by an IBGP neighbor is set to the maximum value (255). It is set to 1 by an EBGP neighbor.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **ebgp-multihop** [ *tth* ] command to set the TTL field of a TCP packet sent by a BGP neighbor.

A larger value of TTL means a longer distance between BGP neighbors. When TTL is 1, the BGP neighbor devices must be directly connected.

### ↘ Setting the Source Address of TCP

By default, BGP automatically selects the source IP address of a TCP connection based on the IP address of the neighbor. Generally, the IP address of a local packet output interface is used.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **update-source** { *interface-type interface-number* | *address* } command to adjust the source IP address of the neighbor's TCP connection.

### ↘ Setting MD5 Encryption

By default, a BGP connection is not encrypted through MD5.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **password** [ *0* | *7* ] *string* command to set encryption for a BGP neighbor's TCP connection.

### ↘ Activating the Address Family Capability of a Neighbor

By default, a neighbor created in the BGP configuration mode activates only the IPv4 Unicast address family capability.

You can run the **address-family** command to enter a corresponding address family mode, and then run the **neighbor** { *peer-address* | *peer-group-name* } **activate** command to activate the address family capability for the BGP neighbor.

## 7.3.2 Configuring a BGP Route Reflector

According to the principle of BGP route advertisement, full mesh must be established for all BGP speakers within an AS (neighborships need to be established between each two BGP speakers). Too many BGP speakers within an AS will increase the resource overhead of the BGP speakers, increase the network administrator's workload and complexity of configuration and decrease the network expansion capability.

Using a route reflector is a method for reducing IBGP peer connections within an AS.

- 
-  The methods for reducing the IBGP peer connections within an AS include using a route reflector and using an AS alliance.
- 

### Working Principle

---

Configure a BGP speaker as a route reflector which classifies IBGP peers in an AS into two types: clients and non-clients.

The rules for implementing a route reflector within an AS are as follows:

- Configure a route reflector and specify clients for the route reflector. The route reflector and its clients form a cluster. The route reflector will connect to its clients.
- The clients of a route reflector in a cluster cannot connect to other BGP speakers out of the cluster.
- Within an AS, full mesh is established among IBGP peers of non-clients. The IBGP peers of non-clients include the following situations: Multiple route reflectors in a cluster; a route reflector in a cluster and BGP speakers (generally not supporting the route reflector function) not involved in the route reflector function out of the cluster; a route reflector in a cluster and route reflectors in other clusters.

The rules for processing a route received by a route reflector are as follows:

- A route update message received by an EBGP speaker will be sent to all clients and non-clients.
- A route update message received by a client will be sent to other clients and all non-clients.
- A route update message received by an IBGP speaker will be sent to all the other clients.

- 
-  Generally, only one route reflector is configured in a cluster. In this case, the Router ID of the route reflector can be used to identify this cluster. To increase the redundancy, you can set multiple route reflectors in a cluster. In this case, you must configure the cluster ID so that a route reflector can identify the route update messages from other route reflectors in the cluster.
  -  If multiple route reflectors are configured for a cluster, you must configure a cluster ID for the cluster.
  -  Generally, it is unnecessary to create connections between the clients of a route reflector in a cluster because the route reflector will reflect the routes between the clients. However, if full mesh has been established among all clients, you can cancel the client route reflection function of the route reflector.
- 

### Related Configuration

---

#### [Configuring a BGP Route Reflector and Reflected Clients](#)

By default, BGP is not configured with route reflection.

You can run the **neighbor peer-address route-reflector-client** command to configure a device as a route reflector and its neighbor devices as reflected clients.

#### ↘ [Configuring BGP Client-Client Reflection](#)

By default, BGP client-client route reflection is enabled, which means that routes received from a reflected client can be advertised to other clients.

You can run the **bgp client-to-client reflection** command to enable or disable (using the **no** form of this command) client-client reflection.

#### ↘ [Configuring a BGP Reflection Cluster ID](#)

By default, a BGP reflection cluster ID is the Router-ID of BGP. If multiple reflection clusters are deployed within an AS, different reflection cluster IDs must be configured for these reflection clusters.

You can run the **bgp cluster-id cluster-id** command to manually configure the cluster ID of a route reflector.

### 7.3.3 Configuring a BGP Alliance

An alliance is another method for reducing the IBGP peer connections within an AS.

#### [Working Principle](#)

Divide an AS into multiple sub ASs and configure a unified alliance ID (namely, the alliance AS NUMBER) for these sub ASs to form an alliance. Outside the alliance, the entire alliance is still considered as an AS and only the AS number of the alliance is visible. Inside the alliance, full mesh of IBGP peers can be established for BGP speakers within a sub AS, and EBGP connections can be established for BGP speakers in different sub ASs. Though EBGP connections are established between BGP speakers within a sub AS, when information is exchanged, NEXT\_HOP, MED, LOCAL\_PREF and other path attributes keep unchanged.

#### [Related Configuration](#)

##### ↘ [Configuring a BGP Alliance ID](#)

By default, no alliance ID is configured for a BGP speaker.

You can run the **bgp confederation identifier as-number** command to configure a BGP alliance ID. After the configuration is successful, the local AS (specified by the **router bgp as-number** command) of BGP becomes the private AS inside the alliance and is invisible to other ASs.

##### ↘ [Configuring a BGP Alliance Neighbor](#)

By default, no alliance neighbor is configured for BGP.

You can run the **bgp confederation peers as-number [.. as-number]** command to configure a BGP alliance neighbor. After the configuration succeeds, the AS specified by this command and the local AS belong to the same alliance.

## 7.3.4 Re-distributing Local AS Network Information to BGP

BGP cannot automatically discover or learn accessible networks. The accessible network information of a local AS must be re-distributed to BGP. Then, BGP can advertise the information to neighbors.

### Working Principle

Two methods can be used to re-distribute local AS network information to BGP:

- Manual static configuration: re-distribute the accessible network information within a specified range to BGP.
- Configuring route re-distribution: re-distribute accessible IGP network information to BGP.

 In addition, you can also re-distribute local AS network information to BGP routes by configuring route aggregation.

### Related Configuration

#### ↘ Configuring a BGP Network

By default, no network is configured for BGP.

You can run the **network** *network-number* [ **mask** *mask* ] [ **route-map** *map-tag* ] [ **backdoor** ] command to configure a BGP network to re-distribute specified accessible network information to BGP. The prerequisite for successfully re-distributing routing information to BGP is that a route is available in the core routing table and this route can be an IGP, directly-connected or static route.

#### ↘ Configuring BGP Route Re-distribution

By default, BGP is not configured with route re-distribution.

You can run the **redistribute** *protocol-type* command to re-distribute the routing information of other protocols to BGP, including OSPF, RIP, ISIS, static and directly-connected routes.

## 7.3.5 Controlling Route Exchange Between BGP Peers

BGP provides powerful route management functions. You can actively control the route exchange between BGP peers.

### Working Principle

Configure the route exchange policy for a BGP peer and control routes to be received by and to be advertised to this peer.

### Related Configuration

#### ↘ Configuring the Default Route to Be Advertised to a Peer

By default, BGP does not advertise the default route.

You can run the **neighbor** { *address* | *peer-group-name* } **default-originate** [ **route-map** *map-tag* ] command to advertise the default route to a peer (or a peer group).

#### ↘ Configuring Next-Hop-Self for a Peer

By default, BGP does not change the next hop of a route when it advertises the route to an IBGP neighbor and sets the next hop to the local BGP speaker when it advertises the route to an EBGP neighbor.

You can run the **neighbor** { *address* | *peer-group-name* } **next-hop-self** command to configure the next hop of a route to the local BGP speaker when distributing the route to a specified BGP peer (group).

#### ▾ Configuring Remove-Private-AS for a Peer

By default, BGP does not delete the private AS in the AS-PATH attribute when it advertises routing information to a peer.

You can run the **neighbor** { *address* | *peer-group-name* } **remove-private-as** command to require that the private AS number recorded in the AS path attribute should be deleted when routing information is distributed to an EBGP peer (group). This command does not apply to an IBGP neighbor.

#### ▾ Configuring Send-Community for a Peer

By default, BGP does not send the community attribute when it advertises routing information to a peer.

You can run the **neighbor** { *address* | *peer-group-name* } **send-community** command to specify that the community attribute can be sent to a specified BGP peer (group).

#### ▾ Configuring Maximum-Prefix for a Peer

By default, BGP does not restrict the records of routing information that can be received by a peer.

You can run the **neighbor** { *address* | *peer-group-name* } **maximum-prefix** *maximum* [ **warning-only** ] command to specify the records of routing information received from a specified peer (group).

#### ▾ Configuring Route Filtering for a BGP Neighbor

By default, a BGP neighbor is not enabled with any filtering policy and receives all legal routing information advertised by a neighbor.

BGP supports multiple methods of configuring the route filtering policies for a neighbor, including:

- **neighbor** { *peer-address* | *peer-group-name* } **distribute-list** { *access-list-number* | *access-list-name* } { **in** | **out** }

Use an ACL to filter routes in the input and output directions of the neighbor.

- **neighbor** { *peer-address* | *peer-group-name* } **filter-list** *access-list-number* { **in** | **out** }

Use an AS-PATH list to filter routes in the input and output directions of the neighbor.

- **neighbor** { *peer-address* | *peer-group-name* } **prefix-list** *prefix-list-name* { **in** | **out** }

Use a prefix-list to filter routes in the input and output directions of the neighbor.

- **neighbor** { *peer-address* | *peer-group-name* } **route-map** *map-tag* { **in** | **out** }

Use a route map to filter routes in the input and output directions of the neighbor.

- **neighbor** { *address* | *peer-group-name* } **unsuppress-map** *map-tag*

Allow for advertising certain routing information previously suppressed by the **aggregate-address** command when distributing routing information to a specified peer.

## 7.3.6 Obtaining Accessible Networks of Other ASs from BGP

Send routing information of other ASs exchanged by BGP to the routing table of a device so that the device can forward packets to other ASs.

Send routing information of other ASs exchanged by BGP to the routing table of a device so that the device can forward packets to other ASs.

### Working Principle

#### ↘ BGP Sends Routing Information to a Core Routing Table

BGP controls routing information sent to the core routing table by using **table-map**. **table-map** can modify the attributes of routing information sent to the core routing table. If the route is matched, BGP modifies the attribute of the routing information and sends the route. If the route is not matched or route matching is denied, BGP does not modify the attribute of the routing information but sends the route.

Changes of **table-map** are not reflected in the core routing table immediately, but reflected a moment later. To update the application of **table-map** immediately, you can run the **clear ip bgp [ vrf vrf-name ] table-map** command to update the routing information in the core routing table immediately. This command does not clear the existing routes in the core routing table, but directly applies **table-map** to send the updated routing information, thereby not causing forwarding flapping.

#### ↘ Re-distributing BGP Routes to IGP

Re-distribute BGP routes on a BGP speaker to IGP to ensure that routers within an AS can obtain routes to other ASs.

### Related Configuration

#### ↘ Configuring table-map

By default, BGP is not configured with a table-map and allows for sending all routes without modifying the attributes of the routes.

You can run the **table-map route-map-name** command to set a table-map and control the routing information to be sent to the core routing table. *route-map-name* specifies a route-map to be associated.

**i** Run the **table-map** command in the BGP configuration mode or in the IPv4 address family mode.

The Match and Set statements supported in the table-map are as follows:

Match statements: as-path, community, ip address, ip next-hop, metric, origin and route-type

Set statements: metric, tag and next-hop

**i** You can run the **no table-map** command to delete the table-map configurations.

#### ↘ Configuring BGP Route Re-distribution by IGP

By default, IGP does not re-distribute BGP routes.

You can run the **redistribute bgp [ route-map map-tag ] [ metric metric-value ]** command to re-distribute BGP routes to IGP (RIP/OSPF/ISIS).

The **bgp redistribute-internal** command controls only whether to re-distribute routes learned from IBGP to IGP. By default, routes learned from IBGP can be re-distributed to IGP.

- i** You can run the **bgp redistribute-internal** command in the BGP configuration mode, IPv4/IPv6 address family mode or the IPv4 VRF address family mode.
- i** You can run the **no bgp redistribute-internal** command to delete the configuration.

### 7.3.7 Configuring Synchronization Between BGP and IGP

Generally, BGP speakers working as mutual IBGP neighbors are not directly connected. IGP devices between the BGP speakers may fail to learn routing information same as that learned by the BGP speakers. When a BGP speaker at the border of an AS forwards packets received from other domains to the next-hop IBGP neighbor, the packets pass an IGP device in the middle. In this case, the packets may be lost due to no routing information on the IGP device.

#### Working Principle

To keep synchronization between BGP and IGP, you must ensure that all routers within an AS can learn routing information to be sent to another AS before the routing information is advertised to this AS.

Synchronization between BGP and IGP is not required only in the following cases:

- Routing information passing through an AS is not available. For example, the AS is an end AS.
- All routers within an AS run BGP. Full mesh is established among all BGP speakers (neighborship is established between each two BGP speakers).

#### Related Configuration

##### ↳ [Configuring BGP Route Synchronization](#)

By default, synchronization between BGP and IBGP routes is disabled.

You can run the **synchronization** command to enable synchronization between BGP and IGP.

- i** You can run the **no synchronization** command to disable synchronization between BGP and IGP.

### 7.3.8 Configuring BGP Soft Reset

If routing policies (including **neighbor distribute-list**, **neighbor route-map**, **neighbor prefix-list** and **neighbor filter-list**) change, an effective method must be provided to implement new routing policies. A traditional method is to terminate a BGP connection and then create a new BGP connection. By configuring BGP Soft Reset, you can execute a new routing policy without terminating a BGP session connection.

#### Working Principle

- i** Routing policies that affect inbound routing information are called inbound routing policies (such as In-route-map and In-dist-list) and routing policies that affect outbound routing information are called outbound routing policies (such as Out-route-map and Out-dist-list).

When outbound routing policies change, BGP soft reset will re-advertise all routing information of a BGP speaker to its neighbors.

If inbound routing policies change, the operation is more complex than that when outbound routing policies change. This is because outbound routing policies are executed in the routing table of the local BGP speaker whereas inbound routing policies are executed for routing information received from the BGP peer. To reduce cost, the local BGP speaker does not store the original routing information received from the BGP peer.

If inbound routing policies change and a neighbor device supports route update, you can configure soft reset to send a route update request to the neighbor device. After receiving the request, the neighbor device re-advertises all routing information. You can also perform configuration to ensure that each BGP peer stores original routing information on the local BGP speaker and provides original routing information basis for modifying inbound routing policies subsequently.

- 
- i** The "route update capability" allows for modifying and executing routing policies without storing original routing information. This product supports the route update capability. You can run the **show ip bgp neighbors** command to check whether a BGP peer supports route update. If yes, you do not need to run the **neighbor soft-reconfiguration inbound** command when inbound routing policies change.
- 

## Related Configuration

### ↘ Configuring BGP Soft Reset

Run the **clear ip bgp** { \* | *peer-address* | **peer-group** *peer-group-name* | **external** } **soft out** command to soft reset a BGP connection. You can activate execution of a routing policy without restarting the BGP session.

### ↘ Saving Original Routing Information of Neighbors

By default, BGP does not save original routing information of neighbors.

Run the **neighbor** { *address* | *peer-group-name* } **soft-reconfiguration inbound** command to save unmodified routing information sent by a BGP peer (group).

## 7.3.9 Configuring the Route Attributes of BGP

BGP provides various control policies for route attributes. You can apply the policies based on actual conditions.

### Working Principle

#### ↘ AS\_PATH Attribute

BGP can control distribution of routing information in three modes:

- IP address. You can run the **neighbor distribute-list** and **neighbor prefix-list** commands for implementation.
- AS\_PATH attribute. See the description in this section.
- COMMUNITY attribute. See the related configuration of the COMMUNITY attribute.

You can use an AS path-based access control list (ACL) to control the distribution of routing information. Where, the AS path-based ACL uses a regular expression to parse the AS path.

Based on the standard (RFC1771), BGP does not consider the AS path length when selecting the optimum path. Generally, a shorter AS path length means a higher path priority; therefore, Ruijie considers the AS path length when selecting the optimum path. You can determine whether to consider the AS path length when selecting the optimum path based on the actual conditions.

- 
-  Within an AS, whether to consider the AS path should be consistent for all BGP speakers when the optimum path is selected; otherwise, the optimum paths selected by the BGP speakers may be different.
- 

#### ↳ **MULTI\_EXIT\_DISC Attribute**

BGP uses the MED value as the basis for comparing priorities of paths learned from EBGP peers. A smaller MED value means a higher path priority.

- By default, the MED value is compared only for paths of peers from the same AS when the optimum path is selected.
- By default, the MED value is not compared for paths of peers from other sub ASs within an AS alliance.
- By default, if a path not configured with the MED attribute is received, it is considered that the MED value of this path is 0. Since a smaller MED value means a higher path priority, this path has the highest priority.
- By default, the MED value is not compared with paths from different ASs; instead, the sequence of receiving the paths is compared.

#### ↳ **LOCAL\_PREF Attribute**

When sending routes received from EBGP peers to IBGP peers, a BGP speaker adds the LOCAL\_PREF attribute. BGP uses the LOCAL\_PREF attribute as the basis for comparing priorities of paths learned from IBGP peers. A larger value of LOCAL\_PREF means a higher path priority.

You can also run the **set local-preference** command of a route map to modify the LOCAL\_PREF attribute of the specified path.

#### ↳ **COMMUNITY Attribute**

The COMMUNITY attribute is another mode for controlling distribution of routing information.

A community is a set of destination addresses. The COMMUNITY attribute is intended to facilitate execution of a routing policy based on a community and thereby simplify the configuration of routing information distribution control on BGP speakers. Each destination address may belong to multiple communities. An AS administrator can define the communities to which a destination address belongs.

By default, all destination addresses belong to the Internet community and are carried in the community attribute of the path.

At present, four common community attribute values are pre-defined:

- Internet: Indicates the Internet community. All paths belong to this community.
- no-export: Indicates that the path is not advertised to EBGP peers.
- no-advertise: Indicates that the path is not advertised to any BGP peer.
- local-as: Indicates that a path is not advertised to other ASs. When an AS alliance is configured, the path is not advertised to other ASs or sub ASs.

By using the community attribute, you can control the receiving, prioritization and distribution of routing information. BGP speakers can set, add or modify the community attribute when learning, advertising or re-distributing routes. An aggregation path will contain the community attribute values of all aggregated paths.

- **i** BGP supports up to 32 COMMUNITY attributes for each route and allows for up to 32 COMMUNITY attributes when match and set COMMUNITY of a route map are configured.

### ↳ Others

During selection of the optimum path, if two paths with the same path attributes are received from different EBGPeers, the optimum path is selected based on the receiving sequence by default. You can disable comparison of the receiving sequence but use the path with a smaller router ID as the optimum path.

## Related Configuration

### ↳ Configuring AS\_PATH Attribute

- **ip as-path access-list** *path-list-name* { **permit** | **deny** } *as-regular-expression*

Defines an AS path list.

- **neighbor** { *address* | *peer-group-name* } **filter-list** *path-list-name* { **in** | **out** }

By default, no filtering policy is configured for BGP peers.

The configuration is the same as that for routing information receiving and sending for a specified BGP peer (group). Routing policies are executed based on the AS path list to advertise or receive only routes that match the policies.

- **neighbor** { *address* | *peer-group-name* } **route-map** *map-tag* { **in** | **out** }

By default, no filtering policy is configured for BGP peers.

The configuration is the same as when receiving and sending routing information for a specified BGP peer (group). Routing policies are executed based on a route map or the set rules in the route map are used to modify routing attributes.

- **i** In the route-map configuration mode, you can run the **match as-path** command to modify AS path attributes by using an AS path list or directly run the **set as-path** command to modify AS attribute values.

- **bgp bestpath as-path ignore**

Allows BGP not to consider the AS path length when selecting the optimum path. The AS path length is compared by default.

By default, a smaller AS path length means a higher path priority.

### ↳ Configuring MULTI\_EXIT\_DISC Attribute

- **bgp always-compare-med**

Allows for comparing the MED values of paths from different ASs, which is disabled by default.

- **bgp bestpath med confed**

Allows for comparing the MED values of paths of peers from other sub ASs in the same AS alliance, which is disabled by default.

- **bgp bestpath med missing-as-worst**

Sets a path not configured with the MED attribute to the lowest priority, which is disabled by default.

- **bgp deterministic-med**

Allows for comparing the paths of peers within the same AS, which is disabled by default.

### ↘ **Configuring LOCAL\_PREF Attribute**

- **bgp default local-preference** *value*

Changes the default local preference value, ranging from 0 to 4,294,967,295. A larger value means a higher priority. The default value is 100.

### ↘ **Configuring COMMUNITY Attribute**

- **ip community-list standard** *community-list-name* { **permit** | **deny** } *community-number*

Creates a community list. **community-list-name** indicates the name of the community list.

**i** *community-number*: Indicates a value (1 to 4,294,967,295) specified by a user or a known community attribute (internet, local-AS, no-advertise or no-export).

- **neighbor** { *address* | *peer-group-name* } **send-community**

Allows for sending the community attribute to a specified BGP peer (group), which is not configured by default.

- **neighbor** { *address* | *peer-group-name* } **route-map** *map-tag* { **in** | **out** }

The configuration is the same as that for routing information receiving and sending for a specified BGP peer (group). Routing policies are executed based on a route map. No filtering policy is configured for peers by default.

**i** In the route-map configuration mode, you can run the **match community-list [exact]** and **set community-list delete** commands to modify the community attribute by using a community list or directly run the **set community** command to modify the community value.

### ↘ **Others**

- **bgp bestpath compare-routerid**

Allows BGP to compare the router ID when selecting the optimum path, which is disabled by default.

## 7.3.10 Configuring BGP Route Aggregation

BGP-4 supports CIDR and therefore allows for creating aggregation entries to reduce the size of a BGP routing table. BGP aggregation entries can be added to a BGP routing table only when valid paths are available within the aggregation range.

### Working Principle

Aggregate one or more detailed BGP routes into a BGP route with a shorter network mask.

- **i** By default, BGP advertises all path information before and after aggregation. If you hope that only aggregated path information is advertised, you can run the **aggregate-address summary-only** command.
- **i** When the **aggregate-address** command is used to configure an aggregated route, the aggregated route takes effect immediately as long as there are routes in the configured address range.

## Related Configuration

### ▾ Configuring BGP Route Aggregation

- **aggregate-address address mask**  
Configures BGP route aggregation. By default, BGP does not create any aggregated routing entry.
- **aggregate-address address mask as-set**  
Configures an aggregation address and stores the AS path information within the aggregation address range. By default, BGP does not store AS path information.
- **aggregate-address address mask summary-only**  
Configures an aggregation address and advertises only an aggregated path. By default, BGP advertises all path information within the aggregation range.
- **aggregate-address address mask as-set summary-only**  
Configures an aggregation address, stores the AS path information within the aggregation address range and advertises only aggregated paths.

## 7.3.11 Configuring BGP Route Dampening

If a route changes between being valid and invalid, route flapping occurs.

Route flapping often causes transmission of unstable routes in a network, and thereby causes network instability. BGP route dampening is a method for reducing route flapping. It reduces possible route flapping by monitoring routing information from EBGP peers.

### Working Principle

Terms used in BGP route dampening are as follows:

- **Route Flap**: A route changes between being valid and invalid.
- **Penalty**: Once route flapping occurs, a BGP speaker enabled with route dampening adds a value to the penalty for this route. The penalty is accumulated until the Suppress Limit is reached.
- **Suppress Limit**: When the penalty of a route is greater than this value, the route will be suppressed.
- **Half-life-time**: The time used for the penalty to be halved.
- **Reuse Limit**: When the penalty value of a route is smaller than this value, route suppression will be canceled.
- **Max-suppress-time**: The longest time that a route can be suppressed.

A brief description of route dampening processing: BGP speaker punishes a route once (adds to the penalty) route flapping occurs. When the penalty reaches the Suppress Limit, the route will be suppressed. When the Half-life-time reaches, the penalty is halved. When the penalty is reduced to the Reuse Limit, the route is activated again. The Max-suppress-time indicates the longest time that the route can be suppressed.

## Related Configuration

### ▾ Configuring BGP Route Dampening

- **bgp dampening**

Enables BGP dampening, which is disabled by default.

- **bgp dampening *half-life-time reuse suppress max-suppress-time***

Configures the parameters of route dampening.

*half-life-time* (1~45minutes): The default value is 15 minutes. A larger value means a longer flapping suppression and dampening period.

*reuse* (1~20000): The default value is 750. A smaller value means longer time for continuous stabilization before a flapping route is enabled again.

*suppress* (1~20000): The default value is 2,000. A smaller value means more flapping times allowed before suppression.

*max-suppress-time* (1~255minutes): The default value is 4\**half-life-time*. A larger value means longer maximum suppression time.

### ▾ Displaying BGP Route Dampening

- **show ip bgp dampening flap-statistics**

Displays the flapping statistics about all routes.

- **show ip bgp dampening dampened-paths**

Displays the statistics about suppressed routes.

### ▾ Resetting BGP Route Dampening

- **clear ip bgp flap-statistics**

Clears the flapping statistics about all routes that are not suppressed.

- **clear ip bgp flap-statistics *address mask***

Clears the flapping statistics about specified routes (excluding suppressed routes).

- **clear ip bgp dampening [ *address* [ *mask* ] ]**

Clears the flapping statistics about all routes, including routes whose suppression is cancelled.

## 7.3.12 Configuring the Management Distance of BGP

The management distance is used to evaluate the reliability of various route sources. A smaller management distance means a better route.

### Working Principle

#### Management Distance of BGP

The management distance indicates the reliability of a route source, ranging from 1 to 255. A larger value means lower reliability. BGP sets different management distances for routing information learned from different sources, including External-distance, Internal-distance and Local-distance.

- External-distance: Indicates the management distance of routes learned from EBGp peers.
- Internal-distance: Indicates the management distance of routes learned from IBGP peers.
- Local-distance: Indicates the management distance for routes learned from peers but it is considered that better routes can be learned from IGP. Generally, these routes can be indicated by the **Network Backdoor** command.

**i** You are not advised to change the management distance of BGP. If you really need to change the management distance of BGP, please remember:

The external-distance should be shorter than the management distances of other IGP routing protocols (OSPF and RIP).

The internal-distance and local-distance should be longer than the management distances of other IGP routing protocols.

#### Backdoor Route

If you prefer an IGP route but do not use an EBGp route, you can set the EBGp route as the backdoor route. By default, the management distance for routes learned from a BGP speaker for which an EBGp connection is established is 20. You can run the **network backdoor** command to set the management distance of the network information to 200 so that the same network information learned from IGP has the highest priority. The networks learned from IGP are considered backdoor networks and are not advertised.

### Related Configuration

#### Configuring the Management Distance of BGP

You can run the **distance bgp** *external-distance internal-distance local-distance* command to configure the management distance of BGP. The value ranges from 1 to 255.

The default value of *external-distance* is 20; the default value of *internal-distance* is 200; the default value of *local-distance* is 200.

A longer management distance means a lower route priority.

#### Configuring a Backdoor Route

Run the **network** *network-number mask network-mask backdoor* command to configure a backdoor route. By default, no backdoor route is configured.

### 7.3.13 Configuring Multi-path Load Balancing of BGP

Multi-path load balancing means that there are multiple paths to the same network and data packets are evenly forwarded by these paths. In a routing table, one route has multiple next hops.

According to the types of equivalent routes, multi-path load balancing of BGP is classified into the following types:

- EBGp load balancing: implement load balancing for routes learned from EBGp neighbors.
  - IBGp load balancing: implement load balancing for routes learned from IBGp neighbors.
- 
-  Both the IPv4 and IPv6 protocol stacks support multi-path load balancing.
  -  Load balancing cannot be implemented between IBGp and EBGp routes (including EBGp routes in an alliance).
- 

#### Working Principle

If a BGP routing table has multiple paths to the same network, BGP calculates the route with the highest priority by default. If there are optimum multiple routes with the same priorities, BGP still selects a unique route by using comparison rules, notifies the route to the forwarding plane and controls the forwarding of data streams. After multi-path load balancing is enabled, BGP calculates a unique optimum route and also lists paths with the same priorities as equivalent routes. Then, BGP notifies the optimum route and the equivalent routes to the forwarding plane to implement load balancing.

Equivalent routes have the same basic attributes and priorities. That is, according to the optimum path selection rules of BGP, the paths have the same priorities before router-IDs are compared.

#### AS\_PATH Loose Comparison

By default, equivalent routes must have the same AS-PATH attributes. Under such strict conditions, load balancing cannot be implemented in certain environments. In this case, you are advertised to enable the AS-PATH loose comparison mode. In the AS-PATH loose comparison mode, when other conditions for equivalent routes are met, as long as the AS-PATH lengths of routes and the AS-PATH lengths of routes from an alliance are the same respectively, it is considered that the conditions for equivalent routes are met.

 When the next hops of multiple BGP equivalent paths recur to the same IGP output interface, load balancing cannot be implemented.

---

#### Related Configuration

##### Configuring Multi-path Load Balancing of BGP

- **maximum-paths ebgp** *number*  
Enables the multi-path load balancing function of EBGp.  
*number* indicates the number of equivalent next hops, ranging from 1 to 32. The default value is 1. A larger value means more equivalent next hops allowed.
- **maximum-paths ibgp** *number*  
Enables the multi-path load balancing function of IBGp.

*number* indicates the number of equivalent next hops, ranging from 1 to 32. The default value is 1. A larger value means more equivalent next hops allowed.

### ↘ [Configuring AS\\_PATH Loose Comparison](#)

- **bgp bestpath as-path multipath-relax**

Enables the BGP AS-PATH loose comparison mode.

## 7.3.14 Configuring BGP FRR

With high-speed development of IP technologies and application of various complex services, the requirements for network security and stability become increasingly higher. Especially, certain real-time services (audios and videos) are sensitive to network running status and may be largely affected by unstable networks. Therefore, more and more focus and importance are attached to network reliability. With these requirements, the IP FRR function comes into being. It is intended to use a backup link to maintain data forwarding during route platform convergence after a faulty link is detected, in order to achieve the ideal targets of "zero delay" and "zero loss" in packet forwarding.

BGP FRR is shorted for Fast Reroute.

### Working Principle

If a BGP routing table has multiple paths to the same network, BGP calculates the route with the highest priority by default. After the BGP FRR function is used, BGP selects a backup route for each optimum route. After BFD FRR detects that the master link is faulty, it switches the data to the originally calculated backup link for forwarding. After route convergence is completed, data is switched to the optimum route re-calculated for forwarding. In this way, BGP FRR can avoid route disconnection due to a link fault before BGP route convergence is completed.

- ❗ BGP FRR is supported only in the IPv4 Unicast and IPv4 VRF address families of BGP.
- ❗ Only one backup route can be generated and the next hop of the backup route cannot be the same as that of the preferred route.
- ❗ A backup next hop cannot be generated for an ECMP route.
- ❗ In the BGP IPv4 VRF configuration mode, BGP FRR has a lower priority than VPN FRR. That is, if VPN FRR is enabled in the VRF mode, BGP FRR takes effect only when VPN FRR fails to calculate a backup route.

### Related Configuration

#### ↘ [Configuring BGP FRR](#)

Run the **bgp fast-reroute** command to enable the BGP FRR function, which is disabled by default.

#### ↘ [Configuring a BFD Session with a BGP Neighbor](#)

Run the **neighbor peer-address fall-over bfd** command to configure a BFD session with a BGP neighbor, which is not configured by default.

#### ↘ [Manually Configuring a BGP BFD Session](#)

If the BFD session with a BGP neighbor cannot be used to fast detect the failure of the master link, you can run the **bfd bind bgp peer-ip** *ip-address* **interface** *interface-type interface-index* **source-ip** *ip-address* command to configure a BGP BFD session, which is not configured by default.

### 7.3.15 Configuring BGP Timers

You can manually configure various timers within BGP to meet the neighbor keepalive and route management requirements in different network environments.

#### Working Principle

##### ↘ BGP Neighbor Keepalive Timer

BGP uses the Keepalive timer to maintain a valid connection with a peer and uses the Holdtime timer to identify whether a peer is valid. By default, the value of the Keepalive timer is 60 seconds and the value of the Holdtime timer is 180 seconds. When a BGP connection is established between two BGP speakers, the two BGP speakers negotiate about the Holdtime timer value and select a smaller value. 1/3 of the negotiated Holdtime timer value and the configured Keepalive timer value are compared and the smaller value is used as the Keepalive timer value.

##### ↘ Neighbor Reconnection Timer

To reduce the impacts of frequent BGP reconnection to a neighbor on the network bandwidth, after a BGP speaker detects failure of a neighbor connection, the BGP speaker attempts to reconnect the neighbor after the connect-retry timer expires. By default, the value of the connect-retry timer is 15s.

##### ↘ Route Advertisement Timer

To reduce the impacts of route update packets on the network bandwidth, after a BGP speaker detects a network topology change, the BGP speaker does not advertise the route update to its neighbors immediately. Instead, the BGP speaker uses a regular update mechanism to advertise all changed routing information to its neighbors.

#### Related Configuration

##### ↘ Configuring the BGP Neighbor Keepalive Timer

- **timers** *bgp keepalive holdtime*

Adjusts the BGP *keepalive* and *holdtime* values for all peers.

The *keepalive* value ranges from 0 to 65,535. The default value is 60 seconds.

The *holdtime* value ranges from 0 to 65,535. The default value is 180 seconds.

- **neighbor** { *address* | *peer-group-name* } **timers** *keepalive holdtime*

Configures the *keepalive* and *holdtime* values used for connecting to a specified BGP peer (group).

The *keepalive* value ranges from 0 to 65,535. The default value is 60 seconds.

The *holdtime* value ranges from 0 to 65,535. The default value is 180 seconds.

##### ↘ Configuring the Neighbor Re-connection Timer

- **neighbor** { *address* | *peer-group-name* } **timers connect** *connect-retry*  
Configures the *connect-retry* value used for reconnecting to a specified BGP peer (group).  
The value of *connect-retry* ranges from 1 to 65,535. The default value is 15 seconds.

#### ↘ Configuring the Route Advertisement Timer

- **neighbor** { *address* | *peer-group-name* } **advertisemet-interval** *seconds*  
Configures the minimum interval for sending route updates to a specified BGP peer (group). The value of *advertisemet-interval* ranges from 0 to 600 seconds. The default value for IBGP peers is 0 seconds and the default value for EBGP peers is 30 seconds.
- **neighbor** { *address* | *peer-group-name* } **as-origination-interval** *seconds*  
Configures the minimum interval for sending local initial route updates to a specified BGP peer (group). The value of *As-origination-interval* ranges from 1 to 65,535. The default value is 1 second.

## 7.3.16 Configuring BGP Route Update Mechanisms

### Working Principle

BGP provides two route update mechanisms: regular-scanning update and event-triggering update. Regular-scanning update indicates that BGP uses an internal timer to start scanning regularly and update the routing table. Event-triggering update indicates that BGP starts scanning and updates the routing table when the BGP configuration commands are changed due to user configuration or the next hop of a BGP route changes.

- i** This function is configured based on address families and can be configured in the IPv4, IPv6, VPNv4, VPNv6, IPv4 vrf and IPv6 VRF address family modes.
- i** If you set the BGP route update mechanism to event-triggering update (by running the **bgp scan-rib disable** command), you must disable synchronization (by running the **no synchronization** command) and enable the BGP next-hop triggering update function (by running the **bgp nexthop trigger enable** command). On the other hand, if you enable synchronization or disable the BGP next-hop triggering update function, the BGP routing table must be updated in the regular scanning mode.

### Related Configuration

#### ↘ Configuring Route Update Mechanisms

- **bgp scan-rib disable**  
Sets the BGP route update mechanism to event-triggering update. Regular-scanning update is used by default.
- **bgp scan-time** *scan-time*  
Configures the regular update interval of BGP. The value of *scan-time* ranges from 5 to 60 seconds. The default value is 60 seconds.

### 7.3.17 Configuring the Next-Hop Triggering Update Function of BGP

The next-hop triggering update function of BGP is a method for reducing the BGP convergence time. This function is used to optimize the method for monitoring the next hop of a route to ensure that BGP can increase the BGP route convergence speed when the network topology is stable.

#### Working Principle

When BGP connects to a neighbor, BGP automatically monitors the next hop of the BGP route learned from the neighbor. When the next hop changes in the core routing table, BGP receives an advertisement about the next hop change and updates the BGP routing table. This optimization measure improves the BGP route convergence performance by reducing the time for detecting next-hop changes.

If this function is disabled, BGP next hop update will be discovered through regular scanning specified by scan-timer.

-  This function is configured based on address families and can be configured in the IPv4, IPv6, VPNv4, and IPv4 vrf address family modes.
-  **bgp nexthop trigger delay** and **bgp scan-time** control the same timer. When bgp scan is enabled (it is enabled by default and can be disabled by the **bgp scan-rib disable** command), if the value of **bgp nexthop trigger delay** is larger than 60s, bgp scan does not take effect because the scan timer is always triggered before the delay.
-  If the network environment is unstable (with frequent next-hop changes), especially with many routes, this function performs unnecessary route calculations, which consumes more CPU resources. Therefore, you are advised to disable this function in this environment.

#### Related Configuration

##### ▾ Configuring the Next-Hop Triggering Update Function of BGP

- **bgp nexthop trigger enable**  
Enables the BGP next-hop triggering function, which is enabled by default.
- **bgp nexthop trigger delay** *delay-time*  
Configures the delay of BGP next-hop triggering update. The value of *delay-time* ranges from 0 to 100 seconds. The default value is 5 seconds.

### 7.3.18 Configuring BGP LOCAL AS

The Local AS function of BGP is used to configure a local AS different from a router BGP AS for a specific peer. This is similar to deploying a new virtual AS between the peer devices. When the local router BGP AS changes, you can establish a BGP connection without changing the BGP configurations on the peer device. This function is mainly used for AS migration and merging of large networks and ensures that the device configurations in other interconnected ASs are not affected.

#### Working Principle

In BGP, when a local device connects to a peer, the local device advertises the local AS number to the peer by using an Open message. The peer checks whether the BGP AS number advertised is the same as the local AS number. If the AS

numbers are different, the peer will deny the BGP connection. By default, the local AS in the BGP connection is a route BGP AS. However, if a local AS is configured for the peer, the configured local AS will replace the route BGP AS when a BGP connection is established between the local device and the peer.

- i** The **neighbor** *peer-address* **local-as** *as-num* command for configuring the BGP Local AS function can be followed by more options. For details, see the Command Reference.
- i** The BGP Local AS function is applied only to EBGP peers, but is not applied to IBGP peers and alliance EBGP peers. In addition, the BGP Local AS function has the following restrictions:
  - 1) The configured local AS cannot be the same as the remote AS of a peer.
  - 2) The local AS cannot be configured independently for a member of a peer group.
  - 3) The configured local AS cannot be the same as the route BGP AS.
  - 4) If a device is a member of an AS alliance, the local AS cannot be the same as the AS alliance number.

## Related Configuration

### Configuring BGP LOCAL AS

- **neighbor** { *address* | *peer-group-name* } **local-as** *as-number*

Configures a local AS for a peer. By default, no local AS is configured for any peer. The local AS of a peer is the route BGP AS.

## 7.3.19 Configuring BGP Capacity Protection

There are often a large number of BGP routes, which may cause overload of a device, especially for a device with small memory. Protecting BGP capacity helps avoid non-predictable running status caused by consumption of device capacity.

### Working Principle

#### Restricting the Number of BGP Routes

Restrict the number of BGP routes by setting the maximum number of routes in a BGP address family and the maximum number of routes that can be learned by a BGP neighbor.

#### Entering the OVERFLOW State in case of Insufficient Memory

If the memory is insufficient, BGP can enter the OVERFLOW state. In the OVERFLOW state, BGP generates a default route pointing to a NULL interface. If a newly learned route is not a refined route other than the default route in the current routing table, the route is discarded. In other words, general newly learned routes are discarded to ensure that the system memory is stable. The purpose of not discarding all routes is to avoid route loops in the entire network. Therefore, it is safe for BGP to enter the OVERFLOW state. BGP is allowed to enter the OVERFLOW state by default.

- i** By default, BGP enters the OVERFLOW state in case of insufficient memory. If you do not want to BGP to enter the OVERFLOW state, you can run the **no overflow memory-lack** command to disable this function.
- i** In the OVERFLOW state, BGP supports only the **clear bgp** { *addressfamily* | **all** } \* command at present. You can also exit from the OVERFLOW state by disabling and enabling BGP again. When the memory becomes sufficient again, BGP can also automatically exit from the OVERFLOW state.

## Related Configuration

### ↘ Restricting the Number of BGP Routes

- **neighbor** { *address* | *peer-group-name* } **maximum-prefix** *maximum* [ **threshold** ] [ **warning-only** ]

Restricts the maximum number of routes that can be learned from a BGP neighbor, which is not restricted by default.

- **maximum-prefix** *maximum*

Restricts the maximum number of routes in a BGP address family. The default maximum number of routes for the BGP IPv4 VRF, IPv6 VRF and IPv4 MDT address families are 10,000 and is not configured for other address families.

### ↘ Configuring BGP OVERFLOW

- **overflow memory-lack**

Enable BGP to enter the OVERFLOW state in case of insufficient memory, which is enabled by default.

## 7.3.20 Configuring BGP GR

Graceful Restart (GR) is intended to implement uninterrupted data forwarding during restart of BGP. During active/standby switching of the management boards, the GR function keeps the network topology stable, maintains the forwarding table and ensures that key services are not interrupted.

### Working Principle

- **i** Comply with RFC4724: Graceful Restart Mechanism for BGP. [BGP GR] is used in the following description to indicate the RFC.

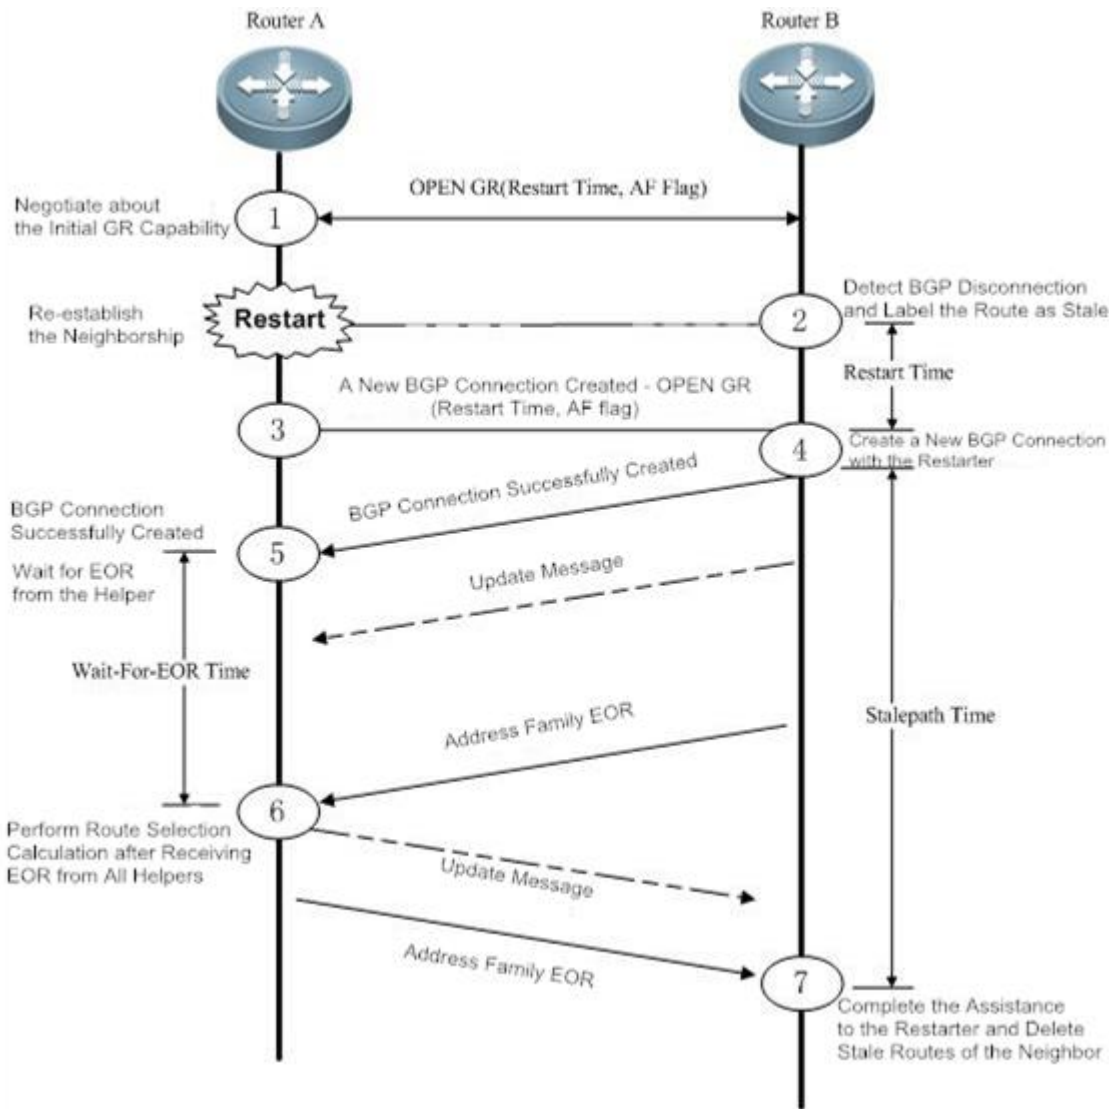

BGP GR is not an independent process, but is jointly completed by the Restarter and Helper.

- The Restarter performs restart and maintains the working capability of the route forwarding plane when the route control plane is faulty.
- The Helper is the BGP neighbor of the Restarter and helps the Restarter to complete GR.

A capability indicating GR is added to the OPEN message of BGP, which is called "Graceful Restart Capability". This capability is used by BGP to tell its neighbor it supports the graceful restart capability. During initialization of a BGP connection, two neighbors negotiate about the GR capability.

The route update end flag (End-of-RIB, shorted as EOR) is added to the Update packet of BGP, which indicates that the routing information update to the neighbor is completed.

Figure 7-3 BGP GR Interaction Process

5. ① When BGP establishes neighborhood at the beginning, BGP uses the GR capability field in the OPEN message to negotiate about the GR capabilities of the two neighbors.
6. ② At a moment, the Restarter starts restart, and the BGP session is disconnected. The Helper detects the disconnection, keeps the route of the Restarter valid but adds the "Stale (aged but not updated)" flag to the route.
7. ③ and ④ The Restarter completes restart and connects to the Helper again.
8. ⑤ The Restarter waits for the route update message and EOR flag from the Helper.
9. ⑥ After receiving the EOR flag from all neighbors, the Restarter performs route calculation, update routing entries and then sends updated routes to the Helper.
10. ⑦ After receiving the updated routes, the Helper cancels the "Stale" flag of the routes. After receiving the EOR flag from the Restarter, the Helper deletes routes with the "Stale" flag (these routes are not updated), performs route calculation, and updates the routing entries. The entire GR process is completed.

BGP GR defines several extended and important timers:

- **Restart-Timer:** The GR Restarter advertises the time value to the GR Helper, which indicates the maximum waiting time that the GR Restarter hopes the Helper to wait before a new connection is established between them. You can run the **bgp graceful-restart restart-time** command to modify the time value.
- **Wait-For-EOR Timer:** Indicates the maximum time that the GR Restarter waits for the EOR flag from all GR Helpers. After receiving the EOR flag from all GR Helpers or after the Wait-For-EOR timer expires, the GR Restarter calculates the preferred route and updates the routing entries. You can run the **bgp update-delay** command to modify the time value.
- **StalePath Timer:** Indicates the maximum time that the GR-Helper waits for the EOR flag from the GR Restarter after a new connection is established between them. Within this period, the Helper keeps the original route of the Restarter valid. After receiving the EOR flag or after the StalePath timer expires, the Helper clears the routing entries still with the "Stale" tag. You can run the **bgp graceful-restart stalepath-time** command to modify the time value.

## Related Configuration

### ↳ Configuring BGP GR

- **bgp graceful-restart**  
Enables the Restarter capability, which is enabled by default.
- **bgp graceful-restart restart-time *time***  
Sets the Restart Timer. The default value is 120 seconds.
- **bgp update-delay *delay***  
Sets the Wait-For-EOR Timer. The default value is 120 seconds.
- **bgp graceful-restart stalepath-time *time***  
Sets the StalePath Timer. The default value is 360 seconds.
- **bgp graceful-restart disable**  
Disables the address family GR capability. The address family GR capability is enabled by default. After the global BGP GR is enabled, the GR capability is automatically enabled for all address families.

---

**i** When BGP GR is implemented, all BGP peers must enable the BGP GR capability. If certain peers do not support or enable GR, BGP GR may fail to be implemented. GR failure may cause a short route black-hole or route loop, which may affect the network. Therefore, you are advised to verify that all neighbors are enabled with the BGP GR capability. You can run the **show ip bgp neighbors** command to display the capabilities successfully negotiated between BGP peers and verify that the GR capability negotiation is successful. In the BGP route configuration mode, run the **bgp graceful-restart** command to enable the BGP GR capability.

**i** The **bgp graceful-restart** command will not be applied to a successfully established BGP connection immediately. That is, when the BGP connection is in the Established state, the BGP peers will not re-negotiate about the GR capability immediately. To enable the BGP peers of the BGP connection to negotiate about the GR capability immediately, you need to forcibly restart the BGP peers to re-negotiate about the GR capability by running the **clear ip**

**bgp 192.168.195.64** command (for example). To make GR enabling or disabling take effect immediately, you must restart the neighborhood for capability negotiation, which may cause network flapping and affect normal use of users. Therefore, you can explicitly control whether to restart the neighborhood.

-  Supporting BGP GR does not mean that a device can be used as the Restarter to implement BGP GR. Whether to implement BGP GR also depends on the hardware capabilities of the device. Ruijie devices must support the dual-engine hot backup when being used as the GR Restarter.
-  The restart period configured by the **bgp graceful-restart restart-time** command should not be longer than the Hold Time of the BGP peers; otherwise, the Hold Time will be used as the restart time to be advertised to the BGP peers during GR capability negotiation.
-  The **bgp graceful-restart disable** command is used to disable the GR capability in an address family in the address family configuration mode, which is not configured by default.

---

### 7.3.21 Configuring 4-Byte AS Numbers of BGP

A traditional AS number consists of 2 bytes, ranging from 1 to 65,535. A newly defined AS number consists of 4 bytes, ranging from 1 to 4,294,967,295. Newly defined AS numbers are used to cope with exhaustion of AS number resources.

#### Working Principle

4-byte AS numbers support two expression modes: the decimal mode and dot mode. The decimal mode is the same as the original expression mode, that is, expressing the 4 bytes of an AS number as decimal digits. The dot mode is expressed as ([higher 2 bytes.]lower 2 bytes). If the higher 2 bytes are 0, they will not be displayed.

For example, an AS number is 65534 in the decimal mode and is 65,534 in the dot mode (the 0 at the beginning is not displayed).

For example, an AS number is 65,536 in the decimal mode, and is 1.0 in the dot mode.

For example, an AS number is 65,538 in the decimal mode, and is 1.2 in the dot mode.

- 
-  Related protocols are as follows: RFC 4893 and RFC 5396.

#### 📄 **Configuring the Display Mode of a 4-Byte AS Number**

A 4-byte AS number is displayed in the decimal mode by default. You can manually set the display mode to the dot mode. After the setting, a regular expression will use the dot mode for matching 4-byte AS numbers.

#### 📄 **Compatibility with Devices Supporting Only 2-Byte AS Numbers**

With introduction of 4-byte AS numbers, BGP connections may be established between old BGP speakers supporting only 2-byte AS numbers and new BGP speakers supporting 4-byte AS numbers. If the AS where a new BGP speaker resides has a 4-byte AS number, when an old BGP speaker creates neighborhood with the new BGP speaker, the old BGP speaker uses the reserved AS number 23,456 to replace the 4-byte AS number of the new BGP speaker. In the OPEN packets sent by the new BGP speaker to the old BGP speaker, the 4-byte AS number in the **My Autonomous System** field will be replaced by 23,456. In addition, in UPDATE packets sent to the old BGP speaker, the 4-byte AS number in the AS-PATH and AGGREGATOR attributes will also be replaced by 23,456. In addition, new optional transfer attributes AS4-PATH and AS4-

AGGREGATOR will be used to record the real 4-byte AS number so that the real AS-PATH and AGGREGATOR attributes can be restored when the route reaches a next new BGP speaker.

In other cases, the real AS number of the remote end is used to create neighborship.

## Related Configuration

### ▾ Configuring the Display Mode of a 4-Byte AS Number

- **bgp asnotation dot**

Displays a 4-byte AS number in the dot mode. The decimal mode is used by default.

## 7.3.22 Configuring a Regular Expression

A regular expression is a formula that matches strings based on a template.

The formula is used to assess text data and return True or False to indicate whether the expression can correctly describe the data.

### Working Principle

Regular expressions are used in BGP path attributes. The following table describes the usages of special characters in a regular expression.

Character	Symbol	Special Meaning
Period	.	Matches any single character.
Asterisk	*	Matches zero or any sequence in a string.
Plus sign	+	Matches one or any sequence in a string.
Question mark	?	Matches zero or one symbol in a string.
Caret	^	Matches the start of a string.
Dollar sign	\$	Matches the end of a string.
Underline	_	Matches the start, end and space of commas, brackets and strings.
Square brackets	[ ]	Matches a single character within a range.

## Related Configuration

### ▾ Using a Regular Expression in a show Command

- **show ip bgp regexp *regexp***

Displays the BGP routing information in a specified regular expression matched by the AS-PATH attribute.

- **show ip bgp quote-regexp *regexp***

Displays the BGP routing information in a regular expression within the specified double quotation marks matched by the AS-PATH attribute.

### 7.3.23 Configuring BGP Session Retention

By default, when an UPDATE packet is received from a neighbor, a BGP session will be disconnected if an error is detected on the multi-protocol routing attribute. This will cause flapping of the routes in all address families of this neighbor. That is, the routing error in an address family will affect the route stability in other address families.

#### Working Principle

After the BGP session retention function is enabled, if an error occurs in the routing attribute of an address family, only the routing information in this address family related to the neighbor is deleted. In addition, the BGP session and other address families are not affected, which enhances the stability of BGP.

**recovery-time** is used to configure the time for waiting for automatic route recovery, which requires that a neighbor should support the route-refresh capability. After the recovery-time, BGP sends the route-refresh message of the address family to the neighbor and re-advertises all routing information in the address family to this neighbor.

---

 In the session retention state, you can manually reset the neighbor to exit from the session retention state.

---

#### Related Configuration

##### ▾ Configuring BGP Session Retention

- **bgp mp-error-handle session-retain [ recovery-time *time* ]**

Enables the BGP session retention function, which is disabled by default.

**recovery-time** *time* configures the time for waiting for automatic route recovery, ranging from 10 to 4,294,967,296 seconds. The default value is 120.

### 7.3.24 Configuring BGP Delayed Advertisement upon System Restart

By default, after the neighborhood is established after system restart, a BGP peer can advertise route information to its neighbors. This is normal in most cases. However, in certain cases, for example, there are many neighbors or routes during startup but writing entries into the hardware is slow. In this case, the neighbors have learned the routes and started forwarding traffic, but the hardware has not completed writing of entries at the local end, which causes failure of traffic forwarding.

#### Working Principle

The BGP delayed advertisement upon system restart ensures that routes are not advertised to neighbors immediately after the neighborhood is established upon system restart and that the routes are advertised after a period. This function has no effect on other behaviors such as route receiving performed by the neighbors.

**delay-time** is used to configure the waiting time before routes are advertised to the neighbors. **startup-time** is used to configure the startup time. Within the startup-time, BGP sends routing information to the neighbors at the interval specified by **delay-time**.

---

 After the startup-time ends, the default route advertisement behavior recovers.

---

#### Related Configuration

## ↘ Configuring BGP Delayed Advertisement upon System Restart

- **bgp initial-advertise-delay** *delay-time* [ *startup-time* ]

Enables BGP delayed advertisement upon system restart, which is disabled by default.

*delay-time* configures the delay time for advertising routes after the BGP neighborhood is established upon system restart, ranging from 1 to 600 seconds. The default value is 1s.

*startup-time* configures the time range for system restart, ranging from 5 to 58,400 seconds. The delayed route advertisement mechanism is used within this range. The default value is 600s.

### 7.3.25 Other Related Configurations

-  For configuration and application of BGP MCE, see section "VRF Configuration Guide".
-  For configuration and application of BGP L2VPN, see section "L2VPN Configuration Guide".
-  For configuration and application of BGP/MPLS VPN, see section "BGP/MPLS VPN Configuration Guide".

## 7.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring a BGP Peer (Group)</a>	 (Mandatory) It is used to create a BGP neighbor.	
	<b>router bgp</b>	Enables BGP.
	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Creates a BGP neighbor.
<a href="#">Configuring MD5 Authentication</a>	 (Optional) It is used to perform encrypted authentication for the BGP neighbor.	
	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>password</b> [ 0   7 ] <i>string</i>	Configures the password for encryption.
<a href="#">Configuring a Route Reflector</a>	 (Optional) It is used to reduce the number of BGP neighbor connections.	
	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>route-reflector-client</b>	Specifies a peer (group) as a reflector client.
<a href="#">Configuring an AS Alliance</a>	 (Optional) It is used to reduce the number of BGP neighbor connections.	
	<b>bgp confederation identifier</b> <i>as-number</i>	Configures the BGP alliance ID.
	<b>bgp confederation peers</b> <i>as-number</i> [... <i>as-number</i> ]	Configures a BGP alliance neighbor.
<a href="#">Configuring Multi-path Load Balancing of BGP</a>	 (Optional) It is used to implement multi-path load balancing.	
	<b>maximum-paths ibgp</b> <i>number</i>	Configures IBGP load balancing.
	<b>maximum-paths ebgp</b> <i>number</i>	Configures EBGP load balancing.

Configuration	Description and Command	
	<b>bgp bestpath as-path multipath-relax</b>	Enables the BGP AS-PATH loose comparison mode.
<a href="#">Configuring EBGP FRR</a>	 (Optional) It is used to increase the convergence speed when a network fault occurs.	
	<b>bgp fast-reroute</b>	Configures BGP FRR.
	<b>neighbor { peer-address   peer-group-name } fall-over bfd</b>	Configures a BFD session with a BGP neighbor.
<a href="#">Configuring FRR in an IBGP Route Reflection Environment</a>	 (Optional) It is used to increase the convergence speed when a network fault occurs.	
	<b>bgp fast-reroute</b>	Configures BGP FRR.
	<b>bfd bind bgp peer-ip ip-address [vrf vrf-name] interface interface-type interface-index source-ip ip-address</b>	Configures a static BFD session.
<a href="#">Configuring Local ASs</a>	 (Optional) It is used for transitional deployment during network migration.	
	<b>neighbor { peer-address   peer-group-name } local-as as-number [ no-prepend [ replace-as [ dual-as ] ] ]</b>	Configures the local AS for a BGP neighbor.
<a href="#">Configuring BGP GR</a>	 (Recommended) It is used to improve the network reliability.	
	<b>bgp graceful-restart</b>	Enables the BGP GR capability.
	<b>bgp graceful-restart restart-time restart-time</b>	Configures the maximum time for BGP GR.
	<b>bgp graceful-restart stalepath-time time</b>	Configures the maximum retention time for BGP stable route.
<a href="#">Configuring a BGP IPv6 Address Family</a>	 (Optional) It is used to deploy an IPv6 network by using BGP.	
	<b>address-family ipv6 unicast</b>	Enters the BGP IPv6 unicast configuration mode.
	<b>neighbor { peer-address   peer-group-name } activate</b>	Activates the address family capability of a BGP neighbor in the current configuration mode.
<a href="#">Configuring Interconnection with Devices Supporting Only 2-Byte AS Numbers</a>	 Optional. It is used for interconnecting with an old device that supports only 2-byte AS numbers.	
	<b>neighbor { peer-address   peer-group-name } remote-as as-number</b>	Creates a BGP neighbor.

## 7.4.1 Configuring a BGP Peer (Group)

### Configuration Effect

- Configure BGP and create IBGP and EBGP neighbors.

## Notes

- If an IBGP neighbor is not directly connected, you need to configure IGP or a static routing protocol to implement interconnection.
- If an EBGP neighbor is not directly connected, you need to configure the **ebgp-multihop** parameter for the neighbor.

## Configuration Steps

### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Configuring a Source Interface for a BGP Neighbor

- (Optional) Perform this configuration in the BGP configuration mode. By default, BGP automatically selects a local interface that reaches the destination IP address of a peer as the source interface.

 For an IBGP neighbor, you are advised to use a Loopback interface as the source interface.

## Verification

- Run the **show** command to display the neighbor status.

## Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>
<b>Parameter</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.
<b>Description</b>	<i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer

end.

📌 **Creating a Source Interface for a BGP Neighbor**

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>update-source</b> { <i>interface-type interface-number</i>   <i>address</i> }
<b>Parameter Description</b>	<p><i>peer-address</i>: Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.</p> <p><i>peer-group-name</i>: Specifies the name of a peer group, consisting of no more than 32 characters.</p> <p><i>interface-type interface-number</i>: Indicates an interface name.</p> <p><i>address</i>: Directly specifies the network interface address used for creating a BGP connection.</p>
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The source interface of a neighbor must be a local valid interface or address.

**Configuration Example**

📌 **Configuring a BGP Peer (Group)**

<p><b>Scenario</b> Figure 7-4</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 7-4.</li> <li>● Configure a loopback interface on A, B, and C and create an IBGP neighbor based on the loopback interface.</li> <li>● Create an EBGP neighborhood by using the directly connected interfaces on C and D.</li> <li>● Create an IBGP peer group on C.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# interface loopback 0 A(config-if-Loopback 0)# ip address 10.1.1.1 255.255.255.255 A(config-if-Loopback 0)# exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip address 192.168.1.1 255.255.255.0 A(config-if-GigabitEthernet 0/1)# exit</pre>

	<pre>A(config)# router bgp 65536 A(config-router)# neighbor 10.1.1.3 remote-as 65536 A(config-router)# neighbor 10.1.1.3 update-source loopback 0</pre>

## Common Errors

- IGP is not enabled and the interconnection between the local loopback address and the loopback address on the IBGP neighbor fails, which causes that the neighbor fails to be created.
- ebgp-multihop is not configured when an EBGp is not directly connected, which causes that a TCP connection fails to be created.

## 7.4.2 Configuring MD5 Authentication

### Configuration Effect

- Configure MD5 for encrypted authentication between EBGP and IBGP neighbors.

### Notes

- If an IBGP neighbor is not directly connected, you need to configure IGP or a static routing protocol to implement interconnection.
- If an EBGP neighbor is not directly connected, you need to configure the **ebgp-multihop** parameter for the neighbor.

### Configuration Steps

#### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display the neighbor status.

### Related Commands

#### ↘ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

#### ↘ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

#### ↘ Configuring an MD5 Password for a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>password</b> [ 0   7 ] <i>string</i>
<b>Parameter Description</b>	<p><i>peer-address</i>: Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.</p> <p><i>peer-group-name</i>: Specifies the name of a peer group, consisting of no more than 32 characters.</p> <p><b>0</b>: Displays a password not encrypted.</p> <p><b>7</b>: Displays a password encrypted.</p> <p><i>string</i>: Indicates a password for TCP MD5 authentication, consisting of a maximum of 80 characters.</p>
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The same passwords must be configured on the two ends of a BGP neighborhood.

### Configuration Example

#### Configuring BGP MD5 Authentication

<b>Scenario</b> Figure 7-5	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 7-5.</li> <li>● Configure a loopback interface on B and C and create an IBGP neighbor based on the loopback interface.</li> <li>● Create an EBGP neighborhood by using the directly connected interfaces on A and B.</li> <li>● Configure the passwords on A, B and C for their neighbors.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip address 192.168.1.1 255.255.255.0 A(config-if-GigabitEthernet 0/1)# exit A(config)# router bgp 65537 A(config-router)# neighbor 192.168.1.2 remote-as 65536 A(config-router)# neighbor 192.168.1.2 password 7 ebgpneighbor</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface loopback 0 B(config-if-Loopback 0)# ip address 10.1.1.1 255.255.255.255</pre>

## Common Errors

- The passwords for MD5 encrypted authentication at the two ends of a BGP neighborhood are different.

## 7.4.3 Configuring a Route Reflector

### Configuration Effect

- Configure a route reflector in the IBGP environment to reduce the number of BGP neighbor connections.

### Notes

- If an IBGP neighbor is not directly connected, you need to configure IGP or a static routing protocol to implement interconnection.

### Configuration Steps

#### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↘ Creating a BGP Reflector

- (Mandatory) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display the neighbor status.

### Related Commands

#### ↘ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

#### ↘ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
----------------	--

<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

➤ **Creating a BGP Reflector**

<b>Command</b>	<b>neighbor { peer-address   peer-group-name } route-reflector-client</b>
<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

Configuration Example

➤ **Configuring a BGP Route Reflector**

<p><b>Scenario</b> Figure 7-6</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 7-6.</li> <li>● Configure a loopback interface on all devices and create an IBGP neighborship by using the loopback interface according to the connection lines as shown in Figure 7-6.</li> <li>● Configure route reflection on the device RR and specify A, B, C and D as reflector clients.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# interface loopback 0 A(config-if-Loopback 0)# ip address 10.1.1.1 255.255.255.255 A(config-if-Loopback 0)# exit</pre>

## 7.4.4 Configuring an AS Alliance

### Configuration Effect

- Configure a BGP alliance to reduce the number of BGP neighbor connections.

### Notes

- It is advised to use private AS numbers for sub ASs (also called member ASs) within an alliance. Private AS numbers range from 64,512 to 65,535.
- Within a sub AS of an alliance, full mesh must be established for all BGP speakers (route reflectors can be further configured within the sub AS).
- An EBGP neighborhood must be established between sub ASs of an alliance.
- All BGP speakers within an alliance must belong to a sub AS within the alliance.

### Configuration Steps

#### ➤ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.
- ↳ **Configuring a BGP Alliance ID**
- (Mandatory) Perform this configuration in the BGP configuration mode.
- ↳ **Configuring a BGP Alliance Member**
- (Mandatory) Perform this configuration in the BGP configuration mode.
- ↳ **Creating a BGP Neighbor**
- (Mandatory) Perform this configuration in the BGP configuration mode.
- ↳ **Configuring Multiple Hops for an EBGP Neighbor**
- Perform this configuration in the BGP configuration mode. It is mandatory when an EBGP neighbor is not directly connected.
- ↳ **Configuring BGP Route Re-distribution to a Network**
- (Optional) Perform this configuration in the BGP configuration mode. Perform this configuration when a local route needs to be advertised. You can also configure an alternative network by means of re-distribution.

## Verification

- Run the **show** command to display the BGP neighbor status.
- Run the **show** command to display the BGP routing table information.

## Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Enabling a BGP Alliance ID

<b>Command</b>	<b>bgp confederation identifier</b> <i>as-number</i>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring a BGP Alliance Member

<b>Command</b>	<b>bgp confederation peers</b> <i>as-number</i> [... <i>as-number</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	All member ASs of a local EBGP alliance must be identified.

### ↘ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↘ Configuring Multiple Hops for an EBGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>ebgp-multihop</b> [ <i>ttl</i> ]
<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>ttl</i> : Indicates the maximum number of hops that are allowed, ranging from 1 to 255.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

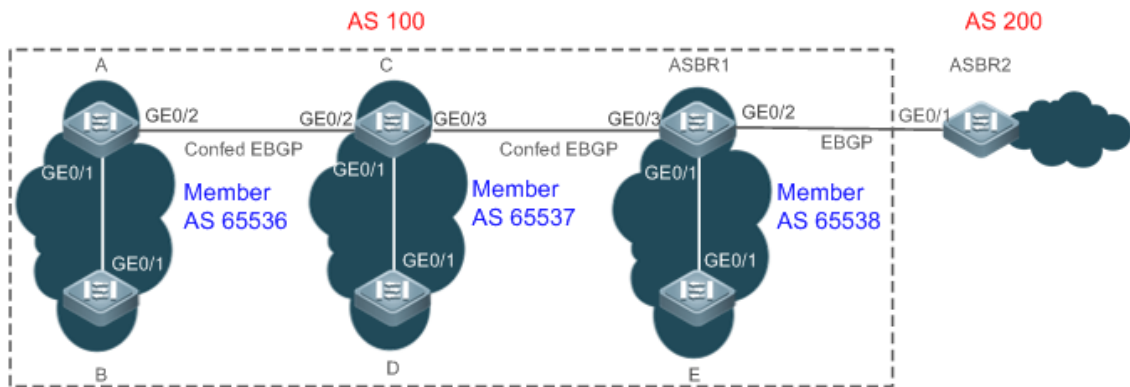

### ↘ Configuring BGP Route Re-distribution to a Network

<b>Command</b>	<b>network</b> <i>network-number</i> [ <b>mask</b> <i>mask</i> ] [ <b>route-map</b> <i>map-tag</i> ] [ <b>backdoor</b> ]
<b>Parameter Description</b>	<i>network-number</i> : Indicates the network address. <i>mask</i> : Indicates the subnet mask. <i>map-tag</i> : Indicates the name of a route map, consisting of no more than 32 characters. <b>backdoor</b> : Indicates that the route is a backdoor route.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The core routing table must contain same IGP (or static and directly connected) routes.

## Configuration Example

### ↘ Configuring a BGP Alliance

**Scenario**  
**Figure 7-7**

**Configuration Steps**

- Configure BGP on A and B, set the AS number to 65,536 and configure an IBGP neighborship.
- Configure BGP on C and D, set the AS number to 65,537 and configure an IBGP neighborship.
- Configure BGP on ASBR1 and E, set the AS number to 65,538 and configure an IBGP neighborship.
- Configure an alliance ID 100 on A, B, C, D, E and ASBR1.
- Configure the alliance member 65,537 on A, configure C as an EBGP neighbor, and set the peer AS number to 65,537.
- Configure the alliance members 65,536 and 65,538 on C, configure A as an EBGP neighbor and set the peer AS number to 65,536, configure ASBR1 as an EBGP neighbor and set the peer AS number to 65,538.
- Configure the alliance members 65,537 on ASBR1, configure C as an EBGP neighbor and set the peer AS number to 65,537, configure ASBR2 as an EBGP neighbor and set the peer AS number to 200.
- Configure BGP on ASBR2 and set the AS number to 200; configure ASBR1 as an EBGP neighbor and set the peer AS number to 100.

### Common Errors

- No BGP alliance neighbor is configured.
- Full mesh is not established within sub ASs of an alliance.

## 7.4.5 Configuring Multi-path Load Balancing of BGP

### Configuration Effect

- Implement multi-path load balancing for IBGP routes.
- Support AS-PATH loose comparison.

### Notes

- Routes learned from an IBGP neighbor must have the same priority (the router-ID does not need to be compared).

### Configuration Steps

#### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↘ Configuring BGP Load Balancing

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↘ Configuring AS-PATH Loose Comparison

- (Optional) Perform this configuration in the BGP configuration mode. Perform this configuration when load balancing needs to be implemented for routes learned from different ASs.

### Verification

- Run the **show** command to display BGP routing information.
- Run the **show** command to display the core routing table information.

## Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Configuring BGP Load Balancing

<b>Command</b>	<b>maximum-paths</b> <b>ibgp</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of equivalent paths, ranging from 1 to 32. If the value is 1, multi-path load balancing of IBGP will be disabled.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↳ Configuring AS-PATH Loose Comparison

<b>Command</b>	<b>bgp bestpath as-path multipath-relax</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

## Configuration Example

### ↳ Configuring Multi-path Load Balancing of IBGP

<p><b>Scenario</b> <b>Figure 7-8</b></p>	<p>The diagram illustrates a network topology with three Autonomous Systems (AS) and five routers. Router A (AS 65530) is connected to Router B (AS 65531) and Router C (AS 65530). Router B (AS 65531) is connected to Router D (AS 65531). Router C (AS 65530) is connected to Router E (AS 65532). Router D (AS 65531) is connected to Router E (AS 65532). A central network 10.5.0.0/16 is also shown. The IP addresses for the routers are: Router A (10.1.1.1/16), Router B (10.1.1.2/16), Router C (10.2.1.1/16), Router D (10.3.3.1/16), and Router E (10.4.1.1/16). The interfaces connecting the routers are: A-B (10.2.1.1/16), A-C (10.2.1.2/16), B-D (10.3.3.2/16), and C-E (10.4.1.2/16).</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 7-8.</li> <li>● Establish IBGP neighborships between A and B and between A and C by using directly connected interfaces.</li> <li>● Establish EBGP neighborships between B and D and between C and E by using directly connected interfaces.</li> <li>● Re-distribute the same routes to D and E.</li> <li>● Configure IBGP load balancing on A and enable the AS-PATH loose comparison mode.</li> </ul>
<p><b>A</b></p>	<pre> A# conf terminal A(config)# interface fastEthernet 0/0 A(config-if-FastEthernet 0/0)# ip address 10.1.1.1 255.255.0.0 A(config-if-FastEthernet 0/0)# exit A(config)# interface fastEthernet 0/1 A(config-if-FastEthernet 0/1)# ip address 10.2.1.1 255.255.0.0 A(config-if-FastEthernet 0/1)# exit A(config)# ip route 10.3.0.0 255.255.0.0 10.1.1.2 A(config)# ip route 10.4.0.0 255.255.0.0 10.2.1.2 A(config)# router bgp 65530 A(config-router)# neighbor 10.1.1.2 remote-as 65530 A(config-router)# neighbor 10.2.1.2 remote-as 65530         </pre>

## Common Errors

- The priorities of multi-hop BGP routes are different, which causes load balancing failure.

## 7.4.6 Configuring EBGPFRR

### Configuration Effect

- Implement EBGPFRR.

### Notes

- A neighbor BFD session must be configured to implement fast link fault detection.

### Configuration Steps

#### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↘ Configuring BGP FRR

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↘ Configuring a Neighbor BFD Session

- (Mandatory) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display routing information.

### Related Commands

#### ↘ Enabling BGP

<b>Command</b>	<code>router bgp as-number</code>
<b>Parameter</b>	<code>as-number</code> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot

```

## Common Errors

- No BFD session is configured for BGP neighbors.

## 7.4.7 Configuring FRR in an IBGP Route Reflection Environment

### Configuration Effect

- Implement FRR in an IBGP route reflection environment.

### Notes

- A BFD session must be manually configured.

### Configuration Steps

#### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↘ Configuring BGP FRR

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↘ Creating a BFD Session

- (Mandatory) Perform this configuration in the global configuration mode.

## Verification

- Run the **show** command to display routing information.

## Related Commands

### ↘ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↘ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↘ Configuring BGP FRR

<b>Command</b>	<b>bgp fast-reroute</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring a BFD Session

<b>Command</b>	<b>bfd bind bgp peer-ip</b> <i>ip-address</i> [ <b>vrf</b> <i>vrf-name</i> ] <b>interface</b> <i>interface-type interface-index</i> <b>source-ip</b>
----------------	--

	<i>ip-address</i>
<b>Parameter Description</b>	<p><b>peer-ip</b> <i>ip-address</i>: Indicates the peer IP address.</p> <p><b>vrf</b> <i>vrf-name</i>: Indicates the VRF instance to which the BFD session belongs. It belongs to the global VRF by default.</p> <p><b>interface</b> <i>interface-type interface-index</i>: Indicates the output interface type and index.</p> <p><b>source-ip</b> <i>ip-address</i>: Indicates the local IP address.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A BFD session must be configured at two ends at the same time.

### Configuration Example

#### Configuring FRR in an IBGP Route Reflection Environment

<p><b>Scenario</b> Figure 7-10</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 7-10.</li> <li>● Establish IBGP neighborships by using the directly-connected interfaces according to the connection lines as shown in Figure 7-10.</li> <li>● Configure route reflection on B and C and specify A and D as reflector clients.</li> <li>● Configure FRR on A.</li> <li>● Configure a BFD session between A and D.</li> </ul>

## Common Errors

- No BFD session is configured.

## 7.4.8 Configuring Local ASs

### Configuration Effect

- Smoothly migrate the network configurations of router A from AS 23 to AS 3600.

### Notes

N/A

### Configuration Steps

#### ▾ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ▾ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ▾ Configuring the Local AS for a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display the information.

## Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Configuring the Local AS for a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>local-as</b> <i>as-number</i> [ <b>no-prepend</b> [ <b>replace-as</b> [ <b>dual-as</b> ] ] ]
<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates a local AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. <b>no-prepend</b> : Does not add the local AS to the AS-PATH in the routing information received by a peer. This option is not available by default. <b>replace-as</b> : For the AS-PATH in the routing information sent by a peer, the local AS is used to replace the BGP AS. This option is not available by default. <b>dual-as</b> : Enables a peer to use the BGP AS or Local AS to establish a BGP connection with a device. This option is not available by default.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

## Configuration Example

## 7.4.9 Configuring BGP GR

### Configuration Effect

- Configure BGP GR to implement network deployment with high reliability.

### Notes

- To successfully deploy the BGP GR function, you need to use a neighbor device as the GR Helper.
- In an BGP environment, you also need to configure IGP GR.
- After BGP GR is enabled, you need to reset a BGP neighbor connection to make it take effect.

### Configuration Steps

#### ▾ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ▾ Configuring BGP GR

- Perform this configuration in the BGP configuration mode, which is configured by default.

#### ▾ Configuring a BGP GR Timer

- (Optional) Perform this configuration in the BGP configuration mode.

#### ▾ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display the neighbor status.

### Related Commands

#### ▾ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>
<b>Parameter</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Description</b>	

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring BGP GR

<b>Command</b>	<b>bgp graceful-restart</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring the BGP GR Restart Timer

<b>Command</b>	<b>bgp graceful-restart restart-time</b> <i>restart-time</i>
<b>Parameter Description</b>	<i>restart-time</i> : Indicates the maximum waiting time that the GR Restarter hopes the GR Helper to wait before a new connection is created, ranging from 1 to 3600 seconds.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring the BGP GR Route Stale Timer

<b>Command</b>	<b>bgp graceful-restart stalepath-time</b> <i>time</i>
<b>Parameter Description</b>	<i>time</i> : Indicates the maximum time that a stale route keeps valid after the connection with a neighbor GR device is recovered, ranging from 1 to 3600 seconds.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↘ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

## Configuration Example

### ↘ Configuring BGP GR

<p><b>Scenario</b> Figure 7-12</p>	<p>The diagram illustrates two Autonomous Systems (ASes). AS 200, represented by a cloud, contains router R1. AS 100, represented by a larger cloud, contains routers R2, R3, and R4. R1 is connected to R2 with a solid line, representing an External BGP (EBGP) neighborship. R2, R3, and R4 are interconnected with dashed lines, representing Internal BGP (IBGP) neighborships. A legend on the right shows a solid line for EBGP and a dashed line for IBGP.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 7-12.</li> <li>● Configure a loopback interface on R2, R3, and R4 and create an IBGP neighborship based on the loopback interface.</li> <li>● Create an EBGP neighborship by using the directly connected interfaces on R1 and R2.</li> <li>● Enable BGP GR on R1, R2, R3, and R4.</li> </ul>
<p><b>R1</b></p>	<pre>R1# configure terminal R1(config-router)# exit R1(config)# router bgp 100 R1(config-router)# bgp graceful-restart</pre>
<p><b>R2</b></p>	<pre>R2# configure terminal R2(config)# router ospf 1 R2(config-router)# graceful-restart R2(config-router)# exit R2(config)# router bgp 100 R2(config-router)# bgp graceful-restart</pre>
<p><b>R3</b></p>	<pre>R3# configure terminal R3(config)# router ospf 1 R3(config-router)# graceful-restart R3(config-router)# exit R3(config)# router bgp 100</pre>

	<pre>R3(config-router)# bgp graceful-restart</pre>
<p><b>R4</b></p>	<pre>R4# configure terminal R4(config)# router ospf 1 R4(config-router)# graceful-restart R4(config-router)# exit R4(config)# router bgp 100 R4(config-router)# bgp graceful-restart</pre>
<p><b>Verification</b></p>	<p>Run the <b>show</b> command to display the BGP neighbor status.</p>
<p><b>R2</b></p>	<pre>R2# show ip ospf  Routing Process "ospf 1" with ID 10.0.0.2  Process uptime is 4 minutes  Process bound to VRF default  Conforms to RFC2328, and RFC1583Compatibility flag is enabled  Supports only single TOS(TOS0) routes  Supports opaque LSA  This router is an ASBR (injecting external routing information)  SPF schedule delay 5 secs, Hold time between two SPFs 10 secs  LsaGroupPacing: 240 secs  Number of incoming current DD exchange neighbors 0/5  Number of outgoing current DD exchange neighbors 0/5  Number of external LSA 4. Checksum 0x0278E0  Number of opaque AS LSA 0. Checksum 0x000000  Number of non-default external LSA 4  External LSA database is unlimited.  Number of LSA originated 6  Number of LSA received 2  Log Neighbor Adjacency Changes : Enabled  Graceful-restart enabled  Graceful-restart helper support enabled  Number of areas attached to this router: 1</pre>

```
Area 0 (BACKBONE)
.....

R2# show ip bgp neighbors

BGP neighbor is 192.168.195.183, remote AS 200, local AS 100, external link

Using BFD to detect fast fallover - BFD session state up

  BGP version 4, remote router ID 10.0.0.1

  BGP state = Established, up for 00:06:37

  Last read 00:06:37, hold time is 180, keepalive interval is 60 seconds

  Neighbor capabilities:

    Route refresh: advertised and received (old and new)

Address family IPv4 Unicast: advertised and received

Graceful restart: advertised and received

  Remote Restart timer is 120 seconds

  Address families preserved by peer:

    None

.....
```

## Common Errors

- GR is not enabled for IGP.
- GR is not enabled for a BGP neighbor device.

## 7.4.10 Configuring a BGP IPv6 Address Family

### Configuration Effect

- Configure BGP IPv6 routes to implement IPv6 network access in different ASs.

### Notes

- Generally, BGP uses IPv6 addresses to create neighborships and implement exchange of IPv6 routes.
- In special scenarios (such as the 6PE function, see the MPLS-L3VPN-SCG.doc), BGP supports exchange of IPv6 routes on the neighbors with IPv4 addresses.
- Configurations related to BGP IPv6 services must be configured in the BGP IPv6 address family mode.

### Configuration Steps

#### ▾ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.
- ↳ **Creating a BGP Neighbor**
- (Mandatory) Perform this configuration in the BGP configuration mode.
- ↳ **Configuring the BGP IPv4 Address Family Mode**
- (Optional) Perform this configuration in the BGP configuration mode.
- ↳ **Disabling the IPv4 Address Family Capability for a BGP Neighbor**
- (Optional) Perform this configuration in the BGP IPv6 configuration mode.
- ↳ **Configuring the BGP IPv6 Address Family Mode**
- (Mandatory) Perform this configuration in the BGP configuration mode.
- ↳ **Configuring the IPv6 Address Family Capability for a BGP Neighbor**
- (Mandatory) Perform this configuration in the BGP IPv6 configuration mode.
- ↳ **Configuring IPv6 Route Advertisement in BGP**
- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

## Verification

- Run the **show** command to display the neighbor status.
- Run the **show** command to display the routing status.

## Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode

<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.
--------------------	---

### ↘ Configuring the BGP IPv4 Address Family Mode

<b>Command</b>	<b>address-family ipv4 unicast</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↘ Disabling the IPv4 Address Family Capability for a BGP Neighbor

<b>Command</b>	<b>no neighbor { peer-address   peer-group-name } activate</b>
<b>Parameter Description</b>	<i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.
<b>Command Mode</b>	BGP IPv4 address family mode
<b>Usage Guide</b>	Neighbors with IPv6 addresses are used to exchange IPv6 routes. However, when a neighbor is configured in the BGP mode, BGP automatically activates the IPv4 unicast address family capability for the neighbor. Therefore, you are advised to manually disable the IPv4 unicast address family capability.

### ↘ Configuring the BGP IPv6 Address Family Mode

<b>Command</b>	<b>address-family ipv6 unicast</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring the IPv6 Address Family Capability for a BGP Neighbor

<b>Command</b>	<b>neighbor { peer-address   peer-group-name } activate</b>
<b>Parameter Description</b>	<i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.
<b>Command Mode</b>	BGP IPv6 address family mode
<b>Usage Guide</b>	-

### ↘ Configuring IPv6 Route Advertisement in BGP

<b>Command</b>	<b>network network-number [ mask mask ] [ route-map map-tag ] [ backdoor ]</b>
<b>Parameter</b>	<i>network-number</i> : Indicates the network number.

<b>Description</b>	<p><i>mask</i>: Indicates the subnet mask.</p> <p><i>map-tag</i>: Indicates the name of a route map, consisting of no more than 32 characters.</p> <p><b>backdoor</b>: Indicates that the route is a backdoor route.</p>
<b>Command Mode</b>	BGP IPv6 address family mode
<b>Usage Guide</b>	-

### Configuration Example

#### Configuring BGP to Implement IPv6 Route Exchange in Different ASs

<p><b>Scenario</b> Figure 7-13</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 7-13.</li> <li>● Configure a BGP neighbor, disable the IPv4 address family capability for the neighbor and activate the IPv6 address family capability.</li> <li>● Configure IPv6 route advertisement in BGP.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# int loopback 0 A(config-if-Loopback)# ipv6 address 30::1/128 A(config-if-Loopback)# exit A(config)# router bgp 65530 A(config-router)# neighbor 100::1 remote-as 65531 A(config-router)# address-family ipv4 A(config-router-af)# no neighbor 100::1 activate A(config-router-af)# exit-address-family A(config-router)# address-family ipv6 A(config-router-af)# neighbor 100::1 activate A(config-router-af)# network 30::1/128</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# router bgp 65531 B(config-router)# neighbor 100::2 remote-as 65530</pre>

	<pre>B(config-router)# address-family ipv4 B(config-router-af)# no neighbor 100::2 activate B(config-router-af)# exit-address-family B(config-router)# address-family ipv6 B(config-router-af)# neighbor 100::2 activate</pre>
<b>Verification</b>	Run the <b>show</b> command to display the BGP neighbor status.
<b>A</b>	<pre>A# show bgp ipv6 unicast summary BGP router identifier 1.1.1.1, local AS number 65530 BGP table version is 1 1 BGP AS-PATH entries 0 BGP Community entries 1 BGP Prefix entries (Maximum-prefix:4294967295)  Neighbor      V      AS MsgRcvd MsgSent  TblVer  InQ  OutQ Up/Down  State/PfxRcd 100::1        4      65531     4      6        1    0    0 00:01:49      0  Total number of neighbors 1</pre>
<b>B</b>	<p>Run the <b>show</b> command to display BGP routing information.</p> <pre>B# show bgp ipv6 unicast BGP table version is 4, local router ID is 2.2.2.2 Status codes: s suppressed, d damped, h history, * valid, &gt; best, i - internal,                 S Stale, b - backup entry Origin codes: i - IGP, e - EGP, ? - incomplete  Network        Next Hop          Metric    LocPrf    Weight Path *&gt; 30::1/128    100::2            0          0        65530 i  Total number of prefixes 1</pre>

**Common Errors**

- The IPv6 address family capability is not activated for BGP neighbors.
- In non-6PE scenarios, IPv4 addresses are used to establish IPv6 routes for exchange between neighbors.

## 7.4.11 Configuring Interconnection with Devices Supporting Only 2-Byte AS Numbers

### Configuration Effect

- Successfully interconnect devices supporting 4-byte AS numbers with devices supporting only 2-byte AS numbers.

### Configuration Steps

#### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↘ Configuring the Display Mode of a 4-Byte AS Number

- (Optional) Perform this configuration in the BGP configuration mode. By default, a 4-byte AS number is displayed as decimal digits.

### Verification

- Run the **show** command to display the neighbor status.

### Related Commands

#### ↘ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i>

**Common Errors**

N/A

**7.4.12 Using Local IPv6 Link Addresses to Establish BGP Neighborships**

**Configuration Effect**

- Use local IPv6 link addresses to establish BGP neighborships.

**Notes**

- Generally, global IPv4 addresses need to be used for establishing BGP neighborships.
- Local IPv6 link addresses can be used for establishing only single-hop BGP neighborships.

- When local IPv6 link addresses are used for establishing neighborships, using local IPv6 link addresses as information sources must be specified on the peer end.
- When local IPv6 link addresses are used for establishing neighborships, local IPv6 link addresses must be configured on both ends.

## Configuration Steps

---

### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Specifying the Message Source for a BGP Neighbor

- Perform this configuration in the BGP configuration mode. If local IPv6 link addresses are configured for a neighbor, this configuration is mandatory; otherwise, this configuration is optional.

### ↳ Configuring the BGP IPv4 Address Family Mode

- (Optional) Perform this configuration in the BGP configuration mode.

### ↳ Disabling the IPv4 Address Family Capability for a BGP Neighbor

- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

### ↳ Configuring the BGP IPv6 Address Family Mode

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Configuring the IPv6 Address Family Capability for a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP IPv6 configuration mode.

### ↳ Configuring IPv6 Route Advertisement in BGP

- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

## Verification

---

- Run the **show** command to display the neighbor status.
- Run the **show** command to display the routing status.

## Related Commands

---

### ↳ Enabling BGP

Command	<code>router bgp <i>as-number</i></code>
---------	--

<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> <i>peer-address</i> <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Specifying the Message Source for a BGP Neighbor

<b>Command</b>	<b>neighbor</b> <i>peer-address</i> <b>update-source</b> <i>interface-type interface-number</i>
<b>Parameter Description</b>	<i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address. <i>interface-type interface-number</i> : Indicates an interface name.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	If the local IPv6 link address of a local interface is used when a BGP neighborhood is established with a neighbor device, this interface must be specified as the message source of the neighborhood when the BGP neighborhood is configured on the local device.

### ↳ Configuring the BGP IPv4 Address Family Mode

<b>Command</b>	<b>address-family ipv4 unicast</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↳ Disabling the IPv4 Address Family Capability for a BGP Neighbor

<b>Command</b>	<b>no neighbor <i>peer-address</i> activate</b>
<b>Parameter Description</b>	<i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address.
<b>Command Mode</b>	BGP IPv4 address family mode
<b>Usage Guide</b>	Neighbors with IPv6 addresses are used to exchange IPv6 routes. However, when a neighbor is configured in the BGP mode, BGP automatically activates the IPv4 unicast address family capability for the neighbor. Therefore, you are advised to manually disable the IPv4 unicast address family capability.

<b>Usage Guide</b>	-

### ↳ Configuring the IPv6 Address Family Capability for a BGP Neighbor

<b>Command</b>	<b>neighbor <i>peer-address</i> activate</b>
<b>Parameter Description</b>	<i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address.
<b>Command Mode</b>	BGP IPv6 address family mode
<b>Usage Guide</b>	-

### ↳ Configuring IPv6 Route Advertisement in BGP

<b>Command</b>	<b>network <i>network-number</i> [ mask <i>mask</i> ] [ route-map <i>map-tag</i> ] [ backdoor ]</b>
<b>Parameter Description</b>	<i>network-number</i> : Indicates the network number. <i>mask</i> : Indicates the subnet mask. <i>map-tag</i> : Indicates the name of a route map, consisting of no more than 32 characters.

	<b>backdoor:</b> Indicates that the route is a backdoor route.
<b>Command Mode</b>	BGP IPv6 address family mode
<b>Usage Guide</b>	-

### Configuration Example

➤ **Using a Local IPv6 Link Address for Configuring a BGP Neighborhood to Implement IPv6 Route Exchange in Different ASs**

<p><b>Scenario</b> Figure 7-15</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 7-15.</li> <li>● Configure a BGP neighbor, specify the update-source, disable the IPv4 address family capability for the neighbor and activate the IPv6 address family capability.</li> <li>● Configure IPv6 route advertisement in BGP.</li> </ul>
<p><b>A</b></p>	<pre> A# configure terminal A(config)# int loopback 0 A(config-if-Loopback)# ipv6 address 30::1/128 A(config-if-Loopback)# exit A(config)# int GigabitEthernet 0/1 A(config-if-Loopback)# ipv6 address fe80:100::2/64 A(config-if-Loopback)# exit A(config)# router bgp 65530 A(config-router)# neighbor fe80:100::1 remote-as 65531 A(config-router)# neighbor fe80:100::1 update-source GigabitEthernet 0/1 A(config-router)# address-family ipv4 A(config-router-af)# no neighbor fe80:100::1 activate A(config-router-af)# exit-address-family                     </pre>

	<pre>A(config-router)# address-family ipv6 A(config-router-af)# neighbor fe80:100::1 activate A(config-router-af)# network 30::1/128</pre>
<p><b>B</b></p>	<pre>B# configure terminal A(config)# int GigabitEthernet 0/1 A(config-if-Loopback)# ipv6 address fe80:100::1/64 A(config-if-Loopback)# exit B(config)# router bgp 65531 B(config-router)# neighbor fe80:100::2 remote-as 65530 A(config-router)# neighbor fe80:100::2 update-source GigabitEthernet 0/1 B(config-router)# address-family ipv4 B(config-router-af)# no neighbor fe80:100::2 activate B(config-router-af)# exit-address-family B(config-router)# address-family ipv6 B(config-router-af)# neighbor fe80:100::2 activate</pre>
<p><b>Verification</b></p>	<p>Run the <b>show</b> command to display the BGP neighbor status.</p>
<p><b>A</b></p>	<pre>A# show bgp ipv6 unicast summary BGP router identifier 1.1.1.1, local AS number 65530 BGP table version is 1 1 BGP AS-PATH entries 0 BGP Community entries 1 BGP Prefix entries (Maximum-prefix:4294967295)  Neighbor      V      AS MsgRcvd MsgSent  TblVer  InQ  OutQ Up/Down  State/PfxRcd FE80:100::1  4      65531     4      6        1    0    0 00:01:49      0  Total number of neighbors 1</pre>
<p><b>B</b></p>	<p>Run the <b>show</b> command to display BGP routing information.</p> <pre>B# show bgp ipv6 unicast BGP table version is 4, local router ID is 2.2.2.2</pre>

Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S Stale, b - backup entry Origin codes: i - IGP, e - EGP, ? - incomplete  <table border="1"> <thead> <tr> <th>Network</th> <th>Next Hop</th> <th>Metric</th> <th>LocPrf</th> <th>Weight</th> <th>Path</th> </tr> </thead> <tbody> <tr> <td>*&gt; 30::1/128</td> <td>FE80:100::2</td> <td>0</td> <td></td> <td>0</td> <td>65530 i</td> </tr> </tbody> </table> Total number of prefixes 1						Network	Next Hop	Metric	LocPrf	Weight	Path	*> 30::1/128	FE80:100::2	0		0	65530 i
Network	Next Hop	Metric	LocPrf	Weight	Path												
*> 30::1/128	FE80:100::2	0		0	65530 i												

## Common Errors

- When a neighborhood is configured, a local IPv6 link address is used to specify the neighborhood; however, no update source is specified as the interface for this local IPv6 link address during local configuration.
- Only one end uses a local IPv6 link address for establishing a neighborhood.

## 7.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears BGP IPv4 unicast routes.	<b>clear ip bgp [ vrf vrf-name ] { *   as-number   peer-address } [ soft ] [ in   out ]</b> <b>clear bgp ipv4 unicast [ vrf vrf-name ] { *   as-number   peer-address } [ soft ] [ in   out ]</b>
Clears BGP IPv4 multicast routes.	<b>clear bgp ipv4 multicast { *   as-number   peer-address }</b>
Clears BGP IPv4 MDT routes.	<b>clear bgp ipv4 mdt { *   as-number   peer-address }</b>
Clears BGP IPv6 unicast routes.	<b>clear bgp ipv6 unicast [ vrf vrf-name ] { *   as-number   peer-address } [ soft ] [ in   out ]</b>
Clears BGP IPv6 multicast routes.	<b>clear bgp ipv6 multicast { *   as-number   peer-address } [ soft ] [ in   out ]</b>

### Displaying

Description	Command
Displays BGP IPv4 unicast routes.	<b>show ip bgp</b> <b>show bgp ipv4 unicast</b>
Displays BGP IPv4 multicast routes.	<b>show bgp ipv4 multicast</b>
Displays BGP IPv4 MDT routes.	<b>show bgp ipv4 mdt</b>
Displays BGP IPv6 unicast routes.	<b>show bgp ipv6 unicast</b>
Displays BGP IPv6 multicast routes.	<b>show bgp ipv6 multicast</b>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Enables all BGP debugging.	<b>debug ip bgp all</b>
Debugs BGP route flapping.	<b>debug ip bgp dampening</b>
Debugs BGP event processing.	<b>debug ip bgp event</b>
Debugs BGP route filtering.	<b>debug ip bgp filter</b>
Debugs BGP status machine.	<b>debug ip bgp fsm</b>
Debugs BGP neighbor keepalive.	<b>debug ip bgp keepalives</b>
Debugs BGP MPLS processing.	<b>debug ip bgp mpls</b>
Debugs BGP core route processing.	<b>debug ip bgp nsm</b>
Debugs BGP UPDATE packets.	<b>debug ip bgp update</b>

## 8 Configuring PBR

### 8.1 Overview

Policy-based routing (PBR) is implemented by applying a route map including policies to interfaces and devices.

Similar to static routing, PBR is also manually configured and cannot automatically update with network changes. In addition, PBR is effective only for packets sent from local interfaces and devices. As compared with static and dynamic routing, PBR is more flexible. Static and dynamic routing can forward packets only based on destination addresses. PBR can forward packets based on source and destination addresses, packet length and input interface.

### 8.2 Applications

Application	Description
<a href="#">Selecting an ISP by Using PBR</a>	Specify preferential output interfaces for packets from different subnets.
<a href="#">Implementing Traffic Classification by Using PBR</a>	Specify QoS values for packets from different subnets.

#### 8.2.1 Selecting an ISP by Using PBR

An existing user network often uses resources of multiple internet server providers (ISPs). PBR needs to be used since different bandwidths may be requested from different ISPs or the network resources for key users need to be protected. By controlling forwarding of certain data packets, you can make full use ISP resources as well as meet the requirements of flexible and diversified applications.

#### Scenario

Figure 8-1

A LAN has two output interfaces for connecting the Internet. PBR is configured on the layer-3 device DEV1 to enable the two output interfaces to implement load sharing and mutual backup.

The specific requirements are as follows:

- Data streams from subnet 1 are sent from GE 0/1.
- Data streams from subnet 2 are sent from GE 0/2.
- If the GE 0/1 link is disconnected, the data streams on GE 0/1 are switched to GE 0/2. Vice versa.

## Deployment

- Configure two different ACLs on the layer-3 device DEV1:  
ACL1: source addresses belong to subnet 1.  
ACL2: source addresses belong to subnet 2.
- Configure two policies in the route map on the layer-3 device DEV1:  
Policy 1: sets the next hops for packets matching ACL1 to GE0/1 and GE0/2 (Based on the configuration sequence, GE0/1 takes effect first and GE0/2 works in the backup mode).  
Policy 2: sets the next hops for packets matching ACL2 to GE0/2 and GE0/1 (Based on the configuration sequence, GE0/2 takes effect first and GE0/1 works in the backup mode).
- Configure PBR on GE0/3 (by using a route map). Then, packets received on this interface are forwarded based on the policies.

## 8.2.2 Implementing Traffic Classification by Using PBR

### Scenario

Networks of medium- and small-sized enterprises have simple structures. Different branch nodes are interconnected to the central nodes through carrier dedicated lines or the Internet VPN mode. Enterprise networks often need to implement

three-in-one integration (of audio, video and data) to maximize the utilization of existing IP networks and save costs. Since all traffic is output from a single output interface, it is necessary to adjust the QoS policies for the output interface, in order to provide preferential communication quality for bandwidth- and delay-sensitive applications.

Figure 8-2

A LAN has an output interface for connecting the Internet. PBR is configured on the layer-3 device DEV1 to change the QoS values for packets from different networks.

The specific requirements are as follows:

- For data streams from subnet 1, representing audio streams, set the DSCP value to 56.
- For data streams from subnet 2, representing video streams, set the DSCP value to 40.
- For data streams from subnet 3, representing data streams, set the DSCP value to 24.

## Deployment

- Configure three different ACLs on the layer-3 device DEV1:
  - ACL1: source addresses belong to subnet 1.
  - ACL2: source addresses belong to subnet 2.
  - ACL3: source addresses belong to subnet 3.
- Configure three policies in the route map on the layer-3 device DEV1:
  - Policy 1: sets the DSCP value for packets matching ACL1 to 56.
  - Policy 2: sets the DSCP value for packets matching ACL2 to 40.
  - Policy 3: sets the DSCP value for packets matching ACL3 to 24.
- Configure PBR on GE0/3 (by using a route map). Then, the DSCP values for packets received on this interface are changed based on the policies.

## 8.3 Features

Feature	Description
<a href="#">Configuring a Policy</a>	Before configuring PBR, configure policies in a route map.
<a href="#">Configuring PBR</a>	Apply a route map including policies to interfaces and devices to implement PBR.

### 8.3.1 Configuring a Policy

A policy is a "match ..., set..." statement, which indicates that "if certain conditions are matched, perform certain processing actions".

 For detailed introduction to the policies, see the section "Route Map".

#### Executing Policies

In the global configuration mode, you can run the **route-map** *route-map-name* [ **permit** | **deny** ] [ *sequence-number* ] command to create a policy in a route map.

A route map may contain multiple policies. Each policy has a corresponding sequence number. A smaller sequence number means a higher priority. Policies are executed based on their sequence numbers. Once the matching condition of a policy is met, the processing action for this policy needs to be executed and the route map exits. If no matching condition of any policy is met, no processing action will be performed.

Policies have two working modes:

- **permit**: When the matching condition of a policy is met, perform the processing action for this policy and exit the route map.
- **deny**: When the matching condition of a policy is met, do not perform the processing action for this policy and exit the route map.

#### Matching conditions of policies

The matching conditions of a policy may contain 0, 1 or more matching rules.

- If 0 matching rule is contained, no packet will be matched.
- If one or more match rules are contained, all match rules must be matched at the same time to meet the matching conditions of the policy.

In the route map mode, run the **match** command to configure match rules. One **match** command is mapped to one match rule.

PBR supports the following **match** commands:

	Command	Description
IPv4 PBR	<b>match length</b>	The IPv4 packet length is used as the matching condition.   Only one <b>match length</b> command can be configured in a policy.

	<b>match ip address</b>	The source IPv4 address (and the destination IPv4 address) is used as the matching condition.   Multiple <b>match ip address</b> commands can be configured in a policy.
	<b>match ip policy</b>	The source IPv4 address (and the destination IPv4 address) and layer-3 authentication traffic redirection domain type are used as the matching conditions.   Only one <b>match ip policy</b> command can be configured in a policy.
IPv6 PBR	<b>match ipv6 address</b>	The source IPv6 address (and the destination IPv6 address) is used as the matching condition.   Only one <b>match ipv6 policy</b> command can be configured in a policy.

-  IPv4 PBR defines the source IP address (and destination IP address) ranges of packets by using the IP standard or extended ACLs. IPv6 PBR defines the source IPv6 address (and destination IPv6 address) ranges of packets by using the IPv6 extended ACLs.
-  Packet forwarding based on policies of IPv4 PBR interfaces supports expert-level and MAC name ACLs. Packet forwarding based on local policies does not support expert-level and MAC name ACLs.
-  When PBR uses an ACL that is unavailable, the route sub-map will not be matched and the next route sub-map will be matched instead. If no route sub-map is matched, a common route will be selected for forwarding. If only ACLs are configured but no ACE is configured, the PBR forwarding behavior is the same as that in a scenario where an ACL is unavailable
-  On a switch, if a route sub-map uses multiple ACLs in PBR, only the first ACL is matched.

### Processing action for a policy

The processing action of a policy may contain 0, 1 or more set rules.

- If 0 set rule is contained, no processing action will be performed and the route map will directly exit.
- If one or more set rules are contained, all processing actions will be performed and the route map will exit.

 If set rules have different priorities, the set rule with the highest priority will take effect.

In the route map mode, run the **set** command to configure set rules. One **set** command is mapped to one set rule.

PBR supports the following **set** commands:

	Command	Description
IPv4 PBR	<b>set ip tos</b>	Modifies the <b>tos</b> field of an IPv4 packet.   This command cannot work with the <b>set ip dscp</b> command.
	<b>set ip precedence</b>	Modifies the <b>precedence</b> field of an IPv4 packet.   This command cannot work with the <b>set ip dscp</b> command.

	Command	Description
	<b>set ip dscp</b>	<p>Modifies the <b>dscp</b> field of an IPv4 packet.</p> <p> This command cannot work with the <b>set ip tos</b> and <b>set ip precedence</b> commands.</p>
	<b>set vrf</b>	<p>Sends IPv4 packets to a VRF for forwarding.</p> <p>Select routes for packets matching the match rules by using a VRF specified by <b>set vrf</b>, no matter whether the interface that receives the packets belongs to the VRF.</p> <p> This command cannot work with the <b>set interface</b> and <b>set default interface</b> commands.</p>
	<b>set ip next-hop</b>	<p>Configures the next hop of IPv4 packet forwarding. The next hop must be directly connected; otherwise, this command is invalid.</p> <p>A packet matching the match rules will be forwarded to the next hop specified by <b>set ip next-hop first</b>, no matter whether the route selected for the packet in the routing table is consistent with the next hop specified by PBR.</p> <p> On a switch, the output interfaces for next hops supported by PBR include the SVI, routing and layer-3 AP interfaces.</p>
	<b>set ip next-hop recursive</b>	<p>Configures the recursive next hop of IPv4 packet forwarding. The next hop can be directly connected or not directly connected. A non-directly-connected next hop will recur to a static or dynamic route in the routing table.</p> <p>This command supports recursion to multiple ECMP next hops of a static or dynamic route. A maximum of 32 next hops are supported. If a recursive route is a static route, only one next hop is supported for the static recursive route.</p> <p>The redundant backup or load balancing mode of multiple recursive next hops is also determined by the <b>ip policy { redundance   load-balance }</b> command.</p> <p>A packet matching the match rules will be forwarded to the recursive next hop specified by <b>set ip next-hop recursive first</b>, no matter whether the route selected for the packet in the routing table is consistent with the next hop specified by PBR.</p> <p> Only when a static or dynamic route has an output interface and a next-hop IP address, the policy-based recursive next hop can take effect.</p>

	Command	Description
	<b>set interface</b>	<p>Configures the output interface of IPv4 packet forwarding. A packet matching the match rules will be forwarded from the interface specified by <b>set interface</b> first, no matter whether the route selected for the packet in the routing table is consistent with the output interface specified by PBR.</p> <hr/> <p> This command cannot work with the <b>set vrf</b> command.</p>
	<b>set ip default next-hop</b>	<p>Configures the default next hop of IPv4 packet forwarding. A packet matching the match rules will be forwarded to the default next hop specified by this command if a route fails to be selected or the default route is selected for this packet in the routing table.</p>
	<b>set ip default interface</b>	<p>Configures the default output interface of IPv4 packet forwarding. A packet matching the match rules will be forwarded from the interface specified by this command if a route fails to be selected or the default route is selected for this packet in the routing table.</p> <hr/> <p> This command cannot work with the <b>set vrf</b> command.</p>
	<b>set ip policy l3-auth</b>	<p>Configures layer-3 authentication for IPv4 packets. Layer-3 authentication will be enabled for packets matching the match rules.</p> <hr/> <p> This command is effective only for packets forwarded by an interface, but not for locally initiated packets.</p>
	<b>set ip policy load-balance</b>	<p>Configures the load balancing mode for IPv4 packets. A packet matching the match rules will select an output interface based on the configured load balancing mode if the load balancing mode is enabled globally for PBR.</p> <hr/> <p> This command is effective only for packets forwarded by an interface, but not for locally initiated packets.</p>
	<b>set ip policy no-ttl-decrease</b>	<p>Configures no decrease by 1 for the TTL field of IPv4 packets. The value of the TTL field will not be decreased by 1 at the header of an IPv4 packet matching the match rules when the packet is forwarded based on policies.</p> <hr/> <p> This command is mainly used for traffic redirection in layer-3 authentication.</p> <hr/> <p> This command is effective only for packets forwarded by an interface, but not for locally initiated packets.</p>
IPv6 PBR	<b>set ipv6 precedence</b>	<p>Modifies the <b>precedence</b> field of an IPv6 packet.</p> <hr/> <p> IPv6 PBR does not support <b>set ipv6 tos</b> or <b>set ipv6 dscp</b>.</p>

	Command	Description
	<b>set ipv6 next-hop</b>	Configures the next hop of IPv6 packet forwarding. An IPv6 packet matching the match rules will be forwarded to the next hop specified by <b>set ipv6 next-hop</b> first, no matter whether the route selected for the IPv6 packet in the routing table is consistent with the next hop specified by PBR. The next hop must be directly connected; otherwise, this command is invalid.
	<b>set ipv6 default next-hop</b>	Configures the default next hop of IPv6 packet forwarding. An IPv6 packet matching the match rules will be forwarded to the default next hop specified by this command if a route fails to be selected or the default route is selected for this packet in the routing table. The next hop must be directly connected; otherwise, this command is invalid.

- i The priority sequence is as follows: **set ip next-hop > set ip next-hop recursive > set interface > common route > set ip default next-hop > set default interface > default route**. The preceding **set** commands can be configured at the same time but only the command with the highest priority takes effect.
- i The priority sequence is as follows: **set ipv6 next-hop > common route > set ipv6 default next-hop > default route**. The preceding **set** commands can be configured at the same time but only the command with the highest priority takes effect.
- ✓ For switches, the **set ipv6 default next-hop** command does not take effect for IPv6 addresses whose mask length exceeds 64.

## 8.3.2 Configuring PBR

### PBR

Apply a route map including policies to interfaces or devices to implement PBR.

- Apply a route map to an interface so that packets received by the interface are routed based on the policy.  
The PBR is often used to control user packets received by a device. This command is effective only for forwarded packets, but not for locally initiated packets.
- Apply a route map to a device so that packets locally initiated are routed based on the policy.  
The PBR is often used to control protocol packets exchanged between devices (such as ping packets sent locally). This command is effective only for locally initiated packets, but not for forwarded packets.

- i By default, PBR is not unavailable on a device and packets are forwarded based on a routing table.

### Redundant backup or load balancing

You can set multiple next hops in a policy. Either redundant backup or load balancing can be implemented among multiple next hops. Redundant backup is implemented by default.

**i** Redundant backup or load balancing is only effective for next hops configured in the **set ip next-hop**, **set ip next-hop recursive**, **set ip default next-hop**, **set ipv6 next-hop** and **set ipv6 default next-hop** commands, and only effective among multiple next hops in the same set rule.

- Redundant backup

Based on the configuration sequence, the first accessible next hop takes effect. When the currently effective next hop (R1) is faulty, the traffic automatically switches to the next accessible next hop (R2). When R1 becomes accessible again, the traffic automatically switches back to R1.

A newly added next hop is arranged at the last of the sequence. Assume that the original sequence of multiple next hops is R1 > R2 > R3. After R1 is deleted and added again, the sequence changes to R2 > R3 > R1.

If no next hop is accessible, packets will be discarded.

- Load balancing

When multiple accessible next hops take effect at the same time, the Weighted Cost Multiple Path (WCMP) and Equal Cost Multiple Path (ECMP) are supported. After an accessible next hop loses effect, traffic will be balanced among the other accessible next hops.

## Correlation with BFD

Correlation between PBR and BFD is effective only for next hops configured by the **set ip next-hop** or **set ipv6 next-hop** command.

The **set ip next-hop** and **set ipv6 next-hop** commands carry the **verify-availability** and **bfd [ vrf vrf-name ] interface-type interface-number gateway** parameters, which can establish correlation between PBR and a BFD session and monitor the accessibility of next hops.

Correlation between PBR and BFD helps enhance the PBR's perception about network environment changes. When BFD detects that the current next hop is not accessible, the BFD will immediately notify the PBR to switch the traffic to another accessible next hop (to implement redundant backup) or all the other accessible next hops (to implement load balancing).

**i** For the configuration and related commands for correlation between PBR and BFD, see the "BFD" section.

## 8.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic Functions of PBR</a>	 (Mandatory) It is used to apply PBR to forward packets.	
	<b>ip policy route-map</b>	Applies PBR for IPv4 packets received by an interface.
	<b>ipv6 policy route-map</b>	Applies PBR for IPv6 packets received by an interface.

Configuration	Description and Command	
	<b>ip local policy route-map</b>	Applies PBR for IPv4 packets locally initiated.
	<b>ipv6 local policy route-map</b>	Applies PBR for IPv6 packets locally initiated.
<a href="#">Setting Redundant Backup or Load Balancing</a>	 (Optional) It is used to set whether PBR implements redundant backup or load balancing among multiple next hops.	
	<b>ip policy { redundancy   load-balance }</b>	Sets whether IPv4 PBR implements redundant backup or load balancing among multiple next hops. The default setting is redundant backup.
	<b>ipv6 policy { redundancy   load-balance }</b>	Sets whether IPv6 PBR implements redundant backup or load balancing among multiple next hops. The default setting is redundant backup.
Configuring Source-Address-Based PBR	 (Optional) It is used to apply source-address-based PBR to forward packets.	
	<b>ip policy-source in-interface</b>	Applies source-address-based PBR for IPv4 packets received by an interface.
	<b>ipv6 policy-source in-interface</b>	Applies source-address-based PBR for IPv6 packets received by an interface.

## 8.4.1 Configuring Basic Functions of PBR

### Configuration Effect

Perform personalized routing management for user data streams by preparing flexible policies.

Perform personalized management for protocol interaction and network topologies by preparing flexible policies.

### Notes

- A route map must be used when PBR is configured; therefore, you must configure a route map on a device.
- If an ACL is used when the route map is configured, you must configure the ACL on the device.

### Configuration Steps

#### 📌 Applying PBR for IPv4 packets received by an interface

- To perform personalized routing management for IPv4 user data streams passing a device, you should perform this configuration.
- Perform this configuration on the input interface for user data streams.
- Run the **ip policy route-map** command to apply a route map to an interface. Then, PBR is executed for IPv4 packets received on this interface.

<b>Command</b>	<b>ip policy route-map</b> <i>route-map-name</i>
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Defaults</b>	By default, PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Only one <b>ip policy route-map</b> command can be configured for an interface. If multiple <b>ip policy route-map</b> commands are configured for an interface, only the last configuration takes effect. If the route map used in PBR is unavailable, the PBR does not take effect.

### ↘ Applying PBR for IPv6 packets received by an interface

- To perform personalized routing management for IPv6 user data streams passing a device, you should perform this configuration.
- Perform this configuration on the input interface for user data streams.
- Run the **ipv6 policy route-map** command to apply a route map to an interface. Then, PBR is executed for IPv6 packets received on this interface.

<b>Command</b>	<b>ipv6 policy route-map</b> <i>route-map-name</i>
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Defaults</b>	By default, PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Only one <b>ipv6 policy route-map</b> command can be configured for an interface. If multiple <b>ipv6 policy route-map</b> commands are configured for an interface, only the last configuration takes effect. If the route map used in PBR is unavailable, the PBR does not take effect.

### ↘ Applying PBR for IPv4 packets locally initiated

- To perform personalized management for IPv4 protocol interaction and IPv4 network topologies, you should perform this configuration.
- Run the **ip local policy route-map** command to apply a route map to a device. Then, PBR is executed for IPv4 packets locally initiated.

<b>Command</b>	<b>ip local policy route-map</b> <i>route-map-name</i>
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Defaults</b>	By default, PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Only one <b>ip local policy route-map</b> command can be configured for a device. If the route map used in PBR is unavailable, the PBR does not take effect.

### ↘ Applying PBR for IPv6 packets locally initiated

- To perform personalized management for IPv6 protocol interaction and IPv6 network topologies, you should perform this configuration.
- Run the **ipv6 local policy route-map** command to apply a route map to a device. Then, PBR is executed for IPv6 packets locally initiated.

<b>Command</b>	<b>ipv6 local policy route-map</b> <i>route-map-name</i>
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Defaults</b>	By default, PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Only one <b>ipv6 local policy route-map</b> command can be configured for a device. If the route map used in PBR is unavailable, the PBR does not take effect.

### Verification

- Check the configurations of PBR.
- Check the configurations of the route map used by PBR.
- If an ACL is used when the route map is configured, you should check the configurations of the ACL.

### ↘ Checking the configurations of IPv4 PBR

<b>Command</b>	<b>show ip policy</b> [ <i>route-map-name</i> ]
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Check the interfaces configured with IPv4 PBR according to the output information and the name of the used route map.</p> <pre>Ruijie# show ip policy Banlance mode: redundance  Interface          Route map local              RM_for_PBR_1 GigabitEthernet 0/1  RM_for_PBR_2</pre> <p><b>Local</b> indicates applying policy-based routing for IPv4 packets locally initiated.</p>

### ↘ Checking the configurations of IPv6 PBR

<b>Command</b>	<b>show ipv6 policy</b> [ <i>route-map-name</i> ]
<b>Parameter</b>	<i>route-map-name</i> : Indicates the name of a route map.

<b>Description</b>	
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Check the interfaces configured with IPv6 PBR according to the output information and the name of the used route map.</p> <pre>Ruijie#show ipv6 policy  Banlance mode: redundance  Interface          Route map ----- local              RM_for_PBR_1 VLAN 1            RM_for_PBR_2</pre> <p><b>Local</b> indicates applying policy-based routing for IPv6 packets locally initiated.</p>

↘ **Checking the configurations of a route map**

<b>Command</b>	<b>show route-map [ route-map-name ]</b>
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Multiple route maps may be available on a device. Focus on the route map used in PBR and check its policy settings.</p> <pre>Ruijie# show route-map  route-map RM_FOR_PBR, permit, sequence 10    Match clauses:     ip address acl1    Set clauses:     ip next-hop 200.24.18.1  route-map RM_FOR_PBR, permit, sequence 20    Match clauses:     ip address acl2    Set clauses:     ip next-hop 200.24.19.1</pre>

↘ **Checking the configurations of an ACL**

<b>Command</b>	<b>show access-lists [ acl-id   acl-name ]</b>
<b>Parameter</b>	<i>acl-id</i> : Indicates the ACL ID.

<b>Description</b>	<i>acl-name</i> : Indicates the ACL name.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Multiple ACLs may be available on a device. Focus on the ACL used by a route map and check its configurations.</p> <pre>Ruijie# show access-lists 1 ip access-list standard 1  10 permit 200.24.16.0 0.0.0.255 ip access-list standard 2  10 permit 200.24.17.0 0.0.0.255</pre>

📌 **Checking the routing information of IPv4 PBR**

<b>Command</b>	<b>show ip pbr route [ interface <i>if-name</i>   local ]</b>
<b>Parameter</b>	<i>if-name</i> : Indicates an interface name.
<b>Description</b>	<b>local</b> : Indicates local.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Specify a local interface or device and check the routing information of IPv4 PBR.</p> <pre>Ruijie# show ip pbr route PBR IPv4 Route Summay : 1 Interface      : GigabitEthernet 0/1 Sequence      : 10 Min Length    : None Max Length    : None VRF ID        : 0 Route Flags   : Route Type    : PBR Direct       : Permit Priority      : High Tos_Dscp     : None Precedence   : None Tos_Dscp     : 0 Precedence   : 0 Mode         : redundance</pre>

	<pre> Nexthop Count  : 1 Nexthop[0]    : 192.168.8.100 Weight[0]     : 1 Ifindex[0]    : 2                 </pre>
--	---

📌 **Checking the routing information of IPv6 PBR**

<b>Command</b>	<b>show ipv6 pbr route [ interface <i>if-name</i>   local ]</b>
<b>Parameter</b>	<i>if-name</i> : Indicates an interface name.
<b>Description</b>	<b>local</b> : Indicates local.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Specify a local interface or device and check the routing information of IPv6 PBR.</p> <pre> Ruijie# show ipv6 pbr route PBR IPv6 Route Summary : 1 Interface      : GigabitEthernet 0/1 Sequence      : 10 ACL[0]        : 2900 ACL_CLS[0]    : 5 Min Length    : None Max Length    : None VRF ID        : 0 Route Flags   : Route Type    : PBR Direct       : Permit Priority      : High Tos_Dscp     : None Precedence   : None Tos_Dscp     : 0 Precedence   : 0 Mode         : redundance Nexthop Count : 1 Nexthop[0]   : 10::2 Weight[0]    : 1                 </pre>

	Ifindex[0] : 2
--	----------------

↘ **Checking a route map used by IPv4 PBR**

<b>Command</b>	<b>show ip pbr route-map <i>rmap-name</i></b>
<b>Parameter Description</b>	<i>rmap-name</i> : Indicates the route map name.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Specify a route map and check the route map used by IPv4 PBR.</p> <pre style="background-color: #f2f2f2; padding: 10px;"> Ruijie# show ip pbr route-map rm PBR VRF: GLOBAL, ID: 0 Forward Mode: redundance Forwarding: On  Route-map rm Route-map index: Sequence 10, permit Match rule: ACL ID : 2900, CLS: 1, Name: acl1 Set rule: IPv4 nexthop: 192.168.8.100, (VRF name: , ID: 0), Weight: 0 PBR state info ifx: 2, Connected: True, Track state: Up                     </pre>

↘ **Checking a route map used by IPv6 PBR**

<b>Command</b>	<b>show ipv6 pbr route-map <i>rmap-name</i></b>
<b>Parameter Description</b>	<i>rmap-name</i> : Indicates the route map name.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Specify a route map and check the route map used by IPv6 PBR.</p> <pre style="background-color: #f2f2f2; padding: 10px;"> Ruijie# show ipv6 pbr route-map rm6 PBR VRF: GLOBAL, ID: 0 Forward Mode: redundance Forwarding: On  Route-map rm6                     </pre>

```

Route-map index: Sequence 10, permit

Match rule:

  ACL ID : 2901, CLS: 5, Name: acl6

Set rule:

  IPv6 nexthop: 10::2, (VRF name: , ID: 0), Weight: 0

  PBR state info ifx: 2, Connected: True, Track state: Up
    
```

↘ **Checking the statistics about packets forwarded by IPv4 PBR**

<b>Command</b>	<b>show ip pbr statistics [ interface <i>if-name</i>   local ]</b>
<b>Parameter</b>	<i>if-name</i> : Indicates an interface name.
<b>Description</b>	<b>local</b> : Indicates local.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<pre> Ruijie# show ip pbr statistics  IPv4 Policy-based route statistic  gigabitEthernet 0/1  statistics : 10         </pre>

↘ **Checking the statistics about packets forwarded by IPv6 PBR**

<b>Command</b>	<b>show ipv6 pbr statistics [ interface <i>if-name</i>   local ]</b>
<b>Parameter</b>	<i>if-name</i> : Indicates an interface name.
<b>Description</b>	<b>local</b> : Indicates local.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<pre> Ruijie# show ipv6 pbr statistics  IPv6 Policy-based route statistic  gigabitEthernet 0/1  statistics : 20         </pre>

**Configuration Example**

➤ **Configuring IPv4 PBR and selecting an output link based on source addresses of packets**

<p><b>Scenario</b> <b>Figure 8-3</b></p>	
	<p>The layer-3 device DEV 1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24 whereas the network segment where subnet 2 resides is 200.24.17.0/24.</p> <p>DEV 1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p>
	<p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Data streams from subnet 1 for accessing the Internet should pass GE 0/1.</li> <li>● Data streams from subnet 2 for accessing the Internet should pass GE 0/2.</li> <li>● If the GE 0/1 link is disconnected, the data streams on the GE 0/1 interface are switched to the GE 0/2 interface. Vice versa.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure two ACLs to match packets from subnets 1 and 2 respectively.</li> <li>● Set a policy to set the next hops for packets from subnet 1 to GE0/1 and GE0/2. (Pay attention to the configuration sequence.)</li> <li>● Set a policy to set the next hops for packets from subnet 2 to GE0/2 and GE0/1. (Pay attention to the configuration sequence.)</li> <li>● Apply the policy to GE 0/3.</li> <li>● Set PBR to implement redundant backup among multiple next hops. (The default setting is redundant backup.)</li> </ul> <p><b>i</b> During redundant backup, based on the configuration sequence, the first next hop takes effect first.</p>
	<pre>DEV1(config)# access-list 1 permit 200.24.16.0 0.0.0.255 DEV1(config)# access-list 2 permit 200.24.17.0 0.0.0.255</pre>

	<pre> DEV1(config)# route-map RM_FOR_PBR 10 DEV1(config-route-map)# match ip address 1 DEV1(config-route-map)# set ip next-hop 200.24.18.1 DEV1(config-route-map)# set ip next-hop 200.24.19.1 DEV1(config-route-map)# exit DEV1(config)# route-map RM_FOR_PBR 20 DEV1(config-route-map)# match ip address 2 DEV1(config-route-map)# set ip next-hop 200.24.19.1 DEV1(config-route-map)# set ip next-hop 200.24.18.1 DEV1(config-route-map)# exit DEV1(config)# interface GigabitEthernet 0/3 DEV1(config-if-GigabitEthernet 0/3)# ip policy route-map RM_FOR_PBR DEV1(config-if-GigabitEthernet 0/3)# exit DEV1(config)# ip policy redundancy         </pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Check the configurations of IPv4 PBR.</li> <li>● Check the configurations of the route map.</li> <li>● Check the configurations of an ACL.</li> </ul>
	<pre> DEV1# show ip policy Interface                Route map GigabitEthernet 0/3      RM_FOR_PBR         </pre>
	<pre> DEV1# show route-map route-map RM_FOR_PBR, permit, sequence 10   Match clauses:     ip address 1   Set clauses: ip next-hop 200.24.18.1 200.24.19.1 route-map RM_FOR_PBR, permit, sequence 20   Match clauses:     ip address 2   Set clauses:         </pre>

ip next-hop 200.24.19.1 200.24.18.1
<pre> DEV1# show access-lists  ip access-list standard 1  10 permit 200.24.16.0 0.0.0.255  ip access-list standard 2  10 permit 200.24.17.0 0.0.0.255         </pre>

📌 **Configuring IPv6 PBR and selecting an output link based on source addresses of packets**

<p><b>Scenario</b></p> <p><b>Figure 8-4</b></p>	<p>The diagram illustrates a network topology. At the top, a cloud labeled 'Internet' is connected to a central 'Layer-3 device DEV1'. The Internet connection is split between two interfaces: GE0/1 with IP 2001::1 and GE0/2 with IP 2002::1. Below DEV1, another interface GE0/3 is connected to two separate clouds representing 'Subnet 1' (IP range 2003::/64) and 'Subnet 2' (IP range 2004::/64).</p>
	<p>DEV 1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 2003::/64 whereas the network segment where subnet 2 resides is 2004::/64.</p> <p>DEV1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 2001::1/64 and 2002::1/64.</p>
	<p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Data streams from subnet 1 for accessing the Internet should pass GE 0/1.</li> <li>● Data streams from subnet 2 for accessing the Internet should pass GE 0/2.</li> <li>● If the GE 0/1 link is disconnected, the data streams on the GE 0/1 interface are switched to the GE 0/2 interface. Vice versa.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure two ACLs to match packets from subnets 1 and 2 respectively.</li> <li>● Set a policy to set the next hops for packets from subnet 1 to GE0/1 and GE0/2. (Pay attention to the configuration sequence.)</li> <li>● Set a policy to set the next hops for packets from subnet 2 to GE0/2 and GE0/1. (Pay attention to the configuration sequence.)</li> <li>● Apply the policy to GE 0/3.</li> </ul>

	<ul style="list-style-type: none"> <li>● Set PBR to implement redundant backup among multiple next hops.</li> </ul> <p><b>i</b> During redundant backup, based on the configuration sequence, the first next hop takes effect first.</p>
	<pre> DEV1(config)# ipv6 access-list net1 DEV1(config-ipv6-acl)# permit ipv6 2003::/64 any DEV1(config-ipv6-acl)# exit DEV1(config)# ipv6 access-list net2 DEV1(config-ipv6-acl)# permit ipv6 2004::/64 any DEV1(config-ipv6-acl)# exit DEV1(config)# route-map RM_FOR_PBR 30 DEV1(config-route-map)# match ipv6 address net1 DEV1(config-route-map)# set ipv6 next-hop 2001::1 DEV1(config-route-map)# set ipv6 next-hop 2002::1 DEV1(config-route-map)# exit DEV1(config)# route-map RM_FOR_PBR 40 DEV1(config-route-map)# match ipv6 address net2 DEV1(config-route-map)# set ipv6 next-hop 2002::1 DEV1(config-route-map)# set ipv6 next-hop 2001::1 DEV1(config-route-map)# exit DEV1(config)# interface GigabitEthernet 0/3 DEV1(config-if-GigabitEthernet 0/3)# ipv6 policy route-map RM_FOR_PBR DEV1(config-if-GigabitEthernet 0/3)# exit DEV1(config)# ipv6 policy redundance                     </pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Check the configurations of IPv6 PBR.</li> <li>● Check the configurations of the route map.</li> <li>● Check the configurations of an ACL.</li> </ul>
	<pre> DEV1# show ipv6 policy  Interface                Route map GigabitEthernet 0/3      RM_FOR_PBR                     </pre>
	<pre> DEV1# show route-map  route-map RM_FOR_PBR, permit, sequence 11                     </pre>

	<pre> Match clauses:   ipv6 address net1  Set clauses:   ipv6 next-hop 2001::1 2002::1  route-map RM_FOR_PBR, permit, sequence 21  Match clauses:   ipv6 address net2  Set clauses:   ipv6 next-hop 2002::1 2001::1                 </pre>
	<pre> DEV1# show access-lists  ipv6 access-list net1 10 permit ipv6 2003::/64 any (0 packets matched)  ipv6 access-list net2 10 permit ipv6 2004::/64 any (0 packets matched)                 </pre>

--	--

--	--

**Common Errors**

- A route map is used when PBR is configured but the route map does not exist.
- An ACL is used when a route map is configured but the ACL does not exist.

**8.4.2 Setting Redundant Backup or Load Balancing**

**Configuration Effect**

- Using multiple next hops in the mutual backup mode can enhance the network reliability.
- Implementing load balancing among multiple next hops can expand the network bandwidth.

## Notes

- The basic functions of PBR must be configured.
- Redundant backup and load balancing are effective only for the next hops set by the following **set** commands.

Command	Description
<b>set ip next-hop</b>	Configures the next hop of IPv4 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.
<b>set ip default next-hop</b>	Configures the default next hop of IPv4 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.
<b>set ipv6 next-hop</b>	Configures the next hop of IPv6 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.
<b>set ipv6 default next-hop</b>	Configures the default next hop of IPv6 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.
<b>set ip next-hop recursive</b>	Configures the recursive next hop of IPv4 packets. Only one command can be configured for a route map and packets can recur to multiple next hops (up to 32 next hops) of a static or dynamic ECMP route. The redundant backup or load balancing mode for recurring to multiple next hops is also determined by the <b>ip policy { redundancy   load-balance }</b> command.

**i** Up to eight next hops can be set for WCMP whereas up to 32 next hops can be set for ECMP.

## Configuration Steps

### Setting whether IPv4 PBR implements redundant backup or load balancing among multiple next hops

- If load balancing needs to be implemented among multiple next hops, this configuration needs to be performed.
- If load balancing is configured at present, you also need to perform this configuration to reset redundant backup.
- This configuration is effective for all PBRs configured on a device.

<b>Command</b>	<b>ip policy { redundancy   load-balance }</b>
<b>Parameter</b>	redundance: Indicates redundant backup.
<b>Description</b>	load-balance: Indicates load balancing.
<b>Defaults</b>	Redundant backup is configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If redundant backup is selected, the first next hop takes effect based on the configuration sequence. If load balancing is selected, all next hops take effect at the same time and share traffic by weight.

### Setting whether IPv6 PBR implements redundant backup or load balancing among multiple next hops

- If load balancing needs to be implemented among multiple next hops, this configuration needs to be performed.
- If load balancing is configured at present, you also need to perform this configuration to reset redundant backup.
- This configuration is effective for all PBRs configured on a device.

<b>Command</b>	<b>ipv6 policy { redundancy   load-balance }</b>
----------------	--

<b>Parameter</b>	redundance: Indicates redundant backup.
<b>Description</b>	load-balance: Indicates load balancing.
<b>Defaults</b>	Redundant backup is configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If redundant backup is selected, the first next hop takes effect based on the configuration sequence. If load balancing is selected, all next hops take effect at the same time and share traffic by weight.

## Verification

- Check whether redundant backup or load balancing is implemented among multiple next hops.

### 📌 Checking whether IPv4 PBR implements redundant backup or load balancing among multiple next hops

<b>Command</b>	<b>show ip policy</b> [ <i>route-map-name</i> ]
<b>Parameter Description</b>	<b><i>route-map-name</i></b> : Specifies a route map.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	See the following example and focus on the red field. <pre>ruijie# show ip policy Banlance mode: redundance  Interface          Route map local              test GigabitEthernet 0/3  test</pre>

### 📌 Checking whether IPv6 PBR implements redundant backup or load balancing among multiple next hops

<b>Command</b>	<b>show ipv6 policy</b> [ <i>route-map-name</i> ]
<b>Parameter Description</b>	<b><i>route-map-name</i></b> : Specifies a route map.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	See the following example and focus on the red field. <pre>ruijie#show ipv6 policy Banlance mode: redundance  Interface          Route map VLAN 1             RM_for_Vlan_1 VLAN 2             RM_for_Vlan_2</pre>

## Configuration Example

➤ **Configuring IPv4 PBR to implement redundant backup among multiple next hops**

See the preceding example: [Configuring IPv4 PBR and selecting an output link based on source addresses of packets](#)

➤ **Configuring IPv6 PBR to implement redundant backup among multiple next hops**

See the preceding example: [Configuring IPv6 PBR and selecting an output link based on source addresses of packets](#)

➤ **Configuring IPv4 PBR to implement load balancing among multiple next hops**

<p><b>Scenario</b> <b>Figure 8-5</b></p>	
	<p>The layer-3 device DEV 1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24 whereas the network segment where subnet 2 resides is 200.24.17.0/24.</p> <p>DEV 1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p>
	<p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows: The traffic is equally shared by GE0/1 and GE0/2.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic functions of PBR. Specify multiple next hops.</li> <li>● Set the load balancing mode.</li> </ul>
	<pre> DEV1(config)# route-map RM_LOAD_PBR 10 DEV1(config-route-map)# set ip next-hop 200.24.18.1 DEV1(config-route-map)# set ip next-hop 200.24.19.1 DEV1(config-route-map)# exit DEV1(config)# interface GigabitEthernet 0/3 DEV1(config-if-GigabitEthernet 0/3)# ip policy route-map RM_LOAD_PBR DEV1(config-if-GigabitEthernet 0/3)# exit                     </pre>

	<pre>DEV1(config)# ip policy load-balance</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the configurations of IPv4 PBR.</li> <li>● Check the configurations of the route map.</li> </ul>
	<pre>DEV1# show ip policy Balance mode: load-balance Interface                Route map GigabitEthernet 0/3      RM_LOAD_PBR</pre>
	<pre>DEV1# show route-map route-map PBR-VRF-Selection, permit, sequence 10 Match clauses: Set clauses: ip next-hop 200.24.18.1 8 ip next-hop 200.24.19.1 8</pre>

➤ **Configuring IPv6 PBR to implement load balancing among multiple next hops**

<p><b>Scenario</b> <b>Figure 8-6</b></p>	<p>The diagram illustrates a network topology. At the top, a cloud labeled 'Internet' is connected to a 'Layer-3 device DEV1' through two interfaces, 'Gi 0/1' and 'Gi 0/2'. A label '2002::1' is placed to the right of these connections. Below DEV1, interface 'Gi 0/3' is connected to two separate clouds representing 'Subnet 1' and 'Subnet 2'. Subnet 1 is labeled with the address '2003::/64' and Subnet 2 is labeled with '2004::/64'.</p>
	<p>DEV 1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 2003::/64 whereas the network segment where subnet 2 resides is 2004::/64.</p> <p>DEV1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 2001::1/64 and 2002::1/64.</p>
	<p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows: The traffic is equally shared by GE0/1 and GE0/2.</p>

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic functions of PBR. Specify multiple next hops.</li> <li>● Set the load balancing mode.</li> </ul>
	<pre> DEV1(config)# route-map RM_LOAD_PBR 20 DEV1(config-route-map)# set ipv6 next-hop 2001::1 DEV1(config-route-map)# set ipv6 next-hop 2002::1 DEV1(config-route-map)# exit DEV1(config)# interface GigabitEthernet 0/3 DEV1(config-if-GigabitEthernet 0/3)# ipv6 policy route-map RM_LOAD_PBR DEV1(config-if-GigabitEthernet 0/3)# exit DEV1(config)# ipv6 policy load-balance                     </pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Check the configurations of IPv6 PBR.</li> <li>● Check the configurations of the route map.</li> </ul>
	<pre> DEV1# show ipv6 policy Balance mode: load-balance  Interface                Route map GigabitEthernet 0/3      RM_LOAD_PBR  DEV1# show route-map route-map PBR-VRF-Selection, permit, sequence 10    Match clauses:   Set clauses:   ipv6 next-hop 2001::1   ipv6 next-hop 2002::1                     </pre>

## 8.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
<p>Clears the statistics about packets forwarded by IPv4 PBR.</p>	<p><b>clear ip pbr statistics</b> [ <b>interface</b> <i>if-name</i>   <b>local</b> ]</p>

Clears the statistics about packets forwarded by IPv6 PBR.	<b>clear ipv6 pbr statistics [ interface <i>if-name</i>   local ]</b>
--	---

## Displaying

Description	Command
Displays the configurations of IPv4 PBR.	<b>show ip policy</b>
Displays the configurations of IPv6 PBR.	<b>show ipv6 policy</b>
Displays the configurations of a route map.	<b>show route-map [ name ]</b>
Displays the configurations of an ACL.	<b>show access-list</b>
Displays the correlation between IPv4 PBR and BFD.	<b>show ip pbr bfd</b>
Displays the correlation between IPv6 PBR and BFD.	<b>show ipv6 pbr bfd</b>
Displays the routing information of IPv4 PBR.	<b>show ip pbr route [ interface <i>if-name</i>   local ]</b>
Displays the routing information of IPv6 PBR.	<b>show ipv6 pbr route [ interface <i>if-name</i>   local ]</b>
Displays a route map used by IPv4 PBR.	<b>show ip pbr route-map <i>rmap-name</i></b>
Displays a route map used by IPv6 PBR.	<b>show ipv6 pbr route-map <i>rmap-name</i></b>
Displays the routing information of IPv4 source-address-based PBR.	<b>show ip pbr source-route [ interface <i>if-name</i> ]</b>
Displays the routing information of IPv6 source-address-based PBR.	<b>show ipv6 pbr source-route [ interface <i>if-name</i> ]</b>
Displays the statistics about IPv4 PBR.	<b>show ip pbr statistics [ interface <i>if-name</i>   local ]</b>
Displays the statistics about IPv6 PBR.	<b>show ipv6 pbr statistics [ interface <i>if-name</i>   local ]</b>

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs PBR errors.	<b>debug pbr error</b>
Debugs PBR events.	<b>debug pbr events</b>
Debugs multiple service cards supported by PBR.	<b>debug pbr ms</b>
Debugs PBR message communication.	<b>debug pbr msg</b>
Debugs interaction between PBR and NSM.	<b>debug pbr nsm</b>
Debugs packet forwarding of PBR.	<b>debug pbr packet</b>
Debugs PBR GR.	<b>debug pbr restart</b>

## 9 Configuring VRF

### 9.1 Overview

A Virtual Private Network (VPN) Routing and Forwarding (VRF) table is used for the forwarding of VPN packets. Each VPN corresponds to a VRF table.

A device that provides the VPN service has multiple routing tables, including a public network routing table and one or multiple VRF tables. The public-network routing table is used for the forwarding of public network packets, and the VRF tables are used for the forwarding of VPN packets. These routing tables are created to separate routes in the public network from those in VPNs and separate routes in different VPNs.

**i** A VPN is a private dedicated network built in the public network. "Virtual" means that the VPN is logically exclusive, instead of physically exclusive.

#### Protocols and Standards

- RFC4364: BGP/MPLS IP Virtual Private Networks (VPNs)

### 9.2 Applications

Application	Description
<a href="#">Local Inter-VPN Access</a>	Provide the VPN service on a routing device and enable VPNs to access each other.
<a href="#">VRF only on Provider Edges (PEs)</a>	Provide the VPN service in an IP/Multiprotocol Label Switching (MPLS) network and connect one Customer Edge (CE) to one VPN.
<a href="#">VRF on CEs and PEs</a>	Provide the VPN service in an IP/ MPLS network and connect one CE to multiple VPNs.

**i** CE: An edge device in a customer network

**i** PE: An edge device in a Service Provider (SP) network

#### 9.2.1 Local Inter-VPN Access

##### Scenario

Provide the VPN service on a routing device and enable VPNs to access each other.

In Figure 9-1, Sub a runs the Routing Information Protocol (RIP), Sub b runs the Open Shortest Path First (OSPF) protocol, and Servers is a network segment directly connected to C. Provide the VPN service on C to Sub a, Sub b, and Servers, and enable Sub a and Sub b to access Servers.

Figure 9-1

### Related Configuration

- On C, create a VRF table for Sub a, bind the interface directly connected to A, and associate the VRF table with A by using RIP.
- On C, create a VRF table for Sub b, bind the interface directly connected to B, and associate the VRF table with B by using OSPF.
- On C, create a VRF table for Servers and bind the interface directly connected to Servers.
- On C, configure the route targets (RTs) of the VRF tables for Suba, Subb, and Servers. Import the routes in the VRF tables for Sub a and Sub b to the VRF table for Servers, and import the routes in the VRF table for Servers to the VRF tables for Sub a and Sub b.
- Configure the Border Gateway Protocol (BGP) on C. Introduce the RIP routes to the VRF table for Sub a, introduce the OSPF routes to the VRF table for Sub b, and introduce the direct routes to the VRF table for Servers.

## 9.2.2 VRF only on PEs

### Scenario

An Internet Service Provider (ISP) provides the VPN service in an IP/MPLS backbone network.

In Figure 9-2, VPN1 runs RIP, and VPN2 runs OSPF.

- One CE is connected to one VPN, and all routes on the CE are exclusively used by the connected VPN. Therefore, no VRF table needs to be created to separate the routes.
- On each PE, VRF tables must be created to separate the routes in VPN1, those in VPN2, and those in the public network from each other.

Figure 9-2

## Deployment

- On PE1, create a VRF table for VPN1 and bind the interface directly connected to CE1. On PE2, create a VRF table for VPN1 and bind the interface directly connected to CE3.
- On PE1, create a VRF table for VPN2 and bind the interface directly connected to CE2. On PE2, create a VRF table for VPN2 and bind the interface directly connected to CE4.
- On PE1, associate the VRF table for VPN1 with CE1 by using RIP. On PE2, associate the VRF table for VPN1 with CE3 by using RIP.
- On PE1, associate the VRF table for VPN2 with CE2 by using OSPF. On PE2, associate the VRF table for VPN2 with CE4 by using OSPF.
- Create a BGP neighbor (VPNv4 address family) between PE1 and PE2.
- In the VRF instance for VPN1 on PE1, redistribute RIP routes to BGP, and redistribute BGP routes to RIP. The configuration on PE2 is similar.
- In the VRF instance for VPN2 on PE1, redistribute OSPF routes to BGP, and redistribute BGP routes to OSPF. The configuration on PE2 is similar.

 For details about the application scenario, see "Configuration Guide > MPLS > L3 VPN".

## 9.2.3 VRF on CEs and PEs (MCE Application)

### Scenario

An ISP provides the VPN service in an IP/MPLS backbone network.

In Figure 9-3, VPN a runs RIP, VPN b runs OSPF, and PE1 and PE2 are connected to BGP/MPLS VPNs.

- One Multi-VPN-Instance CE (MCE) is connected to multiple VPNs. VRF tables must be created to separate the routes in VPN a from those in VPN b.
- On each PE, VRF tables must be created to separate the routes in VPN a, those in VPN b, and those in the public network from each other.

Figure 9-3

### Deployment

- One MCE1, create VRF tables for VPN a and VPN b respectively, bind the interfaces directly connected to VPN a and VPN b, and bind the VLAN interface connected to PE1. The configuration on MCE2 is similar.

- On PE1, create VRF tables for VPN a and VPN b respectively, and bind the VLAN interface connected to MCE1. The configuration on PE2 is similar.
- On MCE1, associate the VRF table for VPN a with VPN a by using RIP. The configuration on MCE2 is similar.
- On MCE1, associate the VRF table for VPN b with VPN b by using OSPF. The configuration on MCE2 is similar.
- Create a BGP neighbor (VPNv4 address family) between PE1 and PE2.
- In the VRF instance for VPN a on MCE1, redistribute RIP routes to BGP, and redistribute BGP routes to RIP. The configuration on MCE2 is similar.
- In the VRF instance for VPN b on MCE1, redistribute OSPF routes to BGP, and redistribute BGP routes to OSPF. The configuration on MCE2 is similar.

 For details about the application scenario, see "Configuration Guide > MPLS > L3 VPN".

## 9.3 Features

### Overview

Feature	Description
<a href="#">VPN Instance</a>	A VPN instance is used to provide the VPN service. It is typically represented by a VRF table.
<a href="#">VPN Route</a>	A VPN route is used to forward VPN packets.
<a href="#">VPN Route Attribute</a>	Route distinguisher (RD): Identifies the VPN to which a route belongs. RT: Indicates the route trade-off mode of VRF.

### 9.3.1 VPN Instance

A VPN instance is used to provide the VPN service. On a device that provides the VPN service, a VPN instance consists of the VRF table, interfaces, routing protocol processes, and configuration that belong to the same VPN. A VPN instance is typically represented by a VRF table.

### Working Principle

A PE exchanges routes with a CE by using the related routing protocol in the corresponding VPN instance. A VRF table is bound to a specific interface to generate its interface set. Packets received on these interfaces will be associated with the VRF table and forwarded along corresponding routes.

### Related Configuration

 Single-protocol VRF tables and multiprotocol VRF tables cannot be created at the same time. Single-protocol VRF tables only support IPv4, whereas multiprotocol VRF tables support IPv4 and IPv6.

#### [Configuring a Single-Protocol VRF Table](#)

By default, a device has no VRF table.

Run the **ip vrf** command to create a single-protocol VRF table.

Run the **ip vrf forwarding** command to bind an interface.

Currently, single-protocol VRF tables only support IPv4.

### 📌 **Configuring a Multiprotocol VRF Table**

By default, a device has no VRF table.

Run the **vrf definition** command to create a multiprotocol VRF table.

Run the **address-family ipv4** command to enable the IPv4 address family.

Run the **address-family ipv6** command to enable the IPv6 address family.

Run the **vrf forwarding** command to bind an interface.

Multiprotocol VRF tables support IPv4 and IPv6.

## 9.3.2 VPN Route

A VPN route is only used to forward VPN packets. It comes from:

- Direct route and host route on the bound interface
- Direct route and host route on the configured import interface (not bound)
- Static and dynamic routes (RIP, RIPng, OSPFv2, OSPFv3, ISIS, and BGP) in the configured VPN instance

---

**i** For details about the static routes in a VPN instance, see "Configuration Guide > IP Route".

**i** For details about RIP in a VPN instance, see "Configuration Guide > IP Route > RIP".

**i** For details about RIPng in a VPN instance, see "Configuration Guide > IP Route > RIPng".

**i** For details about OSPFv2 in a VPN instance, see "Configuration Guide > IP Route > OSPFv2".

**i** For details about OSPFv3 in a VPN instance, see "Configuration Guide > IP Route > OSPFv3".

**i** For details about ISIS in a VPN instance, see "Configuration Guide > IP Route > ISIS".

**i** For details about BGP in a VPN instance, see "Configuration Guide > IP Route > BGP".

---

## 9.3.3 VPN Route Attribute

The BGP extended attributes include two attributes specific to VPN routes: RD and RT.

### Working Principle

#### 📌 **RD**

Two routes with the same address but different RDs in two VRF tables can be advertised separately between PEs, because the routes are sent together with their RDs through multiprotocol BGP (MP-BGP).

#### 📌 **RT**

RT in essence indicates each VRF table's route trade-off and preferences. It is mainly used to control the advertising and installation policies for VPN routes. RT is divided into the import attribute and export attribute. The import attribute indicates

the route of interest, and the export attribute indicates the advertised route. A PE advertises a route to other PEs based on the RT export rule in the corresponding VRF table. The peer PE checks all received routes against the RT import rule in each VRF table. If a route matches an RT export rule (the export rule contains the import rule), it will be added to the corresponding VRF table.

### Related Configuration

#### RD

By default, no RD is configured in VRF mode.

Run the **rd** command to configure an RD.

#### RT

By default, no RT is configured in VRF mode or address family mode.

Run the **route-target { import | export | both }** command to configure an RT.

## 9.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring a Single-Protocol VRF Table</a>	 Single-protocol VRF tables and multiprotocol VRF tables cannot be created at the same time. If IPv6 is supported, configure a multiprotocol VRF table; otherwise, you can configure a single-protocol VRF table or a multiprotocol VRF table. This configuration item creates a VRF table in an IPv4 network. IPv6 is not supported.	
	<b>ip vrf</b> <i>vrf-name</i>	Creates a VRF table.
	<b>rd</b> <i>rd_value</i>	Configures an RD.
	<b>route-target { import   export   both }</b> <i>rt_value</i>	Configures an RT.
	<b>ip vrf forwarding</b> <i>vrf-name</i>	Binds an interface and adds the direct route and host route on the interface to a VRF table.
	<b>ip vrf receive</b> <i>vrf_name</i>	Adds the direct route and host route on an interface to a VRF table without binding the interface.
<a href="#">Configuring a Multiprotocol VRF Table</a>	 Single-protocol VRF tables and multiprotocol VRF tables cannot be created at the same time. If IPv6 is supported, configure a multiprotocol VRF table. otherwise, you can configure a single-protocol VRF table or a multiprotocol VRF table. This configuration item creates a VRF table in an IPv4 or IPv6 network.	
	<b>vrf definition</b> <i>vrf-name</i>	Creates a VRF table.
	<b>description</b> <i>string</i>	Configures a VRF descriptor.
	<b>rd</b> <i>rd_value</i>	Configures an RD.
	<b>route-target { import   export   both }</b> <i>rt_value</i>	Configures an RT.

Configuration	Description and Command	
	<b>address-family ipv4</b>	Enables the IPv4 address family.
	<b>address-family ipv6</b>	Enables the IPv6 address family.
	<b>vrf forwarding</b> <i>vrf-name</i>	Binds an interface and adds the direct route and host route on the interface to a VRF table.
	<b>vrf receive</b> <i>vrf-name</i>	Adds the direct route and host route on an interface to a VRF table without binding the interface.

## 9.4.1 Configuring a Single-Protocol VRF Table

### Configuration Effect

- Provide the VPN service on a device.
- With BGP assistance, flexibly control the separation and access between VPNs.
- With BGP assistance, provide the VPN service in an IP/MPLS backbone network.
- Only IPv4 is supported.

### Notes

- No VRF table needs to be created if the device only forwards packets from one VPN or from the public network.
- If the device needs to forward public network packets and VPN packets or forward packets from multiple VPNs, VRF tables must be created to separate routes.
- In many cases, static or dynamic routes (RIP, OSPF, ISIS, and BGP) need to be added to VRF tables.

### Configuration Steps

#### 📄 Creating a VRF Table

- Mandatory.
- Create a VRF table for each VPN.

#### 📄 Configuring an RD

- Optional.
- When routing information needs to be advertised through BGP in the backbone network, BGP may select the best route for advertising if overlapping network addresses exist in different VPNs, which will make some VPNs fail to obtain corresponding routing information. To solve this problem, you can configure RDs for routes to enable BGP to make routing decisions based on these RDs, thus ensuring that each VPN can obtain corresponding routing information.
- Run the **rd** command in single-protocol VRF mode.

#### 📄 Configuring an RT

- Optional.
- You can run the **route-target export** command to specify the attributes of the route to be advertised, and run the **route-target import** command to specify the attributes of the route to be received. You can also run the **route-target both** command to specify the export and import attributes.
- Run the **route-target** command in single-protocol VRF mode.

#### ↘ Binding an Interface and Adding the Direct Route and Host Route on the Interface to a VRF Table

- Mandatory.
- If the physical link for transmitting VPN packets is exclusively occupied by a VPN, bind the physical interface to the corresponding VRF table.
- If the physical link for transmitting VPN packets is shared by multiple VPNs, you need to create an independent logical link for each VPN, and bind the logical interface to the corresponding VRF table. A logical interface can be a subinterface or a VLAN interface.
- You must bind an interface to the corresponding single-protocol VRF table before you configure the IPv4 address of the interface. If you bind the interface after its IPv4 address is configured, the IPv4 address will be invalid (the IPv6 address of the interface is retained).
- If you bind an interface to the corresponding single-protocol VRF table and enable IPv6 on the interface, the device cannot forward the IPv6 packets received on the interface.

#### ↘ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

- Optional.
- If policy-based routing (PBR) is required for VRF table selection, run the **ip vrf receive** command on the interface to which PBR is applied, and import the direct route and host route on the interface to each VRF table available for choice.

### Verification

- Check whether VRF tables are created correctly on the router.

### Related Commands

#### ↘ Creating a VRF Table

<b>Command</b>	<b>ip vrf</b> <i>vrf-name</i>
<b>Parameter Description</b>	<i>vrf-name</i> : Indicates the name of the VRF table to be created. It cannot exceed 31 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After you run the command, the system will enter VRF mode.

#### ↘ Configuring an RD

<b>Command</b>	<b>rd</b> <i>rd_value</i>
----------------	---------------------------

<b>Parameter Description</b>	<p><i>rd_value</i> has the following three different parameter forms:</p> <p>(1) <i>rd_value</i> = <b>as_num: nn</b>  <b>as_num</b> indicates the 2-byte number that identifies a public autonomous system (AS). <b>nn</b> is configurable in the range 0..4294967295.</p> <p>(2) <i>rd_value</i> = <b>ip_addr: nn</b>  <b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.</p> <p>(3) <i>rd_value</i> = <b>as4_num: nn</b>  <b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.</p>
<b>Command Mode</b>	VRF configuration mode
<b>Usage Guide</b>	<p>You cannot directly change the RD of an existing VRF table. You need to delete the VRF table first and then configure a new RD.</p> <p>A VRF table has only one RD. You cannot configure multiple RDs for one VRF table.</p>

### 📌 Configuring an RT

<b>Command</b>	<b>route-target { import   export   both } <i>rt_value</i></b>
<b>Parameter Description</b>	<p><i>rt_value</i> has the following three different parameter forms:</p> <p>(1) <i>rt_value</i> = <b>as_num: nn</b>  <b>as_num</b> indicates the 2-byte number that identifies a public AS. <b>nn</b> is configurable in the range 0..4294967295.</p> <p>(2) <i>rt_value</i> = <b>ip_addr: nn</b>  <b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.</p> <p>(3) <i>rt_value</i> = <b>as4_num: nn</b>  <b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.</p>
<b>Command Mode</b>	VRF configuration mode
<b>Usage Guide</b>	A VRF table can be configured with multiple import and export RT attributes.

### 📌 Binding an Interface

<b>Command</b>	<b>ip vrf forwarding <i>vrf-name</i></b>
<b>Parameter Description</b>	<i>vrf-name</i> : Indicates the name of a VRF table.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>By default, an interface does not belong to any VRF table.</p> <p>After an interface is bound to the corresponding VRF table, the direct route and host route on the interface will be automatically added to the VRF table.</p> <p>You must bind an interface to the corresponding single-protocol VRF table before you configure the IPv4 address of the interface. If you bind the interface after its IPv4 address is configured, the IPv4 address will be invalid (the IPv6 address of the interface is retained).</p>

➤ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

<b>Command</b>	<code>ip vrf receive vrf-name</code>
<b>Parameter</b>	<i>vrf-name</i> : Indicates the name of a VRF table.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to add the host route and direct route on an interface to a VRF table. If you need to add the host route and direct route on an interface to multiple VRF tables, run the command multiple times. Different from the <code>ip vrf forwarding</code> command, the <code>ip vrf receive</code> command does not bind an interface to the corresponding VRF table. The interface is still a global interface and does not belong to any VRF table. The <code>ip vrf forwarding</code> and <code>ip vrf receive</code> commands are mutually exclusive on the same interface.

➤ Displaying the VRF Information on a Device

<b>Command</b>	<code>show ip vrf [ brief   detail   interfaces ] [ vrf-name ]</code>
<b>Parameter</b>	<b>brief</b> : Displays brief information.
<b>Description</b>	<b>detail</b> : Displays detailed information. <b>interfaces</b> : Displays the interface binding information. <i>vrf-name</i> : Indicates the name of a VRF table.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	This command is used to display the information of a specified VRF table to check whether the VRF table is bound with the correct interface.

➤ Displaying the Routes in a VRF Table

<b>Command</b>	<code>show ip route vrf vrf-name</code>
<b>Parameter</b>	<i>vrf-name</i> : Indicates the name of a VRF table.
<b>Description</b>	
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	This command is used to check whether a specified VRF table contains corresponding routes.

Configuration Example

➤ Local Inter-VPN Access

<b>Scenario</b> Figure 9-4	<p>The diagram shows a central router labeled 'C'. To its left, there are two subnets: 'Sub a' with router 'A' and 'Sub b' with router 'B'. Both 'Sub a' and 'Sub b' are connected to router 'C'. To the right of router 'C', there is a cloud labeled 'Servers', which is also connected to router 'C'.</p>
	Sub a, Sub b, and Servers are three VPNs that have separate address spaces.

	Sub a runs RIP, Sub b runs OSPF, and Servers is a network segment directly connected to C.																								
<b>Configuration Requirements</b>	Routes in Sub a are separated from those in Sub b, but both Sub a and Sub b can access Servers.																								
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>On C, create a VRF table for Sub a, bind the interface directly connected to A, and associate the VRF table with A by using RIP.</li> <li>On C, create a VRF table for Sub b, bind the interface directly connected to B, and associate the VRF table with B by using OSPF.</li> <li>On C, create a VRF table for Servers and bind the interface directly connected to Servers.</li> <li>On C, configure the RTs of the VRF tables for Sub a, Sub b, and Servers. Import the routes in the VRF tables for Sub a and Sub b to the VRF table for Servers, and import the routes in the VRF table for Servers to the VRF tables for Sub a and Sub b.</li> <li>Configure the Border Gateway Protocol (BGP) on C. Introduce the RIP routes to the VRF table for Sub a, introduce the OSPF routes to the VRF table for Sub b (enabled with an address family), and introduce the direct routes to the VRF table for Servers (enabled with an address family).</li> </ul> <p> Planning of interfaces and addresses:</p> <table border="1"> <thead> <tr> <th>Interface Description</th> <th>Interface Name</th> <th>IP Address/Mask</th> <th>VRF Table</th> </tr> </thead> <tbody> <tr> <td>Interface on C connected to A</td> <td>GE0/1</td> <td>10.10.1.1/24</td> <td>VRF table for Sub a</td> </tr> <tr> <td>Interface on C connected to B</td> <td>GE0/2</td> <td>10.10.2.1/24</td> <td>VRF table for Sub b</td> </tr> <tr> <td>Interface on C connected to Servers</td> <td>GE0/3</td> <td>10.10.3.1/24</td> <td>VRF table for Servers</td> </tr> <tr> <td>Interface on A connected to C</td> <td>GE0/1</td> <td>10.10.1.2/24</td> <td>-</td> </tr> <tr> <td>Interface on B connected to C</td> <td>GE0/2</td> <td>10.10.2.2/24</td> <td>-</td> </tr> </tbody> </table>	Interface Description	Interface Name	IP Address/Mask	VRF Table	Interface on C connected to A	GE0/1	10.10.1.1/24	VRF table for Sub a	Interface on C connected to B	GE0/2	10.10.2.1/24	VRF table for Sub b	Interface on C connected to Servers	GE0/3	10.10.3.1/24	VRF table for Servers	Interface on A connected to C	GE0/1	10.10.1.2/24	-	Interface on B connected to C	GE0/2	10.10.2.2/24	-

```

## Common Errors

- An interface is bound to a VRF table after the IP interface of the interface is configured.
- When a physical link is used to forward packets from multiple VPNs, the corresponding physical interface is bound to a VRF table.
- VPN routes are not introduced to BGP.

## 9.4.2 Configuring a Multiprotocol VRF Table

### Configuration Effect

- Provide the VPN service on a device.
- With BGP assistance, flexibly control the separation and access between VPNs.
- With BGP assistance, provide the VPN service in an IP/MPLS backbone network.
- Support IPv4 and IPv6 through address family configuration.

### Notes

- No VRF table needs to be created if the device only forwards packets from one VPN or from the public network.
- If the device needs to forward public network packets and VPN packets or forward packets from multiple VPNs, VRF tables must be created to separate routes.
- In many cases, static or dynamic routes (RIP, OSPF, ISIS, and BGP) need to be added to VRF tables.

### Configuration Steps

#### ↳ Creating a VRF Table

- Mandatory.

- Create a VRF table for each VPN.

#### ▾ Configuring an Address Family

- Mandatory.
- Enable the corresponding address family for each created VRF table.

#### ▾ Configuring an RD

- Optional.
- When routing information needs to be advertised through BGP in the backbone network, BGP may select the best route for advertising if overlapping network addresses exist in different VPNs, which will make some VPNs fail to obtain corresponding routing information. To solve this problem, you can configure RDs for routes to enable BGP to make routing decisions based on these RDs, thus ensuring that each VPN can obtain corresponding routing information.

#### ▾ Configuring an RT

- Optional.
- You can run the **route-target export** command to specify the attributes of the route to be advertised, and run the **route-target import** command to specify the attributes of the route to be received. You can also run the **route-target both** command to specify the export and import attributes.
- Run the **route-target** command in multiprotocol VRF mode or multiprotocol VRF address family mode.

#### ▾ Binding an Interface and Adding the Direct Route and Host Route on the Interface to a VRF Table

- Mandatory.
- If the physical link for transmitting VPN packets is exclusively occupied by a VPN, bind the physical interface to the corresponding VRF table.
- If the physical link for transmitting VPN packets is shared by multiple VPNs, you need to create an independent logical link for each VPN, and bind the logical interface to the corresponding VRF table. A logical interface can be a subinterface or a VLAN interface.
- Before you bind an interface to a multiprotocol VRF table, enable an address family for the table. If you do not enable the IPv4 address family in advance, you cannot configure the IPv4 address and VRRP IPv4 address of the bound interface. If you do not enable the IPv6 address family in advance, you cannot configure the IPv6 address and VRRP IPv6 address of the bound interface.
- You must bind an interface to the corresponding multiprotocol VRF table before you configure the IPv4 or IPv6 address of the interface. If you bind the interface after its IPv4 or IPv6 address is configured, the address will be invalid.

#### ▾ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

- Optional.
- If PBR is required for VRF table selection, run the **ip vrf receive** command on the interface to which PBR is applied, and import the direct route and host route on the interface to each VRF table available for choice.

## Verification

- Check whether multiprotocol VRF tables are created correctly on the router and corresponding address families are enabled.

## Related Commands

### ↳ Creating a VRF Table

<b>Command</b>	<b>vrf definition</b> <i>vrf-name</i>
<b>Parameter Description</b>	<i>vrf-name</i> : Indicates the name of the VRF table to be created. It cannot exceed 31 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After you run the command, the system will enter VRF mode.

### ↳ Enabling the IPv4 Address Family

<b>Command</b>	<b>address-family ipv4</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	VRF mode
<b>Usage Guide</b>	After you run the command, the system will enter VRF IPv4 address family submode.

### ↳ Enabling the IPv6 Address Family

<b>Command</b>	<b>address-family ipv6</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	VRF mode
<b>Usage Guide</b>	After you run the command, the system will enter VRF IPv6 address family submode.

### ↳ Configuring an RD

<b>Command</b>	<b>rd</b> <i>rd_value</i>
<b>Parameter Description</b>	<p><i>rd_value</i> has the following three different parameter forms:</p> <p>(1) <i>rd_value</i> = <b>as_num: nn</b>  <b>as_num</b> indicates the 2-byte number that identifies a public AS. <b>nn</b> is configurable in the range 0..4294967295.</p> <p>(2) <i>rd_value</i> = <b>ip_addr: nn</b>  <b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.</p> <p>(3) <i>rd_value</i> = <b>as4_num: nn</b>  <b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.</p>

<b>Command Mode</b>	VRF configuration mode
<b>Usage Guide</b>	You cannot directly change the RD of an existing VRF table. You need to delete the VRF table first and then configure a new RD. A VRF table has only one RD. You cannot configure multiple RDs for one VRF table.

### ↘ Configuring an RT

<b>Command</b>	<code>route-target { import   export   both } <i>rt_value</i></code>
<b>Parameter Description</b>	<i>rt_value</i> has the following three different parameter forms: (1) <i>rt_value</i> = <b>as_num: nn</b> <b>as_num</b> indicates the 2-byte number that identifies a public AS. <b>nn</b> is configurable in the range 0..4294967295. (2) <i>rt_value</i> = <b>ip_addr: nn</b> <b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535. (3) <i>rt_value</i> = <b>as4_num: nn</b> <b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.
<b>Command Mode</b>	VRF configuration mode or VRF address family submode
<b>Usage Guide</b>	One VRF table can be configured with multiple import and export RT attributes.

### ↘ Binding an Interface

<b>Command</b>	<code>vrf forwarding <i>vrf-name</i></code>
<b>Parameter Description</b>	<i>vrf-name</i> : Indicates the name of a VRF table.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, an interface does not belong to any VRF table. After an interface is bound to the corresponding VRF table, the direct route and host route on the interface will be automatically added to the VRF table. Before you bind an interface to a multiprotocol VRF table, enable an address family for the table. If you do not enable the IPv4 address family in advance, you cannot configure the IPv4 address and VRRP IPv4 address of the bound interface. If you do not enable the IPv6 address family in advance, you cannot configure the IPv6 address and VRRP IPv6 address of the bound interface. You must bind an interface to a multiprotocol VRF table before you configure the IPv4, IPv6, VRRP IPv4, and VRRP IPv6 addresses of the interface; otherwise, these addresses will be invalid and the IPv6 protocol on the interface will be disabled. If the IPv4 address family is deleted from the multiprotocol VRF table, the IPv4 and VRRP IPv4 addresses of all interfaces bound to the VRF table will be deleted, and the IPv4 static routes in the VRF table or next-hop routes are also deleted. If the IPv6 address family is deleted from the multiprotocol VRF table, the IPv6 and VRRP IPv6 addresses of all interfaces bound to the VRF table will be deleted, the IPv6 protocol on the interfaces will be disabled, and the IPv6 static routes in the VRF table or next-hop routes are also deleted.

### ➤ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

<b>Command</b>	<code>vrf receive vrf-name</code>
<b>Parameter</b>	<i>vrf-name</i> : Indicates the name of a VRF table.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to add the host route and direct route on an interface to a VRF table. If you need to add the host route and direct route on an interface to multiple VRF tables, run the command multiple times. Different from the <b>vrf forwarding</b> command, the <b>vrf receive</b> command does not bind an interface to the corresponding VRF table. The interface is still a global interface and does not belong to any VRF table. The <b>vrf forwarding</b> and <b>vrf receive</b> commands are mutually exclusive on the same interface.

### ➤ Displaying the VRF Information on a Device

<b>Command</b>	<code>show vrf [ brief   detail   ipv4   ipv6 ] [ vrf-name ]</code>
<b>Parameter</b>	<b>brief</b> : Displays brief information.
<b>Description</b>	<b>detail</b> : Displays detailed information. <b>ipv4</b> : Displays the brief information of an IPv4 VRF table. <b>ipv6</b> : Displays the brief information of an IPv6 VRF table. <i>vrf-name</i> : Indicates the name of a VRF table.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	This command is used to display the information of a specified VRF table to check whether the VRF table is bound with the correct interface.

### ➤ Displaying the Routes in a VRF Table

<b>Command</b>	<code>show ip route vrf vrf-name</code>
<b>Parameter</b>	<i>vrf-name</i> : Indicates the name of a VRF table.
<b>Description</b>	
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	This command is used to check whether a specified VRF table contains corresponding routes.

### Configuration Example

**i** The following example only describes VRF-related configuration on A1, B1, MCE1, and PE1. The configuration on A2, B2, MCE2, and PE2 is similar.

### ➤ VRF on CEs and PEs (MCE Application)

<p><b>Scenario</b> Figure 9-5</p>																																	
	<p>VPN a and VPN b have independent address spaces. VPN a runs RIP and VPN b runs OSPF.</p>																																
<p><b>Configuration Requirements</b></p>	<p>The routes in VPN a are separated from those in VPN b. A1 and A2 can access each other, and B1 and B2 can access each other.</p>																																
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Connect MCE1 and A1 through RIP. Extend RIP routes on A1. On MCE1, create a VRF table for VPN a, bind the directly connected interface, and configure RIP routes.</li> <li>● Connect MCE1 and B1 through OSPF. Extend OSPF routes on B1. On MCE1, create a VRF table for VPN b, bind the directly connected interface, and configure OSPF routes.</li> <li>● Connect MCE1 and PE1 through BGP. On MCE1 and PE1, create a VRF table for each VPN, bind the VLAN interface, and configure BGP routes.</li> <li>● Configure the physical link between MCE1 and PE1 in Trunk mode.</li> <li>● In the VRF instance for VPN a on MCE1, redistribute the RIP routes to BGP, and redistribute the BGP routes to RIP.</li> <li>● In the VRF instance for VPN b on MCE1, redistribute the OSPF routes to BGP, and redistribute the BGP routes to OSPF.</li> </ul>

	<pre>-</pre>

## Common Errors

- A multiprotocol VRF table is configured, but no address family is enabled.
- An interface is bound to a VRF table after the IP interface of the interface is configured.
- When a physical link is used to forward packets from multiple VPNs, the corresponding physical interface is bound to a VRF table.
- VPN routes are not introduced to BGP.

## 9.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the routes in a specified VRF table.	<b>clear ip route vrf</b> <i>vrf-name</i>

## Displaying

Description	Command
Displays the information of a single-protocol VRF table.	<b>show ip vrf</b> [ <b>brief</b>   <b>detail</b>   <b>interfaces</b> ] [ <i>vrf-name</i> ]
Displays the information of a multiprotocol VRF table.	<b>show vrf</b> [ <b>ipv4</b>   <b>ipv6</b>   <b>brief</b>   <b>detail</b> ] [ <i>vrf-name</i> ]

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Displays the debugging information during the processes where a VRF table is created, an address family is enabled, and an interface is bound to the VRF table.	<b>debug vrf</b>
Prints the information of interface-related VRF operation debugging.	<b>debug vrf interface</b>

# 10 Configuring RIPng

## 10.1 Overview

RIP next generation (RIPng) is a unicast routing protocol that applies to IPv6 networks. RIPng-enabled routers exchange routing information to obtain routes to remote networks.

As an Interior Gateway Protocol (IGP), RIPng can run only within the autonomous system (AS) and is applicable to small-sized networks with routes no more than 16 hops.

### Protocols and Standards

- RFC2080: Defines the RIPng.

## 10.2 Application

RIPng is generally used on some small-sized networks, such as office networks of small companies.

As shown in the following figure, the company builds an IPv6 network, on which all routers support IPv6. The network is small in size, but the workload is still heavy if the network is maintained manually. In this case, RIPng can be configured to adapt to topological changes of the small-sized network, which reduces the workload.

Figure 10-1

## 10.3 Features

### Basic Concepts

#### ↳ IGP and EGP

IGP runs within an AS. For example, RIPng is a type of IGP.

Exterior Gateway Protocol (EGP) runs between ASs. For example, BGP is a type of EGP.

## Feature

Feature	Description
<a href="#">RIPng and RIP</a>	RIPng is an extension of RIPv2 on the basis of IPv6. Both are similar in functions and configurations.
<a href="#">Exchanging Routing Information</a>	By exchanging routing information, RIPng-enabled devices can automatically obtain routes to a remote network and update routes in real time.
<a href="#">Routing Algorithm</a>	RIPng is a protocol based on the distance-vector algorithm. It uses the vector addition method to compute the routing information.
<a href="#">Avoiding Route Loops</a>	RIPng uses functions, such as split horizon and poison reverse, to avoid route loops.

### 10.3.1 RIPng and RIP

RIP applies to IPv4 networks. Two RIP versions are available, including RIPv1 and RIPv2.

RIPng is an extension of RIPv2 on the basis of IPv6. Both are similar in functions and configurations.

#### Working Principle

##### ↳ RIPv2

RIPv2 packets are multicast. The multicast address is 224.0.0.9, and the UDP port ID is 520. RIPv2 can identify the subnet mask.

##### ↳ RIPng

RIPng packets are multicast. The multicast address is FF02::9, the source address is FE80::/10, and the UDP port ID is 521. RIPng can identify the subnet mask.

 This chapter describes functions and configurations of RIPng. For details about RIPv2, see "Configuring RIP".

#### Related Configuration

##### ↳ Enabling the RIPng Process

By default, the RIPng process is disabled.

Run the **ipv6 router rip** command to enable the RIPng process.

You must enable the RIPng process on a device; otherwise, all functions related to RIPng cannot take effect.

##### ↳ Running RIPng on an Interface

By default, RIPng does not run on an interface.

Run the **ipv6 rip enable** command to run RIPng on an interface.

After RIPng runs on an interface, RIPng packets can be exchanged on the interface and RIPng can learn routes to the network segments directly connected to the device.

### ↘ Prohibiting an Interface from Sending or Receiving Packets

By default, a RIPng-enabled interface is allowed to send and receive RIPng packets.

Run the **passive-interface** command to prohibit an interface from sending RIPng packets.

## 10.3.2 Exchanging Routing Information

Compared with static routing, the dynamic routing protocol has a significant advantage, that is, by exchanging routing information, devices can automatically obtain routes to a remote network and update the routes in real time.

### Working Principle

#### ↘ Initialization

After RIPng is enabled on a router, the router sends a request packet to its neighbor router, requesting for all routing information, that is, the routing table. After receiving the request message, the neighbor router returns a response packet containing the local routing table. After receiving the response packet, the router updates the local routing table, and sends an update packet to the neighbor router, informing the neighbor router of the route update information. After receiving the update packet, the neighbor router updates the local routing table, and sends the update packet to other adjacent routers. After a series of updates, all routers can obtain and retain the latest routing information.

#### ↘ Periodical Update

By default, periodical update is enabled for RIPng. Adjacent routers exchange complete routing information with each other every 30s (update timer), that is, the entire routing table is sent to neighbor routers.

- i** For every non-local route, if the route is not updated within 180s (invalid timer), the metric of the route is changed to 16 (unreachable). If the route is still not updated in the next 120s (flush timer), the route is deleted from the routing table.

#### ↘ Default Route

In the routing table, a route to the destination network `::/0` is called default route.

The default route can be learned from a neighbor router, or sent to a neighbor router.

#### ↘ Route Redistribution

For RIPng, other types of routes (such as direct routes, static routes, and routes of other routing protocols) are called external routes.

External routes (excluding the default route) can be redistributed to RIPng and advertised to neighbors.

#### ↘ Route Filtering

Filtering conditions can be configured to limit the routing information exchanged between adjacent routers. Only the routing information that meets filtering conditions can be sent or received.

### Related Configuration

#### ↘ RIPng Timers

By default, the update timer is 30s, the invalid timer is 180s, and the flush timer is 120s.

Run the **timers basic** command to modify durations of RIPng timers.

Increasing the duration of the flush timer can reduce the route flapping. Decreasing the duration of the flush timer helps accelerate route convergence.

The durations of RIPng timers must be consistent on adjacent routers. Unless otherwise required, you are advised not to modify the RIPng timers.

#### ↘ Default Route

Run the **ipv6 rip default-information** command to advertise the default route to neighbors on an interface.

#### ↘ Route Redistribution

Run the **redistribute** command to redistribute external routes (excluding the default route) to RIPng and advertise them to neighbors.

#### ↘ Route Filtering

Run the **distribute-list out** command to set filtering rules to limit the routing information sent by the device.

Run the **distribute-list in** command to set filtering rules to limit the routing information received by the device.

### 10.3.3 Routing Algorithm

RIPng is a protocol based on the distance-vector algorithm. It uses the vector addition method to compute the routing information.

#### Working Principle

##### ↘ Distance-Vector Algorithm

RIPng is a protocol based on the distance-vector algorithm. The distance-vector algorithm treats a route as a vector that consists of the destination network and distance (metric). The router obtains a route from its neighbor and adds the distance vector from itself to the neighbor to the route to form its own route.

RIPng uses the hop count to evaluate the distance (metric) to the destination network. By default, the hop count from a router to its directly connected network is 0, the hop count from a router to a network that can be reached through a router is 1, and so on. That is, the metric is equal to the number of routers from the local network to the destination network. To restrict the convergence time, RIPng stipulates that the metric must be an integer between 0 and 15. If the metric is equal to or greater than 16, the destination network or host is unreachable. For this reason, RIPng cannot be applied to a large-scale network. As shown in the following figure, Router A is connected to the network 2::/64. Router B obtains the route (2::/64, 0) from Router A and adds the metric 1 to the route to obtain its own route (2::/64, 1), and the next hop points to Router A.

Figure 10-2

### Selecting the Optimum Route

RIPng selects an optimum route based on the following principle: If multiple routes to the same destination network is available, a router preferentially selects the route with the smallest metric.

As shown in the following figure, Router A is connected to the network 2::/64. Router C obtains the route (2::/64, 0) from Router A and the route (2::/64, 1) from Router B. Router C will select the route that is obtained from Router A and add metric 1 to this route to form its own route (2::/64, 1), and the next hop points to Router A.

Figure 10-3

**i** When routes coming from different sources exist on a router, the route with the smaller distance is preferentially selected.

Route Source	Default Distance
Directly-connected network	0
Static route	1
OSPF route	110
IS-IS route	115
RIPng route	120
Unreachable route	255

### Related Configuration

#### Modifying the Distance

By default, the distance of a RIPng route is 120.

Run the **distance** command to modify the distance of a RIPng route.

### Modifying the Metric

For a RIPng route that is proactively discovered by a device, the default metric is equal to the number of hops from the local network to the destination network. The metric offset of the interface is 1.

For a RIPng router that is manually configured (default route or redistributed route), the default metric is 1.

Run the **ipv6 rip metric-offset** command to modify the metric offset of the interface.

Run the **default-metric** command to modify the default metric of an external route (redistributed route).

Run the **redistribute** command to modify the metric of an external route (redistributed route) when advertising this route.

Run the **ipv6 rip default-information** command to modify the metric of a default route when advertising the default route.

## 10.3.4 Avoiding Route Loops

RIPng uses functions, such as split horizon and poison reverse, to avoid route loops.

### Working Principle

#### Route Loop

A RIPng route loop occurs due to inherent defects of the distance-vector algorithm.

As shown in the following figure, Router A is connected to the network 2::/64, and sends an update packet every 30s. Router B receives the route to 2::/64 from Router A every 30s. If Router A is disconnected from 2::/64, the route to 2::/64 will be deleted from the routing table on Router A. Next time, the update packet sent by Router A no longer contains this route. As Router B does not receive an update packet related to 2::/64, Router B determines that the route to 2::/64 is valid within 180s and uses the update packet to send this route to Router A. As the route to 2::/64 does not exist on Router A, the route learned from Router B is added to the routing table. Router B determines that data can reach 2::/64 through Router A, and Router A determines that data can reach 2::/64 through Router B. In this way, a route loop is formed.

Figure 10-4

#### Split Horizon

Split horizon can prevent route loops. After split horizon is enabled, a route received on this interface will not be sent out from this interface.

As shown in the following figure, after split horizon is enabled on Router B, Router B will not send the route to 2::/64 back to Router A. Router B will learn 180s later that 2::/64 is not reachable.

Figure 10-5

### ↳ Poison Reverse

Poison reverse can also prevent route loops. Compared with split horizon, poison reverse is more reliable, but brings more protocol packets, which makes network congestion more severe.

After poison reverse is enabled on an interface, a route received from this interface will be sent out from this interface again, but the metric of this router will be changed to 16 (unreachable).

As shown in the following figure, after poison reverse is enabled on Router A, if Router A detects a disconnection from 2::/64, Router A will not delete the route to 2::/64. Instead, Router A changes the number of hops to 16, and advertises the route through the update packet. On receiving the update packet, Router B learns that 2::/64 is not reachable.

Figure 10-6

## Related Configuration

### ↳ Split Horizon

By default, split horizon is enabled.

Run the **no split-horizon** command to disable split horizon.

### ↳ Poison Reverse

By default, poison reverse is disabled.

Run the **split-horizon poisoned-reverse** command to enable poison reverse. (After poison reverse is enabled, split horizon is automatically disabled.)

## 10.4 Configuration

Configuration	Related Commands	
<a href="#">Configuring RIPng Basic Functions</a>	 (Mandatory) It is used to build a RIPng routing domain.	
	<b>ipv6 router rip</b>	Enables a RIPng routing process and enters routing process configuration mode.
	<b>ipv6 rip enable</b>	Runs RIPng on an interface.
	<b>split-horizon</b>	Enables split horizon or poison reverse.
	<b>passive-interface</b>	Configures a passive interface.
<a href="#">Advertising the Default Route or External Routes</a>	 Optional.	
	<b>ipv6 rip default-information</b>	Advertise the default route to neighbors on an interface.
	<b>redistribute</b>	Redistributes routes and advertising external routes to neighbors.
<a href="#">Setting Route Filtering Rules</a>	 Optional.	
	<b>distribute-list in</b>	Filters the received RIPng routing information.
	<b>distribute-list out</b>	Filters the sent RIPng routing information.
<a href="#">Modifying Route Selection Parameters</a>	 Optional.	
	<b>distance</b>	Modifies the administrative distance of a RIPng route.
	<b>ipv6 rip metric-offset</b>	Modifies the metric offset on an interface.
	<b>default-metric</b>	Configure the default metric for route redistribution.
<a href="#">Modifying Timers</a>	 Optional.	
	<b>timers</b>	Modifies the update timer, invalid timer, and flush timer of RIPng.

### 10.4.1 Configuring RIPng Basic Functions

#### Configuration Effect

- Build a RIPng routing domain on the network.
- Routers in the domain obtain routes to a remote network through RIPng.

#### Notes

- IPv6 addresses must be configured.
- IPv6 unicast routes must be enabled.

#### Configuration Steps

- [Enabling a RIPng Routing Process](#)

- Mandatory.
- Unless otherwise required, perform this configuration on every router in the RIPng routing domain.

### ↳ Running RIPng on an Interface

- Mandatory.
- Unless otherwise required, perform this configuration on every interconnected interface of routers in the RIPng routing domain.

### ↳ Enabling Split Horizon or Poison Reverse

- By default, split horizon is enabled and poison reverse is disabled.
- Unless otherwise required, enable split horizon on every interface connected to the broadcast network, such as the Ethernet. (Retain the default setting.)
- Unless otherwise required, enable split horizon on every interface connected to the point-to-point (P2P) network, such as the PPP and HDLC. (Retain the default setting.)
- It is recommended that split horizon and poison reverse be disabled on an interface connected to a non-broadcast multi-access network, such as FR and X.25; otherwise, some devices cannot learn the complete routing information.
- If the secondary IP address is configured for an interface connected to a non-broadcast, it is recommended that split horizon and poison reverse be disabled.

### ↳ Configuring a Passive Interface

- This configuration is recommended.
- Use the passive interface to set the boundary of the RIPng routing domain. The network segment of the passive interface belongs to the RIPng routing domain, but RIPng packets cannot be sent over the passive interface.
- If RIPng routes need to be exchanged on an interface (such as the router interconnect interface) in the RIPng routing domain, this interface cannot be configured as a passive interface.

## Verification

- Check the routing table on a router to verify that the route to a remote network can be obtained through RIPng.

## Related Commands

### ↳ Enabling a RIPng Routing Process

<b>Command</b>	<b>ipv6 router rip</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to create a RIPng routing process and enter routing process configuration mode.

### ↳ Running RIPng on an Interface

<b>Command</b>	<b>ipv6 rip enable</b>
----------------	------------------------

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The configuration for running the RIPng on an interface is different from that of RIPv2. In RIPv2, the <b>network</b> command is configured in routing process configuration mode to define an IP address range. If the IP address of an interface belongs to this IP address range, RIP automatically runs on this interface.

### ↳ Enabling Split Horizon

<b>Command</b>	<b>split-horizon [ poisoned-reverse ]</b>
<b>Parameter Description</b>	<b>poisoned-reverse:</b> Indicates that the split horizon function contains the poison reverse function.
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	Run the <b>show ipv6 rip</b> command to check whether split horizon is enabled. The configuration is different from that of RIPv2. In RIPv2, the split horizon function is configured in interface configuration mode.

### ↳ Configuring a Passive Interface

<b>Command</b>	<b>passive-interface { default   interface-type interface-num }</b>
<b>Parameter Description</b>	<b>default:</b> Indicates all interfaces. <b>interface-type interface-num:</b> Specifies an interface.
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	First, run the <b>passive-interface default</b> command to configure all interfaces as passive interfaces. Then, run the <b>no passive-interface interface-type interface-num</b> command so that the interfaces used for interconnection between routers in the domain are not passive interface.

### ↳ Displaying the IP Routing Table

<b>Command</b>	<b>show ipv6 route</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode or global configuration mode
<b>Usage Guide</b>	Check whether the routing table contains any route to a remote network that is learned through RIPng.

## Configuration Example

### ↳ Building a RIPng Routing Domain

<p><b>Scenario</b> <b>Figure 10-7</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IPv6 addresses on all routers.</li> <li>● Enable RIPng on all routers.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal Enter configuration commands, one per line. End with CNTL/Z. A(config)# ipv6 router rip A(config-router)# exit A(config)# interface GigabitEthernet 0/0 A(config-if-GigabitEthernet 0/0)# ipv6 address 2001:db8::1/32 A(config-if-GigabitEthernet 0/0)# ipv6 rip enable</pre>
<p><b>B</b></p>	<pre>B# configure terminal Enter configuration commands, one per line. End with CNTL/Z. B(config)# ipv6 router rip B(config-router)# exit B(config)# interface GigabitEthernet 0/0 B(config-if-GigabitEthernet 0/0)# ipv6 address 2001:db8::2/32 B(config-if-GigabitEthernet 0/0)# ipv6 rip enable</pre>
<p><b>C</b></p>	<pre>C# configure terminal Enter configuration commands, one per line. End with CNTL/Z. C(config)# ipv6 router rip C(config-router)# exit C(config)# interface GigabitEthernet 0/0 C(config-if-GigabitEthernet 0/0)#</pre>

	<pre>C(config-if-GigabitEthernet 0/0)# ipv6 address 2001:db8::3/32 C(config-if-GigabitEthernet 0/0)# ipv6 rip enable C(config)# interface GigabitEthernet 0/1 C(config-if-GigabitEthernet 0/1)# ipv6 address 2::1/64 C(config-if-GigabitEthernet 0/1)# ipv6 rip enable</pre>
<b>Verification</b>	<p>Check the routing tables on Router A, Router B, and Router C. The routing tables should contain routes to a remote network that are learned through RIPng.</p>
<b>A</b>	<pre>A# show ipv6 route  IPv6 routing table name - Default - 6 entries Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area  R      2::/64 [120/2] via FE80::2D0:F8FF:FEFB:D521, GigabitEthernet 0/0 C      2001:DB8::/32 via GigabitEthernet 0/0, directly connected L      2001:DB8::1/128 via GigabitEthernet 0/0, local host C      FE80::/10 via ::1, Null0 C      FE80::/64 via GigabitEthernet 0/0, directly connected L      FE80::2D0:F8FF:FEFB:E7CE/128 via GigabitEthernet 0/0, local host</pre>
<b>B</b>	<pre>B# show ipv6 route  IPv6 routing table name - Default - 6 entries Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2</pre>

	<pre> IA - Inter area  R    2::/64 [120/2] via FE80::2D0:F8FF:FEFB:D521, GigabitEthernet 0/0 C    2001:DB8::/32 via GigabitEthernet 0/0, directly connected L    2001:DB8::2/128 via GigabitEthernet 0/0, local host C    FE80::/64 via GigabitEthernet 0/0, directly connected L    FE80::2D0:F8FF:FEFB:C9BA/128 via GigabitEthernet 0/0, local host </pre>
<b>C</b>	<pre> Ruijie# show ipv6 route  IPv6 routing table name - Default - 9 entries Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area  C    2::/64 via GigabitEthernet 0/1, directly connected L    2::2/128 via GigabitEthernet 0/1, local host C    2001:DB8::/32 via GigabitEthernet 0/0, directly connected L    2001:DB8::3/128 via GigabitEthernet 0/0, local host C    FE80::/10 via ::1, Null0 C    FE80::/64 via GigabitEthernet 0/0, directly connected L    FE80::2D0:F8FF:FEFB:D521/128 via GigabitEthernet 0/0, local host C    FE80::/64 via GigabitEthernet 0/1, directly connected L    FE80::2D0:F8FF:FEFB:D521/128 via GigabitEthernet 0/1, local host </pre>

### Common Errors

- The IPv6 address is not configured on an interface.
- The interface used for interconnection between devices is configured as a passive interface.

## 10.4.2 Advertising the Default Route or External Routes

### Configuration Effect

- In the RIPng domain, introduce a unicast route of another AS so that the unicast routing service to this AS can be provided for users in the RIPng domain.
- In the RIPng domain, inject a default route to another AS so that the unicast routing service to this AS can be provided for users in the RIPng domain.

### Notes

- The RIPng basic functions must be configured.

### Configuration Steps

#### ▾ Configuring External Route Redistribution

- Optional.
- Perform this configuration if external routes of the RIPng domain should be introduced to the AS border router (ASBR).

#### ▾ Generating a Default Route

- Optional.
- Perform this configuration if the default route should be introduced to an ASBR so that other routers in the RIPng domain access other AS domains through this ASBR by default.

### Verification

- Run the **show ipv6 route rip** command on a non-ASBR to check whether the external routes of the domain and default route have been loaded.

### Related Commands

#### ▾ Advertising the Default Route to Neighbors on an Interface

<b>Command</b>	<code>ipv6 rip default-information { only originate } [ metric <i>metric-value</i> ]</code>
<b>Parameter Description</b>	<p><b>only:</b> Advertises only IPv6 default route.</p> <p><b>originate:</b> Advertises the IPv6 default route and other routes.</p> <p><b>metric <i>metric-value</i>:</b> Indicates the metric of the default route. The value ranges from 1 to 15. The default value is 1.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>After this command is configured on the interface, an IPv6 default route is advertised to the external devices through this interface, but the route itself is not added to the route forwarding table or the device and the RIPng route database.</p> <p>To prevent occurrence of a route loop, once this command is configured on an interface, RIPng refuses to receive the default route updates advertised by neighbors.</p>

↘ Redistributing Routes and Advertising External Routes to Neighbors

<b>Command</b>	<code>redistribute { bgp   connected   isis [ area-tag ]   ospf process-id   static } [ metric metric-value   route-map route-map-name ]</code>
<b>Parameter Description</b>	<p><b>bgp</b>: Indicates redistribution from BGP.</p> <p><b>Connected</b>: Indicates redistribution from direct routes.</p> <p><b>isis [ area-tag ]</b>: Indicates redistribution from IS-IS. <i>area-tag</i> indicates the IS-IS process ID.</p> <p><b>ospf process-id</b>: Indicates redistribution from OSPF. <i>process-id</i> indicates the OSPF process ID. The value ranges from 1 to 65535.</p> <p><b>static</b>: Indicates redistribution from static routes.</p> <p><b>metric metric-value</b>: Sets the metric of the route redistributed to the RIPng domain.</p> <p><b>route-map route-map-name</b>: Sets the redistribution filtering rules.</p>
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	During route redistribution, it is not necessary to convert the metric of one routing protocol to the metric of another routing protocol because different routing protocols use completely different metric measurement methods. RIP measures the metric based on the hop count, and OSPF measures the metric based on the bandwidth. Therefore, the computed metrics cannot be compared with each other.

Configuration Example

<b>Scenario</b> Figure 10-8	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. (Omitted)</li> <li>● On Router B, configure redistribution of static routes.</li> <li>● On the GE0/1 interface of Router A, configure advertisement of the default route.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 rip default-information originate</pre>
<b>B</b>	<pre>B# configure terminal B(config)# ipv6 router rip B(config-router)# redistribute static</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the routing tables on Router A and Router B, and confirm that Router A can learn the route 3001:10:10::/64, and Router B can learn the default route ::/0.</li> </ul>

<b>A</b>	<pre>A# show ipv6 route rip  IPv6 routing table name - Default - 17 entries  Codes: C - Connected, L - Local, S - Static          R - RIP, O - OSPF, B - BGP, I - IS-IS          N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2          E1 - OSPF external type 1, E2 - OSPF external type 2          SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2          IA - Inter area  R       3001:10:10::/64 [120/2] via FE80::2D0:F8FF:FE22:334A, GigabitEthernet 0/1</pre>
<b>B</b>	<pre>B# show ipv6 route rip  IPv6 routing table name - Default - 17 entries  Codes: C - Connected, L - Local, S - Static          R - RIP, O - OSPF, B - BGP, I - IS-IS          N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2          E1 - OSPF external type 1, E2 - OSPF external type 2          SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2          IA - Inter area  R       ::/0 [120/2] via FE80::21A:A9FF:FE41:5B06, GigabitEthernet 0/1</pre>

### 10.4.3 Setting Route Filtering Rules

#### Configuration Effect

- Routes that do not meet filtering criteria cannot be loaded to the routing table, or advertised to neighbors. In this way, users within the network can be prevented from accessing specified destination networks.

#### Notes

- The RIPng basic functions must be configured.

#### Configuration Steps

##### 📄 Filtering the Received RIP Routing Information

- To refuse receiving some specified routes, you can configure the route distribution control list to process all the received route update packets. If no interface is specified, route update packets received on all interfaces will be processed.

Filtering the Sent RIP Routing Information

- If this command does not contain any optional parameter, route update advertisement control takes effect on all interfaces. If the command contains the interface parameter, route update advertisement control takes effect only on the specified interface. If the command contains other routing process parameters, route update advertisement control takes effect only on the specified routing process.

Verification

- Run the **show ipv6 route rip** command to check that the routes that have been filtered out are not loaded to the routing table.

Related Commands

<b>Command</b>	<b>distribute-list prefix-list</b> <i>prefix-list-name</i> { <b>in</b>   <b>out</b> } [ <i>interface-type interface-name</i> ]
<b>Parameter</b>	<b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of the prefix list, which is used to filter routes.
<b>Description</b>	<b>in</b>   <b>out</b> : Specifies update routes (received or sent routes) that are filtered. <i>interface-type interface-name</i> : Indicates that the distribution list is applied to the specified interface.
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	N/A

Configuration Example

<b>Scenario</b> Figure 10-9	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>Configure the RIPng basic functions on all routers. (Omitted)</li> <li>On router A, configure route filtering.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ipv6 prefix-list hello permit 4001::/64 A(config)# ipv6 router rip A(config-router)# distribute-list prefix-list hello in</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check that Router A can learn only the route to 4001::/64.</li> </ul>

<b>A</b>	<pre>A# show ipv6 route rip  IPv6 routing table name - Default - 17 entries  Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  R      4001::/64 [120/2] via FE80::2D0:F8FF:FE22:334A, GigabitEthernet 0/1</pre>
----------	---

## 10.4.4 Modifying Route Selection Parameters

### Configuration Effect

- Change the RIPng routes to enable the traffic pass through specified nodes or avoid passing through specified nodes.
- Change the sequence that a router selects various types of routes so as to change the priorities of RIPng routes.

### Notes

- The RIPng basic functions must be configured.

### Configuration Steps

#### ▾ Modifying the Administrative Distance of a RIPng Route

- Optional.
- Perform this configuration if you wish to change the priorities of RIPng routes on a router that runs multiple unicast routing protocols.

#### ▾ Modifying the Metric Offset on an Interface

- Optional.
- Unless otherwise required, perform this configuration on a router where the metrics of routes need to be adjusted.

#### ▾ Configuring the Default Metric of an External Route Redistributed to RIPng

- Optional.
- Unless otherwise required, perform this configuration on an ASBR to which external routes are introduced.

### Verification

- Run the **show ipv6 rip** command to display the administrative distance of RIPng routes.
- Run the **show ipv6 rip data** command to display the metrics of external routes redistributed to RIPng.

## Related Commands

### Modifying the Administrative Distance of a RIPng Route

<b>Command</b>	<code>distance distance</code>
<b>Parameter Description</b>	<i>distance</i> : Sets the administrative distance of a RIPng route. The value is an integer ranging from 1 to 254.
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	Run this command to set the administrative distance of a RIPng route.

### Modifying the Metric Offset on an Interface

<b>Command</b>	<code>ipv6 rip metric-offset value</code>
<b>Parameter Description</b>	<i>value</i> : Indicates the interface metric offset. The value ranges from 1 to 16.
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	Before a route is added to the routing table, the metric of the route must be added with the metric offset set on the interface. You can control the use of a route by setting the interface metric offset.

### Configuring the Default Metric of an External Route Redistributed to RIPng

<b>Command</b>	<code>default-metric metric</code>
<b>Parameter Description</b>	<i>metric</i> : Indicates the default metric. The valid value ranges from 1 to 16. If the value is equal to or greater than 16, the RGOS determines that this route is unreachable.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the metric is not specified during redistribution of a routing protocol process, RIPng uses the metric defined by the <b>default-metric</b> command. If the metric is specified, the metric defined by the <b>default-metric</b> command is overwritten by the specified metric. If this command is not configured, the value of <b>default-metric</b> is 1.

## Configuration Example

### Modifying the Administrative Distance of a RIPng Route

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. (Omitted)</li> <li>● On Router A, set the administrative distance of a RIPng route to 160.</li> </ul>
	<pre>A# configure terminal A(config)# ipv6 router rip A(config-router)# distance 160</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router A, check whether the administrative distance of a RIPng route is 160.</li> </ul>
	<pre>A# show ipv6 route rip   in 3001::/64 R      3001::/64 [160/2] via FE80::2D0:F8FF:FE22:334A, GigabitEthernet 0/1</pre>

## 10.4.5 Modifying Timers

### Configuration Effect

- Change the duration of RIPng timers to accelerate or slow down the change of the protocol state or occurrence of an event.

### Notes

- The RIPng basic functions must be configured.
- Modifying the protocol control parameters may result in protocol running failures. Therefore, you are advised not to modify the timers.

### Configuration Steps

#### ✚ Modifying the Update Timer, Invalid Timer, and Flush Timer

- Mandatory.
- Unless otherwise required, perform this configuration on a router where RIPng timers need to be modified.

### Verification

- Run the **show ipv6 rip** command to display settings of timers.

### Related Commands

<b>Command</b>	<b>timers update invalid flush</b>
<b>Parameter Description</b>	<p><i>Update</i>: Indicates the route update time in second. It defines the interval at which the device sends the route update packet. Each time an update packet is received, the invalid timer and flush timer are reset. By default, a route update packet is sent every 30s.</p> <p><i>Invalid</i>: Indicates the route invalid time in second, counted from the last time when a valid update packet is received. It defines the time after which the route in the routing list becomes invalid because the route is not updated. The duration of the invalid timer must be at least three times the duration of the update timer. If no</p>

	<p>update packet is received before the invalid timer expires, the corresponding route enters the invalid state. If the update packet is received before the invalid timer expires, the timer is reset. The default duration of the invalid timer is 180s.</p> <p><i>Flush</i>: Indicates the route flushing time in second, counted from the time when the RIPng route enters the invalid state. When the flush timer expires, the route in the invalid state will be deleted from the routing table. The default duration of the flush timer is 120s.</p>
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	By default, the update timer is 30s, the invalid timer is 180s, and the flush timer is 120s.

**Configuration Example**

<b>Scenario</b> Figure 10-11	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. (Omitted)</li> <li>● On Router A, configure the update timer, invalid timer, and flush timer.</li> </ul>
<b>B</b>	<pre>B# configure terminal B(config)# ipv6 router rip B(config-router)# timers 10 30 90</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router B, check the settings of RIPng timers.</li> </ul>

B

```

B# show ipv6 rip

Routing Protocol is "RIPng"

  Sending updates every 10 seconds with +/-50%, next due in 12 seconds
  Timeout after 30 seconds, garbage collect after 90 seconds

  Outgoing update filter list for all interface is: not set
  Incoming update filter list for all interface is: not set

  Default redistribution metric is 1

  Default distance is 120

  Redistribution:

    Redistributing protocol connected

  Default version control:  send version 1, receive version 1

  Interface                Send    Recv
  -----                -
  GigabitEthernet 0/1      1      1

  Routing Information Sources:

    Gateway: fe80::2d0:f8ff:fe22:334a  Distance: 120

  Last Update: 00:00:02  Bad Packets: 0  Bad Routes: 0

```

### Common Errors

- Settings of RIPng timers on devices connected to the same network are inconsistent. Consequently, routes cannot be learned properly.

## 10.5 Monitoring

### Displaying

Description	Command
Displays information about the RIPng process.	<b>show ipv6 rip</b>
Displays the RIPng routing table.	<b>show ipv6 rip database</b>

### Debugging

-  System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs RIPng.	<b>debug ipv6 rip</b> [interface <i>interface-type interface-num</i>   nsm   restart ]

# 11 Managing Routes

## 11.1 Overview

The network service module (NSM) manages the routing table, consolidates routes sent by various routing protocols, and selects and sends preferred routes to the routing table. Routes discovered by various routing protocols are stored in the routing table. These routes are generally classified by source into three types:

- **Direct route:** It is the route discovered by a link-layer protocol and is also called interface route.
- **Static route:** It is manually configured by the network administrator. A static route is easy to configure and less demanding on the system, and therefore applicable to a small-sized network that is stable and has a simple topology. However, when the network topology changes, the static route must be manually reconfigured and cannot automatically adapt to the topological changes.
- **Dynamic route:** It is the route discovered by a dynamic routing protocol.

## 11.2 Applications

Application	Description
<a href="#">Basic Functions of the Static Route</a>	Manually configure a route.
<a href="#">Floating Static Route</a>	Configure a standby route in the multipath scenario.
<a href="#">Load Balancing Static Route</a>	Configure load balancing static routes in the multipath scenario.
<a href="#">Correlation of Static Routes with BFD</a>	Use the Bidirectional Forwarding Detection (BFD) function to test whether the next hop of a static route is reachable.
<a href="#">Fast Reroute of Static Routes</a>	Use the fast reroute function to improve the switching performance in the multipath scenario.

### 11.2.1 Basic Functions of the Static Route

#### Scenario

On a network with a simple topology, you can configure only static routes to implement network interworking. Appropriate configuration and use of static routes can improve the network performance and guarantee the bandwidth for important network applications.

As shown in Figure 11-1, to implement interworking between PC 1, PC 2, and PC 3, you can configure static routes on R 1, R 2, and R 3.

- On R 1, configure a route to the network segment of PC 2 through R 2, and a route to the network segment of PC 3 through R 3.
- On R 2, configure a route to the network segment of PC 1 through R 1, and a route to the network segment of PC 3 through R 3.
- On R 3, configure a route to the network segment of PC 1 through R 1, and a route to the network segment of PC 2 through R 2.

Figure 11-1

## Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, and R 3.

## 11.2.2 Floating Static Route

### Scenario

If no dynamic routing protocol is configured, you can configure floating static routes to implement dynamic switching of routes to prevent communication interruption caused by the network connection failures.

As shown in Figure 11-2, to prevent communication interruption caused by a line failure between R 1 and R 3, you can configure a floating static route respectively on R 1 and R 3. Normally, packets are forwarded on a path with a small administrative distance. If a link on this path is down, the route is automatically switched to the path with a large administrative distance.

- On R1, configure two routes to the network segment of PC 3, including a route through R 3 (default distance = 1) and a route through R 2 (default distance = 2).
- On R 3, configure two routes to the network segment of PC 1, including a route through R 1 (default distance = 1) and a route through R 2 (default distance = 2).

Figure 11-2

### Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, and R 3.

### 11.2.3 Load Balancing Static Route

#### Scenario

If there are multiple paths to the same destination, you can configure load balancing routes. Unlike floating routes, the administrative distances of load balancing routes are the same. Packets are distributed among these routes based on the balanced forwarding policy.

As shown in Figure 11-3, load balancing routes are configured respectively on R 1 and R 3 so that packets sent to the network segment of PC 3 or PC 1 are balanced between two routes, including a route through R 2 and a route through R 4.

- On R 1, configure two routes to the network segment of PC 3, including a route through R 2 and a route through R 4.
- On R 3, configure two routes to the network segment of PC 1, including a route through R 2 and a route through R 4.

Figure 11-3

### Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, R 3, and R 4.
- Configure the load balancing policy on R 1 and R 3.

## 11.2.4 Correlation of Static Routes with BFD

### Scenario

When the floating static routes or load balancing static routes are configured, the static routes may fail to sense the route failures if the line is faulty but the interface status is normal. To resolve this problem, the device needs to check whether the next hop of a static route is reachable. If the next hop is not reachable, the device can switch the traffic to the standby route.

You can use the BFD function to check whether the next hop of a static route is reachable. The following scenario takes BFD as an example.

**!** You can use only one of the Track and BFD functions at a time.

As shown in Figure 11-4, to prevent communication interruption caused by a line failure between R 1 and R 3, you can configure a floating static route respectively on R 1 and R 3, and correlate static routes with BFD.

- On R 1, configure two routes to the network segment of PC 3, including a route through R 3 (default distance = 1) and a route through R 2 (default distance = 2). BFD is enabled on the first route to check whether the next hop 1.1.13.3 is reachable, and on the second route to check whether the next hop 1.1.12.2 is reachable.
- On R 3, configure two routes to the network segment of PC 1, including a route through R 1 (default distance = 1) and a route through R 2 (default distance = 2). BFD is enabled on the first route to check whether the next hop 1.1.13.1 is reachable, and on the second route to check whether the next hop 1.1.23.2 is reachable.

Figure 11-4

## Deployment

- Configure the address and subnet mask of each interface.
- Configure the BFD parameters on each interface.
- Configure static routes and correlate these static routes with BFD on R 1, R 2, and R 3.

## 11.2.5 Fast Reroute of Static Routes

### Scenario

To accelerate route switching and shorten the communication interruption time when no dynamic routing protocol is configured, you can either correlate static routes with BFD to check whether the next hop is reachable. In addition, you can or configure fast reroute to further improve the convergence performance.

As shown in Figure 11-5, to prevent communication interruption caused by a line failure between R 1 and R 3, you can configure static fast reroute respectively on R 1 and R 3. Normally, packets are forwarded on the path between R 1 and R 3. When the link on this route is down, packets are automatically rerouted to R 2.

- On R 1, configure a route with the exit interface set to Gi0/3 and the next hop set to 1.1.13.3, and a standby route with the exit interface set to Gi0/2 and the next hop set to 1.1.12.2.
- On R 3, configure a route with the exit interface set to Gi0/1 and the next hop set to 1.1.13.1, and a standby route with the exit interface set to Gi0/2 and the next hop set to 1.1.23.2.

Figure 11-5

### Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, and R 3.
- Configure static fast reroute on R 1, R 2, and R 3.

## 11.3 Features

Feature	Description
<a href="#">Route Computation</a>	Generate a valid route on a device.
<a href="#">Optimal Route Selection</a>	Select an optimal route to forward packets.
<a href="#">Default Route</a>	Forward all packets and help reduce the size of a routing table.
<a href="#">Route Reliability</a>	Quickly detect a route failure and recover communication.

### 11.3.1 Route Computation

#### Routing Function

Routing functions are classified into IPv4 and IPv6 routing functions. If the routing functions are disabled, a device is equivalent to a host and cannot forward routes.

#### Dynamic Route

A dynamic routing protocol learns remote routes and dynamically updates routes by exchanging routes with neighbors. If a neighbor is the next hop of a route and this neighbor fails, the route fails as well.

## Static Route

On a network with a simple topology, you can configure only static routes to implement network interworking. Appropriate configuration and use of static routes can improve the network performance and guarantee the bandwidth for important network applications.

Whether a static route is active is computed based on the status of the local interface. When the exit interface of a static route is located at layer 3 (L3) and is in Up status (the link status is Up and the IP address is configured), this route is active and can be used for packet forwarding.

A static route can go across VPN routing & forwarding (VRF) instances. The next hop or exit interface of a static route of VRF 1 can be configured on VRF 2.

### 11.3.2 Optimal Route Selection

#### Administrative Distance

When multiple routing protocols generate routes to the same destination, the priorities of these routes can be determined based on the administrative distance. A smaller administrative distance indicates a higher priority.

#### Equal-Cost Route

If multiple routes to the same destination have different next hops but the same administrative distance, these routes are mutually equal-cost routes. Packets are distributed among these routes to implement load balancing based on the balanced forwarding policy.

On a specific device, the total number of equal-cost routes is limited. Routes beyond the limit do not participate in packet forwarding.

#### Floating Route

If multiple routes to the same destination have different next hops and different administrative distances, these routes are mutually floating routes. The route with the smallest administrative distance will be first selected for packet forwarding. If this route fails, a route with a larger administrative distance is further selected for forwarding, thus preventing communication interruption caused by a network line failure.

### 11.3.3 Default Route

In the forwarding routing table, the route with the destination network segment 0.0.0.0 and the subnet mask 0.0.0.0 is the default route. Packets that cannot be forwarded by other routes will be forwarded by the default route. The default route can be statically configured or generated by a dynamic routing protocol.

#### Static Default Route

On a L3 switch, a static route with the network segment 0.0.0.0 and the subnet mask 0.0.0.0 is configured to generate the default route.

#### Default Network

The default network is configured to generate a default route. If the **ip default-network** command is configured to specify a network (a classful network, such as a Class A, B, or C network), and this network exists in the routing table, the router will use this network as the default network and the next hop of this network is the default gateway. As the network specified by the **ip default-network** command is a classful one, if this command is used to identify a subnet in a classful network, the router automatically generates a static route of the classful network instead of any default route.

### 11.3.4 Route Reliability

When a device on a network is faulty, some routes become unreachable, resulting in traffic interruption. If connectivity of the next hop can be detected in real time, the route can be re-computed when a fault occurs, or traffic can be switched over to the standby route.

#### Correlation with BFD

The BFD protocol provides a light-load and fast method for detecting the connectivity of the forwarding path between two adjacent routers. If a dynamic routing protocol or a static route is correlated with the BFD function, the dynamic routing protocol or the static route can quickly learn whether the next hop is reachable so as to respond quickly.

#### Fast Reroute

Fast reroute provides a standby route. When a dynamic routing protocol or a static route detects that the next hop is unreachable, it immediately switches traffic over to the standby route to recovery communication.

## 11.4 Configuration

Configuration Item	Description and Command	
<a href="#">Configuring a Static Route</a>	 (Mandatory) It is used to configure a static route entry.	
	<b>ip route</b>	Configures an IPv4 static route.
	<b>ipv6 route</b>	Configures an IPv6 static route.
<a href="#">Configuring a Default Route</a>	 (Optional) It is used to configure the default gateway.	
	<b>ip default gateway</b>	Configures an IPv4 default gateway on a L2 device.
	<b>ipv6default gateway</b>	Configures an IPv6 default gateway on a L2 device.
	<b>ip route 0.0.0.0 0.0.0.0 gateway</b>	Configures an IPv4 default gateway on a L3 device.

Configuration Item	Description and Command	
	<b>ipv6 route ::/0 ipv6-gateway</b>	Configures an IPv6 default gateway on a L3 device.
	<b>ip default network</b>	Configures an IPv4 default network on a L3 device.
<a href="#">Configuring Route Limitations</a>	 (Optional) It is used to limit the number of equal-cost routes and number of static routes, or disable routing.	
	<b>maximum-paths</b>	Configures the maximum number of equal-cost routes.
	<b>ip static route-limit</b>	Configures the maximum number of IPv4 static routes.
	<b>ipv6 static route-limit</b>	Configures the maximum number of IPv6 static routes.
	<b>no ip routing</b>	Disables IPv4 routing.
	<b>noipv6 unicast-routing</b>	Disables IPv6 routing.
	<b>no ip route static inter-vrf</b>	Prohibits static routing across VRFs.
<a href="#">Correlating a Static Route with BFD</a>	 (Optional) It is used to correlate a static route with BFD.	
	<b>ip route static bfd</b>	Correlates an IPv4 static route with BFD.
	<b>ipv6 route static bfd</b>	Correlates an IPv6 static route with BFD.
<a href="#">Configure Static Fast Reroute</a>	 (Optional) It is used to configure static fast reroute.	
	<b>route-map</b>	Configures a route map.
	<b>set fast-reroute backup-nexthop</b>	Configures the standby interface and standby next hop for fast reroute.
	<b>ip fast-reroute</b>	Configures static fast reroute.

## 11.4.1 Configuring a Static Route

### Configuration Effect

- Generate a static route in the routing table. Use the static route to forward packets to a remote network.

## Notes

- If the **no ip routing** command is configured on a L3 switch, you cannot configure IPv4 static routes on this switch, and existing IPv4 static routes will also be deleted. Before the device is restarted, reconfiguring the **ip routing** command can recover the deleted IPv4 static routes. After the device is restarted, deleted IPv4 static routes cannot be recovered.
- If the **no ipv6 unicast-routing** command is configured on a L3 switch, you cannot configure IPv6 static routes on this switch, and existing IPv6 static routes will also be deleted. Before the device is restarted, reconfiguring the **ipv6 unicast-routing** command can recover the deleted IPv6 static routes. After the device is restarted, deleted IPv6 static routes cannot be recovered.

## Configuration Steps

### ▾ Configuring a Static IPv4 Route

Configure the following command on an IPv4-enabled router.

Command	<b>ip route</b> [ <i>vrf vrf_name</i> ] <i>network</i> / <i>net-mask</i> [ <i>ip-address</i>   <i>interface</i> [ <i>ip-address</i> ]] [ <i>distance</i> ] [ <b>tag</b> <i>tag</i> ] [ <b>permanent</b> ] [ <b>weight</b> <i>number</i> ] [ <b>description</b> <i>description-text</i> ] [ <b>disabled</b>   <b>enabled</b> ] [ <b>global</b> ]	
<b>Parameter Description</b>	<i>vrf vrf_name</i>	(Optional) Indicates the routing VRF, which can be a single-protocol IPv4 VRF or a multi-protocol VRF of a configured IPv4 address family. The VRF is a global VRF by default.
	<i>network</i>	Indicates the address of the destination network.
	<i>net-mask</i>	Indicates the mask of the destination network.
	<i>ip-address</i>	(Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>ip-address</i> is not specified, a static direct route is configured.
	<i>interface</i>	(Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table.
	<i>distance</i>	(Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.
	<i>tag</i>	(Optional) Indicates the tag of the static route. The tag is 0 by default.
	<b>permanent</b>	(Optional) Indicates the flag of the permanent route. The static route is not a permanent route by default.
	<b>weight</b> <i>number</i>	(Optional) Indicates the weight of the static route. The weight is 1 by default.
<b>description</b> <i>descri</i>	(Optional) Indicates the description of the static route. By default, no description is	

	<i>ption-text</i>	configured. <i>description-text</i> is a string of one to 60 characters.
	<b>disabled/enabled</b>	(Optional) Indicates the enable flag of the static route. The flag is enabled by default.
	<b>global</b>	(Optional) Indicates that the next hop belongs to a global VRF. By default, the VRF of the next hop is the same as the VRF specified by <i>vrf name</i> .
<b>Defaults</b>	By default, no static route is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	The simplest configuration of this command is <b>ip route networknet-maskip-address</b> .	

📌 **Configuring an IPv6 Static Route**

Configure the following command on an IPv6-enabled router.

<b>Command</b>	<b>ipv6 route</b> [ <i>vrf vrf-name</i> ] <i>ipv6-prefix/prefix-length</i> { <i>ipv6-address</i> [ <b>nexthop-vrf</b> { <i>vrf-name1</i>   <b>default</b> }]   <i>interface</i> [ <i>ipv6-address</i> [ <b>nexthop-vrf</b> { <i>vrf-name1</i>   <b>default</b> }] ] } [ <i>distance</i> ] [ <b>weightnumber</b> ] [ <b>description</b> <i>description-text</i> ]	
<b>Parameter Description</b>	<i>vrf vrf-name</i>	(Optional) Indicates the routing VRF, which must be a multi-protocol VRF of a configured IPv6 address family. The VRF is a global VRF by default.
	<i>ipv6-prefix</i>	Indicates the IPv6 prefix, which must comply with the address expression specified in RFC4291.
	<i>prefix-length</i>	Indicates the length of the IPv6 prefix. Note that a slash (/) must be added in front of the length.
	<i>ipv6-address</i>	(Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>ipv6-address</i> is not specified, a static direct route is configured.
	<i>interface</i>	(Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table.
	<b>nexthop-vrf vrf-name1</b>	(Optional) Indicates the routing VRF of the next hop, which must be a multi-protocol VRF of a configured IPv6 address family. By default, the VRF of the next hop is the same as the VRF specified by the VRF name. <b>nexthop-vrf default</b> indicates that the VRF of the next shop is a global VRF.

	<i>distance</i>	(Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.
	<b>weight</b> <i>number</i>	(Optional) Indicates the weight of the static route, which must be specified when you configure equal-cost routes. The weight ranges from 1 to 8. When the weights of all equal-cost routes of a route are summed up, the sum cannot exceed the maximum number of equal-cost routes that can be configured for the route. Weighting of equal-cost routes of a route indicates the traffic ratio of these routes. The weight is 1 by default.
	<b>description</b> <i>description-text</i>	(Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.
<b>Defaults</b>	By default, no static route is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	The simplest configuration of this command is <b>ipv6 route</b> <i>ipv6-prefix / prefix-lengthipv6-address</i> .	

## Verification

- Run the **show ip route** command to display the IPv4 routing table and check whether the configured IPv4 static route takes effect.
- Run the **show ipv6 route** command to display the IPv6 routing table and check whether the configured IPv6 static route takes effect.

## Configuration Example

### 📌 Configuring Static Routes to Implement Interworking of the IPv4 Network

<p><b>Scenario</b></p> <p><b>Figure 11-6</b></p>	<pre> graph TD     R1((R1)) --- R2((R2))     R1 --- R3((R3))     R2 --- R3     PC1[PC1] --- R1     PC2[PC2] --- R2     PC3[PC3] --- R3     </pre> <p>Detailed description of Figure 11-6: The diagram shows a network with three routers (R1, R2, R3) and three PCs (PC1, PC2, PC3). R1 is connected to R2 and R3. R2 is connected to R3. PC1 is connected to R1, PC2 to R2, and PC3 to R3. IP addresses are assigned to each interface and PC as follows:</p> <ul style="list-style-type: none"> <li>R1: Gi 0/0 (1.1.1.1/24), Gi 0/2 (1.1.12.1/24), Gi 0/3 (1.1.13.1)</li> <li>R2: Gi 0/0 (1.1.2.1/24), Gi 0/1 (1.1.12.2/24), Gi 0/3 (1.1.23.2/24)</li> <li>R3: Gi 0/1 (1.1.13.3/24), Gi 0/2 (1.1.23.3/24), Gi 0/0 (1.1.3.1/24)</li> <li>PC1: 1.1.1.2/24</li> <li>PC2: 1.1.2.2/24</li> <li>PC3: 1.1.3.2/24</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure interface addresses on each device.</li> </ul>
<p><b>R1</b></p>	<pre> R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/2 R1(config-if-GigabitEthernet 0/2)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/3 R1(config-if-GigabitEthernet 0/3)# ip address 1.1.13.1 255.255.255.0     </pre>

---

📌 **Configuring Static Routes to Implement Interworking of the IPv6 Network**

<p><b>Scenario</b></p> <p><b>Figure 11-7</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure interface addresses on each device.</li> </ul>
<p><b>R1</b></p>	<pre>R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ipv6 address 1111:1111::1/64 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)# ipv6 address 1111:1212::1/64</pre>
<p><b>R2</b></p>	<pre>R2#configure terminal R2(config)#interface gigabitEthernet 0/0 R2(config-if-GigabitEthernet 0/0)#ipv6 address 1111:2323::1/64 R2(config-if-GigabitEthernet 0/0)# exit R2(config)#interface gigabitEthernet 0/1</pre>

	R2(config-if-GigabitEthernet 0/1)# ipv6 address 1111:1212::2/64
	<ul style="list-style-type: none"> <li>● Configure static routes on each device.</li> </ul>
<b>R1</b>	<pre>R1#configure terminal R1(config)# ipv6 route 1111:2323::0/64 gigabitEthernet 0/1</pre>
<b>R2</b>	<pre>R2#configure terminal R2(config)#ipv6 route 1111:1111::0/64 gigabitEthernet 0/1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Display the routing table.</li> </ul>
<b>R1</b>	<pre>R1# show ipv6 route  IPv6 routing table name - Default - 10 entries Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area  C      1111:1111::/64 via GigabitEthernet 0/0, directly connected L      1111:1111::1/128 via GigabitEthernet 0/0, local host C      1111:1212::/64 via GigabitEthernet 0/1, directly connected L      1111:1212::1/128 via GigabitEthernet 0/1, local host S      1111:2323::/64 [1/0] via GigabitEthernet 0/1, directly connected C      FE80::/10 via ::1, Null0 C      FE80::/64 via GigabitEthernet 0/0, directly connected L      FE80::2D0:F8FF:FEFB:C092/128 via GigabitEthernet 0/0, local host C      FE80::/64 via GigabitEthernet 0/1, directly connected L      FE80::2D0:F8FF:FEFB:C092/128 via GigabitEthernet 0/1, local host</pre>
<b>R2</b>	<pre>R2# show ipv6 route</pre>

```

IPv6 routing table name - Default - 10 entries

Codes: C - Connected, L - Local, S - Static
       R - RIP, O - OSPF, B - BGP, I - IS-IS
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       IA - Inter area

C      1111:2323::/64 via GigabitEthernet 0/0, directly connected
L      1111:2323::1/128 via GigabitEthernet 0/0, local host
C      1111:1212::/64 via GigabitEthernet 0/1, directly connected
L      1111:1212::1/128 via GigabitEthernet 0/1, local host
S      1111:1111::/64 [1/0] via GigabitEthernet 0/1, directly connected
C      FE80::/10 via ::1, Null0
C      FE80::/64 via GigabitEthernet 0/0, directly connected
L      FE80::2D0:F8FF:FEFB:C092/128 via GigabitEthernet 0/0, local host
C      FE80::/64 via GigabitEthernet 0/1, directly connected
L      FE80::2D0:F8FF:FEFB:C092/128 via GigabitEthernet 0/1, local host

```

## Common Errors

- The link on the interface is not up.
- No IP address is configured for the interface.

## 11.4.2 Configuring a Default Route

### Configuration Effect

- Generate a default route in the routing table. The default route is used to forward packets that cannot be forwarded by other routes.

### Notes

- On a L3 switch, run the **ip route 0.0.0.0 0.0.0.0 gateway** or **ipv6 route ::/0 ipv6-gateway** command to configure the default gateway.
- If the **no ip routing** or **no ipv6 unicast-routing** command is configured on a L3 switch, you can run the **ip default gateway** or **ipv6 default gateway** command to configure the default gateway.

## Configuration Steps

### Configuring the IPv4 Default Gateway on a L3 Switch

<b>Command</b>	<b>ip route</b> [ <b>vrf</b> <i>vrf_name</i> ] <b>0.0.0.0.0.0.0.0</b> { <i>ip-address</i>   <i>interface</i> [ <i>ip-address</i> ]} [ <i>distance</i> ] [ <b>tag</b> <i>tag</i> ] [ <b>permanent</b> ] [ <b>weight</b> <i>number</i> ] [ <b>description</b> <i>description-text</i> ] [ <b>disabled</b>   <b>enabled</b> ] [ <b>global</b> ]	
<b>Parameter Description</b>	<b>vrf</b> <i>vrf_name</i>	(Optional) Indicates the routing VRF, which can be a single-protocol IPv4 VRF or a multi-protocol VRF of a configured IPv4 address family. The VRF is a global VRF by default.
	<b>0.0.0.0</b>	Indicates the address of the destination network.
	<b>0.0.0.0</b>	Indicates the mask of the destination network.
	<i>ip-address</i>	(Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>ip-address</i> is not specified, a static direct route is configured.
	<i>interface</i>	(Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table.
	<i>distance</i>	(Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.
	<i>tag</i>	(Optional) Indicates the tag of the static route. The tag is 0 by default.
	<b>permanent</b>	(Optional) Indicates the flag of the permanent route. The static route is not a permanent route by default.
	<b>weight</b> <i>number</i>	(Optional) Indicates the weight of the static route. The weight is 1 by default.
	<b>description</b> <i>descript ion-text</i>	(Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.
	<b>disabled /enabled</b>	(Optional) Indicates the enable flag of the static route. The flag is enabled by default.
	<b>global</b>	(Optional) Indicates that the next hop belongs to a global VRF. By default, the VRF of the next hop is the same as the VRF specified by <i>vrf name</i> .
<b>Defaults</b>	By default, no static default route is configured.	
<b>Command Mode</b>	Global configuration mode	

<b>Usage Guide</b>	The simplest configuration of this command is <b>ip route0.0.0.0 0.0.0.0 ip-address</b> .
--------------------	---

▾ **Configuring the IPv6 Default Gateway on a L3 Switch**

<b>Command</b>	<b>ipv6 route [vrf vrf-name] ::/0 { ipv6-address [nexthop-vrf {vrf-name1  default}]   interface [ ipv6-address [nexthop-vrf {vrf-name1  default}]] } [distance] [weight number] [description description-text]</b>	
<b>Parameter Description</b>	<b>vrf vrf-name</b>	(Optional) Indicates the routing VRF, which must be a multi-protocol VRF of a configured IPv6 address family. The VRF is a global VRF by default.
	<b>::</b>	Indicates the IPv6 prefix, which must comply with the address expression specified in RFC4291.
	<b>0</b>	Indicates the length of the IPv6 prefix. Note that a slash (/) must be added in front of the length.
	<b>ipv6-address</b>	(Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>ipv6-address</i> is not specified, a static direct route is configured.
	<b>interface</b>	(Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table.
	<b>nexthop-vrf vrf-name1</b>	(Optional) Indicates the routing VRF of the next hop, which must be a multi-protocol VRF of a configured IPv6 address family. By default, the VRF of the next hop is the same as the VRF specified by <i>vrf name</i> . <b>nexthop-vrf default</b> indicates that the VRF of the next shop is a global VRF.
	<b>distance</b>	(Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.
	<b>weight number</b>	(Optional) Indicates the weight of the static route, which must be specified when you configure equal-cost routes. The weight ranges from 1 to 8. When the weights of all equal-cost routes of a route are summed up, the sum cannot exceed the maximum number of equal-cost routes that can be configured for the route. Weighting of equal-cost routes of a route indicates the traffic ratio of these routes. The weight is 1 by default.
<b>description description-text</b>	(Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.	
<b>Defaults</b>	By default, no static default route is configured.	

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The simplest configuration of this command is <b>ipv6 route ::/0 ipv6-gateway</b> .

📌 **Configuring the IPv4 Default Network on a L3 Switch**

<b>Command</b>	<b>ip default-network network</b>	
<b>Parameter Description</b>	<i>network</i>	Indicates the address of the network. (The network must be a Class A, B, or C network.)
<b>Defaults</b>	By default, no default network is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	If the network specified by the <b>ip default-network</b> command exists, a default route is generated and the next hop to this network is the default gateway. If the network specified by the <b>ip default-network</b> command does not exist, the default route is not generated.	

Verification

- On a L3 switch where routing is enabled, run the **show ip route** or **show ipv6 route** command to display the default route.

Configuration Example

📌 **Configuring IPv4 Default Routes on L3 Switches to Implement Network Interworking**

<b>Scenario</b> Figure 11-8	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IP addresses on L3 devices.</li> </ul>
<b>R1</b>	<pre>R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0</pre>

	<pre>R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit</pre>
<b>R2</b>	<pre>R2#configure terminal R2(config)#interface gigabitEthernet 0/0 R2(config-if-GigabitEthernet 0/0)# ip address 1.1.2.1 255.255.255.0 R2(config-if-GigabitEthernet 0/0)# exit R2(config)#interface gigabitEthernet 0/1 R2(config-if-GigabitEthernet 0/1)# ip address 1.1.12.2 255.255.255.0 R2(config-if-GigabitEthernet 0/0)# exit</pre>
<b>R1</b>	<ul style="list-style-type: none"> <li>● <b>Configure an IPv6 default gateway on R 1.</b></li> </ul> <pre>R1#configure terminal R1(config)#ip route 0.0.0.0 0.0.0.0 GigabitEthernet 0/1 1.1.12.2</pre>
<b>R2</b>	<pre>R2#configure terminal R2(config)#ip route 0.0.0.0 0.0.0.0 GigabitEthernet 0/1 1.1.12.1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● <b>Display the routing table.</b></li> </ul>
<b>R1</b>	<pre>R1# show ip route Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area, * - candidate default  Gateway of last resort is 1.1.12.2 S*   0.0.0.0/0 [1/0] via 1.1.12.2, GigabitEthernet 0/1 C    1.1.1.0/24 is directly connected, GigabitEthernet 0/0 C    1.1.1.1/32 is local host.</pre>

	C 1.1.12.0/24 is directly connected, GigabitEthernet 0/1
	C 1.1.12.1/32 is local host.

### 11.4.3 Configuring Route Limitations

#### Configuration Effect

- Limit the number of equal-cost routes and number of static routes, or disable routing.

#### Notes

N/A

#### Configuration Steps

##### ▾ Configuring the Maximum Number of Equal-Cost Routes

<b>Command</b>	<b>maximum-paths</b> <i>number</i>	
<b>Parameter Description</b>	<i>number</i>	Indicates the maximum number of equal-cost routes. The value ranges from 1 to 32.
<b>Defaults</b>	By default, the number of equal cost routes is 32.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to configure the maximum number of next hops in the equal-cost route. In load balancing mode, the number of routes on which traffic is balanced does not exceed the configured number of equal-cost routes.	

##### ▾ Configuring the Maximum Number of IPv4 Static Routes

<b>Command</b>	<b>ip static route-limit</b> <i>number</i>	
<b>Parameter Description</b>	<i>number</i>	Indicates the upper limit of routes. The value ranges from 1 to 10,000.
<b>Defaults</b>	By default, a maximum of 1,024 IP static routes can be configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to configure the maximum number of IPv4 static routes. If the maximum number of IPv4 static routes is reached, no more IPv4 static route can be configured.	

##### ▾ Configuring the Maximum Number of IPv6 Static Routes

<b>Command</b>	<b>ipv6 static route-limit</b> <i>number</i>	
<b>Parameter Description</b>	<i>number</i>	Indicates the upper limit of routes. The value ranges from 1 to 10,000.
<b>Defaults</b>	By default, a maximum of 1,000 IPv6 static routes can be configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to configure the maximum number of IPv6 static routes. If the maximum number of IPv6 static routes is reached, no more IPv6 static route can be configured.	

↘ **Disabling IPv4 Routing**

<b>Command</b>	<b>no ip routing</b>	
<b>Parameter Description</b>	N/A	
<b>Defaults</b>	By default, IPv4 routing is enabled.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to disable IPv4 routing. If the device functions only as a bridge or a voice over IP (VoIP) gateway, the device does not need to use the IPv4 routing function of the RGOS software. In this case, you can disable the IPv4 routing function of the RGOS software.	

↘ **Disabling IPv6 Routing**

<b>Command</b>	<b>no ipv6 unicast-routing</b>	
<b>Parameter Description</b>	N/A	
<b>Defaults</b>	By default, IPv6 routing is enabled.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to disable IPv6 routing. If the device functions only as a bridge or a VoIP gateway, the device does not need to use the IPv6 routing function of the RGOS software. In this case, you can disable the IPv6 routing function of the RGOS software.	

↘ **Prohibiting Static Routing Across VRFs**

<b>Command</b>	<b>no ip route static inter-vrf</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, static IP or IPv6 routing across VRFs is allowed.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to prohibit static IP routing across VRFs. After this command is configured, the static IP route across VRFs is not active and cannot be participate in packet forwarding.

**Verification**

Run the **show run** command to display the configuration file and verify that the preceding configuration commands exist.

**Configuration Example**

▾ **Configuring at Most Two Static Routing Limitations**

<p><b>Scenario</b> Figure 11-9</p>	
<p><b>Configuration Steps</b></p>	<p>On R 1, configure the IP addresses, static routes, and maximum number of static routes.</p>
	<pre>R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0</pre>

	<pre> R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/2 R1(config-if-GigabitEthernet 0/2)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/3 R1(config-if-GigabitEthernet 0/3)# ip address 1.1.13.1 255.255.255.0 R1(config-if-GigabitEthernet 0/3)# exit R1(config)#ip route 1.1.3.0 255.255.255.0 1.1.13.3 R1(config)#ip route 1.1.4.0 255.255.255.0 1.1.12.2 R1(config)#ip route 1.1.5.0 255.255.255.0 1.1.12.2 R1(config)#ip static route-limit 2  % Exceeding maximum static routes limit. </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the static routes that really take effect in the routing table.</li> </ul>
	<pre> R1(config)# show ip route  Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area, * - candidate default  Gateway of last resort is no set  C    1.1.1.0/24 is directly connected, GigabitEthernet 0/0 C    1.1.1.1/32 is local host. S    1.1.3.0/24 [1/0] via 1.1.13.3 S    1.1.4.0/24 [1/0] via 1.1.12.2 C    1.1.12.0/24 is directly connected, GigabitEthernet 0/2 C    1.1.12.1/32 is local host. C    1.1.13.0/24 is directly connected, GigabitEthernet 0/3 C    1.1.13.1/32 is local host. </pre>

### 11.4.4 Correlating a Static Route with BFD

#### Configuration Effect

- A static route can quickly detect a route failure with the help of BFD.

#### Notes

- BFD correlation cannot be configured on a L2 switch.
- You must configure a static route.
- You must configure the BFD session parameters by running the **bfd interval xmin\_rx xmultiplier x** command.

#### Configuration Steps

##### ↘ Correlating an IPv4 Static Route with BFD

<b>Command</b>	<b>ip route static bfd</b> [ <b>vrf</b> <i>vrf-name</i> ] <i>interface-type interface-number gateway</i> [ <b>source</b> <i>ip-address</i> ]	
<b>Parameter Description</b>	<i>vrf vrf-name</i>	(Optional) Indicates the name of the VRF to which the static route belongs. The VRF is a global VRF by default.
	<i>interface-type</i>	Indicates the interface type.
	<i>interface-number</i>	Indicates the interface number.
	<i>gateway</i>	Indicates the IP address of the gateway, that is, the neighbor IP address of BFD. If the next hop of the static route is this neighbor, BFD is used to check the connectivity of the forwarding path.
	<b>source</b> <i>ip-address</i>	(Optional) Indicates the source IP address used for the BFD session. This parameter must be configured if the neighbor IP address involves multiple hops. By default, the source IP address is not specified.
<b>Defaults</b>	By default, a static route is not correlated with BFD.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to correlate an IPv4 static route with BFD. If the down status of the BFD session is detected, the IPv4 static route is not active and does not participate in packet forwarding.	

##### ↘ Correlating an IPv6 Static Route with BFD

<b>Command</b>	<b>ipv6 route static bfd</b> [ <b>vrf</b> <i>vrf-name</i> ] <i>interface-type interface-number gateway</i> [ <b>source</b> <i>ipv6-address</i> ]	
<b>Parameter Description</b>	<i>vrf vrf-name</i>	(Optional) Indicates the name of the VRF to which the static route belongs. The VRF is a global VRF by default.

	<i>interface-type</i>	Indicates the interface type.
	<i>interface-number</i>	Indicates the interface number.
	<i>gateway</i>	Indicates the IP address of the gateway, that is, the neighbor IP address of BFD. If the next hop of the static route is this neighbor, BFD is used to check the connectivity of the forwarding path.
	<b>source</b> <i>ip-address</i>	(Optional) Indicates the source IP address used for the BFD session. This parameter must be configured if the neighbor IP address involves multiple hops. By default, the neighbor IP address of the BFD session is a single hop, and the source IP address is not used.
<b>Defaults</b>	By default, a static route is not correlated with BFD.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to correlate an IPv6 static route with BFD. If the down status of the BFD session is detected, the IPv6 static route is not active and does not participate in packet forwarding.	

### Verification

- Run the **show bfd neighbors** command to display information about BFD neighbors.
- Run the **show ip route static bfd** or **show ipv6 route static bfd** command to display information about correlation of static routes with BFD.

### Configuration Example

#### Correlating an IPv4 Static Route with BFD

<p><b>Scenario</b></p> <p>Figure 11-10</p>	<p>The diagram shows a network topology with two routers, R1 and R2, and two PCs, PC1 and PC2. PC1 (1.1.1.2/24) is connected to R1 (Gi 0/0, 1.1.1.1/24). R1 is connected to R2 (Gi 0/1, 1.1.12.2/24). R2 is connected to PC2 (1.1.2.2/24). R2 also has an interface Gi 0/0 with IP 1.1.2.1/24.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure a BFD session on the interconnect interface between R 1 and R 2.</li> <li>● Configure static routes on R 1 and R 2, and specify the exit interface or next hop as the interworking interface.</li> <li>● Correlate static routes with BFD on R 1 and R 2, and check the connectivity of the next hops of static routes.</li> </ul>

<p><b>R1</b></p>	<pre>R1#configure terminal R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)# no switchport R1(config-if-GigabitEthernet 0/1)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/1)#bfd interval 50 min_rx 50 multiplier 3 R1(config-if-GigabitEthernet 0/1)# exit R1(config)# ip route 1.1.2.0 255.0.0.0 FastEthernet 0/1 1.1.12.2 R1(config)#ip route static bfd gigabitEthernet 0/1 1.1.12.2</pre>
<p><b>R2</b></p>	<pre>R2#configure terminal R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)# no switchport R1(config-if-GigabitEthernet 0/1)# ip address 1.1.12.2 255.255.255.0 R1(config-if-GigabitEthernet 0/1)#bfd interval 50 min_rx 50 multiplier 3 R1(config-if-GigabitEthernet 0/1)# exit R1(config)# ip route 1.1.1.0 255.0.0.0 FastEthernet 0/1 1.1.12.1 R1(config)#ip route static bfd gigabitEthernet 0/1 1.1.12.1</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Display the status of BFD neighbors.</li> <li>● Display the static routes correlated with BFD.</li> </ul>
<p><b>R1</b></p>	<pre>R1#show bfd neighbors OurAddr      NeighAddr    LD/RD  RH/RS  Holddown(mult)  State  Int 1.1.12.1    1.1.12.2    8192/0  Up     0(3 )           Up GigabitEthernet 0/1  R1#show ip route static bfd S      1.1.2.0/24 via 1.1.12.2, GigabitEthernet 0/1, BFD state is Up</pre>

**Common Errors**

- The link on the interface is not up.
- No IP address is configured for the interface.
- No BFD session parameters are configured.
- No static route is configured.

## 11.4.5 Configure Static Fast Reroute

### Configuration Effect

- Configure and enable static fast reroute.

### Notes

- Static fast reroute cannot be configured on a L2 switch.
- You must configure a static route.
- You must configure a route map.

### Configuration Steps

#### ▾ Defining a Standby Route in the Route Map

<b>Command</b>	<b>set fast-reroute backup-nexthop</b> <i>interface ip-address</i>	
<b>Parameter Description</b>	<i>interface</i>	Indicates the standby exit interface.
	<i>ip-address</i>	Indicates the standby next hop.
<b>Defaults</b>	N/A	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	<p>Run the <b>route-map</b> <i>name</i> [ <b>permit</b>   <b>deny</b> ] <i>sequence</i> command to create a road map.</p> <p>Run the <b>match</b> command to define matching conditions.</p> <p>Run the <b>set fast-reroute backup-nexthop</b> <i>interface ip-address</i> command to define the standby exit interface and standby next hop.</p> <p>If a route meets matching conditions, a standby route is generated for this route. If the <b>match</b> command is not configured, standby routes are generated for any static route with the exit interface and next hop.</p>	

#### ▾ Enabling Fast Reroute and Referencing the Route Map

<b>Command</b>	<b>ip fast-reroute</b> [ <b>vrf</b> <i>vrf-name</i> ] <b>static route-map</b> <i>route-map-name</i>	
<b>Parameter Description</b>	<i>vrf-name</i>	(Optional) Specifies a VRF. If the VRF is not specified, the command is executed on all VRFs.
	<i>route-map-name</i>	Indicates the name of the road map for the standby route.
<b>Defaults</b>	By default, static fast reroute is not configured.	
<b>Command</b>	Global configuration mode	

<b>Mode</b>	
<b>Usage Guide</b>	Run this command to enable fast reroute and reference the route map.

## Verification

Run the **show ip route fast-reroute** command to display the active and standby routes that take effect.

## Configuration Example

### Configuring Fast Re-Routing

<p><b>Scenario</b></p> <p>Figure 11-11</p>	
<p><b>Configuration Steps</b></p>	<p>On R 1, configure a static route to the network segment of PC 3, and the next hop of the exit interface is R 3.</p> <p>On R 1, configure static fast reroute. The next hop of the exit interface of the standby route is R2.</p>
	<pre> R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/2 R1(config-if-GigabitEthernet 0/2)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/3 R1(config-if-GigabitEthernet 0/3)# ip address 1.1.13.1 255.255.255.0 </pre>

# 1 Configuring IP Multicast

## 1.1 Overview

IP multicasting is abstracted hardware multicasting and an extended multicast routing protocol on the standard IP network layer.

In traditional IP transmission, only one host can send packets to a single host (unicast communication) or all hosts (broadcast communication). However, the multicast technology provides the third choice: a host can send packets to certain specified hosts.

IP multicasting is applicable to one-to-many multimedia applications.

## 1.2 Applications

Application	Description
<a href="#">PIM-DM Applications</a>	The PIM-DM multicast service is provided on the same network.
<a href="#">PIM-SM Applications</a>	The PIM-SM multicast service is provided on the same network.

### 1.2.1 PIM-DM Applications

#### Scenario

The PIM-DM multicast service is provided on the same network.

As shown in Figure 1-1:

- A multicast source sends a multicast packet, and receiver A and receiver B on the same network receive the multicast packet.

Figure 1-1

<b>Remark</b>	A and B are layer-3 devices and C is a layer-2 access device.
<b>s</b>	Source is connected to the Gi 0/1 interface of A, and receiver A and receiver B are connected to the Gi 0/2 and Gi 0/3 interfaces of C.

### Deployment

- Run the Open Shortest Path First (OSPF) protocol on the same network to implement unicast routing.
- Run PIM-DM on the same network to implement multicast routing.
- Run the Internet Group Membership Protocol (IGMP) in a user host network segment to implement group member management.

## 1.2.2 PIM-SM Applications

### Scenario

The PIM-SM multicast service is provided on the same network.

As shown in Figure 1-2:

- A multicast source sends a multicast packet, and receiver A and receiver B on the same network receive the multicast packet.

Figure 1-2

<b>Remark</b>	A, B, and C are layer-3 routers.
<b>s</b>	The multicast source is connected to the Gi 0/1 interface of A, receiver B is connected to the Gi 0/1 interface of B, and receiver B is connected to the Gi 0/1 interface of C.

### Deployment

- Run OSPF on the same network to implement unicast routing.
- Run PIM-SM on the same network to implement multicast routing.
- Run IGMP in a user host network segment to implement group member management.

## 1.3 Features

### Basic Concepts

---

#### ↘ PIM Routers and PIM Interfaces

Routers enabled with PIM are called PIM routers. Interfaces enabled with PIM protocol are called PIM interfaces.

Multicast packets are forwarded on PIM routers. The PIM interfaces for receiving multicast packets are called upstream interfaces, and the PIM interfaces for sending multicast packets are called downstream interfaces.

The network segments where upstream interfaces are located are called upstream network segments. The network segments where downstream interfaces are located are called downstream network segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On certain PIM interfaces, borders are configured to divide a large PIM network into multiple PIM domains. Borders may reject specified multicast packets or limit transmission of PIM messages.

#### ↘ Multicast Distribution Tree, DR and RP

Multicast packets are transmitted from one point to multiple points. The forwarding path is in a tree structure. This forwarding path is called a multicast distribution tree (MDT) and has the following types:

- Rendezvous Point Tree (RPT): The RP is regarded as the root and the designated router (DR) that connects group members is regarded as a leaf.
- Shortest Path Tree (SPT): The DR that connects multicast sources is regarded as the root, and RP or DR that connects group members is regarded as a leaf.

The DR and RP are functional roles for a PIM router.

- The RP collects multicast sources and group member information on the network.
- The DR that connects multicast sources reports multicast source information to the RP. The DR that connects group members reports group member information to the RP.

#### ↘ (\*,G) and (S,G)

- (\*,G): Packets sent from any source to group G, routing entries corresponding to the packets, and forwarding path (RPT) corresponding to the packets.
- (S,G): Packets sent from source S to group G, routing entries corresponding to the packets, and forwarding path (SPT) corresponding to the packets.

#### ↘ ASM and SSM

PIM-SM supports the following multicast models that are applicable to different multicast address segments:

- Any-Source Multicast (ASM): In the ASM model, user hosts cannot select multicast sources. User hosts join a group and receive packets sent from all sources to the group.
- Source-Specific Multicast (SSM): In the SSM model, user hosts can select multicast sources. User hosts specify source addresses when joining a group and receive only packets sent from specified sources to the group.

**i** SSM model requirements: User hosts must know the multicast source address in advance using other network services so that the hosts can select multicast sources.

## Overview

Feature	Description
<a href="#">Configuring Basic Functions of IP Multicasting</a>	Creates a PIM network and provides data sources and user terminals on the network with the IPv4 multicast service.
<a href="#">Configuring a TTL Threshold</a>	Configures a TTL threshold for an interface, that is, the minimum TTL value of multicast packets allowed on an interface.
<a href="#">Configuring the Number of Entries That Can Be Added to the Multicast Routing Table</a>	Limits the number of entries that can be added to the multicast routing table.
<a href="#">Configuring an IP Multicasting Border</a>	Configures an interface as a multicast border for a specified group.
<a href="#">Configuring an IP Multicasting Static Route</a>	Allows the multicast forwarding path to be different from the unicast path.
<a href="#">Configuring Layer-2 Direction Control for Multicast Streams</a>	Allows a specified multicast stream to be configured with multiple commands, that is, to be configured with multiple ports that can forward the stream. Once direction control is configured for a multicast stream, the stream can be forwarded only by these configured interfaces. Other interfaces are not permitted to forward the stream.
<a href="#">Configuring RPF Route Selection Based on the Longest Match Rule</a>	Selects an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table according to RPF rules. Among these three routes, the one with the longest match mask is selected as the RPF route.
<a href="#">Configuring Multicast Non-Stop Forwarding Parameters</a>	During normal running, SSP synchronizes the hardware multicast forwarding table to the management board in real time. After the management board is switched, the command for configuring the multicast control plane of the original slave management board is loaded, and the multicast protocol (such as PIM-SM or IGMP Snooping) re-converges. The multicast non-stop forwarding function ensures continuous forwarding of multicast data streams during re-convergence of the multicast protocol.

Feature	Description
<a href="#">Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries</a>	Deletes the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries.

### 1.3.1 Configuring Basic Functions of IP Multicasting

Create a PIM network and provide data sources and user terminals on the network with the IPv4 multicast service.

#### Working Principle

A device maintains the routing table for forwarding multicast packets through multicast routing protocols (such as PIM-DM or PIM-SM) and learns the states of group members in the directly connected network segment through IGMP. A host sends IGMP Report messages to join a specified IGMP group.

#### Related Configuration

##### ↘ [Enabling IPv4 Multicast Routing](#)

By default, IPv4 multicast routing is disabled.

Run **ip multicast-routing** to enable IPv4 multicast routing.

##### ↘ [Configuring IP Multicasting on an Interface](#)

By default, IP multicasting is disabled on an interface.

Run **ip pim sparse-mode** or **ip pim dense-mode** to enable IP multicasting on an interface.

### 1.3.2 Configuring a TTL Threshold

Configure a TTL threshold for an interface, that is, the minimum TTL value of multicast packets allowed on an interface.

#### Working Principle

Configure a TTL threshold for an interface and check the TTL values of multicast packets. Multicast packets whose TTL values are larger than the TTL threshold of the interface are forwarded and those whose TTL values are smaller are discarded.

#### Related Configuration

##### ↘ [Configuring a TTL Threshold](#)

By default, the TTL threshold of an interface is 0.

Run **ip multicast ttl-threshold *tth-value*** to change the TTL threshold of an interface. The value ranges from 0 to 255.

A larger value of *tth-value* means a larger TTL value of multicast packets to be forwarded.

### 1.3.3 Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

Each multicast data packet received on the device maintains a corresponding IP multicast route forwarding entry. However, excess multicast routing entries may exhaust device memory and deteriorate device performance. You can limit the number of entries in the IP multicast routing table based on the actual network and service performance requirements.

#### Working Principle

The number of entries in the IP multicasting routing table is limited based on the actual network and service performance requirements to ensure device performance.

#### Related Configuration

##### ▾ Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

By default, a maximum of 1024 entries can be added to an IP multicast routing table.

Run **ip multicast route-limit** *limit* [ *threshold* ] to change the number of entries that can be added to the IP multicasting routing table. The value ranges from 1 to 65536.

A larger value of *limit* means a larger number of entries that can be added to the IP multicasting routing table.

### 1.3.4 Configuring an IP Multicasting Border

Configure an IP multicasting border to specify the transmission range of multicast packets.

#### Working Principle

An IP multicasting border is configured to specify the transmission range of multicast packets. When an IP multicasting border is configured on an interface, this interface cannot forward or receive multicast packets, including those sent from the local host.

#### Related Configuration

##### ▾ Configuring an IP Multicasting Border

By default, no IP multicasting border is configured.

Run **ip multicast boundary** *access-list* [ *in* | *out* ] to configure an IP multicasting border.

### 1.3.5 Configuring an IP Multicasting Static Route

Configure an IP multicasting static route to specify an RPF interface or RPF neighbor for multicast packets from specified multicast sources.

#### Working Principle

An RPF check is performed once multicast packets are forwarded. An IP multicasting static route can be configured to specify an RPF interface or RPF neighbor for multicast packets from specified multicast sources.

## Related Configuration

### Configuring an IP Multicasting Static Route

By default, no IP multicasting static route is configured.

Run **ip mroute** *source-address mask* [ **bgp** | **isis** | **ospf** | **rip** | **static** ] { *v4rpf-address* | *interface-type interface-number* } [ *distance* ] to configure an IP multicasting static route.

## 1.3.6 Configuring Layer-2 Direction Control for Multicast Streams

Configure layer-2 direction control for multicast streams to control the forwarding of multicast streams on an interface.

### Working Principle

Configure layer-2 direction control for multicast streams and a forwarding interface so that multicast streams can be forwarded only through configured interfaces. In this case, layer-2 forwarding of multicast streams can be controlled.

## Related Configuration

### Configuring Layer-2 Direction Control for Multicast Streams

By default, layer-2 direction control for multicast streams is disabled.

Run **ip multicast static** *source-address group-address interface-type interface-number* to configure layer-2 direction control for multicast streams.

## 1.3.7 Configuring RPF Route Selection Based on the Longest Match Rule

Select an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table and select the one with the longest match mask as the RPF route from the three optimal routes.

### Working Principle

A multicast static route, an MBGP route, and a unicast route that can be used for RPF check are selected respectively from the multicast static routing table, MBGP routing table, and unicast routing table according to RPF rules.

- If the longest match rule is used, the route with the longest match mask is selected as the RPF route. If the three routes have the same mask, the one with the highest priority is selected as the RPF route. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.
- Otherwise, the one with the highest priority is selected as the RPF route. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.

## Related Configuration

### Configuring RPF Route Selection Based on the Longest Match Rule

By default, the route with the highest priority is selected as the RPF route. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.

Run **ip multicstrpf longest-match** to configure RPF route selection based on the longest match rule.

### 1.3.8 Configuring Multicast Non-Stop Forwarding Parameters

The non-stop forwarding function ensures continuous forwarding of multicast data streams during the re-convergence of multicast protocols.

#### Working Principle

During normal running, SSP synchronizes the hardware multicast forwarding table to the management board in real time. After the management board is switched, the command for configuring the multicast control plane of the original slave management board is loaded, and the multicast protocol (such as PIM-SM or IGMP Snooping) re-converges. The multicast non-stop forwarding function ensures continuous forwarding of multicast data streams during re-convergence of multicast protocols.

After the configured protocol convergence period times out, all multicast forwarding table entries that are not updated during the convergence period are deleted.

#### Related Configuration

##### Configuring the Maximum Period for Multicast Protocol Convergence

By default, the maximum period for multicast protocol convergence is 140s.

Run **msf nsf convergence-time *time*** to configure the maximum period for multicast protocol convergence. The value ranges from 0 to 3600s.

A larger value of *time* means a longer maximum period for multicast protocol convergence.

##### Configuring the Multicast Packet Leakage Period

By default, the multicast packet leakage period is 150s.

Run **msf nsf leak *interval*** to configure the multicast packet leakage period. The value ranges from 0 to 3600s.

A larger value of *interval* means a longer leakage period.

### 1.3.9 Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries

Delete the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries.

#### Working Principle

Delete the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries .

#### Related Configuration

##### Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries

By default, the overwriting mechanism upon the overflow of multicast hardware forwarding entries is disabled.

Run **msf ipmc-overflow override** to configure the overwriting mechanism upon overflow of multicast hardware forwarding entries.

## 1.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic Functions of IP Multicasting</a>	 (Mandatory) It is used to configure the multicast service.	
	<b>ip multicast-routing</b>	Enables the IPv4 multicast routing function.
<a href="#">Configuring a TTL Threshold</a>	 Optional.	
	<b>ip multicast ttl-threshold</b> <i>ttl-value</i>	Configures a TTL threshold for an interface.
<a href="#">Configuring the Number of Entries That Can Be Added to the Multicast Routing Table</a>	<b>ip multicast route-limit</b> <i>limit</i> [ <i>threshold</i> ]	Limits the number of entries that can be added to the multicast routing table.
<a href="#">Configuring an IP Multicasting Border</a>	<b>ip multicast boundary</b> <i>access-list</i> [ <i>in</i>   <i>out</i> ]	Configures an interface as a multicast border for a specified group.
<a href="#">Configuring an IP Multicasting Static Route</a>	<b>ip mroute</b> <i>source-address mask</i> { [ <b>bgp</b>   <b>isis</b>   <b>ospf</b>   <b>rip</b>   <b>static</b> ] { <i>v4rpf-address</i>   <i>interface-type interface-number</i> } } [ <i>distance</i> ]	Configures an IP multicasting static route.
<a href="#">Configuring Layer-2 Direction Control for Multicast Streams</a>	<b>ip multicast static</b> <i>source-address group-address interface-type interface-number</i>	Controls the direction of data streams on layer-2 interfaces.
<a href="#">Configuring RPF Route Selection Based on the Longest Match Rule</a>	<b>ip multicast rpf longest-match</b>	Configures RPF route selection based on the longest match rule.
<a href="#">Configuring Multicast Non-Stop Forwarding Parameters</a>	<b>msf nsf convergence-time</b> <i>time</i>	Configures the maximum period for multicast protocol convergence.
	<b>msf nsf leak</b> <i>time</i>	Configures the multicast packet leakage period.
<a href="#">Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries</a>	<b>msf ipmc-overflow override</b>	Configures the overwriting mechanism upon overflow of multicast hardware forwarding entries.

### 1.4.1 Configuring Basic Functions of IP Multicasting

#### Configuration Effect

- Create a PIM network and provide data sources and user terminals on the network with the IPv4 multicast service.

## Notes

- A PIM network needs to use existing unicast routes on the network. Therefore, IPv4 routes must be configured on the network.

## Configuration Steps

### ↳ Enabling IPv4 Multicast Routing

- Mandatory.
- IPv4 multicast routing should be enabled on each router unless otherwise specified.

### ↳ Enabling IP Multicasting for an Interface

- Mandatory.
- IP multicasting protocol should be enabled on interfaces unless otherwise specified:

## Verification

Enable multicast sources to send multicast packets and user hosts to join the groups.

- Check whether the user hosts can successfully receive packets from each group.

## Related Commands

### ↳ Enabling IPv4 Multicast Routing

<b>Command</b>	<code>ip multicast-routing</code>
<b>Parameter</b>	
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Configuring IP Multicasting

-  For IGMP configuration, see the IGMP section.
-  For PIM-DM configuration, see the PIM-DM section.
-  For PIM-SM configuration, see the PIM-SM section.
-  After layer-3 multicasting is enabled in the private VLAN and super VLAN and a multicast source exists in the sub-VLAN, an extra entry whose ingress is the sub-VLAN into which the multicast stream enters needs to be copied due to the validity check during multicast forwarding. This results in occupation of one more multicast hardware entry and one less in the multicast capacity.

### ↳ Displaying Information About the Multicast Forwarding Table

<b>Command</b>	<b>show ip mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>dense</b>   <b>sparse</b> ] [ <b>summary</b>   <b>count</b> ]
<b>Parameter Description</b>	<p><i>group-or-source-address</i>: Specifies a group address or source address.</p> <p><i>group-or-source-address</i>: Specifies a group address or source address.</p> <p><b>dense</b>: Displays the core entry of PIM-DM multicast.</p> <p><b>sparse</b>: Displays the core entry of PIM-SM multicast.</p> <p><b>summary</b>: Displays summary information about multicast routing entries.</p> <p><b>count</b>: Displays counting information about multicast routing entries.</p>
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>The three parameters are optional, and the source address and group address must be specified simultaneously.</p> <p>When no source address or group address is specified, all MFC entries are displayed.</p> <p>When only the source address and group address are specified, MFC entries of the source address and group address are displayed.</p>

## Configuration Example

### Creating the IP Multicast Service on the IPv4 Network and Supporting PIM-DM

<b>Scenario</b> Figure 1-3	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure an IPv4 unicast routing protocol (such as OSPF) on a router.</li> <li>● Enable IPv4 multicast routing on all routers.</li> <li>● Enable PIM-DM on device interconnection interfaces and interfaces for connecting user hosts and multicast sources.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if)# ip pim dense-mode</pre>

	<pre>A(config-if)# exit A(config)# interface GigabitEthernet 0/2 A(config-if)# ip pim dense-mode A(config-if)# exit</pre>
<b>B</b>	<pre>B# configure terminal B(config)# ip multicast-routing B(config)# interface GigabitEthernet 0/1 B(config-if)# ip pim dense-mode B(config-if)# exit B(config)# interface GigabitEthernet 0/2 B(config-if)# ip pim dense-mode B(config-if)# exit</pre>
<b>Verification</b>	<p>Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.3). Enable receiver A to join G.</p> <ul style="list-style-type: none"> <li>● Check multicast packets received by receiver A. Receiver A should be able to receive multicast packets from G.</li> <li>● Check multicast forwarding tables on A and B.</li> </ul>
<b>A</b>	<pre>A# show ip mroute  IP Multicast Routing Table Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,        R - RPT, S - SPT, s - SSM Group Timers: Uptime/Stat Expiry Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.3), uptime 00:01:55, stat expires 00:02:19 Owner PIMDM, Flags: TFS   Incoming interface: GigabitEthernet 0/1   Outgoing interface list:     GigabitEthernet 0/2 (1)</pre>
<b>B</b>	<pre>B# show ip mroute</pre>

```
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,
      R - RPT, S - SPT, s - SSM Group
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(192.168.1.100, 233.3.3.3), uptime 00:00:35, stat expires 00:02:55
Owner PIMDM, Flags: TFS

Incoming interface: GigabitEthernet 0/2

Outgoing interface list:

GigabitEthernet 0/1 (1)
```

## Common Errors

- An IPv4 unicast route is incorrectly configured.
- IPv4 multicast routing is not enabled on a router.
- IP multicasting is not enabled on an interface.

## 1.4.2 Configuring a TTL Threshold

### Configuration Effect

- Configure a TTL threshold for an interface and check the TTL values of multicast packets. Multicast packets whose TTL values are larger than the TTL threshold of the interface are forwarded and those whose TTL values are smaller are discarded.

### Notes

- The basic functions of IP multicasting must be configured.

### Configuration Steps

- Set a TTL threshold on PIM router interfaces unless otherwise specified.

### Verification

Enable multicast sources to send multicast packets and user hosts to join the groups.

- Set a TTL threshold to a value that is larger than the TTL value of the multicast packet on the PIM router interface directly connected to the user host and check whether the user can receive the multicast packet.

## Related Commands

### Configuring a TTL Threshold

<b>Command</b>	<code>ip multicast ttl-threshold <i>ttl-value</i></code>
<b>Parameter Description</b>	<i>ttl-value</i> : Specifies a TTL threshold for an interface. The value ranges from 0 to 255. The default value is 0.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A multicast-enabled device can retain a TTL threshold for each interface. Multicast packets whose TTL values are larger than the TTL threshold of the interface are forwarded and those whose TTL values are smaller are discarded. A TTL threshold takes effect only for multicast frames and must be configured on layer-3 interfaces.

## Configuration Example

### Creating the IP Multicast Service on the IPv4 Network and Configuring a TTL Threshold

<p><b>Scenario</b></p> <p>Figure 1-4</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Configure the basic functions of IP multicasting. (Omitted)</li> <li>Configure the TTL threshold as 100 on the Gi 0/2 interface of device A.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)#int gigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)#ip multicast ttl-threshold 100 A(config-if-GigabitEthernet 0/2)# exit</pre>
<p><b>Verification</b></p>	<p>Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.3). Enable receiver A to join G.</p> <ul style="list-style-type: none"> <li>Configure the TTL threshold as 100 on the Gi 0/2 interface of device A, which is larger than the TTL value of the multicast packet.</li> <li>Check the difference between the route forwarding entries before and after the TTL threshold is configured.</li> </ul>

<p><b>Before Configuring the TTL Threshold</b></p>	<pre>A# show ip mroute IP Multicast Routing Table Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group Timers: Uptime/Stat Expiry Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.3), uptime 00:00:08, stat expires 00:03:29 Owner PIMDM, Flags: TFS   Incoming interface: GigabitEthernet 0/1   Outgoing interface list:     GigabitEthernet 0/2 (1)</pre>
<p><b>After Configuring the TTL Threshold</b></p>	<pre>A# show ip mroute IP Multicast Routing Table Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group Timers: Uptime/Stat Expiry Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.3), uptime 00:00:01, stat expires 00:03:29 Owner PIMDM, Flags: TFS   Incoming interface: GigabitEthernet 0/1   Outgoing interface list:     GigabitEthernet 0/2 (100)</pre>

### 1.4.3 Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

#### Configuration Effect

- Each multicast data packet received on the device maintains a corresponding IP multicast route forwarding entry. However, excess multicast routing entries may exhaust device memory and deteriorate device performance. You can limit the number of entries in the IP multicast routing table based on the actual network and service performance requirements.

## Notes

- The basic functions of IP multicasting must be configured.

## Configuration Steps

- Limit the number of entries in the IP multicast routing table based on the actual network and service performance requirements.

## Verification

Send N groups of multicast packets from the multicast source on the network, configure user hosts to join the groups, configure the number of entries that can be added to the IP multicast routing table as N-1, and check whether the multicast packet received by the user host is that of the N-1 group.

## Related Commands

### 📌 Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

<b>Command</b>	<code>ip multicast route-limit limit [ threshold ]</code>
<b>Parameter Description</b>	<p><i>limit</i>: Specifies the number of entries in the multicast routing table. The value ranges from 1 to 65536. The default value is 1024.</p> <p><i>threshold</i>: Specifies the number of entries in the multicast routing table that triggers the warning message. The default value is 65536.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Due to limitations on hardware resources, routing entries that exceed the range permitted by hardware can be forwarded only by software, deteriorating the performance.

## Configuration Example

### 📌 Creating the IP Multicast Service on the IPv4 Network and Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

<p><b>Scenario</b> <b>Figure 1-5</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic the functions of IP multicasting. (Omitted)</li> <li>● Configure the number of entries that can be added to the multicast routing table on device B as 2.</li> </ul>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# ip multicast route-limit 2</pre>
<p><b>Verification</b></p>	<p>Enable the multicast source (192.168.1.100) to send packets to G1 (233.3.3.1), G2 (233.3.3.2), and G3 (233.3.3.3). Enable receiver A to join G1, G2, and G3.</p> <ul style="list-style-type: none"> <li>● Check multicast packets received by receiver A. Receiver A should be able to receive multicast packets from two groups among G1, G2, and G3.</li> <li>● Check multicast routing entries on A and B.</li> <li>● When the number of entries in the IP multicasting routing table reaches the upper threshold, a prompt message is displayed.</li> </ul>
<p><b>A</b></p>	<pre>A# show ip mroute  IP Multicast Routing Table Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,        R - RPT, S - SPT, s - SSM Group Timers: Uptime/Stat Expiry Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.1), uptime 00:00:06, stat expires 00:03:24 Owner PIMDM, Flags: TFS  Incoming interface: GigabitEthernet 0/1 Outgoing interface list:     GigabitEthernet 0/2 (1)</pre>

	<pre>(192.168.1.100, 233.3.3.2), uptime 00:00:05, stat expires 00:03:25 Owner PIMDM, Flags: TFS   Incoming interface: GigabitEthernet 0/1   Outgoing interface list:     GigabitEthernet 0/2 (1)  (192.168.1.100, 233.3.3.3), uptime 00:00:00, stat expires 00:03:30 Owner PIMDM, Flags: TFS   Incoming interface: GigabitEthernet 0/1   Outgoing interface list:     GigabitEthernet 0/2 (1)</pre>
<b>B</b>	<pre>B# show ip mroute  IP Multicast Routing Table Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,        R - RPT, S - SPT, s - SSM Group Timers: Uptime/Stat Expiry Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.1), uptime 00:01:13, stat expires 00:03:23 Owner PIMDM, Flags: TFS   Incoming interface: GigabitEthernet 0/2   Outgoing interface list:     GigabitEthernet 0/1 (1)  (192.168.1.100, 233.3.3.3), uptime 00:06:08, stat expires 00:03:23 Owner PIMDM, Flags: TFS   Incoming interface: GigabitEthernet 0/2   Outgoing interface list:     GigabitEthernet 0/1 (1)</pre>

**When the number of entries in the IP multicasting routing table reaches the upper threshold, a prompt message is displayed.**

```
B#*Dec 26 10:43:07: %MROUTE-4-ROU TELIMIT: IPv4 Multicast route limit 2 exceeded - VRF default.
```

### Common Errors

- An IPv4 unicast route is incorrectly configured.

## 1.4.4 Configuring an IP Multicasting Border

### Configuration Effect

- Configure an IP multicasting border to specify the transmission range of multicast packets.

### Notes

- The basic functions of IP multicasting must be configured.

### Configuration Steps

- Configure an IP multicasting border on PIM router interfaces unless otherwise specified.

### Verification

Enable multicast sources to send multicast packets and user hosts to join the groups. Configure an IP multicasting border on the PIM router interface connected to the user host and check whether the user can receive the multicast packet.

### Related Commands

#### ↘ Enabling IPv4 Multicast Routing

<b>Command</b>	<b>ip multicast boundary</b> <i>access-list</i> [ <b>in</b>   <b>out</b> ]
<b>Parameter</b>	<i>access-list</i> : Indicates the group address range defined by ACL.
<b>Description</b>	<b>in</b> : Indicates that the IP multicasting border takes effect in the incoming direction of the multicast stream. <b>out</b> : Indicates that the IP multicasting border takes effect in the outgoing direction of the multicast stream.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After this command is executed, IGMP and PIM-SM packets in the group range are filtered on this interface and multicast data streams are not going in and out through this interface. The ACL associated with this command can be a standard ACL or an extended ACL. For extended ACLs, only the destination address is matched and the source address is matched.

### Configuration Example

#### ↘ Creating the IP Multicast Service on the IPv4 Network and Configuring an IP Multicasting Border

<p><b>Scenario</b> <b>Figure 1-6</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> <li>● Configure an ACL on device A.</li> <li>● Configure an IP multicasting border on the Gi 0/1 interface of device A.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)#ip access-list standard ip_multicast A(config-std-nacl)#deny any A(config-std-nacl)#exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ip multicast boundary ip_multicast A A(config-if-GigabitEthernet 0/1)# exit</pre>
<p><b>Verification</b></p>	<p>Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.3). Enable receiver A to join G.</p> <ul style="list-style-type: none"> <li>● Run <b>debug ip pim sparse-mode events</b>.</li> </ul>
<p><b>A</b></p>	<pre>A# debug ip pim sparse-mode events Jan 1 20:58:34: %7: VRF(0): No cache message: src 192.168.1.100 for 233.3.3.3 vif 2 *Jan 1 20:58:34: %7: VRF(0): Ignore No cache message: src 192.168.1.100 for 233.3.3.3 vif 2 in PIM_BOUNDARY_FLT_BOTH range</pre>

**Common Errors**

- An IPv4 unicast route is incorrectly configured.

**1.4.5 Configuring an IP Multicasting Static Route**

**Configuration Effect**

- Configure an IP multicasting static route to specify an RPF interface or RPF neighbor for multicast packets from specified multicast sources.

## Notes

- The basic functions of IP multicasting must be configured.

## Configuration Steps

- An IP multicasting static route can be configured on each device unless otherwise specified.

## Verification

Run **show ip rpf** { *source-address* [ *group-address* ] [ **rd** *route-distinguisher* ] } [ **metric** ] to check the RPF information of a specified source.

## Related Commands

### ▾ Configuring Basic Functions of IP Multicasting

<b>Command</b>	<b>ip mroute</b> <i>source-address mask</i> { [ <b>bgp</b>   <b>isis</b>   <b>ospf</b>   <b>rip</b>   <b>static</b> ] { <i>v4rpf-address</i>   <i>interface-type interface-number</i> } } [ <i>distance</i> ]
<b>Parameter Description</b>	<p><i>source-address</i>: Specifies the multicast source address.</p> <p><i>mask</i>: Specifies the mask of the multicast source address.</p> <p><i>protocol</i>: Indicates the unicast routing protocol currently used.</p> <p><i>rpf-address</i>: Specifies the address of the RPF neighbor (next hop of the multicast source).</p> <p><i>interface-type interface-number</i>: Indicates the RPF interface (outgoing interface of the multicast source).</p> <p><i>distance</i>: Specifies the route management distance. The value ranges from 0 to 255. The default value is 0.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Multicast static routes are applicable only to RPF check.</p> <p>If the IP address of the outgoing interface, but not the next hop, of the static multicast route needs to be specified, the outgoing interface must be a point-to-point type.</p>

### ▾ Displaying the RFP Information of a Specified Source Address

<b>Command</b>	<b>show ip rpf</b> { <i>source-address</i> [ <i>group-address</i> ] [ <b>rd</b> <i>route-distinguisher</i> ] } [ <b>metric</b> ]
<b>Parameter Description</b>	<p><i>source-address</i>: Specifies the source IP address.</p> <p><i>group-address</i>: Specifies the group IP address.</p> <p><b>rd</b> <i>route-distinguisher</i>: Indicates that the RD proxy is used for search.</p> <p><b>metric</b>: Displays the metric of the MDT-SAFI route.</p>
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>The three parameters are optional, and the source address and group address must be specified simultaneously.</p> <p>When no source address or group address is specified, all MFC entries are displayed.</p>

When only the source address and group address are specified, MFC entries of the source address and group address are displayed.

### Configuration Example

#### Creating the IP Multicast Service on the IPv4 Network and Supporting PIM-DM

<p><b>Scenario</b> Figure 1-7</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Configure the basic functions of IP multicasting. (Omitted)</li> <li>Configure a static route to the receiver on device B.</li> </ul>
<p><b>A</b></p>	<pre>B# configure terminal B(config)# ip mroute 10.10.10.10 255.255.255.255 ospf 192.168.1.1 1</pre>
<p><b>Verification</b></p>	<p>Run <b>show ip rpf</b> to view the RPF information to the receiver before and after the configuration.</p>
<p><b>Before Configuration</b></p>	<pre>B# show ip rpf 10.10.10.10 RPF information for 10.10.10.10 RPF interface: GigabitEthernet 0/2 RPF neighbor: 192.168.2.1 RPF route: 10.10.10.10/32 RPF type: unicast (ospf) RPF recursion count: 0 Doing distance-preferred lookups across tables Distance: 110 Metric: 1</pre>
<p><b>After Configuration</b></p>	<pre>B# show ip rpf 10.10.10.10 RPF information for 10.10.10.10 RPF interface: GigabitEthernet 0/0 RPF neighbor: 192.168.1.1 RPF route: 10.10.10.10/32 RPF type: static</pre>

```
RPF recursion count: 0
Doing distance-preferred lookups across tables
Distance: 1
Metric: 0
```

### Common Errors

- An IPv4 unicast route is incorrectly configured.
- IPv4 multicast routing is not enabled on a router.

## 1.4.6 Configuring Layer-2 Direction Control for Multicast Streams

### Configuration Effect

Configure layer-2 direction control for multicast streams to control the forwarding of multicast streams on an interface.

### Notes

- The basic functions of IP multicasting must be configured.

### Configuration Steps

- Layer-2 direction control for multicast streams can be configured on layer-2 devices unless otherwise specified.

### Verification

Send multicast packets on the network containing layer-2 device A, connect multiple user hosts to VLAN 1 of layer-2 device A to receive the group, configure layer-2 direction control for multicast streams on device A, and check whether multicast packets are sent to the configured layer-2 interface.

### Related Commands

#### ▾ Configuring Layer-2 Direction Control for Multicast Streams

<b>Command</b>	<code>ip multicast static source-address group-address interface-type interface-number</code>
<b>Parameter Description</b>	<p><i>source -address</i>: Specifies the multicast source address.</p> <p><i>group-address</i>: Specifies the multicast group address.</p> <p><i>interface-type interface-number</i>: Specifies a layer-2 interface that is allowed to forward the multicast flow.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Allow a specified multicast flow to be configured with multiple commands, that is, to be configured with multiple interfaces. Once direction control is configured for a multicast stream, the stream can be forwarded only by these configured interfaces. Other interfaces are not permitted to forward the stream.</p> <p>This command controls only the forwarding of multicast streams on the interface, but does not directly affect the processing of multicast protocols on the protocol packets. However, since certain features of the</p>

multicast protocol are driven by multicast data streams, behaviors of the multicast routing protocols may also be affected.

### Configuration Example

#### Creating the IP Multicast Service on the IPv4 Network and Configuring Layer-2 Direction Control for Multicast Streams

<p><b>Scenario</b> Figure 1-8</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Configure the basic functions of IP multicasting. (Omitted)</li> <li>Configure layer-2 direction control for multicast streams on device B so that the streams are sent only to the Gi 0/2 interface.</li> </ul>
<p><b>B</b></p>	<pre>A# configure terminal A(config)# ip multicast static 192.168.1.100 233.3.3.3 gigabitEthernet0/2</pre>
<p><b>Verification</b></p>	<p>Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.1). Enable receivers A and B to join G.</p> <ul style="list-style-type: none"> <li>Check multicast packets received by receiver A. Receiver B should not be able to receive multicast packets from G.</li> </ul>

### Common Errors

- An IPv4 unicast route is incorrectly configured.

## 1.4.7 Configuring RPF Route Selection Based on the Longest Match Rule

### Configuration Effect

- Select an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table and select the one with the longest match mask as the RPF route from the three optimal routes.

### Notes

- The basic functions of IP multicasting must be configured.

## Configuration Steps

- Configure RPF route selection based on the longest match rule on each device unless otherwise specified.

## Verification

Configure a multicast static route and a unicast static route to have the same priority and configure the unicast static route to have a longer mask length.

- Run **show ip rpf** { *source-address* [ *group-address* ] [ *rd route-distinguisher* ] } [ *metric* ] to check the RPF information of a specified source.

## Related Commands

### Configuring RPF Route Selection Based on the Longest Match Rule

<b>Command</b>	<b>ip multicast rpf longest-match</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The steps for selecting RFP routes are as follows:</p> <ol style="list-style-type: none"> <li>1. Select an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table for RPF check.</li> <li>2. Select one from the three routes as the RPF route.</li> </ol> <p>If the longest match rule is used, the route with the longest match mask is selected. If the three routes have the same mask, the one with the highest priority is selected. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.</p> <p>If the longest match rule is not used, the route with the longest match mask is selected. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.</p>

## Configuration Example

### Creating the IP Multicast Service on the IPv4 Network and Configuring RPF Route Selection Based on the Longest Match Rule

<b>Scenario</b> Figure 1-9	<p>The diagram illustrates a network topology. On the left, a 'Source' (represented by a server icon) is connected to Router A via interface Gi0/2. Router A is connected to Router B via two interfaces: Gi0/1 and Gi0/2. Router B is connected to the Source via interface Gi0/2.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> </ul>

	<ul style="list-style-type: none"> <li>● On device B, configure an IP multicast static route whose mask length is smaller than that of the unicast static route.</li> <li>● Configure RPF route selection based on the longest match rule on device B.</li> </ul>
<b>B</b>	<pre>B# configure terminal B(config)# ip multicast-routing B(config)# ip mroute 10.10.10.10 255.255.0.0 ospf 192.168.1.1 B(config)# ip multicast rpf longest-match</pre>
<b>Verification</b>	Run <b>show ip rpf</b> to check the RFP information of the multicast source before and after configuring RPF route selection based on the longest match rule.
<b>Before configuration</b>	<pre>B#show ip rpf 10.10.10.10 RPF information for 10.10.10.10   RPF interface: GigabitEthernet 0/0   RPF neighbor: 192.168.1.1   RPF route: 10.10.0.0/16   RPF type: static   RPF recursion count: 0   Doing distance-preferred lookups across tables   Distance: 0   Metric: 0</pre>
<b>After configuration</b>	<pre>B# show ip rpf 10.10.10.10 RPF information for 10.10.10.10   RPF interface: GigabitEthernet 0/2   RPF neighbor: 192.168.2.1   RPF route: 10.10.10.10/32   RPF type: unicast (ospf)   RPF recursion count: 0   Doing prefix-length-preferred lookups across tables   Distance: 110   Metric: 1</pre>

**Common Errors**

- An IPv4 unicast route is incorrectly configured.
- IPv4 multicast routing is not enabled on a router.

## 1.4.8 Configuring Multicast Non-Stop Forwarding Parameters

### Configuration Effect

- The non-stop forwarding function ensures continuous forwarding of multicast data streams during re-convergence of multicast protocols.

### Notes

- The basic functions of IP multicasting must be configured.

### Configuration Steps

#### ↘ Configuring the Maximum Period for Multicast Protocol Convergence

- The maximum period for multicast protocol convergence can be specified on each device unless otherwise specified.

#### ↘ Configuring the Multicast Packet Leakage Period

- The multicast leakage period can be configured on each device unless otherwise specified.

### Verification

Run **show msf nsf** to check the configured multicast non-stop forwarding parameters.

### Related Commands

#### ↘ Configuring the Maximum Period for Multicast Protocol Convergence

<b>Command</b>	<b>msf nsf convergence-time</b> <i>time</i>
<b>Parameter Description</b>	<b>convergence-time</b> <i>time</i> : Specifies the maximum period for multicast protocol convergence. The value ranges from 0 to 3600s. The default value is 140s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

#### ↘ Configuring the Multicast Packet Leakage Period

<b>Command</b>	<b>msf nsf leak</b> <i>interval</i>
<b>Parameter Description</b>	<b>leak</b> <i>interval</i> : Specifies the multicast packet leakage period. The value ranges from 0 to 3600s. The default value is 150s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

▾ **Displaying Multicast Non-Stop Forwarding Configurations**

<b>Command</b>	<b>show msf nsf</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	-

**Configuration Example**

▾ **Creating the IP Multicast Service on the IPv4 Network and Supporting PIM-DM**

<b>Scenario</b>	Basic environment of the IP multicasting service (Omitted)
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> <li>● Configure the maximum period for multicast protocol convergence.</li> <li>● Configure the multicast packet leakage period.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# msf nsf convergence-time 200 A(config)# msf nsf leak 300</pre>
<b>Verification</b>	Run <b>show msf nsf</b> to display multicast non-stop forwarding configurations.
<b>A</b>	<pre>A# show msf nsf Multicast HA Parameters -----+-----+ protocol convergence timeout          200 secs flow leak interval                    300 secs</pre>

**1.4.9 Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries**

**Configuration Effect**

- Delete the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries.

**Notes**

- The basic functions of IP multicasting must be configured.

## Configuration Steps

- The overwriting mechanism upon overflow of multicast hardware forwarding entries can be configured on each device unless otherwise specified.

## Verification

Run **show running-config** to check whether the overwriting mechanism upon overflow of multicast hardware forwarding entries is configured.

## Related Commands

### ↘ Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries

<b>Command</b>	<b>msf ipmc-overflow override</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

## Configuration Example

### ↘ Creating the IP Multicast Service on the IPv4 Network and Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries

<b>Scenario</b>	Basic environment of the IP multicasting service (Omitted)
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> <li>● Configure the overwriting mechanism upon overflow of multicast hardware forwarding entries.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)#msf ipmc-overflow override</pre>
<b>Verification</b>	Run <b>show running-config</b> to check whether the overwriting mechanism upon overflow of multicast hardware forwarding entries is configured.
<b>A</b>	<pre>A# show running-config ... msf ipmc-overflow override ...</pre>

## 1.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and interrupt services.

Description	Command
Clears the IPv4 multicast forwarding table.	<b>clear ip mroute</b> { *   <i>v4group-address</i> [ <i>v4source-address</i> ] }
Resets statistics in the IPv4 multicast forwarding table.	<b>clear ip mroute statistics</b> { *   <i>v4group-address</i> [ <i>v4source-address</i> ] }

### Displaying

Description	Command
Displays help guidance information of each multicast module.	<b>multicast help</b>
Displays status of the IPv4 multicast modules.	<b>view multicast</b>
Displays the IPv4 multicast forwarding table.	<b>show ip mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>dense</b>   <b>sparse</b> ] [ <b>summary</b>   <b>count</b> ]
Displays IPv4 static multicast route information.	<b>show ip mroute static</b>
Displays the RFP Information of a specified IPv4 source address.	<b>show ip rpf</b> { <i>source-address</i> [ <i>group-address</i> ] [ <b>rd route-distinguisher</b> ] } [ <b>metric</b> ]
Displays information about IPv4 multicast interfaces.	<b>show ip mvif</b> [ <i>interface-type interface-number</i> ]
Displays the IPv4 layer-3 multicast forwarding table.	<b>show ip mrf mfc</b>
Displays the IPv4 multi-layer multicast forwarding table.	<b>show msf msc</b>
Displays IPv4 multicast non-stop forwarding configurations.	<b>show msf nsf</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs running of the multicast core.	<b>debug nsm mcast all</b>

Description	Command
Debugs communication between the IPv4 multicast core and the protocol module.	<b>debug nsm mcast fib-msg</b>
Debugs the interface running of the IPv4 multicast core.	<b>debug nsm mcast vif</b>
Debugs the interface and entry statistics processing of the IPv4 multicast core.	<b>debug nsm mcast stats</b>
Debugs the processing of IPv4 layer-3 multicast packet forwarding.	<b>debug ip mrf forwarding</b>
Debugs the operation on layer-3 multicast forwarding entries on an IPv4 network.	<b>debug ip mrf mfc</b>
Debugs the processing of layer-3 multicast forwarding events on an IPv4 network.	<b>debug ip mrf event</b>
Debugs the processing of IPv4 multi-layer multicast packet forwarding.	<b>debug msf forwarding</b>
Debugs the operation on multi-layer multicast forwarding entries on an IPv4 network.	<b>debug msf mfc</b>
Debugs the bottom-layer hardware processing of IPv4 multi-layer multicast packet forwarding.	<b>debug msf ssp</b>
Debugs the invocation of API interfaces provided by IPv4 multi-layer multicast forwarding.	<b>debug msf api</b>
Debugs the processing of multi-layer multicast forwarding events on an IPv4 network.	<b>debug msf event</b>

## 2 Configuring IPv6 Multicast

### 2.1 Overview

IPv6 multicast is enrichment and enhancement of IPv4 multicast. In comparison with IPv4 multicast, the IPv6 multicast address mechanism is greatly enriched.

In traditional IP transmission, a host is allowed to send packets only to a single host (unicast communication) or all hosts (broadcast communication). The multicast technology provides a third choice: A host is allowed to send packets to certain hosts.

The IP multicast technology is applicable to one-to-many multimedia applications.

#### Protocols and Standards

IPv6 multicast covers the following protocols:

- Multicast Listener Discovery (MLD): Runs between a multicast device and a host, and tracks and learns relationships of group members.
- Protocol Independent Multicast – Sparse Mode for IPv6 (PIM-SMv6): Runs between devices and implements multicast packet forwarding by establishing a multicast routing table.

### 2.2 Applications

Application	Description
<a href="#">Typical Application of PIM-SMv6</a>	The PIM-SMv6 multicast service is provided in the same network.

#### 2.2.1 Typical Application of PIM-SMv6

##### Scenario

The PIM-SMv6 multicast service is provided in the same network.

As shown in the following figure:

- R1 and the multicast source are in the same network, R2 is configured as a rendezvous point (RP), R3 is in the same network as Receiver A, and R4 is in the same network as Receiver B. Assume that devices and hosts are correctly connected, IPv6 is enabled on each interface, and IPv6 unicast is enabled on each device.

Figure 2-1

<b>Remark</b>	R1, R2, R3, and R4 are Layer-3 devices and R2 functions as an RP.
<b>s</b>	The multicast source is directly connected to R1, Receiver A is directly connected to R3, and Receiver B is directly connected to R4.

### Deployment

- Run the Open Shortest Path First for IPv6 (OSPFv6) protocol in the same network to implement unicast routing.
- Run the PIM-SMv6 protocol in the same network to implement multicast routing.

## 2.3 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

Routers where the PIM protocol is enabled are called PIM routers. Interfaces where the PIM protocol is enabled are called PIM interfaces.

Multicast packets are forwarded by PIM routers. The PIM interfaces for receiving multicast packets are called upstream interfaces, and the PIM interfaces for transmitting multicast packets are called downstream interfaces.

Network segments where upstream interfaces are located are called upstream network segments. Network segments where downstream interfaces are located are called downstream network segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On some PIM interfaces, borders are set to divide a large PIM network into multiple PIM domains. The borders may reject specific multicast packets or limit transmission of PIM messages.

#### ↘ Multicast Distribution Tree, DR, RP

Multicast packets are transmitted from one point to multiple points. The forwarding path presents a tree structure. This forwarding path is called a multicast distribution tree (MDT). MDTs are classified into two types:

- Rendezvous point tree (RPT): Uses the rendezvous point (RP) as the root and designated routers (DRs) connected to group members as leaves.
- Shortest path tree (SPT): Use the DR connected to a multicast source as the root and the RPs or DRs connected to group members as leaves.

DRs and RPs are function roles of PIM routers.

- RPs collect information about multicast sources and group members in the network.
- The DR connected to a multicast source reports multicast source information to the RP and the DRs connected to group members report the group member information to the RP.

↘ **(\*G), (S,G)**

- (\*G): Indicates the packets transmitted from any source to Group G, routing entries corresponding to the packets, and forwarding path (RPT) corresponding to the packets.
- (S,G): Indicates the packets transmitted from Source S to Group G, routing entries corresponding to the packets, and forwarding path (SPT) corresponding to the packets.

↘ **ASM, SSM**

PIM-SM supports two multicast service models: any-source multicast (ASM) and source-specific multicast (SSM), which are applicable to different multicast address segments.

- ASM: In the ASM model, a user host cannot select a multicast source. The user host joins a multicast group and receives all packets sent from all sources to the multicast group.
- SSM: In the SSM model, a user host can select a multicast source. The user host specifies the source address when joining a multicast group, and then receives packets only from the specified source to the multicast group.

**i** SSM model requirement: Other network services must be used to enable a user host to know the position of a multicast source in advance so that the user host selects the multicast source.

**Overview**

Feature	Description
<a href="#">Configuring IPv6 Multicast Basic Functions</a>	Creates a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.
<a href="#">Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table</a>	Restricts the number of entries that can be added to the multicast routing table.

Feature	Description
<a href="#">Configuring the IPv6 Multicast Border</a>	Sets an interface as the multicast border of a specific group range.
<a href="#">Configuring IPv6 Multicast Static Routing</a>	Configures multicast static routing to adopt multicast forwarding paths different from unicast forwarding paths.
<a href="#">Configuring Layer-2 Flow Direction Control for Multicast Streams</a>	Multiple commands can be configured for a multicast stream, that is, multiple ports can be allowed to forward the multicast stream. If flow direction control is configured for a multicast stream, the multicast stream can be forwarded only by the configured ports. Other ports are not allowed to forward the multicast stream.
<a href="#">Configuring RPF Route Selection According to the Longest Matching Principle</a>	One optimal route is selected from each of the multicast static routing table, MBGP routing table, and unicast routing table according to RPF rules. Among the three optimal routes, the route with the longest subnet mask matching is selected as the RPF route.

### 2.3.1 Configuring IPv6 Multicast Basic Functions

Create a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.

#### Working Principle

A device maintains the routing table used for multicast packet forwarding over an IPv6 multicast routing protocol (such as PIM-SMv6), and learns information about the status of group members in the directly-connected network segments over the MLDv1/v2 protocol. A host joins a specific IPv6 multicast group by transmitting the MLD REPORT message.

#### Related Configuration

##### ▾ [Enabling the IPv6 Multicast Routing Function](#)

The IPv6 multicast routing function is disabled by default.

Run the **ipv6 multicast-routing** command to enable the IPv6 multicast routing function.

##### ▾ [Configuring an IP Multicast Protocol on an Interface](#)

The IPv6 multicast protocol is disabled on an interface by default.

Run the **ipv6 pim dense-mode** command to enable the IPv6 multicast protocol on an interface.

### 2.3.2 Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table

Every multicast data packet received by the device is used to maintain relevant IPv6 multicast routing entries. Excessive multicast routing entries, however, may deplete the device memory and degrade the device performance. Users can restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements.

## Working Principle

Restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements, so as to sustain the device performance.

## Related Configuration

### 📌 **Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table**

By default, 1,024 entries can be added to the IP multicast routing table.

Run the **ipv6 multicast route-limit** *limit* [ *threshold* ] command to adjust the number of entries that can be added to the IPv6 multicast routing table. The value ranges from 1 to 65,536.

A larger value of *limit* means that more entries can be added to the IPv6 multicast routing table, and a smaller value of *limit* means that fewer entries can be added to the IPv6 multicast routing table.

## 2.3.3 Configuring the IPv6 Multicast Border

Configure the IPv6 multicast border to restrict the transmission scope of multicast packets.

## Working Principle

Configure the multicast border to specify the transmission scope of multicast packets. When the multicast forwarding border is configured on an interface, multicast packets including multicast packets sent by the local device cannot be forwarded or received by this interface.

## Related Configuration

### 📌 **Configuring the IPv6 Multicast Border**

No multicast border is configured by default.

Run the **ipv6 multicast boundary** *access-list-name* [ *in* | *out* ] command to configure the multicast border.

## 2.3.4 Configuring IPv6 Multicast Static Routing

Configure IPv6 multicast static routing to specify a reverse path forwarding (RPF) interface or RPF neighbor for multicast packets from a specific multicast source.

## Working Principle

The RPF check is conducted during forwarding of multicast packets. IPv6 multicast static routing can be configured to specify an RPF interface or RPF neighbor for multicast packets from a specific multicast source.

## Related Configuration

### 📌 **Configuring IPv6 Multicast Static Routing**

No multicast static routing is configured by default.

Run the **ipv6 mroute** *ipv6-prefix/prefix-length* [ **bgp** | **isis** | **ospfv3** | **ripng** | **static** ] { *ipv6-prefix* | *interface-type interface-number* } [ *distance* ] command to configure IPv6 multicast static routing.

### 2.3.5 Configuring Layer-2 Flow Direction Control for Multicast Streams

Configure Layer-2 flow direction control for multicast streams to control the forwarding behavior of multicast streams on ports.

#### Working Principle

Configure Layer-2 flow direction control for multicast streams to configure the ports that are allowed to forward multicast streams. Then, multicast streams are forwarded only by the configured ports, thereby controlling Layer-2 forwarding of multicast streams.

#### Related Configuration

##### ▾ Configuring Layer-2 Flow Direction Control for Multicast Streams

Layer-2 flow direction control is disabled for multicast streams by default.

Run the **ipv6 multicast static** *source-address group-address interface-type interface-number* command to configure the Layer-2 flow direction control for multicast streams.

### 2.3.6 Configuring RPF Route Selection According to the Longest Matching Principle

Among the three optimal routes selected from the multicast static routing table, Multiprotocol Border Gateway Protocol (MBGP) routing table, and unicast routing table, select the optimal route with the longest subnet mask matching as the RPF route.

#### Working Principle

According to RPF rules, select a multicast static route, MBGP route, and unicast route used for the RPF check respectively from the multicast static routing table, MBGP routing table, and unicast routing table.

- If route selection according to the longest matching principle is configured, the route with the longest subnet mask matching is selected out of the three routes as the RPF route. If the three routes share the same subnet mask, the route with the highest priority is selected. If the three routes have the same priority, the RPF route is selected according to the sequence of multicast static route, MBGP route, and unicast route.
- If route selection according to the longest matching principle is not configured, the route with the highest priority is selected. If the three routes have the same priority, the RPF route is selected according to the sequence of multicast static route, MBGP route, and unicast route.

#### Related Configuration

##### ▾ Configuring RPF Route Selection According to the Longest Matching Principle

A route with the highest priority is selected as the RPF route by default. If the routes have the same priority, the RPF route is selected according to the sequence of multicast static route, MBGP route, and unicast route.

Run the **ipv6 multicast rpf longest-match** command to configure RPF route selection according to the longest matching principle.

## 2.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring IPv6 Multicast Basic Functions</a>	⚠ (Mandatory) It is used to create a multicast service.	
	<b>ipv6 multicast-routing</b>	Enables the IPv6 multicast routing function.
<a href="#">Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table</a>	⚠ Optional.	
	<b>ipv6 multicast route-limit limit [ threshold ]</b>	Restricts the number of entries that can be added to the multicast routing table.
<a href="#">Configuring the IPv6 Multicast Border</a>	<b>ipv6 multicast boundary access-list-name [ in   out ]</b>	Sets an interface as the multicast border of a specific group range.
<a href="#">Configuring IPv6 Multicast Static Routing</a>	<b>ipv6 mroute ipv6-prefix/prefix-length [ protocol ] { v6rpf-addrress   interface-type interface-number } [ distance ]</b>	Configures IPv6 multicast static routing.
<a href="#">Configuring Layer-2 Flow Direction Control for Multicast Streams</a>	<b>ipv6 multicast static source-address group-address interface-type interface-number</b>	Controls the flow direction of data streams on Layer-2 ports.
<a href="#">Configuring RPF Route Selection According to the Longest Matching Principle</a>	<b>ipv6 multicast rpf longest-match</b>	Configures RPF route selection according to the longest matching principle.

### 2.4.1 Configuring IPv6 Multicast Basic Functions

#### Configuration Effect

- Create a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.

#### Notes

- The PIM network needs to use existing unicast routing in the network. Therefore, IPv6 unicast routing must be configured in the network.

#### Configuration Steps

##### ➤ Enabling the IPv6 Multicast Routing Function

- Mandatory.
- Enable the IPv6 multicast routing function on each router unless otherwise specified.

##### ➤ Enabling an IP Multicast Protocol on Interfaces

- Mandatory.
- Enable the IPv6 multicast protocol function on interfaces unless otherwise specified.

### Verification

Make multicast sources in the network send multicast packets and make a user host join the groups.

- Check whether the user host can successfully receive packets from each group.

### Related Commands

#### ▾ Enabling the IPv6 Multicast Routing Function

<b>Command</b>	<b>ipv6 multicast-routing</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The IPv6 multicast routing function must be enabled before various IPv6 multicast protocols are enabled. The IPv6 multicast routing function and the MLD snooping function are mutually exclusive.

#### ▾ Configuring IPv6 Multicast Protocols

- i** For details about the MLD configuration method, see the *Configuring MLD*.
- i** For details about the PIM-SMv6 configuration method, see the *Configuring PIM-SMv6*.
- i** After the Layer-3 multicast function is enabled on a private VLAN and Super VLAN, if there is a multicast source in the sub-VLAN, an entry needs to be additionally copied, with the inlet of the sub-VLAN where multicast streams enter because the validity check needs to be conducted at the inlet during multicast packet forwarding. As a result, one more multicast hardware entry is occupied, and the multicast capacity needs to be decreased by one.

#### ▾ Displaying Multicast Forwarding Table Information

<b>Command</b>	<b>show ipv6 mroute [ group-or-source-address [ group-or-source-address ] ] [ sparse ] [ summary   count ]</b>
<b>Parameter Description</b>	<i>group-or-source-address</i> : Indicates the group address or source address. <i>group-or-source-address</i> : Indicates the group address or source address. <b>sparse</b> : Displays the core entry of the PIM-SMv6 multicast routing table. <b>summary</b> : Displays the summary of IPv6 multicast routing entries. <b>count</b> : Displays the count information about IPv6 multicast routing entries.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

Creating the IPv6 Multicast Service on an IPv6 Network to Support PIMv6-SM

<p><b>Scenario</b> <b>Figure 2-2</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an IPv6 unicast routing protocol (for example, OSPFv3) on routers.</li> <li>● Enable the IPv6 multicast routing function on all routers.</li> <li>● Enable the PIMv6-SM function on device interconnection interfaces, interface for connecting to the user host, and interface for connecting to the multicast source.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ipv6 multicast-routing A(config)# interface gigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ipv6 pim sparse-mode A(config-if)# exit A(config)# interface gigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)#ipv6 pim sparse-mode A(config-if)# exit</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# ipv6 multicast-routing B(config)# interface gigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)#ipv6 pim sparse-mode B(config-if)# exit B(config)# interface GigabitEthernet 0/2 B(config-if-GigabitEthernet 0/2)#ipv6 pim sparse-mode B(config-if)# exit</pre>
<p><b>Verification</b></p>	<p>Make Multicast Source (2001::1) send packets to G(ff16::16) and make Receiver A join G.</p>

	<ul style="list-style-type: none"> <li>● Check multicast packets received by Receiver A. Receiver A should be able to receive multicast packets from G.</li> <li>● Check the multicast forwarding table on Receiver A and Device B.</li> </ul>
<b>A</b>	<pre>A# show ipv6 mroute  IPv6 Multicast Routing Table  Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group  Timers: Uptime/Stat Expiry  Interface State: Interface  (2001::1, ff16::16), uptime 00:03:12, stat expires 00:02:03  Owner PIMSMV6, Flags: TFS    Incoming interface: GigabitEthernet 0/1    Outgoing interface list:      GigabitEthernet 0/2</pre>
<b>B</b>	<pre>B# show ipv6 mroute  IPv6 Multicast Routing Table  Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group  Timers: Uptime/Stat Expiry  Interface State: Interface  (2001::1, ff16::16), uptime 00:00:23, stat expires 00:03:07  Owner PIMSMV6, Flags: TFR    Incoming interface: GigabitEthernet 0/2    Outgoing interface list:      GigabitEthernet 0/1</pre>

## Common Errors

- IPv6 unicast routing is incorrectly configured.

- IPv6 multicast routing is not enabled on a router.
- No IPv6 multicast protocol is enabled on an interface.

## 2.4.2 Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table

### Configuration Effect

- Every multicast data packet received by the device is used to maintain relevant IPv6 multicast routing entries. Excessive multicast routing entries, however, may deplete the device memory and degrade the device performance. Users can restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements.

### Notes

- The IPv6 multicast basic functions must be configured.

### Configuration Steps

- Restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements.

### Verification

Make multicast sources in the network send multicast packets to N different multicast groups and make a user host join these groups. Set the number of entries that can be added to the IPv6 multicast routing table to N-1 on the device and check that multicast packets received by the user host are from N-1 groups.

### Related Commands

#### 📌 Configuring the Number of Entries That Can Be Added to the IP Multicast Routing Table

<b>Command</b>	<code>ipv6 multicast route-limit limit [ threshold ]</code>
<b>Parameter Description</b>	<i>limit</i> : Indicates the number of multicast routing entries. The value ranges from 1 to 65,536 and the default value is 1,024. <i>threshold</i> : Indicates the multicast routing entry quantity for triggering an alarm. The default value is 65,536.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Routing entries that are beyond the allowable range of hardware can be forwarded only by software due to hardware resource restrictions, making the performance deteriorate.

### Configuration Example

#### 📌 Creating the IPv6 Multicast Service on an IPv6 Network and Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table

<p><b>Scenario</b> <b>Figure 2-3</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IP multicast basic functions (omitted).</li> <li>● Set the number of entries that can be added to the IP multicast routing table to 2 on Device B.</li> </ul>

	A prompt is displayed when the number of entries in the multicast routing table reaches the upper limit. B#* Jan 3 21:40:07: %MROUTE-4-ROU TELIMIT: IPv6 Multicast route limit 2 exceeded..

### Common Errors

- IPv6 unicast routing is incorrectly configured.

## 2.4.3 Configuring the IPv6 Multicast Border

### Configuration Effect

- Configure the IPv6 multicast border to restrict the transmission scope of multicast packets.

### Notes

- The IPv6 multicast basic functions must be configured.

### Configuration Steps

- Configure the IPv6 multicast border on each PIM router interface unless otherwise specified.

### Verification

Make multicast sources send multicast packets to multicast groups and make a user host join these multicast groups. Configure the IPv6 multicast border on the PIM router interface connected to the user host and check whether the user host can receive multicast packets.

### Related Commands

#### ↳ Enabling the IPv6 Multicast Routing Function

<b>Command</b>	<code>ipv6 multicast boundary access-list-name [ in   out ]</code>
<b>Parameter Description</b>	<i>access-list-name</i> : Uses the group address range defined by an access control list (ACL). <b>in</b> : Indicates that the multicast border takes effect in the incoming direction of multicast streams. <b>out</b> : Indicates that the multicast border takes effect in the outgoing direction of multicast streams.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The ACL referenced in this command can be a standard ACL or an extended ACL. If an extended ACL is used, only destination addresses need to be matched.  This command can be used to filter MLD and PIM-SMv6 protocol packets relevant to the IPv6 multicast group range. Multicast data streams are not transmitted or received by multicast border interfaces.

### Configuration Example

Creating the IPv6 Multicast Service on an IPv6 Network and Configuring the IPv6 Multicast Border

<p><b>Scenario</b> Figure 2-4</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IP multicast basic functions (omitted).</li> <li>● Configure an ACL on Device A.</li> <li>● Configure the IP multicast border on Interface Gi0/1 of Device A.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ipv6 access-list ip_multicast A(config-ipv6-acl)#deny udp any any A(config-ipv6-acl)#exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ip multicast boundary ip_multicast A A(config-if-GigabitEthernet 0/1)# exit</pre>

## Common Errors

- IPv6 unicast routing is incorrectly configured.
- IPv6 multicast routing is not enabled on a router.

## 2.4.5 Configuring Layer-2 Flow Direction Control for Multicast Streams

### Configuration Effect

Configure Layer-2 flow direction control for multicast streams to control the forwarding behavior of multicast streams on ports.

### Notes

- The IPv6 multicast basic functions must be configured.

### Configuration Steps

- Configure Layer-2 flow direction control for multicast streams on devices unless otherwise specified.

### Verification

Make Device A send multicast packets to multicast groups in the network. Multiple user hosts connected to VLAN 1 of Device A receive multicast packets from these multicast groups. Configure Layer-2 flow direction control for multicast streams on Device A so that multicast packets are sent to configured ports.

### Related Commands

#### ▾ Configuring Layer-2 Flow Direction Control for Multicast Streams

<b>Command</b>	<code>ipv6 multicast static source-address group-address interface-type interface-number</code>
<b>Parameter Description</b>	<i>source-address</i> : Indicates the multicast source address. <i>group-address</i> : Indicates the multicast group address. <i>interface-type interface-number</i> : Indicates a Layer-2 port that is allowed to forward multicast streams.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Multiple commands can be configured for a multicast stream, that is, multiple ports can be allowed to forward the multicast stream. If flow direction control is configured for a multicast stream, the multicast stream can be forwarded only by the configured ports. Other ports are not allowed to forward the multicast stream.  This command controls only the forwarding behavior of multicast streams on ports. It does not directly affect processing of protocol packets by multicast protocols. Some features of multicast protocols (such as PIM-SMv6) are driven by multicast data streams, and therefore, the behavior of the multicast routing protocols may still be affected.

### Configuration Example

Creating the IPv6 Multicast Service on an IPv6 Network and Configuring Layer-2 Flow Direction Control for Multicast Streams

<p><b>Scenario</b> Figure 2-6</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Configure IP multicast basic functions (omitted).</li> <li>Configure Layer-2 flow direction control for multicast streams on Device B so that multicast streams are transmitted only to Interface Gi0/2.</li> </ul>
<p><b>B</b></p>	<pre>A# configure terminal A(config)# ipv6 multicast static 2001::1 ff16::16 gigabitEthernet 0/2</pre>
<p><b>Verification</b></p>	<p>Make Multicast Source (2001: : 1) send packets to G (ff16::16) and make Receiver A and Receive B join G.</p> <ul style="list-style-type: none"> <li>Receiver A should be able to receive multicast packets from G but Receiver B cannot receive multicast packets from G.</li> </ul>

**Common Errors**

- IPv6 unicast routing is incorrectly configured.

**2.4.6 Configuring RPF Route Selection According to the Longest Matching Principle**

**Configuration Effect**

Among the three optimal routes selected from the multicast static routing table, MBGP routing table, and unicast routing table, select the optimal route with the longest subnet mask matching as the RPF route.

**Notes**

- The IP multicast basic functions must be configured.

**Configuration Steps**

- Configure RPF route selection according to the longest matching principle on each device unless otherwise specified.

**Verification**

Configure a multicast static route and a unicast static route with the same priority and configure the unicast static route to have the longest subnet mask matching.

- Run the **show ipv6 rpf v6source-address** command to check RPF information about a specific source.

### Related Commands

#### Configuring RPF Route Selection According to the Longest Matching Principle

<b>Command</b>	<b>ipv6 multicast rpf longest-match</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The steps of selecting an RPF route are as follows:</p> <p>Select one optimal route used for the RPF check from each of the IPv6 multicast static routing table, IPv6 MBGP routing table, and IPv6 unicast routing table.</p> <p>Select one route out of the three optimal routes as the RPF route.</p> <p>If the command for selecting the RPF route according to the longest matching principle is configured, the route with the longest subnet mask matching is selected out of the three optimal routes as the RPF route.</p> <p>If the three routes share the same subnet mask, the route with the highest priority is selected. If the routes have the same priority, the RPF route is selected according to the sequence of IPv6 multicast static route, IPv6 MBGP route, and IPv6 unicast route.</p> <p>If the command for selecting the RPF route according to the longest matching principle is not configured, the route with the highest priority is selected out of the three optimal routes as the RPF route. If the routes have the same priority, the RPF route is selected according to the sequence of IPv6 multicast static route, IPv6 MBGP route, and IPv6 unicast route.</p>

### Configuration Example

#### Creating the IPv6 Multicast Service on the IPv6 Network and Configuring the RPF Route Selection According to the Longest Matching Principle

<b>Scenario</b> Figure 2-7	<p>The diagram shows a network topology. On the left is a 'Source' represented by a server icon. A line labeled 'Gi0/2' connects the Source to Device A. Device A and Device B are connected to each other via two lines, both labeled 'Gi0/1'. Device B is also connected to the Source via a line labeled 'Gi0/2'.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IP multicast basic functions (omitted).</li> <li>● Configure an IPv6 multicast static route with the subnet mask length smaller than that of the unicast route on Device B.</li> <li>● Configure the RPF route selection according to the longest matching principle on Device B.</li> </ul>

<b>B</b>	<pre> B# configure terminal B(config)# ipv6 multicast-routing B(config)# ipv6 mroute 2005::/64 ospfv3 2002::2 B(config)# ipv6 multicast rpf longest-match </pre>
<b>Verification</b>	<p>Run the <b>show ipv6 rpf</b> command to display the RPF information about the multicast source before and after RPF route selection according to the longest matching principle is configured.</p>
<b>Before Configuration</b>	<pre> B# show ipv6 rpf 2005::1 RPF information for 2005::1 RPF interface: GigabitEthernet 0/2 RPF neighbor: 2002::2 RPF route: 2005::/64 RPF type: unicast (ospf) RPF recursion count: 0 Doing distance-preferred lookups across tables Distance: 110 Metric: 1 </pre>
<b>After Configuration</b>	<pre> B# show ipv6 rpf 2005::1 RPF information for 2005::1 RPF interface: GigabitEthernet 0/1 RPF neighbor: fe80::2d0:f8ff:fe22:341b RPF route: 2005::1/128 RPF type: unicast (ospf) RPF recursion count: 0 Doing distance-preferred lookups across tables Distance: 110 Metric: 1 </pre>

## Common Errors

- IPv6 unicast routing is incorrectly configured.
- IPv6 multicast routing is not enabled on a router.

## 2.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the IPv6 multicast forwarding table.	<b>clear ipv6 mroute</b> { *   <i>v6group-address</i> [ <i>v6source-address</i> ] }
Clears the statistics in the IPv6 multicast forwarding table.	<b>clear ipv6 mroute statistics</b> { *   <i>v6group-address</i> [ <i>v6source-address</i> ] }

### Displaying

Description	Command
Displays the IPv6 multicast forwarding table information.	<b>show ipv6 mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <i>sparse</i> ] [ <i>summary</i>   <i>count</i> ]
Displays RPF information about a specific IPv6 source address.	<b>show ipv6 rpf</b> <i>v6source-address</i>
Displays information the IPv6 static multicast route.	<b>show ipv6 mroute static</b>
Displays information about the configured IPv6 multicast interface that takes effect.	<b>show ipv6 mvif</b> [ <i>interface-type interface-number</i> ]
Displays the IPv6 Layer-3 multicast forwarding table.	<b>show ipv6 mrf mfc</b>
Displays the IPv6 multi-layer multicast forwarding table.	<b>show msf6 msc</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs all running processes of the IPv6 multicast.	<b>debug nsm mcast6 all</b>
Debugs the communication between the IPv6 multicast and the protocol module.	<b>debug nsm mcast6 fib-msg</b>
Debugs the interface running of the IPv6 multicast.	<b>debug nsm mcast6 mif</b>

Description	Command
Debugs the processing of interfaces and behavior statistics of the IPv6 multicast.	<b>debug nsm mcast6 stats</b>
Debugs the Layer-3 multicast forwarding of IPv6.	<b>debug ipv6 mrf forwarding</b>
Debugs the operation process of IPv6 Layer-3 multicast forwarding entries.	<b>debug ipv6 mrf mfc</b>
Debugs the processing of IPv6 Layer-3 multicast forwarding events.	<b>debug ipv6 mrf event</b>
Debugs the forwarding of IPv6 multi-layer multicast packets.	<b>debug msf6 forwarding</b>
Debugs the operation process of IPv6 multi-layer multicast forwarding entries.	<b>debug msf6 mfc</b>
Debugs the underlying hardware for IPv6 multi-layer multicast forwarding.	<b>debug msf6 ssp</b>
Debugs the APIs for IPv6 multi-layer multicast forwarding.	<b>debug msf6 api</b>
Debugs the processing of IPv6 multi-layer multicast forwarding events.	<b>debug msf6 event</b>

## 3 Configuring IGMP

### 3.1 Overview

The Internet Group Management Protocol (IGMP) is a member of TCP/IP protocol family. It manages IP multicast members and is used to establish and maintain multicast group membership between hosts and directly neighboring multicast routers. IGMP behaviors are classified into host behaviors and device behaviors.

- At present, three IGMP versions are available, which are IGMPv1, IGMPv2 and IGMPv3.
- All IGMP versions support the Any-Source Multicast (ASM) model.
- IGMPv3 can be directly used for the Source-Specific Multicast (SSM) model.
- IGMPv1 and IGMPv2 can be used for the SSM model only when the IGMP SSM Mapping technology is supported.

#### Protocols and Standards

- RFC 1112: Host Extensions for IP Multicasting
- RFC 2236: Internet Group Management Protocol, Version 2
- RFC 3376: Internet Group Management Protocol, Version 3
- RFC 4605: Internet Group Management Protocol (IGMP) / Multicast Listener Discovery (MLD)-Based Multicast Forwarding ("IGMP/MLD Proxying")

### 3.2 Applications

Application	Description
<a href="#">Local IGMP Service</a>	Implements the IGMP service in a local network.
<a href="#">IGMP Proxy Service</a>	In a simple tree network topology, use the IGMP proxy service instead of the PIM service.

#### 3.2.1 Local IGMP Service

##### Scenario

As shown in Figure 3-1, receivers 1 and 2 and routers A and B form a local network.

Query packets sent by router A or B are valid in the LAN, whereas Report packets sent by receivers 1 and 2 are also valid locally.

Figure 3-1

<b>Remark</b>	C is the egress gateway (EG) device.
<b>s</b>	A and B are core routers.

### Deployment

- Routers A, B and C run OSPF.
- The interfaces of A, B and C run multicast protocols (PIM-SM or PIM-DM).

## 3.2.2 IGMP Proxy Service

### Scenario

As shown in Figure 3-2, router A implements the proxy function working as a host and forms a local network group with router B. Router A forwards Report packets sent by receivers 1 and 2.

Figure 3-2

<b>Remark</b>	Router A implements the proxy function.
<b>s</b>	Router B provides the PIM service.

### Deployment

- Routers A and B run OSPF.
- The interfaces of A and B run multicast protocols (PIM-SM or PIM-DM).
- The multicast proxy function is implemented on the interfaces Gi0/0 and Gi0/1 of router A.

## 3.3 Features

### Basic Concepts

#### Host Behavior and Device Behavior

- Layer-3 multicast devices that run multicast management protocols are called devices and their behaviors are called device behaviors.
- PCs or simulated PCs that run multicast management protocols are called hosts and their behaviors are called host behaviors.

#### Querier

- Devices compete against each other by comparing IP addresses. Devices with lower IP addresses become queriers and send Query packets regularly.

#### IGMP Proxy-Service Interface

- This interface performs host behaviors, receives Query packets sent by upstream devices (hence also called uplink interface), and sends Report information collected by the router proxy.

#### IGMP Mroute-Proxy Interface

- This interface implements the router functions, sends packets received by the IGMP PROXY-SERVICE interface (hence also called downlink interface), and collects host information and sends the host information to the IGMP PROXY-SERVICE interface.

#### IGMP SSM Mapping

- Mapping of the SSM model. IGMPv1 and IGMPv2 do not support the SSM model, but can enable the SSM-MAP function to support the SSM model.

### Overview

Feature	Description
<a href="#">IGMP Router</a>	Sends Query packets and obtains local member information.
<a href="#">IGMP Querier</a>	Selects a unique querier from a network segment.
<a href="#">IGMP Group Filtering</a>	Filters group members and limit the number of group members.
<a href="#">Static IGMP Group</a>	Static group information is available on a router; therefore, it is unnecessary for the host to send a Report packet to obtain the static group information.
<a href="#">Simulating Hosts to Join IGMP Groups</a>	Simulate the host behavior to directly join a multicast group on an interface.
<a href="#">IGMP Proxy</a>	Use this function in a simple tree network topology where no complex multicast route protocols (such as PIM) need to be executed.

Feature	Description
<a href="#">IGMP SSM Mapping</a>	Provide the SSM model support for IGMPv1 and IGMPv2. When a host joins a group, you can specify a source to save bandwidth and prevent unwanted and invalid multicast data streams from occupying network bandwidth, especially in a network environment where multiple multicast sources share one multicast address.

### 3.3.1 IGMP Router

- This function is used to send Query packets and obtain local member information.

#### Working Principle

In a multicast network running IGMP, a multicast device is specified for sending IGMP Query packets. This device is determined through selection. At the beginning, all devices are in the Querier state. When the devices receive membership queries from a device with a lower IP address, the devices change from the Querier state to the Non-querier state. Therefore, only one device is in the Querier state finally. This device has the lowest IP address among all multicast devices in the network. When the selected querier fails, IGMPv2 also works. Non-querier devices maintain the interval timer for survival of querier. This timer is reset each time a device receives a membership Query packet. If the timer expires, a new round of querier selection starts.

#### Related Configuration

##### ▾ Enabling IGMP

IGMP is disabled on an interface by default.

You can run the **ip pim { sparse-mode | dense-mode }** command to enable or disable IGMP for an interface.

IGMP can be enabled only when Sparse Mode (SM) or Dense Mode (DM) is configured on the interface.

##### ▾ Specifying the IGMP Version

IGMPv2 is enabled by default.

You can run the **ip igmp version { 1 | 2 | 3 }** command to set or reset the IGMP version.

##### ▾ Configuring the Last-Member Query Interval

The interval for sending the last-member Query packets is 1s by default.

You can run the **ip igmp last-member-query-interval interval** command to set or reset the interval for an interface to send Query packets.

*A larger value means a larger interval; a smaller value means a smaller interval.*

##### ▾ Configuring the Last-Member Query Times

The number of the last-member query times is 2 by default.

You can run the **ip igmp last-member-query-count count** command to set or reset the number of the last-member query times.

A larger value means more last-member query times; a smaller value means fewer last-member query times.

#### ↘ **Configuring the Common Member Query Interval**

The common member query interval is 125s by default.

You can run the **ip igmp query-interval** *seconds* command to set or reset the common member query interval.

*A larger value means a larger common query interval; a smaller value means a smaller common query interval.*

#### ↘ **Configuring the Maximum Response Time**

The maximum response time is 10s by default.

You can run the **ip igmp query-max-response-time** *seconds* command to set or reset the maximum response time.

A larger value means longer response time; a smaller value means shorter response time.

#### ↘ **Configuring the Querier Timeout**

The querier timeout is 255s by default.

You can run the **ip igmp query-timeout** *seconds* command to set the querier timeout.

A larger value means longer survival time; a smaller value means shorter survival time.

### 3.3.2 IGMP Group Filtering

Filter group members and limit the number of group members.

#### Working Principle

To prevent hosts in a network segment where an interface resides from joining a multicast group, you can configure an ACL on this interface as a filter. The interface will filter the received IGMP membership Report packets based on this ACL, maintain group membership only for multicast groups allowed by this ACL and set the maximum number of router members.

#### Related Configuration

##### ↘ **Configuring the IGMP Group ACL**

By default, no ACL is used and any group is allowed to join.

You can run the **ip igmp access-group** *access-list-name* command to set or reset the multicast group ACL.

After the ACL is configured, a router receives only packets set in the ACL.

##### ↘ **Configuring the Maximum Number of IGMP Group Members**

The maximum number of IGMP group members is 1,024 by default.

You can run the **ip igmp limit** *number* command to set or reset the maximum number of multicast group members.

A larger value means more members; a smaller value means fewer members.

### 3.3.3 Static IGMP Group

When static IGMP groups are available on a router, it is unnecessary for the host to send a Report packet to obtain the static group information. The router can directly exchange group information with a PIM router.

#### Working Principle

You need to set static group information manually.

#### Related Configuration

##### ▾ [Configuring a Static Group](#)

No static group is configured by default.

You can run the **ip igmp static-group** *group-address* command to configure a static group.

### 3.3.4 Simulating Hosts to Join IGMP Groups

Simulate the host behavior to directly join a multicast group on an interface.

#### Related Configuration

##### ▾ [Configuring the Join-Group function](#)

No join-group information is set by default.

You can run the **ip igmp join-group** *group-address* command to configure the address of the multicast group to be joined by the simulated host.

### 3.3.5 IGMP Proxy

Use this function in a simple tree network topology where no complex multicast route protocols (such as PIM) need to be executed. In this way, a downstream proxy host can send IGMP packets and maintain the membership.

#### Working Principle

When an upstream router is configured as an IGMP proxy-service interface, it is equal to a host that can receive Query packets sent by upstream routers or forward group information sent by downstream hosts. When a downstream router is configured as an IGMP multicast proxy interface, it is equal to a router that can forward Query packets sent by upstream routers or receive Report packets sent by downstream routers.

#### Related Configuration

##### ▾ [Configuring the IGMP Proxy Service](#)

The IGMP proxy service function is disabled by default.

You can run the **ip igmp proxy-service** command to enable the IGMP proxy service.

This function is mandatory when a proxy is to be used.

### 📌 Configuring the IGMP Mroute Proxy

The IGMP mroute proxy function is disabled by default.

You can run the **ip igmp mroute-proxy** *interfacename* command to enable the IGMP mroute proxy.

This function is mandatory when a proxy is to be used.

## 3.3.6 IGMP SSM Mapping

Provide the SSM model support for IGMPv1 and IGMPv2. When a host joins a group, you can specify a source to save bandwidth and prevent unwanted and invalid multicast data streams from occupying network bandwidth, especially in a network environment where multiple multicast sources share one multicast address.

### Working Principle

Based on IGMP v1/v2, IGMPv3 provides an extra function, namely, the multicast source filter function. In IGMPv1/v2, a host determines to join a group only based on the group address and then receive multicast streams sent to this group address from any source. A host using IGMPv3 advertises the multicast group that the host wants to join and the addresses of multicast sources from which this host wants to receive packets. IGMPv1 and IGMPv2 also implement "source address filtering" in some sense; however, they implement this function on the multicast receivers by enabling the SSM mapping function and configuring the static SSM mapping group.

### Related Configuration

#### 📌 Enabling IGMP SSM Mapping

The SSM mapping function is disabled by default.

You can run the **ip igmp ssm-map enable** command to enable the function.

Mandatory.

#### 📌 Configuring Static IGMP SSM Mapping

No static SSM mapping is set by default.

You can run the **ip igmp ssm-map static** *access-list-num A.B.C.D* command to configure static SSM mapping.

## 3.3.7 Router Alert Option

Check whether IGMP packets contain the Router Alert option and discard packets without the Router Alert option.

Support sending IGMP packets containing the Router Alert option.

### **Working Principle**

If a packet contains the Router Alert option, the device needs to check the packet in depth and updates the control data accordingly. If the packet does not contain the option, the device does not check the packet.

After Router Alert option check is enabled, the IGMP packets not containing the Router Alert option are discarded.

After enabled with the function of sending packets with Router Alert option, the device sends IGMP packets with Router Alert option encapsulated.

## Related Configuration

### ▾ Checking Router Alert Option

Router Alert option check is disabled by default.

You can run the **ip igmp enforce-router-alert** command to enable the function.

### ▾ Sending IGMP Packets with Router Alert Option Encapsulated

Packets are sent without the Router Alert option by default.

You can run the **ip igmp send-router-alert** command to enable the function.

## 3.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring IGMP Basic Functions</a>	 (Mandatory) It is used to set up the multicast service.	
	<b>ip multicast-routing</b>	Enables the IPv4 multicast routing function.
<a href="#">Configuring IGMP Routers</a>	<b>ip pim { sparse-mode  dense-mode }</b>	Enables the PIM-SM or PIM-DM function.
	<b>ip igmp version { 1   2   3 }</b>	Specifies the IGMP version.
	<b>ip igmp last-member-query-interval interval</b>	Configures the last-member query interval.
	<b>ip igmp last-member-query-count count</b>	Configures the last-member query times.
	<b>ip igmp query-interval seconds</b>	Configures the membership query interval.
<a href="#">Configuring IGMP Querier</a>	<b>ip igmp query-max-response-time seconds</b>	Configures the maximum response time.
	<b>ip igmp query-timeout seconds</b>	Configures the querier timeout.
<a href="#">Configuring IGMP Group Filtering</a>	<b>ip igmp access-group access-list</b>	Configures the IGMP group ACL.
	<b>ip igmp limit number [ except access-list ]</b>	Configures the maximum number of IGMP group members.
<a href="#">Configuring IGMP Proxy</a>	<b>ip igmp proxy-service</b>	Configures the IGMP proxy service.
	<b>ip igmp mroute-proxy interface-type interface-number</b>	Configures the IGMP mroute proxy.
<a href="#">Configuring IGMP SSM Mapping</a>	<b>ip igmp ssm-map enable</b>	Enables IGMP SSM mapping.
	<b>ip igmp ssm-map static access-list source-address</b>	Configures static IGMP SSM mapping.
<a href="#">Configuring Alert Option</a>	<b>ip igmp enforce-router-alert</b>	Check the Router Alert option.

	<b>ip igmp send-router-alert</b>	Sends IGMP packets containing the Router Alert option.
--	----------------------------------	--

### 3.4.1 Configuring IGMP Basic Functions

#### Configuration Effect

- Enable the multicast routing function of a local network and collect group information of the local network.

#### Notes

- An interface must be enabled with the PIM-SM or PIM-DM function.

#### Configuration Steps

##### ▾ Enabling the IPv4 Multicast Routing Function

- Mandatory.
- If there is no special requirement, the IPv4 multicast routing function should be enabled on each router in the local network.

##### ▾ Enabling the PIM-SM or PIM-DM Function

- Mandatory.
- If there is no special requirement, the PIM-SM or PIM-DM function should be directly enabled on an interface of the local network.

#### Verification

Run the **show ip igmp interface** *interface-type interface-number* command to check whether IGMP is enabled on the interface.

#### Related Commands

##### ▾ Enabling the IPv4 Multicast Routing Function

<b>Command</b>	<b>ip multicast-routing</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

##### ▾ Enabling the PIM-SM or PIM-DM Function

<b>Command</b>	<b>ip pim { sparse-mode  dense-mode }</b>
<b>Parameter</b>	N/A
<b>Description</b>	

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	PIM interfaces must be layer-3 interfaces, including routing interfaces, L3AP, SVI and loopback interfaces. All PIM interfaces should be accessible to IPv4 unicast routes.

## Configuration Example

### ▾ Enabling IGMP for a Local Network

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure an IPv4 unicast routing protocol (such as OSPF) on a router and ensure that the loopback interface is accessible to a unicast route.</li> <li>● Enable the IPv4 multicast route function on all routers.</li> <li>● Enable the PIM-SM or PIM-DM function on interfaces interconnecting devices and interfaces connecting user hosts and multicast sources.</li> </ul>
	<pre>VSU(config)#ip multicast-routing VSU(config)#int gi 0/5 VSU(config-if-GigabitEthernet 0/5)#ip add 192.168.1.90 255.255.255.0 VSU(config-if-GigabitEthernet 0/5)#ip pim sparse-mode</pre>
<b>Verification</b>	Run the <b>show ip igmp interface <i>interface-type interface-number</i></b> command to check whether IGMP is enabled on the interface.
	<pre>VSU#show ip igmp interface gigabitEthernet 0/5 Interface GigabitEthernet 0/5 (Index 5) IGMP Active, Querier, Version 2 (default) Internet address is 192.168.1.90 IGMP interface limit is 1024 IGMP interface has 1 group-record states IGMP interface has 0 static-group records IGMP activity: 3 joins, 0 leaves IGMP query interval is 125 seconds IGMP querier timeout is 255 seconds IGMP max query response time is 10 seconds Last member query response interval is 10 Last member query count is 2 Group Membership interval is 260 seconds Robustness Variable is 2</pre>

## **Common Errors**

---

- Routers in the network are not enabled with the multicast routing function.
- No multicast interface is available in the network.

## **3.4.2 Configuring IGMP Routers**

### **Configuration Effect**

---

- Modify the IGMP router parameters will affect the type of packets to be sent and the sending method.

### **Notes**

---

- The basic functions of IGMP must be configured.

### **Configuration Steps**

---

#### **↘ Specifying the IGMP Version**

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### **↘ Configuring the Last-Member Query Interval**

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### **↘ Configuring the Last-Member Query Times**

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### **↘ Configuring the Common Member Query Interval**

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### **↘ Configuring the Maximum Response Time**

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

## Verification

Run the **show ip igmp interface** *interface-type interface-number* command to display the interface configurations.

## Related Commands

### ▾ Specifying the IGMP Version

<b>Command</b>	<b>ip igmp version</b> { 1   2   3 }
<b>Parameter Description</b>	1: Indicates IGMPv 1. 2: Indicates IGMPv 2. 3: Indicates IGMPv 3.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After this command is configured, IGMP will automatically restart.

### ▾ Configuring the Last-Member Query Interval

<b>Command</b>	<b>ip igmp last-member-query-interval</b> <i>interval</i>
<b>Parameter Description</b>	<i>Interval</i> : Indicates the interval for sending the Query packets of a specific group. The value ranges from 1 to 255 in the unit of 0.1s, and the default value is 10 (namely, 1s).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command applies only to IGMPv2 or IGMPv3. When an interface receives a Leave packet, the interface sends Query packets of the group continually and waits for a response from the host. After timeout occurs, the IGMP router assumes that the group member does not exist in the directly connected network segment and deletes the interface from the IGMP group. The timeout duration is equal to the value of <b>last-member-query-interval</b> multiplied by <b>last-member-query-count</b> plus 1/2 of <b>query-max-response-time</b> .

### ▾ Configuring the Last-Member Query Times

<b>Command</b>	<b>ip igmp last-member-query-count</b> <i>count</i>
<b>Parameter Description</b>	<i>count</i> : Indicates the times for sending the Query packets of a specific group, ranging from 2 to 7. The default value is 2.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command applies only to IGMPv2 or IGMPv3. When an interface receives a Leave packet, the interface sends Query packets of the group continually and waits for a response from the host. After timeout occurs, the IGMP router assumes that the group member does not exist in the directly connected network segment and deletes the interface from the IGMP group. The timeout duration is equal to the value of <b>last-member-query-interval</b> multiplied by <b>last-member-query-count</b> plus 1/2 of <b>query-max-response-time</b> .

### ▾ Configuring the Common Member Query Interval

<b>Command</b>	<b>ip igmp query-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the common member query interval, ranging from 1 to 18,000s. The default value is 125.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Maximum Response Time

<b>Command</b>	<b>ip igmp query-max-response-time</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the maximum response time, ranging from 1 to 25s. The default value is 10.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After sending Query packets, the interface waits for a response. If timeout occurs, the IGMP router assumes that the group member does not exist in the directly connected network segment and deletes the group information.

## Configuration Example

### ▾ Configuring Basic Router Parameters

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of IGMP.</li> <li>● Specify the IGMPv3.</li> <li>● Configure the last-member query interval to 15 (1.5s).</li> <li>● Configure the number of the last-member queries to 3.</li> <li>● Configure the common member query interval to 130s.</li> <li>● Configure the maximum response time to 15s.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp version 3 VSU(config-if-GigabitEthernet 0/5)#ip igmp last-member-query-count 3 VSU(config-if-GigabitEthernet 0/5)#ip igmp last-member-query-interval 15 VSU(config-if-GigabitEthernet 0/5)#ip igmp query-interval 130 VSU(config-if-GigabitEthernet 0/5)#ip igmp query-max-response-time 15</pre>
<b>Verification</b>	Run the <b>show ip igmp interface</b> <i>interface-type interface-number</i> command to check the IGMP functions of the interface.
	<pre>VSU#show ip igmp interface gigabitEthernet 0/5 Interface GigabitEthernet 0/5 (Index 5) IGMP Enabled, Active, Querier, Version 3 Internet address is 192.168.1.90</pre>

<p><b>Scenario</b></p>	<ul style="list-style-type: none"> <li>● Configure basic functions of IGMP.</li> <li>● Specify the IGMPv3.</li> <li>● Configure the last-member query interval to 15 (1.5s).</li> <li>● Configure the number of the last-member queries to 3.</li> <li>● Configure the common member query interval to 130s.</li> <li>● Configure the maximum response time to 15s.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp version 3 VSU(config-if-GigabitEthernet 0/5)#ip igmp last-member-query-count 3 VSU(config-if-GigabitEthernet 0/5)#ip igmp last-member-query-interval 15 VSU(config-if-GigabitEthernet 0/5)#ip igmp query-interval 130 VSU(config-if-GigabitEthernet 0/5)#ip igmp query-max-response-time 15</pre>
	<pre>IGMP interface limit is 1024 IGMP interface has 1 group-record states IGMP interface has 0 static-group records IGMP activity: 3 joins, 0 leaves IGMP query interval is 130 seconds IGMP querier timeout is 267 seconds IGMP max query response time is 15 seconds Last member query response interval is 15 Last member query count is 3 Group Membership interval is 275 seconds Robustness Variable is 2 VSU#</pre>

**Common Errors**

- The basic functions of IGMP are not enabled.

**3.4.3 Configuring IGMP Querier**

**Configuration Effect**

- Select a unique querier in a local network.

**Notes**

- The basic functions of IGMP must be configured.

## Configuration Steps

- If necessary, the querier timeout can be configured.
- If there is no special requirement, you can perform the configuration on all interfaces enabled with IGMP in the local network.

## Verification

Run the **show ip igmp interface** *interface-type interface-number* command to display the interface configurations.

## Related Commands

### ↘ Configuring the Querier Timeout

<b>Command</b>	<b>ip igmp query-timeout</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the keepalive time of the querier, ranging from 60 to 300s. The default value is 255s.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After sending Query packets, an interface waits for Query packets sent by other devices. If timeout occurs, the IGMP router assumes that the querier is unique in the directly connected network segment.

## Configuration Example

### ↘ Configuring the Querier Timeout

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of IGMP.</li> <li>● Set the querier timeout to 280S.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp query-timeout 280</pre>
<b>Verification</b>	Run the <b>show ip igmp interface</b> <i>interface-type interface-number</i> command to check the IGMP functions of the interface.
	<pre>VSU#show ip igmp interface gigabitEthernet 0/5 Interface GigabitEthernet 0/5 (Index 5)   IGMP Enabled, Active, Querier, Version 3   Internet address is 192.168.1.90   IGMP interface limit is 1024   IGMP interface has 1 group-record states   IGMP interface has 0 static-group records   IGMP activity: 11 joins, 0 leaves   IGMP query interval is 130 seconds</pre>

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of IGMP.</li> <li>● Set the querier timeout to 280S.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp query-timeout 280</pre>
	<pre>IGMP querier timeout is 280 seconds IGMP max query response time is 15 seconds Last member query response interval is 15 Last member query count is 3 Group Membership interval is 275 seconds Robustness Variable is 2 VSU#</pre>

### Common Errors

- The basic functions of IGMP are not enabled.

## 3.4.4 Configuring IGMP Group Filtering

### Configuration Effect

- A router filters IGMP group members.

### Notes

- The basic functions of IGMP must be configured.

### Configuration Steps

#### 📄 Configuring the IGMP Group ACL

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### 📄 Configuring the Maximum Number of IGMP Group Members

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

### Verification

#### 📄 IGMP Group ACL

- Configure an interface to allow only groups in ACL 1 to join. The access addresses of ACL 1 are 225.0.0.1~225.0.0.255.
- Configure the interface to join a group whose address is 225.0.0.5.
- Configure the interface to join a group whose address is 236.0.0.5.
- View the group information of the current interface.

#### ▾ Maximum Number of IGMP Group Members

- Set the maximum member quantity to 5 on an interface.
- Configure the interface to join a group whose address is from 225.0.0.5 to 225.0.0.10.
- View the group information of the interface.

### Related Commands

#### ▾ Configuring the IGMP Group ACL

<b>Command</b>	<b>ip igmp access-group</b> <i>access-list</i>
<b>Parameter Description</b>	<i>access-list</i> : Defines a group address range by using a standard IP ACL or an extended ACL. The value ranges from 1 to 199, 1300 to 2699 and characters.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Configure this command on an interface to control the groups that hosts in a directly connected network segment can join. Use an ACL to limit the group address range. If Report packets denied by the ACL are received, the packets will be discarded.  When IGMPv3 is enabled, this command supports an extended ACL. If the received IGMP Report information is (S1,S2,S3...Sn,G), this command will apply the corresponding ACL to the (0,G) information for matching. Therefore, you must configure a (0,G) record explicitly for the extended ACL in order to normally filter (S1,S2,S3...Sn,G).

#### ▾ Configuring the Maximum Number of IGMP Group Members

<b>Command</b>	<b>ip igmp limit</b> <i>number</i> [ <b>except</b> <i>access-list</i> ]
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of IGMP group members, whose value range varies with devices. The default value is 1,024 for an interface and 65,536 globally.  <b>except</b> <i>access-list</i> : Indicates that the groups in the ACL are not counted.  <b>access-list</b> indicates a standard IP ACL. The value ranges from 1 to 99, 1300 to 1999 and words.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Global configuration mode: Limits the maximum quantity of the IGMP group members in a system. Interface configuration mode: limits the maximum quantity of IGMP group members on an interface.  If the quantity of group members exceeds the interface or global limit, the Report packets received subsequently will be ignored.

If an Except ACL is configured, Report packets within a specified range can be normally processed; therefore, the generated group members are not counted.

The interface and global configurations can be performed independently. If the global quantity limit is smaller than that for an interface, the global configuration shall be used.

## Configuration Example

### Configuring IGMP Group Filtering

<b>Scenario</b>	<ul style="list-style-type: none"> <li>Configure the basic functions of IGMP.</li> <li>Configure the access address range of ACL 1 from 225.0.0.1 to 225.0.0.255.</li> <li>Set the address of the group to be joined to 225.0.0.5.</li> <li>Set the address of the group to be joined to 236.0.0.5.</li> </ul>
	<pre>VSU(config)#access-list 1 permit 225.0.0.1 225.0.0.255 VSU(config-if-GigabitEthernet 0/5)#ip igmp access-group 1 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.5 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 236.0.0.5</pre>
<b>Verification</b>	Run the <b>show ip igmp groups [ interface-type interface-number ] [ group-address ] [ detail ]</b> command to display the group information of the interface.
	<pre>VSU(config-if-GigabitEthernet 0/5)#show ip igmp groups IGMP Connected Group Membership Group Address      Interface                Uptime    Expires    Last Reporter 225.0.0.5          GigabitEthernet 0/5     00:14:00 00:02:45  192.168.1.90</pre>

### Configuring the Maximum Number of IGMP Group Members

<b>Scenario</b>	<ul style="list-style-type: none"> <li>Configure the basic functions of IGMP.</li> <li>Configure the maximum number of IGMP group members for the interface to 5.</li> <li>Add group information (225.0.0.5~225.0.0.12).</li> <li>View group information.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp limit 5 VSU(config-if-GigabitEthernet 0/5)# VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.5 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.6 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.7 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.8 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.9</pre>

	<pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.10 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.11 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.12</pre>
<b>Verification</b>	Run the <b>show ip igmp groups</b> [ <i>interface-type interface-number</i> ] [ <i>group-address</i> ] [ <b>detail</b> ] command to display the group information of the interface.
	<pre>VSU(config-if-GigabitEthernet 0/5)#show ip igmp groups  IGMP Connected Group Membership  Group Address      Interface                Uptime    Expires    Last Reporter 225.0.0.5          GigabitEthernet 0/5     00:20:15  00:03:09  192.168.1.90 225.0.0.6          GigabitEthernet 0/5     00:20:24  00:02:58  192.168.1.90 225.0.0.7          GigabitEthernet 0/5     00:00:15  00:04:29  192.168.1.90 225.0.0.8          GigabitEthernet 0/5     00:00:13  00:04:34  192.168.1.90 225.0.0.9          GigabitEthernet 0/5     00:00:11  00:04:33  192.168.1.90</pre>

### Common Errors

- The basic functions of IGMP are not enabled.

## 3.4.5 Configuring IGMP Proxy

### Configuration Effect

- Configure the router proxy function and collect local member information.

### Notes

- The basic functions of IGMP must be configured.

### Configuration Steps

#### ▾ Configuring the IGMP Proxy Service

- Optional.
- If there is no special requirement, you can perform this configuration on directly connected upstream router interfaces.

#### ▾ Configuring the IGMP Mroute Proxy

- Optional.
- If there is no special requirement, you can perform this configuration on directly connected downstream host interfaces.

### Verification

- Set interface 7 for directly connecting to an upstream router as a multicast proxy server.

- Set interface 1 for directly connecting to a downstream host as a multicast proxy.
- Set interface 1 to be joined by groups whose addresses are 225.0.0.6 and 225.5.5.5.
- View the current group information.

## Common Errors

- The basic functions of IGMP are not enabled.

## 3.4.6 Configuring IGMP SSM Mapping

### Configuration Effect

- IGMPv3 supports source filtering; however, IGMPv1 and IGMPv2 do not support source filtering, but provides the SSM mapping function to filter sources.

### Notes

- The basic functions of IGMP must be configured.

### Configuration Steps

#### 📌 Enabling SSM Mapping

(Mandatory) Enable the SSM mapping function.

Enable the SSM mapping function on a router.

### ▾ Configuring Static SSM Mapping

Optional.

Configure this function on routers enabled with SSM mapping.

### Verification

Run the **show ip igmp ssm-mapping** [ *group-address* ] command to display SSM mapping information.

### Related Commands

#### ▾ Enabling SSM Mapping

<b>Command</b>	<b>ip igmp ssm-map enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ip igmp ssm-map enable</b> command to enable the SSM mapping function. Run the <b>ip igmp ssm-map static</b> command to set static mapping entries. Run IGMPv3 on the interface. When IGMPv1 or IGMPv2 Report packets are received, source addresses of static mappings can be added.

#### ▾ Configuring Static SSM Mapping

<b>Command</b>	<b>ip igmp ssm-map static</b> <i>access-list source-address</i>
<b>Parameter Description</b>	<i>access-list</i> : Indicates the group address range set by a standard IP ACL. The value ranges from 1 to 99, 1300 to 1999 and words. <i>source-address</i> : Indicates the source address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ip igmp ssm-map enable</b> command to enable the SSM mapping function. Run the <b>ip igmp ssm-map static</b> command to set static mapping entries. Run IGMPv3 on the interface. When IGMPv1 or IGMPv2 Report packets are received, source addresses of static mappings can be added.

### Configuration Example

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IGMP.</li> <li>● Enable SSM mapping.</li> <li>● Configure static SSM mapping ACL 1.</li> </ul>
	<pre>VSU(config)#ip igmp ssm-map enable</pre>

	VSU(config)#ip igmp ssm-map static 1 192.168.5.9
<b>Verification</b>	Run the <b>show ip igmp ssm-mapping [ group-address ]</b> command to display SSM mapping information.
	<pre>VSU#show ip igmp ssm-mapping SSM Mapping : Enabled Database    : Static mappings configured</pre>

### Common Errors

- The basic functions of IGMP are not enabled.

## 3.4.7 Configuring Alert Option

### Configuration Effect

- Check whether IGMP packets contain the Router Alert option and discards the packets without the Router Alert option.
- Support sending IGMP packets with the Router Alert option.

### Notes

- The basic functions of IGMP must be configured.

### Configuration Steps

#### ▾ Checking Router Alert Option

Optional.

#### ▾ Sending IGMP Packets with Router Alert Option Encapsulated

Optional,

### Verification

#### ▾ Checking Router Alert Option

Check whether the IGMP-enabled interface discards the IGMP packets without the Router Alert option.

#### ▾ Sending IGMP Packets with Router Alert Option Encapsulated

Check whether the IGMP-enabled interface sends the IGMP packets containing the Router Alert option.

### Related Commands

#### ▾ Checking Router Alert Option

<b>Command</b>	<b>ip igmp enforce-router-alert630517</b>
----------------	---

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ip igmp enforce-router-alert</b> command to enable Router Alert option check. Run the <b>no ip igmp enforce-router-alert</b> command to disable Router Alert option check.

### ✚ Sending IGMP Packets with Router Alert Option Encapsulated

<b>Command</b>	<b>ip igmp send-router-alert</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ip igmp send-router-alert</b> command to enable the function of sending IGMP packets containing Router Alert option. Run the <b>no ip igmp send-router-alert</b> command to disable the function.

## Configuration Example

### ✚ Checking Router Alert Option

<b>Scenario</b>	<ul style="list-style-type: none"> <li>Configure the basic functions of IGMP.</li> <li>Configure Router Alert option check.</li> </ul>
	<pre>VSU(config)#ip igmp enforce-router-alert</pre>
<b>Verification</b>	IGMP packets containing Router Alert option 225.1.1.1 are sent to the IGMP-enabled interface and these packets are processed. Run the <b>show ip igmp groups</b> command and you will see 225.1.1.1. IGMP packets not containing Router Alert option 225.1.1.1 are sent to the IGMP-enabled interface and these packets are discarded. Run the <b>show ip igmp groups</b> command and you will not see 225.1.1.1

### ✚ Sending IGMP Packets with Router Alert Option Encapsulated

<b>Scenario</b>	<ul style="list-style-type: none"> <li>Configure the basic functions of IGMP.</li> <li>Configure the function of sending IGMP packets containing router alert option.</li> </ul>
	<pre>VSU(config)#ip igmp send-router-alert</pre>

<b>Verification</b>	Check whether the IGMP-enabled interface sends the IGMP packets containing the Router Alert option.
---------------------	---

## 3.5 Monitoring

### Clearing

Description	Command
Clears dynamic group membership from the IGMP buffer.	<b>clear ip igmp group</b>
Clears interface information from the IGMP buffer.	<b>clear ip igmp interface</b> <i>interface-type interface-number</i>

### Displaying

Description	Command
Displays all groups in a directly connected subnet.	<b>show ip igmp groups</b>
Displays details about all groups in a directly connected subnet.	<b>show ip igmp groups detail</b>
Displays specified groups in a directly connected subnet.	<b>show ip igmp groups</b> <i>A.B.C.D</i>
Displays details about specified groups in a directly connected subnet.	<b>show ip igmp groups</b> <i>A.B.C.D detail</i>
Displays IGMP configurations of a specified interface in a directly connected subnet.	<b>show ip igmp interface</b> <i>interface-type interface-number</i>
Displays details about all groups of a specified interface in a directly connected subnet.	<b>show ip igmp groups</b> <i>interface-type interface-number detail</i>
Displays information about a specified group of a specified interface in a directly connected subnet.	<b>show ip igmp groups</b> <i>interface-type interface-number A.B.C.D</i>
Displays details about a specified group of a specified interface in a directly connected subnet.	<b>show ip igmp groups</b> <i>interface-type interface-number A.B.C.D detail</i>
Displays configurations of an IGMP interface.	<b>show ip igmp interface</b> [ <i>interface-type interface-number</i> ]
Displays configurations of all IGMP interfaces.	<b>show ip igmp interface</b>

Displays configurations of IGMP SSM mapping.	<b>show ip igmp ssm-mapping</b>
Displays the information of IGMP SSM mapping to <i>A.B.C.D</i> .	<b>show ip igmp ssm-mapping <i>A.B.C.D</i></b>

## Debugging

Description	Command
Displays whether IGMP debugging is enabled.	<b>show debugging</b>
Debugs all IGMP information.	<b>debug ip igmp all</b>
Debugs IGMP packet decoding.	<b>debug ip igmp decode</b>
Debugs IGMP packet encoding.	<b>debug ip igmp encode</b>
Debugs IGMP events.	<b>debug ip igmp events</b>
Debugs IGMP FSM.	<b>debug ip igmp fsm</b>
Debugs IGMP state machine.	<b>debug ip igmp tib</b>
Debugs IGMP warning.	<b>debug ip igmp warning</b>

## 4 Configuring MLD

### 4.1 Overview

Multicast Listener Discovery (MLD) is a protocol used in the multicast technology.

This protocol receives the multicast member relationship between hosts and routers to determine multicast flow forwarding. Using information obtained from MLD, a device maintains an interface-based multicast listener status table. The multicast listener status table is activated only when at least one host in the link of the interface is a group member.

Currently, MLD has two versions: MLDv1 and MLDv2.

- MLD of both versions supports the Any-Source Multicast (ASM) model.
- MLDv2 can be directly applied to the Source-Specific Multicast (SSM) model.
- MLDv1 can be applied to the SSM model only when MLD SSM mapping is configured.

#### Protocols and Standards

- RFC2710: Multicast Listener Discovery (MLDv1) for IPv6
- RFC3810: Multicast Listener Discovery Version 2 (MLDv2) for IPv6

### 4.2 Applications

Application	Description
<a href="#">Configuring the MLD Service on the Local Network</a>	Implements the MLD service on the local network.
<a href="#">Configuring the MLD Proxy Service</a>	In the simple tree topology, the MLD proxy service, instead of the PIM service, is used.

#### 4.2.1 Configuring the MLD Service on the Local Network

##### Scenario

As shown in Figure 4-1, the local network consists of receiver 1, receiver 2, router A, and router B.

Query messages sent by router A or router B are valid on the local network, and Report messages sent by receiver A and receiver B are also valid on the local network.

Figure 4-1

<b>Remark</b>	Router C is the egress gateway.
<b>s</b>	Routers A and B are local routers.

### Deployment

- Routers A, B, and C run the OSPFv6 protocol.
- Interfaces on routers A, B, and C run the multicast protocol (PIM SMv6).

## 4.2.2 Configuring the MLD Proxy Service

### Scenario

As shown Figure 4-2, the proxy function is enabled on router A. Router A functions as a host and forms a local management group with router B. Router A forwards Report messages from receivers 1 and 2.

Figure 4-2

<b>Remark</b>	Router A functions as the proxy.
<b>s</b>	Router B provides the PIM service.

### Deployment

- Routers A and B run the OSPFv6 protocol.

- Interfaces on routers A and B run the multicast protocol (PIM SMv6).
- The multicast proxy service is enabled on Gi 0/0 and Gi 0/1 of router A.

## 4.3 Features

### Basic Concepts

#### Host Behaviors and Device Behaviors

Layer-3 multicast devices running multicast management protocols are referred to as devices and their behaviors are device behaviors.

PCs or simulated PCs running multicast management protocols are referred to as hosts and their behaviors are host behaviors.

#### Querier

Devices interact and compete with each other. After IP address comparison, the device with a lower IP address becomes the querier and periodically sends Query messages.

#### MLD PROXY-SERVICE Interface

This interface, also called uplink interface, implements host behaviors. It receives Query messages sent by upstream devices and sends Report messages collected by the router proxy.

#### MLD MROUTE-PROXY Interface

This interface, also called downlink interface, implements router functions. It sends messages received by the proxy service interface and collects and sends host information to the proxy service interface.

#### MLD SSM-MAP

SSM mapping refers to mapping of source-specific multicast. MLDv1 does not support the SSM model until the SSM-MAP function is enabled.

### Overview

Feature	Description
<a href="#">Setting MLD Router Parameters</a>	Sends Query messages to obtain local member information.
<a href="#">Querier Selection Process or Timeout Mechanism</a>	Selects the unique querier in the current network segment.
<a href="#">Filtering MLD Groups</a>	Filters group members and limits the number of group members.
<a href="#">Supporting Static MLD Groups</a>	Stores static group information on the local router instead of obtaining group information by sending Report messages.

Feature	Description
<a href="#">Configuring Simulated Host Group Information</a>	Simulates host behaviors to directly configure group joining information.
<a href="#">Supporting MLD Proxy</a>	Uses this function in the simple tree topology instead of complex multicast routing protocols, such as the PIM.
<a href="#">Supporting SSM-MAP</a>	Provides the SSM model for MLDv1. When a host is added to a group, a specific source can be specified to avoid network bandwidth occupation by unnecessary and invalid multicast data streams. This function is especially useful on a network where multiple multicast sources share the same multicast address.

### 4.3.1 Setting MLD Router Parameters

Sends Query messages to obtain local member information.

#### Working Principle

A device periodically sends Query messages to ensure that a group has at least one host. If no host is available in a group, the group will be deleted.

#### Related Configuration

##### ↳ Enabling MLD

By default, MLD is disabled on an interface.

Run the **ipv6 pim sparse-mode** command to enable or disable MLD on an interface.

MLD can be enabled only after PIM-SM is enabled on the interface.

##### ↳ Configuring MLD Version

By default, the MLD version is 2.

Run the **ipv6 mld version { 1 | 2 }** command to configure or restore the MLD version of an interface.

##### ↳ Configuring the Query Interval of the Last Member

By default, the interval for sending Query messages is 1s.

Run the **ipv6 mld last-member-query-interval interval** command to configure or restore the interval for sending Query messages.

A larger value means a longer interval for sending Query messages.

##### ↳ Configuring the Number of Times for Querying the Last Member

By default, the number of times for querying the last member is 2.

Run the **ipv6 mld last-member-query-count count** command to configure or restore the number of times for querying the last member.

A larger value means a larger number of times for querying the last member.

#### 📌 [Configuring the Interval for Querying a Common Member](#)

By default, the interval for querying a common member is 125s.

Run the **ipv6 mld query-interval** *seconds* command to configure or restore the interval for querying a common member.

A larger value means a longer interval for querying a common member.

#### 📌 [Configuring the Maximum Response Time](#)

By default, the maximum response time is 10s.

Run the **ipv6 mld query-max-response-time** *seconds* command to configure or restore the maximum response time.

A larger value means a longer maximum response time.

### 4.3.2 Querier Selection Process or Timeout Mechanism

Selects the unique querier in the current network segment. The querier sends a Query message to obtain group information on the local network.

#### [Working Principle](#)

On a multicast network running MLD, a multicast device dedicated to query sends MLD Query messages. The device is determined by election. Initially, all devices are in the querier state. When receiving member relationship Query messages from devices with lower IP addresses, the devices switch from the receiver state to non-querier state. Therefore, there is only one device in the query state in the end. This device has the lowest IP address among all multicast devices on the network. When the querier device does not work, MLD also works. Non-querier devices maintain the keepalive interval timer for other queriers. The timer is reset once the device receives a member relationship query message. If the timer times out, the device starts to send Query messages and a new querier election starts.

#### [Related Configuration](#)

#### 📌 [Configuring the Keepalive Interval of the Querier](#)

By default, the keepalive interval of the querier is 255s.

Run the **ipv6 mld querier-timeout** *seconds* command to configure or restore the keepalive interval of the querier.

A larger value means a longer keepalive interval of the querier.

### 4.3.3 Filtering MLD Groups

Filters group members and limits the number of group members.

#### [Working Principle](#)

If you do not want hosts in the network segment where an interface resides to be added to certain multicast groups, you can configure ACL rules on the interface as a filter. The interface will filter received MLD member relationship Report messages

based on the ACL rules and maintain member relationships only for multicast groups permitted by the rules. The largest number of router members can also be set.

### Related Configuration

#### ↳ [Configuring Access Control for Multicast Groups](#)

By default, no access control is configured and hosts can be added to any groups.

Run the **ipv6 mld access-group** *access-list-name* command to configure or restore access control for multicast groups.

After the configuration, the router can receive messages only from hosts in groups specified in the access list.

#### ↳ [Configuring the Maximum Number of MLD Group Members](#)

By default, an MLD group has a maximum of 1024 members.

Run the **ipv6 mld limit** *number* command to configure or restore the maximum number of MLD group members.

A larger value means a larger number of group members.

## 4.3.4 Supporting Static MLD Groups

Stores static group information on a local router instead of obtaining group information by sending Report messages. The local router can directly exchange group information with the PIM router.

### Working Principle

Manually configure static group information.

### Related Configuration

#### ↳ [Configuring Static-Group](#)

By default, no static group information is configured.

Run the **ipv6 mld static-group** *group-address* command to configure or cancel static group information.

## 4.3.5 Configuring Simulated Host Group Information

Simulates host behaviors to directly configure group joining information.

### Related Configuration

#### ↳ [Configuring Join-Group](#)

By default, no join-group information is configured.

Run the **ipv6 mld join-group** *group-address* command to configure or cancel join-group information.

### 4.3.6 Supporting MLD Proxy

In the simply tree topology, it is not necessary to run complex multicast routing protocols (such as PIM). In this case, MLD proxy can be used to send MLD messages for downstream hosts and maintain member relationships.

#### Working Principle

When an upstream router is configured as an MLD proxy service interface, it functions as a host and can receive Query messages from upstream routers as well as forward group information of downstream hosts. When a downstream router is configured as an MLD multicast proxy interface, it functions as a router and can forward Query messages of upstream routers as well as receive Report messages from downstream routers.

#### Related Configuration

##### ↘ **Configuring MLD PROXY-SERVICE**

By default, the MLD proxy service is disabled on an interface.

Run the **ipv6 mld proxy-service** command to configure or cancel the MLD proxy function on an interface.

This function must be configured when proxy is used.

##### ↘ **Configuring MLD MROUTE-PROXY**

By default, the multicast proxy service is disabled on an interface.

Run the **ipv6 mld mroute-proxy** interfacename command to configure or cancel the multicast proxy function on an interface.

This function must be configured when proxy is used.

### 4.3.7 Supporting SSM-MAP

This function provides the SSM model for MLDv1. When a host is added to a group, a specific source can be specified to avoid network bandwidth occupation by unnecessary and invalid multicast data streams. This function is especially useful on a network where multiple multicast sources share the same multicast address.

#### Working Principle

Based on MLDv1, MLDv2 provides an extra function, that is, source filtering multicast. In MLDv1, a host determines to join a group only based on the group address and receives multicast streams sent to the group address from any source. However, an MLDv2 host advertises the multicast group that the host wants to join and the address of the multicast source that it wants to receive. In MLDv1, source address filtering can be implemented to some extent, but filtering is implemented by enabling SSM-MAP and configuring SSM-MAP static groups on multicast flow receivers.

#### Related Configuration

##### ↘ **Enabling MLD SSM-MAP**

By default, SSM-MAP is disabled.

Run the **ipv6 mld ssm-map enable** command to enable or disable the SSM-MAP function.

This function must be enabled when SSM-MAP is used.

### 📌 [Configuring MLD SSM-MAP STATIC](#)

By default, no SSM-MAP static link table is configured.

Run the **ipv6 mld ssm-map static access-list-num A.B.C.D** command to enable or disable the SSM-MAP static link table.

## 4.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic Functions of MLD</a>	 (Mandatory) It is used to configure the multicast service.	
	<b>ipv6 multicast-routing</b>	Enables the IPv6 multicast routing function.
	<b>ipv6 pim sparse-mode</b>	Enables the PIM-SM function.
<a href="#">Configuring MLD Router Parameters</a>	<b>ipv6 mld version { 1   2 }</b>	Configures the MLD version.
	<b>ipv6 mld last-member-query-interval</b> <i>interval</i>	Configures the interval for querying the last member.
	<b>ipv6 mld last-member-query-count</b> <i>count</i>	Configures the number of times for querying the last member.
	<b>ipv6 mld query-interval</b> <i>seconds</i>	Configures the interval for querying a common member.
<a href="#">Querier Selection Process or Timeout Mechanism</a>	<b>ipv6 mld query-max-response-time</b> <i>seconds</i>	Configures the maximum response interval.
<a href="#">Filtering MLD Groups</a>	<b>ipv6 mld querier-timeout</b> <i>seconds</i>	Configures the keepalive interval of the querier.
<a href="#">MLD Proxy</a>	<b>ipv6 mld access-group</b> <i>access-list</i>	Filters MLD group members.
	<b>ipv6 mld proxy-service</b>	Configures the MLD PROXY-SERVICE.
<a href="#">Supporting SSM-MAP</a>	<b>ipv6 mld mroute-proxy</b> <i>interface-type interface-number</i>	Configures the MLD MROUTE-PROXY.
	<b>ipv6 mld ssm-map enable</b>	Enables the SSM-MAP function.
	<b>ipv6 mld ssm-map static</b> <i>access-list source-address</i>	Configures the SSM-MAP static link table.

### 4.4.1 Configuring Basic Functions of MLD

#### [Configuration Effect](#)

- Enable the multicast routing function and collect group information on the local network.

#### [Notes](#)

- The PIM-SM function must be enabled on an interface.

## Configuration Steps

### ↳ Enabling the IPv6 Multicast Routing Function

- Mandatory.
- The IPv6 multicast routing function should be enabled on all routers on the local network unless otherwise specified.

### ↳ Enabling the PIM-SM Function

- Mandatory.
- The PIM-SM function should be directly enabled on an interface on the local network unless otherwise specified.

## Verification

Run the **show ipv6 mld interface** *interface-type interface-number* command to check whether MLD is enabled on the interface.

## Related Commands

### ↳ Enabling the IPv6 Multicast Routing Function

<b>Command</b>	<b>ipv6 multicast-routing</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Enabling the PIM-SM Function

<b>Command</b>	<b>ipv6 pim sparse-mode</b>
<b>Parameter</b>	-
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	PIM interfaces must be layer-3 interfaces, including: routing, L3AP, SVI, and loopback interfaces. IPv6 unicast routes should be accessible to all PIM interfaces.

## Configuration Example

### ↳ Enabling MLD on the Local Network

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure an IPv6 unicast routing protocol (such as OSPF) on a router and ensure that unicast routes are accessible to the loopback interface. (Omitted)</li> <li>● Enable the IPv6 multicast routing function on all routers.</li> <li>● Enable the PIM-SM function on device interconnection interfaces and interfaces for connecting user hosts and multicast sources.</li> </ul>
----------------------------	---

	<pre> VSU(config)#ipv6 multicast-routing VSU(config)#int gi 0/1 VSU(config-if-GigabitEthernet 0/1)# ipv6 address 2001::1/64 VSU(config-if-GigabitEthernet 0/1)#ipv6 pim sparse-mode </pre>
<b>Verification</b>	Run the <b>show ipv6 mld interface <i>interface-type interface-number</i></b> command to check whether MLD is enabled on the interface.
	<pre> VSU#show ipv6 mld interface gigabitEthernet 0/1 Interface GigabitEthernet 0/1 (Index 1)   MLD Active, Querier, Version 2 (default)   Internet address is fe80::2d0:f8ff:fe22:33b1   MLD interface limit is 1024   MLD interface has 0 group-record states   MLD interface has 0 join-group records   MLD interface has 0 static-group records   MLD activity: 0 joins, 0 leaves   MLD query interval is 125 seconds   MLD querier timeout is 255 seconds   MLD max query response time is 10 seconds   Last member query response interval is 10 (1/10s)   Last member query count is 2   Group Membership interval is 260   Robustness Variable is 2 </pre>

### Common Errors

- Multicast routing is disabled on routers on the network.
- No multicast interface is available on the network.

## 4.4.2 Configuring MLD Router Parameters

### Configuration Effect

- Modify MLD router parameters to change the message type or sending mode.

### Notes

- The basic functions of MLD must be configured.

## Configuration Steps

### Configuring MLD Version

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

### Configuring the Interval for Querying the Last Member

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

### Configuring the Number of Times for Querying the Last Member

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

### Configuring the Interval for Querying a Common Member

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

### Configuring the Maximum Response Interval

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

## Verification

Run the **show ipv6 mld interface** *interface-type interface-number* command to view the configuration information.

## Related Commands

### Configuring the MLD Version

<b>Command</b>	<b>ipv6 mld version { 1   2 }</b>
<b>Parameter Description</b>	1: Indicates version 1. 2: Indicates version 2.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After this command is executed, MLD will automatically restart.

### Configuring the Interval for Querying the Last Member

<b>Command</b>	<b>ipv6 mld last-member-query-interval</b> <i>interval</i>
----------------	--

<b>Parameter Description</b>	<i>Interval</i> : Specifies the interval for sending Query messages of a specified group. The unit is 0.1s, the value ranges from 1 to 255, and the default value is 10 (1s).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After receiving the Done message, the interface will continuously send Query messages of a specified group and wait for responses from the host. After timeout, it is considered that the no group member exists in the directly-connected network segment and the interface is deleted from the MLD group member record. The timeout interval is calculated as follows: Timeout interval = last-member-query-interval x last-member-query-count + query-max-response-time/2.

### ↘ Configuring the Number of Times for Querying the Last Member

<b>Command</b>	<b>ipv6 mld last-member-query-count</b> <i>count</i>
<b>Parameter Description</b>	<i>count</i> : Specifies the number of times for sending Query messages of a specified group. The value ranges from 2 to 7. The default value is 2.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After receiving the Done message, the interface will continuously send Query messages of a specified group and wait for responses from the host. After timeout, it is considered that the no group member exists in the directly-connected network segment and the interface is deleted from the MLD group member record. The timeout interval is calculated as follows: Timeout interval = last-member-query-interval x last-member-query-count + query-max-response-time/2

### ↘ Configuring the Interval for Querying a Common Member

<b>Command</b>	<b>ipv6 mld query-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Specifies the interval for querying a common member. The unit is s, the value ranges from 1 to 18000, and the default value is 125.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring the Maximum Response Interval

<b>Command</b>	<b>ipv6 mld query-max-response-time</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Specifies the maximum response time. The unit is s, the value ranges from 1 to 25, and the default value is 10.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After sending Query messages, the interface waits for responses. After timeout, it is considered that no group member exists in the directly-connected network segment and group information is deleted.

## Configuration Example

▾ **Configuring Basic Router Parameters**

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic functions of MLD. (Omitted)</li> <li>● Configure MLD version 2.</li> <li>● Configure the interval for querying the last member as 15 (1.5s).</li> <li>● Configure the number of times for querying the last member as 3.</li> <li>● Configure the interval for querying the common member as 130s.</li> <li>● Configure the maximum response time as 15s.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/1)#ipv6 mld version 2 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld last-member-query-count 3 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld last-member-query-interval 15 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld query-interval 130 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld query-max-response-time 15</pre>
<p><b>Verification</b></p>	<p>Run the <b>show ipv6 mld interface</b> <i>interface-type interface-number</i> command to check whether MLD is enabled on the interface.</p>
	<pre>VSU(config-if-GigabitEthernet 0/1)# show ipv6 mld interface gi 0/1 Interface GigabitEthernet 0/1 (Index 1)   MLD Enabled, Active, Querier, Version 2 (default)   Internet address is fe80::2d0:f8ff:fe22:33b1   MLD interface limit is 1024   MLD interface has 0 group-record states   MLD interface has 0 join-group records   MLD interface has 0 static-group records   MLD activity: 0 joins, 0 leaves   MLD query interval is 130 seconds   MLD querier timeout is 267 seconds   MLD max query response time is 15 seconds   Last member query response interval is 15 (1/10s)   Last member query count is 3   Group Membership interval is 275   Robustness Variable is 2</pre>

**Common Errors**

- Basic functions of MLD are not enabled.

### 4.4.3 Querier Selection Process or Timeout Mechanism

#### Configuration Effect

- Select the unique querier on the local network.

#### Notes

- The basic functions of MLD must be configured.

#### Configuration Steps

- This function must be configured if the querier keepalive interval needs to be configured.
- This function can be configured on all MLD-enabled interfaces on the local network.

#### Verification

Run the **show ipv6 mld interface** *interface-type interface-number* command to view the configuration information of the interface.

#### Related Commands

##### ↘ Configuring the Keepalive Interval of Other Queriers

<b>Command</b>	<b>ipv6 mld querier-timeout</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Specifies the keepalive interval for other queriers. The unit is s, the value ranges from 60 to 300, and the default value is 255.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After sending Query messages, the interface waits for Query messages from other devices. After timeout, it is considered that it is the unique querier in the directly-connected network segment.

#### Configuration Example

##### ↘ Configuring the Keepalive Interval of Other Queriers

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of MLD. (Omitted)</li> <li>● Configure the keepalive interval of a querier as 280s.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/1)#ipv6 mld querier-timeout 280</pre>
<b>Verification</b>	Run the <b>show ipv6 mld interface</b> <i>interface-type interface-number</i> command to check whether MLD is enabled on the interface.
	<pre>VSU#show ipv6 mld interface gigabitEthernet 0/1 Interface GigabitEthernet 0/1 (Index 1)</pre>

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of MLD. (Omitted)</li> <li>● Configure the keepalive interval of a querier as 280s.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/1)#ipv6 mld querier-timeout 280</pre>
	<pre>MLD Enabled, Active, Querier, Version 2 (default) Internet address is fe80::2d0:f8ff:fe22:33b1 MLD interface limit is 1024 MLD interface has 0 group-record states MLD interface has 0 join-group records MLD interface has 0 static-group records MLD activity: 0 joins, 0 leaves MLD query interval is 130 seconds MLD querier timeout is 280 seconds MLD max query response time is 15 seconds Last member query response interval is 15 (1/10s) Last member query count is 3 Group Membership interval is 275 Robustness Variable is 2</pre>

**Common Errors**

- The basic functions of MLD are not enabled.

**4.4.4 Filtering MLD Groups**

**Configuration Effect**

- A router filters MLD group information.

**Notes**

- The basic functions of MLD must be configured.

**Configuration Steps**

➤ **Configuring Access Control for Multicast Groups**

Optional.

This function can be configured on all router interfaces directly connected to the local network unless otherwise specified.

➤ **Configuring the Maximum Number of MLD Group Members**

Optional.

This function can be configured on all router interfaces directly connected to the local network unless otherwise specified.

## Verification

### Filtering MLD Groups

Configure the interface to allow for only groups in link table 1. The access address of link table 1 is (FF66::100/64).

Configure the interface to add a group FF66::05.

Configure the interface to add a group FF65::05.

Check group information on the interface.

### Configuring the Maximum Number of MLD Group Members

Configure the number of group members as 5 on the interface.

Configure the interface to add a group (FF66::05 ~ FF65::0B).

Check group information on the interface.

## Related Commands

### Configuring Access Control for Multicast Groups

<b>Command</b>	<code>ipv6 mld access-group <i>access-list</i></code>
<b>Parameter Description</b>	<i>access-list</i> : Specifies the group address range by using IP standard ACLs or IP extended ACLs. The value ranges from 1 to 199, 1300 to 2699, and WORD.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>After running this command on the interface, you can control the groups that hosts in the directly-connected network segment can join. Use ACLs to limit the group address range. Report messages denied by the ACLs will be discarded.</p> <p>When MLDv2 is enabled, this command supports extended ACLs to precisely filter source record information in MLDv2 messages. When the received MLD Report message is (S1,S2,S3...Sn,G), this command will match (0,G) using the corresponding ACLs. Therefore, to normally use this command, you must explicitly configure a (0, G) in the extended ACLs to filter (S1,S2,S3...Sn,G).</p>

### Configuring the Maximum Number of MLD Group Members

<b>Command</b>	<code>ipv6 mld limit <i>number</i> [ <b>except</b> <i>access-list</i> ]</code>
<b>Parameter Description</b>	<p><i>number</i>: Specifies the maximum number of MLD group members. The value range depends on the specific device. The interface default value is 1024 and the global one is 65536.</p> <p><b>except</b> <i>access-list</i>: Groups in the access list are not counted.</p> <p>The access list is an IP standard ACL. The value ranges from 1 to 99, 1300 to 1999, and WORD.</p>

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Global configuration mode: Limits the number of MLD group members on the whole device.</p> <p>Interface configuration mode: Limits the number of MLD group members of the interface.</p> <p>If the number of group members exceeds the interface limit or global limit, subsequent Report messages will be ignored.</p> <p>If an except list is configured, Report messages in a specified range can be normally processed. Therefore, the group members are not counted.</p> <p>Interface and global limits can be configured separately. If the global limit is smaller than the interface limit, use the global limit.</p>

### Configuration Example

#### Configuring Group Filtering

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the basic functions of MLD. (Omitted)</li> <li>Configure the access address of link table 1 as (FF66::100/64).</li> <li>Configure the group to join as FF66::05.</li> <li>Configure the group to join as FF65::05.</li> </ul>
	<pre>VSU(config)#ipv6 access-list acl VSU(config-ipv6-acl)#permit ipv6 ::/64 ff66::100/64 VSU(config-ipv6-acl)#permit ipv6 2222::3333/64 ff66::100/64 VSU(config-ipv6-acl)#exit VSU(config)# VSU(config)#int gi 0/1 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld access-group acl VSU(config-if-GigabitEthernet 0/1)#ipv6 mld join-group ff66::5 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld join-group ff65::5</pre>
<b>Verification</b>	Run the <b>show ipv6 mld groups</b> [ <i>interface-type interface-number</i> ] [ <i>group-address</i> ] [ <b>detail</b> ] command to view the group information on the interface.
	<pre>VSU#show ipv6 mld groups MLD Connected Group Membership  Group Address                               Interface           Uptime    Expires    Last Reporter ff66::5                                       GigabitEthernet 0/1  00:05:07  00:03:46 fe80::2d0:f8ff:fe22:33b1</pre>

### Configuring the Maximum Number of MLD Group Members

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the basic functions of MLD. (Omitted)</li> <li>Configure the maximum number of group members on the interface as 5.</li> <li>Add group information (FF66::5 ~ FF66::0B).</li> <li>View the group information.</li> </ul>

	<pre> MLD Connected Group Membership Group Address                Interface                Uptime    Expires    Last Reporter ff66::5                      GigabitEthernet 0/1    00:00:36  00:04:00 fe80::2d0:f8ff:fe22:33b1 ff66::6                      GigabitEthernet 0/1    00:00:34  00:04:01 fe80::2d0:f8ff:fe22:33b1 ff66::7                      GigabitEthernet 0/1    00:00:22  00:04:13 fe80::2d0:f8ff:fe22:33b1 ff66::8                      GigabitEthernet 0/1    00:00:18  00:04:19 fe80::2d0:f8ff:fe22:33b1 ff66::9                      GigabitEthernet 0/1    00:00:14  00:04:21 fe80::2d0:f8ff:fe22:33b1                     </pre>

#### Common Errors

- The basic functions of MLD are not enabled.

#### 4.4.5 MLD Proxy

##### Configuration Effect

- Configure the router proxy function and collect local member information.

### Notes

- The basic functions of MLD must be configured.

### Configuration Steps

#### ▾ Configuring MLD PROXY-SERVICE

Optional.

This function can be configured on the interface of routers directly connected to the upstream devices unless otherwise specified.

#### ▾ Configuring MLD MROUTE-PROXY

Optional

This function can be configured on the interface of hosts directly connected to the downstream devices unless otherwise specified.

### Verification

- Configure the interface that directly connects interface 7 and upstream router as the multicast proxy service.
- Configure the interface that directly connects interface 1 and downstream host as the multicast proxy.
- Configure groups FF66::05 and FF66::06 to be added to interface 1.
- Check information of the current group.

### Related Commands

#### ▾ Configuring MLD PROXY-SERVICE

<b>Command</b>	<b>ipv6 mld proxy-service</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Run the <b>ipv6 mld proxy-service</b> command to configure the upstream interface as the proxy-service interface.</p> <p>Run the <b>ipv6 mld mroute-proxy</b> command to configure the downstream interface as the mroute-proxy interface.</p> <p>Configure the proxy-service interface to forward MLD Query messages to the mroute-proxy interface.</p> <p>Configure the mroute-proxy interface to forward MLD Reports messages to the proxy-service interface.</p> <p>A maximum of 32 proxy-service interfaces can be configured on a device. After receiving MLD Query messages, the proxy-service interface sends a response based on the MLD group member records.</p>

If you run **switchport** command on the proxy-service interface, the **ipv6 mld mroute-proxy** command configured on the mroute-proxy interface will be automatically deleted.

### Common Errors

- The basic functions of MLD are not enabled.

## 4.4.6 Supporting SSM-MAP

### Configuration Effect

- MLDv2 supports source filtering while MLDv1 does not. However, MLDv1 provides the SSM-MAP function to implement source filtering.

### Notes

- The basic functions of MLD must be configured.

### Configuration Steps

#### ▾ Enabling SSM-MAP

This function must be configured if SSM-MAP.

This function must be enabled on a router where SSM-MAP is enabled.

#### ▾ Configuring an SSM-MAP Static Link Table

Optional.

This function must be enabled on a router where SSM-MAP is enabled.

### Verification

Run the **show ipv6 mld ssm-mapping** [ *group-address* ] command to display SSM-MAP information.

### Related Commands

#### ▾ Enabling SSM-MAP

<b>Command</b>	<b>ipv6 mld ssm-map enable</b>
<b>Parameter</b>	-
<b>Description</b>	

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ipv6 mld ssm-map enable</b> command to enable the SSM-MAP function. Run the <b>ipv6 mld ssm-map static</b> command to configure static mapping table items. The interface runs MLDv2. When receiving Report messages from MLDv1, the interface adds the static mapping source address.

### ↘ Configuring an SSM-MAP Static Link Table

<b>Command</b>	<b>ipv6 mld ssm-map static</b> access-list source-address
<b>Parameter Description</b>	access-list: Specifies the group address range configured by the ACL. source-address: Source address
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ipv6 mld ssm-map enable</b> command to enable the SSM-MAP function. Run the <b>ipv6 mld ssm-map static</b> command to configure static mapping table items. The interface runs MLDv2. When receiving Report messages from MLDv1, the interface adds the static mapping source address.

### Configuration Example

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of MLD. (Omitted)</li> <li>● Enable SSM-MAP.</li> <li>● Configure SSM-MAP static link table 3.</li> </ul>
	<pre>VSU(config)#ipv6 mld ssm-map enable VSU(config)#ipv6 mld ssm-map static 3 1500::5</pre>
<b>Verification</b>	Run the <b>show ipv6 mld ssm-mapping [ group-address ]</b> command to view SSM mapping information.
	<pre>VSU(config)#show ipv6 mld ssm-mapping SSM Mapping : Enabled Database    : Static mappings configured</pre>

### Common Errors

- The basic functions of MLD are not enabled.

## 4.5 Monitoring

### Clearing

Description	Command
Clears dynamic group member records in the MLD cache.	<b>clear ipv6 mld group</b> [ <i>group-address</i> ] [ <i>interface-type interface-number</i> ]
Clears all MLD statistics and group member records on the interface.	<b>clear ipv6 mld interface</b> <i>interface-type interface-number</i>

## Displaying

Description	Command
Displays groups directly connected to the device and group information learned from MLD.	<b>show ipv6 mld groups</b> [ <i>group-address</i>   <i>interface-type interface-number</i> ] [ <b>detail</b> ]
Displays configurations of the interface.	<b>show ipv6 mld interface</b> [ <i>interface-type interface-number</i> ]
Displays SSM-MAP information.	<b>show ipv6 mld ssm-mapping</b> [ <i>group-address</i> ]

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Displays the MLD debugging switch status.	<b>show debugging</b>
Debugs all MLD information.	<b>debug ipv6 mld all</b>
Debugs MLD packet resolution.	<b>debug ipv6 mld decode</b>
Debugs MLD packet encoding.	<b>debug ipv6 mld encode</b>
Debugs MLD event information.	<b>debug ipv6 mld events</b>
Debugs MLD Finite State Machine (FSM).	<b>debug ipv6 mld fsm</b>
Debugs MLD state machine information.	<b>debug ipv6 mld tib</b>
Debugs MLD warning.	<b>debug ipv6 mld warning</b>

## 5 Configuring PIM-DM

### 5.1 Overview

Protocol Independent Multicast (PIM) is an intra-domain multicast routing protocol.

A multicast source sends a packet to a group address. The packet is forwarded by network devices hop by hop and finally reaches the group members. On layer-3 network devices, PIM is used to create and maintain multicast routing entries, so as to support multicast forwarding.

PIM works in two modes: Protocol Independent Multicast - Sparse Mode (PIM-SM) and Protocol Independent Multicast - Dense Mode (PIM-DM).

- PIM-SM is applicable to large-scale networks where group members are sparsely distributed in a wide scope.
- PIM-DM is applicable to small networks where group members are densely distributed.

#### Protocols and Standards

- RFC3973: Protocol Independent Multicast - Dense Mode (PIM-DM)
- RFC2715: Interoperability Rules for Multicast Routing Protocols

### 5.2 Applications

Application	Description
<a href="#">Providing the Multicast Service in the Same Network</a>	The multicast service is provided in the same network.

#### 5.2.1 Providing the Multicast Service in the Same Network

##### Scenario

The multicast service is provided in the same network.

The following figure is taken as an example:

- A multicast source sends a multicast packet, and Receiver A and Receiver B in the same network receive the multicast packet.

Figure 5-1

<b>Remark</b>	A, B, and C are Layer-3 routers.
<b>s</b>	The multicast source is connected to the Gi0/1 interface of A, Receiver A is connected to the Gi0/1 interface of B, and Receiver B is connected to Gi0/1 of C.

### Deployment

- Run the Open Shortest Path First (OSPF) protocol in the same network to implement unicast routing.
- Run the PIM-DM protocol in the same network to implement multicast routing.
- Run the Internet Group Management Protocol (IGMP) in a user host network segment to implement group member management.

## 5.3 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

Routers where the PIM protocol is enabled are called PIM Routers. Interfaces where the PIM protocol is enabled are called PIM interfaces.

Multicast packets are forwarded on PIM routers. The PIM interfaces where multicast packets are received are called Upstream Interfaces, and the PIM interfaces where multicast packets are sent are called Downstream Interfaces.

The network segments where upstream interfaces are located are called Upstream Network Segments. The network segments where downstream interfaces are located are called Downstream Network Segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On some PIM interfaces, borders can be set to divide a large PIM network into multiple PIM domains. The borders are able to reject specified multicast packets or limit the transmission of PIM messages.

#### ↘ Multicast Distribution Tree

Multicast packets are packets transmitted from one point to multiple points. The forwarding path is in a tree structure. This forwarding path is called the Multicast Distribution Tree (MDT).

#### ↘ (\*,G), (S,G)

- (\*,G): Packets sent from any source to Group G, the corresponding routing entries, and the forwarding path called Rendezvous Point Tree (RPT).
- (S,G): Packets sent from Source S to Group G, the corresponding routing entries, and the forwarding path called Shortest Path Tree (SPT).

### Overview

Feature	Description
<a href="#">PIM-DM Neighbor</a>	Neighbor relationships are established between PIM routers to form a PIM network.
<a href="#">PIM-DM MDT</a>	PIM-DM creates the MDT by using flooding, pruning, and grafting.
<a href="#">PIM-DM SRM</a>	PIM-DM uses a State Refresh Message (SRM) to update the network state.
<a href="#">MIB</a>	The Simple Network Management Protocol (SNMP) manager uses information in the Management Information Base (MIB) to directly manage the PIM-DM function.

### 5.3.1 PIM-DM Neighbor

Neighbor relationships are established between PIM routers to form a PIM network. Neighbor relationships must be established between PIM routers before PIM control messages can be exchanged or multicast packets can be forwarded.

#### Working Principle

A Hello message is sent from a PIM interface. For the IPv4 multicast packet with the Hello message encapsulated, the destination address is 224.0.0.13 (indicating all PIM routers in the same network segment), the source address is the IP address of the PIM interface, and the Time To Live (TTL) value is 1. For the IPv6 multicast packet with the Hello message encapsulated, the destination address is ff02::d.

Function of a Hello message: It is used to discover neighbors, coordinate protocol parameters, and maintain neighbor relationships.

#### ↘ Discovering Neighbors

PIM routers in the same network segment receive multicast packets from the destination address 224.0.0.13 or ff02::d. In this way, the PIM routers obtain neighbor information and establish neighbor relationships.

When a PIM interface is enabled or detects a new neighbor, a Triggered-Hello-Delay message is used to generate a random time. Within the time, the interface sends Hello packets.

#### ↘ Coordinating Protocol Parameters

A Hello message includes multiple protocol parameters, which are described as follows:

- DR\_Priority: Router interfaces contend for the designated router (DR) based on their DR priorities. A higher priority means a higher chance of winning.
- Holdtime: Time in which a neighbor is held in the reachable state
- LAN\_Delay: LAN delay for transmitting a Prune message in a shared network segment
- Override-Interval: Prune override time carried in a Hello message.

When a PIM router receives a Prune message from an upstream interface, it indicates that downstream interfaces exist in the shared network segment. If the PIM router still needs to receive multicast data, the PIM router must send a Prune Override message to the upstream interface within the Override-Interval.

$\text{LAN\_Delay} + \text{Override-Interval} = \text{PPT}$  (Prune-Pending Timer). After a PIM router receives a Prune message from an downstream interface, the PIM router will not immediately perform pruning until PPT times out. Within the time of PPT, if the PIM router receives a Prune rejection message from the downstream interface, the PIM router cancels pruning.

### 📌 Maintaining Neighbor Relationships

A Hello message is sent periodically between PIM routers. If a Hello packet is not received from a PIM neighbor within Holdtime, the neighbor is considered unreachable and is deleted from the neighbor list. Any change of PIM neighbors will cause change of the multicast topology in the network. If an upstream or downstream neighbor in an MDT is unreachable, multicast routes converge again and the MDT is reshaped.

## Related Configuration

### 📌 Enabling PIM-DM on an Interface

By default, PIM-DM is disabled on an interface.

Use the **ip pim dense-mode** command to enable or disable PIM-DM on an interface.

PIM-DM must be enabled on an interface to involve the interface in the PIM protocol.

### 📌 Setting the Interval of Hello Messages on an Interface

By default, a Hello message is sent at an interval of 30 seconds.

The **ip pim query-interval** *interval-seconds* command is used to adjust the interval of Hello messages. The value of the interval ranges from 1 to 65,535.

A Hello message is transmitted less frequently when the value of *interval-seconds* is larger.

## 5.3.2 PIM-DM MDT

PIM-DM creates the MDT by using flooding, pruning, and grafting.

### Working Principle

When a multicast source sends multicast packets, the system may forward them to the outgoing interfaces of multicast neighbors and local members, depending on the results of the Reverse Path Forwarding (RPF) check. The packets not passing the RPF check are discarded. If an outgoing interface exists, the packets that have passed the RPF check are accepted for

forwarding; if no outgoing interface exists, a prune packet is sent to upstream devices. After the upstream interface receives the prune packet, the upstream interface transmits the source interface of the prune packet as the Pruned state and sets the Prune Timer (PT). In this way, the MDT based on the multicast source is created.

When the system receives a Join message from a local member, if a downstream device in the Pruned state sends a Graft message to an upstream device, the upstream device returns a Graft Ack message and resume multicast forwarding to the interfaces of the downstream device after receiving the Graft message.

- 
-  In network deployment, when multiple PIM-DM neighbors are created through multiple links between devices and downstream devices have no or less need in receiving, the CPU usage may be high. In this scenario, PIM-SM is recommended to deploy the environment.
- 

## Related Configuration

### Configuring the Prune Override Interval on an Interface

By default, the prune override interval is 500 ms.

The **ip pim override-interval** *interval-milliseconds* command is used to modify the prune override interval.

## 5.3.3 PIM-DM SRM

PIM-DM uses an SRM to refresh the network state.

### Working Principle

Devices connected to a multicast source periodically send SRMs to downstream devices to notify changes of the network topology. After receiving the SRMs, the adjacent devices receiving the SRMs add the local topology state information to the messages by modifying some fields in SRMs, and send the messages to downstream devices. When the messages reach leaf devices, the state information of the entire network is updated.

## Related Configuration

### Disabling the Processing and Forwarding of SRMs

By default, the processing and forwarding of SRMs are enabled.

The **ip pim state-refresh disable** command is used to disable the processing and forwarding of SRMs.

- 
-  Disabling the SRM function may cause the converged PIM-DM MDT to re-converge, which leads to unnecessary bandwidth waste and multicast routing table flapping. Therefore, it is recommended not to disable SRM in general conditions.
- 

### Setting the Interval of SRMs

By default, an SRM is sent at an interval of 60 seconds.

The **ip pim state-refresh origination-interval** *interval-seconds* command is used to adjust the interval of SRMs. The value of the interval ranges from 1 to 100.

SRMs are transmitted less frequently when the value of *interval-seconds* is larger.

-  Only devices that are directly connected to a multicast source will periodically send a PIM SRM to downstream interfaces. For a device not directly connected to the multicast source, the interval of SRMs on its downstream interfaces is invalid.

### 5.3.4 MIB

Connected to other agents, the Simple Network Management Protocol (SNMP) manager uses information in the Management Information Base (MIB) to directly manage the PIM-DM function.

#### Working Principle

The MIB specifies variables (namely information that can be queried and set by the management process) maintained by network elements and directly manages the PIM-DM function.

#### Related Configuration

##### ↳ Enabling PIM-DM MIB

By default, the PIM-DM MIB function is enabled.

The `ip pim mib dense-mode` command is used to enable the PIM-DM MIB function.

## 5.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring PIM-DM Basic Functions</a>	 (Mandatory) It is used to create the multicast service.	
	<code>ip multicast-routing</code>	Enables IPv4 multicast routing.
	<code>ip pim dense-mode</code>	Enables PIM-DM.
<a href="#">Configuring PIM-DM Neighbors</a>	 (Optional) It is used to limit the (S,G) pairs of legitimate multicast packets in Any Source Multicast (ASM) model.	
	<code>ip pim query-interval interval-seconds</code>	Sets the Interval of Hello messages on an interface.
	<code>ip pim propagation-delay interval-milliseconds</code>	Sets the prune propagation delay on an interface.
	<code>ip pim override-interval interval-milliseconds</code>	Sets the prune override interval on an interface.
	<code>ip pim neighbor-filter access-list</code>	Configures neighbor filtering on an interface.
<a href="#">Configuring PIM-DM SRMs</a>	<code>ip pim state-refresh disable</code>	Disables the processing and forwarding of SRMs.
	<code>ip pim state-refresh origination-interval interval-seconds</code>	Sets the Interval of SRMs on an interface.
<a href="#">Configuring PIM-DM MIB</a>	<code>ip pim mib dense-mode</code>	Enables PIM-DM MIB.

## 5.4.1 Configuring PIM-DM Basic Functions

### Configuration Effect

- Create a PIM-DM network and provide data sources and user terminals in the network with the IPv4 multicast service.

### Notes

- PIM-DM needs to use the unicast routes existing in the network. Therefore, IPv4 unicast routing must be configured in the network.

### Configuration Steps

#### ↳ Enabling IPv4 Multicast Routing

- Mandatory
- IPv4 multicast routing should be enabled on each router unless otherwise specified.

#### ↳ Enabling PIM-DM

- Mandatory
- PIM-DM should be enabled on the following interfaces unless otherwise specified: interconnected interfaces on routers and interfaces connecting multicast sources and user hosts.

### Verification

Make multicast sources send multicast packets and make user hosts join the groups.

- Check whether the user hosts can successfully receive packets from each group.
- Check whether correct PIM-DM routing entries are created on routers.

### Related Commands

#### ↳ Enabling IPv4 Multicast Routing

<b>Command</b>	<b>ip multicast-routing</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ↳ Enabling PIM-DM

<b>Command</b>	<b>ip pim dense-mode</b>
<b>Parameter</b>	N/A
<b>Description</b>	

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	PIM interfaces must be at Layer-3, including: routing interfaces, aggregate ports(APs), switch virtual interfaces (SVIs), and loopback interfaces. For all PIM interfaces, IPv4 unicast routes should be reachable.

➤ **Displaying the PIM-SM Routing Table**

<b>Command</b>	<b>show ip pim dense-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>summary</b> ]
<b>Parameter Description</b>	<i>group-or-source-address</i> : Indicates a group address or source address. <i>group-or-source-address</i> : Indicates a group address or source address (The two addresses cannot be group addresses or source addresses at the same time). <b>summary</b> : Displays the routing table summary.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	Check whether sufficient routing entries are provided. Check the upstream and downstream interface lists and ensure that a correct SPT tree is created.

**Configuration Example**

➤ **Enabling IPv4 Multicast Routing on the IPv4 Network**

<b>Scenario Figure 5-2</b>	<p>The diagram illustrates a network topology for IPv4 multicast routing. On the left, a 'Multicast Source' is connected to Router A via interface Gi0/1. Router A is connected to Router B via interface Gi0/2. Router B is connected to 'Receiver A' via interface Gi0/1.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IPv4 unicast routing protocols (for example, OSPF) on all the routers.</li> <li>● Enable the IPv4 multicast routing function on all the routers.</li> <li>● Enable the PIM-DM function on all the interconnected interfaces of the routers, Source, and Receiver..</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if)# ip pim dense-mode A(config-if)# exit A(config)# interface GigabitEthernet 0/2</pre>

	<pre>A(config-if)# ip pim dense-mode A(config-if)# exit</pre>
<b>B</b>	<pre>B# configure terminal B(config)# ip multicast-routing B(config)# interface GigabitEthernet 0/1 B(config-if)# ip pim dense-mode B(config-if)# exit B(config)# interface GigabitEthernet 0/2 B(config-if)# ip pim dense-mode B(config-if)# exit</pre>
<b>Verification</b>	<p>Configure the multicast source (192.168.1.10) to send packets to G (229.1.1.1). Make Receiver A join G.</p> <ul style="list-style-type: none"> <li>● Check whether the multicast packets from Source G are received by Receiver A..</li> <li>● Check PIM-DM routing tables on Router A and Router B.</li> </ul>
<b>A</b>	<pre>A# show ip pim dense-mode mroute PIM-DM Multicast Routing Table (192.168.1.10, 229.1.1.1) MRT lifetime expires in 182 seconds Source directly connected on GigabitEthernet 0/1 State-Refresh Originator State: Originator SRT:57, SAT:147 Upstream IF: GigabitEthernet 0/1 Upstream State: Forwarding Assert State: NoInfo Downstream IF List: GigabitEthernet 0/2, in 'olist': Downstream State: NoInfo Assert State: NoInfo</pre>
<b>B</b>	<pre>B# show ip pim dense-mode mroute PIM-DM Multicast Routing Table (192.168.1.10, 229.1.1.1)</pre>

```
MRT lifetime expires in 130 seconds
RPF Neighbor: 192.168.2.1, Nexthop: 192.168.2.1, GigabitEthernet 0/2
Upstream IF: GigabitEthernet 0/2
Upstream State: Forwarding
Assert State: Loser, AT:125
Downstream IF List:
GigabitEthernet 0/1, in 'olist':
Downstream State: NoInfo
Assert State: NoInfo
```

## Common Errors

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- PIM-DM is not enabled on a certain interface.

## 5.4.2 Configuring PIM-DM Neighbors

### Configuration Effect

- Coordinate protocol parameters and adjust parameters in the Hello packet.
- Enable neighbor filtering to improve network security.

### Notes

- Basic functions of PIM-DM must be configured.

### Configuration Steps

- Set parameters on PIM router interfaces unless otherwise specified.

### Verification

- Set parameters in a Hello packet on an interface and run the **debug ip pim dense-mode encode** command to check parameters.
- Enable neighbor filtering and run the **show ip pim dense-mode decode** command to display neighbor filtering information.
- Run the **show running-config interface [ interface-type interface-number ]** command to display configurations on an interface.

### Related Commands

### Setting the Interval of Hello Messages

<b>Command</b>	<b>ip pim query-interval</b> <i>interval-seconds</i>
<b>Parameter Description</b>	<i>interval-seconds</i> : The value ranges from 1 to 65,535 in the unit of seconds.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	When the Hello interval is set, the holdtime value will be updated as its 3.5 times.
<p><b>i</b> Every time when the interval of Hello messages is updated, the holdtime value is automatically updated as 3.5 times of the interval. If the result of the interval of Hello messages multiplied by 3.5 is greater than 65,535, the holdtime value is updated as 65,535.</p>	

### Setting the Prune Propagation Delay

<b>Command</b>	<b>ip pim propagation-delay</b> <i>interval-milliseconds</i>
<b>Parameter Description</b>	<i>interval-milliseconds</i> : The value ranges from 1 to 32,767 in the unit of milliseconds.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Set <b>propagation-delay</b> of an interface, that is, configure the prune propagation delay of an interface.

### Setting the Prune Override Interval

<b>Command</b>	<b>ip pim override-interval</b> <i>interval-milliseconds</i>
<b>Parameter Description</b>	<i>interval-milliseconds</i> : The value ranges from 1 to 32,767 in the unit of milliseconds.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Set <b>override-interval</b> of an interface, that is, configure the prune override time of an interface.

### Configuring PIM-DM Neighbor Filtering

<b>Command</b>	<b>ip pim neighbor-filter</b> <i>access-list</i>
<b>Parameter Description</b>	<i>access-list</i> : The supported ACL ranges from 1 to 99. Naming an ACL is also supported.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Only addresses that meet ACL filtering conditions can be used as PIM neighbors of the current interface. Otherwise, the addresses filtered out cannot be neighbors.</p> <p>Peering refers to exchange of protocol packets between PIM neighbors. If peering with a PIM device is suspended, the neighbor relationship with it cannot be formed so that PIM protocol packets will not be received from the device.</p>

## Configuration Example

### Configuring PIM-DM Neighbors on the IPv4 Network

<p><b>Scenario</b> Figure 5-3</p>

```

### Common Errors

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- PIM-DM is not enabled on a certain interface.

## 5.4.3 Configuring PIM-DM SRMs

### Configuration Effect

- Enable or disable the PIM-DM SRM function.
- Adjust the interval of SRMs.

### Notes

- Basic functions of PIM-DM must be configured.

### Configuration Steps

- The interval of SRMs is only applicable only to the PIM router interfaces that are directly connected to the multicast source.

### Verification

- Configure the PIM-DM SRMs and run the **show running-config** command to display the SRM status.
- Run the **show ip pim dense-mode track** command to display the SRM number.
- Run the **show running-config interface [ interface-type interface-number ]** command to display interface configurations.

### Related Commands

#### Disabling the Processing and Forwarding of SRMs

<b>Command</b>	<b>ip pim state-refresh disable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When the processing and forwarding of SRMs are disabled, the State Refresh Capable option is not included in a Hello packet, and is not processed when the Hello packet is received.

	Disabling the SRM function may cause the converged PIM-DM MDT to re-converge, which leads to unnecessary bandwidth waste and multicast routing table flapping. Therefore, it is recommended not to disable this function in general conditions.
--	---

➤ **Setting the Interval of SRMs**

<b>Command</b>	<b>ip pim state-refresh origination-interval</b> <i>interval-seconds</i>
<b>Parameter Description</b>	<i>interval-seconds</i> : The value ranges from 1 to 100 in the unit of second.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### Common Errors

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- PIM-DM is not enabled on a certain interface.

## 5.4.4 Configuring PIM-DM MIB

### Configuration Effect

- Enable the MIB function for PIM-DM.

### Verification

- Configure the MIB function of PIM-SM and run the **show running-config** command to check whether the function is configured.

Displays the number of PIM-DM packets sent and received since the statistic start time.	<b>show ip pim dense-mode track</b>
Displays the PIM-DM running status.	<b>view pim-dm</b>

## 6 Configuring PIM-SM

### 6.1 Overview

Protocol Independent Multicast (PIM) is an intra-domain multicast routing protocol.

A multicast source sends a packet to a group address. The packet is forwarded by network devices hop by hop and finally reaches the group members. On Layer-3 network devices, PIM is used to create and maintain multicast routing entries, so as to support multicast forwarding.

PIM works in two modes: Protocol Independent Multicast - Sparse Mode (PIM-SM) and Protocol Independent Multicast - Dense Mode (PIM-DM).

- PIM-SM is applicable to large-scale networks where group members are sparsely distributed in a wide scope.
- PIM-DM is applicable to small networks where group members are densely distributed.

#### Protocols and Standards

- RFC4601: Protocol Independent Multicast -Sparse Mode (PIM-SM)
- RFC5059: Bootstrap Router (BSR) Mechanism for Protocol Independent Multicast (PIM)
- RFC3962: Protocol Independent Multicast - Dense Mode protocol
- RFC4607: Source-Specific Multicast for IP

### 6.2 Applications

Application	Description
<a href="#">Enabling ASM for PIM-SM</a>	The receiver receives any multicast source.
<a href="#">Enabling SSM for PIM-SM</a>	The receiver receives only a specific multicast source.

#### 6.2.1 Enabling ASM for PIM-SM

##### Scenario

Provide multicast services within only one domain.

For example, in the following figure, the receiver receives any multicast source.

Figure 6-1

<b>Remark</b>	R 1 is connected directly to the multicast source.
<b>s</b>	R 2 serves as the rendezvous point (RP).
	R 3 is connected directly to Receiver A.
	R 4 is connected directly to Receiver B.

### Deployment

- Run the Open Shortest Path First (OSPF) protocol to realize unicast routing.
- Run PIM-SM to realize multicast routing.
- Run the Internet Group Management Protocol (IGMP) in the network segment of the user host to manage group members.

## 6.2.2 Enabling SSM for PIM-SM

### Scenario

Provide multicast services within only one domain.

For example, in the following figure, the receiver receives a specific multicast source.

Figure 6-2

<b>Remark</b>	R 1 is connected directly to the multicast source.
<b>s</b>	R 2 serves as the RP.
	R 2 is connected directly to Receiver A.

	R 2 is connected directly to Receiver B.
--	--

### Deployment

- Run the OSPF protocol to realize unicast routing.
- Run PIM-SM to realize multicast routing.
- Run the source-specific multicast (SSM) of PIM-SM within the domain.
- Run IGMPv3 in the network segment of the user host to manage group members.

## 6.2.3 Enabling PIM-SM in a Hot Backup Environment

### Scenario

In a hot backup environment, run PIM-SM. A device performs hot backup switching to ensure that traffic is not interrupted.

Figure 6-3

<b>Remark</b>	R1 is connected to the video server, R2 is directly connected to the receiver, and R2 runs in hot backup mode.
<b>s</b>	A Layer-3 multicast protocol runs on R1 and R2.

### Deployment

- Run OSPF on R1 and R2 to implement unicast routing.
- Run PIM-SM on R1 and R2 to implement multicast routing.
- Make R2 run in two-node cluster hot backup mode.

<b>Remarks</b>	R2 may perform hot backup switching in the hot backup environment. In this case, the query interval of PIM Hello packets needs to be adjusted on R2 because the keepalive timer of the neighbor in PIM Hello packets of R1 may have expired. The multicast function relies on the unicast function currently, and the multicast function starts convergence after the unicast function convergence is complete. For example, the default graceful restart (GR) convergence time of the unicast function is 120 seconds. It is recommended that the query interval of PIM Hello packets be set to 60 seconds. The keepalive time of the neighbor in PIM Hello packets is 210 seconds. In this scenario, the query interval of PIM Hello packets need to be set with a reference to the GR convergence time of the unicast function and the value of 3.5 times the query interval of PIM Hello packets must be larger than the GR convergence time of the unicast function. In addition, if the convergence time of the unicast function is long, the transmission interval of PIM Join/Prune packets also need to be adjusted, because the keepalive time of PIM Join/Prune packets is 3.5 times the transmission interval of PIM Join/Prune packets. The default keepalive time of PIM Join/Prune packets is 210 seconds. If R2 is configured as a dynamic RP, the interval for a candidate RP (C-RP) to transmit C-RP notifications also needs to be adjusted. The default transmission interval is 60 seconds and the keepalive time is 2.5 times the transmission interval of C-RP notifications. For example, if the convergence time of the unicast function is longer than 150 seconds, the transmission interval of C-RP notifications needs to be adjusted. In a hot backup environment, it is recommended that the query interval of PIM Hello packets be larger than the default value (30 seconds). Otherwise, the keepalive timer of the neighbor in PIM Hello packets of the peer end times out during hot backup switching.
----------------	---

## 6.3 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

A router running PIM is called a PIM router. An interfaces running PIM is called a PIM interface.

Multicast packets are forwarded on PIM routers. The PIM interfaces where multicast packets are received are called upstream interfaces, and the PIM interfaces where multicast packets are sent are called downstream interfaces.

The network segments where upstream interfaces are located are called upstream network segments, and the network segments where downstream interfaces are located are called downstream network segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces to form a PIM network.

On some PIM interfaces, borders can be set to divide a large PIM network into multiple PIM domains. The borders can reject the passage of specific multicast packets or limit the transmission of PIM packets.

#### ↘ Multicast Distribution Tree, DR, and RP

Multicast packets are transmitted from one point to multiple points, forming a tree-shaped forwarding path. Such forwarding path is called the multicast distribution tree (MDT), which includes the following two types:

- RP Tree (RPT): It is rooted at an RP, and uses the designated router (DR) of the member groups connected to it as its leaves.
- Shortest path tree (SPT): It is rooted at a DR that is connected to the multicast source, and uses the RP or the DR of the member groups connected to it as its leaves.

Both the DR and RP are the functions of a PIM router.

- An RP collects the information of a multicast source or multicast member on the network.
- The DR connected to the multicast source advertises the multicast source information to the RP; the DR connected to multicast group members advertises the information of multicast group members to the RP.

↘ (\*, G), (S, G)

- (\*, G): Indicates the packets sent from any source to a group (G), the corresponding route entries, and the RPT.
- (S, G): Indicates the packets sent from the source (S) to a group (G), the corresponding routing entries, and the SPT.

↘ ASM, SSM

PIM-SM supports both any-source multicast (ASM) and SSM, and it is applicable to different multicast group address segments.

- ASM: In this model, a user is not allowed to select a multicast source. The user host joins a group, and receives the packets sent from all sources.
- SSM: In this model, a user can select a multicast source. The user host joins a group and specifies the source address. Then only the packets sent from this source address is received.

**i** Requirements for using an SSM model: Before selecting a multicast source, you need to learn the address of the multicast source using other network services.

**Overview**

Feature	Description
<a href="#">PIM-SM Neighbor</a>	Establishes neighbor relationships between RIM routers to form a PIM network.
<a href="#">DR Election</a>	In the network segment where group member hosts are located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the group members. In the network segment where the multicast source is located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the multicast source.
<a href="#">BSR Mechanism</a>	On a PIM network, the BSR generates periodic candidate RPs and bootstrap packets of corresponding group addresses.
<a href="#">RP Mechanism</a>	On a PIM network, through static RP configuration or dynamic RP election, the location of the RP can be learned by each PIM router.
<a href="#">Register Information of the Multicast Source</a>	When the multicast source is detected on the network, the source DR sends a register packet to the RP, which obtains the source information and multicast packet.

Feature	Description
<a href="#">Creating an RPT</a>	When a group member is detected on the network, the DR connecting to the group members send packets toward the RP to form an RPT. If the multicast source already exists on the network, the packets arrived at the RP can be sent to the group members along the RPT.
<a href="#">Creating an SPT</a>	When data packets arrive at the DR connecting to group members, the DR sends these packets toward the multicast source to form an SPT, and multicast packets are sent to group members along the SPT.
<a href="#">ASM and SSM</a>	A PIM router can provide multicast services of both ASM model and SSM model at the same time. SSM model applies to the groups whose addresses are within the range of the SSM addresses. For other groups, use ASM model.

### 6.3.1 PIM-SM Neighbor

Neighbor relationships are established between PIM routers to form a PIM network. Neighbor relationships must be established between PIM routers before PIM control packets can be exchanged or multicast packets can be forwarded.

#### Working Principle

A PIM interface sends a Hello packet. For the IPv4 multicast packet whose Hello packet is encapsulated, the destination address is 224.0.0.13 (indicating all PIM routers in the same network segment), the source address is the IP address of the PIM interface, and the Time To Live (TTL) value is 1. For the IPv6 multicast packet whose Hello packet is encapsulated, the destination address is ff02::d.

A Hello packet is used to discover neighbors, coordinate protocol parameters, and maintain neighbor relationships.

#### Discovering Neighbors

PIM routers in the same network segment receive multicast packets from the destination address 224.0.0.13. In this way, the PIM routers obtain neighbor information and establish neighbor relationships.

When a PIM interface is enabled or detects a new neighbor, a triggered-hello-delay packet is used to generate a random time. Within the time, the interface sends Hello packets.

#### Coordinating Protocol Parameters

A Hello packet includes multiple protocol parameters, which are described as follows:

- DR\_Priority: indicates the priority of a router interface for competing for the DR. A higher priority means a higher chance of winning.
- Holdtime: Indicates the time in which a neighbor is held in the reachable state
- LAN\_Delay: Indicates the LAN delay for transmitting a Prune packet in a shared network segment.
- Override-Interval: Indicates the prune override time carried in a Hello packet.

When a PIM router receives a Prune packet from an upstream interface, it indicates that downstream interfaces exist in the shared network segment. If the PIM router still needs to receive multicast data, the PIM router must sent a Prune Override packet to the upstream interface within the override interval.

$\text{LAN\_Delay} + \text{Override Interval} = \text{PPT}$  (Prune-Pending Timer). After a PIM router receives a Prune packet from a downstream interface, the PIM router will not immediately perform pruning until PPT times out. Within the time of PPT, if the PIM router receives a Prune rejection packet from the downstream interface, the PIM router cancels pruning.

### ↳ Maintaining Neighbor Relationships

A Hello packet is sent periodically between PIM routers. If a Hello packet is not received from a PIM neighbor within Holdtime, the neighbor is considered unreachable and is deleted from the neighbor list. Any change of PIM neighbors will cause change of the multicast topology in the network. If an upstream or downstream neighbor in an MDT is unreachable, multicast routes converge again and the MDT is reshaped.

## Related Configuration

### ↳ Enabling PIM-SM on an Interface

By default, PIM-SM is disabled on an interface.

Run **ip pim sparse-mode** to enable or disable PIM-SM on an interface.

PIM-SM must be enabled on an interface to involve the interface in the PIM protocol. If PIM-SM is not enabled for the interface of a DR, static RP, candidate RP (C-RP), or candidate BSR (C-BSR), corresponding roles of the PIM protocol cannot be run.

### ↳ Setting the Interval of Hello Packets on an Interface

By default, a Hello packet is sent every 30s.

Run **ip pim query-interval** *interval-seconds* to adjust the interval of Hello packets. The value ranges from 1 to 65, 535.

A Hello packet is transmitted less frequently when the value of *interval-seconds* is greater.

## 6.3.2 DR Election

In the network segment where group member hosts are located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the group members.

In the network segment where the multicast source is located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the multicast source.

The DR sends Join/Prune packets toward the MDT, or sends the multicast source data to the MDT.

## Working Principle

When creating a PIM neighbor, you can send a Hello packet to obtain the IP address and DR priority of the neighbor to elect a DR.

Two parameters play a key role in winning the DR election: the DR priority of an interface and the IP address of the interface.

### ↳ DR Priority of an Interface

During the DR election, the RIM router with the highest DR priority will be elected as the DR.

### ↳ Interface IP Address

During the DR election, if the priority of interfaces is the same, then interface IP addresses will be compared. The interface with the maximum IP address will be elected as the DR.

## Related Configuration

### ↳ Enabling PIM-SM on an Interface

By default, PIM-SM is disabled on an interface.

Run **ip pim sparse-mode** to enable or disable PIM-SM on an interface.

PIM-SM must be enabled on an interface to involve the interface in the PIM protocol. If PIM-SM is not enabled for the interface of a DR, static RP, C-RP, or C-BSR, corresponding protocols cannot be run.

### ↳ Adjusting the DR Priority of an Interface

By default, the DR priority is 1.

Run **ip pim dr-priority** *priority-value* to adjust the DR priority of the interface. The value ranges from 0 to 4,294,967,294.

The DR priority is used in the DR election in the network segment directly connected the interface. A greater value indicates a higher priority.

## 6.3.3 BSR Mechanism

On a PIM network, the BSR generates periodic candidate RPs and bootstrap packets of corresponding group addresses. These bootstrap packets are sent hop by hop in the domain. All the routers on the entire network will receive these bootstrap packets, and record these candidate RPs and their corresponding group addresses.

## Working Principle

One or multiple candidate BSRs are configured in a PIM-SM domain. You need to apply a certain algorithm to select the BSR from these candidate BSRs.

## Related Configuration

### ↳ Configuring Candidate BSRs

By default, candidate BSRs are not configured.

Run **ip pim bsr-candidate** *interface-type interface-number* [ *hash-mask-length* [ *priority-value* ] ] to configure or cancel the configuration of candidate BSRs.

Through bootstrap packet (BSM) learning and competition of candidate BSRs, a unique BSR is generated for the PIM-SM domain.

### ↳ Configuring BSR Borders

By default, BSR borders are not configured.

Run **ip pim bsr-border** to configure or cancel the configuration of BSR borders.

After this command is configured, BSMs received by the interface will be discarded and will not be forwarded by this interface, preventing BSM flooding.

#### ↘ Filtering BSMs

By default, BSMs from the BSR are not filtered.

Run **ip pim accept-bsr list** { <1-99> | <1300-1999> | *WORD* } to configure whether to filter BSMs.

If this function is enabled, only legible BSMs are received by the interface; if this function is disabled, all the external BSMs will be received by the device running PIM-SM.

#### ↘ Configuring Legible C-RP Addresses and the Multicast Groups They Serve for a Candidate BSR

By default, Candidate-RP-Advertisement (C-RP-Adv) packets are not filtered by a candidate BSR.

Run **ip pim accept-crp list** { <100-199> | <2000-2699> | *WORD* } to configure whether to filter C-RP-Adv packets.

If this function is enabled, C-RP addresses and corresponding multicast groups are filtered by a candidate BSR. If this function is disabled, all external C-RP-Adv packets are received by a candidate BSR.

#### ↘ Allowing a C-BSR to Receive a C-RP-ADV Packet Whose Prefix-Count Is 0

By default, a candidate BSR cannot receive a C-RP-ADV packet whose prefix-count is 0.

Run **ip pim accept-crp-with-null-group** to configure whether to receive a C-RP-ADV packet whose prefix-count is 0.

If this function is enabled, a C-RP-ADV packet whose prefix-count is 0 can be received by a candidate BSR. If this function is disabled, a C-RP-ADV packet whose prefix-count is 0 cannot be received by a candidate BSR.

## 6.3.4 RP Mechanism

On a PIM network, through static RP configuration or dynamic RP election, the location of the RP can be learned by each PIM router. The RP as the root of the RPT, is the point where the RPT is rooted at and RPT data traffic is forwarded from.

### Working Principle

All PIM routers in the same PIM domain must be mapped to the same RP as a specific multicast group address. On a PIM network, an RP can be configured as static or dynamic.

#### ↘ Static RP

In static RP configuration, RP addresses are configured directly on PIM routers and these addresses are learnt by the entire PIM network.

#### ↘ Dynamic RP

In a PIM-SM domain, there are candidate RPs that send unicast packets (including RP addresses and the multicast groups they serve) to the BSR, which generates periodic candidate RPs and bootstrap packets of corresponding group addresses. These bootstrap packets are sent hop by hop in the domain, and received and saved by PIM routers, which apply a hash

function to map the group addresses to the candidate RP that can provide services. Then the RP corresponds to these multicast group addresses can be confirmed.

## Related Configuration

### ▾ Configuring Static RP Addresses

By default, no RP address is configured.

Run **ip pim rp-address** *rp-address* [ *access-list* ] to configure a static RP address for a PIM router.

To use static RP addresses, the static RP address of all routers in the PIM-SM domain must be the same, so that the PIM SM multicast routing remains consistent.

### ▾ Configuring Candidate C-RP Addresses

By default, no C-RP address is configured.

Run **ip pim rp-candidate** *interface-type interface-number* [ **priority** *priority-value* ] [ **interval** *interval-seconds* ] [ **group-list** *access-list* ] to configure or cancel a PIM router as a candidate C-RP.

After a candidate RP is configured, it can send periodic C-RP-Adv packets to the BSR, and the information carried by these C-RP-Adv packets will be advertised to all PIM-SMs in the domain, ensuring the uniqueness of RP mapping.

### ▾ Ignoring the RP Priority in RP-Set

By default, C-RP of the highest priority is configured.

Run **ip pim ignore-rp-set-priority** to select or deselect the RP priority when selecting the corresponding RP of a multicast group.

If you want to select an RP from multiples RPs that serve the same multicast group address, you can run this command to ignore the RP priority. If this command is not configured, RP priority will be considered when two RPs are compared.

## 6.3.5 Register Information of the Multicast Source

When the multicast source is detected on the network, the source DR sends a register packet to the RP, which obtains the source information and multicast packet.

### Working Principle

When a source DR receives a multicast packet from the host directly connected to it, the source DR encapsulates the multicast packet into the register packet, and sends the unicast packet to RP to form an (S, G) entry.

If the RP has an outgoing interface for the forwarding entry, it encapsulates the data packet and forwards the packet to the outgoing interface.

If the RP does not have the forwarding entry of the present group, it generates the (S, G) entry and enables the timer. If the timer times out, the RP sends a Register-Stop packet to the DR to delete the entry. The source DR sends an inspection packet before timeout after it receives the Register-Stop packet.

If no Register-Stop packet is received by the DR, the DR on the timeout data source will encapsulate the multicast data in the register packet and send the unicast packet to the RP.

If a Register-Stop packet is received by the DR, time-delay will be performed once again, and an inspection packet will be sent before time delay.

## Related Configuration

### ↘ Detecting the Reachability of a Register Packet

By default, the reachability of an RP is not detected.

Run **ip pim register-rp-reachability** to configure or cancel the detection of the reachability of an RP.

You can enable this function if you want to detect whether an RP is reachable for a register packet sent from a DR. After this function is enabled, the DR will detect the reachability of a register packet before it is sent to an RP, namely, the DR will check whether a route to the RP exists in the unicast routing entry and static multicast routing entry. If the route does not exist, the register packet will not be sent.

### ↘ Configuring an RP to Filter the Addresses of Register Packets

By default, all register packets are received an RP.

Run **ip pim accept-register { list *access-list* [route-map *map-name* ] | route-map *map-name* [list *access-list* ] }** to configure an RP to filter or cancel the filtering of the source addresses of received register packets.

You can run this command if you want to filter the source addresses of received register packets. If this function is not enabled, all register packets will be received by the RP. If this function is disabled, only the register packets whose source addresses and multicast group addresses included in access control lists (ACLs) are processed; otherwise, the packets will be filtered.

### ↘ Limiting the Speed for Sending a Register Packet

By default, the speed for sending a register packet is not limited.

Run **ip pim register-rate-limit *rate*** to limit or cancel the limitation of the speed for sending a register packet.

If the **no** form of this command is configured, the speed is not limited. This command takes effect for only the register packet of each (S, G) packet, but not all the register packets in the entire system.

### ↘ Calculating the Checksum of the Entire Register Packet Length

By default, the checksum of a register packet is calculated as stipulated by the protocol.

Run **ip pim register-checksum-wholepkt [ group-list *access-list* ]** to configure the checksum of the register packet length.

You can enable this function if you want to include the length of encapsulated multicast packets into the checksum of the register packet length. If this function is disabled, the checksum of a register packet is calculated as stipulated by the protocol.

### ↘ Configuring an RP to Forward Multicast Data Packets to Downstream Interfaces After Decapsulating Register Packets

By default, register packets are not decapsulated and multicast packet are not forwarded to interfaces.

Run **ip pim register-decapsulate-forward** to forward or cancel the forwarding of data packets to downstream interfaces.

You can run this command if you want to decapsulate a register packet and forward the multicast packet. If this function is disabled, the multicast packet will not be forwarded.

#### ↘ **Configuring the Source IP Address of a Register Packet**

By default, the source IP address of a register packet is the same as the interface address of the DR connected to the multicast source.

Run **ip pim register-source** { *local\_address* | *Interface-type interface-number* } to configure the source IP address.

You can run this command if you want to configure the source IP address of the register packet sent by a DR. If this function is disabled or the **no** form of this command is used, the source address of the register packet will be the same as the interface address of the DR connected to the multicast source. If you want to configure *local\_address*, the configured address must be reachable for a unicast route. *Interface-type interface-number* can be a typical a loopback interface or an interface of other types. The interface address must have been advertised by a unicast route.

#### ↘ **Configuring the Suppression Time of a Register Packet**

By default, the suppression time of a register packet is 60s.

Run **ip pim register-suppression** *seconds* to configure the suppression time.

If you run this command on a DR, you can change the suppression time of the register packets sent from the DR. If you run this command but does not run **ip pim rp-register-kat** on an RP, the keepalive period of the RP will be changed.

#### ↘ **Configuring the Inspection Time of a Null Register Packet**

By default, the inspection time is 5s.

Run **ip pim probe-interval** *interval-seconds* to configure the inspection time.

In the time interval before the timeout of register packet suppression, the source DR can send a null register packet to an RP. This time interval is called the inspection time, which is 5s by default.

#### ↘ **Configuring the Time of a RP KAT**

By default, the default value of a keepalive timer (KAT) is used. The default value is calculated as follows: Suppression time of a register packet x 3 + Inspection time of a null register packet.

Run **ip pim rp-register-kat** *seconds* to configure the KAT time.

You can run this command if you want to configure the keepalive time of (S, G) of a register packet sent from an RP.

### 6.3.6 Creating an RPT

When a group member is detected on the network, the DR connecting to the group members send packets toward the RP to form an RPT. If the multicast source already exists on the network, the packets arrived at the RP can be sent to the group members along the RPT.

## Working Principle

To create an RPT, perform the following steps:

A receiver DR receives an IGMP (\*, G) include report packet from the receiving end.

If the DR is not the RP of this group (G), the DR will send a (\*, G) Join packet toward the RP. The router receiving this (\*, G) Join packet will send the packet hop by hop until it is received by the RP, which means that the RP has joined the RPT.

When the data source host sends the multicast data to a group, the source data is encapsulated in the register packet, and sent from the source DR to the RP in unicast mode. Then the RP decapsulates the register packet, takes the data packets out, and forwards these packets to each group member along the RPT.

The RP sends the (S, G) Join packets along the data source to join the SPT of this source.

After the SPT between the RPs to the source DR is created, the data packets from the data source will be sent decapsulated to the RPs along the SPT.

When the first multicast data packet arrives at an RP along the SPT, the RP sends a Register-Stop packet to the source DR to stop sending a register packet. After the source DR receives the Register-Stop packet, it stops encapsulating a register packet and sends the packet along the SPT to the RP, which will forwards the packet to each group member.

## Related Configuration

### ▾ Configuring the Interval for Sending a Join/Prune Packet

By default, the interval for sending a Join/Prune packet is 60s.

Run **ip pim jp-timer *seconds*** to configure the interval for sending a Join/Prune packet.

You can run this command to configure the interval for sending a Join/Prune packet. If not configured, the value will be a default 60s.

## 6.3.7 Creating an SPT

When data packets arrive at the DR connecting to group members, the DR sends these packets toward the multicast source to form an SPT, and multicast packets are sent to group members along the SPT. In this way, the burden on RP in the RPT is reduced, and the source DR will arrive at the receiver DR with less hops.

## Working Principle

To create an SPT, perform the following steps:

The receiver DR sends (\*, G) Join packets toward the source DR along the SPT, and (\*, G) Join packets are then send hop by hop until they are received by the source DR, forming an SPT.

## Related Configuration

By default, SPT switchover is not enabled.

Run **ip pim spt-threshold [ *group-list access-list* ]** to configure whether to switch to an SPT.

If this function is enabled, upon the reception of the first (S, G) packet, a PIM Join packet is triggered, and an SPT is created. If **group-list** is specified, all the specified groups will be switched to the SPT. If the **no** form of this command is used and **group-list** is not specified, an RPT will not be switched to an SPT, and the DR will remain in the RPT and send a Prune packet toward the source DR; if the **no** form of this command is used and **group-list** is specified, and that the ACLs have been configured, it means that the association between **group-list** and the ACLs is canceled, and all the groups are allowed to switch from an RPT to an SPT.

### 6.3.8 ASM and SSM

A PIM router can provide multicast services of both ASM model and SSM model at the same time. SSM model applies to the groups whose addresses are within the range of the SSM addresses. For other groups, use ASM model. In an ASM model, only the multicast group (G) is specified for a multicast receiver, and the multicast source (S) is not specified. In an SSM model, both the multicast source (S) and multicast group (G) can be specified for a multicast receiver.

#### Working Principle

**!** To realize SSM in an IPv4 router, IGMPv3 needs to be applied for managing membership between the host and devices, and PIM-SM needs to be applied to connect to devices.

In an SSM model, as a multicast receiver has learnt the (S, G) of the multicast source through a certain channel (for example, by visiting the server or receiving an advertisement), when a multicast receiver needs to request a multicast service, the multicast receiver can send the IGMP (S, G) Join packet toward the router of last hop. For example, as shown in Figure 6-4, the multicast receiver 1 sends the IGMP (S, G) Join packet to request the multicast service (S, G). After the router of last hop receives the IGMP (S, G) Join packet, it sends the PIM (S, G) Join packet to the multicast source hop by hop. As shown in Figure 6-4, when R 1 receives the IGMP (S, G) Join packet sent from multicast Receiver 1, R 1 sends the PIM (S, G) Join packet to R 3, which then sends the packet to R 4, thereby forming an SPT connecting the multicast receiver and multicast source.

Figure 6-4 SSM Model

To create an SSM model, the following requirements need to be met:

- A multicast receiver needs to learn the (S, G) of the multicast source in advance, and an IGMP (S, G) Join packet needs to be sent if the receiver needs to request a multicast service.
- IGMPv3 must be run on the interface of the last hop router connecting to the multicast receiver. IGMPv1 and IGMPv2 does not support SSM.
- PIM-SM and SSM must be run on the devices connecting the multicast receiver and multicast source.

 The default range of SSM groups is 232/8. You can run a command to change the value.

An SSM has the following features:

- A multicast receiver can learn the information of the multicast source through a certain channel (for example, by visiting the server or receiving an advertisement) in advance.
- An SSM model is a specific subnet of PIM-SM. It handles only the PIM (S, G) Join and PIM (S, G) Prune packets and discards the RPT-related packets, for example, PIM (\*, G) Join/Prune packets, that are within the scope the SSM. If the SSM detects a register packet within the scope, it will respond immediately with a Register-Stop packet.
- If an RP is not required, the election and distribution of RP information are not performed. The MDTs in an SSM are all SPTs.

### Related Configuration

ASM is enabled by default.

Run `ip pim ssm { default | range access-list }` to configure whether to switch to SSM.

In SSM, multicast packets can be received by the multicast source directly but not along the RP tree.

## 6.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic PIM-SM Functions</a>	 (Mandatory) It is used to configure the multicast service.	
	<code>ip multicast-routing</code>	Enables IPv4 multicast routing.
	<code>ip pim sparse-mode</code>	Enables PIM-SM.
	<code>ip pim rp-address</code>	Configures a static RP.
	<code>ip pim rp-candidate</code>	Configures a C-RP.
	<code>ip pim bsr-candidate</code>	Configures a C-BSR.
<a href="#">Configuring PIM-SM Neighbors</a>	 (Optional) It is used to configure the parameters for sending and receiving the Hello packets between neighbors.	
	<code>ip pim query-interval interval-seconds</code>	Configures the interval for sending Hello packets.
	<code>ip pim propagation-delay milliseconds</code>	Configures the prune propagation delay.

Configuration	Description and Command	
	<b>ip pim override-interval</b> <i>milliseconds</i>	Configures the prune override interval.
	<b>ip pim neighbor-tracking</b>	Enables the suppression capability of an interface for sending Join packets.
	<b>ip pim triggered-hello-delay</b> <i>interval-seconds</i>	Configures the delay for sending Hello packets.
	<b>ip pim dr-priority</b> <i>priority-value</i>	Configures the DR priority of a Hello packet.
	<b>ip pim neighbor-filter</b> <i>access_list</i>	Configures neighbor filtering.
<a href="#">Configuring BSR Parameters</a>	 (Optional) It is used to configure a BSR.	
	<b>ip pim bsr-border</b>	Configures BSR borders.
	<b>ip pim accept-bsr list</b> { <1-99>   <1300-1999>   <i>WORD</i> }	Configures BSM packets limit on a PIM router.
	<b>ip pim accept-crp list</b> <i>access-list</i>	Configures a C-BSR to inspect the address range of a C-PR.
<a href="#">Configuring RP and DR Parameters</a>	 (Optional) It is used to configure the parameters of an RP or a DR.	
	<b>ip pim ignore-rp-set-priority</b>	Ignores the C-RP priority.
	<b>ip pim register-rp-reachability</b>	Enables the source DR to detect the RP reachability.
	<b>ip pim accept-register list</b> <i>access-list</i>	Configures the range of source register (S, G) addresses.
	<b>ip pim register-rate-limit</b> <i>rate</i>	Limits the speed for sending register packets.
	<b>ip pim register-checksum-wholepkt</b> [ <b>group-list</b> <i>access-list</i> ]	Calculates the checksum of the entire register packet.
	<b>ip pim register-decapsulate-forward</b>	Enables an RP to decapsulate a register packet and forwards the multicast packet to interfaces.
	<b>ip pim register-source</b> { <i>local_address</i>   <i>Interface-type interface-number</i> }	Configures the source IP address of a register packet.
	<b>ip pim register-suppression</b> <i>seconds</i>	Configures the suppression time of a register packet.
	<b>ip pim probe-interval</b> <i>seconds</i>	Configures the inspection time of a null register packet.
<b>ip pim rp-register-kat</b> <i>seconds</i>	Configures the interval of KATs on an RP.	
<a href="#">Configuring the Interval for Sending a Join/Prune Packet</a>	 (Optional) It is used to specify the interval for sending a Join/Prune packet.	
	<b>ip pim jp-timer</b> <i>seconds</i>	Configures the interval for sending a Join/Prune packet.

Configuration	Description and Command
<a href="#">Configuring the Router of Last Hop to Switch from an RPT to SPT</a>	 (Optional) It is used to switch from SPT to RPT.
	<pre>ip pim spt-threshold [ group-list access-list ]</pre> <p>Enables SPT switchover.</p>

## 6.4.1 Configuring Basic PIM-SM Functions

### Configuration Effect

- Create a PIM-SM network and provide data sources and user terminals on the network with the IPv4 multicast service.
- Any of ASM or SSM or both models can be configured.

### Notes

- PIM-SM needs to use existing unicast routes on the network. Therefore, IPv4 unicast routes must be configured on the network.
- If the PIM network needs to support SSM multicast services, IGMPv3 or SSM mapping must be configured.

### Configuration Steps

#### ▾ Enabling IPv4 Multicast Routing

- Mandatory.
- If not specified, IPv4 multicast routing must be enabled on each router.

#### ▾ Enabling PIM-SM

- Mandatory.
- If not specified, PIM-SM must be enabled on the following interfaces: interconnecting router interfaces, interfaces of static RPs, C-RPs, and C-BSRs, and the interfaces connecting to the multicast source and user hosts.

#### ▾ Configuring an RP

- An RP must be configured if ASM multicast services need to be provided on a PIM network.
- An RP can be configured in three models: configuring only a static RP, configuring only a dynamic RP, and configuring both a static RP and dynamic RP. If both a static RP and dynamic RP are configured, the dynamic RP takes precedence over the static RP.
- Configuring a static RP: If not specified, a static RP should be configured on each router.
- Configuring a dynamic RP: If not specified, a C-RP and C-BSR should be configured on one or multiple routers.

#### ▾ Enabling SSM

- SSM must be enabled if SSM multicast services need to be provided on a PIM network.
- If not specified, SSM must be enabled on every router.

## Verification

Send multicast packets from the multicast source to the groups within the address range of ASM and SSM, and join user hosts to these groups.

- Check whether the user hosts can successfully receive packets from each group.
- Check whether PIM-SM routing entries are created on routers correctly.

## Related Commands

### ▾ Enabling IPv4 Multicast Routing

<b>Command</b>	<b>ip multicast-routing</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling PIM-SM

<b>Command</b>	<b>ip pim sparse-mode</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	PIM interfaces must be at Layer-3, including: routing interfaces, aggregate ports (APs), switch virtual interfaces (SVIs), and loopback interfaces. For all PIM interfaces, IPv4 unicast routes should be reachable.

### ▾ Configuring a Static RP

<b>Command</b>	<b>ip pim rp-address</b> <i>rp-address</i> [ <i>access_list</i> ]
<b>Parameter</b>	<i>rp-address</i> : Indicates the address of an RP.
<b>Description</b>	<i>access_list</i> : Specifies the range of multicast group addresses served by a static RP using an ACL. By default, an RP services all groups.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to locate a static RP. A static RP should be one with good routing performance. It is recommended that the address of the loopback interface be used as the static RP address. The static RP of all routers must be the same (including the RP address and the range of multicast group addresses it serves). It is recommended that the address of the loopback interface be used as the static RP address.

The load can be shared if you configure multiple static RPs to serve different multicast group addresses. It is recommended that the address of the loopback interface be used as the static RP address.

### ↘ Configuring a C-RP

<b>Command</b>	<b>ip pim rp-candidate</b> <i>interface-type interface-number</i> [ <b>priority</b> <i>priority-value</i> ] [ <b>interval</b> <i>seconds</i> ] [ <b>group-list</b> <i>access_list</i> ]
<b>Parameter Description</b>	<p><i>interface-type interface-number</i>: Uses the address of this interface as the address of the C-RP.</p> <p><b>priority</b> <i>priority-value</i>: Competes for the RP priority. A greater value indicates a higher priority. The value ranges from 0 to 255 (192 by default).</p> <p><b>interval</b> <i>seconds</i>: Indicates the interval for sending a C-RP packet to a BSR. The value ranges from 1 to 16,383 (60 by default).</p> <p><b>group-list</b> <i>access_list</i>: Specifies the range of multicast group addresses served by a C-RP using an ACL. By default, a C-RP services all multicast groups.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to configure a router as a C-RP.</p> <p>A C-RP should be one with good routing performance. A C-RP and C-BSR can be on the same router or different routers.</p> <p>It is recommended that the address of the loopback interface be used as the C-RP address.</p> <p>If multiple C-RPs serve the same group, redundancy can be realized.</p> <p>If multiple C-RPs serve the different groups, load can be shared.</p>

### ↘ Configuring a C-BSR

<b>Command</b>	<b>ip pim bsr-candidate</b> <i>interface-type interface-number</i> [ <i>hash-mask-length</i> [ <i>priority-value</i> ] ]
<b>Parameter Description</b>	<p><i>interface-type interface-number</i>: Uses the address of this interface as the address of the C-BSR.</p> <p><i>hash-mask-length</i>: Indicates the length of hash mask used to competing for the RP. The value ranges from 0 to 32 (10 by default).</p> <p><i>priority-value</i>: Indicates the priority for competing for the BSR. A greater value indicates a higher priority. The value ranges from 0 to 255 (64 by default).</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to configure a router as a C-BSR.</p> <p>A C-BSR should be one with good routing performance. A C-RP and C-BSR can be on the same router or different routers.</p> <p>It is recommended that the address of the loopback interface be used as the C-BSR address.</p> <p>Configuring multiple C-BSRs can realize redundancy.</p>

### ↘ Enabling SSM

<b>Command</b>	<b>ip pim ssm</b> { <b>default</b> / <b>range</b> <i>access_list</i> }
----------------	--

<b>Parameter Description</b>	<b>default:</b> Indicates the default range of SSM group addresses, which is 232.0.0.0/8. <b>range <i>access_list</i>:</b> Specifies the range of SSM group addresses using an ACL.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The SSM group addresses configured on all routers must be the same.

▾ **Displaying the PIM-SM Routing Entry**

<b>Command</b>	<b>show ip pim sparse-mode mroute [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>proxy</b> ]</b>
<b>Parameter Description</b>	<b><i>group-or-source-address</i>:</b> Indicates a multicast group address or source address (the two addresses cannot be multicast group addresses or source addresses at the same time). <b>proxy:</b> Indicates the RPF vector carried by an entry.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	Check whether sufficient routing entries are provided. Check the upstream and downstream interface lists and ensure that a correct SPT tree is created.

**Configuration Example**

▾ **Enabling IPv4 Multicast Routing to Support ASM and SSM**

<b>Scenario</b> Figure 6-5	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure a IPv4 unicast routing protocol (such as OSPF) on a router, and the router is reachable for the unicast route of a loopback interface. (Omitted)</li> <li>● Enable IPv4 multicast routing on all the routers.</li> <li>● Enable PIM-SM on all the interconnected interfaces of the routers, Source, and Receiver.</li> <li>● Configure C-RP and C-BSR on the loopback interfaces of Router A and Router B, and enable PIM-SM on the loopback interfaces.</li> <li>● Enable SSM on all routers.</li> <li>● Enable IGMPv3 on the router interfaces connecting to user terminals. ### Common Errors

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- SSM is not enabled on a router or the SSM group address is different from that of the others'.
- PIM-SM is not enabled on an interface (for example, the interface is configured as a C-RP or C-BSR interface, or is used to connecting to the user host or used as an interface of the multicast source).
- IGMPv3 is not enabled on an interface connecting to the used host.
- RP is not configured on the network.
- A static RP is not configured on a router, or the configured static RP is different from that on other routers.
- C-RPs are configured on the network, but C-BSRs are not.
- Static RPs, C-RPs or C-BSRs are unreachable for unicast routes.

## 6.4.2 Configuring PIM-SM Neighbors

### Configuration Effect

- Coordinate protocol parameters and adjust parameters in the Hello packet.
- A RIM router is used to discover neighbors, coordinate protocol parameters, and maintain neighbor relationships.
- Maintain neighbor relationships and filter the neighbors.

### Notes

- Basic PIM-SM functions must be configured.

## Configuration Steps

- Configure parameters on PIM router interfaces. If not specified.

## Verification

Configure the parameters of a Hello packet sent from an interface and run **debug ip pim sparse-mode packet** to display the parameters.

Enable neighbor filtering and run **show ip pim sparse-mode neighbor** to display neighbor information.

## Related Commands

### ▾ Configuring the Interval for Sending Hello Packets

<b>Command</b>	<b>ip pim query-interval</b> <i>interval-seconds</i>
<b>Parameter Description</b>	Indicates the interval for sending Hello packets, Indicates the suppression time of a register packet in the unit of seconds. The value ranges from 1 to 65,535 (30 by default).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Every time when the interval for sending Hello packets is updated, the holdtime value is automatically updated as 3.5 times of the interval. If the result of the interval for sending Hello packets multiplied by 3.5 is greater than 65,535, the holdtime value is forcibly updated as 18,725.

### ▾ Configuring the Prune Propagation Delay

<b>Command</b>	<b>ip pim propagation-delay</b> <i>milliseconds</i>
<b>Parameter Description</b>	<i>milliseconds</i> : The unit is ms. The value ranges from 1 to 32,767 (500 by default).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Once the prune propagation delay or prune override interval is changed, the Join/Prune packet override interval will be changed. As specified by the protocol, the Join/Prune packet override interval must be smaller than the holdtime of a Join/Prune packet; otherwise, short break-up of traffic may be caused. The administrator should maintain such configuration.

### ▾ Configuring the Prune Override Interval

<b>Command</b>	<b>ip pim override-interval</b> <i>milliseconds</i>
<b>Parameter Description</b>	<i>milliseconds</i> : The unit is ms. The value ranges from 1 to 65,535 (2,500 by default).
<b>Command Mode</b>	Interface configuration mode

<b>Usage Guide</b>	<p>Once the prune propagation delay or prune override interval is changed, the Join/Prune packet override interval will be changed.</p> <p>As specified by the protocol, the Join/Prune packet override interval must be smaller than the holdtime of a Join/Prune packet; otherwise, short break-up of traffic may be caused. The administrator should maintain such configuration.</p>
--------------------	--

#### ▾ Enabling Suppression Capability of an Interface for Sending Join Packets

<b>Command</b>	<b>ip pim neighbor-tracking</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Once Join packets suppression of an interface is enabled, when the present router is to send a Join packet to the upstream neighbor, which has sent a Join packet to its own upstream neighbor, the present router will not send the Join packet; if Join packets suppression is disabled, the Join packet will be sent. When Join packets suppression from downstream receivers are disabled, upstream neighbors will learn how many downstream neighbors are there by counting the Join packets it received, which is called neighbor tracking.</p>

#### ▾ Configuring the Delay for Sending Hello Packets

<b>Command</b>	<b>ip pim triggered-hello-delay</b> <i>interval-seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : The unit is second. The value ranges from 1 to 5 (5 by default).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	When a PIM interface is enabled or detects a new neighbor, a triggered-hello-delay packet is used to generate a random time. Within the time, the interface sends Hello packets.

#### ▾ Configuring the DR Priority of a Hello Packet

<b>Command</b>	<b>ip pim dr-priority</b> <i>priority-value</i>
<b>Parameter Description</b>	<i>priority-value</i> : Indicates the priority. A greater value indicates a higher priority. The value ranges from 0 to 4,294,967,294 (1 by default).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>A DR may be selected based on the following principles:</p> <p>If all the Hello packets sent from the routers on a local area network (LAN) are configured with priorities, when selecting a DR, the priorities will be compared, and the router with the highest priority will be selected as the DR. If the priority of all routers is the same, their IP addresses will be compared, and the router with the maximum IP address will be selected as the DR.</p>

	If the priority of the Hello packets sent from a certain router is not configured, the IP addresses of the routers will be compared, and the router with the maximum IP address will be selected as the DR.
--	---

### ▾ Configuring Neighbor Filtering

<b>Command</b>	<b>ip pim neighbor-filter</b> <i>access_list</i>
<b>Parameter Description</b>	<i>access_list</i> : Configures the range of neighbor addresses using a standard IP ACL. The value can be set from 1 to 99 or a string.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Enabling neighbor filtering can enhance the security of the PIM network and limit the range of legible neighbor addresses. Once a neighbor is filtered out, PIM-SM will not establish peering with it or stop the peering with it.

### ▾ Displaying the Neighbor Information of an Interface

<b>Command</b>	<b>show ip pim sparse-mode neighbor</b> [ <b>detail</b> ]
<b>Parameter Description</b>	<b>detail</b> : Displays detailed information.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure the interval for sending Hello packets as 50s.</li> <li>● Configure the prune propagation delay as 400 ms.</li> <li>● Configure the prune override interval as 3,000 ms.</li> <li>● Enable suppression capability of an interface for sending Join packets.</li> <li>● Configure the delay for sending Hello packets as 3s.</li> <li>● Configure the DR priority of a hello packet as 5.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie (config)#int gi 0/1 Ruijie (config-if-GigabitEthernet 0/1)#ip pim query-interval 50 Ruijie (config-if-GigabitEthernet 0/1)#ip pim propagation-delay 400 Ruijie (config-if-GigabitEthernet 0/1)#ip pim override-interval 3000 Ruijie (config-if-GigabitEthernet 0/1)#ip pim triggered-hello-delay 3 Ruijie (config-if-GigabitEthernet 0/1)#ip pim neighbor-tracking</pre>
<b>Verification</b>	Run <b>debug ip pim sparse-mode packet</b> to display the parameters of a Hello packet.

	<pre>Ruijie# debug ip pim sparse-mode packet 00:01:49:43: %7: VRF(0): Hello send to GigabitEthernet 0/1 00:01:49:43: %7: Send Hello packet 00:01:49:43: %7: Holdtime: 175 00:01:49:43: %7: T-bit: on 00:01:49:43: %7: Propagation delay: 400 00:01:49:43: %7: Override interval: 3000 00:01:49:43: %7: DR priority: 5 00:01:49:43: %7: Gen ID: 355154648 00:01:49:43: %7: RPF Vector capable</pre>
<b>Configuration Steps</b>	Configure neighbor filtering and set the allowed address range to 192.168.1.0 to 192.168.1.255.
	<pre>Ruijie# configure terminal Ruijie (config)#int gi 0/1 Ruijie (config-if-GigabitEthernet 0/1)# ip pim neighbor-filter 1 % access-list 1 not exist Ruijie(config)# access-list 1 permit 192.168.1.0 0.0.0.255 Ruijie(config)#</pre>
<b>Verification</b>	Display neighbor information before neighbor filtering is configured.
	<pre>Ruijie# show ip pim sparse-mode neighbor Neighbor          Interface          Uptime/Expires    Ver  DR Address                                     Priority/Mode 192.168.36.89     GigabitEthernet 0/1 01:12:13/00:01:32 v2   1 / P</pre>
	Display neighbor information after neighbor filtering is configured.
	<pre>Ruijie# show ip pim sparse-mode neighbor</pre>

### Common Errors

- Basic PIM-SM functions are not configured or the configuration is not successful.

## 6.4.3 Configuring BSR Parameters

### Configuration Effect

- Configure the address range of BSM packets.

## Notes

---

- Basic PIM-SM functions must be configured.
- C-RPs and C-BSRs must be configured.
- Borders must be configured on the interfaces between domains.

## Configuration Steps

---

### ↘ Configuring Borders

- Borders must be configured if there are multiple domains.
- Borders are configured on the interfaces separating two domains.

### ↘ Configuring BSM Packets Limit on a PIM Router

- Optional.
- If not specified, BSM packets limit can be configured on all PIM routers.

### ↘ Configuring a C-BSR to Inspect the Address Range of a C-PR

- Optional.
- If not specified, C-PR range inspection can be configured on all C-BSRs.

### ↘ Allowing a C-BSR to Receive a C-RP-ADV Packet Whose Prefix-Count Is 0

- Optional.
- If not specified, this function can be configured on all C-BSRs.

## Verification

---

### ↘ Border Inspection

Enable basic PIM-SM functions. Configure two routers to be in different domains, configure Router B as the C-BSR, and Router A to receive BSM packets.

Configure the junction of Router A and Router B as the border so that Router A does not receive BSM packets.

### ↘ Configuring to Inspect BSM Packets Limit on a PIM Router

When basic PIM-SM functions are enabled, and Router B is set as the C-BSR, Router A can receive BSM packets. When the address range of C-BSRs are limited on Router A, BSM packets will not be received by Router A.

### ↘ Configuring a C-BSR to Inspect the Address Range of a C-PR

When basic PIM-SM functions are enabled, Router B is set as the C-BSR, and Router A as the C-RP, if the address range of the C-RPs is limited on C-BSR, Router B will not receive the packets sent from the C-RPs.

## Related Commands

---

### ▾ Configuring BSR Borders

<b>Command</b>	<b>ip pim bsr-border</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To prevent BSM flooding, you can configure a BSR border on an interface, so that the BSM packets arriving at this interface will be discarded but not forwarded.

### ▾ Configuring BSM Packets Limit on a PIM Router

<b>Command</b>	<b>ip pim accept-bsr list { &lt;1-99&gt;   &lt;1300-1999&gt;   WORD }</b>
<b>Parameter Description</b>	<b>list access-list.</b> Configures the range of BSR addresses using a standard IP ACL. The value can be 1 to 99, 1,300 to 1,999, or a string.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this function is enabled, PIM-SM routers receive only the BSM packets sent from legible BSRs.

### ▾ Configuring a C-BSR to Inspect the Address Range of a C-PR

<b>Command</b>	<b>ip pim accept-crp list access-list</b>
<b>Parameter Description</b>	<b>list access-list.</b> Specifies the range of C-RP addresses and the multicast group addresses they serve using an extended IP ACL. The value can be 100 to 199, 2,000 to 2,699, or a string.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command should be configured on a C-BSR. When the C-BSR becomes a BSR, it can set the range of legible C-RP addresses and the range of multicast group addresses they serves.

### ▾ Displaying BSM Packets Information

<b>Command</b>	<b>show ip pim sparse-mode bsr-router</b>
<b>Parameter Description</b>	
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Displaying the Packets of All RPs and the Multicast Group Addresses They Serve

<b>Command</b>	<b>show ip pim sparse-mode [ vrf vid ] rp mapping</b>
<b>Parameter Description</b>	<b>vrf vid.</b> Specifies VRF.

<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### Configuring BSR Borders

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure basic PIM-SM functions. 	<p> After C-RP filtering is configured on a router, only the C-RP packets sent from other routers are filtered, and those sent from the present router are not filtered.</p>

**Common Errors**

- Basic PIM-SM functions are not configured or the configuration is not successful.
- C-BSRs are not configured.
- The BSR border is not configured on the interfaces of different domains.

## 6.4.4 Configuring RP and DR Parameters

### Configuration Effect

- Ignore the C-RP priority and reselect an RP.
- Detect the reachability of an RP for the source DR.
- Configure the range of (S, G) addresses of source register packets, and allow the ASM to serve only the multicast packets within the range.
- Limit the speed of the source DR for sending register packets.
- Configure the checksum of the register packet length.
- Configure an RP to decapsulate register packets and forward the multicast packets to downstream interfaces.
- Configure the source IP address of a register packet.
- Configure the suppression time of a register packet.
- Configure the inspection time of a null register packet.
- Configure the (S, G) lifetime based on the register packet received by an RP.

### Notes

- Basic PIM-SM functions must be configured.

### Configuration Steps

#### ↳ Ignoring the C-RP Priority and Reselecting an RP

- Optional.
- If not specified, the C-RP priority can be disabled on every router.

#### ↳ Detecting the Reachability of an RP for the Source DR

- Optional.
- If not specified, this function can be enabled on the DR connected directly to the data source.

#### ↳ Configuring the Range of Source Register (S, G) Addresses

- Optional.
- If not specified, source register address filtering can be enabled on all C-RPs or static RPs.

#### ↳ Limiting the Speed of the Source DR for Sending Register Packets

- Optional.
- If not specified, this function can be enabled on the source DR.

#### ↘ **Configuring the Checksum of the Register Packet Length**

- Optional.
- If not specified, this function can be enabled on all C-RPs or static RPs.

#### ↘ **Configuring Whether to Forward the Multicast Packet After Decapsulating a Register Packet**

- Optional.
- If not specified, this function can be enabled on all C-RPs or static RPs.

#### ↘ **Configuring the Source IP Address of a Register Packet**

- Optional.
- If not specified, the source IP address of a register packet can be configured on the DR connected directly to the data source.

#### ↘ **Configuring the Suppression Time of a Register Packet**

- Optional.
- If not specified, the suppression time of a register packet can be configured on the DR connected directly to the data source.

#### ↘ **Configuring the Inspection Time of a Null Register Packet**

- Optional.
- If not specified, the inspection time of a null register packet can be configured on the DR connected directly to the data source.

#### ↘ **Configuring the (S, G) Lifetime Based on the Register Packet Received by an RP**

- Optional.
- If not specified, the (S, G) lifetime can be configured on all C-RPs or static RPs.

### **Verification**

---

#### ↘ **Ignoring the C-RP priority**

On Router A, configure the C-RP address as 192.168.8.8, and default priority as 192. On Router B, configure the C-RP address as 192.168.5.5, priority as 200, and C-BSR address as 192.168.6.6.

- Run **show ip pim sparse-mode rp** 233.3.3.3 to display the RPs of the present group.

#### ↘ **Enabling the Source DR to Detect RP Reachability**

On Router A, configure the C-RP address as 192.168.8.8, and default priority as 192. On Router B, configure the C-RP address as 192.168.5.5, priority as 192, and C-BSR address as 192.168.6.6. Enable Router B to detect RP reachability.

- Run **show running-config** to check whether the preceding configurations take effect.

#### ↘ Configuring the Range of Source Register (S, G) Addresses

On Router A, configure the C-RP address as 192.168.8.8, and default priority as 192. On Router B, configure the address of the C-BSR as 192.168.6.6. Configure the source address a 192.168.1.100 and the multicast group address as 233.3.3.3. On Router A, configure the range of allowed source multicast group addresses to 192.168.2.0 to 192.168.2.255.

- Run **show ip pim sparse-mode mroute** to display the (S, G) entry.

#### ↘ Limiting the Speed of the Source DR for Sending Register Packets

Configure the speed of Router B for sending register packets, and run **show ip pim sparse-mode track** to display the number of packets that has been sent.

#### ↘ Configuring the Checksum of the Register Packet Length

On Router A, configure to calculate the checksum of the entire register packet length but not just the packet header. Run **show running-config** to check the configuration.

#### ↘ Forwarding an RP Register Packet After It Is Decapsulated

On Router A, configure to forward a register packet after it is decapsulated. Run **show running-config** to display the configuration.

#### ↘ Configuring the Source IP Address of a Register Packet

Configure the source address of a register packet on Router B, and run **show running-config** to display the configuration.

#### ↘ Configuring the Suppression Time of a Register Packet and the Inspection Time of a Null Register Packet

On Router B, configure the suppression time and inspection time of a register packet, and run **show ip pim sparse-mode track** to display the configuration.

#### ↘ Configuring an RP to Receive Register Packets and the (S, G) Lifetime

On Router A, configuring an RP to receive register packets and the (S, G) lifetime, and run **show ip pim sparse-mode mroute** to display the maximum (S, G) lifetime.

### Related Commands

#### ↘ Ignoring the C-RP priority

<b>Command</b>	<b>ip pim ignore-rp-set-priority</b>
<b>Parameter</b>	N/A
<b>Description</b>	

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Displaying the RP Corresponding to a Group

<b>Command</b>	<b>show ip pim sparse-mode rp-hash</b> <i>group-address</i>
<b>Parameter Description</b>	<i>group-address</i> : Indicates the parsed multicast group address.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling the Source DR to Detect RP Reachability

<b>Command</b>	<b>ip pim register-rp-reachability</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this function is enabled, the source DR will detect the RP reachability before sending a register packet. If the RP is unreachable, the packet will not be sent.

### ▾ Configuring the Range of Source Register (S, G) Addresses

<b>Command</b>	<b>ip pim accept-register</b> { <b>list</b> <i>access-list</i> [ <b>route-map</b> <i>map-name</i> ]   <b>route-map</b> <i>map-name</i> [ <b>list</b> <i>access-list</i> ] }
<b>Parameter Description</b>	<b>list</b> <i>access-list</i> : Configures the range of (S, G) addresses using an extended IP ACL. The value can be 100 to 199, 2,000 to 2699, or a string. <b>route-map</b> <i>map-name</i> : Configures the range of (S, G) addresses using a route map.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is run on a static RP or a C-RP to specify the source address and multicast group address of a register packet.

### ▾ Displaying a Multicast Routing Entry

<b>Command</b>	<b>show ip pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>proxy</b> ]
<b>Parameter Description</b>	<i>group-or-source-address</i> : Indicates a multicast group address or source address (the two addresses cannot be multicast group addresses or source addresses at the same time). <b>Proxy</b> : Indicates the RPF vector carried by an entry.

<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	You can specify either a multicast group address or source address, or both a multicast group address and source address; or you can specify neither a multicast group address nor source address. The two addresses cannot be multicast group addresses or source addresses at the same time.

#### Limiting the Speed of the Source DR for Sending Register Packets

<b>Command</b>	<b>ip pim register-rate-limit</b> <i>rate</i>
<b>Parameter Description</b>	<i>Rate</i> : Indicates the maximum number of register packets that can be sent each second. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command takes effect for only the register packet of each (S, G) packet, but not all the register packets in the entire system. Enabling this command can reduce the burden on the source DR and RPs. Only the packets within the speed limit can be sent.

#### Displaying the Counters of PIM-SM Packets

<b>Command</b>	<b>show ip pim sparse-mode track</b>
<b>Parameter Description</b>	
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	The start time for counting PIM-SM packets is automatically enabled upon system startup. Run <b>clear ip pim sparse-mode track</b> to reset the start time and clear the PIM-SM packet counters.

#### Calculating the Checksum of the Entire Register Packet Length

<b>Command</b>	<b>ip pim register-checksum-wholepkt</b> [ <b>group-list</b> <i>access-list</i> ]
<b>Parameter Description</b>	<b>group-list</b> <i>access-list</i> : Configures the multicast group addresses applicable to this configuration using an ACL. <i>access-list</i> : The value can be set to 1 to 99, and 1300 to 1999. It also supports the naming of the ACL.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	You can enable this function if you want to calculate the length of the entire PIM-SM packet, including that of the multicast packet encapsulated in the register packet, but not just the length of the PIM-SM packet header. If <b>group-list</b> <i>access-list</i> is specified, this configuration takes effect for all multicast group addresses.

#### Enabling an RP to Decapsulate a Register Packet and Forward the Multicast Packet to Interfaces

<b>Command</b>	<b>ip pim register-decapsulate-forward</b>
----------------	--

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is configured on a static RP or a C-RP. It is used to decapsulate a register packet with multicast packet and forward the multicast packet to interfaces. If there are too many register packets to be decapsulated, the CPU will be greatly burdened. In this case, this function is recommended to be disabled.

#### ↘ Configuring the Source IP Address of a Register Packet

<b>Command</b>	<b>ip pim register-source</b> { <i>local_address</i>   <i>Interface-type interface-number</i> }
<b>Parameter Description</b>	<i>local_address</i> : Specifies the source IP address of a register packet. <i>interface-type interface-number</i> : Specifies the IP address of this interface as the source IP address of the register packet.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The specified address must be reachable. When an RP sends a Register-Stop packet, the PIM router corresponds to this address need to respond. Therefore, it is recommended that a loopback address (or other physical addresses) be used. This configuration does not require the enabling of PIM.

#### ↘ Configuring the Suppression Time of a Register Packet

<b>Command</b>	<b>ip pim register-suppression</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the suppression time of a register packet in the unit of seconds. The value ranges from 1 to 65,535 (60 by default).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If you configure this parameter on a DR, the suppression time of a register packet sent from the DR will be changed. If <b>ip pim rp-register-kat</b> is not configured and if you configure this parameter on an RP, the RP keepalive will be changed.

#### ↘ Configuring the Inspection Time of a Null Register Packet

<b>Command</b>	<b>ip pim probe-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the inspection time of a null register packet in the unit of seconds. The value ranges from 1 to 65,535 (5 by default).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The inspection time of a null register packet indicates the period of time for sending a null register packet to an RP before the timeout of suppression time.

	The inspection time cannot exceed half of the suppression time; otherwise, the configuration will not take effect, and a warning message will be displayed. Meanwhile, the result of suppression time multiplied by 3 plus the inspection time cannot exceed 65,535, otherwise, a warning will be displayed.
--	--

↘ **Configuring the Interval of KATs on an RP**

<b>Command</b>	<code>ip pim rp-register-kat seconds</code>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the interval of a KAT in the unit of second. The value ranges from 1 to 65,535 (210 by default).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

↘ **Configuring the RPs of Corresponding Multicast Group Addresses When the C-RP Priority is Considered or Not Considered**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● On Router A, configure the address of the C-RP as 192.168.8.8.</li> <li>● On Router B, configure the address of the C-RP as 192.168.5.5, priority as 200, and the address of the C-BSR as 192.168.6.6.</li> <li>● Display the group corresponding to 233.3.3.3.</li> <li>● Configure to ignore the C-RP priority on Router B.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# ip pim ignore-rp-set-priority</pre>
<b>Verification</b>	Display the information before you configure to ignore the C-RP priority.
	<pre>Ruijie# show ip pim sparse-mode rp-hash 233.3.3.3 RP: 192.168.8.8 Info source: 192.168.8.8, via bootstrap  PIMv2 Hash Value 10(mask 255.192.0.0) RP 192.168.8.8, via bootstrap, priority 192, hash value 1084558102 RP 192.168.5.5, via bootstrap, priority 200, hash value 1094656709</pre>
	Display the information after you configure to ignore the C-RP priority.
	<pre>Ruijie# show ip pim sparse-mode rp-hash 233.3.3.3 RP: 192.168.5.5</pre>

	<pre>Info source: 192.168.6.6, via bootstrap  PIMv2 Hash Value 10(mask 255.192.0.0)  RP 192.168.8.8, via bootstrap, priority 192, hash value 1084558102  RP 192.168.5.5, via bootstrap, priority 200, hash value 1094656709</pre>
--	---

↘ **Configuring to Inspect the Reachability of a Source RP**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure to inspect the reachability of a source RP.</li> </ul>
	<pre>Ruijie(config)# ip pim register-rp-reachability</pre>
<b>Verification</b>	Run <b>show running-config</b> to check whether the following information is displayed.
	<pre>Ruijie(config)#show running-config  ip pim register-rp-reachability</pre>

↘ **Configuring the Range of Source Register (S, G) Addresses**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure source address filtering on Router A. The allowed address range is from 192.168.2.0 to 192.168.2.255.</li> </ul>
	<pre>Ruijie#show ip pim sparse-mode mroute  Ruijie(config)#ip pim accept-register list 101  % access-list 101 not exist  Ruijie(config)#access-list 101 permit ip 192.168.2.0 0.0.0.255 any  Ruijie#show ip pim sparse-mode mroute</pre>
<b>Verification</b>	Before enabling source address filtering, run <b>show ip pim sparse-mode mroute</b> to display the multicast entry, and check whether the (S, G) entry and (S, G, RPT) entry exist.
	<pre>Ruijie#show ip pim sparse-mode mroute  IP Multicast Routing Table  (*,*,RP) Entries: 0  (*,G) Entries: 1  (S,G) Entries: 1  (S,G,rpt) Entries: 1</pre>

**Common Errors**

- Basic PIM-SM functions are not configured or the configuration is not successful.
- The (S, G) of register packets is not configured on a C-RP or static RP, or the configuration is not successful.
- The ACL for limiting the (S, G) of register packets is not configured or the range of (S, G) in this ACL is not correctly configured.
- The range of (S, G) of register packets on each C-RP or static RP is not the same.

**6.4.5 Configuring the Interval for Sending a Join/Prune Packet**

**Configuration Effect**

- Change the interval for sending a Join/Prune packet to form an RPT or SPT.

**Notes**

- Basic PIM-SM functions must be configured.

**Configuration Steps**

- Configure the interval for sending a Join/Prune packet.

**Verification**

On Router B, configure the interval for sending a Join/Prune packet as 120s. Run **show ip pim sparse-mode mroute** to display the lifetime of the entry.

**Related Commands**

↘ **Configuring the Interval for Sending a Join/Prune Packet**

<b>Command</b>	<b>ip pim jp-timer</b> <i>seconds</i>
<b>Parameter</b>	
<b>Description</b>	<i>Seconds</i> : Indicates the interval for sending a Join/Prune packet. The unit is second. The value ranges from 1 to 65,535 (60 by default).

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

**Common Errors**

- Basic PIM-SM functions are not configured or the configuration is not successful.

## 6.4.6 Configuring the Router of Last Hop to Switch from an RPT to SPT

### Configuration Effect

- Switch from an RPT to SPT

### Notes

- Basic PIM-SM functions must be configured.

### Configuration Steps

- Configure the router of last hop to switch from an RPT to SPT.

### Verification

Configure basic PIM-SM functions first. Configure the source DR to send the data traffic (\*, 233.3.3.3), and the receiving end to join group 233.3.3.3 forcibly to form an RPT. Configure the receiver DR to switch from the RPT to SPT forcibly. Run **show running-config** to display the result.

### Related Commands

#### ▾ Enabling SPT switchover

<b>Command</b>	<b>ip pim spt-threshold [ group-list access-list ]</b>
<b>Parameter Description</b>	<b>group-list access-list:</b> Specifies the range of multicast group addresses allowed for SPT switchover using an ACL. <b>access-list:</b> The supported value ranges from 1 to 99 or 1,300 to 1,999. Naming an ACL is also supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If <b>group-list access-list</b> is not specified, all groups are allowed to perform SPT switchover.

## 6.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears multicast routing entries.	<b>clear ip mroute</b> { *   <i>group-address</i> [ <i>source-address</i> ] }
Clears the counters of multicast routes.	<b>clear ip mroute statistics</b> { *   <i>group-address</i> [ <i>source-address</i> ] }
Clears the information about dynamic RPs.	<b>clear ip pim sparse-mode bsr rp-set</b> *
Clears the counters of PIM-SM packets.	<b>clear ip pim sparse-mode track</b>

### Displaying

Description	Command
Displays the details of BSR information.	<b>show ip pim sparse-mode bsr-router</b>
Displays the PIM-SM information of an interface.	<b>show ip pim sparse-mode interface</b> [ <i>interface-type interface-number</i> ] [ <b>detail</b> ]
Displays the local IGMP information about a PIM-SM interface.	<b>show ip pim sparse-mode local-members</b> [ <i>interface-type interface-number</i> ]
Displays the information about a PIM-SM multicast routing entry, and displays the RPF vector of a PIM-SM entry using <b>proxy</b> .	<b>show ip pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>proxy</b> ]
Displays the information about PIM-SM neighbors.	<b>show ip pim sparse-mode neighbor</b> [ <b>detail</b> ]

Description	Command
Displays the information about the next hop of PIM-SM obtained from the NSM.	<b>show ip pim sparse-mode nexthop</b>
Displays the information about the RP corresponding the multicast group address <i>group-address</i> .	<b>show ip pim sparse-mode rp-hash</b> <i>group-address</i>
Displays the information about all the RPs and the groups they serve.	<b>show ip pim sparse-mode rp mapping</b>
Displays the number of PIM-SM packets sent and received since the statistic start time.	<b>show ip pim sparse-mode track</b>

## 7 Configuring PIM-SMv6

### 7.1 Overview

Protocol Independent Multicast (PIM) is a multicast routing protocol.

PIM does not rely on a specific unicast routing protocol. It uses the unicast routing table established by any unicast routing protocol to complete the reverse path forwarding (RPF) check and establish multicast routes. PIM does not need to transmit and receive multicast route updates. Therefore, the overhead of PIM is much lower than that of other multicast routing protocols.

PIM defines two modes: dense mode and sparse mode. Protocol Independent Multicast Sparse Mode (PIM-SM) is applicable to various network environments.

---

**i** PIM-SM running on IPv6 is called PIM-SMv6.

---

#### Protocols and Standards

- RFC4601: Protocol Independent Multicast -Sparse Mode (PIM-SM)
- RFC5059: Bootstrap Router (BSR) Mechanism for Protocol Independent Multicast (PIM)
- RFC3962: Protocol Independent Multicast - Dense Mode protocol
- RFC4607: Source-Specific Multicast for IP

### 7.2 Applications

Application	Description
<a href="#">ASM Implementation by Using PIM-SMv6</a>	A receiver receives packets from any multicast source.
<a href="#">SSM Implementation by Using PIM-SMv6</a>	A receiver selects a multicast source.
<a href="#">Application Example of an Embedded RP</a>	An embedded RP address is configured within the IPv6 multicast group address.

#### 7.2.1 ASM Implementation by Using PIM-SMv6

##### Scenario

The multicast service is provided only in one domain.

As shown in the following figure, receivers receive packets from any multicast source.

Figure 7-1

<b>Remarks</b>	R1 is directly connected to the multicast source. R2 is configured as a rendezvous point (RP). R3 is directly connected to Receiver A. R4 is directly connected to Receiver B.
----------------	---

### Deployment

- Run the Open Shortest Path First for IPv6 (OSPFv6) protocol in the domain to implement unicast routing.
- Run the PIM-SMv6 protocol in the domain to implement multicast routing.
- Run the Internet Group Management Protocol version 6 (IGMPv6) protocol in a user host network segment to implement group member management.

## 7.2.2 SSM Implementation by Using PIM-SMv6

### Scenario

The multicast service is provided only in one domain.

As shown in the following figure, receivers receive packets from a specific multicast source.

Figure 7-2

<b>Remarks</b>	R1 is directly connected to the multicast source. R2 is configured as an RP. R2 is directly connected to Receiver A.
----------------	--

R2 is directly connected to Receiver B.
---

### Deployment

- Run the OSPFv6 protocol in the domain to implement unicast routing.
- Run the PIM-SMv6 protocol in the domain to implement multicast routing.
- Enable the source-specific multicast (SSM) function of the PIM-SMv6 protocol to implement the SSM function.
- Run the Internet Group Management Protocol version 3 (IGMPv3) in a user host network segment to implement group member management.

## 7.2.3 Application Example of an Embedded RP

### Scenario

The multicast service is provided only in one domain.

As shown in the following figure, an RP address is configured for R2 to make the router become an embedded RP.

Figure 7-3

<b>Remark</b>	R1 is directly connected to the multicast source. R2 is configured as an RP. R2 is directly connected to Receiver A. R2 is directly connected to Receiver B. R2 is configured as an embedded RP.
---------------	--

### Deployment

- Run the OSPFv6 protocol in the domain to implement unicast routing.
- Run the PIM-SMv6 protocol in the domain to implement multicast routing.
- Enable the SSM function of the PIM-SMv6 protocol to implement the SSM function.
- Run the IGMPv3 protocol in a user host network segment to implement group member management.
- Configure the RP address and embedded RP on R2.

## 7.2.4 PIM-SMv6 Application in a Hot Backup Environment

### Scenario

In a hot backup environment, run PIM-SMv6. A device performs hot backup switching to ensure that traffic is not interrupted.

Figure 7-4

<b>Remarks</b>	R1 is connected to the video server, R2 is directly connected to the receiver, and R2 runs in hot backup mode. A Layer-3 multicast protocol runs on R1 and R2.
----------------	--

### Deployment

- Run OSPF on R1 and R2 to implement unicast routing.
- Run PIM-SMv6 on R1 and R2 to implement multicast routing.
- Make R2 run in two-node cluster hot backup mode.

<b>Remarks</b>	R2 may perform hot backup switching in the hot backup environment. In this case, the query interval of PIM Hello packets (the default value is 30 seconds) needs to be adjusted on R2 because the keepalive timer of the neighbor in PIM Hello packets of R1 may have expired (the default value is 3.5 times the query interval, that is, 105 seconds). The multicast function relies on the unicast function currently, and the multicast function starts convergence after the unicast function convergence is complete. For example, the default graceful restart (GR) convergence time of the unicast function is 120 seconds. It is recommended that the query interval of PIM Hello packets be set to 60 seconds. The keepalive time of the neighbor in PIM Hello packets is 210 seconds. In this scenario, the query interval of PIM Hello packets need to be set with a reference to the GR convergence time of the unicast function and the value of 3.5 times the query interval of PIM Hello packets must be larger than the GR convergence time of the unicast function. In addition, if the convergence time of the unicast function is long, the transmission interval of PIM Join/Prune packets also need to be adjusted, because the keepalive time
----------------	--

of PIM Join/Prune packets is 3.5 times the transmission interval of PIM Join/Prune packets. The default keepalive time of PIM Join/Prune packets is 210 seconds. If R2 is configured as a dynamic RP, the interval for a candidate RP (C-RP) to transmit C-RP notifications also needs to be adjusted. The default transmission interval is 60 seconds and the keepalive time is 2.5 times the transmission interval of C-RP notifications. For example, if the convergence time of the unicast function is longer than 150 seconds, the transmission interval of C-RP notifications needs to be adjusted. In a hot backup environment, it is recommended that the query interval of PIM Hello packets be larger than the default value (30 seconds). Otherwise, the keepalive timer of the neighbor in PIM Hello packets of the peer end times out during hot backup switching.

## 7.3 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

Routers where the PIM protocol is enabled are called PIM routers. Interfaces where the PIM protocol is enabled are called PIM interfaces.

Multicast packets are forwarded by PIM routers. The PIM interfaces for receiving multicast packets are called upstream interfaces, and the PIM interfaces for transmitting multicast packets are called downstream interfaces.

Network segments where upstream interfaces are located are called upstream network segments. Network segments where downstream interfaces are located are called downstream network segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On some PIM interfaces, borders are set to divide a large PIM network into multiple PIM domains. The borders may reject specific multicast packets or limit transmission of PIM messages.

#### ↘ Multicast Distribution Tree, DR, RP

Multicast packets are transmitted from one point to multiple points. The forwarding path presents a tree structure. This forwarding path is called a multicast distribution tree (MDT). MDTs are classified into two types:

- Rendezvous point tree (RPT): Uses the rendezvous point (RP) as the root and designated routers (DRs) connected to group members as leaves.
- Shortest path tree (SPT): Use the DR connected to a multicast source as the root and the RPs or DRs connected to group members as leaves.

DRs and RPs are function roles of PIM routers.

- RPs collect information about multicast sources and group members in the network.
- The DR connected to a multicast source reports multicast source information to the RP and the DRs connected to group members report the group member information to the RP.

## ↘ (\*,G), (S,G)

- (\*,G): Indicates the packets transmitted from any source to Group G, routing entries corresponding to the packets, and forwarding path (RPT) corresponding to the packets.
- (S,G): Indicates the packets transmitted from Source S to Group G, routing entries corresponding to the packets, and forwarding path (SPT) corresponding to the packets.

## ↘ ASM, SSM

PIM-SM supports two multicast service models: any-source multicast (ASM) and source-specific multicast (SSM), which are applicable to different multicast address segments.

- ASM: In the ASM model, a user host cannot select a multicast source. The user host joins a multicast group and receives all packets sent from all sources to the multicast group.
- SSM: In the SSM model, a user host can select a multicast source. The user host specifies the source address when joining a multicast group, and then receives packets only from the specified source to the multicast group.

**i** SSM model requirement: Other network services must be used to enable a user host to know the position of a multicast source in advance so that the user host selects the multicast source.

## Overview

Feature	Description
<a href="#">Establishment of PIM Neighbor Relationships</a>	Neighbor relationships are established between PIM routers to form a PIM network.
<a href="#">DR Election</a>	In the shared network segment connected to group members, DR election is conducted among PIM neighbors to elect the DR connected to group members. In the shared network segment connected to a multicast source, DR election is conducted among PIM neighbors to elect the DR connected to the multicast source.
<a href="#">RP Mechanism</a>	In a PIM network, the RP is statically configured or dynamically elected so that each PIM router knows the position of the RP.
<a href="#">Registration Information About a Multicast Source</a>	When a multicast source arises in a network, the DR connected to the multicast source transmits the Register packet to the RP so that the RP obtains information about the multicast source and multicast packets.
<a href="#">RPT Establishment</a>	When a group member arises in a network, the DR connected to the group member transmits the Join packet in the RP direction to establish an RPT. If there is a multicast source in the network, the multicast packet transmitted to the RP can reach the group member along the RPT.
<a href="#">SPT Establishment</a>	When a data packet reaches the DR connected to a group member, the DR connected to the group member transmits the Join packet in the multicast source direction to establish an SPT. Then, multicast packets are forwarded along the SPT.
<a href="#">ASM and SSM Models</a>	PIM routers provide multicast services of the ASM model and SSM model. The SSM model is used for groups within the SSM address range, and the ASM model is used for other groups.

### 7.3.1 Establishment of PIM Neighbor Relationships

Neighbor relationships are established between PIM routers to form a PIM network. Neighbor relationships must be established between PIM routers before other PIM control messages are exchanged or multicast packets are forwarded.

#### Working Principle

A Hello message is sent by a PIM interface. For the multicast packet for encapsulating the Hello message, the destination address is ff02::d (indicating all PIM routers in the same network segment), the source address is the IP address of the PIM interface, and the time to live (TTL) value is 1.

Hello messages are used to discover neighbors, negotiate about protocol parameters, and maintain neighbor relationships.

#### Discovering PIM Neighbors

PIM routers in the same network segment receive multicast packets with the destination address of ff02::d. In this way, the PIM routers obtain neighbor information and establish neighbor relationships.

When a PIM interface is enabled or detects a new neighbor, the Triggered-Hello-Delay message is used to generate a random time period. Within the time period, the interface sends Hello packets.

#### Negotiating About Protocol Parameters

A Hello message contains multiple protocol parameters, which are described as follows:

- DR\_Priority: Indicates the priority of each router interface for DR election. A higher priority means a higher possibility of being elected as the DR.
- Holdtime: Indicates the timeout time in which a neighbor is held in the reachable state.
- LAN\_Delay: Indicates the delay for transmitting a Prune message in a shared network segment.
- Override-Interval: Indicates the prune override time carried in a Hello message.

When a PIM router receives a Prune message from an upstream interface, it indicates that other downstream interfaces exist in the shared network segment. If the PIM router still needs to receive multicast data, it must send a Prune Override message to the upstream interface within the time of **Override-Interval**.

$\text{LAN\_Delay} + \text{Override-Interval} = \text{PPT}$  (Prune-Pending Timer). After a PIM router receives a Prune message from a downstream interface, it does not immediately perform pruning but waits for PPT timeout. After the PPT times out, the PIM router performs pruning. Within the time of PPT, if the PIM router receives a Prune Override message from the downstream interface, it cancels pruning.

#### Maintaining Neighbor Relationships

A Hello message is sent periodically between PIM routers. If a Hello packet is not received from a PIM neighbor within Holdtime, the neighbor is considered unreachable and is deleted from the neighbor list. Any changes in PIM neighbors will cause multicast topology changes in the network. If an upstream neighbor or a downstream neighbor in an MDT is unreachable, multicast routing re-convergence is performed again and the MDT is migrated.

#### Related Configuration

### 📌 Enabling the PIM-SMv6 Function on an Interface

By default, the PIM-SMv6 function is disabled on an interface.

Run the **ipv6 pim sparse-mode** command to enable or disable the PIM-SMv6 function on an interface.

The PIM-SMv6 function must be enabled on an interface so that the interface participates in the operation of PIM protocols. If the PIM-SMv6 function is disabled on an interface that functions as a DR, static RP, candidate - rendezvous point (C-RP), or candidate – bootstrap router (C-BSR), the corresponding protocol role does not take effect.

### 📌 Adjusting the Transmission Interval of Hello Messages on an Interface

By default, Hello messages are transmitted at an interval of 30 seconds.

Run the **ipv6 pim query-interval** *seconds* command to adjust the transmission interval of Hello messages on an interface. The value ranges from 1 to 65,535.

A larger value of *interval-seconds* means a larger transmission interval of Hello messages and a smaller value of *interval-seconds* means a smaller transmission interval of Hello messages.

## 7.3.2 DR Election

In the shared network segment connected to group members, DR election is conducted among PIM neighbors to elect the DR connected to the group members.

In the shared network segment connected to a multicast source, DR election is conducted among PIM neighbors to elect the DR connected to the multicast source.

The DR transmits the Join/Prune message in the MDT root node direction for the directly connected group members, or transmits data of the directly connected multicast source to the MDT.

### Working Principle

The neighbor IP address and DR priority are obtained from Hello packets of neighbors during establishment of PIM neighbor relationships, so as to elect the DR.

The key of DR election is the DR priorities and IP addresses of interfaces.

### 📌 Interface DR Priority

A higher interface DR priority means a higher probability that a PIM router is successfully elected as the DR during the DR election.

### 📌 Interface IP Address

If interfaces of PIM routers share the same DR priority during DR election, IP addresses of neighbors are compared. A larger IP address means a higher probability that a PIM router is successfully elected as the DR.

### Related Configuration

#### 📌 Setting IP Addresses of Interfaces

By default, no IP addresses are configured for interfaces.

Run the **ipv6 address** command to set an IP address for an interface.

When PIM routers share the same DR priority, the PIM router with a larger IP address is elected as the DR.

#### ↘ Enabling the PIM-SMv6 Function on an Interface

By default, the PIM-SMv6 function is disabled on an interface.

Run the **ipv6 pim sparse-mode** command to enable or disable the PIM-SMv6 function on an interface.

The PIM-SMv6 function must be enabled on an interface so that the interface participates in the operation of PIM protocols. If the PIM-SMv6 function is disabled on an interface that functions as a DR, static RP, C-RP, or C-BSR, the corresponding protocol role does not take effect.

#### ↘ Adjusting the DR Priority of an Interface

By default, the DR priority is 1.

Run the **ipv6 pim dr-priority** *priority-value* command to adjust the DR priority of an interface. The priority value ranges from 0 to 4,294,967,294.

The DR priority of an interface is used to elect the DR in the directly connected network segment of the interface. A larger priority value means a higher probability that a PIM router is elected as the DR.

### 7.3.3 BSR Mechanism

In a PIM network, the bootstrap router (BSR) periodically generates bootstrap messages (BSMs) including information about a series of C-RPs and relevant group addresses. BSMs are transmitted hop by hop in the entire domain. PIM routers throughout the network receive BSMs and record information about C-RPs and the relevant group addresses.

#### Working Principle

One or more C-BSRs are configured in the PIM-SMv6 domain and the BSR is elected from the candidate BSRs according to certain rules.

#### Related Configuration

##### ↘ Configuring a C-BSR

By default, no C-BSR is configured.

Run the **ipv6 pim bsr-candidate** *interface-type interface-number* [ *hash-mask-length* [ *priority-value* ] ] command to configure or cancel a C-BSR.

C-BSRs elect the globally unique BSR in the PIM-SM domain by means of BSM learning and election. The BSR transmits BSMs.

##### ↘ Configuring the BSR Border

By default, no BSR border is configured.

Run the **ipv6 pim bsr-border** command to configure or cancel the BSR border.

After this command is configured for an interface, the interface immediately discards the received BSMs and does not forward BSMs, thereby preventing BSM flooding. No BSR border is configured if this command is not configured.

### 📌 Defining the Valid BSR Range

By default, the BSMs of BSRs are not filtered.

Run the **ipv6 pim accept-bsr list** *ipv6\_access-list* command to define or cancel the BSR range.

After this command is configured, the valid BSR range is defined. If this command is not configured, the device with the PIM-SMv6 function enabled will receive all BSMs.

### 📌 Configuring a C-BSR to Restrict the Address Range of Valid C-RPs and the Range of Multicast Groups Served by the C-RPs

A C-BSR receives notifications from all C-RPs.

Run the **ipv6 pim accept-crp list** *ipv6\_access-list* command to configure whether to filter notifications from C-RPs.

After this command is configured, the C-BSR restricts the address range of valid C-RPs and the range of multicast groups served by the C-RPs. If this command is not configured, the C-BSR receives notifications from all C-RPs.

### 📌 Configuring a C-BSR to Receive C-RP-ADV Packets with prefix-count of 0

By default, a C-BSR does not receive C-RP-ADV packets with prefix-count of 0.

Run the **ipv6 pim accept-crp-with-null-group** command to configure whether to receive C-RP-ADV packets with prefix-count of 0.

After this command is configured, the C-BSR can receive C-RP-ADV packets with prefix-count of 0. If this command is not configured, the C-BSR does not process C-RP-ADV packets with prefix-count of 0.

## 7.3.4 RP Mechanism

In a PIM network, the RP is statically configured or dynamically elected so that each PIM router knows the position of the RP. The RP serves as the root of the RPT. The RPT establishment and the forwarding of RPT data streams must use the RP as the forwarding point.

### Working Principle

All PIM routers in a PIM domain must be able to be mapped to the same RP through a specific multicast group address. RPs are classified into static RPs and dynamic RPs in a PIM network.

#### 📌 Static RP

In static RP configuration, the RP address is directly configured on each PIM router so that all PIM routers in the PIM network know the RP address.

#### 📌 Dynamic RP

C-RPs are also configured in the PIM-SMv6 domain. These C-RPs transmit data packets that contain their addresses and information about multicast groups served by them to the BSR in unicast mode. The BSR periodically generates BSMs that contain information about a series of C-RPs and their group addresses. BSMs are transmitted hop by hop in the entire domain. Devices receive and store these BSMs. The DR at the receive end uses a hash algorithm to map a group address to the C-RP that can serve the group. Then, the RP corresponding to the group address can be determined.

## Related Configuration

### ▾ Setting a Static RP Address

By default, no RP address is configured.

Run the **ipv6 pim rp-address** *ipv6\_rp-address* [ *ipv6\_access-list* ] command to configure or cancel a static RP address for a PIM router.

An RP must be configured so as to implement ASM in a PIM-SMv6 network. You can configure a static RP or dynamic RP.

If a static RP is configured in a PIM-SMv6 network, the static RP configuration on all devices in the PIM-SMv6 domain must be consistent to prevent multicast route ambiguity in the PIM-SMv6 domain.

### ▾ Configuring a C-RP Address

By default, no C-RP address is configured.

Run the **ipv6 pim rp-candidate** *interface-type interface-number* [ **priority** *priority-value* ] [ **interval** *interval-seconds* ] [ **group-list** *ipv6\_access-list* ] command to configure or cancel a PIM router as a C-RP.

C-RPs periodically transmit C-RP notifications to the BSR. Information contained in these C-RP notifications is dispersed to all PIM-SMv6 devices in the domain, thereby ensuring the uniqueness of RP mapping.

### ▾ Ignoring the RP Priority in RP Setting

By default, a C-RP with a higher priority is selected preferentially.

Run the **ipv6 pim ignore-rp-set-priority** command to specify or ignore the RP priority when selecting the RP for a group.

When one RP needs to be selected for a multicast address and multiple RPs can serve this multicast address, use this command if the RP priority needs to be ignored during the RP comparison. If this command is not configured, the RP priority will be considered during the RP comparison.

### ▾ Configuring the Static RP First

By default, a dynamic C-RP is adopted preferentially.

Run the **ipv6 pim static-rp-preferred** command to select the static RP first during RP selection.

After this command is configured, the static RP is adopted first. If this command is not configured, a C-RP is adopted first.

### ▾ Configuring the Embedded RP Function

By default, the embedded RP function is enabled for all IPv6 multicast group addresses where the RP address is embedded.

Run the **ipv6 pim rp embedded [ group-list *ipv6\_acl\_name* ]** command to enable the embedded RP function.

The embedded RP function is the peculiar RP discovery mechanism of IPv6 PIM. This mechanism uses the IPv6 multicast address where the RP address is embedded, to enable a multicast device to directly extract the RP address from the multicast address. By default, the embedded RP function is enabled for all IPv6 multicast group addresses where the RP address is embedded.

### 7.3.5 Registration Information About a Multicast Source

When a multicast source arises in a network, the DR connected to the multicast source transmits the Register packet to the RP so that the RP obtains information about the multicast source and multicast packets.

#### Working Principle

The DR at the data source end receives a multicast data packet from the directly connected host, and encapsulates the multicast data into a Register message. Then, it transmits the Register message to the RP in unicast mode. The RP generates the (S,G) entry.

If the forwarding entry contains an outgoing interface on the RP, the RP forwards the encapsulated data packet to the outgoing interface.

If the RP does not have the forwarding entry of the current group, it starts the (S,G) entry start timer. After the timer expires, the RP transmits the Register-Stop message to the DR and deletes the entry. After the DR at the data source end receives the Register-Stop message, the DR transmits the probing packet before the Register-Stop message timer expires.

If the DR does not receive the Register-Stop message, after the timer expires, the DR at the data source end encapsulates the multicast data into the Register message and transmits it to the RP in unicast mode.

If the DR receives the Register-Stop message, it re-starts the delay and re-transmits the probing packet before the delay expires.

#### Related Configuration

##### ✚ Configuring Reachability Detection of RP Register Packets

By default, the RP reachability is not detected.

Run the **ipv6 pim register-rp-reachability** command to set or cancel the RP reachability detection.

If the RP reachability needs to be detected for the Register packet transmitted from the DR to the RP, you can configure this command. After this command is configured, the RP reachability is detected before the DR transmits the Register packet to the RP. That is, the DR queries the unicast routing table and static multicast routing table to check whether a route reachable to the RP exists. If no, the DR does not transmit the Register packet.

##### ✚ Configuring the RP to Filter Register Packets

By default, the RP allows every received Register packet.

Run the **ipv6 pim accept-register { list *ipv6\_access-list* [route-map *map-name* ] | route-map *map-name* [list *ipv6\_access-list* ] }** command to enable or disable the RP to filter received Register packets.

To filter received Register packets on the RP, configure this command. If this command is not configured, the RP allows every received Register packet. If this command is configured, only Register packets whose source addresses and group addresses are allowed by the ACL are processed. Otherwise, the Register packets are filtered out.

### ▾ Configuring the Transmission Rate Limit for Register Packets

By default, the transmission rate of Register packets is not limited.

Run the **ipv6 pim register-rate-limit** *rate* command to configure whether to limit the transmission rate of Register packets.

If **no** is set in this command, the transmission rate is not limited. This command is used to configure the transmission rate of Register packets from the (S,G) multicast group address rather than the transmission rate of Register packets of the entire system.

### ▾ Configuring the Checksum Calculation of a Register Packet Based on the Entire Register Packet

By default, the checksum in a Register packet is calculated in default mode specified in the protocol.

Run the **ipv6 pim register-checksum-wholepkt** [ **group-list** *ipv6\_access-list* ] command to set the packet length for checksum calculation.

If the entire PIM protocol packet including the encapsulated multicast data packet is used for checksum calculation of a Register packet, use this command. If this command is not configured, the checksum in a Register packet is calculated in default mode specified in the protocol.

### ▾ Configuring the Source Address of Register Packets

By default, the source address of Register packets uses the address of the DR interface connected to a multicast source.

Run the **ipv6 pim register-source** { *ipv6\_local\_address* | *interface-type interface-number* } command to configure the source address of Register packets.

To configure the source address of Register packets transmitted from the DR, use this command. If this command is not configured or **no** is set in this command, the source address of Register packets uses the address of the DR interface connected to a multicast source. If the address parameter of this command is used, the configured address must be a reachable unicast route. If the interface parameter of this command is used, this interface may be a loopback interface or an interface of other types and the interface address must be an advertised unicast route.

### ▾ Configuring the Suppression Time of Register Packets

The default suppression time of Register packets is 60 seconds.

Run the **ipv6 pim register-suppression** *seconds* command to configure the suppression time.

If this command is used to configure the suppression time of Register packets, configuring the value on the DR will change the suppression time of Register packets on the DR. If the **ipv6 pim rp-register-kat** *seconds* command is not configured, defining the value on the RP will change the keepalive time on the RP.

### ▾ Configuring the Probing Time of NULL Register Packets

The default probing time is 5 seconds.

Run the **ipv6 pim probe-interval** *interval-seconds* command to set the probing time.

The source DR transmits the NULL-Register packet to the RP within a certain interval prior to the timeout of the suppression time of the Register packet. This interval is the probing time. The default probing time is 5 seconds.

### 📌 Configuring the Time Value of the RP KAT Timer

By default, the KAT default value is used. KAT default value = Registration suppression time x 3 + Registration detection time.

Run the **ipv6 pim rp-register-kat** *seconds* command to set time of the KAT timer.

To configure the keepalive time of Register packets from the (S,G) multicast group address on the RP, use this command.

## 7.3.6 RPT Establishment

When a group member arises in a network, the DR connected to the group member transmits the Join packet in the RP direction to establish an RPT. If there is a multicast source in the network, the multicast packet transmitted to the RP can reach the group member along the RPT.

### Working Principle

The RPT establishment process is as follows:

1. The DR at the receive end receives an MLD (\*,G)Include report packet from a receiver.
2. If the DR at the receive end is not the RP of Group G, the DR at the receive end transmits one (\*,G)join packet in the RP direction. The upstream device that receives the (\*,G)join packet transmits the (\*,G)join packet in the RP direction. The (\*,G)join packet is transmitted hop by hop till the RP of Group G receives the (\*,G)join packet, indicating that the DR at the receive end joins the RPT.
3. When the data source host transmits multicast data to a group, the source data is encapsulated into the Register message and is transmitted to the RP in unicast mode by the DR at the data source end. The RP decapsulates the Register message, retrieves the data packet, and then forwards it to each group member along the RPT.
4. The RP transmits the (S,G)join packet to the DR at the data source end to join the SPT of this data source.
5. After the SPT from the RP to the DR at the data source end is established, data packets from the data source are transmitted to the RP along the SPT without encapsulation.
6. When the first multicast data packet reaches the RP along the SPT, the RP transmits the Register-Stop message to the DR at the data source end to enable the DR to stop the encapsulation of Register packets. After the DR at the data source end receives the Register-Stop message, it does not encapsulate the Register packets but transmits the Register packets to the RP along the SPT of the data source. The RP forwards the Register packets to each group member along the RPT.

### Related Configuration

#### 📌 Configuring the Transmission Interval of Join/Prune Packets

The default transmission interval of Join/Prune packets is 60 seconds.

Run the **ipv6 pim jp-timer** *seconds* command to set the transmission interval of Join/Prune packets.

To change the default transmission interval of Join/Prune packets, configure this command. If this command is not configured, the default transmission interval of Join/Prune packets is 60 seconds.

### 7.3.7 SPT Establishment

When a data packet reaches the DR connected to a group member, the DR connected to the group member transmits the Join packet in the multicast source direction to establish an SPT. Then, multicast packets are forwarded along the SPT, thereby relieving the load of the RP in the RPT and reducing the number of hops from the DR at the data source end to the receive end.

#### Working Principle

The SPT establishment process is as follows:

The DR at the receive end transmits the (\*,G)join packet to the DR at the source end along the SPT. The (\*,G)join packet is transmitted hop by hop till the DR at the source end receives the (\*,G)join packet, forming an SPT.

#### Related Configuration

By default, SPT switching is disabled.

Run the **ipv6 pim spt-threshold [ group-list ipv6\_access-list ]** command to configure whether to start SPT switching.

After this command is configured, when the DR receives the (S,G) packet from the first group member, one PIM Join message is generated and forwarded to the RP to establish a SPT tree. If **group-list** is defined, the defined group is switched from the RPT to the SPT. If **no** is set in this command and **group-list** is not defined, the switching from the RPT to the SPT is disabled and the device redirects to the RPT and transmits one Prune packet to the source. If **no** is set in this command, **group-list** is defined, and the defined ACL is a configured ACL, the ACL associated with **group-list** is cancelled and all groups are allowed to switch from the RPT to the SPT.

### 7.3.8 ASM and SSM Models

PIM-SM supports two multicast models: ASM and SSM. In the ASM model, a multicast data receiver specifies only to join a multicast group G but does not specify the multicast source S. In the SSM model, a multicast data receiver can specify both the multicast source S and multicast group G.

 When the SSM model is implemented over IPv6, MLDv2 needs to be used to manage the member relationship between hosts and devices and PIM-SMv6 needs to be used to connect devices.

In the SSM model, a multicast receiver learns about the multicast source (S,G) information by means of some channels (such as accessing the server or receiving advertisements) in advance. When the multicast receiver needs to order a multicast service, it directly transmits the MLD(S,G) Join packet to the last-hop device, for example, as shown in the following figure, Multicast Receiver 1 transmits the MLD(S,G) Join packet to order the multicast service (S,G). After receiving the MLD(S,G) Join packet from the multicast receiver, the last-hop device transmits the PIM(S,G) Join packet to the multicast source hop by hop, for example, as shown in the following figure, after receiving the MLD(S,G) Join packet from Multicast Receiver 1, R1 transmits the PIM(S,G) Join packet to R3, which transmits the PIM (S,G) Join packet to R4. As a result, the SPT from the multicast receiver to the multicast source is established.

Figure 7-5

The following conditions need to be met for the implementation of the SSM model:

- A multicast receiver learns about the multicast source (S,G) information beforehand by means of some channels. The multicast receiver initiates the MLD(S,G) Join packet to the desired multicast service.
  - MLDv2 must be enabled on the interface of the last-hop device connected to the multicast receiver. MLDv1 does not support SSM.
  - PIM-SM and SSM must be enabled on the intermediate devices between the multicast receiver and the multicast source.
- i** After the SSM function is enabled, the default group range of SSM is FF3x::/32. You can run a command to change the group range of SSM.

The SSM model has the following features:

- In the SSM model, a multicast receiver can learn about the multicast source information in advance by means of some channels (for example, receiving advertisements or accessing a specified server).
- The SSM model is a specific subset of PIM-SM and processes only PIM(S,G) Join and PIM(S,G) Prune messages. It discards RPT-relevant messages within the SSM range, for example, PIM(\*,G) Join/Prune messages. For Register packets within the SSM range, it immediately responds with the Register-Stop packet.
- In the SSM model, no RP is required and the election and distribution of RP messages are not required. The established MDT is the SPT in SSM.

## 7.4 Configuration

### 7.4.1 Configuring Basic Functions of PIM-SMv6

#### Configuration Effect

- Create a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.
- Both or either of the two multicast service models (ASM and SSM) can be supported.

## Notes

---

- PIM-SMv6 needs to use the IPv6 unicast routing function.
- If the PIM network needs to support the multicast service of the SSM model, MLDv3 or SSM Mapping needs to be configured.

## Configuration Steps

---

### ▾ Enabling the IPv6 Multicast Routing Function

- Mandatory.
- The IPv6 multicast routing function should be enabled on each router unless otherwise specified.

### ▾ Enabling the PIM-SMv6 Function

- Mandatory.
- The PIM-SMv6 function should be enabled on the following interfaces unless otherwise specified: router interconnection interfaces, interface that function as a static RP, C-RP, or C-BSR, interface for connecting to a multicast source, and interface for connecting to a user host.

### ▾ Configuring an RP

- If a PIM network needs to support the multicast service of the ASM model, an RP must be configured.
- There are three methods of configuring an RP: configuring only a static RP, configuring only a dynamic RP, and configuring both a static RP and a dynamic RP. If both a static RP and a dynamic RP are configured, the dynamic RP is preferred.
- Configuring a static RP: A static RP should be configured on each router unless otherwise specified.
- Configuring a dynamic RP: A C-RP or C-BSR should be configured on one or more routers unless otherwise specified.

### ▾ Enabling the SSM

- If a PIM network needs to support the multicast service of the SSM model, the SSM must be enabled.
- The SSM should be enabled on each router unless otherwise specified.

## Verification

---

Make a multicast source in the network send packets to groups within the range of ASM and SSM and make a user host join the groups.

- Check whether the user host can successfully receive packets from each group.
- Check whether correct PIM-SMv6 routing entries are created on routers.

## Related Commands

### ↳ Enabling the IPv6 Multicast Routing Function

<b>Command</b>	<b>ipv6 multicast-routing</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↳ Enabling the PIM-SMv6 Function

<b>Command</b>	<b>ipv6 pim sparse-mode</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Before enabling the PIM-SMv6 function, enable the multicast routing forwarding function in global configuration mode. Otherwise, multicast data packets cannot be forwarded even if the PIM-SMv6 function is enabled.</p> <p>When the PIM-SMv6 function is enabled, MLD is automatically enabled on each interface without manual configuration.</p> <p>If the message "Failed to enable PIM-SMv6 on &lt;interface name&gt;, resource temporarily unavailable, please try again" is displayed during the configuration of this command, try to configure this command again.</p> <p>If the message "PIM-SMv6 Configure failed! VIF limit exceeded in NSM!!!" is displayed during the configuration of this command, the configured number of multicast interfaces reaches the upper limit of multicast interfaces that can be configured on the device. If the PIM-SMv6 function still needs to be enabled on an interface, delete some unnecessary PIM-SMv6 or PIM-DMv6 interfaces.</p> <p>If an interface is of the tunnel type, only the 6Over4 configuration tunnel, 6Over4 GRE tunnel, 6Over6 configuration tunnel, and 6Over6 GRE tunnel support the IPv6 multicast function. The multicast function can also be enabled on tunnel interfaces that do not support the multicast function but no prompts are displayed and multicast packets are neither received nor transmitted.</p> <p>Multicast tunnels can be established only on Ethernet ports. Embedded tunnels and QoS/ACL of multicast data are not supported.</p>

### ↳ Configuring a Static RP

<b>Command</b>	<b>ipv6 pim rp-address</b> <i>ipv6_rp-address</i> [ <i>ipv6_access-list</i> ]
<b>Parameter Description</b>	<p><i>ipv6_rp-address</i>: Indicates the IPv6 address of an RP.</p> <p><i>ipv6_access_list</i>: References an IPv6 ACL to restrict the group address range served by the static RP. A named ACL is supported.</p>

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Multicast static RPs can be configured. A static RP and a C-RP can coexist.</p> <p>Notes:</p> <ol style="list-style-type: none"> <li>1. If both the BSR mechanism and RP static configuration are effective, the dynamic configuration is preferred.</li> <li>2. A control list can be used to statically configure the address of an RP for multiple multicast groups (using the ACL) or all multicast groups (without using the ACL), but one static RP address cannot be used multiple times.</li> <li>3. If multiple static RPs serve the same group, the static RP with a larger IPv6 address is used preferentially.</li> <li>4. Only multicast groups with the addresses allowed by the ACL are effective. By default, all multicast groups are allowed.</li> <li>5. After the configuration is complete, the static RP source address will be inserted into the group range-based static RP group tree structure. The multicast static group in each group range maintains the linked list structure of one static RP group. This linked list is arranged in descending order by IPv6 address. When an RP is selected for a group range, the RP with the largest IPv6 address will be selected.</li> <li>6. When a static RP address is deleted, this address is deleted from all existing groups and an address is selected from the existing static RP tree structure as the RP address.</li> </ol>

### ↘ Configuring a C-RP

<b>Command</b>	<b>ipv6 pim rp-candidate</b> <i>interface-type interface-number</i> [ <b>priority</b> <i>priority-value</i> ] [ <b>interval</b> <i>interval-seconds</i> ] [ <b>group-list</b> <i>ipv6_access-list</i> ]
<b>Parameter Description</b>	<p><i>interface-type interface-number</i>: Indicates an interface name. This interface address is used as the C-RP address.</p> <p><b>priority</b> <i>priority-value</i>: Specifies the priority of the C-RP. The value ranges from 0 to 255 and the default value is <b>192</b>.</p> <p><b>interval</b> <i>seconds</i>: Indicates the interval for transmitting C-RP messages to the BSR, with the unit of seconds. The value ranges from 1 to 16,383 and the default value is <b>60</b>.</p> <p><b>group-list</b> <i>ipv6_access-list</i>: References an IPv6 ACL to restrict the group address range served by the C-RP. A named ACL is supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>In the PIM-SMv6 protocol, the RPT created by the multicast routing uses an RP as the root node. After the BSR is elected, all C-RPs periodically transmit C-RP messages to the BSR in unicast mode and then the BSR disperses the messages in the entire PIM domain.</p> <p>To specify an interface as the C-RP of a specific group range, contain the ACL option in this command. Note that the calculation of the group range is based only on the permitted access control entries (ACEs) and denied ACEs are not involved in the calculation.</p> <p>If <b>group-list</b> <i>ipv6_access-list</i> is not carried in the command, all groups are served.</p>

### ↘ Configuring a C-BSR

<b>Command</b>	<b>ipv6 pim bsr-candidate</b> <i>interface-type interface-number</i> [ <i>hash-mask-length</i> [ <i>priority-value</i> ] ]
<b>Parameter Description</b>	<i>interface-type interface-number</i> : Indicates an interface name. This interface address is used as the C-BSR address. <i>hash-mask-length</i> : Indicates the hash mask length. The value ranges from 0 to 128 and the default value is <b>126</b> . <i>priority-value</i> : Indicates the priority. The value ranges from 0 to 255 and the default value is <b>64</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A unique BSR must exist in a PIM-SMv6 domain. The BSR collects and advertises RP information. The unique well-known BSR is elected from multiple C-BSRs by means of BSMs. All C-BSRs consider that they are the BSR before knowing the BSR information. They periodically transmit BSMs that contain the BSR address and priority in the PIM-SMv6 domain.  This command can be used to enable a device to transmit one BSM to all PIM neighbors by using the allocated BSR address. Each neighbor compares the original BSR address with the address in the received BSM. If the IPv6 address in the received BSM is equal to or larger than its BSR address, the neighbor stores this address as the BSR address and forwards the BSM. Otherwise, the neighbor discards the BSM.  The current device deems that it is the BSR till it receives a BSM from another C-BSR and learns that the C-BSR has a higher priority (or the same priority but a larger IPv6 address).

### ↘ Enabling the SSM

<b>Command</b>	<b>ipv6 pim ssm</b> { <b>default</b> / <b>range</b> <i>ipv6_access-list</i> }
<b>Parameter Description</b>	<b>default</b> : The default group address range of SSM is FF3x::/32. <b>range</b> <i>ipv6_access-list</i> : References an IPv6 ACL to restrict the SSM group address range. A named ACL is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To apply SSM in a PIM-SMv6 network, you must configure this command.

### ↘ Displaying the PIM-SM Routing Table

<b>Command</b>	<b>show ipv6 pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ]
<b>Parameter Description</b>	<i>group-or-source-address</i> : Indicates the group address or source address. The two addresses cannot be group addresses or source addresses at the same time.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	A group address, a source address, or both group address and source address can be specified each time. You can also not specify a specific group address or source address but you cannot specify two group addresses or two source addresses at the same time.

## Configuration Example

### Creating the IPv6 Multicast Service on an IPv6 Network to Support ASM and SSM

<p><b>Scenario</b> <b>Figure 7-6</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an IPv6 unicast routing protocol (such as OSPFv6) on the routers and ensure that the unicast routes of the loopback interfaces are reachable. (Omitted)</li> <li>● Enable the IPv6 multicast routing function on all routers.</li> <li>● Enable the PIM-SMv6 function on device interconnection interfaces, interface for connecting to the user host, and interface for connecting to the multicast source.</li> <li>● Configure a C-RP and a C-BSR on the loopback interfaces of Router A and Router B. Enable the PIM-SMv6 function on the loopback interfaces.</li> <li>● Enable SSM on all routers.</li> <li>● Enable MLDv3 on the router interface for connecting to the user host. (Omitted)</li> </ul>

### Common Errors

- IPv6 unicast routing is incorrectly configured.
- IPv6 multicast routing is not enabled on a router.
- SSM is not enabled on a router or the SSM group address range of the router is different from that of other routers.
- PIM-SMv6 is not enabled on an interface (for example, interface that is specified as a C-RP or C-BSR, or interface that functions as the gateway of a user host or multicast source).
- MLDv3 is not enabled on an interface connected to a user host.
- No RP is configured in the network.
- No static RP is configured on a router or the configured static RP is different from that on other routers.
- A C-RP is configured but no C-BSR is configured in the network.

- The unicast route to the static RP, C-RP, or C-BSR is unreachable.

## 7.4.2 Configuring PIM Neighbor Parameters

### Configuration Effect

- Negotiate about protocol parameters and adjust parameters in a Hello packet.
- PIM routers discover neighbors, negotiate about protocol parameters, and maintain neighbor relationships.
- Protect neighbor relationships to restrict neighbors.

### Notes

- The basic functions of PIM-SMv6 must be configured.

### Configuration Steps

- Set parameters on each PIM router interface unless otherwise specified.

### Verification

Set parameters in a Hello packet on an interface and run the **debug ipv6 pim sparse-mode packet** command to check parameters in the Hello packet.

Set neighbor filtering and run the **show ipv6 pim sparse-mode neighbor** command to check the neighbor relationship.

### Related Commands

#### ↘ Configuring the Transmission Interval of Hello Messages

<b>Command</b>	<b>ipv6 pim query-interval</b> <i>seconds</i>
<b>Parameter Description</b>	Indicates the transmission interval of Hello packets. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>30</b> .
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Each time the transmission interval of Hello messages is updated, the Holdtime of Hello messages is accordingly updated according to the following rule: The Holdtime of Hello messages is updated to 3.5 times transmission interval of Hello messages. If the transmission interval of Hello messages multiplied by 3.5 is larger than 65,535, the transmission interval of Hello messages is forcibly updated to 18,725.

#### ↘ Configuring the Propagation Delay for Hello Messages

<b>Command</b>	<b>ipv6 pim propagation-delay</b> <i>milliseconds</i>
<b>Parameter Description</b>	<i>milliseconds</i> : The unit is milliseconds. The value ranges from 1 to 32,767 and the default value is <b>500</b> .
<b>Command Mode</b>	Interface configuration mode

<b>Usage Guide</b>	Changing the propagation delay or prune override delay will affect J/P-override-interval. According to the protocol, J/P-override-interval must be smaller than the Holdtime of Join-Prune packets. Otherwise, short flow interruption will be incurred. This must be maintained and guaranteed by network administrators.
--------------------	--

### ↘ Configuring the Prune Override Interval for Hello Messages

<b>Command</b>	<b>ipv6 pim override-interval</b> <i>milliseconds</i>
<b>Parameter Description</b>	<i>milliseconds</i> : The unit is milliseconds. The value ranges from 1 to 65,535 and the default value is <b>2500</b> .
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Changing the propagation delay or prune override delay will affect J/P-override-interval. According to the protocol, J/P-override-interval must be smaller than the Holdtime of Join-Prune packets. Otherwise, short flow interruption will be incurred.

### ↘ Configuring the Interface Joining Suppression Capability for Hello Messages

<b>Command</b>	<b>ipv6 pim neighbor-tracking</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	When the joining suppression capability of an interface is enabled and the local router needs to transmit a Join packet to an upstream neighbor, the Join packet of the local router is suppressed and is not transmitted if the local router receives a Join packet from a neighbor to the upstream router. If the joining suppression capability of the interface is disabled, the local router transmits the Join packet. When the joining suppression capability of a downstream receiver is disabled, the upstream neighbor can accurately know the number of receivers connected to the downstream neighbor through the received Join packet, thereby implementing neighbor tracking.

### ↘ Configuring the Delay of Sending Out Hello Messages

<b>Command</b>	<b>ipv6 pim triggered-hello-delay</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : The unit is seconds. The value ranges from 1 to 5 and the default value is <b>5</b> .
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	When an interface is enabled or detects a new neighbor, the Triggered-Hello-Delay message is used to generate a random time period. Within the time period, the interface sends Hello packets.

### ↘ Configuring the DR Priority for Hello Messages

<b>Command</b>	<b>ipv6 pim dr-priority</b> <i>priority-value</i>
----------------	---

<b>Parameter</b>	<i>priority-value</i> : Indicates the priority. A larger value means a higher priority.
<b>Description</b>	The value ranges from 0 to 4,294,967,294 and the default value is 1.
<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	<p>The process of selecting a DR is as follows:</p> <p>The priority parameter is set for Hello packets of devices in the same LAN. The priority is compared for the selection of a DR. The device with a higher priority is the DR. If multiple devices share the same priority, the device with a larger IP address is the DR.</p> <p>When the priority parameter is not set for Hello packets of a device in a LAN, the device with a larger IP address is elected as the DR in the LAN.</p>

### ▾ Configuring Neighbor filtering

<b>Command</b>	<b>ipv6 pim neighbor-filter</b> <i>ipv6_access-list</i>
<b>Parameter</b>	<i>ipv6_access-list</i> : References an IPv6 ACL to restrict the neighbor address range.
<b>Description</b>	
<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	This command can be used to filter neighbors to strengthen the security of the PIM network and restrict the address range of legitimate neighbors. If a neighbor is rejected by an ACL, PIM-SMv6 will not establish a peering relationship with this neighbor or suspend the peering relationship with this neighbor.

### ▾ Displaying Neighbor Information About an Interface

<b>Command</b>	<b>show ipv6 pim sparse-mode neighbor</b> [ detail ]
<b>Parameter</b>	<b>detail</b> : Displays details.
<b>Description</b>	
<b>Command</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

### Configuration Example

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set the transmission interval of Hello packets of PIM-SMv6 to 50 seconds.</li> <li>● Set the propagation delay of Hello packets of PIM-SMv6 to 400 milliseconds.</li> <li>● Set the prune override interval of Hello packets of PIM-SMv6 to 3,000 milliseconds.</li> <li>● Configure the interface joining suppression capability for Hello messages of PIM-SMv6.</li> <li>● Set the delay of sending out Hello messages of PIM-SMv6 to 3 seconds.</li> <li>● Set the DR priority of Hello messages of PIM-SMv6 to 5.</li> </ul>
	<pre> switch # configure terminal switch (config)#int gi 0/1 switch (config-if-GigabitEthernet 0/1)#ipv6 pim query-interval 50 switch (config-if-GigabitEthernet 0/1)#ipv6 pim propagation-delay 400 switch (config-if-GigabitEthernet 0/1)#ipv6 pim override-interval 3000 switch (config-if-GigabitEthernet 0/1)#ipv6 pim triggered-hello-delay 3 switch (config-if-GigabitEthernet 0/1)# ipv6 pim dr-priority 5                     </pre>
<p><b>Verification</b></p>	<p>Run the <b>debug ipv6 pim sparse-mode packet</b> command to check parameters in a Hello packet.</p>
	<pre> switch # debug ipv6 pim sparse-mode packet *Jan 2 02:37:55: %7: Hello send to GigabitEthernet 0/2 *Jan 2 02:37:55: %7: Send Hello message *Jan 2 02:37:55: %7: Holdtime: 175 *Jan 2 02:37:55: %7: T-bit: off *Jan 2 02:37:55: %7: Propagation delay: 400 *Jan 2 02:37:55: %7: Override interval: 3000 *Jan 2 02:37:55: %7: DR priority: 5 *Jan 2 02:37:55: %7: Gen ID: 99572792 *Jan 2 02:37:55: %7: Secondary Addresses: *Jan 2 02:37:55: %7: 2000::2                     </pre>
<p><b>Configuration Steps</b></p>	<p>Configure neighbor filtering on an interface to receive neighbor packets with the address of (8000::1/64).</p>

	<pre>switch(config-if-GigabitEthernet 0/2)#ipv6 pim neighbor-filter acl % access-list acl not exist switch(config-if-GigabitEthernet 0/2)#exit switch(config)#ipv6 access-list acl switch(config-ipv6-acl)#permit ipv6 8000::1/64 any</pre>												
<b>Verification</b>	Before neighbor filtering is configured, display the neighbor information.												
	<pre>switch#show ipv6 pim sparse-mode neighbor</pre> <table border="1"> <thead> <tr> <th>Neighbor Address</th> <th>Interface</th> <th>Uptime/Expires</th> <th>DR</th> </tr> </thead> <tbody> <tr> <td>Pri/Mode</td> <td></td> <td></td> <td></td> </tr> <tr> <td>fe80::21a:a9ff:fe3a:6355</td> <td>GigabitEthernet 0/2</td> <td>00:32:29/00:01:16</td> <td>1 /</td> </tr> </tbody> </table>	Neighbor Address	Interface	Uptime/Expires	DR	Pri/Mode				fe80::21a:a9ff:fe3a:6355	GigabitEthernet 0/2	00:32:29/00:01:16	1 /
Neighbor Address	Interface	Uptime/Expires	DR										
Pri/Mode													
fe80::21a:a9ff:fe3a:6355	GigabitEthernet 0/2	00:32:29/00:01:16	1 /										
<b>Verification</b>	After neighbor filtering is configured, the neighbor information is blank.												
	<pre>switch#show ipv6 pim sparse-mode neighbor</pre>												

### Common Errors

- The basic functions of PIM-SMv6 are not configured or fail to be configured.

## 7.4.3 Configuring BSR Parameters

### Configuration Effect

- Restrict the range of BSMs.

### Notes

- The basic functions of PIM-SMv6 must be configured.
- A C-RP and a C-BSR must be configured.
- The border must be configured on the interface between domains.

### Configuration Steps

#### ↘ Configuring the Border

- The border must be configured if there are multiple domains.
- Configure the border the interface between two domains.

#### ↘ Configuring a PIM Router to Restrict BSMs

- Optional.

- This configuration can be performed on a PIM router unless otherwise specified.

### ↘ Configuring a C-BSR to Restrict the C-PR Range

- Optional.
- This configuration can be performed on all C-BSRs unless otherwise specified.

### ↘ Configuring a C-BSR to Receive C-RP-ADV Packets with prefix-count of 0

- Optional.
- This configuration can be performed on all C-BSRs unless otherwise specified.

## Verification

### ↘ Verifying the Border

Enable the basic functions of PIM-SMv6, set two routers in different domains, and set Router B as a C-BSR. Router A can normally receive BSMs.

Set the common border between Router A and Router B as a border interface. Router A cannot receive BSMs.

### ↘ Verifying a PIM Router to Restrict BSMs

Enable the basic functions of PIM-SMv6 and set Router B as a C-BSR. Router A can normally receive BSMs. Restrict the C-BSR range on Router A. Router A cannot receive BSMs.

### ↘ Verifying a C-BSR to Restrict the C-PR Range

Enable the basic functions of PIM-SMv6, set Router B as a C-BSR, set Router A as a C-RP, and restrict the C-RP range on the C-BSR. Router B cannot receive packets from the C-RP.

## Related Commands

### ↘ Configuring the BSR Border

<b>Command</b>	<b>ipv6 pim bsr-border</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The BSR border can be configured on an interface to restrict flooding of BSMs. When this interface receives BSMs, it immediately discards them and BSMs are not forwarded by this interface.

### ↘ Configuring a PIM Router to Restrict BSMs

<b>Command</b>	<b>ipv6 pim accept-bsr list <i>ipv6_access-list</i></b>
<b>Parameter Description</b>	<b>list <i>ipv6_access-list</i></b> : References an IPv6 ACL to restrict the BSR address range. A named ACL is supported.

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring a C-BSR to Restrict the C-PR Range

<b>Command</b>	<b>ipv6 pim accept-crp list</b> <i>ipv6_access-list</i>
<b>Parameter Description</b>	<b>list</b> <i>ipv6_access-list</i> . References an IPv6 ACL to restrict the address range of the C-RP and the group address range served by the C-RP. A named ACL is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command on a C-BSR. When this C-BSR is elected as the BSR, it can restrict the address range of the valid C-RP and the multicast group range served by the C-RP.

### ↘ Displaying BSMs

<b>Command</b>	<b>show ipv6 pim sparse-mode bsr-router</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

### ↘ Displaying All RPs Configured on the Local Device and the Multicast Groups Served by the RPs

<b>Command</b>	<b>show ipv6 pim sparse-mode rp mapping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ↘ Configuring the BSR Border

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure the BSR border on the juncture interface between Router B and Router A.</li> </ul>
	<pre>Ruijie(config-if-GigabitEthernet 0/2)#ipv6 pim bsr-border</pre>
<b>Verification</b>	<p>Before the BSR border is configured, the BSM information of Router A is displayed as follows:</p>
	<pre>switch#show ipv6 pim sparse-mode bsr-router  PIMv2 Bootstrap information    BSR address: 5000::5    Uptime:      00:05:42, BSR Priority: 64, Hash mask length: 126    Expires:     00:01:28    Role: Non-candidate BSR Priority: 0, Hash mask length: 126    State: Accept Preferred  Candidate RP: 3000::5(Loopback 0)    Advertisement interval 60 seconds    Next Cand_RP_advertisement in 00:00:24  switch#</pre>
	<p> <b>Candidate RP:</b> Indicates all C-RPs configured on the local router, excluding other routers.</p>
	<p>After the BSR border is configured, the BSM information of Router A is displayed as follows:</p>
	<pre>switch#show ipv6 pim sparse-mode bsr-router  Candidate RP: 3000::5(Loopback 0)    Advertisement interval 60 seconds    Next Cand_RP_advertisement in 00:00:53</pre>

**➤ Configuring a PIM Router to Restrict the Source Address Range of BSMs to (8000::5/64)**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure PIM Router A to restrict BSMs. The restricted source address range is (8000::5/64).</li> </ul>
	<pre>switch(config)#ipv6 access-list acl switch(config-ipv6-acl)#permit ipv6 8000::5/64 any switch(config-ipv6-acl)#exit switch(config)#ipv6 pim accept-crp list acl</pre>
<b>Verification</b>	<p>Before the BSM restriction is configured, the BSM information of Router A is displayed as follows:</p>
	<pre>switch#show ipv6 pim sparse-mode bsr-router  PIMv2 Bootstrap information    BSR address: 5000::5    Uptime:      00:05:42, BSR Priority: 64, Hash mask length: 126    Expires:    00:01:28    Role: Non-candidate BSR Priority: 0, Hash mask length: 126    State: Accept Preferred    Candidate RP: 3000::5(Loopback 0)      Advertisement interval 60 seconds      Next Cand_RP_advertisement in 00:00:24  switch#</pre>
	<p>After the BSM restriction is configured, the BSM information of Router A is displayed as follows:</p>
	<pre>switch#show ipv6 pim sparse-mode bsr-router  Candidate RP: 3000::5(Loopback 0)    Advertisement interval 60 seconds    Next Cand_RP_advertisement in 00:00:34</pre>

### ➤ [Configuring a C-BSR to Restrict the Source Address Range of C-PR Packets to \(9000::5/64\)](#)

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure Router B to restrict C-RP packets. The restricted source address range is (9000::5/64).</li> </ul>
	<pre>Ruijie(config)#ipv6 access-list acl Ruijie(config-ipv6-acl)#permit ipv6 9000::5/64 any Ruijie(config-ipv6-acl)#exit Ruijie(config)#ipv6 pim accept-crp list acl</pre>
<b>Verification</b>	<p>Before C-RP packet filtering is configured, information about all RP groups on Router B is displayed as follows:</p>
	<pre>Ruijie#show ipv6 pim sparse-mode rp mapping PIM Group-to-RP Mappings This system is the Bootstrap Router (v2) Group(s): ff00::/8   RP: 3000::5(Not self)     Info source: 3000::5, via bootstrap, priority 192       Uptime: 00:02:26, expires: 00:02:08 Ruijie#</pre>
	<p>After C-RP packet filtering is configured, information about all RP groups on Router B is displayed as follows:</p>
	<pre>Ruijie#show ipv6 pim sparse-mode rp mapping PIM Group-to-RP Mappings This system is the Bootstrap Router (v2)</pre>

➤ **Configuring the Static RP First**

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set the address of Interface Loopback0 of Router A to 3000::5. (Omitted)</li> <li>● Set the address of Interface Loopback1 of Router A to 4000::5. (Omitted)</li> <li>● Set the static address of Router A to 3300::5. (Omitted)</li> <li>● Set the static address of Router B to 3300::5.</li> <li>● Configure the static RP first on Router A.</li> </ul>
	<pre>switch(config)#ipv6 pim rp-address 3300::5 switch(config)#ipv6 pim static-rp-preferred</pre>
<p><b>Verification</b></p>	<p>Before static RP first is configured, display information about the RP corresponding to FF16::1.</p>
	<pre>switch#show ipv6 pim sparse-mode rp ff16::1 RP: 4000::5 Info source: 5000::5, via bootstrap PIMv2 Hash Value 126 RP 4000::5, via bootstrap, priority 56, hash value 892666309 RP 3000::5, via bootstrap, priority 200, hash value 1161101765 RP 3300::5, static (hash value 204800453 not used)</pre>
<p><b>Verification</b></p>	<p>After static RP first is configured, display information about the RP corresponding to FF16::1.</p>
	<pre>switch(config)#show ipv6 pim sparse-mode rp ff16::1 RP: 3300::5 (Static) PIMv2 STATIC RP PREFERRED PIMv2 Hash Value 126 RP 4000::5, via bootstrap, priority 56, hash value 892666309 RP 3000::5, via bootstrap, priority 200, hash value 1161101765 RP 3300::5, static (hash value 204800453 not used) switch(config)#</pre>

**Common Errors**

- The basic functions of PIM-SMv6 are not configured or fail to be configured.
- No C-BSR is configured.

- The BSR border is not configured on an interface between different domains.

## 7.4.4 Configuring RP and DR Parameters

### Configuration Effect

- Configure the ignorance of the C-RP priority for the RP reselection.
- Configure the DR at the data source end to detect the RP reachability.
- Restrict the (S,G) multicast group address of the data source so that the ASM model provides the multicast service only for multicast packets within the allowable range.
- Configure the rate limit for the DR at the data source end to transmit Register packets.
- Configure the checksum length of Register packets.
- Configure the source address of Register packets.
- Configure the suppression time of Register packets.
- Configure the probing time of NULL packets.
- Configure the TTL of Register packets received by the RP from the (S,G) multicast group address.
- Configure the static RP first.

### Notes

- The basic functions of PIM-SMv6 must be configured.

### Configuration Steps

#### ▾ Configuring the Ignorance of the C-RP Priority for the RP Reselection

- Optional.
- The ignorance of the C-RP priority can be enabled on each router unless otherwise specified.

#### ▾ Configuring the DR at the Data Source End to Detect the RP Reachability

- Optional.
- The reachability detection can be enabled on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ Restricting the (S,G) Address Range of Register Packets at the Data Source End

- Optional.
- The (S,G) address range of Register packets at the data source end can be restricted on all routers that function as C-RPs or static RPs unless otherwise specified.

#### ▾ Restricting the Rate for the DR at the Data Source End to Transmit Register Packets

- Optional.
- The transmission rate limit of Register packets can be enabled on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ **Configuring the Checksum Length of Register Packets**

- Optional.
- The checksum length of Register packets can be configured on all C-RPs or static RPs unless otherwise specified.

#### ▾ **Configuring the Source Address of Register Packets**

- Optional.
- The source address of Register packets can be configured on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ **Configuring the Suppression Time of Register Packets**

- Optional.
- The suppression time of Register packets can be configured on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ **Configuring the Probing Time of NULL Packets**

- Optional.
- The probing time of NULL packets can be configured on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ **Configuring the TTL of Register Packets Received by the RP from the (S,G) Multicast Group Address**

- Optional.
- The TTL of Register packets from the (S,G) multicast group address can be configured on all routers that function as C-RPs or static RPs unless otherwise specified.

#### ▾ **Configuring the Static RP First**

- Optional.
- The static RP first can be configured on all routers unless otherwise specified.

### **Verification**

---

#### ▾ **Verifying the Ignorance of the C-RP Priority**

Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. Set the address to 4000::5 and priority to 56 for Interface Loopback1 on Router A. Set the C-BSR address to 5000::5 on Router B.

- Run the **show ipv6 pim sparse-mode rp ff16::2** command to display information about the RP that serves the current group.

### ↘ Verifying the DR at the Data Source End to Detect the RP Reachability

Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. Set the address to 4000 : 5 and priority to 56 for Interface Loopback1 on Router A. Set the C-BSR address to 5000: : 5 on Router B. Configure the RP reachability detection on Router B.

- Run the **show running-config** command to check whether the RP reachability detection is configured.

### ↘ Verifying the Restriction of the (S,G) Address Range of Register Packets at the Data Source End

Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. Set the address to 4000: : 5 and priority to 56 for Interface Loopback1 on Router A. Set the C-BSR address to 5000: : 5 on Router B. The address of the multicast group is FF16::2. Set Router A to receive packets only from the multicast source with the source address of (1300::1/64).

- Run the **show ip pim sparse-mode mroute** command to display the (S,G) entries.

### ↘ Verifying the Rate Limit for the DR at the Data Source End to Transmit Register Packets

- Set the rate of transmitting Register packets for Router B and then run the **show ip pim sparse-mode track** command to check the number of transmitted Register packets for confirmation.

### ↘ Verifying the Checksum Length of Register Packets

- Set Router A to check a Register packet based on the entire packet rather than based only on the packet header and Register packet header. Run the **show running-config** command to check the configuration.

### ↘ Verifying the Source Address of Register Packets

- Configure the source address of Register packets on Router B and run the **show running-config** command to check the configuration on Router A.

### ↘ Verifying the Suppression Time and Probing Time of Register Packets

- Configure the suppression time and probing time of Register packets on Router B and run the **show running-config** command to check the configuration.

### ↘ Verifying the TTL of Register Packets Received by the RP from the (S,G) Multicast Group Address

- Configure the TTL of Register packets from the (S,G) multicast group address on Router A and run the **show ip pim sparse-mode mroute** command to display the maximum (S,G) TTL.

### ↘ Verifying the Static RP First

- Configure a static RP and a C-RP on Router A, configure the static RP first, and then run the **show ipv6 pim sparse-mode rp ff16::2** command to display information about the current RP.

## Related Commands

### ↘ Ignoring the C-RP Priority

Command	ipv6 pim ignore-rp-set-priority

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Displaying Information About the RP That Serves a Group

<b>Command</b>	<b>show ipv6 pim sparse-mode rp-hash</b> <i>group-address</i>
<b>Parameter Description</b>	<i>group-address</i> : Indicates the parsed group address.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring the DR Directly Connected to the Data Source to Detect RP Reachability

<b>Command</b>	<b>ipv6 pim register-rp-reachability</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is configured, the RP reachability is detected before Register packets are transmitted. If the RP is reachable, Register packets are transmitted. If the RP is unreachable, Register packets are not transmitted.

#### ▾ Restricting the (S,G) Address Range of Register Packets at the Data Source End

<b>Command</b>	<b>ipv6 pim accept-register</b> { <b>list</b> <i>ipv6_access-list</i> [ <b>route-map</b> <i>map-name</i> ]   <b>route-map</b> <i>map-name</i> [ <b>list</b> <i>ipv6_access-list</i> ] }
<b>Parameter Description</b>	<b>list</b> <i>ipv6_access-list</i> : References an IP extended ACL to restrict the (S,G) address range. The value range is 100-199, 2000-2699, and Word. <b>route-map</b> <i>map-name</i> : Uses a route map to restrict the (S,G) address range.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is configured, when receiving a Register packet from an unauthorized source, the RP immediately returns the Register-Stop packet.

#### ▾ Displaying Multicast Routing Entries

<b>Command</b>	<b>show ipv6 pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ]
<b>Parameter Description</b>	<i>group-or-source-address</i> : Indicates the group address or source address. The two addresses cannot be group addresses or source addresses at the same time.

<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	A group address, a source address, or both addresses can be specified each time. You can also not specify a specific group address or source address but you cannot specify two group addresses or two source addresses at the same time.

#### ▾ Configuring the Rate Limit for the DR to Transmit Register Packets

<b>Command</b>	<b>ipv6 pim register-rate-limit</b> <i>rate</i>
<b>Parameter Description</b>	<i>Rate</i> : Indicates the number of Register packets that are allowed to be transmitted per second. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the transmission rate of Register packets from the (S,G) multicast group address rather than the Register packets of the entire system. After this command is configured, the load of the source DR and RP will be relieved and Register packets whose rate does not exceed the limit will be transmitted.

#### ▾ Displaying the Statistics on PIM Packets

<b>Command</b>	<b>show ipv6 pim sparse-mode track</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	When the system is started, the statistics start time point is first set. Each time <b>clear ip pim sparse-mode track</b> is called, the statistics start time point is set again and the PIM packet counter is cleared.

#### ▾ Configuring the Checksum Calculation of a Register Packet Based on the Entire Packet

<b>Command</b>	<b>ipv6 pim register-checksum-wholepkt</b> [ <b>group-list</b> <i>ipv6_access-list</i> ]
<b>Parameter Description</b>	<b>group-list</b> <i>access-list</i> : Uses an ACL to restrict the group addresses that use this configuration. <i>access-list</i> : Supports digits <1,99> and <1300,1999>. A named ACL is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The device calculates the checksum of a Register packet based on the entire PIM protocol packet including the encapsulated multicast data packet, rather than the PIM header of the Register packet. If <b>group-list</b> <i>ipv6_access-list</i> is not carried in this command, all group addresses apply this configuration.

#### ▾ Configuring the Source Address of Register Packets

<b>Command</b>	<b>ipv6 pim register-source</b> { <i>ipv6_local_address</i>   <i>interface-type interface-number</i> }
<b>Parameter Description</b>	<i>local_address</i> : Specifies an IPv6 address as the source address of Register packets.

	<i>interface-type interface-number</i> . Specifies the IPv6 address of an interface as the source address of Register packets.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The configured address must be reachable. When the RP receives a Register packet, it transmits the Register-Stop packet with the source IPv6 address of the Register packet as the destination address. PIM-SMv6 does not need to be enabled on associated interfaces.

### ↘ Configuring the Suppression Time of Register Packets

<b>Command</b>	<b>ipv6 pim register-suppression</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the suppression time of Register packets. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>60</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configuring this value on the DR will change the suppression time of Register packets defined on the DR. If the <b>ipv6 pim rp-register-kat</b> command is not configured, configuring this value on the RP will change the keepalive time of the RP.

### ↘ Configuring the Probing Time of Register Packets

<b>Command</b>	<b>ipv6 pim probe-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the probing time of Register packets. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>5</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Probing time of Register packets is the interval for the source DR to transmit the NULL-Register packet to the RP prior to the timeout of the suppression time of Register packets. The probing time of Register packets cannot be larger than half of the suppression time of Register packets. Otherwise, the configuration fails and a warning is displayed. In addition, the suppression time of Register packets multiplied by three plus the probing time of Register packets cannot be larger than 65,535. Otherwise, a warning will be displayed.

### ↘ Configuring the KAT Interval on the RP

<b>Command</b>	<b>ipv6 pim rp-register-kat</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the time of the KAT timer. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>210</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Static RP First

<b>Command</b>	<b>ipv6 pim static-rp-preferred</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is configured, the priority of the static RP is higher than that of the RP elected by using the BSR mechanism.

## Configuration Example

### Configuring Whether the C-RP Priority Is Considered for the Group-to-RP Mapping

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure basic functions of PIM-SMv6. (Omitted)</li> <li>Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. (Omitted)</li> <li>Set the address to 4000::5 and priority to 56 for Interface Loopback1 on Router A. (Omitted)</li> <li>Set the C-BSR address to 5000::5 on Router B. (Omitted)</li> <li>Display the group corresponding to FF16::1.</li> <li>Configure the ignorance of C-RP priority on Router B.</li> </ul>
	<pre>switch#configure terminal Ruijie(config)# ipv6 pim ignore-rp-set-priority</pre>
<b>Verification</b>	Before the ignorance of the C-RP priority is configured, the following information is displayed:
	<pre>switch(config)#show ipv6 pim sparse-mode rp FF16::1 RP: 4000::5 Info source: 5000::5, via bootstrap PIMv2 Hash Value 126 RP 4000::5, via bootstrap, priority 56, hash value 892666309 RP 3000::5, via bootstrap, priority 200, hash value 1161101765</pre>
	After the ignorance of the C-RP priority is configured, the following information is displayed:
	<pre>switch(config)#show ipv6 pim sparse-mode rp FF16::1 RP: 3000::5 Info source: 5000::5, via bootstrap</pre>

### Configuring the Reachability Detection of the RP Directly Connected to the Data Source

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure the reachability detection of the RP directly connected to the data source.</li> </ul>
	<pre>Ruijie(config)#ipv6 pim register-rp-reachability</pre>
<b>Verification</b>	<p>Run the <b>show running-config</b> command to check the configuration. The following information is displayed:</p>
	<pre>Ruijie (config)#show running-config ! ! ! ipv6 pim register-rp-reachability ipv6 pim bsr-candidate Loopback 0 ! !</pre>

📌 **Restricting the (S,G) Address Range of Register Packets at the Data Source End**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set Router A to filter packets by source address and receive packets only from the source address (1300::1/64).</li> </ul>
	<pre>switch(config)#ipv6 pim accept-register list acl % access-list 101 not exist switch(config)#ipv6 access-list acl switch(config-ipv6-acl)#permit ipv6 1300::1/64 any switch(config-ipv6-acl)#exit</pre>
<b>Verification</b>	<p>Before the (S,G) address range of Register packets at the data source end is restricted, run the <b>show ipv6 pim sparse-mode mroute</b> command to display multicast entries. The (S,G) entry and (S,G,RPT) entry exist.</p>
	<pre>switch#show ipv6 pim sparse-mode mroute IPv6 Multicast Routing Table  (*,*,RP) Entries: 0 (*,G) Entries: 1 (S,G) Entries: 1</pre>

### Common Errors

- The basic functions of PIM-SMv6 are not configured or fail to be configured.
- The (S,G) address range of Register packets at the data source end is not restricted or fails to be configured on a C-RP or static RP.
- When the (S,G) address range of Register packets at the data source end is restricted, the referenced ACL is not configured or the source/group address range allowed by the ACL is configured incorrectly.
- The source/group address ranges allowed by C-RPs or static RPs are inconsistent.

## 7.4.5 Configuring the Transmission Interval of Join/Prune Packets

### Configuration Effect

- Change the transmission interval of Join/Prune packets to form an RPT or SPT.

### Notes

- The basic functions of PIM-SMv6 must be configured.

### Configuration Steps

- Configure the transmission interval of Join/Prune packets.

### Verification

Set the transmission interval of Join/Prune packets to 120 seconds on Router B. Run the **show ipv6 pim sparse-mode mroute** command to check the entry TTL.

### Related Commands

▾ **Configuring the Transmission Interval of Join/Prune Packets**

<b>Command</b>	<code>ipv6 pim jp-timer seconds</code>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the transmission interval of Join/Prune packets. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>60</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

▾ **Configuring the Transmission Interval of Join/Prune Packets on a Router**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure the transmission interval of Join/Prune packets on a router.</li> </ul>
	<pre>Ruijie(config)#ip pim jp-timer 120</pre>
<b>Verification</b>	Run the <b>show ipv6 pim sparse-mode mroute</b> command to check the entry. The transmission time of Join/Prune packets is not larger than 120.
	<pre>switch(config)#show ipv6 pim sparse-mode mroute IPv6 Multicast Routing Table  (*,*,RP) Entries: 0 (*,G) Entries: 1 (S,G) Entries: 1 (S,G,rpt) Entries: 1 FCR Entries: 0 REG Entries: 0  (*, ff16::1) RP: 4000::5 RPF nbr: :: RPF idx: None Upstream State: JOINED  00 01 02 03 04 05 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 Local</pre>

## 7.4.6 Configuring the Last-Hop Device to Switch from the RPT to the SPT

### Configuration Effect

- Switch the last-hop device from the RPT to the SPT.

### Notes

- The basic functions of PIM-SMv6 must be configured.

### Configuration Steps

- Configure the last-hop device to switch from the RPT to the SPT.

### Verification

Configure basic functions of PIM-SMv6, make the DR at the data source end transmit data streams to Group FF16::1, and make the receiver forcibly join the Group FF16::1 to form a RPT. The DR at the receive end forcibly performs the switching from the RPT to SPT. Check the configuration on the RP.

### Related Commands

#### ▾ Enabling the SPT Switching Function

<b>Command</b>	<b>ipv6 pim spt-threshold [group-list <i>ipv6_access-list</i> ]</b>
<b>Parameter Description</b>	<b>group-list</b> <i>ipv6_access-list</i> : References an IPv6 ACL to restrict the group address range that allows SPT switching. <i>ipv6_access-list</i> : A named ACL is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If <b>group-list</b> <i>ipv6_access-list</i> parameter is not carried in this command, all multicast groups are allowed to conduct SPT switching.  If <b>no</b> is set in this command, <b>group-list</b> is carried, and the carried ACL is a configured ACL, the restriction of the ACL associated with <b>group-list</b> is cancelled and all groups are allowed to switch from the RPT to the SPT.

### Configuration Example

#### ▾ Configuring the Last-Hop Device to Switch from the RPT to the SPT

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Make the DR at the data source end transmit code streams to Group FF16::1.</li> <li>● Make the DR at the receive end receive code streams from Group FF16::1.</li> <li>● Configure the last-hop device to switch from the RPT to the SPT on the DR at the receive end.</li> </ul>
	<pre>switch(config)#ipv6 pim spt-threshold</pre>
<b>Verification</b>	Run the <b>show running-config</b> command to check the configuration.
	<pre>switch(config)#show running-config ! ! ip pim jp-timer 120 ip pim spt-threshold ip pim rp-candidate Loopback 0 ! !</pre>

## 7.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears information about the dynamic RP.	<b>clear ipv6 pim sparse-mode bsr rp-set *</b>
Sets the packet statistics start time again and clears the PIMv6 packet counter.	<b>clear ipv6 pim sparse-mode track</b>

### Displaying

Description	Command
Displays details about the BSR.	<b>show ipv6 pim sparse-mode bsr-router</b>
Displays the PIM-SM information about an interface.	<b>show ipv6 pim sparse-mode interface</b> [ <i>interface-type interface-number</i> ] [ <b>detail</b> ]
Displays the local MLD information about a PIM-SMv6 interface.	<b>show ipv6 pim sparse-mode local-members</b> [ <i>interface-type interface-number</i> ]
Displays the PIM-SMv6 routing information.	<b>show ipv6 pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ]

Displays the PIM-SMv6 neighbor information.	<b>show ipv6 pim sparse-mode neighbor [ detail ]</b>
Displays next hop-relevant information, including the next-hop interface ID, address, and metric.	<b>show ipv6 pim sparse-mode nexthop</b>
Displays all RPs configured on the local device and the groups served by the RPs.	<b>show ipv6 pim sparse-mode rp mapping</b>
Displays information about the RP that serves the group address.	<b>show ipv6 pim sparse-mode rp-hash <i>ipv6-group-address</i></b>
Displays the number of PIM packets transmitted and received from the statistics start time to the current time.	<b>show ipv6 pim sparse-mode track</b>

## 8 Configuring IGMP Snooping

### 8.1 Overview

Internet Group Management Protocol (IGMP) snooping is a mechanism of listening to IP multicast. It is used to manage and control the forwarding of IP multicast traffic within VLANs, realizing Layer-2 multicasting.

As shown in the following figure, when a Layer-2 device is not running IGMP snooping, IP multicast packets are broadcasted within the VLAN; when the Layer-2 device is running IGMP snooping, IP multicast packets are transmitted only to profile members.

Figure 8-1 Networking Topology of IP Multicast Forwarding within the VLAN Before and After IGMP Snooping Is Run on the Layer-2 Device

#### Protocols and Standards

- RFC4541: Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches

## 8.2 Applications

Application	Description
<a href="#">Layer-2 Multicast Control</a>	Enables precise forwarding of Layer-2 multicast packets to avoid flooding at this layer.
<a href="#">Shared Multicast Services (Multicast VLAN)</a>	Multiple users can share the multicast traffic of the same VLAN.
<a href="#">Premium Channels and Preview</a>	Controls the range of multicast addresses that allow user demanding and allows preview for profiles who are inhibited from demanding.

### 8.2.1 Layer-2 Multicast Control

#### Scenario

As shown in the following figure, multicast packets are transmitted to users through a Layer-2 switch. When Layer-2 multicast control is not performed, namely, when IGMP snooping is not implemented, multicast packets are flooded to all the users including those who are not expected to receive these packets. After IGMP snooping is implemented, the multicast packets from an IP multicast profile will no longer be broadcast within the VLAN but transmitted to designated receivers.

Figure 8-2 Networking Topology of Implementing Layer-2 Multicast Control (Multicast VLAN)

#### Deployment

Configure basic IGMP snooping functions.

## 8.2.2 Shared Multicast Services (Multicast VLAN)

### Scenario

In Shared VLAN Group Learning (SVGL) mode or IVGL-SVGL mode (IVGL: Independent VLAN Group Learning), a device running IGMP snooping can provide shared multicast services (or multicast VLAN services) to the VLAN users. Typically, this function is used to provide the same video-on-demand (VOD) services to multiple VLAN users.

The following figure shows the operation of a Layer-2 multicast device in SVGL mode of IGMP snooping. The multicast router sends a multicast packet to VLAN 1, and the Layer-2 multicast device automatically transfers the packet to VLAN 1, VLAN 2, and VLAN 3. In this way, the multicast services of VLAN 1 are shared by VLAN 2 and VLAN 3.

Figure 8-3 Networking Topology of Shared Multicast Services (Multicast VLAN)

- i If the Layer-2 multicast device operates in IVGL mode, the router must send a packet to each VLAN, which wastes bandwidth and burdens the Layer-2 multicast device.

### Deployment

- Configure basic IGMP snooping functions (in SVGL mode or IVGL-SVG mode).

## 8.2.3 Premium Channels and Preview

### Scenario

In VOD application, by limiting the range of the multicast addresses that a user host can access, unpaid users will not be able to watch the premium channels. Thereafter, the preview service is offered to unpaid users before they decide whether to pay for it.

The users can preview a premium channel for a certain period of time (for example 1 minute) after demanding it.

### Deployment

- Configure basic IGMP snooping functions (in any working mode).

- Configure the range of multicast addresses that a user can access.
- Enable the preview function for VOD profiles that are denied access.

## 8.3 Features

### Basic Concepts

#### ▾ Multicast Router Ports and Member Ports

**i** IGMP snooping is VLAN-based. The ports involved refer to the member ports within the VLAN.

The device running IGMP snooping identifies the ports within the VLAN as a multicast router port or member port so as to manage and control the forwarding of IP multicast traffic within the VLAN. As shown in the following figure, when IGMP snooping is run on a Layer-2 device, multicast traffic enters the multicast router port and exits from the member ports.

Figure 8-4 Networking Topology of Two IGMP Snooping Ports

- Multicast router port: The location of the multicast source is directed by the port on the Layer-2 multicast device which is connected to the multicast router (Layer-3 multicast device): By listening to IGMP packets, the Layer-2 multicast device can automatically detect the multicast router port and maintain the port dynamically. It also allows users to configure a static router port.
- Member port: The port is on a Layer-2 multicast device and is connected to member hosts. It directs the profile members. It is also called the Listener Port. By listening to IGMP packets, the Layer-2 multicast device can automatically detect the member port and maintain the port dynamically. It also allows users to configure a static member port.

#### ▾ IGMP Snooping Forwarding Entry

The device running IGMP snooping forwards IP multicast packets in accordance with the IGMP snooping forwarding entry.

An IGMP snooping forwarding entry includes the following items: source address (S), profile address (G), VLAN ID (VLAN\_ID), multicast router port, and member port. It indicates that packets of required features (including S, G, and VLAN\_ID) should

enter the multicast router port and exit from a member port. An IGMP snooping forwarding entry is identified using a group of S, G, and VLAN\_ID.

To display the IGMP snooping forwarding entry, run the **show ip igmp snooping gda-table** command.

```
Ruijie# show ip igmp snooping gda-table
Multicast Switching Cache Table
  D: DYNAMIC //Dynamic member port
  S: STATIC //Static member port
  M: MROUTE //Multicast router port (dynamic or static)
(*, 233.3.6.29, 1): //(S: any; G: 233.3.6.29; VLAN_ID: VLAN 1)
VLAN(1) 3 OPORTS:
  GigabitEthernet 0/3(S)
  GigabitEthernet 0/2(M)
  GigabitEthernet 0/1(D)

(*, 233.3.6.30, 1): //S: any; G: 233.3.6.30; VLAN_ID: VLAN 1)
VLAN(1) 2 OPORTS:
  GigabitEthernet 0/2(M)
  GigabitEthernet 0/1(D)
```

## Overview

Feature	Description
<a href="#">Listening to IGMP Packets</a>	Discovers and identifies the router port and member port to establish and maintain the IGMP snooping forwarding entries. :
<a href="#">IGMP Snooping Working Modes</a>	Provides independent or shared multicast services to the user VLAN.
<a href="#">Multicast Security Control Profile</a>	Controls the multicast service scope and load to prevent illegal multicast traffic.
<a href="#">Handling QinQ</a>	Defines the range of multicast addresses that permit or deny user requests for reference of other functions.
<a href="#">IGMP Querier</a>	Sets the forwarding mode of multicast packets on the QinQ interface.
	On a network without a Layer-3 multicast device, the Layer-2 multicast device acts as an IGMP querier.

### 8.3.1 Listening to IGMP Packets

A device running IGMP snooping analyzes IGMP packets received, and finds and identifies the router port and member port using these packets, thereby creating and maintaining an IGMP snooping entry.

#### Working Principle

A device running IGMP snooping can identify and handle the following types of IGMP packets:

##### Query Packets

- An IGMP querier periodically sends General Query packets. When the IGMP querier receives Leave packets, it sends Group-Specific Query packets.

When the device running IGMP snooping receives the Query packets, it performs the following operations within the VLAN:

- Forward the IGMP Query packets to all the ports (except the receiving port of these packets).
- If the receiving port is a dynamic router port, reset the aging timer. If the timer expires, the port will no longer be used as the dynamic router port.
- If the receiving port is not a dynamic router port, use it as a dynamic router port and enable the aging timer. If the timer expires, the port will no longer be used as the dynamic router port.
- For general queries, reset the aging timer for all the dynamic member ports. If the timer expires, the port will no longer be used as the dynamic member port for the general group. By default, the maximum response time carried by the IGMP query packets is used as the timeout time of the aging timer. If **ip igmp snooping query-max-response-time** is run, the time displayed is used as the timeout time of the aging timer.
- For designated query packets, reset the aging timer for all the dynamic member ports of the designated profile. If the timer expires, the port will no longer be used as the dynamic member port of the designated profile. By default, the maximum response time carried by the IGMP query packets is used as the timeout time of the aging timer. If **ip igmp snooping query-max-response-time** is run, the time displayed is used as the timeout time of the aging timer.
- If dynamic router port learning is disabled, IGMP snooping will not learn the dynamic router port.

##### Report Packets

- When a member host receives a query, it responds to the query with a Report packet. If a host requests to join a profile, it will also send a report.
- By default, IGMP Snooping is capable of processing IGMPv1 and IGMPv2 packets. For IGMPv3 Report packets, it processes profile information but does not process carried source information. IGMP Snooping v3 can be configured to process all information in IGMPv1, IGMPv2, and IGMPv3 packets.

When the device running IGMP snooping receives the Report packets, it performs the following operations within the VLAN:

- Forward the Report packets from all the router ports. After the **ip igmp snooping suppression enable** command is run in one IGMP query cycle, only the first report received by each profile will be forwarded.
- If the port on which Report packets are received is a dynamic member port, reset the aging timer. If the timer expires, the

port will no longer be used as the dynamic member port of the designated profile.

- If the port on which Report packets are received is not a dynamic member port, use it as a dynamic member port and enable the aging timer. If the timer expires, the port will no longer be used as the dynamic member port of the designated profile.

### ↳ Leave Packets

- If a host requests to leave a profile, it will send a Leave packet.

When the device running IGMP snooping receives the Leave packets, it performs the following operations within the VLAN:

- Forward the leave packets from all the router ports.
- If the port on which leave packets are received is a dynamic member port and the Leave function is enabled, the port will be immediately deleted from the IGMP snooping forwarding entry of the designated profile and will no longer be used as the dynamic member port.
- If the port on which the leave packets are received is a dynamic member port and the Leave function is disabled, the port state should be maintained.

## Related Configuration

### ↳ Configuring a Static Router Port

Run the **ip igmp snooping vlan mrouter interface** command to configure a static router port.

### ↳ Configuring a Static Member Port

Run the **ip igmp snooping vlan static interface** command to configure a static member port.

### ↳ Enabling Report Suppression

Report suppression is disabled by default.

Run the **ip igmp snooping suppression enable** command to enable report suppression.

After report suppression is enabled, in one IGMP query cycle, only the first Report packet received by each profile will be forwarded. The source media access control (MAC) address of the forwarded report will be changed to the MAC address of the device.

### ↳ Enabling Immediate Leave

Immediate leave is disabled by default.

Run the **ip igmp snooping fast-leave enable** command to enable immediate leave.

### ↳ Enabling Dynamic Router Port Learning

Dynamic router port learning is enabled by default.

Run the **no ip igmp snooping mrouter learn pim-dvmrp** command to disable dynamic router port learning.

Run the **no ip igmp snooping vlan vid mrouter learn pim-dvmrp** command to disable dynamic router port learning for designated VLANs.

#### ↘ Configuring the Aging Time of a Dynamic Router Port

The default aging time is 300s.

When a dynamic router port receives a query packet, the aging timer of the port is enabled or reset; if the aging time is not configured, the maximum response time carried by the query packet is used as the aging time.

Run **ip igmp snooping dyn-mr-aging-time** to configure the aging time of the dynamic router port.

#### ↘ Configuring the Aging Time of a Dynamic Member Port

The default aging time is 260s.

When a dynamic member port receives a query packet, the aging timer of the port is enabled or reset, and the aging time is the maximum response time carried by the query packet.

When a dynamic member port receives a Report packet, the aging timer of the port is enabled or reset, and the aging time is the maximum response time of the dynamic member port.

Run **ip igmp snooping host-aging-time** to configure the aging time of the dynamic member port.

#### ↘ Configuring the Maximum Response Time of a Query Packet

The maximum response time of a query packet is not configured by default and the maximum response time carries by the query packet is used.

Run **ip igmp snooping query-max-response-time** to configure the maximum response time of a query packet.

## 8.3.2 IGMP Snooping Working Modes

A device running in the three modes (IVGL, SVGL, and IVGL-SVGL) of IGMP snooping can provide independent multicast services or shared multicast services to the user VLAN.

### Working Principle

#### ↘ IVGL

In IVGL mode, a device running IGMP snooping can provide independent multicast services to each user VLAN.

Independent multicast services indicate that multicast traffic can be forwarded only within the VLAN it belongs to, and a user host can subscribe to the multicast traffic within the VLAN that the host belongs to.

#### ↘ SVGL

In SVGL mode, a device running IGMP snooping can provide shared multicast services to the user VLAN.

Shared multicast services can be provided only on shared VLANs and sub VLANs and SVGL multicast addresses are used. In a shared VLAN, the multicast traffic within the range of SVGL multicast addresses is forwarded to a sub VLAN, and the user hosts within the sub VLAN subscribe to such multicast traffic from the shared VLAN.

- In a shared VLAN and sub VLAN, shared multicast services will be provided to the multicast traffic within the range of SVGL multicast addresses. Other multicast traffic will be discarded.
  - Other VLANs (except shared VLANs and sub VLANs) apply to independent multicast services.
- 
- i** When the user VLAN is set to a shared VLAN or sub VLAN, shared multicast services are provided; when a user VLAN is set to other VLANs, independent multicast services are provided.
- 

### IVGL-SVGL

IVGL-SVGL mode is also called the hybrid mode. In this mode, a device running IGMP snooping can provide both shared and independent multicast services to the user VLAN.

- In a shared VLAN and sub VLAN, multicast services will be provided to the multicast traffic within an SVGL profile. For other multicast traffic, independent multicast services will be provided.
  - Other VLANs (except shared VLANs and sub VLANs) apply to independent multicast services.
- 
- i** When a user VLAN is configured as a shared VLAN or sub VLAN, both public multicast services and independent multicast services are available. When a user VLAN is configured as a VLAN other than shared VLAN and sub VLAN, only the independent multicast services are available.
- 

## Related Configuration

### Enabling IGMP Snooping and Selecting a Working Mode

IGMP snooping is disabled by default.

Run the **ip igmp snooping ivgl** command to enable IGMP snooping in IVGL mode.

Run the **ip igmp snooping svgl** command to enable IGMP snooping in SVGL mode.

Run the **ip igmp snooping ivgl-svgl** command to enable IGMP snooping in IVGL-SVGL mode.

A working mode must be designated when enabling IGMP snooping, namely, one of the preceding working modes must be selected.

### Configuring Shared VLAN

The shared VLAN is VLAN 1 by default.

Run the **ip igmp snooping svgl vlan** command to designate a VLAN as the shared VLAN.

In SVGL mode and IVGL-SVGL mode, only one VLAN can be configured as the shared VLAN.

### Configuring Sub VLAN

By default, a sub VLAN is any VLAN except the shared VLAN.

Run the **ip igmp snooping svgl subvlan** command to designate a VLAN as the sub VLAN.

In SVGL mode and IVGL-SVGL mode, the number of sub VLANs is not limited.

### Configuring an SVGL Profile

No default setting.

Run the **ip igmp snooping svgl profile** *profile\_num* command to configure the address range of an SVGL profile.

 In SVGL mode and IVGL-SVGL mode, the SVGL profile range must be configured; otherwise, shared multicast services cannot be provided.

### 8.3.3 IGMP Security Control

A device running IGMP snooping can control the multicast service scope and load, and effectively prevents illegal multicast traffic.

#### Working Principle

##### ▾ Configuring the Profile Filtering for User Demanding

By configuring the profile list that a user can access, you can customize the multicast service scope to guarantee the interest of operators and prevent illegal multicast traffic.

To enable this function, you should use a profile to define the range of multicast addresses that a user is allowed to access.

- When the profile is applied on a VLAN, you can define the multicast addresses that a user is allowed to access within the VLAN.
- When the profile is applied on an interface, you can define the multicast addresses that a user is allowed to access under the port.

##### ▾ Multicast Preview

If the service provider wants to allow the users to preview some multicast video traffic that denies the users' access, and stop the multicast video traffic after the preview duration is reached, the user-based multicast preview function should be provided. The multicast preview function is used together with multicast permission control. For example, in the application of videos, the administrator controls some premium channels by running the **ip igmp profile** command on a port or VLAN. In this way, unsubscribed users will not be able to watch these channels on demand. If users want to preview the channels before they decide whether to pay for watching or not, the multicast preview function can be enabled, allowing the premium channels to be previewed by unpaid users for a certain period of time (for example 1 minute).

##### ▾ Controlling the Maximum Number of Profiles Allowed for Concurrent Request

If there is too much multicast traffic requested at the same time, the device will be severely burdened. Configuring the maximum number of profiles allowed for concurrent request can guarantee the bandwidth.

- You can limit the number of profiles allowed for concurrent request globally.
- You can also limit the number of profiles allowed for concurrent request on a port.

##### ▾ Controlling the Entry of Multicast Traffic

By running the **ip igmp snooping source-check port** command to enable source port inspection, you can restrict the entry of multicast traffic to prevent illegal traffic.

- When source port inspection is enabled, only the multicast traffic entered from the router port is considered as legal; the

traffic from other ports is considered as illegal and will be discarded.

- When source port inspection is disabled, the traffic entered from any port is considered as legal.

### ▾ **Configuring the Source IP Inspection for Multicast Traffic**

By enabling source IP inspection, you can restrict the IP address of multicast traffic to prevent illegal traffic.

Source IP inspection includes the inspection of the source IP addresses of specific profiles and of default profiles.

- Inspection of the source IP addresses of default profiles (also called source-check default-server): Specifies the source IP addresses for all the multicast profiles within all VLANs. Only the multicast traffic whose source IP address is the same as the set one is considered as legal.
- Inspection of the source IP addresses of specific profiles (also called limit-ipmc): Specifies the source IP addresses for specific multicast profiles within specific VLANs. Among the multicast traffic received from the specific multicast profiles within the VLANs, only the one with the same source IP address as the set one is considered as legal and will be forwarded by the multicast device; other traffic will be discarded.

## **Related Configuration**

### ▾ **Configuring the Profile Filtering**

By default, profiles are not filtered and allow user access.

To filter multicast profiles, run the **ip igmp snooping filter** command in interface configuration mode or global configuration mode.

### ▾ **Enabling Preview**

Preview is not enabled by default.

Run the **ip igmp snooping preview** command to enable preview and restrict the range of the profiles permitted for multicast preview.

Run the **ip igmp snooping preview interval** to set the multicast preview duration.

### ▾ **Configuring the Maximum Number of Profiles Allowed for Concurrent Request on a Port**

By default, the number of profiles allowed for concurrent request is not limited.

Run the **ip igmp snooping max-groups** command to configure the maximum number of profiles allowed for concurrent request.

### ▾ **Configuring the Maximum Number of Multicast Profiles Allowed Globally**

By default, the maximum number of multicast profiles allowed globally is 65,536.

Run the **ip igmp snooping l2-entry-limit** command to configure the maximum number of multicast profiles allowed globally.

### ▾ **Enabling Source Port Inspection**

By default, source port inspection is not configured.

Run the **ip igmp snooping source-check port** command to enable source port inspection.

## ↳ Enabling Source IP Inspection

By default, source IP inspection is disabled.

- Run the **ip igmp snooping source-check default-server** *address* command to enable source IP inspection and specify the default source IP address (applicable to any profile of any VLAN).
- (Optional) Run the **ip igmp snooping limit-ipmc vlan** *vid address group-address server source-address* command to specify a specific source IP address for a specific profile of specific VLAN (applicable to a specific profile of specific VLAN).

First, you must enable source IP inspection to specify default source address, and then a specific source address can be specified for a specific profile of specific VLAN. If a source address is specified for a specific profile of specific VLAN, the multicast traffic of the specific profile will perform inspection for the source address specified by this command. Other multicast traffic will perform inspection for default source addresses.

## 8.3.4 IGMP Profile

A multicast profile is used to define the range of multicast addresses that permit or deny user demanding request for reference of other functions.

### Working Principle

The profile is used to define the range of multicast addresses.

When SVGL mode is enabled, an SVGL profile is used to define the range of SVGL multicast addresses.

When the multicast filter is configured on an interface, a profile is used to define the range of multicast addresses that permit or deny user request under the interface.

When a VLAN filter is configured, a profile is used to define the range of multicast addresses that permit or deny user request under within the VLAN.

When the preview function is enabled, a profile is used to define the range of multicast address allowed for preview.

### Related Configuration

#### ↳ Configuring a Profile

Default configuration:

- Create a profile, which is **deny** by default.

Configuration steps:

- Run the **ip igmp profile** *profile-number* command to create a profile.
- Run the **range** *low-address high\_address* command to define the range of multicast addresses. Multiple address ranges are configured for each profile.
- (Optional) Run the **permit** or **deny** command to permit or deny user request (**deny** by default). Only one **permit** or **deny** command can be configured for each profile.

### 8.3.5 IGMP QinQ

#### Working Principle

On a device with IGMP snooping enabled and dot1q-tunnel (QinQ) port configured, IGMP snooping will handle the IGMP packets received by the QinQ port using the following two approaches:

- Approach 1: Create a multicast entry on the VLAN where IGMP packets are located. The forwarding of IGMP packets on the VLAN where these packets are located is called transparent transmission. For example, presume that IGMP snooping is enabled for a device, Port A is designated as the QinQ port, the default VLAN of this port is VLAN 1, and it allows the passage of VLAN 1 and VLAN 10 packets. When a multicast Query packet is sent by VLAN 10 to Port A, IGMP snooping establishes a multicast entry for VLAN 10 and forwards the multicast Query packet to the router port of VLAN 10.
- Approach 2: Create a multicast entry on the default VLAN of the QinQ port. Encapsulate the multicast packet with the VLAN tag of the default VLAN where the QinQ port is located and forward the packet within the default VLAN. For example, presume that IGMP snooping is enabled for a device, Port A is designated as the QinQ port, the default VLAN of this port is VLAN 1, and it allows the passage of VLAN 1 and VLAN 10 packets. When a multicast Query packet is sent by VLAN 10 to Port A, IGMP snooping establishes a multicast entry for VLAN 1, encapsulates the multicast query packet with the tag of VLAN 1, and forward the packet to VLAN 1 router port.

#### Related Configuration

##### ↳ [Configuring QinQ](#)

By default, IGMP snooping works in the mode specified in Approach 2.

Run the **ip igmp snooping tunnel** command to implement Approach 1.

### 8.3.6 IGMP Querier

On a network with a Layer-3 multicast device, the Layer-3 multicast device acts as an IGMP querier. In this case, a Layer-2 device needs only to listen to IGMP packets to establish and maintain the forwarding entry, realizing Layer-2 multicast.

On a network without a Layer-3 multicast device, the Layer-2 multicast device must be configured with the IGMP querier function so that the device can listen to IGMP packets. In this case, a Layer-2 device needs to act as an IGMP querier as well as listen to IGMP packets to establish and maintain the forwarding entry to realize Layer-2 multicast.

#### Working Principle

A Layer-2 device acts as an IGMP querier to periodically send IGMP Query packets, listen to and maintain the IGMP Report packets replied by a user, and create a Layer-2 multicast forwarding entry. You can adjust relevant parameters of the Query packets sent by the IGMP querier through configuration.

When the device receives a Protocol-Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP) packet, it considers that a multicast router, which will act as an IGMP querier, exists on the network and disables the querier function. In this way, IGMP routing will not be affected.

When the device receives the IGMP Query packets from other devices, it will compete with other devices for the IGMP querier.

### ↳ Enabling the Querier Function

You can enable the querier for a specific VLAN or all VLANs.

Only when the global querier function is enabled can the queriers for specific VLANs take effect.

### ↳ Specifying the IGMP Version for a Querier

The version of IGMP used for sending Query packets can be configured as IGMPv1, or IGMPv2.

### ↳ Configuring the Source IP Address of a Querier

You can configure the source IP address of a query packet sent by the querier based on VLANs.

When the source IP address of the querier is not configured, the querier will not take effect.

### ↳ Configuring the Query Interval of a Querier

You can configure the intervals for sending global Query packets based on different queriers on different VLANs.

### ↳ Configuring the Maximum Response Time of a Query Packet

You can configure the maximum response time carried by a Query packet that is sent by a querier. As IGMPv1 does not support the carrying of maximum response time by a Query packet, this configuration does not take effect when the querier is running IGMPv1. You can configure different maximum response time for queriers on different VLANs.

### ↳ Configuring the Aging Time of a Querier

When other IGMP queriers exist on a network, the existing device will compete with other queriers. If the existing device fails to be elected and is in the non-querier state, the aging timer of a querier will be enabled. After the timer expires, other queriers on the network are considered as expired and the existing device will be resumed as the querier.

## Related Configuration

### ↳ Enabling the Querier Function

By default, the querier function of a device is disabled.

Run the **ip igmp snooping querier** command to enable the global querier function.

Run the **ip igmp snooping vlan num querier** command to enable the querier function for specific VLANs.

### ↳ Specifying the IGMP Version for a Querier

By default, a querier runs IGMPv2.

Run the **ip igmp snooping querier version** command to configure the global querier version.

Run the **ip igmp snooping vlan querier version** command to specify the querier version for specific VLANs.

### ↘ **Configuring the Source IP Address of a Querier**

By default, the source IP address of a querier is 0.

Run the **ip igmp snooping querier address** command to enable global source IP addresses of queriers.

Run the **ip igmp snooping vlan querier address** command to specify the source IP addresses of the queriers on specific VLANs.

### ↘ **Configuring the Query Interval of a Querier**

By default, the query interval of a querier is 60s.

Run the **ip igmp snooping querier query-interval** command to enable the global query interval of queriers.

Run **ip igmp snooping vlan querier query-interval** to specify the global query interval of the queriers on specific VLANs.

### ↘ **Configuring the Maximum Response Time of a Query Packet**

By default, the maximum response time of a query packet is 10s.

Run the **ip igmp snooping querier max-response-time** command to configure the maximum response time of the query packets sent by global queriers.

Run the **ip igmp snooping vlan querier max-response-time** command to specify the maximum response time of the query packets sent by the queriers on specific VLANs.

### ↘ **Configuring the Aging Time of a Querier**

By default, the aging time of a querier is 125s.

Run the **ip igmp snooping querier max-response-time** command to configure the aging time of global queriers.

Run the **ip igmp snooping vlan querier max-response-time** command to configure the aging time of queriers on specific VLANs.

## 8.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic IGMP Snooping Functions (IVGL Mode)</a>	 Any of IVGL mode, SVGL mode, and IVGL-SVGL mode must be selected. It is used to enable IGMP snooping in IVGL mode.	
	<b>ip igmp snooping ivgl</b>	Enables global IGMP snooping in IVGL mode.
	<b>no ip igmp snooping vlan num</b>	Disables IGMP snooping for a VLAN.
<a href="#">Configuring Basic IGMP Snooping Functions (SVGL Mode)</a>	 Any of IVGL mode, SVGL mode, and IVGL-SVGL mode must be selected. It is used to enable IGMP snooping in SVGL mode.	
	<b>ip igmp snooping svgl</b>	Enables global IGMP snooping in IVGL mode.

	<b>no ip igmp snooping vlan <i>num</i></b>	Disables IGMP snooping for a VLAN.
	<b>ip igmp snooping svgl profile <i>profile_num</i></b>	Configures the SVGL profile.
	<b>ip igmp snooping svgl vlan</b>	Specifies the SVGL shared VLAN.
	<b>ip igmp snooping svgl subvlan</b>	Specifies the SVGL sub VLAN.
<a href="#">Configuring Basic IGMP Snooping Functions (IVGL-SVGL Mode)</a>	 Any of IVGL mode, SVGL mode, and IVGL-SVGL mode must be selected. It is used to enable IGMP snooping in IVGL-SVGL mode.	
	<b>ip igmp snooping ivgl-svgl</b>	Enables global IGMP snooping in IVGL-SVGL mode.
	<b>no ip igmp snooping vlan <i>num</i></b>	Disables IGMP snooping for a VLAN.
	<b>ip igmp snooping svgl profile <i>profile_num</i></b>	Configures the SVGL profile.
	<b>ip igmp snooping svgl vlan</b>	Specifies the SVGL shared VLAN.
	<b>ip igmp snooping svgl subvlan</b>	Specifies the SVGL sub VLAN.
<a href="#">Configuring the Packet Processing</a>	 (Optional) It is used to adjust relevant configurations for processing protocol packets.	
	<b>ip igmp snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b>	Configures a static router port.
	<b>p igmp snooping vlan <i>vid</i> static group-address interface <i>interface-type</i> <i>interface-number</i></b>	Configures a static member port.
	<b>ip igmp snooping vlan <i>vlan-id</i> mrouter learn pim-dvmrp</b>	Enables dynamic router port learning.
	<b>ip igmp snooping dyn-mr-aging-time <i>time</i></b>	Configures the aging time of a dynamic router port.
	<b>ip igmp snooping host-aging-time <i>time</i></b>	Configures the aging time of a dynamic member port.
	<b>ip igmp snooping fast-leave enable</b>	Enables the immediate-leave function for a dynamic member port.
	<b>ip igmp snooping query-max-response-time <i>time</i></b>	Configures the maximum response time of an IGMP query packet.
	<b>ip igmp snooping suppression enable</b>	Enables IGMP Report packet suppression.
<a href="#">Configuring IGMP Security Control</a>	 (Optional) It used to guarantee the security when a user requests a multicast profile.	
	<b>ip igmp snooping filter <i>profile-number</i></b>	Configures the profile filtering for user access.
	<b>ip igmp snooping vlan <i>num</i> filter <i>profile-number</i></b>	Configures the per-VLAN profile filtering for user access.
	<b>ip igmp snooping l2-entry-limit <i>number</i></b>	Configures the maximum number of profiles globally for user access.

	<b>ip igmp snooping max-groups</b> <i>number</i>	Configures the maximum number of dynamic profiles for user access.
	<b>ip igmp snooping source-check port</b>	Enables source IP inspection, which ensures the multicast traffic from the router port is legal.
	<b>ip igmp snooping source-check default-server</b> <i>address</i>	Enables source IP inspection. The multicast traffic whose source IP address matches the specified source IP address is considered as legal traffic.
	<b>ip igmp snooping limit-ipmc vlan</b> <i>vid address group-address server source-address</i>	Specifies a VLAN. In the multicast traffic of multicast addresses, the one whose source IP address matches the specified source IP address is considered as legal traffic.
	<b>ip igmp snooping preview</b> <i>profile-number</i>	Enables the preview function for a specified profile.
	<b>ip igmp snooping preview interval</b> <i>num</i>	Configures the preview duration.
<a href="#">Configuring an IGMP Profile</a>	 (Optional) It is used to define the range of multicast addresses that permits or denies the access of a user host.	
	<b>ip igmp profile</b> <i>profile-number</i>	Creates a profile.
	<b>range</b> <i>low-address high_address</i>	Configures the profile range.
	<b>permit</b>	Permits the access of a user host.
	<b>deny</b>	Denies the access of a user host.
<a href="#">Configuring IGMP QinQ</a>	 (Optional) It is used to configure QinQ interface to forward multicast packets using the VLAN identifier (VID) carried by packets.	
	<b>ip igmp snooping tunnel</b>	Configures QinQ to transmit IGMP packets transparently.
<a href="#">Configuring an IGMP Querier</a>	 (Optional) It is used to enable IGMP querier function on a network without a Layer-3 multicast device.	
	<b>ip igmp snooping querier</b>	Enables global querier function.
	<b>ip igmp snooping vlan</b> <i>num querier</i>	Enables the querier for a VLAN.
	<b>ip igmp snooping querier version</b> <i>num</i>	Specifies the IGMP version for queriers globally.
	<b>ip igmp snooping vlan</b> <i>num querier version num</i>	Specifies the IGMP version for a querier of a VLAN.
	<b>ip igmp snooping querier address</b> <i>a.b.c.d</i>	Configures the source IP address of queriers globally.

<b>ip igmp snooping vlan <i>num</i> querier address a.b.c.d</b>	Configures the source IP address for a querier of a VLAN.
<b>ip igmp snooping querier query-interval <i>num</i></b>	Configures the query interval of queriers globally.
<b>ip igmp snooping vlan <i>num</i> querier query-interval <i>num</i></b>	Configures the query interval for a querier of a VLAN.
<b>ip igmp snooping querier max-response-time <i>num</i></b>	Configures the maximum response time for query packets globally.
<b>ip igmp snooping vlan <i>num</i> querier max-response-time <i>num</i></b>	Configures the maximum response time of query packets for a VLAN.
<b>ip igmp snooping querier timer expiry <i>num</i></b>	Configures the aging timer for queriers globally.
<b>ip igmp snooping vlan <i>num</i> querier timer expiry <i>num</i></b>	Configures the aging timer for a querier of a VLAN.

## 8.4.1 Configuring Basic IGMP Snooping Functions (IVGL Mode)

### Configuration Effect

- Enable IGMP snooping to realize Layer-2 multicast.
- Provide independent multicast services to each VLAN.

### Notes

- IP multicast cannot be realized in SVGL mode. If IP multicast must be used, select the IVGL mode.

### Configuration Steps

#### ▾ Enabling Global IGMP Snooping in IVGL Mode

Mandatory.

After IGMP snooping is enabled globally, this function will be enabled for all VLANs.

If not specified, it is advised to run global IGMP snooping on all the devices connected user hosts.

#### ▾ Disabling IGMP Snooping for a VLAN

(Optional) You can use this function if you wish to disable IGMP snooping on specified VLANs.

Only when global IGMP snooping is enabled can it be disabled on specified VLANs.

In IVGL mode, each VLAN can enjoy independent multicast services. Disabling any VLAN multicast services will not interfere in the services provided to the others.

### Verification

- Run the **show ip igmp snooping gda-table** command to display the IGMP snooping forwarding table and verify that the member ports include only those connecting member hosts.
- Run the **show ip igmp snooping** command to display the basic IGMP snooping information and verify that IGMP snooping is working in IVGL mode.

## Related Commands

### ▾ Enabling Global IGMP Snooping in IVGL Mode

<b>Command</b>	<b>ip igmp snooping ivgl</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is executed, IGMP snooping will be run on all VLANs. By default, IGMP snooping is disabled.

### ▾ Disabling IGMP Snooping for a VLAN

<b>Command</b>	<b>no ip igmp snooping vlan <i>num</i></b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Only when global IGMP snooping is enabled can it be disabled on specified VLANs. In IVGL mode, you can disable IGMP snooping on any VLAN.

### ▾ Displaying the IGMP Snooping Entry

<b>Command</b>	<b>show ip igmp snooping gda-table</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	This command is used to verify that the ports include only those connecting member hosts.

### ▾ Displaying the IGMP Snooping Working Mode

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A

<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If a device is running in IVGL mode, the following information is displayed: <div style="background-color: #e0e0e0; padding: 5px; margin-top: 5px;">IGMP Snooping running mode: IVGL</div>

### Configuration Example

#### ▾ Providing Layer-2 Multicast Services for the Subnet Hosts

<p><b>Scenario</b> Figure 8-5</p>	
	<p>A is the multicast router and is connected directly to the multicast source.                  B is the Layer-2 device and is connected directly to the user host.                  Receiver 1, Receiver 2, and Receiver 3 belong to VLAN 1.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the IP address and VLAN.</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> <li>● Enable IGMP snooping on B and select IVGL mode.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip pim sparse-mode A(config-if-GigabitEthernet 0/1)# exit A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode</pre>

	A(config-if-VLAN 1)# exit
<b>B</b>	<pre>B# configure terminal B(config)# ip igmp snooping ivgl</pre>
<b>Verification</b>	<p>Send packets from the source (10.1.1.1) to G (229.1.1.1) to add Receiver 1 to G.</p> <ul style="list-style-type: none"> <li>● Confirm that the packets (10.1.1.1 and 229.1.1.1) are received by Receiver 1.</li> <li>● Display the IGMP snooping forwarding entry on B and ensure that the port (10.1.1.1, 229.1.1.1, 1) includes only Fa0/2.</li> <li>● Check whether the IGMP snooping working mode is IVGL.</li> </ul>
<b>B</b>	<pre>B# show ip igmp snooping gda-table Multicast Switching Cache Table D: DYNAMIC S: STATIC M: MROUTE (*,224.1.1.1, 1): VLAN(1) 2 OPORTS: FastEthernet 0/1(M) FastEthernet 0/2(D)</pre> <pre>B# show ip igmp snooping IGMP Snooping running mode: IVGL IGMP Snooping L2-entry-limit: 65536 Source port check: Disable Source ip check: Disable IGMP Fast-Leave: Disable IGMP Report suppress: Disable IGMP Global Querier: Disable IGMP Preview: Disable IGMP Tunnel: Disable IGMP Preview group aging time : 60(Seconds) Dynamic Mroute Aging Time : 300(Seconds) Dynamic Host Aging Time : 260(Seconds)</pre>

```
vlan 1
-----
IGMP Snooping state: Enable
Multicast router learning mode: pim-dvmrp
IGMP Fast-Leave: Disabled
IGMP VLAN querier: Disable
IGMP VLAN Mode: STATIC
```

### Common Errors

- The working mode of IGMP snooping is improper.

## 8.4.2 Configuring Basic IGMP Snooping Functions (SVGL Mode)

### Configuration Effect

- Enable IGMP snooping and select SVGL mode to realize Layer-2 multicast.
- Share the VLAN multicast services.

### Configuration Steps

#### ▾ Enabling Global IGMP Snooping in SVGL Mode

Mandatory.

Enable global IGMP snooping in SVGL mode.

Configure the range of associated SVGL profiles.

#### ▾ Specifying the SVGL Shared VLAN

(Optional) By default, VLAN 1 is used as the shared VLAN. You can adjust this configuration for other options.

#### ▾ Specifying the SVGL Sub VLAN

(Optional) By default, all the VLANs are used as the sub VLANs of SVGL and can share the multicast services of the shared VLAN. You can adjust this configuration for other options.

### Verification

- Run the **show ip igmp snooping** command to display the basic IGMP snooping information and verify that IGMP snooping is working in SVGL mode.
- Run the **show ip igmp snooping gda-table** command to check whether inter-VLAN multicast entries are properly formed.

### Related Commands

### ▾ Enabling Global IGMP Snooping in SVGL Mode

<b>Command</b>	<b>ip igmp snooping svgl</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, IGMP snooping is disabled. After the SVGL mode is selected, the range of profiles within SVGL multicast addresses needs to be associated.

### ▾ Configuring the SVGL profile

<b>Command</b>	<b>ip igmp snooping svgl profile</b> <i>profile_num</i>
<b>Parameter Description</b>	<i>profile_num</i> : Configures SVGL to associate a profile.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, no profile is associated with SVGL.

### ▾ Specifying the SVGL Shared VLAN

<b>Command</b>	<b>ip igmp snooping svgl vlan</b> <i>vid</i>
<b>Parameter Description</b>	<i>vid</i> : Indicates a VLAN.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, VLAN 1 is used as the shared VLAN.

### ▾ Specifying the SVGL Sub VLAN

<b>Command</b>	<b>ip igmp snooping svgl subvlan</b> <i>vid-range</i>
<b>Parameter Description</b>	<i>vid-range</i> : Indicates VLAN ID or the range of VLAN IDs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, all the VLANs except the shared VLAN are used as sub VLANs.

### ▾ Displaying the IGMP Snooping Working Mode

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A

<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If a device is running in SVGL mode, the following information is displayed: <div style="background-color: #e0e0e0; padding: 5px; margin-top: 5px;">IGMP Snooping running mode: SVGL</div>

## Configuration Example

### Enabling SVGL on the Access Device

<p><b>Scenario</b> Figure 8-6</p>	
	<p>A is the multicast router and is connected directly to the multicast source.                  B is the Layer-2 device and is connected directly to the user host.                  Receiver 1 is connected to VLAN 2, Receiver 2 is connected to VLAN 3, and Receiver 3 is connected to VLAN 4.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the IP address and VLAN. (Omitted)</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> <li>● Enable IGMP snooping on B and select SVGL mode.</li> <li>● Configure the range of associated SVGL multicast addresses on B.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip pim sparse-mode A(config-if-GigabitEthernet 0/1)# exit A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode</pre>

	<pre>A(config-if-VLAN 1)# exit</pre>
<b>B</b>	<pre>B# configure terminal B(config)#ip igmp profile 1 B(config-profile)#permit B(config-profile)#range 224.1.1.1 238.1.1.1 B(config-profile)#exit B(config)#ip igmp snooping svgl B(config)#ip igmp snooping svgl profile 1</pre>
<b>Verification</b>	<p>Send packets from the source (10.1.1.1) to G (229.1.1.1) and add Receiver 1, Receiver 2 and Receiver 3 to G.</p> <ul style="list-style-type: none"> <li>● Confirm that the packets (10.1.1.1 and 224.1.1.1) are received by Receiver 1, Receiver 2, and Receiver 3.</li> <li>● Display the IGMP snooping forwarding entry on B and ensure that the ports (*, 224.1.1.1, 1) include Gi0/2, Gi0/3, and Gi0/4.</li> <li>● Check whether the IGMP snooping working mode is SVGL.</li> </ul>
<b>B</b>	<pre>B# show ip igmp snooping gda-table Multicast Switching Cache Table D: DYNAMIC S: STATIC M: MROUTE (*,224.1.1.1, 1): VLAN(2) 1 OPORTS: GigabitEthernet 0/2(D) VLAN(3) 1 OPORTS: GigabitEthernet 0/3(D) VLAN(4) 1 OPORTS: GigabitEthernet 0/4(D)  B# show ip igmp snooping IGMP Snooping running mode: SVGL IGMP Snooping L2-entry-limit: 65536</pre>

```
SVGL vlan: 1
SVGL profile number: 1
Source port check: Disable
Source ip check: Disable
IGMP Fast-Leave: Disable
IGMP Report suppress: Disable
IGMP Globle Querier: Disable
IGMP Preview: Disable
IGMP Tunnel: Disable
IGMP Preview group aging time : 60(Seconds)
Dynamic Mroute Aging Time : 300(Seconds)
Dynamic Host Aging Time : 260(Seconds)
```

### Common Errors

- The SVGL profile is not configured.
- The sent multicast traffic is not within the SVGL profile.

## 8.4.3 Configuring Basic IGMP Snooping Functions (IVGL-SVGL Mode)

### Configuration Effect

- Enable IGMP snooping and select IVGL-SVGL mode to realize Layer-2 multicast.
- The SVGL profiles can share the multicast services.
- The non-SVGL profiles run in IVGL mode.

### Configuration Steps

#### ↘ Enabling Global IGMP Snooping in IVGL-SVGL Mode

Mandatory.

Enable global IGMP snooping in IVGL-SVGL mode.

Configure the range of associated SVGL profiles.

#### ↘ Specifying the SVGL Shared VLAN

(Optional) By default, VLAN 1 is used as the shared VLAN. You can adjust this configuration for other options.

#### ↘ Specifying the SVGL Sub VLAN

(Optional) By default, all the VLANs are used as the sub VLANs of SVGL and can share the multicast services of the shared VLAN. You can adjust this configuration for other options.

## Verification

- Run the **show ip igmp snooping** command to display the basic IGMP snooping information and verify that IGMP snooping is working in IVGL-SVGL mode.
- Run the **show ip igmp snooping gda-table** command to check whether inter-VLAN multicast entries are properly formed for the SVGL profiles.
- Run the **show ip igmp snooping gda-table** command to check whether intra-VLAN multicast entries are properly formed for the SVGL profiles.

## Related Commands

### ▾ Enabling Global IGMP Snooping in IVGL-SVGL Mode

<b>Command</b>	<b>ip igmp snooping ivgl-svgl</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, IGMP snooping is disabled. After the IVGL-SVGL mode is selected, the SVGL profiles needs to be associated.

### ▾ Configuring the SVGL Profile

<b>Command</b>	<b>ip igmp snooping svgl profile <i>profile_num</i></b>
<b>Parameter Description</b>	<i>profile_num</i> : Configures SVGL to associate a profile.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, no profile is associated with SVGL.

### ▾ Specifying the SVGL Shared VLAN

<b>Command</b>	<b>ip igmp snooping svgl vlan <i>vid</i></b>
<b>Parameter Description</b>	<i>vid</i> : Indicates a VLAN.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, VLAN 1 is used as the shared VLAN.

### ▾ Specifying the SVGL Sub VLAN

<b>Command</b>	<b>ip igmp snooping svgl subvlan <i>vid-range</i></b>
----------------	---

<b>Parameter Description</b>	<i>vid-range</i> : Indicates VLAN ID or the range of VLAN IDs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, all the VLANs except the shared VLAN are used as sub VLANs.

#### ▾ Displaying the IGMP Snooping Working Mode

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If a device is running in SVGL mode, the following information is displayed: <pre>IGMP Snooping running mode: SVGL</pre>

#### ▾ Displaying the IGMP Snooping Working Mode

Dynamic Host Aging Time : 260(Seconds)
```

### Common Errors

- The SVGL profile is not configured.
- The sent multicast traffic is not within the SVGL profile.
- The IVGL multicast traffic cannot be forwarded within the SVGL profile.

## 8.4.4 Configuring the Packet Processing

### Configuration Effect

- Configure specified ports as the static router ports to receive the multicast traffic from all profiles.
- Configure specified ports as the static member ports to receive the multicast traffic from specified profiles
- Enable Report packets suppression to forward only the first Report packet from a specified VLAN or profile to the router port within a query interval, and the following Report packets will not be forwarded to the router port, thereby reducing the quantity of packets on the network.
- Configure the immediate-leave function to delete a port from the entry of member ports when a leave packet is received by the port.

- Disable dynamic router port learning to disable the learning of any router port.
- Based on network load and configuration of a multicast device, you can adjust the aging time of a router port and member port as well as the maximum response time of a query packet.

## Notes

---

- Only when basic IGMP snooping is configured can relevant configurations take effect.

## Configuration Steps

---

### ▾ Configuring a Static Router Port

- Optional.
- You can perform this configuration if you want to specify a static port to receive all the multicast traffic within the VLAN.

### ▾ Configuring a Static Member Port

- Optional.
- You can perform this configuration if you want to specify a static port to receive specific multicast traffic within the VLAN.

### ▾ Enabling Report Packet Suppression

- Optional.
- When there are numerous receivers to receive the packets from the same multicast profile, you can enable Report packets suppression to suppress the number of Report packets to be sent.

### ▾ Enabling the Immediate-Leave Function

- Optional.
- When there is only one receiver on a port, you can enable Leave to speed up the convergence of protocol upon leave.

### ▾ Disabling Dynamic Router Port Learning

- Optional.
- This function is used when multicast traffic needs to be forwarded only within the Layer-2 topology but not to a Layer-3 router.

### ▾ Configuring the Aging Time of a Dynamic Router Port

- Optional.
- You can configure the aging time based on network load.

### ▾ Configuring the Aging Time of a Dynamic Member Port

- Optional.
- You can configure the aging time based on the interval for sending IGMP query packets by the connected multicast router. Typically, the aging time is calculated as follows: Interval for sending IGMP query packets x 2 + Maximum response time of IGMP packets

### ↘ Configuring the Maximum Response Time of a Query Packet

- Optional.
- You can configure the aging time based on network load.

### Verification

- Run the **show ip igmp snooping mrouter** command to check whether the configured static router port has an "S" in the displayed configuration information.
- Run the **show ip igmp snooping gda** command to check whether the configured static member port is marked with an S.
- Run the **show ip igmp snooping** command to check whether Report packets suppression, immediate leave, router port learning, router port aging time, member port aging time, and the maximum response time of the Query packet take effect.

### Related Commands

#### ↘ Configuring a Static Router Port

<b>Command</b>	<b>ip igmp snooping vlan</b> <i>vid</i> <b>mrouter interface</b> <i>interface-type interface-number</i>
<b>Parameter</b>	<i>vid</i> : Indicates a VLAN. The value ranges from 1 to 4,094.
<b>Description</b>	<i>interface-type interface-number</i> : Indicates an interface name.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>In SVGL mode, if a sub VLAN is not configured, only the configurations for the static router port within the shared VLAN can take effect, and the others can be configured but cannot take effect. If a sub VLAN is configured, only the configurations for the static router port within the shared VLAN or a non-sub VLAN can take effect, and the others can be configured but cannot take effect.</p> <p>In IVGL-SVGL mode, if a sub VLAN is not configured, the configurations for the static router ports within all the VLANs can take effect; if a sub VLAN is configured, only the configurations for the static router port within the shared VLAN or a non-sub VLAN can take effect, and the others can be configured but cannot take effect.</p> <p>In IVGL mode, the configurations for the static router ports within all the VLANs can take effect.</p>

#### ↘ Configuring a Static Member Port

<b>Command</b>	<b>ip igmp snooping vlan</b> <i>vid</i> <b>static</b> <i>group-address</i> <b>interface</b> <i>interface-type interface-number</i>
<b>Parameter</b>	<i>vid</i> : Indicates a VLAN. The value ranges from 1 to 4,094.
<b>Description</b>	<i>group-address</i> : Indicates a profile address. <i>interface-type interface-number</i> : Indicates an interface name.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, no static member port is configured.

#### ↘ Enabling Report Packet Suppression

<b>Command</b>	<b>ip igmp snooping suppression enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When Report packets suppression is enabled, only the first Report packet from a specified VLAN or profile is forwarded to the router port within a Query interval, and the following Report packets will not be forwarded to the router port, thereby reducing the quantity of packets on the network.  Only the IGMPv1 and IGMPv2 Report packets can be suppressed, and the IGMPv3 Report packets cannot be suppressed.

### ▾ Enabling the Immediate-Leave Function

<b>Command</b>	<b>ip igmp snooping fast-leave enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When this function is enabled, a port will be deleted from the entry of the member port when the port receives a leave packet. After that, the packets will no longer be forwarded to this port when it receives the query packets of specified profiles. Leave packets include the IGMPv2 Leave packets as well as the IGMPv3 Report packets that include types but carry no source address.  The immediate-leave function applies only to the scenario where only one host is connected to a device port. It is used to conserve bandwidth and resources.

### ▾ Enabling Dynamic Router Port Learning

<b>Command</b>	<b>ip igmp snooping [ vlan <i>vid</i> ] mrouter learn pim-dvmrp</b>
<b>Parameter Description</b>	<b>vlan <i>vid</i></b> : Specifies a VLAN. This configuration applies to all VLANs by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A router port is the port that is connected directly to a multicast device running IGMP snooping and a multicast neighbor device running multicast routing protocol. By default, dynamic router port learning is enabled and the device automatically listens to IGMP Query packets, DVMRP packets, and PIM Hello packets.

### ▾ Configuring the Aging Time of a Dynamic Router Port

<b>Command</b>	<b>ip igmp snooping dyn-mr-aging-time <i>seconds</i></b>
<b>Parameter Description</b>	<b><i>seconds</i></b> : Indicates the aging time of a dynamic router port in the unit of seconds. The value ranges from 1 to 3,600.

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If a dynamic router port does not receive an IGMP general query packet or a PIM Hello packet before the aging timer expires, the device will delete this port from the router port entry.</p> <p>When dynamic router port learning is enabled, you can run this command to adjust the aging time of the dynamic router port. If the aging time is too short, the multicast device may frequently add or delete a router port.</p>

### ↘ Configuring the Aging Time of a Dynamic Member Port

<b>Command</b>	<b>ip igmp snooping host-aging-time</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the aging time.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The aging time of a dynamic member port indicates the time when a device port receives the IGMP join packet sent from host for subscribing to an IP multicast profile.</p> <p>When the IGMP join packet is received, the aging time of the dynamic member port will be reset. The value of the timer time is host-aging-time. If the timer expires, the multicast device deems that no user host for receiving the multicast packet exists under the port, and will delete the port from the entry of IGMP snooping member port. After the aging time is configured, the aging time of following received IGMP join packets will be host-aging-time. This configuration takes effect after the next IGMP join packet is received, and the timer of the port in use will not be refreshed.</p>

### ↘ Configuring the Maximum Response Time of a Query Packet

<b>Command</b>	<b>ip igmp snooping query-max-response-time</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the maximum response time.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>When an IGMP general Query packet is received, the multicast device will reset the aging time of all the dynamic member ports, which is query-max-response-time. If the timer expires, the multicast device deems that no user host for receiving the multicast packet exists under the port, and will delete the port from the entry of IGMP snooping member port.</p> <p>When an IGMP profile-specific Query packet is received, the multicast device will reset the aging time of all the dynamic member ports of the specific profile, which is query-max-response-time. If the timer expires, the multicast device deems that no user host for receiving the multicast packet exists under the port, and will delete the port from the entry of IGMP snooping member port.</p> <p>This configuration takes effect after the next Query packet is received, and the timer in use will not be refreshed. The timer of an IGMPv3 profile-specific Query packet is not refreshed.</p>

### ▾ Displaying Router Ports

<b>Command</b>	<b>show ip igmp snooping mroute</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If the router port is successfully configured, an "S" will be displayed in the port information.</p> <pre>Ruijie(config)#show ip igmp snooping mrouter Multicast Switching Mroute Port     D: DYNAMIC     S: STATIC (*, *, 1):     VLAN(1)  1 MROUTES:         GigabitEthernet 0/1(S)</pre>

### ▾ Displaying the Information of Dynamic Router Port Learning

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>Run the <b>show ip igmp snooping</b> command to display the aging time and learning status of the dynamic router port.</p> <pre>Dynamic Mroute Aging Time : 300(Seconds) Multicast router learning mode: pim-dvmrp</pre>

### ▾ Displaying the Information of a Member Port

<b>Command</b>	<b>show ip igmp snooping gda-table</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If the member port is successfully configured, an "S" will be displayed in the port information.</p> <pre>Ruijie(config)#show ip igmp snooping gda-table Multicast Switching Cache Table</pre>

<p>D: DYNAMIC</p> <p>S: STATIC</p> <p>M: MROUTE</p> <p>(*, 224.1.1.1, 1):</p> <p>VLAN(1) 1 OPORTS:</p> <p>GigabitEthernet 0/1(S)</p>
--

▾ **Displaying Other Parameters**

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>Run the <b>show ip igmp snooping</b> command to display the aging time of the router port, aging time of the dynamic member port, response time of the query packet, and Report packets suppression, and immediate leave.</p> <pre style="background-color: #f0f0f0;"> IGMP Fast-Leave: Enable IGMP Report suppress: Enable Query Max Response Time: 20(Seconds) Dynamic Mroute Aging Time : 300(Seconds) Dynamic Host Aging Time : 260(Seconds)                     </pre>

**Configuration Example**

▾ **Configuring a Static Router Port and Static Member Port**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic IGMP snooping functions.</li> <li>● Configure a static router port and static member port.</li> </ul>
	<pre> Ruijie# configure terminal Ruijie(config)# ip igmp snooping vlan 1 mrouter interface GigabitEthernet 0/0 Ruijie(config)# ip igmp snooping vlan 1 static 224.1.1.1 interface GigabitEthernet 0/0 Ruijie(config)# end                     </pre>
<b>Verification</b>	Run the <b>show ip igmp snooping mrouter</b> and <b>show ip igmp snooping gda-table</b> commands to check whether the configuration takes effect.
	<pre> Ruijie#show ip igmp snooping mrouter                     </pre>

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic IGMP snooping functions.</li> <li>● Configure a static router port and static member port.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# ip igmp snooping vlan 1 mrouter interface GigabitEthernet 0/0 Ruijie(config)# ip igmp snooping vlan 1 static 224.1.1.1 interface GigabitEthernet 0/0 Ruijie(config)# end</pre>
<p><b>Verification</b></p>	<p>Run the <b>show ip igmp snooping mrouter</b> and <b>show ip igmp snooping gda-table</b> commands to check whether the configuration takes effect.</p>
	<pre>Multicast Switching Mroute Port   D: DYNAMIC   S: STATIC (*, *, 1):   VLAN(1) 1 MROUTES:     GigabitEthernet 0/0(S)  Ruijie#show ip igmp snooping gda-table Multicast Switching Cache Table   D: DYNAMIC   S: STATIC   M: MROUTE (*, 224.1.1.1, 1):   VLAN(1) 1 OPORTS:     GigabitEthernet 0/0(SM)</pre>

➤ **Enabling Report Packet Suppression**

<p><b>Scenario</b> <b>Figure 8-8</b></p>	
	<p>A is the multicast router and is connected directly to multicast Source 1. B is a Layer-2 device and is connected directly to the user host and multicast Source 2. Receiver 1, Receiver 2, and Receiver 3 are connected to VLAN 1.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the IP address and VLAN. (Omitted)</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> <li>● Enable IGMP snooping on B and select IVGL mode.</li> <li>● Enable Report packets suppression on B.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip pim sparse-mode A(config-if-GigabitEthernet 0/1)# exit A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode A(config-if-VLAN 1)# exit</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)#ip igmp snooping ivgl B(config)# ip igmp snooping suppression enable</pre>

<p><b>Verification</b></p>	<p>Check whether Receiver 1 and Receiver 2 are added to profile 239.1.1.1, and only the IGMP Report packets of profile 239.1.1.1 are forwarded from interface Gi0/1 of B.</p>
<p><b>B</b></p>	<pre> B# show ip igmp snooping IGMP Snooping running mode: IVGL IGMP Snooping L2-entry-limit: 65536 Source port check: Disable Source ip check: Disable IGMP Fast-Leave: Disable IGMP Report suppress: Enable IGMP Globle Querier: Disable IGMP Preview: Disable IGMP Tunnel: Disable IGMP Preview group aging time : 60(Seconds) Dynamic Mroute Aging Time : 300(Seconds) Dynamic Host Aging Time : 260(Seconds)                     </pre>

📌 **Configuring Other Parameters**

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic IGMP snooping functions.</li> <li>● Enable Immediate-leave function.</li> <li>● Disable router port learning.</li> <li>● Configure the aging time of a router port.</li> <li>● Configuring the aging time of a member port.</li> <li>● Configure the response time of a Query packet.</li> </ul>
	<pre> Ruijie# configure terminal Ruijie(config)# ip igmp snooping fast-leave enable Ruijie(config)# no ip igmp snooping mrouter learn pim-dvmrp Ruijie(config)#ip igmp snooping dyn-mr-aging-time 200 Ruijie(config)#ip igmp snooping host-aging-time 100 Ruijie(config)#ip igmp snooping query-max-response-time 60 Ruijie(config)# end                     </pre>
<p><b>Verification</b></p>	<p>Run the <b>show ip igmp snooping</b> command to check whether the configuration is successful.</p>

```
Ruijie#show ip igmp snooping
IGMP Snooping running mode: IVGL
IGMP Snooping L2-entry-limit: 65536
Source port check: Disable
Source ip check: Disable
IGMP Fast-Leave: Enable
IGMP Report suppress: Enable
IGMP Globle Querier: Disable
IGMP Preview: Disable
IGMP Tunnel: Disable
Query Max Response Time: 60(Seconds)
IGMP Preview group aging time : 60(Seconds)
Dynamic Mroute Aging Time : 200(Seconds)
Dynamic Host Aging Time : 100(Seconds)
```

## Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.

## 8.4.5 Configuring IGMP Security Control

### Configuration Effect

- Configure the range of multicast addresses that a user can access.
- Configure to allow a user from an unauthorized profile to preview a multicast channel.
- Configure the number of multicast addresses that a user can access.
- Configure to limit a user to receive only the multicast traffic from a router port to prevent illegal multicast traffic sent by the end user.
- Configure to limit a user to receive only the multicast traffic from designated source IP addresses to prevent illegal multicast traffic.

### Notes

- Basic IGMP snooping functions must be configured.

### Configuration Steps

#### 📌 Configuring the Profile Filtering

- Optional.
- If you want to limit the profile packets to be received by a port, you can configure the profile filtering on the port.
- If you want to limit the multicast packets to be received by a VLAN, you can configure the per-VLAN profile filtering.

#### ▾ Enabling Multicast Preview

- Optional.
- You can enable multicast preview for a user from an unauthorized profile.

#### ▾ Configuring the Maximum Number of Profiles

- Optional.
- If you want to limit the number of multicast profiles that a port is allowed to receive, you can configure the maximum number of multicast profiles allowed for this port.
- If you want to limit the number of multicast profiles that global ports are allowed to receive, you can configure the maximum number of multicast profiles allowed for these ports.

#### ▾ Configuring Source Port Inspection

- Optional.
- You can perform this configuration if you want to allow a port to receive only the multicast traffic from the router port.

#### ▾ Configuring Source IP Inspection

- Optional.
- You can perform this configuration to specify the source IP address for all the multicast profiles of all VLANs. Only the multicast traffic whose source IP address is the same as the set one is considered as legal.
- You can also specify the source IP addresses for specific multicast profiles within specific VLANs. Among the multicast traffic received from the specific multicast profiles within the VLANs, only the one with the same source IP address as the set one is considered as legal and will be forwarded by the multicast device; other traffic will be discarded.

### Verification

- Run the **show ip igmp snooping interfaces** command to display the profile filtering and the maximum number of multicast profiles for a port.
- Run the **show ip igmp snooping vlan** command to display the per-VLAN profile filtering.
- Run the **show ip igmp snooping** command to check whether the maximum number of global multicast profiles, preview function, source port inspection, and source IP address inspection take effect.

### Related Commands

#### ▾ Configuring the Profile Filtering

<b>Command</b>	<b>ip igmp snooping filter</b> <i>profile-number</i>
<b>Parameter</b>	<i>profile-number</i> : Indicates a profile number.
<b>Description</b>	

<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Per-VLAN Profile Filtering

<b>Command</b>	<b>ip igmp snooping vlan</b> <i>vid filter profile-number</i>
<b>Parameter</b>	<i>vid</i> : Indicates a VLAN. The value ranges from 1 to 4,094.
<b>Description</b>	<i>profile-number</i> : Indicates a profile number.
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Maximum Number of Profiles on a Port

<b>Command</b>	<b>ip igmp snooping max-groups</b> <i>number</i>
<b>Parameter</b>	<i>number</i> : Indicates the maximum number of multicast profiles.
<b>Description</b>	
<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	This value indicates only the number of dynamic multicast profiles, and the number of static profiles is not included. The counter of multicast profiles is based on the VLAN that the port belongs to. For example, if a port belongs to three VLANs, and all three of them receive a request packet from multicast profile 224.1.1.1 simultaneously, then the counter of multicast profiles will be 3 but not 1.

#### ↘ Configuring the Maximum Number of Global Profiles

<b>Command</b>	<b>ip igmp snooping l2-entry-limit</b> <i>number</i>
<b>Parameter</b>	<i>number</i> : Indicates the maximum number of multicast profiles.
<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	This value includes the number of both dynamic profiles as well as static profiles.

#### ↘ Configuring Source Port Inspection

<b>Command</b>	<b>ip igmp snooping source-check port</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	After source port inspection is enabled, the multicast traffic received by a device will be discarded if no router port is detected in the network environment.

### ↘ Configuring Source IP Inspection

<b>Command</b>	<b>ip igmp snooping source-check default-server</b> <i>source-address</i>
<b>Parameter Description</b>	<i>source-address</i> : Indicates the source IP address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Enabling Source IP Inspection for a Specific Profile

<b>Command</b>	<b>ip igmp snooping limit-ipmc vlan</b> <i>vid</i> <b>address</b> <i>group-address</i> <b>server</b> <i>source-address</i>
<b>Parameter Description</b>	<i>vid</i> vlan id <i>group-address</i> : Indicates a profile address. <i>source-address</i> : Indicates the source IP address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Enabling Preview

<b>Command</b>	<b>ip igmp snooping preview</b> <i>profile-number</i>
<b>Parameter Description</b>	<i>profile number</i> : Indicates the range of multicast addresses allowed for preview. The value ranges from 1 to 1,024.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Preview Duration

<b>Command</b>	<b>ip igmp snooping preview interval</b> <i>num</i>
<b>Parameter Description</b>	<i>num</i> : Specifies the preview duration which ranges from 1s to 300s (60s by default).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This configuration allows unauthorized users to receive multicast traffic within the preview duration. After the duration is met, the preview will be stopped; the preview can be resumed in 300s.

### ↘ Displaying the Per-Port Profile Filtering

<b>Command</b>	<b>show ip igmp snooping interface</b>
<b>Parameter Description</b>	N/A

<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode									
<b>Usage Guide</b>	<p>If the function is configured, the profile will be displayed, for example:</p> <pre>Ruijie#show ip igmp snooping interfaces gigabitEthernet 0/1</pre> <table border="1"> <thead> <tr> <th>Interface</th> <th>Filter profile number</th> <th>max-group</th> </tr> <tr> <th>-----</th> <th>-----</th> <th>-----</th> </tr> </thead> <tbody> <tr> <td>GigabitEthernet 0/1</td> <td>1</td> <td></td> </tr> </tbody> </table>	Interface	Filter profile number	max-group	-----	-----	-----	GigabitEthernet 0/1	1	
Interface	Filter profile number	max-group								
-----	-----	-----								
GigabitEthernet 0/1	1									

▾ **Displaying the Per-VLAN Profile Filtering**

<b>Command</b>	<b>show ip igmp snooping vlan</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If the function is configured, the profile will be displayed, for example:</p> <pre>IGMP VLAN filter: 1</pre>

▾ **Displaying the Maximum Number of Interface Profiles**

<b>Command</b>	<b>show ip igmp snooping interface</b>									
<b>Parameter Description</b>	N/A									
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode									
<b>Usage Guide</b>	<p>If the maximum number of multicast addresses for a port is configured, the value will be displayed, for example:</p> <pre>Ruijie#show ip igmp snooping interfaces gigabitEthernet 0/1</pre> <table border="1"> <thead> <tr> <th>Interface</th> <th>Filter profile number</th> <th>max-group</th> </tr> <tr> <th>-----</th> <th>-----</th> <th>-----</th> </tr> </thead> <tbody> <tr> <td>GigabitEthernet 0/1</td> <td>1</td> <td>200</td> </tr> </tbody> </table>	Interface	Filter profile number	max-group	-----	-----	-----	GigabitEthernet 0/1	1	200
Interface	Filter profile number	max-group								
-----	-----	-----								
GigabitEthernet 0/1	1	200								

▾ **Displaying the Maximum Number of Global Profiles**

<b>Command</b>	<b>show ip igmp snooping vlan</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode

<b>Usage Guide</b>	If the function is configured, the profile will be displayed, for example: <pre>IGMP Snooping L2-entry-limit: 65536</pre>
--------------------	--

↘ **Displaying the Information of Source Port Inspection**

<b>Command</b>	<b>show ip igmp snooping vlan</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If source port inspection is enabled, the following information will be displayed: <pre>Source port check: Enable</pre>

↘ **Displaying the Information of Source IP Inspection**

<b>Command</b>	<b>show ip igmp snooping vlan</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If source IP address inspection is enabled, the following information will be displayed: <pre>Source ip check: Enable</pre>

↘ **Displaying the Information of the Preview Function**

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If the range of multicast addresses for a port is configured, preview will be enabled, for example: <pre>IGMP Preview: Enable</pre> <pre>IGMP Preview group aging time : 60(Seconds)</pre>

**Configuration Example**

↘ **Configuring the Profile Filtering and the Maximum Number of Demanded Profiles**

<p><b>Scenario</b> <b>Figure 8-9</b></p>	
	<p>A is the multicast router and is connected directly to multicast Source 1.          B is a Layer-2 device and is connected directly to the user host and multicast Source 2.          Receiver 1, Receiver 2, and Receiver 3 are connected to VLAN 1.          By configuring VLAN 1, you can configure to allow the users within VLAN 1 to receive only the profiles whose addresses range from 225.1.1.1 to 225.1.255.255.          You can configure Receiver 1 to receive only the profiles whose addresses range from 225.1.1.1 to 225.1.1.255, Receiver 2 to receive only the profiles whose addresses range from 225.1.2.1 to 255.1.2.255, and Receiver 3 to receive only the profiles whose addresses range from 225.1.3.1 to 225.1.3.255.          At most 10 profiles can be added to a port and at most 100 profiles can be added globally.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the IP address and VLAN. (Omitted)</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> <li>● Enable IGMP snooping on B and select IVGL mode.</li> <li>● Configure the range and maximum number of multicast addresses on B.</li> </ul>
<p><b>A</b></p>	<pre> A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip pim sparse-mode A(config-if-GigabitEthernet 0/1)# exit A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode A(config-if-VLAN 1)# exit                     </pre>

<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run the <b>show ip igmp snooping</b> command to check whether source IP inspection is enabled.</li> <li>● Check whether Receiver 1 can request the multicast traffic of profile 224.1.1 and 225.1.1.1 and cannot request that of profile 226.1.1.1.</li> </ul>
<p><b>B</b></p>	<pre>B#show ip igmp snooping IGMP Snooping running mode: IVGL IGMP Snooping L2-entry-limit: 65536 Source port check: Disable</pre>

Source ip check: Enable
IGMP Fast-Leave: Disable
IGMP Report suppress: Disable
IGMP Globle Querier: Disable
IGMP Preview: Disable
IGMP Tunnel: Disable
IGMP Preview group aging time : 60(Seconds)
Dynamic Mroute Aging Time : 300(Seconds)
Dynamic Host Aging Time : 260(Seconds)

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.
- The multicast router port is not learned, leading to failure to receive the multicast traffic.
- The IP address for source IP inspection is inconsistent with the multicast IP address, leading to failure to receive the multicast traffic.

## 8.4.6 Configuring an IGMP Profile

### Configuration Effect

- Create an IGMP filtering profile.

### Configuration Steps

#### 📄 Creating a Profile

- (Optional) Create an IGMP filtering profile.

#### 📄 Configuring the Profile Range

- (Optional) Configure the range of multicast profile addresses.

#### 📄 Configuring the Profile Filtering

- (Optional) Configure the filtering mode of profile to **permit** or **deny**.

### Verification

- Run the **show running-config** command to check whether the preceding configurations take effect.

### Related Commands

#### 📄 Creating a Profile

<b>Command</b>	<b>ip igmp profile</b> <i>profile-number</i>
<b>Parameter Description</b>	<i>profile-number</i> : Indicates the number of a profile.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	

### ▾ Configuring the Profile Range

<b>Command</b>	<b>range</b> <i>low-ip-address</i> [ <i>high-ip-address</i> ]
<b>Parameter Description</b>	<i>low-ip-address</i> : Specifies the start address. <i>low-ip-address</i> : Specifies the end address. Only one address is configured by default.
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	You can configure multiple addresses. If the IP addresses of different ranges are consecutive, the addresses will be combined.

### ▾ Configuring the Profile Filtering

<b>Command</b>	<b>deny</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	If the filtering mode of profile is set to <b>deny</b> while the range of multicast profiles is not specified, no profile is to be denied, which means to permit all profiles.

### ▾ Configuring the Profile Filtering

<b>Command</b>	<b>permit</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	If the filtering mode of profile is set to <b>permit</b> while the range of multicast profiles is not specified, no profile is to be permitted, which means to deny all profiles.

## Configuration Example

### ▾ Creating a Filtering Profile

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Create a filtering profile.</li> </ul>
	<pre>B(config)#ip igmp profile 1 B(config-profile)#permit B(config-profile)#range B(config-profile)#range 224.1.1.1 235.1.1.1 B(config-profile)#</pre>
<b>Verification</b>	Run the <b>show running-config</b> command to check whether the configuration is successful.
	<pre>ip igmp profile 1   permit   range 224.1.1.1 235.1.1.1 !</pre>

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.
- The mode of profile is set to **permit** while the range of multicast profiles is not specified, leading to the denial of all profiles.

## 8.4.7 Configuring IGMP QinQ

### Configuration Effect

- Create a multicast entry on the VLAN where IGMP packets are located. Forward IGMP packets on the VLAN where these packets are located, realizing transparent transmission.

### Notes

- Basic IGMP snooping functions must be configured.

### Configuration Steps

#### ▾ Configuring QinQ Transparent Transmission

- If the QinQ interface needs to forward multicast packets on the VLANs where the VLAN IDs of the packets specify, enable QinQ to realize transparent transmission.

### Verification

- Run the **show ip igmp snooping** command to check whether the configuration takes effect.

### Related Commands

▾ **Configuring QinQ Transparent Transmission**

<b>Command</b>	<b>ip igmp snooping tunnel</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Enable QinQ to realize transparent transmission of IGMP packets.

▾ **Displaying QinQ Configuration**

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If QinQ is enabled, the following content is displayed. <div style="background-color: #f0f0f0; padding: 5px;">IGMP Tunnel: Enable</div>

**Configuration Example**

▾ **Configuring QinQ Transparent Transmission**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic IGMP snooping functions.</li> <li>● Configure QinQ transparent transmission.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# ip igmp snooping tunnel Ruijie(config)# Ruijie(config)# end</pre>
<b>Verification</b>	Run the <b>show ip igmp snooping</b> command to check whether the configuration is successful.
	<div style="background-color: #f0f0f0; padding: 5px;">IGMP Tunnel: Enable</div>

**Common Errors**

- Basic IGMP snooping functions are not configured or the configuration is not successful.

**8.4.8 Configuring an IGMP Querier**

**Configuration Effect**

- Configure the device as an IGMP querier, which will send IGMP Query packets periodically and collect user demanding information.

## Notes

- Basic IGMP snooping functions must be configured.

## Configuration Steps

### ▾ Enabling the Querier Function

- (Optional) Enable IGMP querier function globally or for a specified VLAN.
- (Optional) Disable the IGMP querier function for a specified VLAN.

### ▾ Configuring the Source IP Address of a Querier

- (Optional) You can configure the source IP address of a Query packet sent by the querier based on VLANs.
- After a querier is enabled, a source IP address must be specified for the querier; otherwise, the configuration will not take effect.

### ▾ Configuring the Maximum Response Time of a Query Packet

- (Optional) Adjust the maximum response time carried by an IGMP Query packet. As IGMPv1 does not support the carrying of maximum response time by a Query packet, this configuration does not take effect when the querier is running IGMPv1.

### ▾ Configuring the Query Interval of a Querier

- (Optional) Adjust the interval of the IGMP querier for sending query packets.

### ▾ Configuring the Aging Timer of a Querier

- (Optional) Configure the aging timer of other IGMP queriers on the network.

### ▾ Specifying the IGMP Version for a Querier

- (Optional) Specify the IGMP version for a querier (IGMPv2 by default).

## Verification

- Run the **show ip igmp snooping querier detail** command to check whether the configuration takes effect.

## Related Commands

### ▾ Enabling the IGMP Querier Function

<b>Command</b>	<b>ip igmp snooping [ vlan <i>vid</i> ] querier</b>
<b>Parameter Description</b>	<b>vlan <i>vid</i></b> : Specifies a VLAN. This configuration applies to all VLANs by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	IGMP querier for a specified VLAN will take effect only after global IGMP querier is enabled. If global IGMP querier is disabled, IGMP querier for all the VLANs will be disabled.

### ▾ Configuring the Source IP Address of a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier address a.b.c.d</b>
<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default. <b>a.b.c.d:</b> Indicates the source IP address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After a querier is enabled, a source IP address must be specified for the querier; otherwise, the configuration will not take effect. If the source IP address is specified by a VLAN, the address will be used preferentially.

### ▾ Configuring the Maximum Response Time of a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier max-response-time seconds</b>
<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default. <b>seconds:</b> Indicates the maximum response time. in the unit of seconds. The value ranges from 1 to 25.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the query interval is specified by a VLAN, the value will be used preferentially.

### ▾ Configuring the Query Interval of a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier address a.b.c.d</b>
<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default. <b>seconds:</b> Indicates the query interval in the unit of seconds. The value ranges from 1 to 18,000.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the query interval is specified by a VLAN, the value will be used preferentially.

### ▾ Configuring the Aging Timer of a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier timer expiry seconds</b>
<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default. <b>seconds:</b> Indicates the timeout time in the unit of seconds. The value ranges from 60 to 300.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A device may fail to be elected as the querier even when its querier function is enabled. If a device that fails to be elected does not receive the Query packet sent by the querier in the aging time, the querier in use is considered as expired, and a new round of election will be raised. If the aging time is specified by a VLAN, the value will be used preferentially.

### ▾ Specifying the IGMP Version for a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier version 1</b>
----------------	--

<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A querier can be run in IGMPv1 and IGMPv2 (IGMPv2 by default). You can also run a command to configure the version to IGMPv1. If the IGMP version for a querier is specified by a VLAN, the version will be used preferentially.

📄 **Displaying the IGMP Querier Configuration**

<b>Command</b>	<b>show ip igmp snooping querier detail</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If QinQ is enabled, the following content is displayed.</p> <pre> Ruijie(config)#show ip igmp snooping querier detail  Vlan      IP Address      IGMP Version      Port ----- Global IGMP switch querier status ----- admin state           : Enable admin version         : 2 source IP address     : 1.1.1.1 query-interval (sec)  : 60 max-response-time (sec) : 10 querier-timeout (sec) : 125  Vlan 1:  IGMP switch querier status ----- admin state           : Disable admin version         : 2 source IP address     : 1.1.1.1 query-interval (sec)  : 60                     </pre>

max-response-time (sec)	: 10
querier-timeout (sec)	: 125

operational version	: 2

### Configuration Example

#### Enabling the IGMP Querier Function

<p><b>Scenario</b> Figure 8-11</p>									
	<p>In the scenario without Layer-3 multicast equipment, the multicast traffic can be forwarded only on the Layer-2 network. A acts as a Layer-2 device to connect to the multicast source and receiver.</p>								
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable global IGMP snooping on A in IVGL mode.</li> <li>● Enable IGMP querier for VLAN 1 on A.</li> </ul>								
<p><b>A</b></p>	<pre>A(config)#ip igmp snooping ivgl A(config)#ip igmp snooping querier A(config)#ip igmp snooping querier address 10.1.1.1 A(config)#ip igmp snooping vlan 1 querier</pre>								
<p><b>Verification</b></p>	<p>Run the <b>show ip igmp snooping querier</b> command to check whether the querier of VLAN 1 takes effect.</p>								
<p><b>A</b></p>	<pre>A(config)#show ip igmp snooping querier</pre> <table border="1"> <thead> <tr> <th>Vlan</th> <th>IP Address</th> <th>IGMP Version</th> <th>Port</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>10.1.1.1</td> <td>2</td> <td>switch</td> </tr> </tbody> </table>	Vlan	IP Address	IGMP Version	Port	1	10.1.1.1	2	switch
Vlan	IP Address	IGMP Version	Port						
1	10.1.1.1	2	switch						

```
A(config)#show ip igmp snooping querier vlan 1

Vlan 1:  IGMP switch querier status
-----
elected querier is 10.1.1.1      (this switch querier)
-----

admin state           : Enable
admin version         : 2
source IP address     : 10.1.1.1
query-interval (sec)  : 60
max-response-time (sec) : 10
querier-timeout (sec) : 125
operational state     : Querier
operational version    : 2
```

### Common Errors

- The source IP address is not configured for the querier and the querier does not take effect.

## 8.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the statistics on IGMP snooping.	<b>clear ip igmp snooping statistics</b>
Clears the dynamic router ports and member ports.	<b>clear ip igmp snooping gda-table</b>

### Displaying

Description	Command
Displays basic IGMP snooping configurations.	<b>show ip igmp snooping [ vlan <i>vlan-id</i> ]</b>
Displays the statistics on IGMP snooping.	<b>show ip igmp snooping statistics [ vlan <i>vlan-id</i> ]</b>
Displays the router ports.	<b>show ip igmp snooping mrouter</b>

Displays the IGMP snooping entries.	<b>show ip igmp snooping gda-table</b>
Displays the profile.	<b>show ip igmp profile</b> [ <i>profile-number</i> ]
Displays the IGMP snooping configurations on an interface.	<b>show ip igmp snooping interface</b> <i>interface-name</i>
Displays the IGMP querier.	<b>show ip igmp snooping querier</b> [ <i>detail</i> ]

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs all IGMP Snooping functions.	<b>debug igmp-snp</b>
Debugs the IGMP snooping events.	<b>debug igmp-snp event</b>
Debugs the IGMP snooping packets.	<b>debug igmp-snp packet</b>
Debugs the communications between IGMP snooping and MSF.	<b>debug igmp-snp msf</b>
Debugs the IGMP snooping alarms.	<b>debug igmp-snp warning</b>

# 1 Configuring AAA

## 1.1 Overview

Authentication, authorization, and accounting (AAA) provides a unified framework for configuring the authentication, authorization, and accounting services. Ruijie Networks devices support the AAA application.

AAA provides the following services in a modular way:

**Authentication:** Refers to the verification of user identities for network access and network services. Authentication is classified into local authentication and authentication through Remote Authentication Dial In User Service (RADIUS) and Terminal Access Controller Access Control System+ (TACACS+).

**Authorization:** Refers to the granting of specific network services to users according to a series of defined attribute-value (AV) pairs. The pairs describe what operations users are authorized to perform. AV pairs are stored on network access servers (NASs) or remote authentication servers.

**Accounting:** Refers to the tracking of the resource consumption of users. When accounting is enabled, NASs collect statistics on the network resource usage of users and send them in AV pairs to authentication servers. The records will be stored on authentication servers, and can be read and analyzed by dedicated software to realize the accounting, statistics, and tracking of network resource usage.

AAA is the most fundamental method of access control. Ruijie Networks also provides other simple access control functions, such as local username authentication and online password authentication. Compared to them, AAA offers higher level of network security.

AAA has the following advantages:

- Robust flexibility and controllability
- Scalability
- Standards-compliant authentication
- Multiple standby systems

## 1.2 Applications

Application	Description
<a href="#">Configuring AAA in a Single-Domain Environment</a>	AAA is performed for all the users in one domain.
<a href="#">Configuring AAA in a Multi-Domain Environment</a>	AAA is performed for the users in different domains by using different methods.

## 1.2.1 Configuring AAA in a Single-Domain Environment

### Scenario

In the network scenario shown in Figure 1-1, the following application requirements must be satisfied to improve the security management on the NAS:

1. To facilitate account management and avoid information disclosure, each administrator has an individual account with different username and password.
2. Users must pass identity authentication before accessing the NAS. The authentication can be in local or centralized mode. It is recommended to combine the two modes, with centralized mode as active and local mode as standby. As a result, users must undergo authentication by the RADIUS server first. If the RADIUS server does not respond, it turns to local authentication.
3. During the authentication process, users can be classified and limited to access different NASs.
4. Permission management: Users managed are classified into Super User and Common User. Super users have the rights to view and configure the NAS, and common users are only able to view NAS configuration.
5. The AAA records of users are stored on servers and can be viewed and referenced for auditing. (The TACACS+ server in this example performs the accounting.)

Figure 1-1

<b>Remarks</b>	<p>User A, User B, and User C are connected to the NAS in wired or wireless way.</p> <p>The NAS is an access or convergence switch.</p> <p>The RADIUS server can be the Windows 2000/2003 Server (IAS), UNIX system component, and dedicated server software provided by a vendor.</p> <p>The TACACS+ server can be the dedicated server software provided by a vendor.</p>
----------------	---

### Deployment

- Enable AAA on the NAS.
- Configure an authentication server on the NAS.
- Configure local users on the NAS.
- Configure the authentication service on the NAS.

- Configure the authorization service on the NAS.
- Configure the accounting service on the NAS.

## 1.2.2 Configuring AAA in a Multi-Domain Environment

### Scenario

Configure the domain-based AAA service on the NAS.

- A user can log in by entering the username PC1@ruijie.net or PC2@ruijie.com.cn and correct password on an 802.1X client.
- Permission management: Users managed are classified into Super User and Common User. Super users have the rights to view and configure the NAS, and common users are only able to view NAS configuration.
- The AAA records of users are stored on servers and can be viewed and referenced for auditing.

Figure 1-2

<b>Remarks</b>	<p>The clients with the usernames <b>PC1@ruijie.net</b> and <b>PC2@ruijie.com.cn</b> are connected to the NAS in wired or wireless way.</p> <p>The NAS is an access or convergence switch.</p> <p>The Security Accounts Manager (SAM) server is a universal RADIUS server provided by Ruijie Networks.</p>
----------------	--

### Deployment

- Enable AAA on the NAS.
- Configure an authentication server on the NAS.
- Configure local users on the NAS.
- Define an AAA method list on the NAS.
- Enable domain-based AAA on the NAS.
- Create domains and AV sets on the NAS.

## 1.3 Features

### Basic Concepts

#### Local Authentication and Remote Server Authentication

Local authentication is the process where the entered passwords are verified by the database on the NAS.

Remote server authentication is the process where the entered passwords are checked by the database on a remote server. It is mainly implemented by the RADIUS server and TACACS+ server.

### Method List

AAA is implemented using different security methods. A method list defines a method implementation sequence. The method list can contain one or more security protocols so that a standby method can take over the AAA service when the first method fails. On Ruijie devices, the first method in the list is tried in the beginning and then the next is tried one by one if the previous gives no response. This method selection process continues until a security method responds or all the security methods in the list are tried out. Authentication fails if no method in the list responds.

A method list contains a series of security methods that will be queried in sequence to verify user identities. It allows you to define one or more security protocols used for authentication, so that the standby authentication method takes over services when the active security method fails. On Ruijie devices, the first method in the list is tried in the beginning and then the next is tried one by one if the previous gives no response. This method selection process continues until a method responds or all the methods in the method list are tried out. Authentication fails if no method in the list responds.

**!** The next authentication method proceeds on Ruijie devices only when the current method does not respond. When a method denies user access, the authentication process ends without trying other methods.

Figure 1-3

Figure 1-3 shows a typical AAA network topology, where two RADIUS servers (R1 and R2) and one NAS are deployed. The NAS can be the client for the RADIUS servers.

Assume that the system administrator defines a method list, where the NAS selects R1 and R2 in sequence to obtain user identity information and then accesses the local username database on the server. For example, when a remote PC user initiates dial-up access, the NAS first queries the user's identity on R1. When the authentication on R1 is completed, R1 returns an Accept response to the NAS. Then the user is permitted to access the Internet. If R1 returns a Reject response, the user is denied Internet access and the connection is terminated. If R1 does not respond, the NAS considers that the R1 method times out and continues to query the user's identity on R2. This process continues as the NAS keeps trying the remaining authentication methods, until the user request is authenticated, rejected, or terminated. If all the authentication methods are responded with Timeout, authentication fails and the connection will be terminated.

**i** The Reject response is different from the Timeout response. The Reject response indicates that the user does not meet the criteria of the available authentication database and therefore fails in authentication, and the Internet access request is denied. The Timeout response indicates that the authentication server fails to respond to the identity query.

When detecting a timeout event, the AAA service proceeds to the next method in the list to continue the authentication process.

-  This document describes how to configure AAA on the RADIUS server. For details about the configuration on the TACACS+ server, see the *Configuring TACACS+*.

### AAA Server Group

You can define an AAA server group to include one or more servers of the same type. If the server group is referenced by a method list, the NAS preferentially sends requests to the servers in the referenced server group when the method list is used to implement AAA.

### VRF-Enabled AAA Group

Virtual private networks (VPNs) enable users to share bandwidths securely on the backbone networks of Internet service providers (ISPs). A VPN is a site set consisting of shared routes. An STA site connects to the network of an ISP through one or multiple interfaces. AAA supports assigning a VPN routing forwarding (VRF) table to each user-defined server group.

When AAA is implemented by the server in a group assigned with a VRF table, the NAS sends request packets to the remote servers in the server group. The source IP address of request packets is an address selected from the VRF table according to the IP addresses of the remote servers.

If you run the **ip radius/tacacs+ source-interface** command to specify the source interface for the request packets, the IP address obtained from the source interface takes precedence over the source IP address selected from the VRF table.

## Overview

Feature	Description
<a href="#">AAA Authentication</a>	Verifies whether users can access the Internet.
<a href="#">AAA Authorization</a>	Determines what services or permissions users can enjoy.
<a href="#">AAA Accounting</a>	Records the network resource usage of users.
<a href="#">Multi-Domain AAA</a>	Creates domain-specific AAA schemes for 802.1X stations (STAs) in different domains.

### 1.3.1 AAA Authentication

Authentication, authorization, and accounting are three independent services. The authentication service verifies whether users can access the Internet. During authentication, the username, password, and other user information are exchanged between devices to complete users' access or service requests. You can use only the authentication service of AAA.

-  To configure AAA authentication, you need to first configure an authentication method list. Applications perform authentication according to the method list. The method list defines the types of authentication and the sequence in which they are performed. Authentication methods are implemented by specified applications. The only exception is the default method list. All applications use the default method list if no method list is configured.

### AAA Authentication Scheme

- No authentication (**none**)

The identity of trusted users is not checked. Normally, the no-authentication (None) method is not used.

- Local authentication (**local**)

Authentication is performed on the NAS, which is configured with user information (including usernames, passwords, and AV pairs). Before local authentication is enabled, run the **username password** command to create a local user database.

- Remote server group authentication (**group**)

Authentication is performed jointly by the NAS and a remote server group through RADIUS or TACACS+. A server group consists of one or more servers of the same type. User information is managed centrally on a remote server, thus realizing multi-device centralized and unified authentication with high capacity and reliability. You can configure local authentication as standby to avoid authentication failures when all the servers in the server group fail.

## AAA Authentication Types

Ruijie products support the following authentication types:

- Login authentication

Users log in to the command line interface (CLI) of the NAS for authentication through Secure Shell (SSH), Telnet, and File Transfer Protocol (FTP).

- Enable authentication

After users log in to the CLI of the NAS, the users must be authenticated before CLI permission update. This process is called Enable authentication (in Privileged EXEC mode).

- Dot1X (IEEE802.1X) authentication

Dot1X (IEEE802.1X) authentication is performed for users that initiate dial-up access through IEEE802.1X.

- Web (second generation portal) authentication

Web authentication is performed by the second generation portal server.

## Related Configuration

### Enabling AAA

By default, AAA is disabled.

To enable AAA, run the **aaa new-model** command.

### Configuring an AAA Authentication Scheme

By default, no AAA authentication scheme is configured.

Before you configure an AAA authentication scheme, determine whether to use local authentication or remote server authentication. If the latter is to be implemented, configure a RADIUS or TACACS+ server in advance. If local authentication is selected, configure the local user database information on the NAS.

### Configuring an AAA Authentication Method List

By default, no AAA authentication method list is configured.

Determine the access mode to be configured in advance. Then configure authentication methods according to the access mode.

## 1.3.2 AAA Authorization

AAA authorization allows administrators to control the services or permissions of users. After AAA authorization is enabled, the NAS configures the sessions of users according to the user configuration files stored on the NAS or servers. After authorization, users can use only the services or have only the permissions permitted by the configuration files.

### AAA Authorization Scheme

- Direct authorization (**none**)

Direct authorization is intended for highly trusted users, who are assigned with the default permissions specified by the NAS.

- Local authorization (**local**)

Local authorization is performed on the NAS, which authorizes users according to the AV pairs configured for local users.

- Remote server-group authorization (**group**)

Authorization is performed jointly by the NAS and a remote server group. You can configure local or direct authorization as standby to avoid authorization failures when all the servers in the server group fail.

### AAA Authorization Types

- EXEC authorization

After users log in to the CLI of the NAS, the users are assigned with permission levels (0 to 15).

- Config-commands authorization

Users are assigned with the permissions to run specific commands in configuration modes (including the global configuration mode and sub-modes).

- Console authorization

After users log in through consoles, the users are authorized to run commands.

- Command authorization

Authorize users with commands after login to the CLI of the NAS.

- Network authorization

After users access the Internet, the users are authorized to use the specific session services. For example, after users access the Internet through PPP and Serial Line Internet Protocol (SLIP), the users are authorized to use the data service, bandwidth, and timeout service.

## Related Configuration

### Enabling AAA

By default, AAA is disabled.

To enable AAA, run the **aaa new-model** command.

### Configuring an AAA Authorization Scheme

By default, no AAA authorization scheme is configured.

Before you configure an AAA authorization scheme, determine whether to use local authorization or remote server-group authorization. If remote server-group authorization needs to be implemented, configure a RADIUS or TACACS+ server in advance. If local authorization needs to be implemented, configure the local user database information on the NAS.

### ↘ **Configuring an AAA Authorization Method List**

By default, no AAA authorization method list is configured.

Determine the access mode to be configured in advance. Then configure authorization methods according to the access mode.

## 1.3.3 AAA Accounting

In AAA, accounting is an independent process of the same level as authentication and authorization. During the accounting process, start-accounting, update-accounting, and end-accounting requests are sent to the configured accounting server, which records the network resource usage of users and performs accounting, audit, and tracking of users' activities.

In AAA configuration, accounting scheme configuration is optional.

### ↘ **AAA Accounting Schemes**

- No accounting (**none**)

Accounting is not performed on users.

- Local accounting (**local**)

Accounting is completed on the NAS, which collects statistics on and limits the number of local user connections. Billing is not performed.

- Remote server-group accounting (**group**)

Accounting is performed jointly by the NAS and a remote server group. You can configure local accounting as standby to avoid accounting failures when all the servers in the server group fail.

### ↘ **AAA Accounting Types**

- EXEC accounting

Accounting is performed when users log in to and out of the CLI of the NAS.

- Command accounting

Records are kept on the commands that users run on the CLI of the NAS.

- Network accounting

Records are kept on the sessions that users set up after completing 802.1X and Web authentication to access the Internet.

## Related Configuration

### ↘ **Enabling AAA**

By default, AAA is disabled.

To enable AAA, run the **aaa new-model** command.

### ↘ Configuring an AAA Accounting Scheme

By default, no AAA accounting method is configured.

Before you configure an AAA accounting scheme, determine whether to use local accounting or remote server-group accounting. If remote server-group accounting needs to be implemented, configure a RADIUS or TACACS+ server in advance. If local accounting needs to be implemented, configure the local user database information on the NAS.

### ↘ Configuring an AAA Accounting Method List

By default, no AAA accounting method list is configured.

Determine the access mode to be configured in advance. Then configure accounting methods according to the access mode.

## 1.3.4 Multi-Domain AAA

In a multi-domain environment, the NAS can provide the AAA services to users in different domains. The user AVs (such as usernames and passwords, service types, and permissions) may vary with different domains. It is necessary to configure domains to differentiate the user AVs in different domains and configure an AV set (including an AAA service method list, for example, RADIUS) for each domain.

Our products support the following username formats:

1. userid@domain-name
2. domain-name\userid
3. userid.domain-name
4. userid

The fourth format (userid) does not contain a domain name, and it is considered to use the **default** domain name.

The NAS provides the domain-based AAA service based on the following principles:

- Resolves the domain name carried by a user.
- Searches for the user domain according to the domain name.
- Searches for the corresponding AAA method list name according to the domain configuration information on the NAS.
- Searches for the corresponding method list according to the method list name.
- Provides the AAA services based on the method list.

---

**i** If any of the preceding procedures fails, the AAA services cannot be provided.

---

Figure 1-4 shows the typical multi-domain topology.

Figure 1-4

## Related Configuration

### ↳ Enabling AAA

By default, AAA is disabled.

To enable AAA, run the **aaa new-model** command.

### ↳ Configuring an AAA Method List

By default, no AAA method list is configured.

For details, see section 1.4.1, section 1.4.2, and section 1.4.3.

### ↳ Enabling the Domain-Based AAA Service

By default, the domain-based AAA service is disabled.

To enable the domain-based AAA service, run the **aaa domain enable** command.

### ↳ Creating a Domain

By default, no domain is configured.

To configure a domain, run the **aaa domain domain-name** command.

### ↳ Configuring an AV Set for a Domain

By default, no domain AV set is configured.

A domain AV set contains the following elements: AAA method lists, the maximum number of online users, whether to remove the domain name from the username, and whether the domain name takes effect.

### ↳ Displaying Domain Configuration

To display domain configuration, run the **show aaa domain** command.

**i** The system supports a maximum of 32 domains.

## 1.4 Configuration

Configuration	Description and Command
<a href="#">Configuring AAA</a>	 Mandatory if user identities need to be verified.

Configuration	Description and Command	
<a href="#">Authentication</a>	<b>aaa new-model</b>	Enables AAA.
	<b>aaa authentication login</b>	Defines a method list of login authentication.
	<b>aaa authentication enable</b>	Defines a method list of Enable authentication.
	<b>aaa authentication dot1x</b>	Defines a method list of 802.1X authentication.
	<b>login authentication</b>	Applies Login authentication on a specific terminal line.
	<b>dot1x authentication</b>	Configures 802.1x authentication method.
	<b>aaa local authentication attempts</b>	Sets the maximum number of login attempts.
	<b>aaa local authentication lockout-time</b>	Sets lockout time after a login failure.
<a href="#">Configuring AAA Authorization</a>	 Mandatory if different permissions and services need to be assigned to users.	
	<b>aaa new-model</b>	Enables AAA.
	<b>aaa authorization exec</b>	Defines a method list of EXEC authorization.
	<b>aaa authorization commands</b>	Defines a method list of command authorization.
	<b>aaa authorization network</b>	Configures a method list of network authorization.
	<b>authorization exec</b>	Applies EXEC authorization methods to a specified VTY line.
	<b>authorization commands</b>	Applies command authorization methods to a specified VTY line.
<a href="#">Configuring AAA Accounting</a>	 Mandatory if accounting, statistics, and tracking need to be performed on the network resource usage of users.	
	<b>aaa new-model</b>	Enables AAA.
	<b>aaa accounting exec</b>	Defines a method list of EXEC accounting.
	<b>aaa accounting commands</b>	Defines a method list of command accounting.
	<b>aaa accounting network</b>	Defines a method list of network accounting.
	<b>accounting exec</b>	Applies EXEC accounting methods to a specified VTY line.
	<b>accounting commands</b>	Applies command accounting methods to a specified VTY line.
	<b>aaa accounting update</b>	Enables accounting update.
<b>aaa accounting update periodic</b>	Configures the accounting update interval.	

Configuration	Description and Command	
<a href="#">Configuring an AAA Server Group</a>	 Recommended if a server group needs to be configured to handle AAA through different servers in the group.	
	<b>aaa group server</b>	Creates a user-defined AAA server group.
	<b>server</b>	Adds an AAA server group member.
	<b>ip vrf forwarding</b>	Configures the VRF attribute of an AAA server group.
<a href="#">Configuring the Domain-Based AAA Service</a>	 Mandatory if AAA management of 802.1X access STAs needs to be performed according to domains.	
	<b>aaa new-model</b>	Enables AAA.
	<b>aaa domain enable</b>	Enables the domain-based AAA service.
	<b>aaa domain</b>	Creates a domain and enters domain configuration mode.
	<b>authentication dot1x</b>	Associates the domain with an 802.1X authentication method list.
	<b>accounting network</b>	Associates the domain with a network accounting method list.
	<b>authorization network</b>	Associates the domain with a network authorization method list.
	<b>state</b>	Configures the domain status.
	<b>username-format</b>	Configures whether to contain the domain name in usernames.
<b>access-limit</b>	Configures the maximum number of domain users.	

## 1.4.1 Configuring AAA Authentication

### Configuration Effect

Verify whether users are able to obtain access permission.

### Notes

- If an authentication scheme contains multiple authentication methods, these methods are executed according to the configured sequence.
- The next authentication method is executed only when the current method does not respond. If the current method fails, the next method will be not tried.
- When the **none** method is used, users can get access even when no authentication method gets response. Therefore, the **none** method is used only as standby.

- i** Normally, do not use None authentication. You can use the **none** method as the last optional authentication method in special cases. For example, all the users who may request access are trusted users and the users' work must not be delayed by system faults. Then you can use the **none** method to assign access permissions to these users when the authentication server does not respond. It is recommended that the local authentication method be added before the **none** method.
- If AAA authentication is enabled but no authentication method is configured and the default authentication method does not exist, users can directly log in to the Console without being authenticated. If users log in by other means, the users must pass local authentication.
- When a user enters the CLI after passing login authentication (the **none** method is not used), the username is recorded. When the user performs Enable authentication, the user is not prompted to enter the username again, because the username that the user entered during login authentication is automatically filled in. However, the user must enter the password previously used for login authentication.
- The username is not recorded if the user does not perform login authentication when entering the CLI or the **none** method is used during login authentication. Then, a user is required to enter the username each time when performing Enable authentication.

## Configuration Steps

### ↳ Enabling AAA

- Mandatory.
- Run the **aaa new-model** command to enable AAA.
- By default, AAA is disabled.

### ↳ Defining a Method List of Login Authentication

- Run the **aaa authentication login** command to configure a method list of login authentication.
- This configuration is mandatory if you need to configure a login authentication method list (including the configuration of the default method list).
- By default, no method list of login authentication is configured.

### ↳ Defining a Method List of Enable Authentication

- Run the **aaa authentication enable** command to configure a method list of Enable authentication.
- This configuration is mandatory if you need to configure an Enable authentication method list. (You can configure only the default method list.)
- By default, no method list of Enable authentication is configured.

### ↳ Defining a Method List of 802.1X Authentication

- Run the **aaa authentication dot1x** command to configure a method list of 802.1X authentication.
- This configuration is mandatory if you need to configure an 802.1X authentication method list (including the configuration of the default method list).

- By default, no method list of 802.1X authentication is configured.

#### ↘ Applying Login Authentication Method on a Specific Terminal Line

- Run the **login authentication** command in the line mode to apply Login authentication method.
- This configuration is mandatory if you need to apply an authentication method list on a specific line.
- By default, all lines are associated with the default method list.

#### ↘ Configuring 802.1x Authentication Method

- Run the **dot1x authentication** command to configure 802.1x authentication method.
- This configuration is mandatory if you need to specify the 802.1x authentication method.
- By default, 802.1x authentication does not apply the method list.

#### ↘ Setting the Maximum Number of Login Attempts

- Optional.
- By default, a user is allowed to enter passwords up to three times during login.

#### ↘ Setting the Maximum Lockout Time After a Login Failure

- Optional.
- By default, a user is locked for 15 minutes after entering wrong passwords three times.

### Verification

- Run the **show aaa method-list** command to display the configured method lists.
- Run the **show aaa lockout** command to display the settings of the maximum number of login attempts and the maximum lockout time after a login failure.
- Run the **show running-config** command to display the authentication method lists associated with login authentication and 802.1X authentication.

### Related Commands

#### ↘ Enabling AAA

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To enable the AAA services, run this command. None of the rest of AAA commands can be effective if AAA is not enabled.

#### ↘ Defining a Method List of Login Authentication

<b>Command</b>	<b>aaa authentication login</b> { <b>default</b>   <i>list-name</i> } <i>method1</i> [ <i>method2...</i> ]
<b>Parameter</b> <b>Description</b>	<p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><i>list-name:</i> Indicates the name of a login authentication method list in characters.</p> <p><i>method:</i> Indicates authentication methods from <b>local</b>, <b>none</b> and <b>group</b>. A method list contains up to four methods.</p> <p><b>local:</b> Indicates that the local user database is used for authentication.</p> <p><b>none:</b> Indicates that authentication is not performed.</p> <p><b>group:</b> Indicates that a server group is used for authentication. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If the AAA login authentication service is enabled on the NAS, users must perform login authentication negotiation through AAA. Run the <b>aaa authentication login</b> command to configure the default or optional method lists for login authentication.</p> <p>In a method list, the next method is executed only when the current method does not receive response.</p> <p>After you configure login authentication methods, apply the methods to the VTY lines that require login authentication; otherwise, the methods will not take effect.</p>

#### ▾ Defining a Method List of Enable Authentication

<b>Command</b>	<b>aaa authentication enable default</b> <i>method1</i> [ <i>method2...</i> ]
<b>Parameter</b> <b>Description</b>	<p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><i>list-name:</i> Indicates the name of an Enable authentication method list in characters.</p> <p><i>method:</i> Indicates authentication methods from <b>enable</b>, <b>local</b>, <b>none</b>, and <b>group</b>. A method list contains up to four methods.</p> <p><b>enable:</b> Indicates that the password that is configured using the <b>enable</b> command is used for authentication.</p> <p><b>local:</b> Indicates that the local user database is used for authentication.</p> <p><b>none:</b> Indicates that authentication is not performed.</p> <p><b>group:</b> Indicates that a server group is used for authentication. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If the AAA login authentication service is enabled on the NAS, users must perform Enable authentication negotiation through AAA. Run the <b>aaa authentication enable</b> command to configure the default or optional method lists for Enable authentication.</p> <p>In a method list, the next method is executed only when the current method does not receive response.</p>

#### ▾ Defining a Method List of 802.1X Authentication

<b>Command</b>	<b>aaa authentication dot1x</b> { <b>default</b>   <i>list-name</i> } <i>method1</i> [ <i>method2...</i> ]
<b>Parameter</b> <b>Description</b>	<p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><i>list-name:</i> Indicates the name of an 802.1X authentication method list in characters.</p> <p><i>method:</i> Indicates authentication methods from <b>local</b>, <b>none</b>, and <b>group</b>. A method list contains up to four</p>

	<p>methods.</p> <p><b>local:</b> Indicates that the local user database is used for authentication.</p> <p><b>none:</b> Indicates that authentication is not performed.</p> <p><b>group:</b> Indicates that a server group is used for authentication. Currently, the RADIUS server group is supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If the AAA 802.1X authentication service is enabled on the NAS, users must perform 802.1X authentication negotiation through AAA. Run the <b>aaa authentication dot1x</b> command to configure the default or optional method lists for 802.1X authentication.</p> <p>In a method list, the next method is executed only when the current method does not receive response.</p>

📌 **Setting the Maximum Number of Login Attempts**

<b>Command</b>	<b>aaa local authentication attempts</b> <i>max-attempts</i>
<b>Parameter Description</b>	<i>max-attempts</i> : Indicates the maximum number of login attempts. The value ranges from 1 to 2,147,483,647.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to set the maximum number of times a user can attempt to login.

📌 **Setting the Maximum Lockout Time After a Login Failure**

<b>Command</b>	<b>aaa local authentication lockout-time</b> <i>lockout-time</i>
<b>Parameter Description</b>	<i>lockout-time</i> : Indicates the time during which a user is locked after entering wrong passwords up to the specified times. The value ranges from 1 to 2,147,483,647, in the unit of minutes.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to set the maximum time during which a user is locked after entering wrong passwords up to the specified times.

**Configuration Example**

📌 **Configuring AAA Login Authentication**

Configure a login authentication method list on the NAS containing **group** *radius* and **local** methods in order.

<b>Scenario</b> Figure 1-5	<pre> graph LR     User[Laptop] --- Gi01[Gi 0/1] --- NAS[NAS]     NAS --- Gi02[Gi 0/2] --- Server[Server 10.1.1.1]             </pre>
<b>Configuration Steps</b>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS or TACACS+ server in advance if group-server authentication needs to be implemented. Configure the local user database information on the NAS if local authentication needs to be</p>

	<p>implemented. (This example requires the configuration of a RADIUS server and local database information.)</p> <p>Step 3: Configure an AAA authentication method list for login authentication users. (This example uses <b>group radius</b> and <b>local</b> in order.)</p> <p>Step 4: Apply the configured method list to an interface or line. Skip this step if the default authentication method is used.</p>
<b>NAS</b>	<pre>Ruijie#configure terminal Ruijie(config)#username user password pass Ruijie(config)#aaa new-model Ruijie(config)#radius-server host 10.1.1.1 Ruijie(config)#radius-server key ruijie Ruijie(config)#aaa authentication login list1 group radius local Ruijie(config)#line vty 0 20 Ruijie(config-line)#login authentication list1 Ruijie(config-line)#exit</pre>
<b>Verification</b>	Run the <b>show aaa method-list</b> command on the NAS to display the configuration.
<b>NAS</b>	<pre>Ruijie#show aaa method-list  Authentication method-list: aaa authentication login list1 group radius local  Accounting method-list:  Authorization method-list:</pre>
	<p>Assume that a user remotely logs in to the NAS through Telnet. The user is prompted to enter the username and password on the CLI.</p> <p>The user must enter the correct username and password to access the NAS.</p>
<b>User</b>	<pre>User Access Verification  Username:user Password:pass</pre>

## ➤ Configuring AAA Enable Authentication

Configure an Enable authentication method list on the NAS containing **group radius**, **local**, and then **enable** methods in order.

<p><b>Scenario</b> Figure 1-6</p>	
<p><b>Configuration Steps</b></p>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS or TACACS+ server in advance if group-server authentication needs to be implemented. Configure the local user database information on the NAS if local authentication needs to be implemented. Configure Enable authentication passwords on the NAS if you use Enable password authentication.</p> <p>Step 3: Configure an AAA authentication method list for Enable authentication users.</p> <hr/> <p><b>i</b> You can define only one Enable authentication method list globally. You do not need to define the list name but just default it. After that, it will be applied automatically.</p>
<p><b>NAS</b></p>	<pre>Ruijie#configure terminal Ruijie(config)#username user privilege 15 password pass Ruijie(config)#enable secret w Ruijie(config)#aaa new-model Ruijie(config)#radius-server host 10.1.1.1 Ruijie(config)#radius-server key ruijie Ruijie(config)#aaa authentication enable default group radius local enable</pre>
<p><b>Verification</b></p>	<p>Run the <b>show aaa method-list</b> command on the NAS to display the configuration.</p>
<p><b>NAS</b></p>	<pre>Ruijie#show aaa method-list  Authentication method-list: aaa authentication enable default group radius local enable  Accounting method-list:  Authorization method-list:</pre>
	<p>The CLI displays an authentication prompt when the user level is updated to level 15. The user must enter</p>

	the correct username and password to access the NAS.
<b>NAS</b>	<pre>Ruijie&gt;enable Username:user Password:pass Ruijie#</pre>

### ↘ Configuring AAA 802.1X Authentication

Configure an 802.1X authentication method list on the NAS containing **group radius**, and then **local** methods in order.

<b>Scenario</b> <b>Figure 1-7</b>	 <pre> graph LR     User[User] --- Gi01[Gi 0/1] --- NAS[NAS]     NAS --- Gi02[Gi 0/2] --- Server[Server]     Server --- IP[10.1.1.1]   </pre>
<b>Configuration</b> <b>Steps</b>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS server in advance if group-server authentication needs to be implemented. Configure the local user database information on the NAS if local authentication needs to be implemented. (This example requires the configuration of a RADIUS server and local database information.) Currently, 802.1X authentication does not support TACACS+.</p> <p>Step 3: Configure an AAA authentication method list for 802.1X authentication users. (This example uses <b>group radius</b> and <b>local</b> in order.)</p> <p>Step 4: Apply the AAA authentication method list. Skip this step if the default authentication method is used.</p> <p>Step 5: Enable 802.1X authentication on an interface.</p>
<b>NAS</b>	<pre>Ruijie#configure terminal Ruijie(config)#username user1 password pass1 Ruijie(config)#username user2 password pass2 Ruijie(config)#aaa new-model Ruijie(config)#radius-server host 10.1.1.1 Ruijie(config)#radius-server key ruijie Ruijie(config)#aaa authentication dot1x default group radius local Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-gigabitEthernet 0/1)#dot1x port-control auto Ruijie(config-if-gigabitEthernet 0/1)#exit</pre>
<b>Verification</b>	Run the <b>show aaa method-list</b> command on the NAS to display the configuration.
<b>NAS</b>	<pre>Ruijie#show aaa method-list</pre>

```
Authentication method-list:

aaa authentication dot1x default group radius local

Accounting method-list:

Authorization method-list:
```

## Common Errors

- No RADIUS server or TACACS+ server is configured.
- Usernames and passwords are not configured in the local database.

## 1.4.2 Configuring AAA Authorization

### Configuration Effect

- Determine what services or permissions authenticated users can enjoy.

### Notes

- EXEC authorization is often used with login authentication, which can be implemented on the same line. Authorization and authentication can be performed using different methods and servers. Therefore, the results of the same user may be different. If a user passes login authentication but fails in EXEC authorization, the user cannot enter the CLI.
- The authorization methods in an authorization scheme are executed in accordance with the method configuration sequence. The next authorization method is executed only when the current method does not receive response. If authorization fails using a method, the next method will be not tried.
- Command authorization is supported only by TACACS+.
- Console authorization: The RGOS can differentiate between the users who log in through the Console and the users who log in through other types of clients. You can enable or disable command authorization for the users who log in through the Console. If command authorization is disabled for these users, the command authorization method list applied to the Console line no longer takes effect.

### Configuration Steps

#### ▾ Enabling AAA

- Mandatory.
- Run the **aaa new-model** command to enable AAA.
- By default, AAA is disabled.

#### ▾ Defining a Method List of EXEC Authorization

- Run the **aaa authorization exec** command to configure a method list of EXEC authorization.
  - This configuration is mandatory if you need to configure an EXEC authorization method list (including the configuration of the default method list).
  - By default, no EXEC authorization method list is configured.
- 
- i** The default access permission level of EXEC users is the lowest. (Console users can connect to the NAS through the Console port or Telnet. Each connection is counted as an EXEC user, for example, a Telnet user and SSH user.)
- 

#### ▾ Defining a Method List of Command Authorization

- Run the **aaa authorization commands** command to configure a method list of command authorization.
- This configuration is mandatory if you need to configure a command authorization method list (including the configuration of the default method list).
- By default, no command authorization method list is configured.

#### ▾ Configuring a Method List of Network Authorization

- Run the **aaa authorization network** command to configure a method list of network authorization.
- This configuration is mandatory if you need to configure a network authorization method list (including the configuration of the default method list).
- By default, no authorization method is configured.

#### ▾ Applying EXEC Authorization Methods to a Specified VTY Line

- Run the **authorization exec** command in line configuration mode to apply EXEC authorization methods to a specified VTY line.
- This configuration is mandatory if you need to apply an EXEC authorization method list to a specified VTY line.
- By default, all VTY lines are associated with the default authorization method list.

#### ▾ Applying Command Authorization Methods to a Specified VTY Line

- Run the **authorization commands** command in line configuration mode to apply command authorization methods to a specified VTY line.
- This configuration is mandatory if you need to apply a command authorization method list to a specified VTY line.
- By default, all VTY lines are associated with the default authorization method list.

#### ▾ Enabling Authorization for Commands in Configuration Modes

- Run the **aaa authorization config-commands** command to enable authorization for commands in configuration modes.
- By default, authorization is disabled for commands in configuration modes.

#### ▾ Enabling Authorization for the Console to Run Commands

- Run the **aaa authorization console** command to enable authorization for console users to run commands.

- By default, authorization is disabled for the Console to run commands.

## Verification

Run the **show running-config** command to verify the configuration.

## Related Commands

### ↳ Enabling AAA

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To enable the AAA services, run this command. None of the rest of AAA commands can be effective if AAA is not enabled.

### ↳ Defining a Method List of EXEC Authorization

<b>Command</b>	<b>aaa authorization exec { default   list-name } method1 [ method2...]</b>
<b>Parameter</b>	<b>default:</b> With this parameter used, the configured method list will be defaulted.
<b>Description</b>	<p><i>list-name:</i> Indicates the name of an EXEC authorization method list in characters.</p> <p><i>method:</i> Specifies authentication methods from <b>local</b>, <b>none</b>, and <b>group</b>. A method list contains up to four methods.</p> <p><b>local:</b> Indicates that the local user database is used for EXEC authorization.</p> <p><b>none:</b> Indicates that EXEC authorization is not performed.</p> <p><b>group:</b> Indicates that a server group is used for EXEC authorization. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The RGOS supports authorization of the users who log in to the CLI of the NAS to assign the users CLI operation permission levels (0 to 15). Currently, EXEC authorization is performed only on the users who have passed login authentication. If a user fails in EXEC authorization, the user cannot enter the CLI.</p> <p>After you configure EXEC authorization methods, apply the methods to the VTY lines that require EXEC authorization; otherwise, the methods will not take effect.</p>

### ↳ Defining a Method List of Command Authorization

<b>Command</b>	<b>aaa authorization commands level { default   list-name } method1 [ method2...]</b>
<b>Parameter</b>	<b>default:</b> With this parameter used, the configured method list will be defaulted.
<b>Description</b>	<p><i>list-name:</i> Indicates the name of a command authorization method list in characters.</p> <p><i>method:</i> Indicates authentication methods from <b>none</b> and <b>group</b>. A method list contains up to four methods.</p> <p><b>none:</b> Indicates that command authorization is not performed.</p> <p><b>group:</b> Indicates that a server group is used for command authorization. Currently, the TACACS+ server</p>

	group is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The RGOS supports authorization of the commands executable by users. When a user enters a command, AAA sends the command to the authentication server. If the authentication server permits the execution, the command is executed. If the authentication server forbids the execution, the command is not executed and a message is displayed showing that the execution is rejected.</p> <p>When you configure command authorization, specify the command level, which is used as the default level. (For example, if a command above Level 14 is visible to users, the default level of the command is 14.)</p> <p>After you configure command authorization methods, apply the methods to the VTY lines that require command authorization; otherwise, the methods will not take effect.</p>

### ↘ Configuring a Method List of Network Authorization

<b>Command</b>	<b>aaa authorization network { default   list-name } method1 [ method2...]</b>
<b>Parameter Description</b>	<p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><i>list-name:</i> Indicates the name of a network authorization method list in characters.</p> <p><i>method:</i> Indicates authentication methods from <b>none</b> and <b>group</b>. A method list contains up to four methods.</p> <p><b>none:</b> Indicates that authentication is not performed.</p> <p><b>group:</b> Indicates that a server group is used for network authorization. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The RGOS supports authorization of network-related service requests such as PPP and SLIP requests. After authorization is configured, all authenticated users or interfaces are authorized automatically.</p> <p>You can configure three different authorization methods. The next authorization method is executed only when the current method does not receive response. If authorization fails using a method, the next method will be not tried.</p> <p>RADIUS or TACACS+ servers return a series of AV pairs to authorize authenticated users. Network authorization is based on authentication. Only authenticated users can perform network authorization.</p>

### ↘ Enabling Authorization for Commands in Configuration Modes (Including the Global Configuration Mode and Sub-Modes)

<b>Command</b>	<b>aaa authorization config-commands</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If you need to enable authorization for commands only in non-configuration modes (for example, privileged EXEC mode), disable authorization in configuration modes by using the <b>no</b> form of this command. Then users can run commands in configuration mode and sub-modes without authorization.

➤ **Enabling Authorization for the Console to Run Commands**

<b>Command</b>	<b>aaa authorization console</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The RGOS can differentiate between the users who log in through the Console and the users who log in through other types of clients. You can enable or disable command authorization for the users who log in through the Console. If command authorization is disabled for these users, the command authorization method list applied to the Console line no longer takes effect.

**Configuration Example**

➤ **Configuring AAA EXEC Authorization**

Configure login authentication and EXEC authorization for users on VTY lines 0 to 4. Login authentication is performed in local mode, and EXEC authorization is performed on a RADIUS server. If the RADIUS server does not respond, users are redirected to the local authorization.

<b>Scenario</b> Figure 1-8	<pre> graph LR     User[User] --- GI01[GI 0/1] --- NAS[NAS]     NAS --- GI02[GI 0/2] --- Server[Server]     Server --- IP[10.1.1.1]             </pre>
<b>Configuration Steps</b>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS or TACACS+ server in advance if remote server-group authorization needs to be implemented. If local authorization needs to be implemented, configure the local user database information on the NAS.</p> <p>Step 3: Configure an AAA authorization method list according to different access modes and service types.</p> <p>Step 4: Apply the configured method list to an interface or line. Skip this step if the default authorization method is used.</p> <p>EXEC authorization is often used with login authentication, which can be implemented on the same line.</p>
<b>NAS</b>	<pre> Ruijie#configure terminal Ruijie(config)#username user password pass Ruijie(config)#username user privilege 6 Ruijie(config)#aaa new-model Ruijie(config)#radius-server host 10.1.1.1 Ruijie(config)#radius-server key test Ruijie(config)#aaa authentication login list1 group local Ruijie(config)#aaa authorization exec list2 group radius local             </pre>

	<pre>Ruijie(config)#line vty 0 4 Ruijie(config-line)#login authentication list1 Ruijie(config-line)# authorization exec list2 Ruijie(config-line)#exit</pre>
<b>Verification</b>	Run the <b>show run</b> and <b>show aaa method-list</b> commands on the NAS to display the configuration.
<b>NAS</b>	<pre>Ruijie#show aaa method-list  Authentication method-list: aaa authentication login list1 group local  Accounting method-list:  Authorization method-list: aaa authorization exec list2 group radius local</pre>
	<pre>Ruijie# show running-config aaa new-model ! aaa authorization exec list2 group local aaa authentication login list1 group radius local ! username user password pass username user privilege 6 ! radius-server host 10.1.1.1 radius-server key 7 093b100133 ! line con 0 line vty 0 4 authorization exec list2 login authentication list1</pre>

```
!
End
```

📌 **Configuring AAA Command Authorization**

Provide command authorization for login users according to the following default authorization method: Authorize level-15 commands first by using a TACACS+ server. If the TACACS+ server does not respond, local authorization is performed. Authorization is applied to the users who log in through the Console and the users who log in through other types of clients.

<p><b>Scenario</b> Figure 1-9</p>	
<p><b>Configuration Steps</b></p>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS or TACACS+ server in advance if remote server-group authorization needs to be implemented. If local authorization needs to be implemented, configure the local user database information on the NAS.</p> <p>Step 3: Configure an AAA authorization method list according to different access modes and service types.</p> <p>Step 4: Apply the configured method list to an interface or line. Skip this step if the default authorization method is used.</p>
<p><b>NAS</b></p>	<pre>Ruijie#configure terminal Ruijie(config)#username user1 password pass1 Ruijie(config)#username user1 privilege 15 Ruijie(config)#aaa new-model Ruijie(config)#tacacs-server host 192.168.217.10 Ruijie(config)#tacacs-server key aaa Ruijie(config)#aaa authentication login default local Ruijie(config)#aaa authorization commands 15 default group tacacs+ local Ruijie(config)#aaa authorization console</pre>
<p><b>Verification</b></p>	<p>Run the <b>show run</b> and <b>show aaa method-list</b> commands on the NAS to display the configuration.</p>
<p><b>NAS</b></p>	<pre>Ruijie#show aaa method-list  Authentication method-list:  aaa authentication login default local  Accounting method-list:</pre>

	<pre>Authorization method-list: aaa authorization commands 15 default group tacacs+ local</pre>
	<pre>Ruijie#show run ! aaa new-model ! aaa authorization console aaa authorization commands 15 default group tacacs+ local aaa authentication login default local ! ! nfpp ! vlan 1 ! username user1 password 0 pass1 username user1 privilege 15 no service password-encryption ! tacacs-server host 192.168.217.10 tacacs-server key aaa ! line con 0 line vty 0 4 ! ! end</pre>

## ➤ Configuring AAA Network Authorization

<p><b>Scenario</b> Figure 1-10</p>	
<p><b>Configuration Steps</b></p>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS or TACACS+ server in advance if remote server-group authorization needs to be implemented. If local authorization needs to be implemented, configure the local user database information on the NAS.</p> <p>Step 3: Configure an AAA authorization method list according to different access modes and service types.</p> <p>Step 4: Apply the configured method list to an interface or line. Skip this step if the default authorization method is used.</p>
<p><b>NAS</b></p>	<pre>Ruijie#configure terminal Ruijie(config)#aaa new-model Ruijie(config)#radius-server host 10.1.1.1 Ruijie(config)#radius-server key test Ruijie(config)#aaa authorization network default group radius none Ruijie(config)# end</pre>
<p><b>Verification</b></p>	<p>Run the <b>show aaa method-list</b> command on the NAS to display the configuration.</p>
<p><b>NAS</b></p>	<pre>Ruijie#show aaa method-list  Authentication method-list:  Accounting method-list:  Authorization method-list: aaa authorization network default group radius none</pre>

**Common Errors**

N/A

**1.4.3 Configuring AAA Accounting**

**Configuration Effect**

- Record the network resource usage of users.

- Record the user login and logout processes and the commands executed by users during device management.

## Notes

---

About accounting methods:

- If an accounting scheme contains multiple accounting methods, these methods are executed according to the method configuration sequence. The next accounting method is executed only when the current method does not receive response. If accounting fails using a method, the next method will be not tried.
- After the default accounting method list is configured, it is applied to all VTY lines automatically. If a non-default accounting method list is applied to a line, it will replace the default one. If you apply an undefined method list to a line, the system will display a message indicating that accounting on this line is ineffective. Accounting will take effect only when a defined method list is applied.

EXEC accounting:

- EXEC accounting is performed only when login authentication on the NAS is completed. EXEC accounting is not performed if login authentication is not configured or the **none** method is used for authentication. If Start accounting is not performed for a user upon login, Stop accounting will not be performed when the user logs out.

Command accounting

- Only the TACACS+ protocol supports command accounting.

## Configuration Steps

---

### ▾ Enabling AAA

- Mandatory.
- Run the **aaa new-model** command to enable AAA.
- By default, AAA is disabled.

### ▾ Defining a Method List of EXEC Accounting

- Run the **aaa accounting exec** command to configure a method list of EXEC accounting.
- This configuration is mandatory if you need to configure an EXEC accounting method list (including the configuration of the default method list).
- The default access permission level of EXEC users is the lowest. (Console users can connect to the NAS through the Console port or Telnet. Each connection is counted as an EXEC user, for example, a Telnet user and SSH user.)
- By default, no EXEC accounting method list is configured.

### ▾ Defining a Method List of Command Accounting

- Run the **aaa accounting commands** command to configure a method list of command accounting.
- This configuration is mandatory if you need to configure a command accounting method list (including the configuration of the default method list).

- By default, no command accounting method list is configured. Only the TACACS+ protocol supports command accounting.

#### ▾ Defining a Method List of Network Accounting

- Run the **aaa accounting network** command to configure a method list of network accounting.
- This configuration is mandatory if you need to configure a network accounting method list (including the configuration of the default method list).
- By default, no network accounting method list is configured.

#### ▾ Applying EXEC Accounting Methods to a Specified VTY Line

- Run the **accounting exec** command in line configuration mode to apply EXEC accounting methods to a specified VTY line.
- This configuration is mandatory if you need to apply an EXEC accounting method list to a specified VTY line.
- You do not need to run this command if you apply the default method list.
- By default, all VTY lines are associated with the default accounting method list.

#### ▾ Applying Command Accounting Methods to a Specified VTY Line

- Run the **accounting commands** command in line configuration mode to apply command accounting methods to a specified VTY line.
- This configuration is mandatory if you need to apply a command accounting method list to a specified VTY line.
- You do not need to run this command if you apply the default method list.
- By default, all VTY lines are associated with the default accounting method list.

#### ▾ Applying 802.1X Network Accounting Methods

- Run the **dot1x accounting network** command to configure 802.1X network accounting methods.
- This configuration is mandatory if you need to specify 802.1X network accounting methods.
- You do not need to run this command if you apply the default method list.
- By default, all VTY lines are associated with the default accounting method list.

#### ▾ Enabling Accounting Update

- Optional.
- It is recommended that accounting update be configured for improved accounting accuracy.
- By default, accounting update is disabled.

#### ▾ Configuring the Accounting Update Interval

- Optional.
- It is recommended that the accounting update interval not be configured unless otherwise specified.

## Verification

Run the **show running-config** command to verify the configuration.

## Related Commands

### ↳ Enabling AAA

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To enable the AAA services, run this command. None of the rest of AAA commands can be effective if AAA is not enabled.

### ↳ Defining a Method List of EXEC Accounting

<b>Command</b>	<b>aaa accounting exec { default   list-name } start-stop method1 [ method2...]</b>
<b>Parameter</b>	<b>default:</b> With this parameter used, the configured method list will be defaulted.
<b>Description</b>	<i>list-name:</i> Indicates the name of an EXEC accounting method list in characters. <i>method:</i> Indicates authentication methods from <b>none</b> and <b>group</b> . A method list contains up to four methods. <b>none:</b> Indicates that EXEC accounting is not performed. <b>group:</b> Indicates that a server group is used for EXEC accounting. Currently, the RADIUS and TACACS+ server groups are supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The RGOS enables EXEC accounting only when login authentication is completed. EXEC accounting is not performed if login authentication is not performed or the <b>none</b> authentication method is used. After accounting is enabled, when a user logs in to the CLI of the NAS, the NAS sends a start-accounting message to the authentication server. When the user logs out, the NAS sends a stop-accounting message to the authentication server. If the NAS does not send a start-accounting message when the user logs in, the NAS will not send a stop-accounting message when the user logs out. After you configure EXEC accounting methods, apply the methods to the VTY lines that require EXEC accounting; otherwise, the methods will not take effect.

### ↳ Defining a Method List of Command Accounting

<b>Command</b>	<b>aaa accounting commands level { default   list-name } start-stop method1 [ method2...]</b>
<b>Parameter</b>	<i>level:</i> Indicates the command level for which accounting will be performed. The value ranges from 0 to 15.
<b>Description</b>	After a command of the configured level is executed, the accounting server records related information based on the received accounting packet. <b>default:</b> With this parameter used, the configured method list will be defaulted. <i>list-name:</i> Indicates the name of a command accounting method list in characters. <i>method:</i> Indicates authentication methods from <b>none</b> and <b>group</b> . A method list contains up to four methods.

	<p><b>none:</b> Indicates that command accounting is not performed.</p> <p><b>group:</b> Indicates that a server group is used for command accounting. Currently, the TACACS+ server group is supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The RGOS enables command accounting only when login authentication is completed. Command accounting is not performed if login authentication is not performed or the <b>none</b> authentication method is used. After accounting is enabled, the NAS records information about the commands of the configured level that users run and sends the information to the authentication server.</p> <p>After you configure command accounting methods, apply the methods to the VTY lines that require command accounting; otherwise, the methods will not take effect.</p>

### ▾ Defining a Method List of Network Accounting

<b>Command</b>	<b>aaa accounting network { default   list-name } start-stop method1 [ method2...]</b>
<b>Parameter Description</b>	<p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><i>list-name:</i> Indicates the name of a network accounting method list in characters.</p> <p><b>start-stop:</b> Indicates that a start-accounting message and a stop-accounting message are sent when a user accesses a network and when the user disconnects from the network respectively. The start-accounting message indicates that the user is allowed to access the network, regardless of whether accounting is successfully enabled.</p> <p><i>method:</i> Indicates authentication methods from <b>none</b> and <b>group</b>. A method list contains up to four methods.</p> <p><b>none:</b> Indicates that network accounting is not performed.</p> <p><b>group:</b> Indicates that a server group is used for network accounting. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The RGOS sends record attributes to the authentication server to perform accounting of user activities. The <b>start-stop</b> keyword is used to configure user accounting options.

### ▾ Enabling Accounting Update

<b>Command</b>	<b>aaa accounting update</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Accounting update cannot be used if the AAA services are not enabled. After the AAA services are enabled, run this command to enable accounting update.

### ▾ Configuring the Accounting Update Interval

<b>Command</b>	<b>aaa accounting update periodic interval</b>
<b>Parameter</b>	<i>Interval:</i> Indicates the accounting update interval, in the unit of minutes. The shortest is 1 minute.

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Accounting update cannot be used if the AAA services are not enabled. After the AAA services are enabled, run this command to configure the accounting update interval.

### Configuration Example

#### Configuring AAA EXEC Accounting

Configure login authentication and EXEC accounting for users on VTY lines 0 to 4. Login authentication is performed in local mode, and EXEC accounting is performed on a RADIUS server.

<p><b>Scenario</b> Figure 1-11</p>	
<p><b>Configuration Steps</b></p>	<p>Step 1: Enable AAA.</p> <p>If remote server-group accounting needs to be implemented, configure a RADIUS or TACACS+ server in advance.</p> <p>Step 2: Configure an AAA accounting method list according to different access modes and service types.</p> <p>Step 3: Apply the configured method list to an interface or line. Skip this step if the default accounting method is used.</p>
<p><b>NAS</b></p>	<pre>Ruijie#configure terminal Ruijie(config)#username user password pass Ruijie(config)#aaa new-model Ruijie(config)#radius-server host 10.1.1.1 Ruijie(config)#radius-server key test Ruijie(config)#aaa authentication login list1 group local Ruijie(config)#aaa accounting exec list3 start-stop group radius Ruijie(config)#line vty 0 4 Ruijie(config-line)#login authentication list1 Ruijie(config-line)# accounting exec list3 Ruijie(config-line)#exit</pre>
<p><b>Verification</b></p>	<p>Run the <b>show run</b> and <b>show aaa method-list</b> commands on the NAS to display the configuration.</p>
<p><b>NAS</b></p>	<pre>Ruijie#show aaa method-list</pre>

	<pre> Authentication method-list: aaa authentication login list1 group local  Accounting method-list: aaa accounting exec list3 start-stop group radius  Authorization method-list: </pre>

📌 **Configuring AAA Network Accounting**

Configure a network accounting method list for 802.1X STAs, and configure a RADIUS remote server for authentication and accounting.

<p><b>Scenario</b> Figure 1-13</p>	
<p><b>Configuration Steps</b></p>	<p>Step 1: Enable AAA.</p> <p>Step 2: If remote server-group accounting needs to be implemented, configure a RADIUS server in advance.</p> <p>Step 3: Configure an AAA accounting method list according to different access modes and service types.</p> <p>Step 4: Apply the configured AAA accounting method list. Skip this step if the default accounting method is used.</p> <hr/> <p><b>i</b> Accounting is performed only when 802.1X authentication is completed.</p>

<b>NAS</b>	<pre>Ruijie#configure terminal Ruijie(config)#username user password pass Ruijie(config)#aaa new-model Ruijie(config)#radius-server host 10.1.1.1 Ruijie(config)#radius-server key test Ruijie(config)#aaa authentication dotlx autlx group radius local Ruijie(config)#aaa accounting network acclx start-stop group radius Ruijie(config)#dotlx authentication autlx Ruijie(config)#dotlx accounting acclx Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#dotl port-control auto Ruijie(config-if-GigabitEthernet 0/1)#exit</pre>
<b>Verification</b>	Run the <b>show aaa method-list</b> command on the NAS to display the configuration.
<b>NAS</b>	<pre>Ruijie#show aaa method-list  Authentication method-list: aaa authentication dotlx autlx group radius local  Accounting method-list: aaa accounting network acclx start-stop group radius  Authorization method-list:</pre>

## Common Errors

---

N/A

## 1.4.4 Configuring an AAA Server Group

### Configuration Effect

---

- Create a user-defined server group and add one or more servers to the group.
- When you configure authentication, authorization, and accounting method lists, name the methods after the server group name so that the servers in the group are used to handle authentication, authorization, and accounting requests.
- Use self-defined server groups to separate authentication, authorization, and accounting.

### Notes

---

In a user-defined server group, you can specify and apply only the servers in the default server group.

## Configuration Steps

### ↘ Creating a User-Defined AAA Server Group

- Mandatory.
- Assign a meaningful name to the user-defined server group. Do not use the predefined **radius** and **tacacs+** keywords in naming.

### ↘ Adding an AAA Server Group Member

- Mandatory.
- Run the **server** command to add AAA server group members.
- By default, a user-defined server group does not have servers.

### ↘ Configuring the VRF Attribute of an AAA Server Group

- Optional.
- Run the **ip vrf forwarding** command to configure the VRF attribute of an AAA server group.
- By default, the AAA server group belongs to the global VRF table.

## Verification

Run the **show aaa group** command to verify the configuration.

## Related Commands

### ↘ Creating a User-Defined AAA Server Group

<b>Command</b>	<b>aaa group server {radius   tacacs+} name</b>
<b>Parameter Description</b>	<i>name</i> : Indicates the name of the server group to be created. The name must not contain the <b>radius</b> and <b>tacacs+</b> keywords because they are the names of the default RADIUS and TACACS+ server groups.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure an AAA server group. Currently, the RADIUS and TACACS+ server groups are supported.

### ↘ Adding an AAA Server Group Member

<b>Command</b>	<b>server ip-addr [auth-port port1] [acct-port port2]</b>
<b>Parameter Description</b>	<i>ip-addr</i> : Indicates the IP address of a server. <i>port1</i> : Indicates the authentication port of a server. (This parameter is supported only by the RADIUS server group.) <i>port2</i> : Indicates the accounting port of a server. (This parameter is supported only by the RADIUS server group.)

<b>Command Mode</b>	Server group configuration mode
<b>Usage Guide</b>	When you add servers to a server group, the default ports are used if you do not specify ports.

📌 **Configuring the VRF Attribute of an AAA Server Group**

<b>Command</b>	<b>ip vrf forwarding</b> <i>vrf_name</i>
<b>Parameter Description</b>	<i>vrf_name</i> : Indicates the name of a VRF table.
<b>Command Mode</b>	Server group configuration mode
<b>Usage Guide</b>	Use this command to assign a VRF table to the specified server group.

**Configuration Example**

📌 **Creating an AAA Server Group**

Create RADIUS server groups named g1 and g2. The IP addresses of the servers in g1 are 10.1.1.1 and 10.1.1.2, and the IP addresses of the servers in g2 are 10.1.1.3 and 10.1.1.4.

<p><b>Scenario</b> Figure 1-14</p>	
<p><b>Prerequisites</b></p>	<ol style="list-style-type: none"> <li>1. The required interfaces, IP addresses, and VLANs have been configured on the network, network connections have been set up, and the routes from the NAS to servers are reachable.</li> <li>2. Enable AAA.</li> </ol>
<p><b>Configuration Steps</b></p>	<p>Step 1: Configure a server (which belongs to the default server group).</p> <p>Step 2: Create user-defined AAA server groups.</p> <p>Step 3: Add servers to the AAA server groups.</p>
<p><b>NAS</b></p>	<pre>Ruijie#configure terminal Ruijie(config)#radius-server host 10.1.1.1 Ruijie(config)#radius-server host 10.1.1.2</pre>

	<pre>Ruijie(config)#radius-server host 10.1.1.3 Ruijie(config)#radius-server host 10.1.1.4 Ruijie(config)#radius-server key secret Ruijie(config)#aaa group server radius g1 Ruijie(config-gs-radius)#server 10.1.1.1 Ruijie(config-gs-radius)#server 10.1.1.2 Ruijie(config-gs-radius)#exit Ruijie(config)#aaa group server radius g2 Ruijie(config-gs-radius)#server 10.1.1.3 Ruijie(config-gs-radius)#server 10.1.1.4 Ruijie(config-gs-radius)#exit</pre>
<b>Verification</b>	Run the <b>show aaa group</b> and <b>show run</b> commands on the NAS to display the configuration.
<b>NAS</b>	<pre>Ruijie#show aaa group Type      Reference  Name ----- radius    1          radius tacacs+   1          tacacs+ radius    1          g1 radius    1          g2</pre>
	<pre>Ruijie#show run ! radius-server host 10.1.1.1 radius-server host 10.1.1.2 radius-server host 10.1.1.3 radius-server host 10.1.1.4 radius-server key secret ! aaa group server radius g1   server 10.1.1.1   server 10.1.1.2</pre>

```
!  
aaa group server radius g2  
    server 10.1.1.3  
    server 10.1.1.4  
!  
!
```

## Common Errors

- For RADIUS servers that use non-default authentication and accounting ports, when you run the **server** command to add servers, specify the authentication or accounting port.
- Only the RADIUS server group can be configured with the VRF attribute.

## 1.4.5 Configuring the Domain-Based AAA Service

### Configuration Effect

Create AAA schemes for 802.1X users in different domains.

### Notes

About referencing method lists in domains:

- The AAA method lists that you select in domain configuration mode should be defined in advance. If the method lists are not defined in advance, when you select them in domain configuration mode, the system prompts that the configurations do not exist.
- The names of the AAA method lists selected in domain configuration mode must be consistent with those of the method lists defined for the AAA service. If they are inconsistent, the AAA service cannot be properly provided to the users in the domain.

About the default domain:

- Default domain: After the domain-based AAA service is enabled, if a username does not carry domain information, the AAA service is provided to the user based on the default domain. If the domain information carried by the username is not configured in the system, the system determines that the user is unauthorized and will not provide the AAA service to the user. If the default domain is not configured initially, it must be created manually.
- When the domain-based AAA service is enabled, the default domain is not configured by default and needs to be created manually. The default domain name is **default**. It is used to provide the AAA service to the users whose usernames do not carry domain information. If the default domain is not configured, the AAA service is not available for the users whose usernames do not carry domain information.

About domain names:

- The domain names carried by usernames and those configured on the NAS are matched in the longest matching principle. For example, if two domains, **domain.com** and **domain.com.cn** are configured on a NAS and a user sends a

request carrying **aaa@domain.com**, the NAS determines that the user belongs to **domain.com**, instead of **domain.com.cn**.

- If the username of an authenticated user carries domain information but the domain is not configured on the NAS, the AAA service is not provided to the user.

## Configuration Steps

---

### ↳ Enabling AAA

- Mandatory.
- Run the **aaa new-model** command to enable AAA.
- By default, AAA is disabled.

### ↳ Enabling the Domain-Based AAA Service

- Mandatory.
- Run the **aaa domain enable** command to enable the domain-based AAA service.
- By default, the domain-based AAA service is disabled.

### ↳ Creating a Domain and Entering Domain Configuration Mode

- Mandatory.
- Run the **aaa domain** command to create a domain or enter the configured domain.
- By default, no domain is configured.

### ↳ Associating the Domain with an 802.1X Authentication Method List

- Run the **authentication dot1x** command to associate the domain with an 802.1X authentication method list.
- This configuration is mandatory if you need to apply a specified 802.1X authentication method list to the domain.
- Currently, the domain-based AAA service is applicable only to 802.1X access.

### ↳ Associating the Domain with a Network Accounting Method List

- Run the **accounting network** command to associate the domain with a network accounting method.
- This configuration is mandatory if you need to apply a specified network accounting method list to the domain.
- If a domain is not associated with a network accounting method list, by default, the global default method list is used for accounting.

### ↳ Associating the Domain with a Network Authorization Method List

- Run the **authorization network** command to associate the domain with a network authorization method list.
- This configuration is mandatory if you need to apply a specified network authorization method list to the domain.
- If a domain is not associated with a network authorization method list, by default, the global default method list is used for authorization.

### ↘ Configuring the Domain Status

- Optional.
- When a domain is in Block state, the users in the domain cannot log in.
- By default, after a domain is created, its state is Active, indicating that all the users in the domain are allowed to request network services.

### ↘ Configuring Whether to Contain the Domain Name in Usernames

- Optional.
- By default, the usernames exchanged between the NAS and an authentication server carry domain information.

### ↘ Configuring the Maximum Number of Domain Users

- Optional.
- By default, the maximum number of access users allowed in a domain is not limited.

## Verification

Run the **show aaa domain** command to verify the configuration.

## Related Commands

### ↘ Enabling AAA

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To enable the AAA services, run this command. None of the rest of AAA commands can be effective if AAA is not enabled.

### ↘ Enabling the Domain-Based AAA Service

<b>Command</b>	<b>aaa domain enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to enable the domain-based AAA service.

### ↘ Creating a Domain and Entering Domain Configuration Mode

<b>Command</b>	<b>aaa domain { default   domain-name }</b>
<b>Parameter</b>	<b>default:</b> Uses this parameter to configure the default domain.

<b>Description</b>	<i>domain-name</i> : Indicates the name of the domain to be created.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure a domain to provide the domain-based AAA service. The <b>default</b> parameter specifies the default domain. If a username does not carry domain information, the NAS uses the method list associated with the default domain to provide the AAA service to the user. The <i>domain-name</i> parameter specifies the name of the domain to be created. If the domain name carried by a username matches the configured domain name, the NAS uses the method list associated with this domain to provide the AAA service to the user. The system supports a maximum of 32 domains.

#### ↘ Associating the Domain with an 802.1X Authentication Method List

<b>Command</b>	<b>authentication dot1x</b> { <b>default</b>   <i>list-name</i> }
<b>Parameter</b>	<b>default</b> : Indicates that the default method list is used.
<b>Description</b>	<i>list-name</i> : Indicates the name of the method list to be associated.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Use this command to associate the domain with a 802.1X authentication method list.

#### ↘ Associating the Domain with a Network Accounting Method List

<b>Command</b>	<b>accounting network</b> { <b>default</b>   <i>list-name</i> }
<b>Parameter</b>	<b>default</b> : Indicates that the default method list is used.
<b>Description</b>	<i>list-name</i> : Indicates the name of the method list to be associated.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Use this command to associate the domain with a network accounting method list.

#### ↘ Associating the Domain with a Network Authorization Method List

<b>Command</b>	<b>authorization network</b> { <b>default</b>   <i>list-name</i> }
<b>Parameter</b>	<b>default</b> : Indicates that the default method list is used.
<b>Description</b>	<i>list-name</i> : Indicates the name of the method list to be associated.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	

#### ↘ Configuring the Domain Status

<b>Command</b>	<b>state</b> { <b>block</b>   <b>active</b> }
<b>Parameter</b>	<b>block</b> : Indicates that the configured domain is invalid.
<b>Description</b>	<b>active</b> : Indicates that the configured domain is valid.
<b>Command Mode</b>	Domain configuration mode

<b>Usage Guide</b>	Use this command to make the configured domain valid or invalid.
--------------------	--

📌 **Configuring Whether to Contain the Domain Name in Usernames**

<b>Command</b>	<code>username-format { without-domain   with-domain }</code>
<b>Parameter Description</b>	<b>without-domain:</b> Indicates to remove domain information from usernames. <b>with-domain:</b> Indicates to keep domain information in usernames.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Use this command in domain configuration mode to determine whether to include domain information in usernames when the NAS interacts with authentication servers in a specified domain.

📌 **Configuring the Maximum Number of Domain Users**

<b>Command</b>	<code>access-limit num</code>
<b>Parameter Description</b>	<i>num</i> : Indicates the maximum number of access users allowed in a domain. This limit is applicable only to 802.1X STAs.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Use this command to limit the number of access users in a domain.

Configuration Example

📌 **Configuring the Domain-Based AAA Services**

Configure authentication and accounting through a RADIUS server to 802.1X users (username: *user@domain.com*) that access the NAS. The usernames that the NAS sends to the RADIUS server do not carry domain information, and the number of access users is not limited.

<b>Scenario</b> Figure 1-15	<pre> graph LR     User[User] --- Gi01[Gi 0/1] --- NAS[NAS]     NAS --- Gi02[Gi 0/2] --- Server[Server 10.1.1.1]         </pre>
<b>Configuration Steps</b>	<p>The following example shows how to configure RADIUS authentication and accounting, which requires the configuration of a RADIUS server in advance.</p> <p>Step 1: Enable AAA.</p> <p>Step 2: Define an AAA method list.</p> <p>Step 3: Enable the domain-based AAA service.</p> <p>Step 4: Create a domain.</p> <p>Step 5: Associate the domain with the AAA method list.</p> <p>Step 6: Configure the domain attribute.</p>
<b>NAS</b>	<pre> Ruijie#configure terminal Ruijie(config)#aaa new-model         </pre>

## 2 Configuring RADIUS

### 2.1 Overview

The Remote Authentication Dial-In User Service (RADIUS) is a distributed client/server system.

RADIUS works with the Authentication, Authorization, and Accounting (AAA) to conduct identity authentication on users who attempt to access a network, to prevent unauthorized access. In RGOS implementation, a RADIUS client runs on a device or Network Access Server (NAS) and transmits identity authentication requests to the central RADIUS server, where all user identity authentication information and network service information are stored. In addition to the authentication service, the RADIUS server provides authorization and accounting services for access users.

RADIUS is often applied in network environments that have high security requirements and allow the access of remote users. RADIUS is a completely open protocol and the RADIUS server is installed on many operating systems as a component, for example, on UNIX, Windows 2000, and Windows 2008. Therefore, RADIUS is the most widely applied security server currently.

The Dynamic Authorization Extensions to Remote Authentication Dial In User Service is defined in the IETF RFC3576. This protocol defines a user offline management method. Devices communicate with the RADIUS server through the Disconnect-Messages (DMs) to bring authenticated users offline. This protocol implements compatibility between devices of different vendors and the RADIUS server in terms of user offline processing.

In the DM mechanism, the RADIUS server actively initiates a user offline request to a device, the device locates a user according to the user session information, user name, and other information carried in the request and brings the user offline. Then, the device returns a response packet that carries the processing result to the RADIUS server, thereby implementing user offline management of the RADIUS server.

#### Protocols and Standards

- RFC2865: Remote Authentication Dial In User Service (RADIUS)
- RFC2866: RADIUS Accounting
- RFC2867: RADIUS Accounting Modifications for Tunnel Protocol Support
- RFC2868: RADIUS Attributes for Tunnel Protocol Support
- RFC2869: RADIUS Extensions
- RFC3576: Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)

### 2.2 Applications

Application	Description
<a href="#">Providing Authentication, Authorization, and Accounting</a>	Authentication, authorization, and accounting are conducted on access users on a network, to prevent unauthorized access or operations.

Application	Description
<a href="#">Services for Access Users</a>	
<a href="#">Forcing Users to Go Offline</a>	The server forces an authenticated user to go offline.

## 2.2.1 Providing Authentication, Authorization, and Accounting Services for Access Users

### Scenario

RADIUS is typically applied in the authentication, authorization, and accounting of access users. A network device serves as a RADIUS client and transmits user information to a RADIUS server. After completing processing, the RADIUS server returns the authentication acceptance/authentication rejection/accounting response information to the RADIUS client. The RADIUS client performs processing on the access user according to the response from the RADIUS server.

Figure 2-1 Typical RADIUS Networking Topology

<b>Remarks</b>	<p>PC 1 and PC 2 are connected to the RADIUS client as access users in wired or wireless mode, and initiate authentication and accounting requests.</p> <p>The RADIUS client is usually an access switch or aggregate switch.</p> <p>The RADIUS server can be a component built in the Windows 2000/2003, Server (IAS), or UNIX operating system or dedicated server software provided by vendors.</p>
----------------	--

### Deployment

- Configure access device information on the RADIUS server, including the IP address and shared key of the access devices.
- Configure the AAA method list on the RADIUS client.
- Configure the RADIUS server information on the RADIUS client, including the IP address and shared key.
- Enable access control on the access port of the RADIUS client.
- Configure the network so that the RADIUS client communicates with the RADIUS server successfully.

## 2.2.2 Forcing Users to Go Offline

### Scenario

The RADIUS server forces authenticated online users to go offline for the sake of management.

See Figure 2-1 for the networking topology.

## Deployment

- Add the following deployment on the basis of 1.2.1 "Deployment".
- Enable the RADIUS dynamic authorization extension function on the RADIUS client.

## 2.3 Features

### Basic Concepts

#### Client/Server Mode

- **Client:** A RADIUS client initiates RADIUS requests and usually runs on a device or NAS. It transmits user information to the RADIUS server, receives responses from the RADIUS server, and performs processing accordingly. The processing includes accepting user access, rejecting user access, or collecting more user information for the RADIUS server.
- **Server:** Multiple RADIUS clients map to one RADIUS server. The RADIUS server maintains the IP addresses and shared keys of all RADIUS clients as well as information on all authenticated users. It receives requests from a RADIUS client, conducts authentication, authorization, and accounting, and returns processing information to the RADIUS client.

#### Structure of RADIUS Packets

The following figure shows the structure of RADIUS packets.

- **Code:** Identifies the type of RADIUS packets, which occupies one byte. The following table lists the values and meanings.

Code	Packet Type	Code	Packet Type
1	Access-Request	4	Accounting-Request
2	Access-Accept	5	Accounting-Response
3	Access-Reject	11	Access-Challenge

- **Identifier:** Indicates the identifier for matching request packets and response packets, which occupies one byte. The identifier values of request packets and response packets of the same type are the same.
- **Length:** Identifies the length of a whole RADIUS packet, which includes **Code**, **Identifier**, **Length**, **Authenticator**, and **Attributes**. It occupies two bytes. Bytes that are beyond the **Length** field will be truncated. If the length of a received packet is smaller than the value of **Length**, the packet is discarded.

- Authenticator: Verifies response packets of the RADIUS server by a RADIUS client, which occupies 16 bytes. This field is also used for encryption/decryption of user passwords.
- Attributes: Carries authentication, authorization, and accounting information, with the length unfixed. The **Attributes** field usually contains multiple attributes. Each attribute is represented in the Type, Length, Value (TLV) format. Type occupies one byte and indicates the attribute type. The following table lists common attributes of RADIUS authentication, authorization, and accounting. Length occupies one byte and indicates the attribute length, with the unit of bytes. Value indicates the attribute information.

Attribute No.	Attribute Name	Attribute No.	Attribute Name
1	User-Name	43	Acct-Output-Octets
2	User-Password	44	Acct-Session-Id
3	CHAP-Password	45	Acct-Authentic
4	NAS-IP-Address	46	Acct-Session-Time
5	NAS-Port	47	Acct-Input-Packets
6	Service-Type	48	Acct-Output-Packets
7	Framed-Protocol	49	Acct-Terminate-Cause
8	Framed-IP-Address	50	Acct-Multi-Session-Id
9	Framed-IP-Netmask	51	Acct-Link-Count
10	Framed-Routing	52	Acct-Input-Gigawords
11	Filter-ID	53	Acct-Output-Gigawords
12	Framed-MTU	55	Event-Timestamp
13	Framed-Compression	60	CHAP-Challenge
14	Login-IP-Host	61	NAS-Port-Type
15	Login-Service	62	Port-Limit
16	Login-TCP-Port	63	Login-LAT-Port
18	Reply-Message	64	Tunnel-Type
19	Callback-Number	65	Tunnel-Medium-Type
20	Callback-ID	66	Tunnel-Client-Endpoint
22	Framed-Route	67	Tunnel-Server-Endpoint
23	Framed-IPX-Network	68	Acct-Tunnel-Connection
24	State	69	Tunnel-Password
25	Class	70	ARAP-Password
26	Vendor-Specific	71	ARAP-Features
27	Session-Timeout	72	ARAP-Zone-Access
28	Idle-Timeout	73	ARAP-Security
29	Termination-Action	74	ARAP-Security-Data
30	Called-Station-Id	75	Password-Retry
31	Calling-Station-Id	76	Prompt
32	NAS-Identifier	77	Connect-Info
33	Proxy-State	78	Configuration-Token
34	Login-LAT-Service	79	EAP-Message

Attribute No.	Attribute Name	Attribute No.	Attribute Name
35	Login-LAT-Node	80	Message-Authenticator
36	Login-LAT-Group	81	Tunnel-Private-Group-id
37	Framed-AppleTalk-Link	82	Tunnel-Assignment-id
38	Framed-AppleTalk-Network	83	Tunnel-Preference
39	Framed-AppleTalk-Zone	84	ARAP-Challenge-Response
40	Acct-Status-Type	85	Acct-Interim-Interval
41	Acct-Delay-Time	86	Acct-Tunnel-Packets-Lost
42	Acct-Input-Octets	87	NAS-Port-Id

### Shared Key

A RADIUS client and a RADIUS server mutually confirm their identities by using a shared key during communication. The shared key cannot be transmitted over a network. In addition, user passwords are encrypted for transmission for the sake of security.

### RADIUS Server Group

The RADIUS security protocol, also called RADIUS method, is configured in the form of a RADIUS server group. Each RADIUS method corresponds to one RADIUS server group and one or more RADIUS servers can be added to one RADIUS server group. For details about the RADIUS method, see the *Configuring AAA*. If you add multiple RADIUS servers to one RADIUS server group, when the communication between a device and the first RADIUS server in this group fails or the first RADIUS server becomes unreachable, the device automatically attempts to communicate with the next RADIUS server till the communication is successful or the communication with all the RADIUS servers fails.

### RADIUS Attribute Type

- Standard attributes
- The RFC standards specify the RADIUS attribute numbers and attribute content but do not specify the format of some attribute types. Therefore, the format of attribute contents needs to be configured to adapt to different RADIUS server requirements. Currently, the format of the RADIUS Calling-Station-ID attribute (attribute No.: 31) can be configured.

The RADIUS Calling-Station-ID attribute is used to identify user identities when a network device transmits request packets to the RADIUS server. The RADIUS Calling-Station-ID attribute is a string, which can adopt multiple formats. It needs to uniquely identify a user. Therefore, it is often set to the MAC address of a user. For example, when IEEE 802.1X authentication is used, the Calling-Station-ID attribute is set to the MAC address of the device where the IEEE 802.1X client is installed. The following table describes the format of MAC addresses.

Format	Description
ietf	Indicates the standard format specified in the IETF standard (RFC3580), which is separated by the separator (-). Example: 00-D0-F8-33-22-AC
Normal	Indicates the common format that represents a MAC address (dotted hexadecimal format), which is separated by the separator (.). Example: 00d0.f833.22ac

Unformatted	Indicates the format without separators. This format is used by default. Example: 00d0f83322ac
-------------	---

- Private attributes

RADIUS is an extensible protocol. According to RFC2865, the Vendor-Specific attribute (attribute No.: 26) is used by device vendors to extend the RADIUS protocol to implement private functions or functions that are not defined in the standard RADIUS protocol. Table 1-3 lists private attributes supported by Ruijie products. The **TYPE** column indicates the default configuration of private attributes of Ruijie products and the **Extended TYPE** column indicates the default configuration of private attributes of other non-Ruijie products.

ID	Function	TYPE	Extended TYPE
1	max-down-rate	1	76
2	port-priority	2	77
3	user-ip	3	3
4	vlan-id	4	4
5	last-supPLICANT-version	5	5
6	net-ip	6	6
7	user-name	7	7
8	password	8	8
9	file-directory	9	9
10	file-count	10	10
11	file-name-0	11	11
12	file-name-1	12	12
13	file-name-2	13	13
14	file-name-3	14	14
15	file-name-4	15	15
16	max-up-rate	16	16
17	current-supPLICANT-version	17	17
18	flux-max-high32	18	18
19	flux-max-low32	19	19
20	proxy-avoid	20	20
21	dailup-avoid	21	21
22	ip-privilege	22	22
23	login-privilege	42	42
26	ipv6-multicast-address	79	79
27	ipv4-multicast-address	87	87
62	sdg-type	62	62
85	sdg-zone-name	85	85
103	sdg-group-name	103	103

## Overview

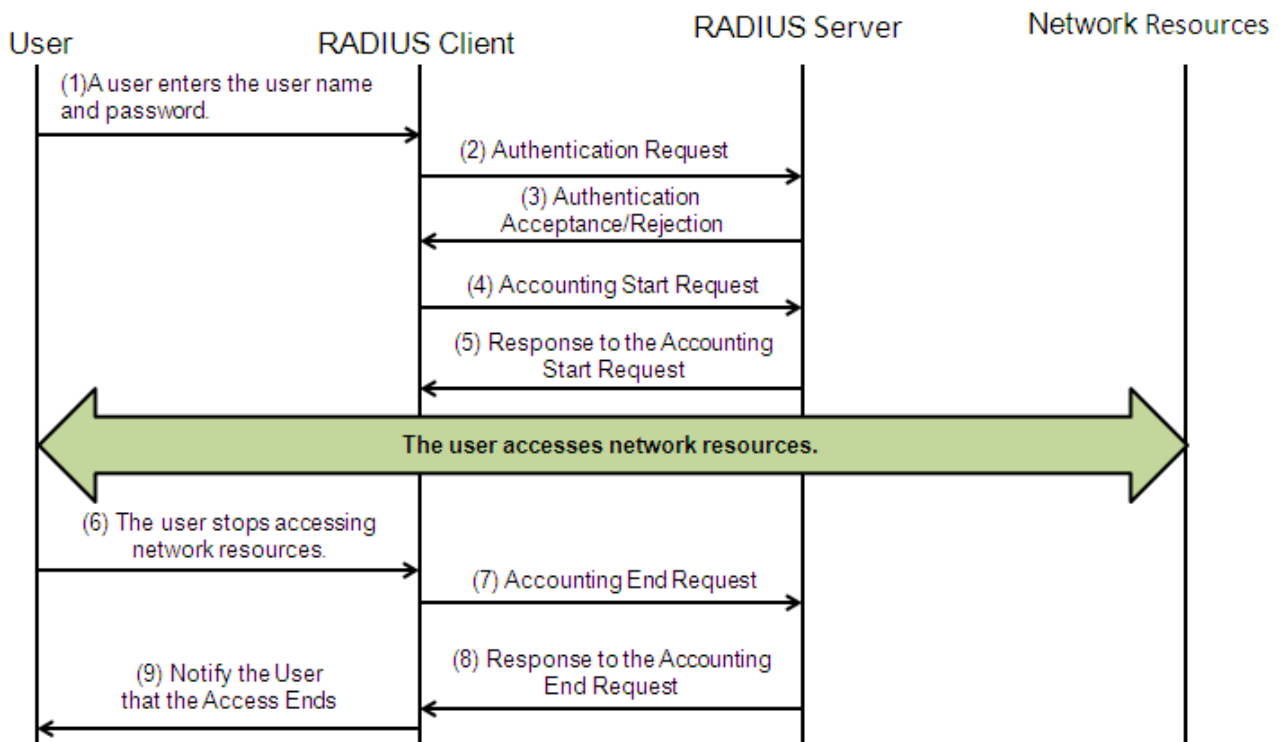

Feature	Description
<a href="#">RADIUS Authentication, Authorization, and Accounting</a>	Conducts identity authentication and accounting on access users, safeguards network security, and facilitates management for network administrators.
<a href="#">Source Address of RADIUS Packets</a>	Specifies the source IP address used by a RADIUS client to transmit packets to a RADIUS server.
<a href="#">RADIUS Timeout Retransmission</a>	Specifies the packet retransmission parameter for a RADIUS client when a RADIUS server does not respond to packets transmitted from the RADIUS client within a period of time.
<a href="#">RADIUS Server Accessibility Detection</a>	Enables a RADIUS client to actively detect whether a RADIUS server is reachable and maintain the accessibility of each RADIUS server. A reachable RADIUS server is selected preferentially to improve the handling performance of RADIUS services.
<a href="#">RADIUS Forced Offline</a>	Enables a RADIUS server to actively force authenticated users to go offline.

### 2.3.1 RADIUS Authentication, Authorization, and Accounting

Conduct identity authentication and accounting on access users, safeguard network security, and facilitate management for network administrators.

#### Working Principle

Figure 2-2

The RADIUS authentication and authorization process is described as follows:

1. A user enters the user name and password and transmits them to the RADIUS client.
2. After receiving the user name and password, the RADIUS client transmits an authentication request packet to the RADIUS server. The password is encrypted for transmission. For the encryption method, see RFC2865.
3. The RADIUS server accepts or rejects the authentication request according to the user name and password. When accepting the authentication request, the RADIUS server also issues authorization information apart from the authentication acceptance information. The authorization information varies with the type of access users.

The RADIUS accounting process is described as follows:

1. If the RADIUS server returns authentication acceptance information in Step (3), the RADIUS client sends an accounting start request packet to the RADIUS server immediately.
2. The RADIUS server returns the accounting start response packet, indicating accounting start.
3. The user stops accessing network resources and requests the RADIUS client to disconnect the network connection.
4. The RADIUS client transmits the accounting end request packet to the RADIUS server.
5. The RADIUS server returns the accounting end response packet, indicating accounting end.
6. The user is disconnected and cannot access network resources.

## Related Configuration

### ↘ [Configuring RADIUS Server Parameters](#)

No RADIUS server is configured by default.

You can run the **radius-server host** command to configure a RADIUS server.

At least one RADIUS server must be configured so that RADIUS services run normally.

### ↘ [Configuring the AAA Authentication Method List](#)

No AAA authentication method list is configured by default.

You can run the **aaa authentication** command to configure a method list for different user types and select **group radius** when setting the authentication method.

The RADIUS authentication can be conducted only after the AAA authentication method list of relevant user types is configured.

### ↘ [Configuring the AAA Authorization Method List](#)

No AAA authorization method list is configured by default.

You can run the **aaa authorization** command to configure an authorization method list for different user types and select **group radius** when setting the authorization method.

The RADIUS authorization can be conducted only after the AAA authorization method list of relevant user types is configured.

### ↘ [Configuring the AAA Accounting Method List](#)

No AAA accounting method list is configured by default.

You can run the **aaa accounting** command to configure an accounting method list for different user types and select **group radius** when setting the accounting method.

The RADIUS accounting can be conducted only after the AAA accounting method list of relevant user types is configured.

### 2.3.2 Source Address of RADIUS Packets

Specify the source IP address used by a RADIUS client to transmit packets to a RADIUS server.

#### Working Principle

When configuring RADIUS, specify the source IP address to be used by a RADIUS client to transmit RADIUS packets to a RADIUS server, in an effort to reduce the workload of maintaining a large amount of NAS information on the RADIUS server.

#### Related Configuration

The global routing is used to determine the source address for transmitting RADIUS packets by default.

Run the **ip radius source-interface** command to specify the source interface for transmitting RADIUS packets. The device uses the first IP address of the specified interface as the source address of RADIUS packets.

### 2.3.3 RADIUS Timeout Retransmission

#### Working Principle

After a RADIUS client transmits a packet to a RADIUS server, a timer is started to detect the response of the RADIUS server. If the RADIUS server does not respond within a certain period of time, the RADIUS client retransmits the packet.

#### Related Configuration

##### ▾ **Configuring the RADIUS Server Timeout Time**

The default timeout time is 5 seconds.

You can run the **radius-server timeout** command to configure the timeout time. The value ranges from 1 second to 1,000 seconds.

The response time of a RADIUS server is relevant to its performance and the network environment. Set an appropriate timeout time according to actual conditions.

##### ▾ **Configuring the Retransmission Count**

The default retransmission count is 3.

You can run the **radius-server retransmit** command to configure the retransmission count. The value ranges from 1 to 100.

##### ▾ **Configuring Whether to Retransmit Accounting Update Packets**

Accounting update packets are not retransmitted by default.

You can run the **radius-server account update retransmit** command to configure retransmission of accounting update packets for authenticated users.

## 2.3.4 RADIUS Server Accessibility Detection

### Working Principle

A RADIUS client actively detects whether a RADIUS server is reachable and maintains the accessibility of each RADIUS server. A reachable RADIUS server is selected preferentially to improve the handling performance of RADIUS services.

### Related Configuration

#### Configuring the Criteria for the Device to Judge That a RADIUS Server Is Unreachable

The default criteria configured for judging that a RADIUS server is unreachable meet the two conditions simultaneously: 1. The device does not receive a correct response packet from the RADIUS security server within 60 seconds. 2. The device transmits the request packet to the same RADIUS security server for consecutive 10 times.

You can run the **radius-server dead-criteria** command to configure the criteria for the device to judge that the RADIUS security server is unreachable.

#### Configuring the Test User Name for Actively Detecting the RADIUS Security Server

No test user name is specified for actively detecting the RADIUS security server by default.

You can run the **radius-server host x.x.x.xtestusername xxx** command to configure the test user name.

## 2.3.5 RADIUS Forced Offline

### Working Principle

Figure 2-3 DM Message Exchange of the RADIUS Dynamic Authorization Extension Protocol

The preceding figure shows the exchange of DM messages between the RADIUS server and the device. The RADIUS server transmits the Disconnect-Request message to UDP Port 3799 of the device. After processing, the device returns the Disconnect-Response message that carries the processing result to the RADIUS server.

### Related Configuration

## 2.4 Configuration

Configuration	Description and Command	
<a href="#">RADIUS Basic Configuration</a>	 (Mandatory) It is used to configure RADIUS authentication, authorization, and accounting.	
	<b>radius-serverhost</b>	Configures the IP address of the remote RADIUS security server.
	<b>radius-serverkey</b>	Configures the shared key for communication between the device and the RADIUS server.
	<b>radius-serverretransmit</b>	Configures the request transmission count, after which the device confirms that a RADIUS server is unreachable.
	<b>radius-servertimeout</b>	Configures the waiting time, after which the device retransmits a request.
	<b>radius-server account update retransmit</b>	Configures retransmission of accounting update packets for authenticated users.
	<b>ip radius source-interface</b>	Configures the source address of RADIUS packets.
<a href="#">Configuring the RADIUS Attribute Type</a>	 (Optional) It is used to define attribute processing adopted when the device encapsulates and parses RADIUS packets.	
	<b>radius-serverattribute31</b>	Configures the MAC address format of RADIUS attribute No. 31 (Calling-Station-ID).
	<b>radius attribute</b>	Configures the RADIUS private attribute type.
	<b>radius set qoscos</b>	Sets the private attribute port-priority issued by the server to the COS value of an interface. For COS-relevant concepts, see the <i>Configuring QoS</i> .
	<b>radius support cui</b>	Configures the device to support the CUI attribute.
	<b>radius vendor-specific</b>	Configures the mode of parsing private attributes by the device.
<a href="#">Configuring RADIUS Accessibility Detection</a>	 (Optional) It is used to detect whether a RADIUS server is reachable and maintain the accessibility of the RADIUS server.	
	<b>radius-server dead-criteria</b>	Configures the global criteria for judging that a RADIUS security server is unreachable.
	<b>radius-server deadtime</b>	Configures the duration for the device to stop transmitting request packets to an unreachable RADIUS server.
	<b>radius-server host</b>	Configures the IP address of the remote RADIUS security server, authentication port, accounting port, and active detection parameters.

## 2.4.1 RADIUS Basic Configuration

### Configuration Effect

- RADIUS authentication, authorization, and accounting can be conducted after RADIUS basic configuration is complete.

### Notes

- Before configuring RADIUS on the device, ensure that the network communication of the RADIUS server is in good condition.
- When running the **ip radius source-interface** command to configure the source address of RADIUS packets, ensure that the device of the source IP address communicates with the RADIUS server successfully.
- When conducting RADIUS IPv6 authentication, ensure that the RADIUS server supports RADIUS IPv6 authentication.

### Configuration Steps

#### ▾ Configuring the Remote RADIUS Security Server

- Mandatory.
- Configure the IP address, authentication port, accounting port, and shard key of the RADIUS security server.

#### ▾ Configuring the Shared Key for Communication Between the Device and the RADIUS Server

- Optional.
- Configure a shared key in global configuration mode for servers without a shared key.

 The shared key on the device must be consistent with that on the RADIUS server.

#### ▾ Configuring the Request Transmission Count, After Which the Device Confirms That a RADIUS Server Is Unreachable

- Optional.
- Configure the request transmission count, after which the device confirms that a RADIUS server is unreachable, according to the actual network environment.

#### ▾ Configuring the Waiting Time, After which the Device Retransmits a Request

- Optional.
- Configure the waiting time, after which the device retransmits a request, according to the actual network environment.

 In an 802.1X authentication environment that uses the RADIUS security protocol, if a network device serves as the 802.1X authenticator and Ruijie SU is used as the 802.1X client software, it is recommended that **radius-server timeout** be set to 3 seconds (the default value is 5 seconds) and **radius-server retransmit** be set to 2 (the default value is 3) on the network device.

#### ▾ Configuring Retransmission of Accounting Update Packets for Authenticated Users

- Optional.

- Determine whether to enable the function of retransmitting accounting update packets of authenticated users according to actual requirements.

▾ **Configuring the Source Address of RADIUS Packets**

- Optional.
- Configure the source address of RADIUS packets according to the actual network environment.

**Verification**

- Configure the AAA method list that specifies to conduct authentication, authorization, and accounting on users by using RADIUS.
- Enable the device to interact with the RADIUS server. Conduct packet capture to confirm that the device communicates with the RADIUS server over the RADIUS protocol.

**Related Commands**

▾ **Configuring the Remote RADIUS Security Server**

<b>Command</b>	<b>radius-server host</b> [ <b>oob</b> [ <b>via</b> <i>mgmt_name</i> ] ] { <i>ipv4-address</i>   <i>ipv6-address</i> } [ <b>auth-port</b> <i>port-number</i> ] [ <b>acct-port</b> <i>port-number</i> ][ <b>test username</b> <i>name</i> [ <b>idle-time</b> <i>time</i> ] [ <b>ignore-auth-port</b> ] [ <b>ignore-acct-port</b> ] ] [ <b>key</b> [ <b>0</b>   <b>7</b> ] <i>text-string</i> ]
<b>Parameter Description</b>	<p><b>oob</b>: Indicates oob authentication, that is, the source interface for transmitting packets to the RADIUS server is an mgmt port.</p> <p><b>via</b><i>mgmt_name</i>: Specifies a specific mgmt port when oob supports multiple mgmt ports.</p> <p><b>ipv4-address</b>: Indicates the IPv4 address of the RADIUS security server.</p> <p><b>ipv6-address</b>: Indicates the IPv6 address of the RADIUS security server.</p> <p><b>auth-port</b><i>port-number</i>: Indicates the UDP port for RADIUS identity authentication. The value ranges from 0 to 65,535. If it is set to <b>0</b>, the host does not conduct identity authentication.</p> <p><b>acct-port</b> <i>port-number</i>: Indicates the UDP port for RADIUS accounting. The value ranges from 0 to 65,535. If it is set to <b>0</b>, the host does not conduct accounting.</p> <p><b>test username</b> <i>name</i>: Enables the function of actively detecting the RADIUS security server and specifies the user name used for active detection.</p> <p><b>idle-time</b><i>time</i>: Indicates the interval for the device to transmit test packets to a reachable RADIUS security server. The default value is 60 minutes. The value ranges from 1 minute to 1,440 minutes (24 hours).</p> <p><b>ignore-auth-port</b>: Disables the function of detecting the authentication port of the RADIUS security server. It is enabled by default.</p> <p><b>ignore-acct-port</b>: Disables the function of detecting the accounting port of the RADIUS security server. It is enabled by default.</p> <p><b>key</b> [ <b>0</b>   <b>7</b> ] <i>text-string</i> : Configures the shared key of the server. The global shared key is used if it is not configured. The configured key is displayed as "*" and you are required to enter the same key twice. If the entered keys are inconsistent, you need to re-enter the key. If inconsistency occurs for five consecutive times, the configuration will fail.</p>
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	A RADIUS security server must be defined to implement the AAA security service by using RADIUS. You can run the <b>radius-server host</b> command to define one or more RADIUS security servers. If a RADIUS security server is not added to a RADIUS server group, the device uses the global routing table when transmitting RADIUS packets to the RADIUS server. Otherwise, the device uses the VRF routing table of the RADIUS server group.

### ▾ Configuring the Shared Key for Communication Between the Device and the RADIUS Server

<b>Command</b>	<b>radius-server key [0   7]text-string</b>
<b>Parameter</b>	<i>text-string</i> : Indicates the text of the shared key.
<b>Description</b>	<b>0   7</b> : Indicates the encryption type of the key. The value <b>0</b> indicates no encryption and <b>7</b> indicates simple encryption. The default value is <b>0</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A shared key is the basis for correct communication between the device and the RADIUS security server. The same shared key must be configured on the device and RADIUS security server so that they can communicate with each other successfully.

### ▾ Configuring the Request Transmission Count, After Which the Device Confirms That a RADIUS Server Is Unreachable

<b>Command</b>	<b>radius-server retransmitretries</b>
<b>Parameter Description</b>	<i>retries</i> : Indicates the RADIUS retransmission count. The value ranges from 1 to 100.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The prerequisite for AAA to use the next user authentication method is that the current security server used for authentication does not respond. The criteria for the device to judge that a security server does not respond are that the security server does not respond within the RADIUS packet retransmission duration of the specified retransmission count. There is an interval between consecutive two retransmissions.

### ▾ Configuring the Waiting Time, After which the Device Retransmits a Request

<b>Command</b>	<b>radius-server timeoutseconds</b>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the timeout time, with the unit of seconds. The value ranges from 1 second to 1,000 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to adjust the packet retransmission timeout time.

### ▾ Configuring Retransmission of Accounting Update Packets for Authenticated Users

<b>Command</b>	<b>radius-server account update retransmit</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure retransmission of accounting update packets for authenticated users. Accounting update packets are not retransmitted by default. The configuration does not affect users of other types.

### Configuration Example

#### Using RADIUS Authentication, Authorization, and Accounting for Login Users

<p><b>Scenario</b> Figure 2-4</p>	 <p>The diagram illustrates a network setup for RADIUS authentication. On the left, a laptop is connected to a central device labeled 'Radius client'. This client is then connected to three separate 'Radius server' units. The top server has the IP address 192.168.5.22, the middle server has 192.168.5.34, and the bottom server has the IPv6 address 3000::100.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable AAA.</li> <li>● Configure the RADIUS server information.</li> <li>● Configure to use the RADIUS authentication, authorization, and accounting methods.</li> <li>● Apply the configured authentication method on the interface.</li> </ul>
<p><b>RADIUS Client</b></p>	<pre>Ruijie#configure terminal Ruijie (config)#aaa new-model Ruijie (config)# radius-server host 192.168.5.22 Ruijie (config)#radius-server host 3000::100 Ruijie (config)# radius-server key aaa Ruijie (config)#aaa authentication login test group radius Ruijie (config)#aaa authorizationexecetest group radius Ruijie (config)#aaa accountingexecetest start-stop group radius Ruijie (config)# line vty 0 4 Ruijie (config-line)#login authentication test Ruijie (config-line)# authorization exec test</pre>

	<pre>Ruijie (config-line)# accounting exec test</pre>
<b>Verification</b>	Telnet to a device from a PC. The screen requesting the user name and password is displayed. Enter the correct user name and password to log in to the device. After obtaining a certain access level granted by the server, only run commands under this access level. Display the authentication log of the user on the RADIUS server. Perform management operations on the device as the user and then log out. Display the accounting information on the user on the RADIUS server.
	<pre>Ruijie#show running-config ! radius-server host 192.168.5.22 radius-server host 3000::100 radius-server key aaa aaa new-model aaa accounting exec test start-stop group radius aaa authorization exec test group radius aaa authentication login test group radius no service password-encryption iptcp not-send-rst ! vlan 1 ! line con 0 line vty 0 4   accounting exec test   authorization exec test   login authentication test !</pre>

### Common Errors

- The key configured on the device is inconsistent with that configured on the server.
- No method list is configured.

## 2.4.2 Configuring the RADIUS Attribute Type

### Configuration Effect

- Define the attribute processing adopted when the device encapsulates and parses RADIUS packets.

### Notes

- Private attributes involved in "Configuring the RADIUS Attribute Type" refer to Ruijie private attributes.

### Configuration Steps

#### ▾ Configuring the MAC Address Format of RADIUS Attribute No. 31 (Calling-Station-ID)

- Optional.
- Set the MAC address format of **Calling-Station-Id** to a type supported by the server.

#### ▾ Configuring the RADIUS Private Attribute Type

- Optional.
- If the server is a Ruijie application server, the RADIUS private attribute type needs to be configured.

#### ▾ Setting the Private Attribute port-priority Issued by the Server to the COS Value of an Interface

- Optional.
- Set the private attribute **port-priority** issued by the server to the COS value of an interface as required.

#### ▾ Configures the Device to Support the CUI Attribute

- Optional.
- Configure whether the device supports the RADIUS CUI attribute as required.

#### ▾ Configuring the Mode of Parsing Private Attributes by the Device

- Optional.
- Configure the index of a Ruijie private attribute parsed by the device as required.

### Verification

- Configure the AAA method list that specifies to conduct authentication, authorization, and accounting on users by using RADIUS.
- Enable the device to interact with the RADIUS server. Conduct packet capture to display the MAC address format of Calling-Station-Id.
- Enable the device to interact with the RADIUS server. Display the debug information of the device to check that Ruijie private attributes are correctly parsed by the device.
- Enable the device to interact with the RADIUS server. Display the debug information of the device to check that the CUI attribute is correctly parsed by the device.

## Related Commands

### Configuring the MAC Address Format of RADIUS Attribute No. 31 (Calling-Station-ID)

<b>Command</b>	<b>radius-server attribute 31 mac format {ietf   normal   unformatted }</b>
<b>Parameter Description</b>	<p><b>ietf</b>: Indicates the standard format specified in the IETF standard (RFC3580), which is separated by the separator (-). Example: 00-D0-F8-33-22-AC.</p> <p><b>normal</b>: Indicates the common format that represents a MAC address (dotted hexadecimal format), which is separated by the separator (.). Example: 00d0.f833.22ac.</p> <p><b>unformatted</b>: Indicates the format without separators. This format is used by default. Example: 00d0f83322ac.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Some RADIUS security servers (mainly used for 802.1X authentication) can identify only MAC addresses in the IETF format. In this case, set the MAC address format of Calling-Station-ID to IETF.

### Configuring the RADIUS Private Attribute Type

<b>Command</b>	<b>radius attribute{id   down-rate-limit   dscp   mac-limit   up-rate-limit} vendor-type type</b>
<b>Parameter Description</b>	<p><i>id</i>: Indicates the function ID. The value ranges from 1 to 255.</p> <p><i>type</i>: Indicates the type of private attributes.</p> <p><b>down-rate-limit</b>: Indicates the downstream rate limit attribute.</p> <p><b>dscp</b>: Indicates the DSCP attribute.</p> <p><b>mac-limit</b>: Indicates the MAC-limit attribute.</p> <p><b>up-rate-limit</b>: Indicates the upstream rate limit attribute.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure the type of private attributes.

### Setting the Private Attribute port-priority Issued by the Server to the COS Value of an Interface

<b>Command</b>	<b>radius set qoscos</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command to use the issued QoS value as the CoS value. The QoS value is used as the DSCP value by default.

### Configures the Device to Support the CUI Attribute

<b>Command</b>	<b>radius support cui</b>
<b>Parameter Description</b>	N/A

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command to enable the RADIUS-compliant device to support the CUI attribute.

### ↘ [Configuring the Mode of Parsing Private Attributes by the Device](#)

<b>Command</b>	<b>Radius vendor-specific extend</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to identify attributes of all vendor IDs by type.

## [Configuration Example](#)

### ↘ [Configuring the RADIUS Attribute Type](#)

<b>Scenario</b>	One authentication device
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the MAC address format of RADIUS Calling-Station-Id.</li> <li>● Configure the RADIUS private attribute type.</li> <li>● Set the QoS value issued by the RADIUS server as the COS value of the interface.</li> <li>● Configure the RADIUS function to support the CUI attribute.</li> <li>● Configure the device to support private attributes of other vendors.</li> </ul>
	<pre>Ruijie(config)#radius-server attribute 31 mac format ietf Ruijie(config)#radius attribute 16 vendor-type 211 Ruijie(config)#radiussetqoscos Ruijie(config)#radiussupport cui Ruijie(config)#radiusvendor-specific extend</pre>
<b>Verification</b>	Conduct packet capture or display debug information of the device to check whether the RADIUS standard attributes and private attributes are encapsulated/parsed correctly.

## 2.4.3 Configuring RADIUS Accessibility Detection

### [Configuration Effect](#)

The device maintains the accessibility status of each configured RADIUS server: reachable or unreachable. The device will not transmit authentication, authorization, and accounting requests of access users to an unreachable RADIUS server unless all the other servers in the same RADIUS server group as the unreachable server are all unreachable.

The device actively detects a specified RADIUS server. The active detection function is disabled by default. If the active detection function is enabled for a specified RADIUS server, the device will, according to the configuration, periodically transmits detection requests (authentication requests or accounting requests) to the RADIUS server. The transmission interval is as follows:

- For a reachable RADIUS server, the interval is the active detection interval of the reachable RADIUS server (the default value is 60 minutes).
- For an unreachable RADIUS server, the interval is always 1 minute.

## Notes

All the following conditions need to be met before the active detection function is enabled for a specified RADIUS server:

- The test user name of the RADIUS server is configured on the device.
- At least one tested port (authentication port or accounting port) of the RADIUS server is configured on the device.

If the following two conditions are all met, it is deemed that a reachable RADIUS server becomes unreachable:

- After the previous correct response is received from the RADIUS server, the time set in **radius-server dead-criteria timeseconds** has elapsed.
- After the previous correct response is received from the RADIUS server, the count that the device transmits requests to the RADIUS server but fails to receive correct responses (including retransmission) reaches the value set in **radius-server dead-criteria triesnumber**.

If any of the following conditions is met, it is deemed that an unreachable RADIUS server becomes reachable:

- The device receives correct responses from the RADIUS server.
- The duration that the RADIUS server is in the unreachable state exceeds the time set in **radius-server deadtime** and the active detection function is disabled for the RADIUS server.
- The authentication port or accounting port of the RADIUS server is updated on the device.

## Configuration Steps

### ▾ Configuring the Global Criteria for Judging That a RADIUS Security Server Is Unreachable

- Mandatory.
- Configuring the global criteria for judging that a RADIUS security server is unreachable is a prerequisite for enabling the active detection function.

### ▾ Configuring the IP Address of the Remote RADIUS Security Server, Authentication Port, Accounting Port, and Active Detection Parameters

- Mandatory.
- Configuring active detection parameters of the RADIUS server is a prerequisite for enabling the active detection function.

### ↘ Configuring the Duration for the Device to Stop Transmitting Request Packets to an Unreachable RADIUS Server

- Optional.
- The configured duration for the device to stop transmitting request packets to an unreachable RADIUS server takes effect only when the active detection function is disabled for the RADIUS server.

#### Verification

- Run the **show radius server** command to display the accessibility information of each RADIUS server.

#### Related Commands

### ↘ Configuring the Global Criteria for Judging That a RADIUS Security Server Is Unreachable

<b>Command</b>	<b>radius-server dead-criteria</b> { <i>timeseconds</i> [ <i>triesnumber</i> ]   <i>triesnumber</i> }
<b>Parameter Description</b>	<p><i>timeseconds</i>: Indicates the time condition parameter. If the device fails to receive a correct response packet from a RADIUS security server within the specified time, it is deemed that the RADIUS security server meets the inaccessibility duration condition. The value ranges from 1 second to 120 seconds.</p> <p><i>triesnumber</i>: Indicates the consecutive request timeout count. If the timeout count of request packets transmitted by the device to the same RADIUS security server reaches the preset count, it is deemed that the RADIUS security server meets the consecutive timeout count condition of inaccessibility. The value ranges from 1 to 100.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If a RADIUS security server meets both the duration condition and the consecutive request timeout count condition, it is deemed that the RADIUS security server is unreachable. Users can use this command to adjust parameter values in the duration condition and consecutive request timeout count condition.

### ↘ Configuring the Duration for the Device to Stop Transmitting Request Packets to an Unreachable RADIUS Server

<b>Command</b>	<b>Radius-server deadtime</b> <i>minutes</i>
<b>Parameter Description</b>	<i>minutes</i> : Indicates the duration for the device to stop transmitting requests to an unreachable RADIUS security server, with the unit of minutes. The value ranges from 1 minute to 1,440 minutes (24 hours).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the active detection function is enabled for a RADIUS security server on the device, the time parameter in <b>radius-server deadtime</b> does not take effect on the RADIUS server. If the active detection function is disabled for a RADIUS security server, the device automatically restores the RADIUS security server to the reachable state when the duration that the RADIUS security server is in the unreachable state exceeds the time specified in <b>radius-server deadtime</b> .

#### Configuration Example

➤ **Configuring Accessibility Detection on the RADIUS Server**

<p><b>Scenario</b> Figure 2-5</p>	 <p style="text-align: center;">192.168.5.22</p> <p style="text-align: center;">Radius client      Radius server</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the global criteria for judging that a RADIUS security server is unreachable.</li> <li>● Configure the IP address of the remote RADIUS security server, authentication port, accounting port, and active detection parameters.</li> </ul>
<p><b>RADIUS Client</b></p>	<pre>Ruijie(config)#radius-server dead-criteria time120 tries 5 Ruijie(config)# radius-server host 192.168.5.22 test username test ignore-acct-port idle-time 90</pre>
<p><b>Verification</b></p>	<p>Disconnect the network communication between the device and the server with the IP address of 192.168.5.22. Conduct RADIUS authentication through the device. After 120 seconds, run the <b>show radius server</b> command to check that the server state is <b>dead</b>.</p>
	<pre>Ruijie#show running-config ... radius-server host 192.168.5.22 test username test ignore-acct-port idle-time 90 radius-server dead-criteria time 120 tries 5 ...</pre>

## 2.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears statistics of the RADIUS dynamic authorization extension function and restarts statistics.	<b>clear radius dynamic-authorization-extension statistics</b>

### Displaying

Description	Command
Displays global parameters of the RADIUS server.	<b>show radius parameter</b>

Description	Command
Displays the configuration of the RADIUS server.	<b>show radius server</b>
Displays the configuration of the RADIUS private attribute type.	<b>show radius vendor-specific</b>
Displays statistics relevant to the RADIUS dynamic authorization extension function.	<b>show radius dynamic-authorization-extension statistics</b>
Displays statistics relevant to RADIUS authentication.	<b>show radius auth statistics</b>
Displays statistics relevant to RADIUS accounting.	<b>show radius acct statistics</b>
Displays configuration of RADIUS server groups.	<b>show radius group</b>

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the RADIUS event.	<b>debugradiusevent</b>
Debugs RADIUS packet printing.	<b>debugradiusdetail</b>
Debugs the RADIUS dynamic authorization extension function.	<b>debug radiusextension event</b>
Debugs the RADIUS dynamic authorization extension packet printing.	<b>debug radius extension detail</b>

### 3 Configuring TACACS+

#### 3.1 Overview

TACACS+ is a security protocol enhanced in functions based on the Terminal Access Controller Access Control System (TACACS) protocol. It is used to implement the authentication, authorization, and accounting (AAA) of multiple users.

##### Protocols and Standards

- RFC 1492 Terminal Access Controller Access Control System

#### 3.2 Applications

Application	Description
<a href="#">Managing and Controlling Login of End Users</a>	Password verification and authorization need to be conducted on end users.

##### 3.2.1 Managing and Controlling Login of End Users

##### Scenario

TACACS+ is typically applied in the login management and control of end users. A network device serves as the TACACS+ client and sends a user name and password to the TACACS+ server for verification. The user is allowed to log in to the network device and perform operations after passing the verification and obtaining authorization. See the following figure.

Figure 3-1

<b>Remarks</b>	<ul style="list-style-type: none"> <li>● A is a client that initiates TACACS+ requests.</li> <li>● B, C, and D are servers that process TACACS+ requests.</li> </ul>
----------------	--

##### Deployment

- Start the TACACS+ server on Server B, Server C, and Server D, and configure information on the access device (Device A) so that the servers provide TACACS+-based AAA function for the access device. Enable the AAA function on Device A to start authentication for the user login.
- Enable the TACACS+ client function on Device A, add the IP addresses of the TACACS+ servers (Server B, Server C, and Server D) and the shared key so that Device A communicates with the TACACS+ servers over TACACS+ to implement the AAA function.

### 3.3 Features

#### Basic Concepts

##### Format of TACACS+ Packets

Figure 3-2

4	8	16	24	32 bit
Major	Minor	Packet type	Sequence no.	Flags
Session ID				
Length				

- Major Version: Indicates the major TACACS+ version number.
- Minor Version: Indicates the minor TACACS+ version number.
- Packet Type: Indicates the type of packets, with the options including:  
 TAC\_PLUS\_AUTHEN: = 0x01 (authentication);  
 TAC\_PLUS\_AUTHOR: = 0x02 (authorization);  
 TAC\_PLUS\_ACCT: = 0x03 (accounting)
- Sequence Number: Indicates the sequence number of a data packet in the current session. The sequence number of the first TACACS+ data packet in a session must be 1 and the sequence number of subsequent each data packet increases by one. Therefore, the client sends data packets only with an odd sequence number and TACACS+ Daemon sends packets only with an even sequence number.
- Flags: Contains various bitmap format flags. One of the bits in the value specifies whether data packets need to be encrypted.
- Session ID: Indicates the ID of a TACACS+ session.
- Length: Indicates the body length of a TACACS+ data packet (excluding the header). Packets are encrypted for transmission on a network.

#### Overview

Feature	Description
---------	-------------

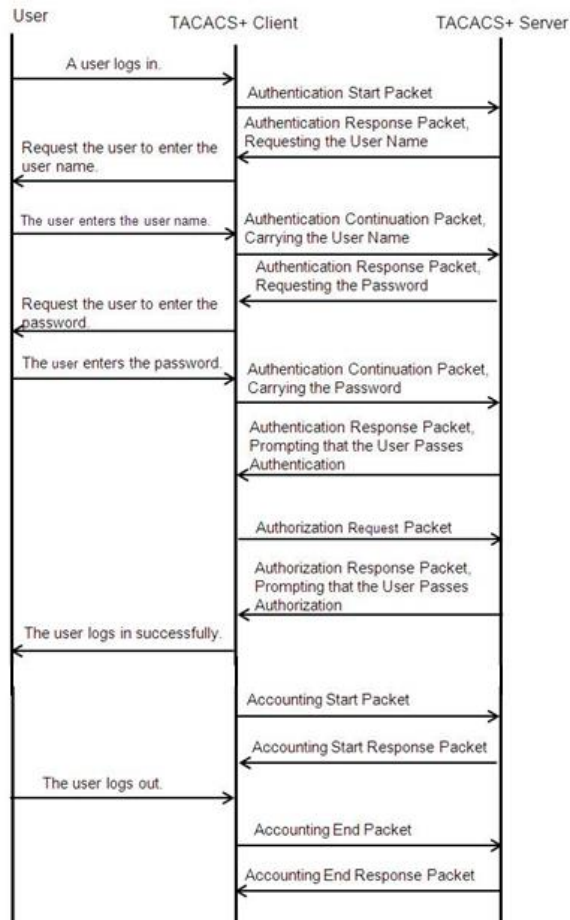

<a href="#">TACACS+ Authentication, Authorization, and Accounting</a>	Conducts authentication, authorization, and accounting on end users.
---	--

### 3.3.1 TACACS+ Authentication, Authorization, and Accounting

#### Working Principle

The following figure uses basic authentication, authorization, and accounting of user login to describe interaction of TACACS+ data packets.

Figure 3-3

The entire basic message interaction process includes three sections:

1. The authentication process is described as follows:
  - 1) A user requests to log in to a network device.
  - 2) After receiving the request, the TACACS+ client sends an authentication start packet to the TACACS+ server.
  - 3) The TACACS+ server returns an authentication response packet, requesting the user name.
  - 4) The TACACS+ client requests the user to enter the user name.

- 5) The user enters the login user name.
  - 6) After receiving the user name, the TACACS+ client sends an authentication continuation packet that carries the user name to the TACACS+ server.
  - 7) The TACACS+ server returns an authentication response packet, requesting the login password.
  - 8) The TACACS+ client requests the user to enter the login password.
  - 9) The user enters the login password.
  - 10) After receiving the login password, the TACACS+ client sends an authentication continuation packet that carries the login password to the TACACS+ server.
  - 11) The TACACS+ server returns an authentication response packet, prompting that the user passes authentication.
2. The user authorization starts after successful authentication:
- 1) The TACACS+ client sends an authorization request packet to the TACACS+ server.
  - 2) The TACACS+ server returns an authorization response packet, prompting that the user passes authorization.
  - 3) After receiving the authorization success packet, the TACACS+ client outputs the network device configuration screen for the user.
3. Accounting and audit need to be conducted on the login user after successful authorization:
- 1) The TACACS+ client sends an accounting start packet to the TACACS+ server.
  - 2) The TACACS+ server returns an accounting response packet, prompting that the accounting start packet has been received.
  - 3) The user logs out.
  - 4) The TACACS+ client sends an accounting end packet to the TACACS+ server.
  - 5) The TACACS+ server returns an accounting response packet, prompting that the accounting end packet has been received.

## 3.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring TACACS+ Basic Functions</a>	 (Mandatory) It is used to enable the TACACS+ security service.	
	<b>tacacs-server host</b>	Configures the TACACS+ server.
	<b>tacacs-server key</b>	Specifies the key shared by the server and network device.
	<b>tacacs-server timeout</b>	Configures the global waiting timeout time of the TACACS+ server for communication between a network device and the TACACS+ server.

Configuration	Description and Command	
<a href="#">Configuring Separate Processing of Authentication, Authorization, and Accounting of TACACS+</a>	 (Optional) It is used to separately process authentication, authorization, and accounting requests.	
	<b>aaa group server tacacs+</b>	Configures TACACS+ server groups and divides TACACS+ servers into different groups.
	<b>server</b>	Adds servers to TACACS+ server groups.

### 3.4.1 Configuring TACACS+ Basic Functions

#### Configuration Effect

- The TACACS+ basic functions are available after the configuration is complete. When configuring the AAA method list, specify the method of using TACACS+ to implement TACACS+ authentication, authorization, and accounting.
- When authentication, authorization, and accounting operations are performed, TACACS+ initiates the authentication, authorization, and accounting requests to configured TACACS+ servers according to the configured sequence. If response timeout occurs on a TACACS+ server, TACACS+ traverses the TACACS+ server list in sequence.

#### Notes

- The TACACS+ security service is a type of AAA service. You need to run the **aaa new-model** command to enable the security service.
- Only one security service is provided after TACACS+ basic functions are configured. To make the TACACS+ functions take effect, specify the TACACS+ service when configuring the AAA method list.

#### Configuration Steps

##### ↳ Enabling AAA

- Mandatory. The AAA method list can be configured only after AAA is enabled. TACACS+ provides services according to the AAA method list.

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	The AAA function is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The AAA method list can be configured only after AAA is enabled. TACACS+ provides services according to the AAA method list.

##### ↳ Configuring the IP Address of the TACACS+ Server

- Mandatory. Otherwise, a device cannot communicate with the TACACS+ server to implement the AAA function.

<b>Command</b>	<b>tacacs-server host oob</b> [ <b>via</b> <i>mgmt_name</i> ] { <i>ipv4-address</i>   <i>ipv6-address</i> } [ <b>port</b> <i>integer</i> ] [ <b>timeout</b> <i>integer</i> ] [ <b>key</b> [ <b>0</b>   <b>7</b> ] <i>text-string</i> ]
<b>Parameter Description</b>	<p><i>ipv4-address</i>: Indicates the IPv4 address of the TACACS+ server.</p> <p><i>ipv6-address</i>: Indicates the IPv6 address of the TACACS+ server.</p> <p><b>oob</b>: Uses an MGMT port as the source interface for communicating with the TACACS+ server. A non-MGMT port is used for communication by default.</p> <p><b>via</b> <i>mgmt_name</i>: Specifies a specific MGMT port when oob supports multiple MGMT ports.</p> <p><b>port</b><i>integer</i>: Indicates the TCP port used for TACACS+ communication. The default TCP port is 49.</p> <p><b>timeout</b> <i>integer</i>: Indicates the timeout time of the communication with the TACACS+ server. The global timeout time is used by default.</p> <p><b>key</b> [ <b>0</b>   <b>7</b> ] <i>text-string</i>: Indicates the shared key of the server. The global key is used if it is not configured. An encryption type can be specified for the configured key. The value <b>0</b> indicates no encryption and <b>7</b> indicates simple encryption. The default value is <b>0</b>.</p>
<b>Defaults</b>	No TACACS+ server is configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<ol style="list-style-type: none"> <li>You can specify the shared key of the server when configuring the IP address of the server. If no shared key is specified, the global key configured using the <b>tacacs-server key</b> command is used as the shared key of the server. The shared key must be completely the same as that configured on the server.</li> <li>You can specify the communication port of the server when configuring the IP address.</li> <li>You can specify the communication timeout time of the server when configuring the IP address.</li> </ol>

### ▾ Configuring the Shared Key of the TACACS+ Server

- Optional.
- If no global communication protocol is configured using this command, set **key** to specify the shared key of the server when running the **tacacs-server host** command to add server information. Otherwise, a device cannot communicate with the TACACS+ server.
- If no shared key is specified by using **key** when you run the **tacacs-server host** command to add server information, the global key is used.

<b>Command</b>	<b>tacacs-server</b> [ <b>key</b> [ <b>0</b>   <b>7</b> ] <i>text-string</i> ]
<b>Parameter Description</b>	<p><i>text-string</i>: Indicates the text of the shared key.</p> <p><b>0</b>   <b>7</b>: Indicates the encryption type of the key. The value <b>0</b> indicates no encryption and <b>7</b> indicates simple encryption.</p>
<b>Defaults</b>	No shared key is configured for any TACACS+ server.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure a global shared key for servers. To specify a different key for each server, set <b>key</b> when running the <b>tacacs-server host</b> command.

### ▾ Configuring the Timeout Time of the TACACS+ Server

- Optional.
- You can set the timeout time to a large value when the link between the device and the server is unstable.

<b>Command</b>	<b>tacacs-server timeout</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the timeout time, with the unit of seconds. The value ranges from 1 second to 1,000 seconds.
<b>Defaults</b>	The default value is 5 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the global server response timeout time. To set different timeout time for each server, set <b>timeout</b> when running the <b>tacacs-server host</b> command.

### Verification

Configure the AAA method list that specifies to conduct authentication, authorization, and accounting on users by using TACACS+.

- Enable the device to interact with the TACACS+ server and conduct packet capture to check the TACACS+ interaction process between the device and the TACACS+ server.
- View server logs to check whether the authentication, authorization, and accounting are normal.

### Configuration Example

#### Using TACACS+ for Login Authentication

<b>Scenario</b> Figure 3-4	<p>The diagram illustrates a network topology for TACACS+ authentication. On the left, a laptop icon represents the 'User'. A horizontal line connects the laptop to a central device labeled 'A', which is identified as the 'TACACS+ Client'. Another horizontal line connects device 'A' to a server rack icon labeled 'B', identified as the 'TACACS+ Server' with the IP address '192.168.5.22'.</p>
<b>Remarks</b>	<ul style="list-style-type: none"> <li>● A is a client that initiates TACACS+ requests.</li> <li>● B is a server that processes TACACS+ requests.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable AAA.</li> <li>● Configure the TACACS+ server information.</li> <li>● Configure the method of using TACACS+ for authentication.</li> <li>● Apply the configured authentication method on an interface.</li> </ul>
<b>A</b>	<pre>Ruijie# configure terminal Ruijie(config)# aaa new-model</pre>

	<pre>Ruijie(config)# tacacs-server host 192.168.5.22 Ruijie(config)# tacacs-server key aaa Ruijie(config)# aaa authentication login test group tacacs+ Ruijie(config)# line vty 0 4 Ruijie(config-line)# login authentication test</pre>
<b>Verification</b>	Telnet to a device from a PC. The screen requesting the user name and password is displayed. Enter the correct user name and password to log in to the device. View the authentication log of the user on the TACACS+ server.

### Common Errors

- The AAA security service is disabled.
- The key configured on the device is inconsistent with the key configured on the server.
- No method list is configured.

## 3.4.2 Configuring Separate Processing of Authentication, Authorization, and Accounting of TACACS+

### Configuration Effect

- The authentication, authorization, and accounting in the security service are processed by different TACACS+ servers, which improves security and achieves load balancing to a certain extent.

### Notes

- The TACACS+ security service is a type of AAA service. You need to run the **aaa new-model** command to enable the security service.
- Only one security service is provided after TACACS+ basic functions are configured. To make the TACACS+ functions take effect, specify the TACACS+ service when configuring the AAA method list.

### Configuration Steps

#### ▾ Configuring TACACS+ Server Groups

- Mandatory. There is only one TACACS+ server group by default, which cannot implement separate processing of authentication, authorization, and accounting.
- Three TACACS+ server groups need to be configured for separately processing authentication, authorization, and accounting.

<b>Command</b>	<b>aaa group server tacacs+group-name</b>
<b>Parameter</b>	<i>group-name</i> : Indicates the name of a group. A group name cannot be radius or tacacs+, which are the names of embedded groups.
<b>Description</b>	

<b>Defaults</b>	No TACACS+ server group is configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Group TACACS+ servers so that authentication, authorization, and accounting are completed by different server groups.

### ▾ Adding Servers to TACACS+ Server Groups

- Mandatory. If no server is added to a server group, a device cannot communicate with TACACS+ servers.
- In server group configuration mode, add the servers that are configured using the **tacacs-server host** command.

<b>Command</b>	<b>server</b> { <i>ipv4-address</i>   <i>ipv6-address</i> }
<b>Parameter Description</b>	<i>ipv4-address</i> : Indicates the IPv4 address of the TACACS+ server. <i>ipv6-address</i> : Indicates the IPv6 address of the TACACS+ server.
<b>Defaults</b>	No server is configured.
<b>Command Mode</b>	TACACS+ server group configuration mode
<b>Usage Guide</b>	Before configuring this command, you must run the <b>aaa group server tacacs+</b> command to enter the TACACS+ server group configuration mode. For the address of a server configured in a TACACS+ server group, the server must be configured using the <b>tacacs-server host</b> command in global configuration mode. If multiple servers are added to one server group, when one server does not respond, the device continues to send a TACACS+ request to another server in the server group.

### ▾ Configuring VRF of a TACACS+ Server Group

- Optional. Configure Virtual Routing and Forwarding (VRF) if a device needs to send TACACS+ packets through a specified address.
- In server group configuration mode, use a configured VRF name to specify the routing for the communication of servers in this group.

<b>Command</b>	<b>ip vrf forwarding</b> <i>vrf-name</i>
<b>Parameter Description</b>	<i>vrf-name</i> : Indicates the VRF name.
<b>Defaults</b>	No VRF is specified by default.
<b>Command Mode</b>	TACACS+ server group configuration mode
<b>Usage Guide</b>	Before configuring this command, you must run the <b>aaa group server tacacs+</b> command to enter the TACACS+ server group configuration mode. For VRF configured in a TACACS+ server group, a valid name must be configured for VRF by using the <b>vrf definition</b> command in global configuration mode.

### Verification

Configure the AAA method list that specifies to conduct authentication, authorization, and accounting on users by using TACACS+.

- Enable a device to interact with TACACS+ servers. Conduct packet capture, check that the authentication, authorization, and accounting packets are interacted with different servers, and check the source addresses in packets.

### Configuration Example

#### Configuring Different TACACS+ Server Groups for Separately Processing Authentication, Authorization, and Accounting

<p><b>Scenario</b> Figure 3-5</p>	<p>The diagram illustrates a network setup for TACACS+ services. On the left, a 'User' (represented by a laptop icon) is connected to a 'TACACS+ Client' (represented by a server rack icon labeled 'A'). This client is then connected to a central line that branches out to three separate 'TACACS+ Server' units (represented by server rack icons). These servers are labeled B, C, and D, with their respective IP addresses: B (192.168.5.22), C (192.168.5.34), and D (192.168.5.44).</p>
<p><b>Remarks</b></p>	<ul style="list-style-type: none"> <li>● A is a client that initiates TACACS+ requests.</li> <li>● B is a server that processes TACACS+ authentication requests.</li> <li>● C is a server that processes TACACS+ authorization requests.</li> <li>● D is a server that processes TACACS+ accounting requests.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable AAA.</li> <li>● Configure the TACACS+ server information.</li> <li>● Configure TACACS+ server groups.</li> <li>● Add servers to TACACS+ server groups.</li> <li>● Configure the method of using TACACS+ for authentication.</li> <li>● Configure the method of using TACACS+ for authorization.</li> <li>● Configure the method of using TACACS+ for accounting.</li> <li>● Apply the configured authentication method on an interface.</li> <li>● Apply the configured authorization method on an interface.</li> <li>● Apply the configured accounting method on an interface.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(Ruijie(config)# aaa new-model Ruijie(config)# tacacs-server host 192.168.5.22</pre>

```

Ruijie(config)# tacacs-server host 192.168.5.34
Ruijie(config)# tacacs-server host 192.168.5.44
Ruijie(config)# tacacs-server key aaa
Ruijie(config)# aaa group server tacacs+ tacgrp1
Ruijie(config-gs-tacacs)# server 192.168.5.22
Ruijie(config-gs-tacacs)# exit
Ruijie(config)# aaa group server tacacs+ tacgrp2
Ruijie(config-gs-tacacs)# server 192.168.5.34
Ruijie(config-gs-tacacs)# exit
Ruijie(config)# aaa group server tacacs+ tacgrp3
Ruijie(config-gs-tacacs)# server 192.168.5.44
Ruijie(config-gs-tacacs)# exit
Ruijie(config)# aaa authentication login test1 group tacacs+
Ruijie(config)# aaa authentication enable default group tacgrp1
Ruijie(config)# aaa authorization exec test2 group tacgrp2
Ruijie(config)# aaa accounting commands 15 test3 start-stop group tacgrp3
Ruijie(config)# line vty 0 4
Ruijie(config-line)# login authentication test1
Ruijie(config-line)# authorization exec test2
Ruijie(config-line)# accounting commands 15 test3

```

<b>Verification</b>	<p>Telnet to a device from a PC. The screen requesting the user name and password is displayed. Enter the correct user name and password to log in to the device. Enter the <b>enable</b> command and enter the correct <b>enable</b> password to initiate <b>enable</b> authentication. Enter the privilege EXEC mode after passing the authentication. Perform operations on the device and then exit the device.</p> <p>View the authentication log of the user on the server with the IP address of 192.168.5.22.</p> <p>View the <b>enable</b> authentication log of the user on the server with the IP address of 192.168.5.22.</p> <p>View the <b>exec</b> authorization log of the user on the server with the IP address of 192.168.5.34.</p> <p>View the command accounting log of the user on the server with the IP address of 192.168.5.44.</p>
---------------------	--

## Common Errors

- The AAA security service is disabled.
- The key configured on the device is inconsistent with the key configured on the server.
- Undefined servers are added to a server group.

- No method list is configured.

## 3.5 Monitoring

### Displaying

Description	Command
Displays interaction with each TACACS+ server.	<b>show tacacs</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs TACACS+.	<b>debug tacacs+</b>

## 4 Configuring 802.1X

### 4.1 Overview

IEEE 802.1X is a standard for port-based network access control that provides secure access service for local area networks (LANs).

In IEEE 802-compliant LANs, users connecting to the network access devices (NASs) can access network resources without authentication and authorization, bringing security risks to the network. IEEE 802.1X was proposed to resolve security problems of such LANs.

802.1X supports three security applications: authentication, authorization, and accounting, which are called AAA.

- Authentication: Checks whether to allow user access and restricts unauthorized users.
- Authorization: Grants specified services to users and controls permissions of authorized users.
- Accounting: Records network resource status of users to provide statistics for charges.

802.1X can be deployed in a network to realize user authentication, authorization and other functions.

#### Protocols and Standards

- IEEE 802.1X: Port-Based Network Access Control

### 4.2 Applications

Application	Description
<a href="#">Wired 802.1X Authentication</a>	To ensure secure admission on the campus network, 802.1X authentication is deployed on access switches.

#### 4.2.1 Wired 802.1X Authentication

##### Scenario

The campus network is deployed at the access, convergence, and core layers. 802.1X is deployed on access switches connected to dormitories to perform secure admission. Dormitory users must pass 802.1X authentication before accessing the campus network.

As shown in Figure 4-1:

- User ends must be installed with 802.1X clients (which can come with the operating system, or others like Ruijie Supplicant).
- Access switches support 802.1X.

- One or multiple Remote Authentication Dial-In User Service (RADIUS) servers perform authentication.

Figure 4-1

<b>Remarks</b>	The supplicant software installed on the user ends (or software coming with the operating system) performs 802.1X authentication. 802.1X authentication is deployed on access switches, convergence switches, or core switches. The RADIUS server runs the RADIUS server software to perform identity verification.
----------------	---

## Deployment

- Enable 802.1X authentication on ports between access switches and users to make ports controllable. Only authenticated users on one port can access the network.
- Configure an AAA authentication method list so that 802.1X can adopt the appropriate method and authentication server.
- Configure RADIUS parameters to ensure proper communication between a switch and the RADIUS server. For details, see the *Configuring RDS*.
- If a Ruijie RADIUS server is used, configure SNMP parameters to allow the RADIUS server to manage devices, such as querying and setting.
- Configure the port between the access switch and the RADIUS server as an uncontrolled port to ensure proper communication between them.
- Create an account on the RADIUS server, register the IP address of an access switch, and configure RADIUS-related parameters. Only in this case, can the RADIUS server respond to the requests of the switch.

## 4.3 Features

### Basic Concepts

---

#### ↘ User

In wired environment, 802.1X is a LAN-based protocol. It identifies users based on physical information but not accounts. In a LAN, a user is identified by the MAC address and VLAN ID (VID). Except them, all other information such as the account ID and IP address can be changed.

#### ↘ RADIUS

RADIUS is a remote authentication protocol defined in RFC2865, which get wide practice. Using this protocol, the authentication server can remotely deploy and perform authentication. During 802.1X deployment, the authentication server is remotely deployed, and 802.1X authentication information between the NAS and the authentication server is transmitted through RADIUS.

#### ↘ Timeout

During authentication, an NAS needs to communicate with the authentication client and server. If the authentication client or server times out, not responding within the time specified by 802.1X, authentication will fail. During deployment, ensure that the timeout specified by 802.1X is longer than that specified by RADIUS.

#### ↘ MAB

MAC address bypass (MAB) authentication means that the MAC address is used as the user name and password for authentication. Since Ruijie Supplicant cannot be installed on some dumb ends such as network printers, use MAB to perform security control.

#### ↘ EAP

802.1X uses Extensible Authentication Protocol (EAP) to carry authentication information. Defined in RFC3748, EAP provides a universal authentication framework, in which multiple authentication modes are embedded, including Message Digest Algorithm 5 (MD5), Challenge Handshake Authentication Protocol (CHAP), Password Authentication Protocol (PAP), and Transport Layer Security (TLS). Ruijie 802.1X authentication supports various modes including MD5, CHAP, PAP, PEAP-MSCHAP, and TLS.

#### ↘ Authorization

Authorization means to bind specified services to authenticated users, such as IP address, VLAN, Access Control List (ACL), and Quality of Service (QoS).

#### ↘ Accounting

Accounting performs network audit on network usage duration and traffic for users, which facilitates network operation, maintenance, and management.

**i** Some RADIUS servers such as RG-SAMRG-SMP servers need to check the online/offline status based on accounting packets. Therefore, accounting must be enabled on these RADIUS servers.

### Overview

Feature	Description
<a href="#">Authentication</a>	Provides secure admission for users. Only authenticated users can access the network.
<a href="#">Authorization</a>	Grants network access rights to authenticated users, such as IP address binding and ACL binding
<a href="#">Accounting</a>	Provides online record audit, such as online duration and traffic.

### 4.3.1 Authentication

Authentication aims to check whether users are authorized and prevent unauthorized users from accessing the network. Users must pass authentication to obtain the network access permission. They can access the network only after the authentication server verifies the account. Before user authentication succeeds, only EAPOL packets (Extensible Authentication Protocol over LAN, 802.1X packets) can be transmitted over the network for authentication.

#### Working Principle

802.1X authentication is very simple. After a user submits its account information, the NAS sends the account information to the remote RADIUS server for identity authentication. If the authentication succeeds, the user can access the network.

#### Roles in Authentication

802.1X authentication involves three roles: supplicant, authenticator, and server. In real applications, their respective roles are client, network access server (NAS), and authentication server (mostly RADIUS server).

Figure 4-2

- Supplicant

The supplicant is the role of end users, usually a PC. It requests to access network services and replies to the request packets of the authenticator. The supplicant must run software compliant with the 802.1X standard. Except the typical 802.1X client support embedded in the operating system, Ruijie has launched a Ruijie Supplicant compliant with the 802.1X standard.

- Authenticator

The authenticator is usually an NAS such as a switch or wireless access hotspot. It controls the network connection of a client based on the client's authentication status. As a proxy between the client and the authentication server, the authenticator requests the user name from the client, verifies the authentication information from the authentication server, and forwards it to the client. Except as the 802.1X authenticator, the so-called NAS also acts as a RADIUS Client. It encapsulates the replies of the client into the RADIUS-format packets and forwards the packets to the RADIUS server. After receiving the information from the RADIUS server, it interprets the information and forwards it to the client.

The authenticator has two types of ports: controlled port and uncontrolled port. Users connected to controlled ports can access network resources only when authenticated. Users connected to uncontrolled ports can directly access network resources without authentication. We can connect users to controlled ports to control users. Uncontrolled ports are mainly used to connect the authentication server to ensure proper communication between the authentication server and the NAS.

- Authentication server

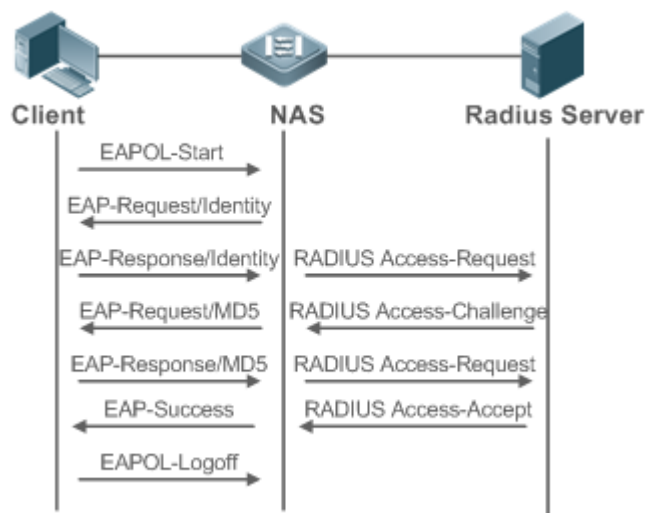

The authenticator server is usually an RADIUS server. It cooperates with the authenticator to provide authentication service for users. The authentication server saves the user names, passwords, and related authorization information. One server can provides authentication service for multiple authenticators to achieve centralized user management. The authentication server also manages accounting data received from authenticators. Ruijie RADIUS servers compliant with 802.1X standard include Microsoft IAS/NPS, Free RADIUS Server, and Cisco ACS.

### 📌 Authentication Process and Packet Exchange

The supplicant exchanges information with the authenticator through EAPOL while exchanges information with the authentication server through RADIUS. EAPOL is encapsulated on the MAC layer, with the type number of 0x888E. IEEE assigned a multicast MAC address 01-80-C2-00-00-03 for EAPOL to exchange packets during initial authentication. Ruijie Supplicant may also use 01-D0-F8-00-00-03 to for initial authentication packets.

Figure 4-3 shows the typical authentication process of a wired user.

Figure 4-3

This is a typical authentication process initiated by a user. In special cases, the NAS, may take place of the user to initiate an authentication request.

### ✚ **Authenticating User Status**

802.1X determines whether a user on a port can access the network based on the authentication status of the port. Ruijie products extend the 802.1X and realizes access control based on users (identify a wired user by the MAC address) by default. Ruijie 802.1X can also be enabled in interface configuration mode. For details, see the chapter "Configuration."

All users on an uncontrolled port can access network resources, while users on a controlled port can access network resources only after authenticated. When a user initiates authentication, its status remains Unauthenticated and cannot access the network yet. After it passes authentication, its status changes to Authenticated and can access network resources.

If the user connected to a controlled port does not support 802.1X, it will not respond to the NAS requesting the user name of the user. That means, the user remains Unauthenticated and cannot access network resources.

In the case of 802.1X-enabled user and 802.1X-disabled NAS, if the user does not receive any responses after sending a specified number of EAPOL-Start packets, it regards the connected port uncontrolled and directly accesses network resources.

On 802.1X-enabled devices, all ports are uncontrolled by default. We can configure a port as controlled so that all users on this port have to be authenticated.

If a user passes authentication (that is, the NAS receives a success packet from the RADIUS server), the user becomes Authenticated and can freely access network resources. If the user fails in authentication, it remains Unauthenticated and re-initiates authentication. If the communication between the NAS and the RADIUS server fails, the user remains Unauthenticated and cannot access network resources.

When a user sends an EAPOL-LOGOFF packet, the user's status changes from Authenticated to Unauthenticated.

When a port of the NAS goes down, all users on this port will become Unauthenticated.

When the NAS restarts, all users on it become Unauthenticated.

If you want to forcibly make a client free from authentication, it is recommended to add a static MAC address or enable the IP-MAC binding.

### ✚ **Deploying the Authentication Server**

802.1X authentication uses the RADIUS server as the authentication server. Therefore, when 802.1X secure admission is deployed, the RADIUS server also needs to be deployed. Common RADIUS servers include Microsoft IAS/NPS, Cisco ACS, and RG-SAM/SMP. For details about the deployment procedure, see related software description.

### ✚ **Configuring Authentication Parameters**

To use 802.1X authentication, enable 802.1X authentication on the access port and configure AAA authentication method list and RADIUS server parameters. To ensure the accessibility between the NAS and RADIUS server, the 802.1X server timeout should be longer than the RADIUS server timeout.

### ✚ **Supplicant**

A user should start Ruijie Supplicant to enter the user name and initiate authentication. If the operating system brings an own authentication client and the network is available, a dialog box will be displayed, asking the user to enter the user name. Different clients may have different implementation processes and Graphical User Interfaces (GUIs). It is recommended to use Ruijie Supplicant as the authentication client. If other software is used, see related software description.

#### 📌 Offline

If a user does not want to access the network, it can choose to go offline by multiple approaches, such as powering off the device, connecting the port to the network, and offline function provided by some supplicants.

### 4.3.2 Authorization

After a user passes authentication, the NAS restricts the accessible network resources of the user in multiple approaches, such as binding the IP address and the MAC address, and specifying the maximum online time or period, accessible VLANs, and bandwidth limit.

#### Working Principle

Authorization means to bind the permissions with the users. A user is identified based on the MAC address and VLAN ID, as mentioned before. Besides MAC-VID binding, some other information such as the IP address and VLAN ID are bound with a user to implement authorization.

#### 📌 IP Authorization

802.1X does not support IP address identification. Ruijie 802.1X authentication extends 802.1X to support IP-MAC binding, which is called IP authorization. IP authorization supports four modes:

Supplicant authorization: The IP address is provided by Ruijie Supplicant.

RADIUS authorization: After successful authentication, the RADIUS server delivers the IP address to the NAS.

DHCP authorization: In such case, an authenticated user will initiate a DHCP request to obtain an IP address, and then bind the IP address with the MAC address of the client. However, some users may need to obtain IP addresses statically instead. You can configure static IP-MAC binding for these users.

Mixed authorization: IP-MAC binding is configured for users in the following sequence: Supplicant authorization -> RADIUS authorization -> DHCP authorization. That is, the IP address provided by Ruijie Supplicant preferred, then the IP address provided by the RADIUS server, and finally the IP address provided by DHCP.

#### 📌 ACL Authorization

After user authentication is complete, the authentication server delivers the ACL or ACE to users. The ACL must be configured on the authentication server before delivery while no extra configuration is required for ACE delivery. ACL authorization delivers the ACL based on RADIUS attributes such as standard attributes, Ruijie-proprietary attributes, and Cisco-proprietary attributes. For details, see the software description related to the RADIUS server.

#### 📌 Kickoff

Used with RG-SAM/SMP, Ruijie 802.1X server can kick off online users who will be disconnected with the network. This function applies to the environment where the maximum online period and real-time accounting check function are configured.

### 4.3.3 Accounting

Accounting allows the network operators to audit the network access or fees of accessed users, including the online time and traffic.

#### Working Principle

Accounting is enabled on the NAS. The RADIUS server supports RFC2869-based accounting. When a user goes online, the NAS sends an accounting start packet to the RADIUS server which then starts accounting. When the user goes offline, the NAS sends an accounting end packet to the RADIUS server which then completes the accounting and generates a network fee accounting list. Different servers may perform accounting in different ways. Moreover, not all servers support accounting. Therefore, refer to the usage guide of the authentication server during actual deployment and accounting.

#### Accounting Start

After a user passes authentication, the accounting-enabled switch sends the RADIUS server an accounting start packet carrying user accounting attributes such as user name and accounting ID. After receiving the packet, the RADIUS server starts accounting.

#### Accounting Update

The NAS periodically sends Accounting Update packets to the RADIUS server, making the accounting more real-time. The accounting update interval can be provided by the RADIUS server or configured on the NAS.

#### Accounting End

After a user goes offline, the NAS sends the RADIUS server an accounting end packet carrying the online period and traffic of the user. The RADIUS server generates online records based on the information carried in this packet.

## 4.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring 802.1X Basic Functions</a>	 (Mandatory) It is used to configure basic authentication and accounting.	
	<b>aaa new-model</b>	Enables AAA.
	<b>aaa authentication dot1x</b>	Configures an AAA authentication method list.
	<b>aaa accounting networks</b>	Configures an AAA accounting method list.
	<b>radius-server host</b>	Configures the RADIUS server parameters.

	<b>radius-server key</b>	Configures the preshared key for communication between the NAS and the RADIUS server.
	<b>dot1x port-control auto</b>	Enables 802.1X authentication on a port.
<a href="#">Configuring 802.1X Parameters</a>	<p> (Optional) It is used to configure 802.1X parameters.</p> <p> Ensure that the 802.1X server timeout is longer than the RADIUS server timeout.</p> <p> Online Ruijie client detection applies only to Ruijie Supplicant.</p>	
	<b>dot1x re-authentication</b>	Enables re-authentication.
	<b>dot1x timeout re-authperiod</b>	Configures the re-authentication interval.
	<b>dot1x timeout tx-period</b>	Configures the interval of EAP-Request/Identity packet retransmission.
	<b>dot1x reauth-max</b>	Configures the maximum times of EAP-Request/Identity packet retransmission.
	<b>dot1x timeout supp-timeout</b>	Configures the interval of EAP-Request/Challenge packet retransmission.
	<b>dot1x max-req</b>	Configures the maximum times of EAP-Request/Challenge packet retransmission.
	<b>dot1x timeout server-timeout</b>	Configures the authentication server timeout.
	<b>dot1x timeout quiet-period</b>	Configures the quiet period after authentication fails.
	<b>dot1x auth-mode</b>	Specifies the authentication mode (EAP/CHAP/PAP).
	<b>dot1x client-probe enable</b>	Enables online Ruijie client detection.
	<b>dot1x probe-timer interval</b>	Configures the interval of online Ruijie client detection.
	<b>dot1x probe-timer alive</b>	Configures the duration of online Ruijie client detection.
<a href="#">Configuring Authorization</a>	<p> (Optional) It is used to configure authorization.</p> <p> Ruijie Supplicant should be used to perform supplicant authorization in IP authorization mode.</p>	
	<b>aaa authorization ip-auth-mode</b>	Specifies the IP authorization mode.
	<b>dot1x private-supplicant-only</b>	Filters non-Ruijie clients.

	<p><b>dot1x redirect</b></p>	<p>Enables Web Redirection for 2G Ruijie Supplicant Deployment.</p>
	<p><b>snmp</b></p>	<p>Configures SNMP parameters. RG-SAM/SMP can implement functions for 802.1X online users through SNMP. SNMP parameters should be configured to implement such functions.</p>
<p><a href="#">Configuring MAB</a></p>	<p> (Optional) It is used to configure MAC Authentication Bypass (MAB).</p> <p> 802.1X authentication takes priority over MAB.</p> <p> MAB does not support IP authorization.</p> <p> Single-user MAB and multi-user MAB cannot be enabled at the same time.</p> <p> MAB adopts the PAP authentication mode. Ensure correct server configurations during deployment.</p>	
	<p><b>dot1x mac-auth-bypass</b></p>	<p>Enables single-user MAB.</p>
	<p><b>dot1x mac-auth-bypass multi-user</b></p>	<p>Enables multi-user MAB.</p>
	<p><b>dot1x multi-mab quiet-period</b></p>	<p>Configures the quiet period after multi-user MAB fails.</p>
	<p><b>dot1x mac-auth-bypass timeout-activity</b></p>	<p>Configures the timeout of MAB users.</p>
	<p><b>dot1x mac-auth-bypass violation</b></p>	<p>Enables MAB violation mode.</p>
	<p><b>dot1x mac-auth-bypass vlan</b></p>	<p>Configures VLAN-based MAB.</p>
	<p><b>dot1x mac-auth-bypass valid-ip-auth</b></p>	<p>Enables IP address-based MAB.</p>
	<p><b>dot1x mab-username upper</b></p>	<p>Enables uppercase letters in MAB user names.</p>
<p><a href="#">Configuring IAB</a></p>	<p> (Optional) It is used to configure Inaccessible Authentication Bypass (IAB).</p>	
	<p><b>dot1x critical</b></p>	<p>Enables IAB.</p>
	<p><b>dot1x critical recovery action reinitialize</b></p>	<p>Enables IAB recovery.</p>
<p><a href="#">Configuring Extended Functions</a></p>	<p> (Optional) It is used to configure active authentication requests on a port.</p> <p> (Optional) It is used to configure the authenticated client list.</p> <p> (Optional) It is used to enable 802.1X packet sending with the pseudo source MAC address.</p> <p> (Optional) It is used to configure multiple accounts for the same MAC address.</p>	
	<p><b>dot1x auto-req</b></p>	<p>Enables active authentication.</p>
	<p><b>dot1x auto-req packet-num</b></p>	<p>Configures the number of active authentication requests.</p>
	<p><b>dot1x auto-req user-detect</b></p>	<p>Enables user detection for active authentication.</p>

	<b>dot1x auto-req req-interval</b>	Configures the interval of active authentication request.
	<b>dot1x auth-address-table address</b>	Configures the authenticatable client list.
	<b>dot1x pseudo source-mac</b>	Enables 802.1X packets sending with the pseudo source MAC address.
	<b>dot1x multi-account enable</b>	Enables multi-account authentication with one MAC address.
	<b>dot1x valid-ip-acct enable</b>	Enables IP-triggered accounting.
	<b>dot1x valid-ip-acct timeout</b>	Configures the timeout of obtaining IP addresses after users get authenticated. If timeout is reached, they will be kicked off.

## 4.4.1 Configuring 802.1X Basic Functions

### Configuration Effect

- Enable basic authentication and accounting services.
- On a wired network, run the **dot1x port-control auto** command in interface configuration mode to enable 802.1X authentication on a port.
- Run the **radius-server host ip-address** command to configure the IP address and port information of the RADIUS server and the **radius-server key** command to configure the RADIUS communication key between the NAS and the RADIUS server to ensure secure communication.
- Run the **aaa accounting update** command in global configuration mode to enable accounting update and the **aaa accounting update interval** command on the NAS to configure the accounting update interval. If the RADIUS server supports accounting update, you can also configure it on the RADIUS server. Prefer to use the parameters assigned by the authentication server than the parameters configured on the NAS.

### Notes

- Configure accurate RADIUS parameters so that the basic RADIUS communication is proper.
- The 802.1X authentication method list and accounting method list must be configured in AAA. Otherwise, errors may occur during authentication and accounting.
- Due to chipset restriction on switches, if 802.1X is enabled on one port, all ports will send 802.1X packets to the CPU.
- If 802.1X is enabled on a port but the number of authenticated users exceeds the maximum number of users configured for port security, port security cannot be enabled.
- If port security and 802.1X are both enabled but the security address has aged, 802.1X users must re-initiate authentication requests to continue the communication.
- Users with IP addresses statically configured or compliant with IP-MAC binding can access the network without authentication.

- 802.1X uses the default method list by default. If the default method list is not configured for AAA, run the **dot1x authentication** and **dot1x accounting** commands to reconfigure the it.
- When RG-SAM/SMP is used, accounting must be enabled. Otherwise, the RADIUS server will fail to detect users going offline, causing offline users remaining in the online user table.

## Configuration Steps

### ↳ Enabling AAA

- (Mandatory) 802.1X authentication and accounting take effect only after AAA is enabled.
- Enable AAA on the NAS that needs to control user access by 802.1X.

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	AAA is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	AAA is disabled by default. This command is mandatory for the deployment of 802.1X authentication.

### ↳ Enabling an AAA Authentication Method List

- Mandatory.
- The AAA authentication method list must be consistent with the 802.1X authentication method list.
- Enable an AAA authentication method list after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>aaa authentication dot1x <i>list-name</i> group radius</b>
<b>Parameter</b>	<i>list-name</i> : Indicates the 802.1X authentication method list of AAA.
<b>Description</b>	
<b>Defaults</b>	No AAA authentication method list is configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	AAA authentication modes are disabled by default. The AAA authentication mode must be consistent with the 802.1X authentication mode.

### ↳ Configuring the RADIUS Server Parameters

- (Mandatory) The RADIUS server parameters must be configured to ensure proper communication between the NAS and the RADIUS server.
- Configure RADIUS server parameters after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>radius-server host <i>ip-address</i> [ <b>auth-port</b> <i>port1</i> ] [ <b>acct-port</b> <i>port2</i> ]</b>
<b>Parameter</b>	<i>ip-address</i> : Indicates the IP address of the RADIUS server.
<b>Description</b>	<i>port1</i> : Indicates the authentication port. <i>port2</i> : Indicates the accounting port.

<b>Defaults</b>	No RADIUS server parameters are configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Preshared Key for Communication between the NAS and RADIUS Server

- (Mandatory) The preshared key for communication between the NAS and RADIUS server must be configured to ensure proper communication between the NAS and the RADIUS server.
- Configure the preshared key of the RADIUS server after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>radius-server key <i>string</i></b>
<b>Parameter Description</b>	<i>string</i> : Indicates the preshared key.
<b>Defaults</b>	No preshared key is configured for communication between the NAS and RADIUS server by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The IP address of the NAS must be the same as that registered on the RADIUS server. The preshared key on the NAS must be the same as that on the RADIUS server. If the default RADIUS communication ports are changed on the RADIUS server, you need to change the communication ports on the NAS correspondingly.

### ↘ Enabling 802.1X on a Port

- This command is mandatory for a wired network.
- Enable 802.1X on switches.

<b>Command</b>	<b>dot1x port-control auto</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	802.1X is disabled on a port by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	802.1X is disabled on a port by default. This command is mandatory for the deployment of 802.1X authentication. The default method list is used by default. If the 802.1X authentication method list in AAA is not the default one, the configured 802.1X authentication method list should match.

## Verification

Start Ruijie Supplicant and initiate authentication, enter the correct account information, and initiate authentication. Then check whether the 802.1X and RADIUS configurations are correct.

### ↘ Checking for 802.1X Authentication Entries

	<b>show dot1x summary</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	Display entries of authenticated users to check the authentication status of users, for example, authenticating, authenticated, or quiet.
<b>Command Display</b>	<pre>Ruijie#show dot1x summary ID      Username  MAC              Interface VLAN Auth-State      Backend-state Port-Status User-Type Time ----- 16777302 ts-user    b048.7a7f.f9f3 wlan 1      1      Authenticated   Idle           Authed static   0days 0h 0m12s</pre>

### ▾ Checking for AAA User Entries

<b>Command</b>	<b>show aaa user all</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	Display information of AAA users.
<b>Command Display</b>	<pre>Ruijie#show aaa user all -----       Id ----- Name 2345687901      wwxy -----</pre>

- Check whether the RADIUS server responds to authentication based on the RADIUS packets between the NAS and the RADIUS server. If no, it means that the network is disconnected or parameter configurations are incorrect. If the RADIUS server directly returns a rejection reply, check the log file on the RADIUS server to identify the cause, e.g., of the authentication mode of the authentication server is incorrectly configured.

### Configuration Example

**i** In this example, RG-SAM acts as the authentication server.

### ▾ Configuring 802.1X Authentication on a Switch

<p><b>Scenario</b></p> <p><b>Figure 4-4</b></p>																													
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Register the IP address of the switch on the RADIUS server and configure the communication key between the switch and the RADIUS server.</li> <li>● Create an account on the RADIUS server.</li> <li>● Enable AAA on the switch.</li> <li>● Configure RADIUS parameters on the switch.</li> <li>● Enable 802.1X authentication on ports of the switch.</li> </ul> <p>Switch configurations are as follows. For detailed configuration on the RADIUS server, see the <i>Configuring RADIUS</i>.</p>																												
	<pre>ruijie# configure terminal ruijie (config)# aaa new-model ruijie (config)# radius-server host 192.168.32.120 ruijie (config)# radius-server key ruijie ruijie (config)# interface FastEthernet 0/1 ruijie (config-if)# dot1x port-control auto</pre>																												
<p><b>Verification</b></p>	<p>Check whether authentication is proper and network access behaviors change after authentication.</p> <ul style="list-style-type: none"> <li>● The account is successfully created, such as <b>username:tests-user,password:test</b>.</li> <li>● The user fails to ping 192.168.32.120 before authentication.</li> <li>● After the user enters account information and click <b>Authenticate</b> on Ruijie Supplicant, the authentication succeeds and the user can successfully ping 192.168.32.120.</li> <li>● Information of the authenticated user is displayed.</li> </ul> <pre>ruijie# show dot1x summary</pre> <table border="1"> <thead> <tr> <th>ID</th> <th>Username</th> <th>MAC</th> <th>Interface</th> <th>VLAN</th> <th>Auth-State</th> <th>Backend-State</th> </tr> <tr> <th>Port-Status</th> <th>User-Type</th> <th>Time</th> <th></th> <th></th> <th></th> <th></th> </tr> </thead> <tbody> <tr> <td>16778217</td> <td>ts-user</td> <td>0023.aaaa.4286</td> <td>Fa0/1</td> <td>2</td> <td>Authenticated</td> <td>Idle</td> </tr> <tr> <td>static</td> <td>0days 0h 0m 7s</td> <td></td> <td></td> <td></td> <td></td> <td>Authed</td> </tr> </tbody> </table>	ID	Username	MAC	Interface	VLAN	Auth-State	Backend-State	Port-Status	User-Type	Time					16778217	ts-user	0023.aaaa.4286	Fa0/1	2	Authenticated	Idle	static	0days 0h 0m 7s					Authed
ID	Username	MAC	Interface	VLAN	Auth-State	Backend-State																							
Port-Status	User-Type	Time																											
16778217	ts-user	0023.aaaa.4286	Fa0/1	2	Authenticated	Idle																							
static	0days 0h 0m 7s					Authed																							

**Common Errors**

- RADIUS parameters are incorrectly configured.
- The RADIUS server has a special access policy, for example, the RADIUS packets must carry certain attributes.
- The AAA authentication mode list is different from the 802.1X authentication mode list, causing authentication failure.

## 4.4.2 Configuring 802.1X Parameters

### Configuration Effect

- Adjust 802.1X parameter configurations based on the actual network situation. For example, if the authentication server has poor performance, you can raise the authentication server timeout.

### Notes

- 802.1X and RADIUS have separate server timeouts. By default, the authentication server timeout of 802.1X is 5 seconds while that of RADIUS is 15 seconds. In actual situations, ensure that the former is greater than the latter. You can run the **dot1x timeout server-timeout** command to adjust the authentication server timeout of 802.1X. For detailed configuration about the RADIUS server timeout, see the *Configuring RADIUS*.
- Online client detection applies only to Ruijie Supplicant.

### Configuration Steps

#### ▾ Enabling Re-authentication

- (Optional) After re-authentication is enabled, the NAS can periodically re-authenticate online users.
- Enable re-authentication after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x re-authentication</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	Re-authentication is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	You can run this command to periodically re-authenticate users.

#### ▾ Configuring the Re-authentication Interval

- (Optional) You can configure the re-authentication interval for users.
- Configure the re-authentication interval after 802.1X authentication is enabled on the NAS. The re-authentication interval takes effect only after re-authentication is enabled.

<b>Command</b>	<b>dot1x timeout re-authperiod <i>period</i></b>
<b>Parameter</b>	<i>period</i> : Indicates the re-authentication interval in the unit of seconds.
<b>Description</b>	
<b>Defaults</b>	The default value is 3,600 seconds.
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	Adjust the re-authentication interval as required.

### ▾ Configuring the Interval of EAP-Request/Identity Packet Retransmission

- (Optional) A larger value indicates a longer interval of packet retransmission.
- Configure the interval of EAP-Request/Identity packet retransmission after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x timeout tx-period</b> <i>period</i>
<b>Parameter Description</b>	<i>period</i> : Indicates the interval of EAP-Request/Identity packet retransmission in the unit of seconds.
<b>Defaults</b>	The default value is 3 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	It is recommended to use the default value. Adjust the value based on how long the authentication client responds to the NAS's requests.

### ▾ Configuring the Maximum Times of EAP-Request/Identity Packet Retransmission

- (Optional) A larger value indicates more frequent retransmissions.
- Configure the maximum times of EAP-Request/Identity packet retransmission after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x reauth-max</b> <i>num</i>
<b>Parameter Description</b>	<i>num</i> : Indicates the maximum times of EAP-Request/Identity packet retransmission.
<b>Defaults</b>	The default value is 3 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	It is recommended to use the default value. In the case of high-rate packet loss, increase this value so that the clients can easily receive packets from the NAS.

### ▾ Configuring the Interval of EAP-Request/Challenge Packet Retransmission

- (Optional) A larger value indicates a longer retransmission interval.
- Configure the interval of EAP-Request/Challenge packet retransmission after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x timeout supp-timeout</b> <i>time</i>
<b>Parameter Description</b>	<i>time</i> : Indicates the interval of EAP-Request/Challenge packet transmission in the unit of seconds.
<b>Defaults</b>	The default value is 3 seconds.
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	It is recommended to use the default value. Increase this value in the case of high-rate packet loss.
--------------------	---

#### ▾ Configuring the Maximum Times of EAP-Request/Challenge Packet Retransmission

- (Optional) A larger value indicates more frequent retransmissions.
- Configure the maximum times of EAP-Request/Challenge packet retransmission after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x max-req <i>num</i></b>
<b>Parameter Description</b>	<i>num</i> : Indicates the maximum times of EAP-Request/Challenge packet retransmission in the unit of seconds.
<b>Defaults</b>	The default value is 3.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Optional. It is recommended to use the default value. Increase this value in the case of high-rate packet loss.

#### ▾ Configuring the Authentication Server Timeout

- (Optional) A larger value indicates a longer authentication server timeout.
- Configure the authentication server timeout after 802.1X authentication is enabled on the NAS.
- The server timeout of RADIUS must be greater than that of 802.1X.

<b>Command</b>	<b>dot1x timeout server-timeout <i>time</i></b>
<b>Parameter Description</b>	<i>time</i> : Indicates the authentication server timeout in the unit of seconds.
<b>Defaults</b>	The default value is 5 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	It is recommended to use the default value. Increase this value if the communication between the NAS and RADIUS server is unstable.

#### ▾ Configuring the Quiet Period after Authentication Fails

- (Optional) A larger value indicates a longer quiet period.
- Configure the quiet period after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x timeout quiet-period <i>time</i></b>
<b>Parameter Description</b>	<i>time</i> : Indicates the quiet period after authentication fails. The unit is second.
<b>Defaults</b>	The default value is 10 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	It is recommended to use the default value. Increase this value to prevent users from frequently initiating

	authentication to the RADIUS server, thereby reducing the load of the authentication server.
--	--

### ▾ Specifying the Authentication Mode

- (Optional) Configure the mode for 802.1X authentication.
- Configure the authentication mode after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x auth-mode</b> {eap   chap   pap}
<b>Parameter</b>	<b>eap</b> : Indicates EAP authentication.
<b>Description</b>	<b>chap</b> : Indicates CHAP authentication. <b>pap</b> : Indicates PAP authentication.
<b>Defaults</b>	The default value is <b>eap</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Select the authentication mode supported by Ruijie Supplicant and authentication server.

### ▾ Enabling Online Ruijie Client Detection

- (Optional) If online Ruijie client detection is enabled, the NAS can find clients going offline in a timely manner to prevent incorrect accounting.
- This function applies only to Ruijie 802.1X authentication clients.
- Enable online Ruijie client detection after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x client-probe enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	Online Ruijie client detection is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	It is recommended to enable this function when Ruijie Supplicant is used.

### ▾ Configuring the Interval of Online Ruijie Client Detection

- (Optional) A larger value indicates a longer time interval at which Ruijie clients send detection packets.
- Configure the interval of online Ruijie client detection after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x probe-timer interval</b> <i>time</i>
<b>Parameter</b>	<i>time</i> : Indicates the time interval at which Ruijie Supplicant sends a heartbeat packet to the NAS. The unit is second.
<b>Description</b>	
<b>Defaults</b>	The default value is 20 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	It is recommended to use the default value.

### ▾ Configuring the Duration of Online Ruijie Client Detection

- (Optional) A larger value indicates a longer interval at which the NAS finds clients going offline.
- Configure the duration of online Ruijie client detection after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x probe-timer alive</b> <i>time</i>
<b>Parameter Description</b>	<i>time</i> : Indicates the duration of online Ruijie client detection in the unit of seconds.
<b>Defaults</b>	The default value is 250 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Optional. If the NAS does not receive any detection packets from an online client within the detection duration, it regards the client offline. It is recommended to use the default value.

### Verification

Run the **show dot1x** command to check whether parameter configurations take effect.

### Configuration Example

#### ▾ Specifying the Authentication Mode

<b>Scenario</b>	The NAS is deployed in standalone mode.
<b>Configuration Steps</b>	Set the authentication mode to <b>chap</b> .
	<pre>Ruijie(config)#dot1x auth-mode chap</pre>
<b>Verification</b>	<p>Display the configurations.</p> <pre>Ruijie(config)#show dot1x</pre> <p>802.1X basic information:</p> <pre> 802.1X Status ..... enable Authentication Mode ..... chap Authorization mode ..... disable Total User Number ..... 0 (exclude dynamic user) Authenticated User Number ..... 0 (exclude dynamic user) Dynamic User Number ..... 0 Re-authentication ..... disable Re-authentication Period ..... 3600 seconds Re-authentication max ..... 3 times                     </pre>

	Quiet Period ..... 10 seconds Tx Period ..... 30 seconds Supplicant Timeout ..... 3 seconds Server Timeout ..... 5 seconds Maximum Request ..... 3 times Client Online Probe ..... disable Eapol Tag ..... disable 802.1x redirect ..... disable Private supplicant only ..... disable
--	--

📌 Enabling Online Client Detection

<p><b>Scenario</b></p> <p><b>Figure 4-5</b></p>	
<p><b>Configuration Steps</b></p>	<p>Enable online client detection.</p> <pre>Ruijie(config)#dot1x client-probe enable</pre> <ul style="list-style-type: none"> <li>Users can remain online only when their Ruijie Supplicant sends online detection packets as scheduled.</li> </ul>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>Display the configurations.</li> </ul> <pre>Ruijie(config)#show dot1x</pre> <p>802.1X basic information:</p> <pre>802.1X Status ..... enable Authentication Mode ..... chap Authorization mode ..... disable Total User Number ..... 0 (exclude dynamic user)</pre>

Authenticated User Number .....	0 (exclude dynamic user)
Dynamic User Number .....	0
Re-authentication .....	disable
Re-authentication Period .....	3600 seconds
Re-authentication max .....	3 times
Quiet Period .....	10 seconds
Tx Period .....	30 seconds
Supplicant Timeout .....	3 seconds
Server Timeout .....	5 seconds
Maximum Request .....	3 times
Client Online Probe .....	enable
Eapol Tag .....	disable
802.1x redirect .....	disable

### Common Errors

- The server timeout is shorter than the RADIUS timeout.
- Online client detection is enabled but the authentication program is not Ruijie Supplicant.

### 4.4.3 Configuring Authorization

#### Configuration Effect

- In IP authorization, authenticated users have to use the specified IP addresses to access the network, preventing IP address fake. IP authorization can be enabled in global configuration mode or interface configuration mode. IP authorization enabled in interface configuration mode takes priority over that configured in global configuration mode.
- Enable non-Ruijie client filtering. If this function is enabled, users must use Ruijie Supplicant for authentication so that they will enjoy services provided by Ruijie Supplicant, such as anti-proxy or SMS.
- Enable Web redirection to support 2G Ruijie Supplicant deployment. 2G Ruijie Supplicant deployment means that a user needs to download Ruijie Supplicant through the browser and then initiate authentication through Ruijie Supplicant. 2G Ruijie Supplicant deployment facilitates quick deployment of Ruijie Supplicant in the case of massive users.

#### Notes

- If the real-time kickoff function of RG-SAM/SMP is used, you need to configure correct SNMP parameters. For details, see the *Configuring SNMP*.
- If multiple authentication supplicants are used, disable this function.

- If the IP authorization mode is changed, all authenticated users will go offline and have to get re-authenticated before online again.
- In mixed authorization mode, IP authorization with a higher priority is used during user authentication. For example, if Ruijie Supplicant provides an IP address for this RADIUS-authentication user during its re-authentication, this IP address will be used for authorization.
- In DHCP authorization mode, if a user must use a static IP address, you can configure an IP-MAC binding for this user so that this user can properly access the network while other users must be authorized through DHCP.
- 2G Ruijie Supplicant deployment and Web authentication cannot be used at the same time.
- 2G Ruijie Supplicant deployment requires the setting of the **redirect** parameter. For details, see the *Configuring Web Authentication*.
- The kickoff function of RG-SAM/SMP is implemented through SNMP. Therefore, you need to configure SNMP parameters. For details, see the *Configuring SNMP*.

## Configuration Steps

### ▾ Specifying the Global IP Authorization Mode

- The **supplicant** mode only applies to Ruijie Supplicant.
- In **radius-server** mode, the authentication server needs to assign IP addresses based on the **framed-ip** parameters.
- In **dhcp-server** mode, DHCP snooping must be enabled on the NAS.
- (Optional) Configure an IP-MAC binding.
- Configure the IP authorization mode after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>aaa authorization ip-auth-mode { disable   supplicant   radius-server   dhcp-server   mixed }</b>
<b>Parameter Description</b>	<p><b>disable:</b> Disables IP authorization.</p> <p><b>supplicant:</b> Indicates IP authorization by the supplicant.</p> <p><b>radius-server:</b> Indicates IP authorization by the RADIUS server.</p> <p><b>dhcp-server:</b> Indicates IP authorization by the DHCP server.</p> <p><b>mixed:</b> Indicates IP authorization in a mixed manner.</p>
<b>Defaults</b>	IP authorization is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Select the IP authorization mode based on actual deployment.

### ▾ Specifying the IP Authorization Mode for a Port

- The **supplicant** mode only applies to Ruijie Supplicant.
- In **radius-server** mode, the authentication server needs to assign IP addresses based on the **framed-ip** parameters.
- In **dhcp-server** mode, DHCP snooping must be enabled on the NAS and server.
- (Optional) Configure an IP-MAC binding on the port.

- Configure the IP authorization mode after 802.1X authentication is enabled on the port.
- IP authorization configured for a port takes priority over global IP authorization.

<b>Command</b>	<b>dot1x authorization ip-auth-mode { disable   supplicant   radius-server   dhcp-server   mixed }</b>
<b>Parameter Description</b>	<p><b>disable:</b> Disables IP authorization.</p> <p><b>supplicant:</b> Indicates IP authorization by the supplicant.</p> <p><b>radius-server:</b> Indicates IP authorization by the RADIUS server.</p> <p><b>dhcp-server:</b> Indicates IP authorization by the DHCP server.</p> <p><b>mixed:</b> Indicates IP authorization in a mixed manner.</p>
<b>Defaults</b>	IP authorization is disabled on a port by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Select the IP authorization mode for a port based on actual deployment.

### ↘ Configuring an IP-MAC Binding

- (Optional) The **dot1x address-binding** command is used to provide IP-MAC binding information for DHCP and mixed authorization modes to avoid IP authorization by the DHCP server.

<b>Command</b>	<b>dot1x address-binding mac mac-addr ip ip-address</b>
<b>Parameter Description</b>	<p><b>mac-address:</b> Indicates the MAC address to bind.</p> <p><b>ip-address:</b> Indicates the IP address to bind.</p>
<b>Defaults</b>	No IP-MAC binding is configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command based on the actual deployment.

### ↘ Enabling Web Redirection for 2G Ruijie Supplicant Deployment

- (Optional) If the redirection for 2G Ruijie Supplicant deployment is enabled, users not having any 802.1X authentication clients on a controlled port can download and install an 802.1X authentication client through Web pages.
- Enable Web redirection for 2G Ruijie Supplicant deployment after 802.1X authentication is enabled on the NAS.
- The **redirect** parameter must be configured. For details, see the *Configuring Web Authentication*.

<b>Command</b>	<b>dot1x redirect</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The redirection for 2G Ruijie Supplicant deployment is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The <b>redirect</b> parameter must be configured. For details, see the <i>Configuring Web Authentication</i> .

### ↘ Enabling Non-Ruijie Client Filtering

- (Optional) If this function is enabled, non-Ruijie clients cannot perform authentication.

- Enable non-Ruijie client filtering after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x private-supplicant-only</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	Non-Ruijie client filtering is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This function can be enabled only when Ruijie Supplicant is used.

### Verification

- After IP authorization is enabled, use the client to initiate authentication and go online, and then change the IP address. As a result, the client cannot access the network.
- Enable Web redirection for 2G Ruijie Supplicant deployment. When you start the browser to visit a website, the system automatically redirects to the download Web page and downloads the authentication client. You can access the network only when authenticated by the client.
- After a user is authenticated and goes online, enable the kickoff function on RG-SAM/SMP. The NAS will force the user offline and the user will fail to access the network.

### Configuration Example

#### Configuring the IP Authorization Mode

<b>Scenario</b> Figure 4-6	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable AAA.</li> <li>● Configure RADIUS.</li> <li>● Enable 802.1X on a controlled port.</li> <li>● Globally enable IP authorization in <b>supplicant</b> mode.</li> </ul>
	<pre>Ruijie(config)#aaa authorization ip-auth-mode supplicant</pre>
	<ul style="list-style-type: none"> <li>● Ruijie Supplicant initiates authentication and the authentication succeeds.</li> <li>● Ruijie Supplicant only uses 192.168.217.82 for communication.</li> </ul>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Display the configurations.</li> </ul> <pre>Ruijie(config)#show dot1x user name ts-user</pre>

```

Supplicant information:
  MAC address ..... b048.7a7f.f9f3
  Username ..... ts-user
  User ID ..... 16777303
  Type ..... static
  VLAN ..... 1
  Port ..... wlan 1
  Online duration ..... 0days 0h 0m21s
  Up average bandwidth ..... 0 kBps
  Down average bandwidth ..... 0 kBps
  Authorized VLAN ..... 1
  Authorized session time ..... 20736000 seconds
  Authorized flux ..... unlimited
  Accounting ..... No
  Proxy user ..... Permit
  Dial user ..... Permit
  IP privilege ..... 0
  Private supplicant ..... no
  Max user number on this port ..... 0
  Authorization ip address ..... 192.168.217.82

```

## Common Errors

- There are multiple authentication clients on the network but non-Ruijie client filtering is enabled, causing some users to fail authentication.
- RG-SAM/SMP is used but SNMP parameters are not configured on the switch, causing kickoff failure.
- The **redirect** parameter is incorrectly configured, causing abnormalities in redirection for 2G Ruijie Supplicant downloading.

## 4.4.4 Configuring MAB

### Configuration Effect

- If the MAC address of an access user is used as the authentication account, the user does not need to install any supplicants. This applies to some dumb users such as networking printers.

- Single-user MAB applies to two scenarios:
  - There is only one dumb user connected to a port.
  - Only one user needs to be authenticated. After this, all other users can access the network. For example, if a port is connected with a wireless router, you can enable real-time MAB on the wireless router. If authentication succeeds, all users connected to the wireless router can access the network.
- Multi-user MAB applies to the scenario where multiple dumb users connected to a port. For example, multiple VoIP devices are deployed in the network call center.
- Multi-user MAB can be used with 802.1X authentication. It applies to mixed access scenarios such as the PC-VoIP daisy-chain topology.

### Notes

- A MAB-enabled port sends an authentication request packet as scheduled by **tx-period**. If the number of the sent packets exceeds the number specified by **reauth-max** but still no client responds, this port enters the MAB mode. Ports in MAB mode can learn the MAC addresses and use them as the account information for authentication.
- When using the MAC address as the user name and password on the authentication server, delete all delimiters. For example, if the MAC address of a user is 00-d0-f8-00-01-02, the user name and password should be set to 00d0f8000102 on the authentication server.
- 802.1X takes priority over MAB. Therefore, if a user having passed MBA authentication uses a client to initiate 802.1X authentication, MAB entries will be removed.
- MAB supports only PAP authentication. PAP authentication should be enabled also on the authentication server.
- Only when active authentication is enabled, can MAB detect whether the user can perform 802.1X authentication. Therefore, automatic authentication must be enabled for MAB deployment.

### Configuration Steps

#### ↳ Enabling Single-User MAB

- Optional.
- Single-user MAB applies when only one user connected to a port needs to be authenticated.
- Enable single-user MAB on the 802.1X controlled port of the NAS.

<b>Command</b>	<b>dot1x mac-auth-bypass</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	Single-user MAB is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command applies only to switches. Single-user MAB applies when only one dumb user connected to a port needs to be authenticated. If you want to restrict the number of users, enable the violation mode.

### ↘ Configuring the Timeout of MAB Users

- Optional.
- After a MAC address in MAB mode is authenticated and goes online, the NAS regards the MAC address online unless re-authentication fails, the port goes down, or the MAC address goes offline due to management policies such as kickoff. You can configure the timeout of authenticated MAC addresses. The default value is 0, indicating always online.
- Configure the timeout of MAB users on the 802.1X controlled port of the NAS.

<b>Command</b>	<b>dot1x mac-auth-bypass timeout-activity</b> <i>value</i>
<b>Parameter Description</b>	<i>value</i> : Indicates the maximum online time of MAB users in the unit of seconds.
<b>Defaults</b>	The default value is 0, indicating no time restriction.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The MAB timeout applies to both single-user MAB and multi-user MAB.

### ↘ Enabling the MAB Violation Mode

- Optional.
- Enable MAB violation on the 802.1X controlled port of the NAS.
- By default, after one MAC address passes MAB authentication, data of all switches connected to the port can be forwarded. However, for security purposes, the administrator may request one MAB port to support only one MAC address. In this case, you can enable MAB violation on the port. If more than one MAC address is found connected to a MAB violation-enabled port after the port enters MAB mode, the port will become a violation.

<b>Command</b>	<b>dot1x mac-auth-bypass violation</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	MAB violation is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command applies only to switches. Configure this command only when only one dumb user is connected to the port. MAB violation applies only to single-user MAB.

### ↘ Enabling Multi-user MAB

- Optional.
- Enable multi-user MAB on the 802.1X controlled port of the NAS.

<b>Command</b>	<b>dot1x mac-auth-bypass multi-user</b>
<b>Parameter Description</b>	N/A

<b>Defaults</b>	Multi-user MAB is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command applies only to switches. Configure this command when multiple dumb users connected to the port need to be authenticated.

#### ▾ Configuring the Quiet Period after Multi-user MAB Fails

- Optional.
- Configure the quiet period of the multi-user MAB failure after multi-user MAB is enabled on the NAS.
- If multi-user MAB is enabled, you should prohibit unauthorized users from frequently initiating authentication to protect the NAS from attacks of these users and thereby reduce the load of the authentication server. Configure the quiet period of the multi-user MAB failure in global configuration mode. That is, if a MAC address fails authentication, it needs to re-initiate authentication after the quiet period. Configure this quiet period based on the actual situation. The default value is 0, indicating that a user can re-initiate authentication immediately after authentication fails.

<b>Command</b>	<b>dot1x multi-mab quiet-period</b> <i>value</i>
<b>Parameter Description</b>	<i>value</i> : Indicates the quiet period after authentication fails.
<b>Defaults</b>	The default value is 0s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command applies only to switches. If too many dumb users connected to a port are authenticated, run this command to limit the authentication rate.

#### ▾ Configuring VLAN-based MAB

- Optional.
- Enable VLAN-based MAB after multi-user MAB is enabled on the NAS.
- If you configure VLANs as MAB VLANs, only users in these VLANs can perform MAB.

<b>Command</b>	<b>dot1x mac-auth-bypass vlan</b> <i>vlan-list</i>
<b>Parameter Description</b>	<i>vlan-list</i> : Indicates the VLANs supporting MAB.
<b>Defaults</b>	VLAN-based MAB is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command applies only to switches. Run this command when a port allows only users in specified VLANs to perform MAB.

#### ▾ Enabling IP Address-based MAB

- Optional.

- Enable IP address-based MAB after multi-user MAB is enabled on the NAS.
- Run this command if the IP address must be carried in a user's MAB request. Since IP addresses of MAB users are generally obtained through DHCP, enable DHCP snooping on the NAS. If IP addresses of MAB users are static, enable static IP-MAC binding to obtain their IP addresses. For details, see related commands in the *Configuring Authorization*.

<b>Command</b>	<b>dot1x mac-auth-bypass valid-ip-auth</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	IP address-based MAB is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command applies only to switches. Run this command if the IP address must be carried in a user's MAB request.

### Verification

Check whether the dumb user can access the network. If yes, MAB takes effect. If no, MAB does not take effect.

- Check whether MAB functions are configured on the authentication server and NAS.
- Check whether dumb users with illegitimate MAC addresses cannot access the network.
- Check whether dumb users with illegitimate MAC addresses can access the network.

### Configuration Example

#### Enabling Multi-user MAB on a Switch

<p><b>Scenario</b></p> <p>Figure 4-7</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Register the IP address of the Switch A on the RADIUS server and configure the communication key between Switch A and the RADIUS server.</li> <li>● Create an account on the RADIUS server.</li> <li>● Enable AAA on Switch A.</li> <li>● Configure RADIUS parameters on Switch A.</li> <li>● Enable 802.1X and multi-user MAB on a port of Switch A.</li> </ul> <p>Switch configurations are as follows. For detailed configuration on the RADIUS server, see the <i>Configuring RADIUS</i>.</p>

	<pre>ruijie# configure terminal ruijie (config)# aaa new-model ruijie (config)# radius-server host 192.168.32.120 ruijie (config)# radius-server key ruijie ruijie (config)# interface FastEthernet 0/1 ruijie (config-if)# dot1x port-control auto ruijie (config-if)# dot1x mac-auth-bypass multi-user</pre>																												
<p><b>Verification</b></p>	<p>Check whether authentication is proper and network access behaviors change after authentication.</p> <ul style="list-style-type: none"> <li>● The account is successfully created, such as <b>username: 0023aeaa4286,password: 0023aeaa4286</b>.</li> <li>● The user fails to ping 192.168.32.120 before authentication.</li> <li>● The user connects to the switch, the authentication succeeds, and the user can successfully ping 192.168.32.120.</li> <li>● Information of the authenticated user is displayed.</li> </ul> <pre>ruijie# show dot1x summary</pre> <table border="1"> <thead> <tr> <th>ID</th> <th>Username</th> <th>MAC</th> <th>Interface</th> <th>VLAN</th> <th>Auth-State</th> <th>Backend-State</th> </tr> <tr> <th>Port-Status</th> <th>User-Type</th> <th>Time</th> <th></th> <th></th> <th></th> <th></th> </tr> </thead> <tbody> <tr> <td>16778217</td> <td>0023aea...</td> <td>0023.aeaa.4286</td> <td>Fa0/1</td> <td>2</td> <td>Authenticated</td> <td>Idle</td> </tr> <tr> <td>static</td> <td>0days 0h 5m 8s</td> <td></td> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>	ID	Username	MAC	Interface	VLAN	Auth-State	Backend-State	Port-Status	User-Type	Time					16778217	0023aea...	0023.aeaa.4286	Fa0/1	2	Authenticated	Idle	static	0days 0h 5m 8s

static	0days 0h 5m 8s																												

## Common Errors

- The MAC account format is incorrect on the authentication server.

## 4.4.5 Configuring IAB

### Configuration Effect

- Enable IAB. After IAB is enabled, newly authenticated users can access the network even when all RADIUS servers configured on the NAS are inaccessible.
- Enable IAB recovery. When RADIUS servers recover to their reachable status, re-verify the users authorized during inaccessibility.

### Notes

- Configure an account and standards for testing RADIUS server accessibility. For details, see the *Configuring RADIUS*.

- IAB takes effect only when only RADIUS authentication exists in the globally configured 802.1X authentication mode list and all RADIUS servers in the list are inaccessible. If other authentication modes (for example, local and none) exist in the list, IAB does not take effect.
- After multi-domain AAA is enabled, 802.1X authentication does not need the globally configured authentication mode list any more. If IAB detects that all RADIUS servers configured in the globally configured 802.1X authentication mode list are inaccessible, it directly returns an authentication success reply to users, with no need to enter the user name. Therefore, multi-domain AAA does not take effect on this port.
- Users authenticated in IAB mode do not need to initiate accounting requests to the accounting server.
- Authenticated users can properly access the network, not affected by server inaccessibility.
- If 802.1X-based IP authorization is enabled globally, users on this port, except those having been authenticated, cannot be authenticated in IAB mode.

## Configuration Steps

### ↳ Enabling IAB

- (Optional) After IAB is enabled, the NAS authorizes newly authenticated users if the authentication server is faulty.
- Enable IAB after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x critical</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	IAB is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command applies to ports on which newly authenticated users need to be authorized when the authentication server is inaccessible.

### ↳ Enabling IAB Recovery

- (Optional) After the authentication server is recovered, the NAS re-authenticates users that are authorized when the authentication server is inaccessible.
- Enable IAB recovery actions after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x critical recovery action reinitialize</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	IAB recovery is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If IAB recovery is enabled on a port, properly authenticated users on the port can access the network without re-authentication after the authentication server is recovered. After the authentication server is recovered, the NAS initiates authentication only to users authenticated in IAB mode during server inaccessibility.

## Verification

- When the authentication server is accessible, check whether users can go online only by using the correct user name and password.
- When the authentication server is inaccessible, authenticated users get related commands within the limit of authority.

## Configuration Example

### ▾ Enabling IAB

<p><b>Scenario</b></p> <p><b>Figure 4-8</b></p>	 <p>The diagram illustrates a network setup for 802.1X authentication. A central switch, labeled 'Switch A' and 'NSA', has three interfaces: F 0/1 connected to a server 'SU' (IP 192.168.217.82), F 0/23 connected to a 'Radius Server' (IP 192.168.32.120), and F 0/24 connected to the 'Internet'. The switch itself has the IP address 192.168.217.81.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Register the IP address of the NAS on the RADIUS server and configure the communication key between the NAS and the RADIUS server.</li> <li>● Create an account on the RADIUS server.</li> <li>● Enable AAA on the NAS.</li> <li>● Configure RADIUS parameters and enable server accessibility probe on the NAS.</li> <li>● Enable 802.1X and multi-user MAB on a port of the NAS.</li> </ul> <p>NAS configurations are as follows. For detailed configuration on the RADIUS server, see the <i>Configuring RADIUS</i>.</p>
	<pre>ruijie# configure terminal ruijie (config)# aaa new-model ruijie (config)# radius-server host 192.168.32.120 ruijie (config)# radius-server key ruijie ruijie (config)# interface FastEthernet 0/1 ruijie (config-if)# dot1x port-control auto</pre>
<p><b>Verification</b></p>	<p>Check whether authentication is proper and network access behaviors change after authentication.</p> <ul style="list-style-type: none"> <li>● The account is successfully created, such as <b>username: test,password: test</b>.</li> <li>● When the authentication server is accessible, the user fails to ping 192.168.32.120 before authentication.</li> <li>● When the authentication server becomes inaccessible, the user connects to the NAS,</li> </ul>

authentication succeeds, and the user can successfully ping 192.168.32.120.

- Information of the authenticated user is displayed.

```
ruijie# show dot1x summary
```

ID	Username	MAC	Interface	VLAN	Auth-State	Backend-State
Port-Status	User-Type	Time				
16778217	test	0023.aeaa.4286	Fa0/1	2	Authenticated	Idle
static	0days 0h10m20s					

### 4.4.6 Configuring Dynamic VLAN Assignment

#### Configuration Effect

- Enable 802.1X-based dynamic VLAN assignment for a port. If the authentication server assigns a VLAN to redirect after a user passes authentication, the NAS can add this user to the assigned VLAN to perform authorization on this user.
- Controlled ports on the VLAN to redirect fall in three types: Access, Trunk, and Hybrid (MAC VLAN is disabled). You can change native VLANs of these ports to realize 802.1X-based dynamic VLAN assignment.
- If controlled ports on the VLAN to redirect are Hybrid ports (and MAC VLAN is enabled), dynamically create MAC VLAN entries to add users to the assigned VLAN.

#### Notes

- The NAS can extend RADIUS attributes to assign VLANs. When assigning VLANs to the access switch based on extended attributes, the RADIUS server encapsulates these attributes in RADIUS Attribute 26, with the vendor ID of 0x00001311. The default type No. of the extended attribute is 4. You can run the **radius attribute 4 vendor-type type** command on the NAS to receive the VLAN of which the extended attribute type No. is set to **type**. For details about the command, see the *Configuring RADIUS*.
- The RADIUS server can assign VLANs based on the following RADIUS attributes:
  - Attribute 64: Tunnel-Type, with the value being VLAN (13).
  - Attribute 65: Tunnel-Medium-Type, with the value being 802 (6).
  - Attribute 81: Tunnel-Private-Group-ID, which can be the VLAN ID or VLAN name.
- The NAS can perform 802.1X authentication on Access, Trunk, and Hybrid ports. If 802.1X-based dynamic VLAN assignment is enabled on other ports, authentication will fail.
- If the assigned VLAN is the VLAN name, the system checks whether the VLAN name exists on the access switch. If yes, the port of the user redirects to this VLAN. If no, the NAS identifies the assigned VLAN as the VLAN ID. If the VLAN ID is valid (in the VLAN ID range supported by the system), the port of the user redirects to this VLAN. If the VLAN ID is 0, no VLAN information is assigned. In other cases, users fail authentication.

- Private VLANs, remote VLANs, or super VLANs (including sub VLANs) cannot be assigned for redirection.
- In dynamic VLAN assignment on an Access port, check whether any assigned VLAN is configured on the switch:
  - Yes: If the Access port can redirect to the assigned VLAN, the port will leave the configured VLAN and migrate to the assigned VLAN, and user authentication will succeed. Otherwise (see the related description below), user authentication will fail.
  - No: If the NAS identifies the assigned VLAN attribute as the VLAN ID, it will create a VLAN and enable the port to redirect to the new VLAN, and user authentication will succeed. If the NAS identifies the assigned VLAN attribute as the VLAN name, it will fail to find the corresponding VLAN ID, causing authentication failure.
- In dynamic VLAN assignment on a Trunk port, check whether any assigned VLAN is configured on the switch:
  - Yes: If the Trunk port can redirect to the assigned VLAN, the NAS will use the native VLAN of the port as the assigned VLAN, and user authentication will succeed. Otherwise (see the related description below), user authentication will fail.
  - No: If the NAS identifies the assigned VLAN attribute as the VLAN ID, it will use the native VLAN of the port, and user authentication will succeed. If the NAS identifies the assigned VLAN attribute as the VLAN name, it will fail to find the corresponding VLAN ID, causing authentication failure.
- If MAC VLAN is disabled on a Hybrid port, check whether any assigned VLAN is configured on the switch:
  - Yes: If the Hybrid port can redirect to the assigned VLAN or the assigned VLAN does not exist in the tagged VLAN list of the Hybrid port, the NAS will allow the assigned VLAN to pass through the Hybrid port without carrying any tags and uses the native VLAN as the assigned VLAN, and user authentication will succeed. Otherwise (see the related description below), user authentication will fail.
  - No: If the NAS identifies the assigned VLAN attribute as the VLAN ID, it will create a VLAN, allow the VLAN to pass through the Hybrid port without carrying any tags, and use the native VLAN as the assigned VLAN, and user authentication will succeed. If the NAS identifies the assigned VLAN attribute as the VLAN name, it will fail to find the corresponding VLAN ID, causing authentication failure.
- If MAC VLAN is enabled on a Hybrid port, VLAN assignment is as follows:

If the VLAN assigned by the authentication server does not exist on the NAS (MAC VLAN requires VLANs to have static configurations), or has been added to the Hybrid port with tags, or is not supported by MAC VLAN (see the *Configuring MAC VLAN*), user authentication will fail. Otherwise, the NAS will dynamically create MAC VLAN entries based on the assigned VLAN and the MAC addresses of users, and user authentication will succeed. When users go offline, MAC VLAN entries will be dynamically removed.
- If MAC VLAN is disabled on a port, VLAN assignment changes only the native VLAN but not the **native vlan** command configurations of the port. The assigned VLAN takes priority over the VLAN configured in related commands. That is, the native VLAN effective after authentication acts as the assigned VLAN while the native VLAN configured in related commands takes effect only when users go offline.
- If MAC VLAN is enabled on a port and user authentication is based on the MAC address, VLAN assignment dynamically creates MAC VLAN entries without changing the native VLAN of the port.
- No matter MAC VLAN is enabled or not on a Hybrid port, if the assigned VLAN is added to the port with tags, VLAN assignment fails.
- If MAC VLAN is enabled on a port (see the *Configuring MAC VLAN*), VLAN assignment creates an MAC VLAN entry with an all-F mask. If the MAC address of an 802.1X user is overwritten by the MAC address specified by the new MAC

VLAN entry, the assigned VLAN must be the same as the VLAN specified by the new MAC VLAN entry. Otherwise, errors will occur to 802.1X users in VLAN assignment. Errors are as follows (including but not limited to): User authentication succeeds but subsequent valid data packets are discarded, causing network access failure. When a user goes offline by sending an EAPOL-LOGOFF packet, the 802.1X authentication entry remains on the NAS and the user status on the authentication server is still online.

## Configuration Steps

### ↳ Enabling Dynamic VLAN Assignment on a Port

- (Optional) After dynamic VLAN assignment is enabled on a port, authenticated users on this port will enter the assigned VLAN.
- Enable dynamic VLAN assignment after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x dynamic-vlan enable</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	Dynamic VLAN assignment is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Configure this command when authenticated users should be added to the VLAN assigned by the authentication server.

## Verification

- Run the **show dot1x summary** command to display the VLAN of a user and the **show dot1x user id** command to display the VLAN assigned by the RADIUS server.
- Users with VLANs assigned can access the network in the assigned VLANs.

## Configuration Example

### ↳ Enabling Dynamic VLAN Assignment on a Port

<p><b>Scenario</b></p> <p><b>Figure 4-9</b></p>	<p>The diagram illustrates a network setup for dynamic VLAN assignment. A central Switch is connected to a Hub via port F0/1. The Hub is connected to two devices: a laptop with IP address 192.168.217.83 and a server with IP address 192.168.217.82. The Switch is also connected to a Radius Server via port F0/23 (IP address 192.168.32.120) and to the Internet via port F0/24 (IP address 192.168.217.81).</p>
<p><b>Configuration</b></p>	<ul style="list-style-type: none"> <li>● Register the IP address of the NAS on the RADIUS server and configure the communication key</li> </ul>

<b>Steps</b>	<p>between the NAS and the RADIUS server.</p> <ul style="list-style-type: none"> <li>● Create an account on the RADIUS server.</li> <li>● Enable AAA on the NAS.</li> <li>● Configure RADIUS parameters and enable VLAN delivery on the NAS.</li> <li>● Enable 802.1X authentication on ports of the NAS.</li> <li>● Enable dynamic VLAN assignment on a controlled port.</li> </ul> <p>NAS configurations are as follows. For detailed configuration on the RADIUS server, see the <i>Configuring RADIUS</i>.</p>																												
	<pre>ruijie# configure terminal ruijie (config)# aaa new-model ruijie (config)# radius-server host 192.168.32.120 ruijie (config)# radius-server key ruijie ruijie (config)# interface FastEthernet 0/1 ruijie (config-if)# dot1x port-control auto ruijie (config-if)# dot1x dynamic-vlan enable</pre>																												
<b>Verification</b>	<p>Check whether authentication is proper, network access behaviors change after authentication, and dynamic users can access the network.</p> <ul style="list-style-type: none"> <li>● The account is successfully created, such as <b>username:tests-user,password:test</b>.</li> <li>● The user fails to ping 192.168.32.120 before authentication.</li> <li>● After the user enters account information and click <b>Authenticate</b> on Ruijie Supplicant, the authentication succeeds and the user can successfully ping 192.168.32.120.</li> <li>● After passing authentication, dynamic users can successfully ping 192.168.32.120.</li> <li>● Information of the authenticated user is displayed, showing that the user jumps from VLAN 2 to VLAN 3.</li> </ul> <pre>ruijie# show dot1x summary</pre> <table border="1"> <thead> <tr> <th>ID</th> <th>Username</th> <th>MAC</th> <th>Interface</th> <th>VLAN</th> <th>Auth-State</th> <th>Backend-State</th> </tr> <tr> <th>Port-Status</th> <th>User-Type</th> <th>Time</th> <th></th> <th></th> <th></th> <th></th> </tr> </thead> <tbody> <tr> <td>16778217</td> <td>ts-user</td> <td>0023.aaaa.4286</td> <td>Fa0/1</td> <td>3</td> <td>Authenticated</td> <td>Idle</td> </tr> <tr> <td>static</td> <td>0days</td> <td>2h17m29s</td> <td></td> <td></td> <td></td> <td>Authed</td> </tr> </tbody> </table>	ID	Username	MAC	Interface	VLAN	Auth-State	Backend-State	Port-Status	User-Type	Time					16778217	ts-user	0023.aaaa.4286	Fa0/1	3	Authenticated	Idle	static	0days	2h17m29s				Authed
ID	Username	MAC	Interface	VLAN	Auth-State	Backend-State																							
Port-Status	User-Type	Time																											
16778217	ts-user	0023.aaaa.4286	Fa0/1	3	Authenticated	Idle																							
static	0days	2h17m29s				Authed																							

## Common Errors

- RADIUS attributes for VLAN assignment are incorrectly configured on the authentication server.
- RADIUS attribute support for VLAN assignment is disabled on the NAS.
- When MAC VLAN is enabled on a Hybrid port for dynamic VLAN assignment, the assigned VLAN has tags.

## 4.4.7 Configuring Extended Functions

### Configuration Effect

- Some users use authentication clients embedded in the operating system. These clients may not initiate authentication immediately after the users access the network, affecting user experience on network access. Enable active authentication to so that such users can initiate authentication immediately after accessing the network.
- Active authentication means that the NAS sends a request/id packet to trigger Ruijie Supplicant to perform 802.1 authentication. Therefore, you can use this function to detect whether Ruijie Supplicant is used. For example, this function is required for MAB deployment.
- Configure the authenticable host list to specify users that can be authenticated on the port, which restricts physical access points of users to enhance network security
- The multi-account function allows a user to switch its account upon re-authentication. In special scenarios such as Windows domain authentication, multiple authentications are required to access the domain and the user account changes during authentication. This function applies to these scenarios.
- By default, the NAS uses its own MAC address as the source MAC address of EAP packets during 802.1X authentication. Some versions of Ruijie supplicants check whether the access switch is a Ruijie switch based on the MAC address of EAP packets and implement some private features. When performing 802.1X authentication with these supplicants, you can enable the virtual source MAC address to use related private features.
- 802.1X allows users to obtain IP addresses before accounting. In this manner, the IP address is carried during user accounting, meeting service requirements. After a user is authenticated and goes online, the NAS can obtain the IP address of the user from the supplicant or through DHCP snooping, and then 802.1X server initiates an accounting request. To avoid the case in which the NAS does not initiate accounting for a long time due to failure to obtain the IP address of the authentication client, configure the IP detection timeout for this function. If the NAS does not obtain the IP address of the user within the configured time (5 minutes by default), it forces the user offline.
- 802.1X allows the NAS to initiate accounting to the authentication server after obtaining user information from the authentication client. In this way, user information of the authentication client can be transferred to the authentication server. To ensure that the wired switch obtains user information from the authentication client in a timely manner and initiate accounting to the authentication server, you can configure a timeout. If the NAS does not obtain any user information within the timeout, it directly initiates accounting to the authentication server.
- In gateway authentication mode, if IP authorization is enabled, 802.1X supports ARP detection when wired users (including 802.1X users and MAB users) migrate to a new VLAN and port. That is, after finding a user migrated, the NAS sends an ARP request on the original port and VLAN of the user to detect whether the user has migrated. Disable ARP detection if it is not suitable.

### Notes

- The multi-account function must be disabled if accounting is enabled. Otherwise, accounting may be inaccurate.
- MAB requires active authentication. Therefore, active authentication must be enabled if MAB is enabled.

- IP-based accounting is not required in two situations:
  - IPv4 addresses and Ruijie Supplicant are deployed. This function is not required because Ruijie Supplicant can upload the IPv4 addresses of users.
  - Static IP addresses are deployed.

## Configuration Steps

### ▾ Enabling Active Authentication

- (Optional) If active authentication is enabled, the controlled port sends an authentication request actively after configuration. After receiving this request, the authentication client initiates 802.1X authentication.
- Enable active authentication after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x auto-req</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	Enabled
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The destination addresses of active authentication packets are the multicast address. If the connected clients may not initiate authentication automatically, configure this command to make the NAS actively initiate authentication. When controlled ports are Trunk ports, enable active authentication so that authentication requests can be sent based on each VLAN of trunk ports.

### ▾ Configuring the Number of Active Authentication Requests

- (Optional) Configure the number of active authentication requests sent by the NAS.
- Configure the number of active authentication requests after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x auto-req packet-num num</b>
<b>Parameter Description</b>	<i>num</i> : Indicates the number of active authentication requests.
<b>Defaults</b>	The number of active authentication request is not configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If active authentication is enabled, configure this command to restrict the number of active authentication packets sent by a port and thereby avoid sending excessive packets.

### ▾ Enabling User Detection for Active Authentication

- (Optional) Configure the NAS not to send authentication requests actively if there are authenticated users on a controlled port.
- Enable user detection for active authentication after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x auto-req user-detect</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	User detection for active authentication is enabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is configured, the NAS does not send authentication packets actively if there are authenticated users on controlled Access ports. On Trunk ports, the NAS checks for authenticated users based each VLAN. If there are authenticated users on a VLAN, the NAS does not send authentication packets automatically.

### ▾ Configuring the Interval of Active Authentication Request

- (Optional) Configure the interval at which the NAS sends an authentication request actively.
- Enable the interval of active authentication request after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x auto-req req-interval time</b>
<b>Parameter Description</b>	<i>Time</i> : Indicates the interval of active authentication request.
<b>Defaults</b>	The default value is 30s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Authenticatable Client List

- (Optional) Configure the authenticatable client list on a controlled port. Only clients on the list can perform 802.1X authentication.
- Configure the authenticatable client list after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x auth-address-table address mac-addr interface interface</b>
<b>Parameter Description</b>	<i>mac-addr</i> : Indicates the MAC address of the access user. <i>interface</i> : Indicates the port of the access user.
<b>Defaults</b>	All users can perform authentication.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command when specified users should be able to perform authentication on a controlled port.

### ▾ Enabling 802.1X Packets Sending with the Pseudo Source MAC Address

- (Optional) Configure the **dot1x pseudo source-mac** command when Ruijie Supplicant fails to identify the NAS as a Ruijie device based on the MAC address of the NAS.
- Configure the pseudo MAC address as the source MAC address for 802.1X authentication after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x pseudo source-mac</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	This function is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command when Ruijie Supplicants cannot identify the NAS as a Ruijie device based on the source MAC address in the EAPOL packet sent by the NAS or implement private attributes during authentication. If this command is configured, the EAPOL packet sent by the NAS uses 00-1A-A9-17-FF-FF as the source MAC address so that these Ruijie Supplicants can identify the NAS as a Ruijie device.

#### ▾ Enabling Multi-account Authentication with One MAC Address

- (Optional) Run the **dot1x multi-account enable** command to allow the same MAC address to be used by multiple accounts.
- Enable multi-account authentication with one MAC address after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x multi-account enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	Multi-account authentication is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command when multi-account authentication is required in 802.1X authentication, e.g. in the case of Windows domain authentication. In this case, the authentication client can directly use a new account to initiate authentication while the previous account is still online. Multi-account authentication is disabled by default.

#### ▾ Configuring the Maximum Number of Authenticated Users on a Port

- (Optional) You can restrict the number of online users on a controlled port, including static users and dynamic users.
- Configure the maximum number of authenticated users on a port after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x default-user-limit <i>num</i></b>
<b>Parameter</b>	<i>num</i> : Indicates the maximum number of online users.
<b>Description</b>	
<b>Defaults</b>	There is no restriction on the number of users on a port by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Configure this command when there is a need to restrict the number of authenticated users on a port.

#### ▾ Enabling IP-triggered Accounting

- (Optional) If IP-triggered accounting is enabled, the NAS sends an accounting request to the authentication server after obtaining the IP address of the user.

- Enable IP-triggered accounting after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x valid-ip-acct enable</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	IP-triggered accounting is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If both accounting and IP-triggered accounting are enabled, the NAS initiates accounting only after obtaining the IP address of the authentication client, and forces the user offline if it fails to obtain the IP address. If accounting is disabled but IP-triggered accounting is enabled, the NAS does not initiate accounting after obtaining the IP address of the authentication client, and forces the user offline if it fails to obtain the IP address within the timeout.

### ↘ Configuring the Timeout of Obtaining IP Addresses After Authentication

- (Optional) Configure the timeout of obtaining IP addresses if IP-triggered accounting is enabled.
- Configure the IP address obtaining timeout after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x valid-ip-acct timeout <i>time</i></b>
<b>Parameter Description</b>	<i>time</i> : Indicates the timeout in the unit of minutes.
<b>Defaults</b>	The default value is 5 minutes.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	It is recommended to use the default value. Configure this command when there is a need to change the IP address obtaining timeout after users pass authentication.

### ↘ Enabling User-based Accounting

- (Optional) If IP-based accounting is enabled, the NAS sends an accounting request to the authentication server after obtaining the user information.
- Enable user-based accounting after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x valid-terminal-acct enable</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	User-based accounting is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If both accounting and user-based accounting are enabled, the NAS initiates accounting only after obtaining the user information from the authentication client, and forces the user offline if it fails to obtain the user information.

### ↘ Configuring the User Information Obtaining Timeout

- (Optional) Configure the user information obtaining timeout if user-based accounting is enabled.
- Configure the user information obtaining timeout after 802.1X authentication is enabled on the NAS.

<b>Command</b>	<b>dot1x valid-terminal-acct timeout</b> <i>time</i>
<b>Parameter Description</b>	<i>time</i> : Indicates the timeout in the unit of minutes. The default value is 2 minutes.
<b>Defaults</b>	The default value is 2 minutes.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	It is recommended to use the defaults. Configure this command when there is a need to change the user information obtaining timeout after users pass authentication.

## 4.5 Monitoring

### Clearing

 Authentication user information can be cleared after 802.1X is disabled.

Description	Command
Clears 802.1X user information.	<b>no do1x port-control auto</b>
Clears 802.1X user information.	<b>clear dot1x user</b>
Restores the default 802.1X configuration.	<b>dot1x default</b>

### Displaying

Description	Command
Displays the parameters and status of the RADIUS server.	<b>show radius server</b>
Displays 802.1X status and parameters.	<b>show dot1x</b>
Displays the authenticable host list.	<b>show dot1x auth-address-table</b>
Displays the active authentication status.	<b>show dot1x auto-req</b>
Displays the port control status.	<b>show dot1x port-control</b>
Displays the status and parameters of host probe.	<b>show dot1x probe-timer</b>
Displays of the information of authenticated users.	<b>show dot1x summary</b>
Displays the maximum times of EAP-Request/Challenge packet retransmission.	<b>show dot1x max-req</b>

Displays the information of controlled ports.	<b>show dot1x port-control</b>
Displays the non-Ruijie client filtering information.	<b>show dot1x private-supplicant-only</b>
Displays the re-authentication status.	<b>show dot1x re-authentication</b>
Displays the maximum times of EAP-Request/Identity packet retransmission.	<b>show dot1x reauth-max</b>
Displays the quiet period after authentication fails.	<b>show dot1x timeout quiet-period</b>
Displays the re-authentication interval.	<b>show dot1x timeout re-authperiod</b>
Displays the authentication server timeout.	<b>show dot1x timeout server-timeout</b>
Displays the supplicant timeout.	<b>show dot1x timeout supptimeout</b>
Displays the interval of EAP-Request/Identity packet retransmission.	<b>show dot1x timeout tx-period</b>
Displays user information based on the user ID.	<b>show dot1x user id</b>
Displays user information based on the MAC address.	<b>show dot1x user mac</b>
Displays user information based on the user name.	<b>show dot1x user name</b>
Displays the summary information of authenticated users on an RIPT AP.	<b>show dot1x ript summary</b>
Displays user information on an RIPT AP based on the user ID.	<b>show dot1x ript user id</b>
Displays user information on an RIPT AP based on the MAC address.	<b>show dot1x ript user mac</b>
Displays user information on an RIPT AP based on the user name.	<b>show dot1x ript user name</b>

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable the debugging switch immediately after use.

Description	Command
Debugs AAA. (For details, see the <i>Configuring AAA</i> .)	<b>debug aaa</b>
Debugs RADIUS. (For details, see	<b>debug radius</b>

---

the <i>Configuring RADIUS</i> .)	
Debugs 802.1X events.	<b>debug dot1x event</b>
Debugs 802.1X packets.	<b>debug dot1x packet</b>
Debugs 802.1X state machine (STM).	<b>debug dot1x stm</b>
Debugs 802.1X internal communication.	<b>debug dot1x com</b>
Debugs 802.1X errors.	<b>debug dot1x error</b>

## 5 Configuring Web Authentication

### 5.1 Overview

#### 5.1.1 Web Authentication

Web authentication controls user access to networks. It requires no authentication software on clients. Instead, users can perform authentication on common browsers.

When unauthenticated clients attempt to access the Internet using browsers, the network access server (NAS) forcibly redirects the browsers to a specified site pointing to a Web authentication server, also called a portal server. Users can access the services on the portal server before being authenticated, such as downloading security patches and reading notices. If a user wants to access network resources beyond the portal server, the user must get authenticated by the portal server through a browser.

Besides providing convenient authentication, the portal server performs Webpage interaction with browsers, providing personalized services, such as advertisements, notices, and business links on the authentication page.

#### Ruijie Web Authentication Versions

There are two versions of Ruijie Web authentication, including Ruijie First-Generation Web Authentication and Ruijie Second-Generation Web Authentication. The Web authentication process varies with authentication versions. For details, see Section 5.3 "Features".

 The two versions of Web authentication are highly divergent in features and configurations. It is recommended to read through the relevant chapters carefully before configuration.

#### Protocols and Standards

- HTTP: RFC1945 and RFC2068
- HTTPS: RFC2818
- SNMP: RFC1157 and RFC 2578
- RADIUS: RFC2865, RFC2866, and RFC3576

### 5.2 Applications

Application	Description
<a href="#">Basic Scenario of Web Authentication</a>	Basic layer-2 authentication scenario, where a NAS, portal server, and RADIUS server constitute an authentication system which connects a client with the NAS through the layer-2 network.

## 5.2.1 Basic Scenario of Web Authentication

### Scenario

See Figure 5-1.

- Deploy a Web authentication scheme on the NAS.
- The client connected to the NAS needs to pass Web authentication before accessing the Internet.

Figure 5-1 Networking Topology of Web Authentication

<b>Remarks</b>	Web authentication is applicable to both layer-2 and layer-3 networks. Here, layer-2 NAS is used as an example. RG-SAM is a program for the RADIUS server. RG-ePortal is a program for the portal server.
----------------	---

### Deployment

- Enable Web authentication on the client-accessed interface on the NAS.
- Configure the ePortal server and the communication key on the NAS.
- Configure the Simple Network Management Protocol (SNMP) communication parameters of the ePortal server on the NAS.
- Configure the consistent communication parameters on the web authentication server and SAM server (for only Ruijie First-Generation Web Authentication).
- Create user accounts on the SAM server.
- Configure AAA and method lists on the NAS (for only Ruijie Second-Generation Web Authentication).
- Configure the IP address of the SAM server on the NAS (for only Ruijie Second-Generation Web Authentication).
- Configure the names of the Web authentication method lists on the NAS (for only Ruijie Second-Generation Web Authentication).

## 5.3 Features

### Basic Concepts

#### ▾ Ruijie First-Generation Web Authentication

Ruijie First-Generation Web Authentication should cooperate with the RG-ePortal software. The server installed with RG-ePortal provides a login page to submit user authentication information, and initiates an authentication request to the RADIUS server directly. After authentication succeeds, the NAS gets user information delivered through the SNMP protocol, and thereby controls user access permissions. Communication during Web authentication of this version depends on private SNMP nodes. Moreover, the ePortal server takes the place of the NAS in authentication and accounting, which relieves the NAS from service burden.

### ▾ Ruijie Second-Generation Web Authentication

Ruijie Second-Generation Web Authentication is an upgrade of the First-Generation version. It complies with the *CMCC WLAN Service Portal Specification*. The portal server is responsible only for Webpage interaction with users. The NAS interacts with the RADIUS server to implement authentication. The interaction between the portal server and the NAS complies with the *CMCC WLAN Service Portal Specification*. The ePortal software provides a login page for users to submit their information, and the ePortal server informs the NAS of user information through the portal protocols. The NAS completes authentication by interacting with the RADIUS server based on the user information, assigns access permissions to authenticated clients, and returns authentication results to the ePortal server.

The implementation process of Ruijie Second-Generation Web Authentication is mainly completed on the NAS. This raises a higher demand on the NAS's capability to handle heavy tasks. Meanwhile, the ePortal server is simplified. The standard *CMCC WLAN Service Portal Specification*, which gains highly industry support, enables various vendors to develop compatible products.

### ▾ Version Comparison

Authentication roles:

- Client: Its functions are the same among the three types of Web authentication.
- NAS: In Ruijie First-Generation Web Authentication, the NAS implements only URL redirection and receives user login/logout notifications sent by the portal server. In Ruijie Second-Generation Web Authentication, the NAS is responsible for redirecting and authenticating users as well as notifying the portal server of authentication results.
- Portal server: In Ruijie First-Generation Web Authentication, the portal server is responsible for interaction with clients through Webpages, authenticating users, and notifying the NAS of authentication results. In Ruijie Second-Generation Web Authentication, the portal server is responsible for interacting with clients through Webpages, notifying the NAS of users' authentication information, and receiving authentication results from the NAS.
- RADIUS server: Its functions are the same among the three types of Web authentication.

Authentication process:

- In Ruijie Second-Generation Web Authentication, the authentication and accounting functions are transferred from the portal server to the NAS.
- Because authentication proceeds on the NAS, the second-generation NAS does not need to wait for the authentication results notified by the portal server as the first generation.

Logout process:

- In Ruijie First-Generation Web Authentication, Accounting Stop packets are sent by the portal server.

- i** The selection of the Web authentication versions depends on the type of the portal server in use.
- i** Command parameters in this document may be shared by the two Web authentication versions or not. Read through this document carefully to avoid parameter misconfiguration that will affect Web authentication.

## Overview

Feature	Description
<a href="#">Ruijie First-Generation Web Authentication</a>	Realizes Ruijie First-Generation Web Authentication.
<a href="#">Ruijie Second-Generation Web Authentication</a>	Realizes Ruijie Second-Generation Web Authentication.

### 5.3.1 Ruijie First-Generation Web Authentication

#### HTTP Interception

HTTP interception means the NAS intercepts to-be-forwarded HTTP packets. Such HTTP packets are initiated by the browsers of the clients connected to the NAS, but they are not destined for the NAS. For example, when a client attempts to visit the website [www.google.com](http://www.google.com) using the Internet Explorer, the NAS is expected to forward the HTTP request packets to the gateway. If HTTP interception is enabled, these packets will not be forwarded.

After HTTP interception is successful, the NAS redirects the HTTP requests from the client to itself to establish a session between them. Then, the NAS pushes a Webpage to the client through HTTP redirection, which can be used for authentication, software downloading or other purposes.

You can specify the clients and destination interfaces to enable or disable HTTP interception for Web authentication. In general, HTTP requests from unauthenticated clients will be intercepted, and those from authenticated clients will not. HTTP interception is the foundation of Web authentication. Web authentication is automatically triggered once HTTP interception succeeds.

#### HTTP Redirection

According to HTTP protocols, after the NAS receives a HTTP GET or HEAD request packet from a client, a packet with 200 (Ok) status code is replied if it is able to provide the required resources, or a packet with 302 (Moved Temporarily) status code is returned if unable. Another URL is provided in the 302 packet. After receiving the packet, the client may resend a HTTP GET or HEAD request packet to the new URL for requesting resources. This process is called redirection.

HTTP redirection is an important procedure following HTTP interception in Web authentication. It takes the advantage of 302 status code defined in HTTP protocols. HTTP interception creates a session between the NAS and a client. The client sends HTTP GET or HEAD request packets (which should have been sent to another site) to the NAS. The NAS responds with a 302 packet with a specific redirection page. Thereby, the client resends the requests to the redirection page.

## Working Principle

Figure 5-1 shows the networking topology of Web authentication.

First-generation Webauth roles:

1. Authentication client: Is usually a browser running HTTP protocols. It sends HTTP requests for accessing the Internet.

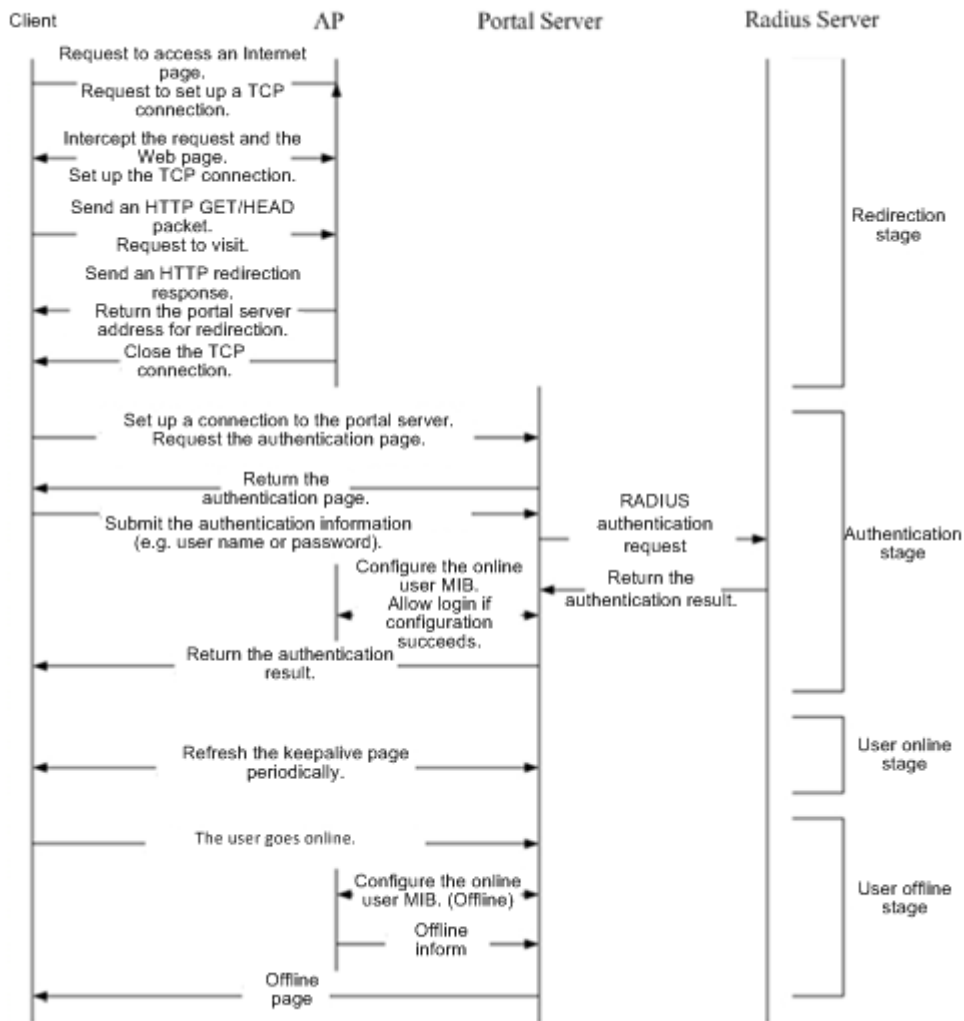

2. NAS: Is an access-layer device in a network (for example, a wireless access point [AP] on a wireless network). The NAS is directly connected to clients and must be enabled with Web authentication.
3. Portal server: Provides a Web page for Web authentication and related operations. After receiving an HTTP authentication request from a client, the portal server extracts account information from the request, sends the information to the RADIUS server for authentication, and notifies the client and NAS of the authentication result. Figure 5-1 shows Ruijie ePortal server.
4. RADIUS server: Provides the RADIUS-based authentication service to remote clients. The portal server extracts users' authentication account information from HTTP packets and initiates authentication requests to the RADIUS server through the RADIUS protocol. The RADIUS server returns the authentication result to the portal server through the RADIUS protocol. Figure 5-1 shows the RADIUS server installed with the RG-SAM program.

First-generation Webauth process:

1. Before authentication, the NAS intercepts all HTTP requests from a client and redirects these requests to the Portal server. Thereafter, an authentication page is displayed on the browser.
2. During authentication, the client enters information, for example, username, password, and verification code, on the Webauth URL to interact with the portal server and complete authentication.
3. After the user is authenticated, the portal server notifies the NAS that the client has passed authentication, and the NAS allows the client to access resources on the Internet.

Figure 5-2 shows the flowchart of Ruijie First-Generation Web Authentication by using an AP as the NAS.

Figure 5-2 Flowchart of Ruijie First-Generation Web Authentication

First-generation client logout process:

There are two scenarios of client logout. One scenario is detected by the NAS that a client gets offline for the maximum online time is out, the upper traffic limit is reached, or the link is disconnected. The other scenario is detected by the portal server that a client logs out by clicking the **Logout** button on the logout page or the keep-alive page is invalid.

1. Scenario 1: The NAS detects a client to logout and informs the portal server. Then the portal server deletes the user information on the NAS through SNMP and displays a logout page to the client.
2. Scenario 2: The portal server detects a client to logout and informs the NAS through SNMP and displays a logout page to the client.
3. In the two scenarios, the portal server sends an Accounting Stop request to the RADIUS server and notifies the RADIUS server that the client has logged out.

### Related Configuration

➤ [Configuring the First-Generation Webauth Template](#)

By default, the first-generation Webauth template is not configured.

Run the **web-auth template eportalv1** command in global configuration mode to create the first-generation Webauth template.

The template is used to implement Web authentication.

### 📌 Configuring the IP Address of the Portal Server

By default, the IP address of the portal server is not configured.

Run the **ip {ip-address}** command in template configuration mode to configure the IP address of the portal server.

Any request packets to access the portal server will be filtered and rate-limited by the NAS.

### 📌 Configuring the Webauth URL of the Portal Server

By default, the Webauth URL of the portal server is not configured.

Run the **url {url-string}** command in template configuration mode to configure the Webauth URL of the portal server.

The URL to which clients are redirected is the address of the Webauth URL provided by the portal server.

### 📌 Configuring the Webauth Communication Key

By default, the Webauth communication key is not configured.

Run the **web-auth portal key {string}** command in global configuration mode to configure the Webauth communication key.

The communication key is used to encrypt URL parameters to avoid information disclosure.

### 📌 Enabling Ruijie First-Generation Web Authentication

By default, Ruijie First-Generation Web Authentication is disabled.

Run the **web-auth enable** command in interface configuration mode to enable Ruijie First-Generation Web Authentication on the client-connected ports.

After Web authentication is enabled, the unauthenticated clients connecting to a port will be redirected to the Webauth URL.

### 📌 Configuring the SNMP-Server Host

By default, the SNMP-server host and community string are not configured.

Run the **snmp-server host {ip-address} version 2c {community-string} web-auth** command in global configuration mode to configure the SNMP-server host and community string for Web authentication.

The SNMP-server host is configured to receive Inform/Trap packets of user logout.

### 📌 Configuring the SNMP-Server Community String

By default, the SNMP-server community string is not configured.

Run the **snmp-server community {community-string} rw** command in global configuration mode to configure the SNMP-server community string.

The SNMP-server community string is configured to read/write user information from/to the NAS.

### ▾ Enabling the SNMP Trap/Inform Function

By default, the SNMP Trap/Inform function is disabled.

Run the **snmp-server enable traps web-auth** command in global configuration mode to enable the SNMP Trap/Inform function.

The SNMP Trap/Inform function is configured to enable the NAS to inform the portal server of user logout.

## 5.3.2 Ruijie Second-Generation Web Authentication

### HTTP Interception

Same as the HTTP interception technology of Ruijie First-Generation Web Authentication.

### HTTP Redirection

Same as the HTTP redirection technology of Ruijie First-Generation Web Authentication.

### Working Principle

Figure 5-1 shows the networking topology of Web authentication.

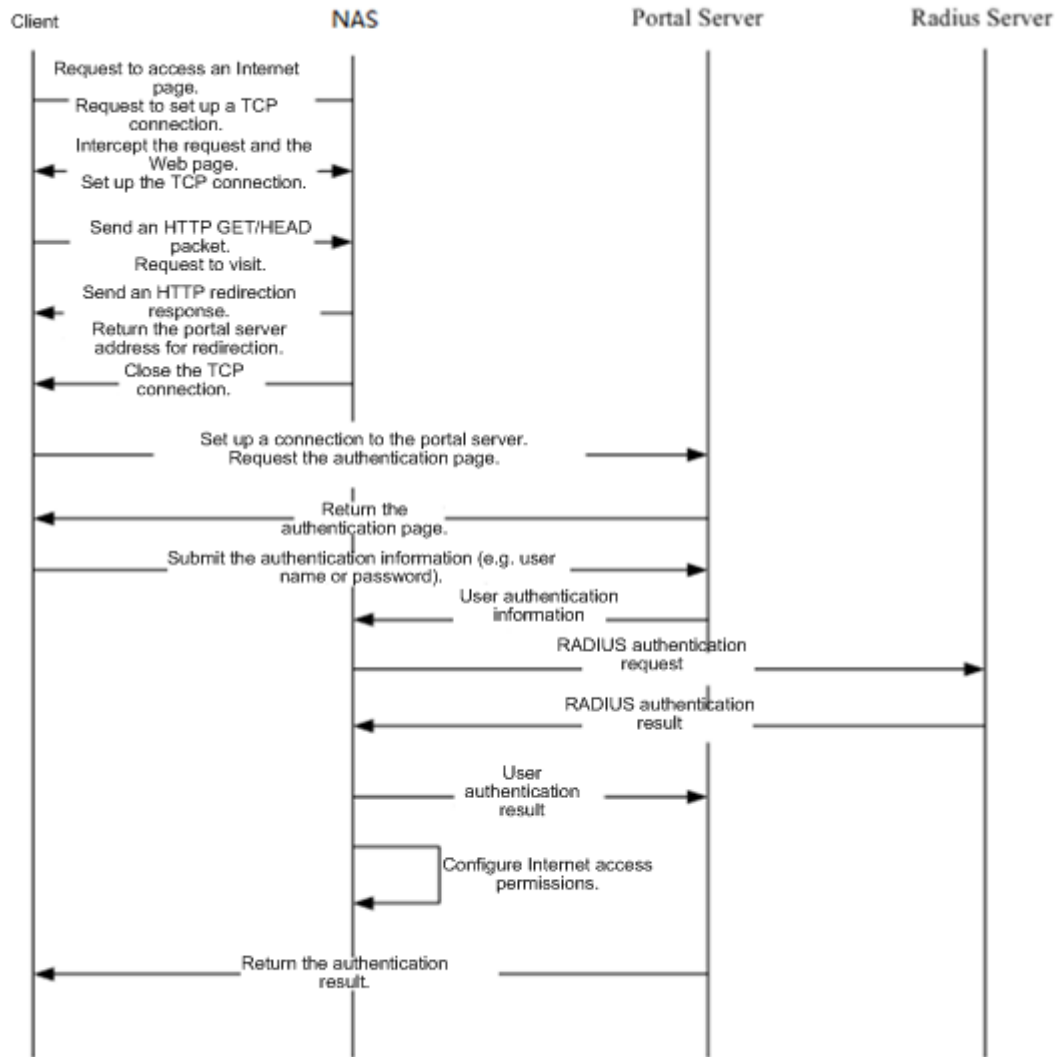

Second-generation Webauth roles:

1. Authentication client: Is usually a browser running HTTP protocols. It sends HTTP requests for accessing the Internet.
2. NAS: Is an access-layer device in a network (for example, an AP on a wireless network). The NAS is directly connected to clients and must be enabled with Web authentication. The NAS receives user authentication information from the portal server, sends authentication requests to the RADIUS server, determines whether users can access the Internet according to authentication results, and returns the authentication results to the portal server.
3. Portal server: Provides a Web page for Web authentication and related operations. After receiving an HTTP authentication request from a client, the portal server extracts account information from the request, transfers the information to the NAS, and displays the authentication result returned by the NAS to the user on a page. Figure 5-1 shows Ruijie ePortal server.
4. RADIUS server: Provides the RADIUS-based authentication service to remote clients. Figure 5-1 shows the RADIUS server installed with the RG-SAM program.

Second-generation Webauth process:

1. Before authentication, the NAS intercepts all HTTP requests from a client and redirects these requests to the iPortal server. Thereafter, an authentication page is displayed on the browser.
2. During authentication, the client enters information, for example, username, password, and verification code, on the Webauth URL to interact with the portal server.
3. The portal server sends the user authentication information to the NAS.
4. The NAS initiates authentication to the RADIUS server and returns the authentication result to the portal server.
5. The portal server displays the authentication result (success or failure) to the user on a page.

Figure 5-3 Flowchart of Ruijie Second-Generation Web Authentication

Second-generation client logout process:

There are two scenarios of client logout. One scenario is detected by the NAS that a client gets offline for the maximum online time is out, the upper traffic limit is reached, or the link is disconnected. The other scenario is detected by the portal server that a client logs out by clicking the **Logout** button on the logout page or the keep-alive page is invalid.

1. When the device detects that a user has logged out, it notifies the portal server of the user's status (via the portal protocol) and deletes the user's information. Then the portal server pushes a logout page to the user.
2. When the portal server detects that a user has logged out, it notifies the device of the user's status (via the portal protocol). Then the portal server pushes a logout page to the user.
3. Under both circumstances, the device sends requests to the Radius server to end accounting and notifies the server that the user has logged out.

## Related Configuration

### Configuring the Second-Generation Webauth Template

By default, the second-generation Webauth template is not configured.

Run the **web-auth template**{*eportalv2* | *template-name v2*} command in global configuration mode to create a second-generation Webauth template.

The template is used to implement Web authentication.

### ▾ **Configuring the IP Address of the Portal Server**

By default, the IP address of the portal server is not configured.

Run the **ip** { *ip-address* } command in template configuration mode to configure the IP address of the portal server.

Any request packets to access the portal server will be filtered and rate-limited by the NAS.

### ▾ **Configuring the Webauth URL of the Portal Server**

By default, the Webauth URL of the portal server is not configured.

Run the **url** { *url-string* } command in template configuration mode to configure the Webauth URL of the portal server.

The URL to which clients are redirected is the address of the Webauth URL provided by the portal server.

### ▾ **Configuring the Webauth Communication Key**

By default, the Webauth communication key is not configured.

Run the **web-auth portal key** { *string* } command in global configuration mode to configure the Webauth communication key.

The communication key is used to encrypt URL parameters to avoid information disclosure.

### ▾ **Enabling Ruijie Second-Generation Web Authentication**

By default, Ruijie Second-Generation Web Authentication is disabled.

Run the **web-auth enable** {*eportalv2* | *template-name v2*} command in interface configuration mode to enable Ruijie Second-Generation Web Authentication on the client-connected ports.

After Web authentication is enabled, the unauthenticated clients connecting to a port will be redirected to the Webauth URL.

### ▾ **Enabling AAA**

By default, AAA is disabled.

Run the **aaa new-model** command in global configuration mode to enable AAA.

Ruijie Second-Generation Web Authentication relies on AAA. Enable AAA before you implement the former.

### ▾ **Configuring the RADIUS-Server Host and Communication Key**

By default, the RADIUS-server host and communication key are not configured.

Run the **radius-server host** command in global configuration mode to configure the RADIUS-server host and communication key.

The RADIUS-server host is responsible for authenticating users.

### ▾ **Configuring an AAA Method List for Ruijie Second-Generation Web Authentication**

By default, no AAA method list is configured for Ruijie Second-Generation Web Authentication.

Run the **aaa authentication web-auth** command in global configuration mode to configure an AAA method list for Ruijie Second-Generation Web Authentication.

The AAA authentication method list is used for interaction during the Webauth process.

📌 **Configuring an AAA Method List for Ruijie Second-Generation Web Accounting**

By default, no AAA method list is configured for Ruijie Second-Generation Web Accounting.

Run the **aaa accounting network** command in global configuration mode to configure an AAA method list for Ruijie Second-Generation Web Accounting.

The AAA method list for Web accounting is used for accounting interaction during the Webauth process.

📌 **Specifying an AAA Method List**

The default AAA method list is used if no list is specified.

Run the **authentication** command in template configuration mode to specify an AAA method list.

The AAA method list is specified to send authentication requests to AAA.

📌 **Specifying an AAA Accounting Method List**

The default AAA accounting method list is used if no list is specified.

Run the **accounting** command in template configuration mode to specify an AAA accounting method list.

The AAA accounting method list is specified to send accounting requests to AAA.

📌 **Specifying the UDP Port of the Portal Server**

By default, UDP Port 50100 is used.

Run the **port** command in template configuration mode to specify the UDP port of the portal server.

The UDP port is specified for the portal server to communicate with the NAS.

## 5.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Ruijie First-Generation Web Authentication</a>	 (Mandatory) It is used to set the basic parameters of Ruijie First-Generation Web Authentication.	
	<b>web-auth template eportalv1</b>	Configures the first-generation Webauth template.
	<b>ip {ip-address}</b>	Configures the IP address of the portal server.
	<b>url {url-string}</b>	Configures the Webauth URL of the portal server.

Configuration	Description and Command	
	<b>web-auth portal key</b> { <i>key-string</i> }	Configures the Webauth communication key.
	<b>snmp-server community</b> { <i>community-string</i> } <b>rw</b>	Configures the SNMP-server community string.
	<b>snmp-server host</b> { <i>ip-address</i> } <b>inform version 2c</b> { <i>community-string</i> } <b>web-auth</b>	Configures the SNMP-server host.
	<b>snmp-server enable traps web-auth</b>	Enables the SNMP-server Trap/Inform function.
	<b>web-auth enable</b>	Enables Ruijie First-Generation Web Authentication on an interface.
<a href="#">Configuring Ruijie Second-Generation Web Authentication</a>	 (Mandatory) It is used to set the basic parameters of Ruijie Second-Generation Web Authentication.	
	<b>aaa new-model</b>	Enables AAA.
	<b>radius-server host</b> { <i>ip-address</i> }[ <b>auth-port</b> <i>port-number</i> ] [ <b>acct-port</b> <i>port-number</i> ] <b>key</b> { <i>string</i> }	Configures the RADIUS-server host and communication key.
	<b>aaa authentication web-auth</b> { <b>default</b>   <i>list-name</i> } <i>method1</i> [ <i>method2</i> ...]	Configures an AAA method list for Web authentication. (RADIUS authentication is implemented.)
	<b>aaa accounting network</b> { <b>default</b>   <i>list-name</i> } <b>start-stop</b> <i>method1</i> [ <i>method2</i> ...]	Configures an AAA method list for Web Accounting. (RADIUS accounting is implemented.)
	<b>web-auth template</b> { <b>eportalv2</b>   <i>portal-namev2</i> }	Configures a second-generation Webauth template.
	<b>ip</b> { <i>ip-address</i> }	Configures the IP address of the portal server.
	<b>url</b> { <i>url-string</i> }	Configures the Webauth URL of the portal server.
	<b>web-auth portal key</b> { <i>key-string</i> }	Configures the Webauth communication key.
<a href="#">Specifying an Authentication Method List</a>	 (Optional) It is used to specify an AAA authentication method list. The name of the method list must be correctly specified.	
	<b>authentication</b> { <i>mlist-name</i> }	Specifies an AAA authentication method list(only for Ruijie Second-Generation Web Authentication.)

Configuration	Description and Command
<a href="#">Specifying an Accounting Method List</a>	<p> (Optional) It is used to specify an AAA accounting method. The name of the method list must be correctly specified.</p> <p><b>accounting</b> { <i>mlist-name</i> }</p> <p>Specifies an AAA accounting method list(only for Ruijie Second-Generation Web Authentication.)</p>
<a href="#">Configuring the Communication Port of the Portal Server</a>	<p> (Optional) It is used to specify the UDP port of the portal server. The configured port number must be consistent with that on the RADIUS server.</p> <p><b>port</b> { <i>port-num</i> }</p> <p>Configures the communication port of the portal server.</p>
<a href="#">Specifying the Webauth Binding Mode</a>	<p> (Optional) It is used to specify the entry binding mode.</p> <p><b>bindmode</b> {<b>ip-mac-mode</b>   <b>ip-only-mode</b>}</p> <p>Specifies the template binding mode.</p>
<a href="#">Configuring the Redirection HTTP Port</a>	<p> (Optional) It is used to configure the TCP interception port for redirection, so that the packets on the specified port can be redirected when interception is enabled.</p> <p><b>http redirect port</b> { <i>port-num</i> }</p> <p>Configures the redirection TCP port.</p>
<a href="#">Configuring Rate Limit Webauth Logging</a>	<p> (Optional) It is used to configure the syslog function in Web authentication.</p> <p><b>web-auth logging enable</b> {<i>num</i> }</p> <p>Configures the rate limit Webauth logging.</p>
<a href="#">Configuring the Maximum Number of HTTP Sessions for Unauthenticated Clients</a>	<p> (Optional) It is used to adjust the HTTP session limit. The limit value needs to be increased when there are many sessions in the background.</p> <p><b>http redirect session-limit</b> { <i>session-num</i> } [ <b>port</b> { <i>port-session-num</i> } ]</p> <p>Configures the maximum number of HTTP sessions for unauthenticated clients.</p>
<a href="#">Configuring the HTTP Redirection Timeout</a>	<p> (Optional) It is used to modify the timeout period for redirection connections. The timeout needs to be increased to complete redirection when the network condition is bad.</p> <p><b>http redirect timeout</b>{ <i>seconds</i> }</p> <p>Configures the HTTP redirection timeout.</p>
<a href="#">Configuring the Straight-Through ARP Resource Range</a>	<p> (Optional) It is used to permit the ARP of the specified addresses to pass. The gateway ARP must be permitted to pass when ARP check is enabled.</p> <p><b>http redirect direct-arp</b> { <i>ip-address</i> [ <i>ip-mask</i> ] }</p> <p>Configures the straight-through ARP resource.</p>
<a href="#">Configuring an Authentication-Exempted Address Range</a>	<p> (Optional) It is used to exempt clients from authentication when accessing the Internet.</p> <p><b>web-auth direct-host</b> { <i>ip-address</i> [ <i>ip-mask</i> ] [ <b>arp</b> ] } [ <b>port</b> <i>interface-name</i>   <i>mac-address</i> }</p> <p>Configures the range of the IP or MAC addresses of clients free from authentication.</p>

Configuration	Description and Command
<a href="#">Enabling DHCP Address Check</a>	 (Optional) It is used to check whether the IP address of a client is allocated by the DHCP server. If not, the client's authentication request is denied.
	<code>web-auth dhcp-check</code> Checks whether the IP address of a client is assigned by the DHCP server.

## 5.4.1 Configuring Ruijie First-Generation Web Authentication

### Configuration Effect

Redirect unauthenticated clients to the Webauth URL to perform authentication.

### Notes

N/A

### Configuration Steps

#### ▾ Configuring the Portal Server

- (Mandatory) To enable Web authentication successfully, you must configure and apply the portal server.
- When the NAS or convergence device finds an unauthenticated client attempting to access network resources through HTTP, it redirects the access request to the specified Webauth URL, where the client can initiate authentication to the portal server. If the IP address of the portal server is configured as a free network resource, unauthenticated clients can directly visit this IP address through HTTP.

#### ▾ Configuring the Communication Key Between the NAS and Portal Server

- (Mandatory) To enable Web authentication successfully, you must configure the key used for the communication between the NAS or convergence device and portal server.
- When the NAS finds an unauthenticated client attempting to access network resources, it redirects the client to the specified Webauth URL, where the client can initiate authentication to the portal server. During the authentication process, the communication key is used to encrypt some data exchanged between the NAS and portal server to improve security.

#### ▾ Setting the SNMP Parameters Between the NAS and Portal Server

- (Mandatory) To enable Web authentication successfully, you must set the SNMP network management parameters used for the communication between the NAS and portal server.
- The NAS or convergence device and portal server jointly manage authenticated clients through SNMP/MIB. A table of authenticated clients is managed by MIB on the NAS. The portal server is able to access the MIB to obtain client statistics so as to control client login and logout. When a client logs out, the NAS or convergence device will inform the portal server by Webauth Inform packets.

#### ▾ Enabling Ruijie First-Generation Web Authentication on an Interface

- Mandatory.
- When Ruijie First-Generation Web Authentication is enabled in interface configuration mode, Web authentication is not enabled on any port by default. The users connecting to the port do not need to perform Web authentication.

## Verification

- Check whether unauthenticated clients are required to perform authentication.
- Check whether authenticated clients can access the Internet normally.

## Related Commands

### ▾ Configuring the First-Generation Webauth Template

<b>Command</b>	<b>web-auth template eportalv1</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<b>eportalv1</b> is the default template of Ruijie First-Generation Web Authentication.

### ▾ Configuring the IP Address of the Portal Server

<b>Command</b>	<b>ip {ip-address}</b>
<b>Parameter</b>	Indicates the IP address of the portal server.
<b>Description</b>	
<b>Command Mode</b>	Webauth template configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Webauth URL of the Portal Server

<b>Command</b>	<b>url {url-string}</b>
<b>Parameter</b>	<i>url-string</i> : Indicates the Webauth URL of the portal server.
<b>Description</b>	
<b>Command Mode</b>	Webauth template configuration mode
<b>Usage Guide</b>	The URL starts with <b>http://</b> or <b>https://</b> .

### ▾ Configuring the Webauth Communication Key

<b>Command</b>	<b>web-auth portal key {key-string}</b>
<b>Parameter</b>	<i>key-string</i> : Indicates the Webauth communication key used for the communication between the NAS and portal server. The key contains up to 255 characters.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the SNMP-Server Community String

<b>Command</b>	<b>snmp-server community</b> {community-string}rw
<b>Parameter</b>	<i>community-string</i> : Indicates the community string.
<b>Description</b>	<b>rw</b> : Must be set to <b>rw</b> to support the read and write operations as the Set operation on MIB is required.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The SNMP-server community string is used by the portal server to manage the online clients on the NAS or convergence device.

### ▾ Configuring the SNMP-Server Host

<b>Command</b>	<b>snmp-server host</b> {ip-address} <b>inform version 2c</b> {community-string} <b>web-auth</b>
<b>Parameter</b>	<i>ip-address</i> : Indicates the IP address of the SNMP-server host, that is, the portal server.
<b>Description</b>	<i>community-string</i> : Configures the community string used to send an SNMP Inform message.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Configure the SNMP-server host to receive Webauth messages, including the type, version, community string, and other parameters.</p> <p><b>inform</b>: Enables the SNMP Inform function. The NAS or convergence device will send a message to the portal server when a client logs out. The message type is set to Inform instead of Trap to avoid message loss.</p> <p><b>version 2c</b>: Indicates SNMPv2 for SNMP Inform is not supported in all SNMP versions excluding SNMPv1.</p> <p><b>web-auth</b>: Indicates the preceding parameters to be used for Web authentication.</p> <hr/> <p>For details regarding SNMP configuration and others, see the <i>Configuring SNMP</i>.</p> <hr/> <p>The SNMP parameter <b>version 2c</b> listed here is aimed at SNMPv2. SNMPv3 is recommended if higher security is required for the SNMP communication between the NAS and portal server. To use SNMPv3, change <b>SNMP Community</b> to <b>SNMP User</b>, <b>version 2c</b> to <b>SNMPv3</b>, and set SNMPv3-related security parameters. For details, see the <i>Configuring SNMP</i>.</p> <hr/>

### ▾ Enabling the Webauth Trap/Inform Function

<b>Command</b>	<b>snmp-server enable traps web-auth</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure the NAS or convergence device to send Webauth Trap and Inform messages externally. web-auth: Indicates Web authentication messages.

### ▾ Enabling Ruijie First-Generation Web Authentication on an Interface

<b>Command</b>	<b>web-auth enable</b>
----------------	------------------------

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### Configuring Ruijie First-Generation Web Authentication

<b>Scenario</b> <b>Figure 5-4</b>	 <p>The diagram illustrates a network topology for web authentication. A central Network Access Server (NAS) with IP address 192.168.197.95 is connected to four entities: the Internet, a SAM server (192.168.197.80), an ePortal server (192.168.197.79), and a User (192.168.197.64).</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>On the NAS, configure the IP address of the ePortal server and the key (ruijie) used for communicating with the ePortal server.</li> <li>Configure the Webauth URL on the NAS.</li> <li>Set the SNMP network management parameters (community string: public) used for the communication between the NAS and ePortal server.</li> <li>Enable Web authentication on ports GigabitEthernet 0/2 and GigabitEthernet 0/3 on the NAS.</li> </ul>
	<pre>Ruijie# config Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#web-auth template eportalv1 Ruijie(config.tmpl.eportalv1)#ip 192.168.197.79 Ruijie(config.tmpl.eportalv1)#exit Ruijie(config)# web-auth portal key ruijie</pre>
	<pre>Ruijie(config)# web-auth template eportalv1 Ruijie(config.tmpl.eportalv1)#url http://192.168.197.79:8080/eportal/index.jsp Ruijie(config.tmpl.eportalv1)#exit</pre>
	<pre>Ruijie(config)# snmp-server community public rw Ruijie(config)# snmp-server enable traps web-auth Ruijie(config)# snmp-server host 192.168.197.79 inform version 2c public web-auth</pre>

### Common Errors

- N/A

## 5.4.2 Configuring Web Authentication

### Configuration Effect

Redirect unauthenticated clients to the Webauth URL to perform authentication.

### Notes

- N/A

### Configuration Steps

#### ↘ **Enabling AAA**

- (Mandatory) To enable Ruijie Second-Generation Web Authentication, you must enable AAA.
- The NAS is responsible for initiating authentication to the portal server through AAA in Ruijie Second-Generation Web Authentication.

#### ↘ **Configuring the RADIUS-Server Host and Communication Key**

- (Mandatory) To enable Ruijie Second-Generation Web Authentication, you must configure the RADIUS server.
- Clients' account information is stored on the RADIUS server. The NAS needs to connect to the RADIUS server to validate a client.

#### ↘ **Configuring an AAA Method List for Web Authentication**

- (Mandatory) To enable Ruijie Second-Generation Web Authentication, you must configure an AAA authentication method list.
- An AAA authentication method list associates Web authentication requests with the RADIUS server. The NAS selects an authentication method and server based on the method list.

#### ↘ **Configuring an AAA Method List for Web Accounting**

- (Mandatory) To enable Ruijie Second-Generation Web Authentication, you must configure an AAA method list for Web accounting.
- An accounting method list is used to associate an accounting method and server. In Web authentication, accounting is implemented to record client fees.

### ▾ **Configuring the Portal Server**

- (Mandatory) To enable Ruijie Second-Generation Web Authentication, you must configure and apply the portal server.
  - When the NAS or convergence device finds an unauthenticated client attempting to access network resources through HTTP, it redirects the access request to the specified Webauth URL, where the client can initiate authentication to the portal server. If the IP address of the portal server is configured as a free network resource, unauthenticated clients can directly visit this IP address through HTTP.

### ▾ **Configuring the Communication Key Between the NAS and Portal Server**

- (Mandatory) To enable Ruijie Second-Generation Web Authentication, you must configure the key used for the communication between the NAS or convergence device and portal server.
- When the NAS finds an unauthenticated client attempting to access network resources, it redirects the client to the specified Webauth URL, where the client can initiate authentication to the portal server. During the authentication process, the communication key is used to encrypt some data exchanged between the NAS and portal server to improve security.

### ▾ **Configuring the Portal Server in Global or Interface Configuration Mode**

- (Mandatory) To enable Ruijie Second-Generation Web Authentication, you must specify the use of the second generation portal server in global or interface configuration mode.
- The NAS first selects the portal server in interface configuration mode. If such a portal server does not exist, the NAS selects the portal server in global configuration mode. If such a portal server does not exist, eportalv1 is used by default. The NAS redirects users to the selected portal server.

### ▾ **Enabling Ruijie Second-Generation Web Authentication on an Interface**

- Mandatory.
- When Ruijie Second-Generation Web Authentication is enabled in interface configuration mode, Web authentication is not enabled on any port by default. The users connecting to the port do not need to perform Web authentication.

## **Verification**

- Check whether unauthenticated clients are required to perform authentication.
- Check whether authenticated clients can access the Internet normally.

## **Related Commands**

### ▾ **Enabling AAA**

<b>Command</b>	<b>aaa new-model</b>
----------------	----------------------

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	You can configure the AAA authentication and accounting method lists only after AAA is enabled.

### ↘ Configuring the RADIUS-Server Host and Communication Key

<b>Command</b>	<b>radius-server host</b> { <i>ip-address</i> } [ <b>auth-port</b> <i>port-number1</i> ] [ <b>acct-port</b> <i>port-number2</i> ] <b>key</b> { <i>string</i> }
<b>Parameter Description</b>	<i>ip-address</i> : Indicates the IP address of the RADIUS server host. <i>port-number1</i> : Indicates the authentication port. <i>port-number2</i> : Indicates the accounting port. <i>string</i> : Indicates the key string.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, the authentication port number is 1812, and the accounting port number is 1813.

### ↘ Configuring an AAA Method List for Web Authentication

<b>Command</b>	<b>aaa authentication web-auth</b> { <b>default</b>   <i>list-name</i> } <i>method1</i> [ <i>method2</i> ...]
<b>Parameter Description</b>	<i>list-name</i> : Creates a method list. <i>method1</i> : Configures method 1. <i>method2</i> : Configures method 2.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Ruijie Second-Generation Web Authentication adopts the RADIUS authentication method.

### ↘ Configuring an AAA Method List for Web Accounting

<b>Command</b>	<b>aaa accounting network</b> { <b>default</b>   <i>list-name</i> } <b>start-stop</b> <i>method1</i> [ <i>method2</i> ...]
<b>Parameter Description</b>	<i>list-name</i> : Creates a method list. <i>method1</i> : Configures method 1. <i>method2</i> : Configures method 2.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Ruijie Second-Generation Web Authentication adopts the RADIUS accounting method.

### ↘ Configuring the Second-Generation Webauth Template

<b>Command</b>	<b>web-auth template</b> { <i>eportalv2</i>   <i>portal-name v2</i> }
<b>Parameter Description</b>	<i>portal-name</i> : Indicates the customized portal server name.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<b>eportalv2</b> indicates the default template of Ruijie Second-Generation Web Authentication.

### ↘ Configuring the IP Address of the Portal Server

<b>Command</b>	<b>ip</b> { <i>ip-address</i>   <i>ipv6-address</i> }
<b>Parameter Description</b>	Indicates the IP address of the portal server.
<b>Command Mode</b>	Webauth template configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Webauth URL of the Portal Server

<b>Command</b>	<b>url</b> { <i>url-string</i> }
<b>Parameter Description</b>	Indicates the Webauth URL of the portal server.
<b>Command Mode</b>	Webauth template configuration mode
<b>Usage Guide</b>	The URL starts with <b>http://</b> or <b>https://</b> .

### ↘ Configuring the Webauth Communication Key

<b>Command</b>	<b>web-auth portal key</b> { <i>key-string</i> }
<b>Parameter Description</b>	<i>key-string</i> : Indicates the Webauth communication key used for the communication between the NAS and portal server. The key contains up to 255 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

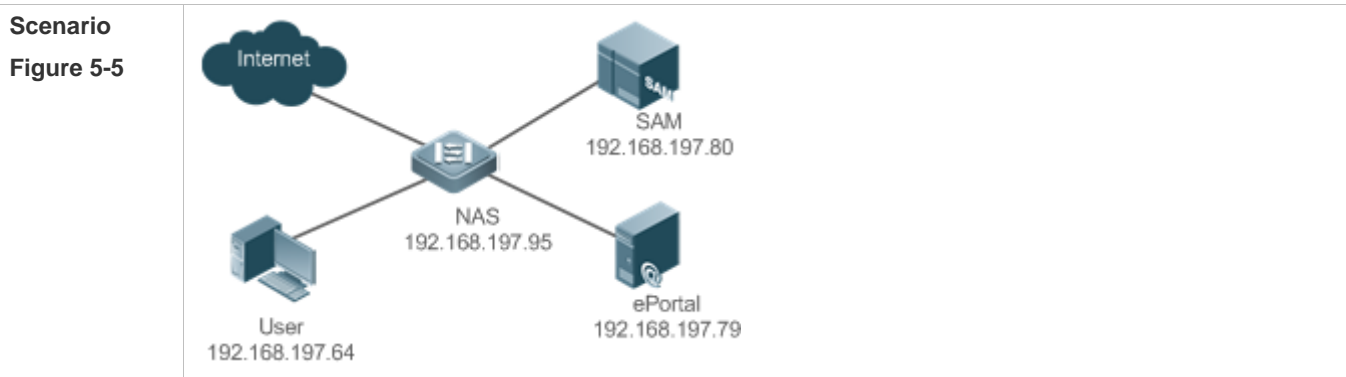

### ↘ Enabling Ruijie Second-Generation Web Authentication on an Interface

<b>Command</b>	<b>web-auth enable</b> { <i>eportalv2</i>   <i>template-name</i> }
<b>Parameter Description</b>	Indicates a Webauth template.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ↘ Configuring Ruijie Second-Generation Web Authentication

- Configuration Steps**
- Enable AAA on the NAS.
  - Configure the RADIUS-server host and communication key on the NAS.
  - Configure the default AAA method lists for Web authentication and accounting on the NAS.
  - Configure the IP address of the portal server and the Webauth communication key (ruijie) used for communicating with the portal server on the NAS.
  - Configure the Webauth URL on the NAS.
  - Configure Ruijie Second-Generation Web Authentication in global configuration mode on the NAS.
  - Enable Web authentication on ports GigabitEthernet 0/2 and GigabitEthernet 0/3 on the NAS.

```
Ruijie#configure
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie(config)#aaa new-model
```

```
Ruijie(config)#radius-server host 192.168.197.79 key ruijie
```

```
Ruijie(config)#aaa authentication web-auth default group radius
Ruijie(config)#aaa accounting network default start-stop group radius
```

```
Ruijie(config)#web-auth template eportalv2
Ruijie(config.tmplt.eportalv2)#ip 192.168.197.79
Ruijie(config.tmplt.eportalv2)#exit
Ruijie(config)#web-auth portal key ruijie
```

```
Ruijie(config)# web-auth template eportalv2
Ruijie(config.tmplt.eportalv2)#url http://192.168.197.79:8080/eportal/index.jsp
Ruijie(config.tmplt.eportalv2)#exit
```

```
Ruijie(config)# interface range GigabitEthernet 0/2-3
Ruijie(config-if-range)# web-auth enable eportalv2
Ruijie(config-if-range)# exit
```

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether Web authentication is configured successfully.</li> </ul>
	<pre>Ruijie(config)#show running-config ... aaa new-model aaa authentication web-auth default group radius aaa accounting network default start-stop group radius ... radius-server host 192.168.197.79 key ruijie ... web-auth template eportalv2  ip 192.168.197.79  url http://192.168.197.79:8080/eportal/index.jsp ! web-auth portal key ruijie ... interface GigabitEthernet 0/2  web-auth enable eportalv2 ! interface GigabitEthernet 0/3  web-auth enable eportalv2</pre>

### Common Errors

- N/A

## 5.4.3 Specifying an Authentication Method List

### Configuration Effect

- The portal server sends an authentication request to the NAS when a user submits authentication information. The NAS resolves the authentication server information and other information based on the configured authentication method list name before initiating authentication.
- The NAS selects the authentication server based on the specified authentication method list.

### Notes

- Before you configure an authentication method list name, ensure that the authentication methods in the list have been configured on the AAA module. The command used to configure authentication methods on the AAA module is **aaa authentication web-auth** { *default* | *list-name* } *method1* [ *method2...*].

### Configuration Steps

- Optional.

- The default authentication method is used if no authentication method list is configured. Run the **authentication** { *mlist-name* } command to configure an authentication method list name when the authentication method list name on the AAA module needs to be modified or multiple method lists exist.

## Verification

- Configure two authentication method lists on the AAA module. Apply list 1 to server 1 and list 2 to server 2.
- Create user a and configured a password for the user on server 1. Create user b on server 2.
- Configure the use of list 1.
- Perform authentication as user b and check that authentication fails.
- Perform authentication as user a and check that authentication is successful.

## Related Commands

### ▾ Specifying an Authentication Method List

<b>Command</b>	<b>authentication</b> { <i>mlist-name</i> }
<b>Parameter</b>	Indicates a method list name.
<b>Description</b>	
<b>Command Mode</b>	Webauth template configuration mode
<b>Usage Guide</b>	Ensure that the configured authentication method list name is consistent with that on the AAA module.

## Configuration Example

### ▾ Specifying an Authentication Method List

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Specify the authentication method list <b>mlist1</b>.</li> </ul>
	<pre>Ruijie(config.tmpl.eportalv2)#authentication mlist1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the configuration is successful.</li> </ul>
	<pre>Ruijie#show web-auth template Webauth Template Settings: ----- Name:      eportalv2 Url:       http://17.17.1.21:8080/eportal/index.jsp Ip:        17.17.1.21 BindMode:  ip-only-mode Type:      v2</pre>

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Specify the authentication method list <b>mlist1</b>.</li> </ul>
	<pre>Ruijie(config.tmpl.eportalv2)#authentication mlist1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the configuration is successful.</li> </ul>
	<pre>Port:      50100 Acctmlist: Authmlist: mlist1</pre>

## 5.4.4 Specifying an Accounting Method List

### Configuration Effect

- The NAS sends an accounting request when a user passes authentication. The recipient of the request depends on the configuration of the accounting method list and is usually the portal server.
- Specify an accounting method list for the NAS to perform accounting.

### Notes

- Ensure that the accounting method list has been configured on the AAA module. The command used to configure accounting methods on the AAA module is **aaa accounting network {default | list-name }start-stop method1 [method2...]**.

### Configuration Steps

- Optional.
- The default accounting method is used if no accounting method list is configured. Run the **accounting {mlist-name }** command to configure an accounting method list name when the accounting method list name on the AAA module needs to be modified or multiple method list names exist.

### Verification

- Configure two accounting method lists on the AAA module. Apply list 1 to server 1 and list 2 to server 2.
- Configure the use of list 1.
- Use a valid account to perform authentication to access the Internet.
- View user accounting information on server1 and server2. Check that the user accounting information exists only on server1.

### Related Commands

#### ↘ Specifying an Accounting Method List

<b>Command</b>	<b>accounting{mlist-name}</b>
----------------	-------------------------------

<b>Parameter Description</b>	Indicates a method list name.
<b>Command Mode</b>	Webauth template configuration mode
<b>Usage Guide</b>	Ensure that the configured accounting method list name is consistent with that on the AAA module.

## Configuration Example

## 5.4.5 Configuring the Communication Port of the Portal Server

### Configuration Effect

- When the NAS detects that a user logs out, it notifies the portal server. The NAS interacts with the portal server through the portal specification, which specifies the port number used to listen to and send/receive packets.
- When the listening port of the portal server is changed, the communication port of the portal server must be modified on the NAS to enable the NAS to interact with the portal server.

## Notes

- The configured port number must be consistent with the port actually used by the portal server.

## Configuration Steps

- Optional.
- Run the **port** *port-num* command to maintain port configuration consistency when the portal server does not use the default port number.

## Verification

- Change the listening port of the server to 10000.
- Run the **port** *port-num* command to configure the port number 10000.
- Simulate the scenario where a user performs authentication to access the Internet.
- Force the user offline on the NAS, refresh the online page, and check that a user logout notification is displayed.

## Related Commands

## 5.4.6 Specifying the Webauth Binding Mode

### Configuration Effect

- When a user goes online, the user's entry needs to be written to a forwarding rule. The forwarding rule mapping method can be modified by specifying different binding modes, which further affects the Internet access rules applied to users. In IP-only mode, all the packets carrying the specified IP address are permitted to pass, and the STAs who send the packets can access the Internet. In IP+MAC mode, only the packets carrying both the specified IP address and MAC address are permitted to pass, and the STAs who send the packets can access the Internet.

### Notes

- In Layer-3 authentication, the MAC addresses visible to the NAS are the gateway addresses of STAs. Because these MAC addresses are not accurate, the IP-only mode should be used.

### Configuration Steps

- (Optional) The default Webauth binding mode is IP+MAC.
- Determine a binding mode based on the accuracy of user information obtained by the NAS. When the IP and MAC addresses of STAs are accurate (in L2 authentication, for example), IP+MAC is recommended. When the IP and MAC addresses are not accurate, select IP-only.

### Verification

- Change the binding mode to IP-only.
- Simulate the scenario where a user performs authentication to access the Internet.

- Modify the MAC address of the user, or use a client with the same IP address but a different MAC address to access the Internet.
- Check that the user accesses the Internet normally.

## 5.4.7 Configuring the Redirection HTTP Port

### Configuration Effect

- When an STA accesses network resources (for example, the user accesses the Internet using a browser), the STA sends HTTP packets. The NAS or convergence device intercepts these HTTP packets to determine whether the STA is

accessing network resources. If the NAS or convergence device detects that the STA is not authenticated, it prevents the STA from accessing network resources and displays an authentication page to the STA. By default, the NAS intercepts the HTTP packets that STAs send to port 80 to determine whether STAs are accessing network resources.

- After a redirection HTTP port is configured, the HTTP requests that STAs send to the specified destination port can be redirected.

## Notes

- The commonly used management ports on the NAS or convergence device, such as ports 22, 23 and 53, and ports reserved by the system are not allowed to be configured as the redirection port. All ports except port 80 with numbers smaller than 1000 are seldom used by the HTTP protocol. To avoid a conflict with the well-known TCP port, do not configure a port with a small number as the redirection port unless necessary.

## Configuration Steps

- Optional.
- When you configure automatic client acquisition, if you need to enable the NAS to intercept the HTTP packets that STAs send to the specified destination port, configure a redirection HTTP port.

## Verification

- Configure an interception port.
- Open the browser of a PC and access the Internet through the port without performing authentication.
- Check whether the access requests are redirected to an authentication page.

## Related Commands

### ⌵ Configuring the Redirection HTTP Port

<b>Command</b>	<b>http redirect port</b> <i>port-num</i>
<b>Parameter Description</b>	<i>port-num</i> : Indicates the port number.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A maximum of 10 different destination port numbers can be configured, including default ports 80.

## Configuration Example

### ⌵ Configuring the Redirection HTTP Port

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure port 8080 as the redirection HTTP port.</li> </ul>
	<pre>Ruijie(config)#http redirect port 8080</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the configuration is successful.</li> </ul>

	<pre>Ruijie(config)#show web-auth rdport Rd-Port: 80 8080</pre>

## 5.4.8 Configuring Rate Limit Webauth Logging

### Configuration Effect

- The Web authentication module sends syslog messages to the administrator to display the information and relevant events of users who perform login/logout. By default, syslog messages are shielded.
- After syslog output rate limiting is configured, syslog messages are sent at a certain rate.

### Notes

- When the login/logout rate is high, syslog messages are output frequently, which affects device performance and results in spamming.

### Configuration Steps

- Optional.
- Configure syslog output rate limiting when you need to view the syslog messages about user login/logout.

### Verification

- Configure logging rate limiting.
- Check whether users log in and out at a certain rate.
- Check that syslog messages are printed out at the limit rate.

### Related Commands

#### ↘ Configuring Rate Limit Webauth Logging

<b>Command</b>	<b>web-auth logging enable <i>num</i></b>
<b>Parameter Description</b>	<i>num</i> : Indicates the syslog output rate (entry/second).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When the syslog output rate is set to <b>0</b> , syslog messages are output without limit. The output of syslog

messages of the critical level and syslog messages indicating errors is not limited.

## Configuration Example

### Configuring Rate Limit Webauth Logging

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Disable rate limit Webauth Logging.</li> </ul>
	<pre>Ruijie(config)#web-auth logging enable 0</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the configuration is successful.</li> </ul>
	<pre>Ruijie(config)#show running-config ... web-auth logging enable 0 ...</pre>

## 5.4.9 Configuring the Maximum Number of HTTP Sessions for Unauthenticated Clients

### Configuration Effect

- When an unauthenticated user accesses network resources, the user's PC sends requests for HTTP session connection. The NAS or convergence device intercepts the HTTP packets and redirects the user to a Web authentication page. To prevent an unauthenticated user from initiating too many HTTP connection requests and save resources on the NAS, it is necessary to limit the maximum number of HTTP sessions that the unauthenticated user can initiate on the NAS.
- A user occupies an HTTP session when performing authentication, and the other application programs of the user may also occupy HTTP sessions. For this reason, it is recommended that the maximum number of HTTP sessions for an unauthenticated user be not set to 1. By default, each unauthenticated user can initiate 255 HTTP sessions globally, and each port supports up to 300 HTTP sessions initiated by unauthenticated clients.

### Notes

- If the authentication page fails to be displayed during Web authentication, the maximum number of HTTP sessions may be reached. When this happens, the user can close the application programs that may occupy HTTP sessions and then perform Web authentication again.

### Configuration Steps

- Optional.
- Perform this configuration when you need to change the maximum number of HTTP sessions that each unauthenticated user can initiate and the maximum number of HTTP sessions that unauthenticated clients can initiate on each port.

- Perform this configuration when you configure automatic SU client acquisition.

### Verification

- Modify the maximum number of HTTP sessions that an unauthenticated user can initiate.
- Simulate the scenario where an unauthenticated user constructs identical sessions to connect to the NAS continuously.
- Simulate the scenario where the unauthenticated user accesses the Internet using a browser. Check whether the access requests are redirected and the NAS notifies the user that the maximum number of sessions is reached.

### Related Commands

#### Configuring the Maximum Number of HTTP Sessions for Unauthenticated Clients

<b>Command</b>	<b>http redirect session-limit { session-num } [ port { port-session-num } ]</b>
<b>Parameter Description</b>	<i>session-num</i> : Indicates the maximum number of HTTP sessions for unauthenticated clients. The value range is 1 to 255. The default value is 255. <i>port-session-num</i> : Indicates the maximum number of HTTP sessions on each port for authenticated clients. The value range is 1 to 65,535. The default value is 300.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### Configuring the Maximum Number of HTTP Sessions for Unauthenticated Clients

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Set the maximum number of HTTP sessions for unauthenticated clients to 3.</li> </ul> <pre>Ruijie(config)#http redirect session-limit 3</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the configuration is successful.</li> </ul> <pre>Ruijie(config)#show web-auth parameter HTTP redirection setting:   session-limit: 3   timeout:      3 Ruijie(config)#</pre>

## 5.4.10 Configuring the HTTP Redirection Timeout

### Configuration Effect

- Configure the HTTP redirection timeout to maintain redirection connections. When an unauthenticated user tries to access network resources through HTTP, the TCP connection requests sent by the user will be intercepted and

re-established with the NAS or convergence device. Then, the NAS or convergence device waits for the HTTP GET/HEAD packets from the user and responds with HTTP redirection packets to close the connection. The redirection timeout is intended to prevent the user from occupying the TCP connection for a long time without sending GET/HEAD packets. By default, the timeout for maintaining a redirection connection is 3s.

### Notes

N/A

### Configuration Steps

- Optional.
- Perform this configuration to change the timeout for maintaining redirection connections.

### Verification

- Change the timeout period.
- Use a network packet delivery tool to set up a TCP connection.
- View the status of the TCP connection on the NAS. Check whether the TCP connection is closed when the timeout is reached.

### Related Commands

#### ⌵ Configuring the HTTP Redirection Timeout

<b>Command</b>	<code>http redirect timeout { seconds }</code>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the timeout for maintaining redirection connections, in the unit of seconds. The value ranges from 1 to 10. The default value is 3s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### ⌵ Configuring the HTTP Redirection Timeout

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>• Set the HTTP redirection timeout to 5s.</li> </ul> <pre>Ruijie(config)#http redirect timeout 5</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>• Check whether the configuration is successful.</li> </ul> <pre>Ruijie(config)#show web-auth parameter HTTP redirection setting:   session-limit: 255</pre>

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Set the HTTP redirection timeout to 5s.</li> </ul>
	<pre>Ruijie(config)#http redirect timeout 5</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the configuration is successful.</li> </ul>
	<pre>timeout:      5</pre>

## 5.4.11 Configuring the Straight-Through Network Resources

### Configuration Effect

- After Web authentication or 802.1X authentication is enabled on a port, the users connecting to the port need to pass Web authentication or 802.1X authentication before accessing network resources.
- Perform this configuration to exempt users from authentication when accessing some network resources.
- If a website is configured as a network resource of authentication exemption, all users, including unauthenticated clients, can access the website. By default, authentication exemption is not configured, and unauthenticated clients are not allowed to access network resources.

### Notes

- The maximum number of free resources and the maximum number of unauthenticated clients cannot exceed 50 respectively. The actual number of available resources may be reduced because of other security modules. Therefore, it is recommended that network segments be configured if many addresses need to be set.
- http redirect direct-site** is used to configure the straight-through URL address for users, and **http redirect** is used to configure the straight-through IP address of the Web authentication server. The addresses configured using the two commands can be accessed without authentication, but they have different usages. It is recommended not to configure the IP address of the Web authentication server by using **http redirect direct-site**.

### Configuration Steps

- Optional.
- Run the **http redirect direct-site** command to enable unauthenticated clients to access network resources.

### Verification

- Configure the straight-through network resources.
- Check whether unauthenticated clients can access the configured network resources using PCs.

### Related Commands

#### ▾ Configuring the Straight-Through Network Resources

<b>Command</b>	<b>http redirect direct-site</b> { <i>ip-address</i> [ <i>ip-mask</i> ] [ <i>arp</i> ] }
<b>Parameter Description</b>	<i>ip address</i> : Indicates the IP address of the network exempt from authentication. <i>ip-mask</i> : Indicates the mask of the network exempt from authentication.

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To set authentication-exempted ARP resource, use the <b>http redirect direct-arp</b> command preferentially.

## Configuration Example

### Configuring the Straight-Through Network Resources

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the straight-through network resources as 192.168.0.0/16.</li> </ul>
	<pre>Ruijie(config)#http redirect direct-site 192.168.0.0 255.255.0.0</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the configuration is successful.</li> </ul>
	<pre>Ruijie(config)#show web-auth direct-site Direct sites:   Address          Mask           ARP Binding   -----   192.168.0.0     255.255.0.0   Off Ruijie(config)#</pre>

## 5.4.12 Configuring the Straight-Through ARP Resource Range

### Configuration Effect

When ARP check or similar functions are enabled, the ARP learning performed by clients is controlled. As a result, clients cannot learn the ARPs of the gateway and other devices, which affects user experience. You can configure the straight-through ARP resource range to permit the ARP learning packets destined for the specified address to pass.

### Notes

- When ARP check is enabled, you need to configure the gateway of the PCs connecting to the Layer-2 access device as a straight-through ARP resource. Note the following point when you perform the configuration:  
When you configure straight-through websites and ARP resources in the same address or network segment, the **http redirect direct-arp** command automatically combines the websites and ARP resources. If no ARP option is specified for the configured websites, an ARP option will be automatically added after the combination.

### Configuration Steps

- Optional.
- If ARP check is enabled on the NAS, you must configure the free resources and gateway address as straight-through ARP resources.

### Verification

- Configure straight-through ARP resources.

- Clear the ARP cache of the PC of an unauthenticated user. (Run the **arp -d** command in the Windows operating system.)
- Run the **ping** command on the PC to access the straight-through ARP resources.
- View the ARP cache on the PC (run the **arp -a** command in the Windows operating system) and check whether the PC learns the ARP address of the straight-through ARP resources.

## Related Commands

### ▾ Configuring the Straight-Through ARP Resource Range

<b>Command</b>	<b>http redirect direct-arp</b> { <i>ip-address</i> [ <i>ip-mask</i> ] }
<b>Parameter</b>	<i>ip-address</i> : Indicates the IP address of free resources.
<b>Description</b>	<i>ip-mask</i> : Indicates the mask of free resources.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ▾ Configuring the Straight-Through ARP Resource

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the straight-through ARP resource as 192.168.0.0/16.</li> </ul>
	<pre>Ruijie(config)#http redirect direct-arp 192.168.0.0 255.255.0.0</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the configuration is successful.</li> </ul>
	<pre>Ruijie(config)#show web-auth direct-arp  Direct arps:    Address          Mask   -----   192.168.0.0      255.255.0.0  Ruijie(config)#</pre>

## 5.4.13 Configuring an Authentication-Exempted IP Address Range

### Configuration Effect

- Exempt users from Web authentication when accessing reachable network resources. By default, no authentication-exempted address range is configured. All users must pass Web authentication before accessing network resources.

### Notes

N/A

## Configuration Steps

- Optional.
- Perform this configuration to allow unauthenticated clients to access network resources.

## Verification

- Configure an authentication-exempted user.
- Check whether the user can access the Internet without authentication.

## Related Commands

### 📄 Configuring an Authentication-Exempted Address Range

<b>Command</b>	<b>web-auth direct-host</b> { <i>ip-address</i> [ <i>ip-mask</i> ] [ <b>arp</b> ] } [ <b>port</b> <i>interface-name</i> ]
<b>Parameter Description</b>	<i>ip-address</i> : Indicates the IP address of the user exempt from authentication. <i>ip-mask</i> : Indicates the mask of the user exempt from authentication. <i>interface-name</i> : Indicates the name of the interface on which authentication exemption is enabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The <b>arp</b> field is used to assign pass permissions to ARP packets. This field must be set when ARP check is enabled. After the <b>port</b> field is set, authentication exemption takes effect only on the configured interface.

## Configuration Example

### 📄 Configuring an Authentication-Exempted Address Range

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>• Configure an authentication-exempted address range.</li> </ul> <pre>Ruijie (config)# web-auth direct-host 192.168.197.64</pre>

## 5.4.14 Configuring the Portal Communication Port

### Configuration Effect

- Configure the port (source port) used for the communication between the NAS and portal server.

### Notes

- Only one port can be configured for the communication between the NAS and portal server.

### Configuration Steps

- Configure a port as the portal communication port.

### Verification

- After Web authentication is enabled, capture a packet on the portal server during the authentication process and check whether the source IP address of the packet is the IP address of the specified port.

### Related Commands

### 5.4.15 Configuring the Interval for Updating Online User Information

#### Configuration Effect

- The NAS or convergence device maintains and periodically updates the information of online users, including users' online duration, to monitor the usage of network resources. When the online duration threshold is reached, users will be prevented from using network resources.

#### Notes

- The user information updating interval must be configured as 60 or multiple of 60; otherwise, the system will select the minimum multiple of 60 above and closest to the actual configuration as the interval.

#### Configuration Steps

- Optional.
- Perform this configuration to allow unauthenticated clients to access network resources.

#### Verification

- Configure the interval for updating online user information.
- View the information of online users after the update interval has elapsed.

#### Related Commands

##### Configuring the Interval for Updating Online User Information

<b>Command</b>	<b>web-auth update-interval</b> { <i>seconds</i> }
<b>Parameter Description</b>	<i>seconds</i> : Indicates the interval for updating online user information, in the unit of seconds. The value ranges from 30 to 3,600. The default value is 180s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To restore the default updating interval, run the <b>no web-auth update-interval</b> command in global configuration mode.

#### Configuration Example

##### Configuring the Interval for Updating Online User Information

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Set the interval for updating online user information to 60s.</li> </ul> <pre>Ruijie (config)# web-auth update-interval 60</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the configuration is successful.</li> </ul> <pre>Ruijie(config)#show run   include web-auth update-interval web-auth update-interval 60</pre>

## 5.4.16 Enabling DHCP Address Check

### Configuration Effect

- Allow only the clients that are allocated with IP addresses through DHCP to perform authentication.

### Notes

- To use the DHCP address check function, you must configure DHCP snooping.
- DHCP address check is supported only for IPv4.
- DHCP address check is applicable only to Ruijie Second-Generation Web Authentication and iPortal Web Authentication.
- The requirement that users obtain IP addresses through DHCP must be specified during network deployment. Those users cannot also use static IP addresses; otherwise, the existing users that use static IP addresses will be affected.
- If a few users need to use static IP addresses, configure these IP addresses as straight-through addresses, and these users are exempt from authentication.

### Configuration Steps

- Optional.
- Enable DHCP snooping.
- Enable DHCP address check.

### Verification

- Enable DHCP address check.
- Configure a static IP address that is not allocated by the DHCP server on a client.
- Connect the client to the Internet and check whether the STA cannot perform authentication.

### Related Commands

#### ↳ Enabling DHCP Address Check

<b>Command</b>	<b>web-auth dhcp-check</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure DHCP address check to allow only the users who obtain IP addresses through DHCP to access the Internet. This function helps prevent the users who configure IP addresses without authorization from performing authentication to access the Internet.

### Configuration Example

#### ↳ Enabling DHCP Address Check

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable DHCP address check.</li> </ul>
	<pre>Ruijie(config)#web-auth dhcp-check</pre>

	<pre>Ruijie(config)#show running-config ... web-auth dhcp-check ...</pre>

## 5.4.17 Upgrade Compatibility

### Configuration Effect

- Some configuration commands are optimized in the 11.X series software and the command formats are changed. For details, see the subsequent description.
- The 10.X series software supports smooth upgrade without function loss. However, some commands are displayed in new formats after upgrade.
- When you run the commands in earlier formats in the **no** form in the 11.X series software, a message is displayed, indicating the **no** form is not supported. You need to perform the **no** operation in new command formats.

### Configuration Steps

- It is recommended that you run commands in new formats.

### Verification

- Check that function loss does not occur when the 10.X series software is upgraded to the 11.X series software, and commands are displayed and stored in new formats.
- The commands in new formats have the same functions as the commands in earlier formats.

### Related Commands

#### 📄 [Configuring the Resource Address of the Portal Server in Ruijie First-Generation Web Authentication](#)

<b>Command</b>	<code>http redirect homepage url</code>
<b>Parameter Description</b>	<i>url</i> : Indicates the resource address of the ePortal server in Ruijie First-Generation Web Authentication.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In the 11.X version, the command is converted into an eportalv1 template, and the <b>url</b> command in template configuration mode is executed to configure and display the IP address of the portal server.

#### 📄 [Configuring the Portal Server](#)

<b>Command</b>	<b>portal-server [eportal1   eportalv2]</b>
<b>Parameter Description</b>	<b>eportav1</b> : Indicates the information of the portal server used in Ruijie First-Generation Web Authentication. <b>eportav2</b> : Indicates the information of the portal server used in Ruijie Second-Generation Web Authentication.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In the 11.X version, the command is converted into an eportalv1 or eportalv2 template, and relevant information is filled in. The main parameters of the portal server include the IP address and URL of the server. The original command will be replaced by the <b>ip</b> command and <b>url</b> command in the template.

### ▾ Configuring Web Authentication Control on a Port

<b>Command</b>	<b>web-auth port-control</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	In the 11.X version, the command is converted into <b>web-auth enable &lt;type&gt;</b> , in which <b>type</b> specifies the type (first or second generation) of Web authentication. The default type is Ruijie First-Generation Web Authentication.

### ▾ Configuring the IP-Only Binding Mode

<b>Command</b>	<b>web-auth port-control ip-only-mode</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	In the 11.X version, the command is converted into an eportalv1 or eportalv2 template, depending on the actual configuration. The server binding mode is configured and displayed by using the <b>bindmode</b> command in template configuration mode.

### ▾ Displaying the Configuration Information of Ruijie First-Generation Web Authentication

<b>Command</b>	<b>show http redirect</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged mode
<b>Usage Guide</b>	In the 11.X version, the command is unavailable and changed to <b>show web-auth template</b> .

### ▾ Displaying the Port Control Information

<b>Command</b>	<b>show web-auth port-control</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command Mode</b>	Privileged mode
<b>Usage Guide</b>	In the 11.X version, the command is unavailable and changed to <b>show web-auth control</b> .

## Configuration Example

### Configuring Ruijie First-Generation Web Authentication

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Check that the NAS runs on the 10.X version and is configured with the IP address of the portal server used by Ruijie First-Generation Web Authentication.</li> </ul>
	<pre>Ruijie(config)# http redirect 192.168.197.64</pre>
	<ul style="list-style-type: none"> <li>Upgrade the NAS to 11.X.</li> </ul>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show running-config</b> command after the upgrade and check whether the new command formats are used.</li> </ul>
	<pre>Ruijie#sh running-config web-auth template eportalv1 Ip 192.168.197.64 !</pre>

## 5.5 Monitoring

### Clearing

Description	Command
Forces users offline.	<b>clear web-auth user</b> { <b>all</b>   <b>ip</b> <i>ip-address</i>   <b>mac</b> <i>mac-address</i>   <b>name</b> <i>name-string</i>   <b>session-id</b> <i>num</i> }

### Displaying

Description	Command
Displays the basic parameters of Web authentication.	<b>show web-auth parameter</b>
Displays the Webauth template configuration.	<b>show web-auth template</b>
Displays the authentication-exempted host range.	<b>show web-auth direct-host</b>
Displays the straight-through address range.	<b>show web-auth direct-site</b>
Displays the straight-through ARP range.	<b>show web-auth direct-arp</b>

Description	Command
Displays the TCP interception port.	<b>show web-auth rdport</b>
Displays the Webauth configuration on a port.	<b>show web-auth control</b>
Displays the online information of all users or specified users.	<b>show web-auth user{ all   ip <i>ip-address</i>   mac <i>mac-address</i>   name <i>name-string</i>   session-id <i>num</i> }</b>

## Debugging

 System resources are occupied when debugging information is output. Disable the debugging switch immediately after use.

Description	Command
Debugs Web authentication.	<b>debug web-auth all</b>

## 6 Configuring SCC

### 6.1 Overview

The Security Control Center (SCC) provides common configuration methods and policy integration for various access control and network security services, so that these access control and network security services can coexist on one device to meet diversified access and security control requirements in various scenarios.

Typical access control services are dot1x, Web authentication, Address Resolution Protocol (ARP) check, and IP Source Guard. The network security services include Access Control List (ACL), Network Foundation Protection Policy (NFPP), and anti-ARP gateway spoofing. When two or more access control or network security services are simultaneously enabled on the device, or when both access control and network security services are simultaneously enabled on the device, the SCC coordinates the coexistence of these services according to relevant policies.

**i** For details about the access control and network security services, see the related configuration guide. This document describes the SCC only.

#### Protocol and Standards

N/A

### 6.2 Application

Typical Application	Scenario
<a href="#">Access Control of Extended Layer 2 Campus Networks</a>	Students on a campus network can access the Internet based on dot1x client authentication or Web authentication. ARP spoofing between the students should be prevented. In addition, terminal devices in some departments (such as the headmaster's office) can access the Internet without authentication.

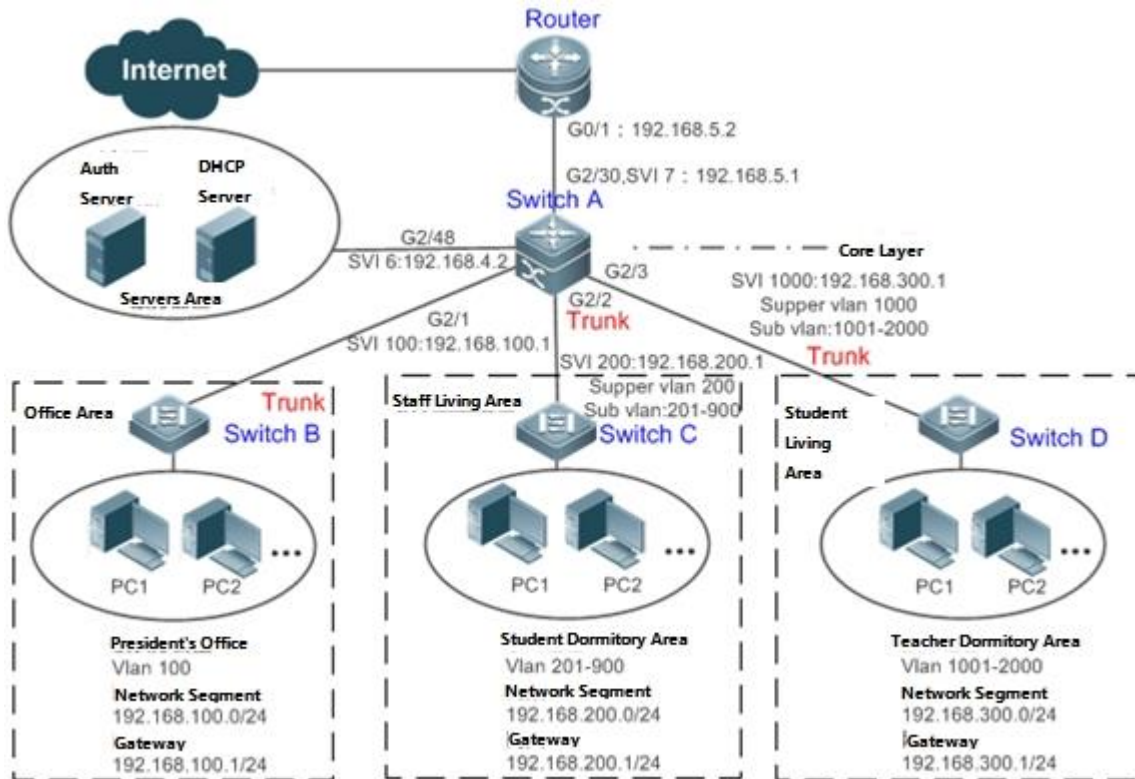

#### 6.2.1 Access Control of Extended Layer 2 Campus Networks

##### Scenario

Students on a campus network of a university usually need to be authenticated through the dot1x client or Web before accessing the Internet, so as to facilitate accounting and guarantee the benefits of the university.

- The students can access the Internet through dot1x client authentication or Web authentication.
- ARP spoofing between the students is prevented, so as to guarantee the stability of the network.
- Terminal devices in some departments (such as the headmaster's office) can access the Internet without authentication.

Figure 6-1

<b>Remarks</b>	<p>A traditional campus network is hierarchically designed, which consists of an access layer, a convergence layer and a core layer, where the access layer performs user access control. On an extended Layer 2 campus network, however, user access control is performed by a core switch, below which access switches exist without involving any convergence device in between. The ports between the core switch and the access switches (such as switches B, C, and D in Figure 6-1) are all trunk ports.</p> <p>The user access switches B, C, and D connect to PCs in various departments via access ports, and VLANs correspond to sub VLANs configured on the downlink ports of the downlink ports of the core switch, so that access users are in different VLANs to prevent ARP spoofing.</p> <p>The core switch A connects to various servers, such as the authentication server and the DHCP server. Super VLANs and sub VLANs are configured on the downlink ports. One super VLAN correspond to multiple sub VLANs, and each sub VLAN represents an access user.</p>
----------------	--

**Deployment**

On the core switch, different access users are identified by VLAN and port numbers. Each access user (or a group of access users) corresponds to one VLAN. The ports on each access switch that connect to downstream users are configured as access ports, and one user VLAN is assigned to each access user according to VLAN planning. The core switch does not forward ARP requests. The core switch replies to the ARP requests from authenticated users only, so as to prevent ARP spoofing. On the core switch A, user VLANs are regarded as sub VLANs, super VLANs are configured, and SVIs corresponding to the super VLANs are configured as user gateways.

- On the downlink ports of the core switch (switch A in this example) that connect to the teachers' living area and the students' living area, both dot1x authentication and Web authentication are enabled, so that users can freely select either authentication mode for Internet access.
- Any special department (such as the headmaster's office in this example) can be allocated to a particular VLAN, and this VLAN can be configured as an authentication-exemption VLAN so that users in this department can access the Internet without authentication.

## Basic Concepts

### Authentication-Exemption VLAN

Some special departments may be allocated to authentication-exemption VLANs to simplify network management, so that users in these departments can access network resources without authentication. For example, the headmaster's office can be divided into the authentication-exemption VLANs on the campus network, so that users in the headmaster's office can access the Internet without authentication.

### IPv4 User Capacity

The number of IPv4 access users can be restricted to protect the access stability of online users on the Internet and improve the operational stability of the device.

 The number of IPv4 access users is not restricted by default; that is, a large number of users can get online after being authenticated, till reaching the maximum hardware capacity of the device.

 IPv4 access users include IP users (such as IP authenticated users) based on dot1x authentication, users based on Web authentication, and IP users manually bound (using IP source guard, ARP check, or other means).

### Authenticated-User Migration

Online-user migration means that an online user can get authenticated again from different physical locations to access the network. On the campus network, however, for ease of management, students are usually requested to get authenticated from a specified location before accessing the Internet, but cannot get authenticated on other access ports. This means that the users cannot migrate. In another case, some users have the mobile office requirement and can get authenticated from different access locations. Then the users can migrate.

### User Online-Status Detection

For a chargeable user, accounting starts immediately after the user passes the authentication and gets online. The accounting process does not end until the user actively gets offline. Some users, however, forget to get offline when leaving their PCs, or cannot get offline because of terminal problems. Then the users suffer certain economical losses as the accounting process continues. To more precisely determine whether a user is really online, we can preset a traffic value, so that the user is considered as not accessing the Internet and therefore directly brought offline when the user's traffic is lower than the preset value in a period of time or there is not traffic of the user at all in a period of time.

## 6.3 Features

Feature	Function
<a href="#">Authentication-Exemption VLAN</a>	Users in a specified VLAN can be configured as authentication-exemption users.
<a href="#">IPv4 User Capacity</a>	The IPv4 user capacity of a specified interface can be restricted to guarantee the access stability of users on the Internet.
<a href="#">Authenticated-User Migration</a>	You can specify whether the authenticated can migrate.
<a href="#">User Online-Status Detection</a>	You can specify whether to detect the traffic of online users, so that a user is forced offline when the traffic of the user is lower than a preset value in a period of time.

### 6.3.1 Authentication-Exemption VLAN

Authentication-exemption VLANs are used to accommodate departments with special access requirements, so that users in these departments can access the Internet without authentication such as dot1x or Web authentication.

#### Working Principle

Suppose the authentication-exemption VLAN feature is enabled on a device. When the device detects that a packet comes from an authentication-exemption VLAN, access control is not performed. In this way, users in the authentication-exemption VLAN can access the Internet without authentication. The authentication-exemption VLAN feature can be regarded as a kind of applications of secure channels.

-  Only the switches support the authentication-exemption VLAN feature.
-  A maximum of 100 authentication-exemption VLANs can be configured.
-  The authentication-exemption VLANs occupy hardware entries. When access control such as authentication is disabled, configuring authentication-exemption VLANs has the same effect as the case where no authentication-exemption VLANs are configured. Therefore, it is recommended that authentication-exemption VLANs be configured for users who need to access the Internet without authentication, only when the access control function has been enabled.
-  Although packets from authentication-exemption VLANs are exempt from access control, they still need to be checked by a security ACL. If the packets of the users in an authentication-exemption VLAN are denied according to the security ACL, the users still cannot access the Internet.

### 6.3.2 IPv4 User Capacity

To improve the operational stability of the device and guard against brutal force impacts from unauthorized users, you can restrict the total number of IPv4 access users on a certain port of the device.

#### Working Principle

If the total number of IPv4 access users is restricted, new users going beyond the total number cannot access the Internet.

-  Only the switches support the restriction on the number of IPv4 access users.

- 
-  The number of IPv4 access users is not restricted on the device by default, but depends on the hardware capacity of the device.
  -  The number of IPv4 access users includes the IPv4 authenticated users based on dot1x authentication, IPv4 users based on Web authentication, and IPv4 users based on various binding functions. Because the number of IPv4 access users is configured in interface configuration mode, the restriction includes both the number of IPv4 users generated on the port and IPv4 users globally generated. For example, you can set the maximum number of IPv4 access users on the Gi 0/1 port to 2, run commands to bind an IPv4 user to the port, and then run commands to bind a global IPv4 user to the port. Actually there are already two access users on the port. If you attempt to bind another IPv4 user or another global IPv4 user to the port, the binding operation fails.
- 

### 6.3.3 Authenticated-User Migration

On an actual network, users do not necessarily access the Internet from a fixed place. Instead, users may be transferred to another department or office after getting authenticated at one place. They do not actively get offline but remove network cables and carry their mobile terminals to the new office to access the network. Then this brings about an issue about authenticated-user migration. If authenticated-user migration is not configured, a user who gets online at one place cannot get online at another place without getting offline first.

#### Working Principle

When authenticated-user migration is enabled, the dot1x or Web authentication module of the device detects that the port number or VLAN corresponding to a user's MAC address has changed. Then the user is forced offline and needs to be authenticated again before getting online.

- 
-  Only the switches or wireless devices support authenticated-user migration. In addition, cross-switch migration is not supported. For example, authentication and migration are enabled on two switches, and a user gets online after being authenticated on one of the two switches. If the user attempts to migrate to the other switch, the migration fails.
  -  The authenticated-user migration function requires a check of users' MAC addresses, and is invalid for users who have IP addresses only.
  -  The authenticated-user migration function enables a user who gets online at one place to get online at another place without getting offline first. If the user gets online at one place and then gets offline at that place, or if the user does not get online before moving to another place, the situation is beyond the control range of authenticated-user migration.
  -  During migration, the system checks whether the VLAN ID or port number that corresponds to a user's MAC address has changed, so as to determine whether the user has migrated. If the VLAN ID or port number is the same, it indicates that the user does not migrate; otherwise, it indicates that the user has migrated. According to the preceding principle, if another user on the network uses the MAC address of an online user, the system will wrongly disconnect the online user unless extra judgment is made. To prevent such a problem, the dot1x or Web authentication will check whether a user has actually migrated. For a user who gets online through Web authentication or dot1x authentication with IP authorization, the dot1x or Web authentication sends an ARP request to the original place of the user if detecting that the same MAC address is online in another VLAN or on another port. If no response is received within the specified time, it indicates that the user's location has indeed changed and then the migration is allowed. If a response is received within the specified time, it indicates that the user actually does not migrate and a fraudulent user may exist on the

network. In the latter case, the migration is not performed. The ARP request is sent once every second by default, and sent for a total of five times. This means that the migration cannot be confirmed until five seconds later. Timeout-related parameters, including the probe interval and probe times, can be changed using the **arp retry times** *times* and **arp retry interval** *interval* commands. For details about the specific configuration, see *ARP-SCG.doc*. It should be noted that the migration check requires the configuration of IP authorization for users based on dot1x authentication.

---

### 6.3.4 User Online-Status Detection

After a user accesses the Internet, the user may forget to get offline or cannot actively get offline due to terminal faults. In this case, the user will keep being charged and therefore will suffer a certain economical loss. To protect the benefits of users on the Internet, the device provides a function to detect whether the users are really online. If the device considers that a user is not online, the device actively disconnects the user.

#### Working Principle

A specific detection interval is preset on the device. If a user's traffic is lower than a certain value in this interval, the device considers that the user is not using the network and therefore directly disconnects the user.

---

-  Only the switches and wireless devices support the user online-status detection function.
  -  The user online-status detection function applies to only users who get online through dot1x or Web authentication.
  -  Currently, the switch supports zero-traffic detection only.
  -  Currently, due to hardware chip restrictions of the switch, the time to disconnect a user without any traffic relates to the configured MAC address aging time. If the traffic detection interval is set to *m* minutes and the MAC address aging time is set to *n* minutes, the interval from the moment when an authenticated user leaves the network without actively getting offline to the moment when the user is disconnected upon detection of zero traffic is about [*m*, *m+n*] minutes. In other words, if an online user does not incur any Internet access traffic, the user is disconnected about [*m*, *m+n*] minutes later.
-

## 6.4 Configuration

Configuration Item	Suggestions and Related Commands	
<a href="#">Configuring Authentication-Exemption VLANs</a>	 Optional configuration, which is used to specify the users of which VLANs can access the Internet without authentication.	
	<b>[no] direct-vlan</b>	Configures authentication-exemption VLANs.
<a href="#">Configuring the IPv4 User Capacity</a>	 Optional configuration, which is used to specify the maximum number of users who are allowed to access a certain interface.	
	<b>[no] nac-author-user maximum</b>	Configures the number of IPv4 users who are allowed to access a certain interface.
<a href="#">Configuring Authenticated-User Migration</a>	 Optional configuration, which is used to specify whether online users with static MAC addresses can migrate.	
	<b>[no] station-move permit</b>	Configures whether authenticated users can migrate.
<a href="#">Configuring User Online-Status Detection</a>	 Optional configuration, which is used to specify whether to enable the user online-status detection function.	
	<b>offline-detect interval threshold</b>	Configures the parameters of the user online-status detection function.
	<b>no offline-detect</b>	Disables the user online-status detection function.
	<b>default offline-detect</b>	Restores the default user online-status detection mode.

### 6.4.1 Configuring Authentication-Exemption VLANs

#### Configuration Effect

Configure authentication-exemption VLANs, so that users in these VLANs can access the Internet without experiencing dot1x or Web authentication.

#### Notes

Authentication-exemption VLANs only mean that users in these VLANs do not need to experience a check related to access authentication, but still need to experience a check based on a security ACL. If specified users or VLANs are denied according to the security ACL, corresponding users still cannot access the Internet. Therefore, during ACL configuration, you need to ensure that specified VLANs or specified users in the authentication-exemption VLANs are not blocked if you hope that users in the authentication-exemption VLANs can access the Internet without being authenticated.

## Related Commands

### ↘ Configuring Authentication-Exemption VLANs

- Optional configuration. To spare all users in certain VLANs from dot1x or Web authentication, configure these VLANs as authentication-exemption VLANs.
- Perform this configuration on access, convergence, or core switches depending on user distribution.

<b>Command</b>	<b>[no] direct-vlan <i>vlanlist</i></b>
<b>Parameter Description</b>	<b>no:</b> If the command carries this parameter, it indicates that the authentication-exemption VLAN configuration will be deleted. <b>vlanlist:</b> This parameter indicates the list of authentication-exemption VLANs to be configured or deleted.
<b>Defaults</b>	No authentication-exemption VLAN has been configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure or delete authentication-exemption VLANs.

## Verification

Check the authentication-exemption VLAN configuration using the following method:

- Enable dot1x authentication on downlink ports that connect to user terminals, add the downlink ports that connect to the user terminals to a specific VLAN, and configure the VLAN as an authentication-exemption VLAN. Then open the Internet Explorer, and enter a valid extranet address (such as www.baidu.com). If the users can open the corresponding webpage on the Internet, it indicates that the authentication-exemption VLAN is valid; otherwise, the authentication-exemption VLAN does not take effect.
- Use the **show direct-vlan** command to check the authentication-exemption VLAN configuration on the device.

<b>Command</b>	<b>show direct-vlan</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	Global configuration mode
<b>Usage Example</b>	<pre>Ruijie#show direct-vlan direct-vlan 100</pre>

## Configuration Examples

**i** The following configuration example describes SCC-related configuration only.

### ↘ Configuring Authentication-exemption VLANs so that Specific Users Can Access the Internet Without Being Authenticated

<p><b>Scenario</b> Figure 6-2</p>	<p>The diagram illustrates a network architecture with a core layer (Switch A) and three access layer switches (Switch B, C, D) connected via Layer 2 Trunk links. The Internet is connected to a Router, which is connected to Switch A. The Office Area (Switch B) has VLAN 100 (Headmaster's Office). The Staff Living Area (Switch C) has VLAN 201-900. The Student Living Area (Switch D) has VLAN 1001-2000. IP addresses and gateway information are provided for each area.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● On switch A (which is the core gateway device), set the GI 2/1 port as a trunk port, and enable dot1x authentication on this port.</li> <li>● On switch A (which is the core gateway device), configure VLAN 100 to which the headmaster's office belongs as an authentication-exemption VLAN.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA(config)#vlan 100 SwitchA(config-vlan)#exit SwitchA(config)#direct-vlan 100 SwitchA(config)#int GigabitEthernet 0/1 SwitchA(config-if-GigabitEthernet 0/1)#switchport mode trunk SwitchA(config-if-GigabitEthernet 0/1)#dot1x port-control auto *Oct 17 16:06:45: %DOT1X-6-ENABLE_DOT1X: Able to receive EAPOL packet and DOT1X authentication enabled.</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Open the Internet Explorer from any PC in the headmaster's office, enter a valid extranet address, and confirm that the corresponding webpage can be opened.</li> <li>● Use the <b>show direct-vlan</b> command to check whether the authentication-exemption VLAN is valid.</li> </ul>

<b>Switch A</b>	<pre>SwitchA(config)#show direct-vlan direct-vlan 100</pre>
-----------------	---

## 6.4.2 Configuring the IPv4 User Capacity

### Configuration Effect

Configure the IPv4 user capacity, so as to restrict the number of users who are allowed to access an access port.

### Notes

N/A

### Configuration Method

#### 📌 Configuring the IPv4 User Capacity

- Optional configuration. To limit the maximum of users who are allowed to access an access port, configure the IPv4 user capacity. The access user capacity is not limited on an access port by default. Suppose the user capacity limit is configured on a specific interface. When the number of authenticated users on the interface reaches the maximum, new users cannot be authenticated on this interface and cannot get online, until existing authenticated users get offline on the interface.
- Perform this configuration on access switches, which may be access switches on the network edge or core gateway devices.

<b>Command</b>	<b>nac-author-user maximum</b> <i>max-user-num</i> <b>no nac-author-user maximum</b>
<b>Parameter Description</b>	<b>no</b> : If the command carries this parameter, it indicates that the limit on the IPv4 access user capacity will be removed from the port. <i>max-user-num</i> : This parameter indicates the maximum number of IPv4 users who allowed to access the port. The value range is from 1 to 1024.
<b>Defaults</b>	The number of IPv4 access users is not limited.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to limit the number of IPv4 access users on a specific access port.

### Verification

Check the IPv4 user capacity configuration on a port using the following method:

- dot1x authentication: When the number of users who get online based on 1x client authentication on the port reaches the specified user capacity, no any new user can get online from this port.
- Web authentication: When the number of users who get online based on Web authentication on the port reaches the specified user capacity, no any new user can get online from this port.

- Use the **show nac-author-user [ interface interface-name ]** command to check the IPv4 user capacity configured on the device.

<b>Command</b>	<b>show nac-author-user [ interface interface-name ]</b>
<b>Parameter Description</b>	<b>interface-name:</b> This parameter indicates the interface name.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	Global configuration mode
<b>Usage Example</b>	<pre>Ruijie#show nac-author-user interface GigabitEthernet 0/1 Port      Cur_num  Max_num -----  - Gi0/1    0        4</pre>

### Configuration Examples

**i** The following configuration example describes SCC-related configuration only.

#### Restricting the Number of IP4 Users on a Port to Prevent Excessive Access Terminals from Impacting the Network

<b>Scenario</b> Figure 6-3	<p>The diagram shows a central switch labeled 'Switch A'. It has three interfaces: GigabitEthernet 0/1 connected to the Internet, GigabitEthernet 0/2 connected to a 'Student Dept' network, and GigabitEthernet 0/3 connected to another 'Student Dept' network. Each 'Student Dept' network contains two PCs labeled 'PC1' and 'PC2'.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Assume that the dot1x authentication environment has been well configured on the access switch A, and dot1x authentication is enabled on the Gi 0/2 port.</li> <li>● Set the maximum number of IPv4 access users on the Gi 0/2 port to 4.</li> </ul>
<b>Switch A</b>	<pre>SwitchA(config)#int GigabitEthernet 0/2 SwitchA(config-if-GigabitEthernet 0/2)#nac-author-user maximum 4</pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Perform dot1x authentication for all the four PCs in the dormitory, so that the PCs get online. Then take an additional terminal to access the network, and attempt to perform dot1x authentication for this terminal. Verify that the terminal cannot be successfully authenticated to get online.</li> <li>● Use the <b>show nac-author-user</b> command to check whether the configuration has taken effect.</li> </ul>
<b>Switch A</b>	<pre>SwitchA(config)#show nac-author-user  Port      Cur_num  Max_num -----  - Gi0/1     0        4</pre>

### 6.4.3 Configuring Authenticated-User Migration

#### Configuration Effect

By default, when a user gets online after passing dot1x or Web authentication at a physical location (which is represented by a specific access port plus the VLAN number) and quickly moves to another physical location without getting offline, the user cannot get online through dot1x or Web authentication from the new physical location, unless the authenticated-user migration feature has been configured in advance.

#### Notes

- If the authenticated-user migration feature is not yet configured, an online user cannot get online from the new physical location after quickly moving from one physical location to another physical location without getting offline first. However, if the user gets offline before changing the physical location or gets offline during the location change (for example, the user online-status detection function disconnects the user), the user can still normally get online after being authenticated at the new physical location, even if the authenticated-user migration feature is not configured.
- After moving to the new physical location, the online user needs to perform dot1x or Web authentication so as to get online.

#### Configuration Method

##### 📌 Configuring Authenticated-User Migration

- Optional configuration. To allow users to be authenticated and get online from different physical locations, enable the authenticated-user migration function.
- Perform this configuration on access, convergence, or core switches depending on user distribution.

<b>Command</b>	<b>[no] station-move permit</b>
<b>Parameter Description</b>	<b>no station-move permit:</b> Indicates that authenticated-user migration is not permitted.
<b>Defaults</b>	<b>station-move permit:</b> Indicates that authenticated-user migration is permitted.
	Authenticated-user migration is not permitted; that is, when a user getting online from one physical location on the network moves to another physical location and attempts to get online from the new physical location without getting offline first, the authentication fails and the user cannot get online from the new physical

	location.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure authenticated-user migration.

**Verification**

Check the authenticated-user migration configuration using the following method:

- A PC is authenticated and gets online from a dot1x-based port of the device using dot1x SU client, and does not actively get offline. Move the PC to another port of the device on which dot1x authentication is enabled, and perform dot1x authentication again. Check whether the PC can successfully get online.

**Configuration Examples**

**i** The following configuration example describes SCC-related configuration only.

**Configuring Online-User Migration so that an Online User Can Perform Authentication and Get Online from Different Ports Without Getting Offline First**

<p><b>Scenario</b> Figure 6-4</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable dot1x authentication on access ports Gi 0/2 and Gi 0/3, and configure authentication parameters. The authentication is MAC-based.</li> <li>● Configure online-user migration.</li> </ul>
<p><b>Switch A</b></p>	<pre>swl(config)#station-move permit</pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>● A lap-top PC in the R&amp;D department performs authentication using dot1x SU client, and gets online. Remove the network cable from the PC, connect the PC to the LAN where the test department resides, and perform dot1x authentication for the PC again using dot1x SU client. Confirm that the PC can successfully get online.</li> </ul>
<b>Switch A</b>	<pre>swl(config)#show running-config   include station station-move permit</pre>

## 6.4.4 Configuring User Online-Status Detection

### Configuration Effect

After the user online-status detection function is enabled, if a user's traffic is lower than a certain threshold within the specified period of time, the device automatically disconnects the user, so as to avoid the economical loss incurred by constant charging to the user.

### Notes

It should be noted that if disconnecting zero-traffic users is configured, generally software such as 360 Security Guard will run on a user terminal by default. Then such software will send packets time and again, and the device will disconnect the user only when the user's terminal is powered off.

### Configuration Method

#### ▾ Configuring User Online-Status Detection

- Optional configuration. A user is disconnected if the user does not involve any traffic within eight hours by default.
- Perform this configuration on access, convergence, or core switches depending on user distribution. The configuration acts on only the configured device instead of other devices on the network.
- If the traffic threshold parameter `threshold` is set to 0, it indicates that zero-traffic detection will be performed.

<b>Command</b>	<b>offline-detect interval <i>interval</i> threshold <i>threshold</i></b> <b>no offline-detect</b> <b>default offline-detect</b>
<b>Parameter Description</b>	<i>interval</i> : This parameter indicates the offline-detection interval. The value range is from 6 to 65535 in minutes on a switch or from 1 to 65535 in minutes on a non-switch device. The default value is 8 hours, that is, 480 minutes. <i>threshold</i> : This parameter indicates the traffic threshold. The value range is from 0 to 4294967294 in bytes. The default value is 0, indicating that the user is disconnected when no traffic of the user is detected. <b>no offline-detect</b> : Disables the user online-status detection function. <b>default offline-detect</b> : Restores the default value. In other words, an online user will be disconnected when the device detects that the user does not have any traffic within eight hours.
<b>Defaults</b>	8 hours
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	Use this command to configure user online-status detection, so that a user is disconnected when its traffic is lower than a specific threshold within a specific period of time. Use the <b>no offline-detect</b> command to disable the user online-status detection function, or use the <b>default offline-detect</b> command to restore the default detection mode.

### Verification

Check the user online-status detection configuration using the following method:

- After the user online-status detection function is enabled, power off the specified authenticated terminal after the corresponding user gets online. Then wait for the specified period of time, and run the online user query command associated with dot1x or Web authentication on the device to confirm that the user is already offline.

### Configuration Examples

**i** The following configuration example describes SCC-related configuration only.

#### Configuring User Online-Status Detection so that a User Is Disconnected if the User Does Not Have Traffic Within Five Minutes

<p><b>Scenario</b> Figure 6-5</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable dot1x authentication on the access port Gi 0/2, and configure authentication parameters. The authentication is MAC-based.</li> <li>● Configure user online-status detection so that a user is disconnected if the user does not have traffic within five minutes.</li> </ul>

<b>Switch A</b>	<pre>swl(config)# offline-detect interval 5 threshold 0</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Perform dot1x authentication using dot1x SU client for a PC in the R&amp;D department, so that the PC gets online. Then power off the PC, wait for 6 minutes, and run the online user query command available with dot1x authentication on switch 1 to confirm that the user of the PC is already offline.</li> </ul>
<b>Switch A</b>	<pre>swl(config)#show running-config   include offline-detect offline-detect interval 5</pre>

## 6.5 Monitoring

### Displaying

Command	Function
<b>show direct-vlan</b>	Displays the authentication-exemption VLAN configuration.
<b>show nac-author-user [ interface <i>interface-name</i> ]</b>	Displays information about IPv4 user entries on a specific interface.

### Debugging

 System resources are occupied when debugging information is output. Therefore, close the debugging switch immediately after use.

Command	Function
<b>debug scc event</b>	Debugs the ACL running process.
<b>debug scc user [ mac   author   mac ]</b>	Debugs SCC user entries.
<b>debug scc acl-show summary</b>	Debugs ACLs stored in the current SCC and delivered by various services.
<b>debug scc acl-show all</b>	Debugs all ALCs stored in the current SCC.

## 7 Configuring Global IP-MAC Binding

### 7.1 Overview

Enable the global IP-MAC binding function manually to verify the input packets. If a specified IP address is bound with a MAC address, the device receives only the IP packets containing matched IP address and MAC address. The other packets are discarded.

The address bounding feature is used to verify the input packets. Note that the address binding feature takes precedence over the 802.1X authentication, port security, and access control list (ACL).

### 7.2 Applications

Application	Description
<a href="#">Global IP-MAC Binding</a>	Only hosts with the specified IP addresses can access the network, and the hosts connected to a device can move freely.

#### 7.2.1 Global IP-MAC Binding

##### Scenario

The administrator assigns a fixed IP address for each host to facilitate management.

- Only hosts with the specified IP addresses can access the external network, which prevents IP address embezzlement by unauthorized hosts.
- Hosts can move freely under the same device.

Figure 7-1

<b>Remarks</b>	A is an access device. A user is a host configured with a static IP address. IP Network is an external IP network.
----------------	--

## Deployment

- Manually configure the global IP-MAC binding. (Take three users as an example.)

User	MAC Address	IP Address
User 1	00d0.3232.0001	192.168.1.10
User 2	00d0.3232.0002	192.168.1.20
User 3	00d0.3232.0003	192.168.1.30

- Enable the IP-MAC binding function globally.
- Configure the uplink port (Gi0/5 port in this example) of the device as the exclude port.

## 7.3 Features

### Basic Concepts

#### IPv6 Address Binding Mode

IPv6 address binding modes include Compatible, Loose, and Strict. The default mode is Strict. If IPv4-MAC binding is not configured, the IPv6 address binding mode does not take effect, and all IPv4 and IPv6 packets are allowed to pass through. If IPv4-MAC binding is configured, the IPv6 address binding mode takes effect, and the device forwards IPv4 and IPv6 packets based on the forwarding rules described in the following table:

Mode	IPv4 Packet Forwarding Rule	IPv6 Packet Forwarding Rule
Strict	Packets matching the global IPv4-MAC binding are forwarded.	Packets matching the global IPv6-MAC binding are forwarded. (The binding is generated by other access security functions, such as port security and IPv6 Source Guard.)
Loose	Packets matching the global IPv4-MAC binding are forwarded.	If IPv6+MAC address binding is configured, packets matching the IPv6-MAC binding are forwarded. (The binding is generated by other access security functions, such as port security and IPv6 Source Guard.) If IPv6-MAC binding does not exist, all IPv6 packets are forwarded.
Compatible	Packets matching the global IPv4-MAC binding are forwarded.	If the IPv6 packets contain a MAC address matching the MAC address in the IPv4-MAC binding, the IPv6 packets are forwarded. Packets matching the global IPv6-MAC binding conditions are forwarded. (The binding is generated by other access security functions, such as port security and IPv6 Source Guard.)

#### Exclude Port

By default, the IP-MAC binding function takes effect on all ports of the device. You can configure exclude ports so that the address binding function does not take effect on these ports. In practice, the IP-MAC bindings of the input packets on the

uplink port are not fixed. Generally, the uplink port of the device is configured as the exclude port so that the packets on the uplink port are not checked for IP-MAC binding.

## Overview

Feature	Description
<a href="#">Configuring Global IP-MAC Binding</a>	Control forwarding of IPv4 or IPv6 packets.
<a href="#">Configuring the IPv6 Address Binding Mode</a>	Change the IPv6 packet forwarding rules.
<a href="#">Configuring the Exclude Port</a>	Disable the global address binding function on the specified port.

### 7.3.1 Configuring Global IP-MAC Binding

#### Working Principle

Enable the global IP-MAC binding function manually to verify the input packets. If a specified IP address is bound with a MAC address, the device receives only the IP packets containing matched IP address and MAC address. The other packets are discarded.

#### Related Configuration

##### ▾ [Configuring IP-MAC Binding](#)

Run the **address-bind** command in global configuration mode to add or delete an IPv4-MAC binding.

##### ▾ [Enabling the IP-MAC Binding Function](#)

Run the **address-bind install** command in global configuration mode to enable the IP-MAC binding function. By default, this function is disabled.

### 7.3.2 Configuring the IPv6 Address Binding Mode

#### Working Principle

After the global IPv4-MAC binding is configured and enabled, IPv6 packets are forwarded based on the IPv6 address binding mode. IPv6 binding modes include Compatible, Loose, and Strict.

#### Related Configuration

##### ▾ [Configuring the IPv6 Address Binding Mode](#)

By default, the IPv6 address binding mode is Strict.

Run the **address-bind ipv6-mode** command to specify an IPv6 address binding mode.

### 7.3.3 Configuring the Exclude Port

#### Working Principle

Configure an exclude port so that the address binding function does not take effect on this port.

## Related Configuration

### ↘ [Configuring the Exclude Port](#)

Run the **address-bind uplink** command to configure an exclude port. By default, no port is the exclude port.

## 7.4 Configuration

Configuration	Description and Command
<a href="#">Configuring Global IP-MAC Binding</a>	 (Mandatory) It is used to configure and enable address binding.
	<b>address-bind</b> Configures a global IPv4-MAC binding.
	<b>address-bind install</b> Enables the address binding function.
<a href="#">Configuring the IPv6 Address Binding Mode</a>	 (Optional) It is used to configure the IPv6 address binding mode.
	<b>address-bind ipv6-mode</b> Configures the IPv6 address binding mode.
<a href="#">Configuring the Exclude Port</a>	 (Optional) It is used to disable the address binding function on a specified port.
	<b>address-bind uplink</b> Configures an exclude port.

### 7.4.1 Configuring Global IP-MAC Binding

#### Configuration Effect

- Configure a global IPv4-MAC binding.
- Enable the address binding function to control forwarding of the IPv4 or IPv6 packets.

#### Notes

- If you run the **address-bind install** command without IP-MAC binding configured, IP-MAC binding does not take effect and all packets are allowed to pass through.

#### Configuration Steps

##### ↘ [Configuring Global IP-MAC Binding](#)

- (Mandatory) Perform this configuration in global configuration mode.

##### ↘ [Enabling the Address Binding Function](#)

- (Mandatory) Perform this configuration in global configuration mode.

#### Verification

Run the **show run** or **show address-bind** command to check whether the configuration takes effect.

## Related Commands

### Configuring Global IP-MAC Binding

<b>Command</b>	<b>address-bind</b> { <i>ip-address</i>   <i>ipv6-address</i> } <i>mac-address</i>
<b>Parameter Description</b>	<i>ip-address</i> : Indicates the bound IPv4 address. <i>ipv6-address</i> : Indicates the bound IPv6 address. <i>mac-address</i> : Indicates the bound MAC address.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	Run this command to configure the binding relationship between an IPv4/IPv6 address and a MAC address.

### Enabling the Address Binding Function

<b>Command</b>	<b>address-bind install</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	Run this command to enable the global IP-MAC binding function. This function is used to control forwarding of IPv4 or IPv6 packets.

## Configuration Example

### Configuring Global IP-MAC Binding and Enabling Address Binding

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure a global IPv4-MAC binding.</li> <li>Enable the address binding function.</li> </ul>
	<pre>Ruijie# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)# address-bind 192.168.5.1 00d0.f800.0001 Ruijie(config)# address-bind install</pre>
<b>Verification</b>	Display the global IP-MAC binding on the device.
	<pre>Ruijie#show address-bind Total Bind Addresses in System : 1 IP Address          Binding MAC Addr ----- 192.168.5.1        00d0.f800.0001</pre>

## 7.4.2 Configuring the IPv6 Address Binding Mode

### Configuration Effect

- Change the IPv6 address binding mode so as to change the forwarding rules for IPv6 packets.

### Configuration Steps

#### ▾ Configuring the IPv6 Address Binding Mode

- (Optional) Perform this configuration when you want to change the forwarding rules for IPv6 packets.

### Verification

- Run the **show run** command to check whether the configuration takes effect.

## 8 Configuring Password Policy

### 8.1 Overview

The Password Policy is a password security function provided for local authentication of the device. It is configured to control users' login passwords and login states.

---

 The following sections introduce password policy only.

---

#### 8.1.1 Protocols and Standards

N/A

### 8.2 Features

#### Basic Concepts

---

##### ↘ Minimum Password Length

Administrators can set a minimum length for user passwords according to system security requirements. If the password input by a user is shorter than the minimum password length, the system does not allow the user to set this password but displays a prompt, asking the user to specify another password of an appropriate length.

##### ↘ Strong Password Detection

The less complex a password is, the more likely it is to crack the password. For example, a password that is the same as the corresponding account or a simple password that contains only characters or digits may be easily cracked. For the sake of security, administrators can enable the strong password detection function to ensure that the passwords set by users are highly complex. After the strong password detection function is enabled, a prompt will be displayed for the following types of passwords:

1. Passwords that are the same as corresponding accounts;
2. Simple passwords that contain characters or digits only.

##### ↘ Password Life Cycle

The password life cycle defines the validity time of a user password. When the service time of a password exceeds the life cycle, the user needs to change the password.

If the user inputs a password that has already expired during login, the system will give a prompt, indicating that the password has expired and the user needs to reset the password. If the new password input during password resetting does not meet system requirements or the new passwords consecutively input twice are not the same, the system will ask the user to input the new password once again.

### ↘ Guard Against Repeated Use of Passwords

When changing the password, the user will set a new password while the old password will be recorded as the user's history records. If the new password input by the user has been used previously, the system gives an error prompt and asks the user to specify another password.

The maximum number of password history records per user can be configured. When the number of password history records of a user is greater than the maximum number configured for this user, the new password history record will overwrite the user's oldest password history record.

### ↘ Storage of Encrypted Passwords

Administrators can enable the storage of encrypted passwords for security consideration. When administrators run the **show running-config** command to display configuration or run the **write** command to save configuration files, various user-set passwords are displayed in the cipher text format. If administrators disable the storage of encrypted passwords next time, the passwords already in cipher text format will not be restored to plaintext passwords.

## 8.3 Configuration

Configuration	Description and Command	
<a href="#">Configuring the Password Security Policy</a>	 Optional configuration, which is used to configure a combination of parameters related to the password security policy.	
	<b>password policy life-cycle</b>	Configures the password life cycle.
	<b>password policy min-size</b>	Configures the minimum length of user passwords.
	<b>password policy no-repeat-times</b>	Sets the no-repeat times of latest password configuration, so that the passwords specified in these times of latest password configuration can no longer be used in future password configuration.
	<b>password policy strong</b>	Enables the strong password detection function.
	<b>service password-encryption</b>	Sets the storage of encrypted passwords.

### 8.3.1 Configuring the Password Security Policy

#### Networking Requirements

- Provide a password security policy for local authentication of the device. Users can configure different password security policies to implement password security management.

#### Notes

- The configured password security policy is valid for global passwords (configured using the commands **enable password** and **enable secret**) and local user passwords (configured using the **username name password password** command). It is invalid for passwords in Line mode.

## Configuration Steps

---

### ↘ Configuring the Password Life Cycle

- Optional
- Perform this configuration on each device that requires the configuration of a password life cycle unless otherwise stated.

### ↘ Configuring the Minimum Length of User Passwords

- Optional
- Perform this configuration on each device that requires a limit on the minimum length of user passwords unless otherwise stated.

### ↘ Setting the No-Repeat Times of Latest Password Configuration

- Optional
- Perform this configuration on each device that requires a limit on the no-repeat times of latest password configuration unless otherwise stated.

### ↘ Enabling the Strong Password Detection Function

- Optional
- Perform this configuration on each device that requires strong password detection unless otherwise stated.

### ↘ Setting the Storage of Encrypted Passwords

- Optional
- Perform this configuration on each device that requires the storage of passwords in encrypted format unless otherwise stated.

## Verification

---

Configure a local user on the device, and configure a valid password and an invalid password for the user.

- When you configure the valid password, the device correctly adds the password.
- When you configure the invalid password, the device displays a corresponding error log.

## Related Commands

---

### ↘ Configuring the Password Life Cycle

<b>Command Syntax</b>	<b>password policy life-cycle</b> <i>days</i>
<b>Parameter Description</b>	<b>life-cycle</b> <i>days</i> : Indicates the password life cycle in the unit of days. The value range is from 1 to 65535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The password life cycle is used to define the validity period of user passwords. If the user logs in with a password whose service time already exceeds the life cycle, a prompt is given, asking the user to change the password.

### ▾ Configuring the Minimum Length of User Passwords

<b>Command Syntax</b>	<b>password policy min-size</b> <i>length</i>
<b>Parameter Description</b>	<b>min-size</b> <i>length</i> : Indicates the minimum length of passwords. The value range is from 1 to 31.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the minimum length of passwords. If the minimum length of passwords is not configured, users can input a password of any length.

### ▾ Setting the No-Repeat Times of Latest Password Configuration

<b>Command Syntax</b>	<b>password policy no-repeat-times</b> <i>times</i>
<b>Parameter Description</b>	<b>no-repeat-times</b> <i>times</i> : Indicates the no-repeat times of latest password configuration. The value range is from 1 to 31.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this function is enabled, all old passwords used in the several times of latest password configuration will be recorded as the user's password history records. If the new password input by the user has been used previously, the system gives an error prompt and the password modification fails. You can configure the maximum number of password history records per user. When the number of password history records of a user is greater than the maximum number configured for the user, the new password history record will overwrite the user's oldest password history record.

### ▾ Enabling the Strong Password Detection Function

<b>Command Syntax</b>	<b>password policy strong</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	After the strong password detection function is enabled, a prompt is displayed for the following types of passwords: <ol style="list-style-type: none"> <li>4. Passwords that are the same as corresponding accounts;</li> <li>5. Simple passwords that contain characters or digits only.</li> </ol>
--------------------	---

### ▾ Setting the Storage of Encrypted Passwords

<b>Command Syntax</b>	<b>service password-encryption</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Before the storage of encrypted passwords is set, all passwords used in the configuration process will be displayed and stored in plaintext format, unless the passwords are configured in cipher text format. You can enable the storage of encrypted passwords for security consideration. When you run the <b>show running-config</b> command to display configuration or run the <b>write</b> command to save configuration files, various user-set passwords are displayed in the cipher text format. If you disable the storage of encrypted passwords next time, the passwords already in cipher text format will not be restored to plaintext passwords.

### ▾ Checking User-Configured Password Security Policy Information

<b>Command Syntax</b>	<b>show password policy</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Privileged EXEC mode/ Global configuration mode/ Interface configuration mode
<b>Usage Guide</b>	Use this command to display the password security policy configured on the device.

## Configuration Examples

 The following configuration example describes configuration related to a password security policy.

### ▾ Configuring Password Security Check on the Device

<b>Typical Application</b>	<ol style="list-style-type: none"> <li>1. Assume that the following password security requirements arise in a network environment:</li> <li>2. The minimum length of passwords is 8 characters;</li> <li>3. The password life cycle is 90 days;</li> <li>4. Passwords are stored and transmitted in cipher text format;</li> </ol>
----------------------------	--

	<p>5. The number of no-repeat times of password history records is 3;</p> <p>6. Passwords shall not be the same as user names, and shall not contain simple characters or digits only.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Set the minimum length of passwords to 8.</li> <li>● Set the password life cycle to 90 days.</li> <li>● Enable the storage of encrypted passwords.</li> <li>● Set the no-repeat times of password history records to 3.</li> <li>● Enable the strong password detection function.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# password policy min-size 8 Ruijie(config)# password policy life-cycle 90 Ruijie(config)# service password-encryption Ruijie(config)# password policy no-repeat-times 3 Ruijie(config)# password policy strong</pre>
<b>Verification</b>	<p>When you create a user and the corresponding password after configuring the password security policy, the system will perform relevant detection according to the password security policy.</p> <ul style="list-style-type: none"> <li>● Run the <b>show password policy</b> command to display user-configured password security policy information.</li> </ul> <pre>Ruijie# show password policy Global password policy configurations: Password encryption:           Enabled Password strong-check:         Enabled Password min-size:             Enabled (8 characters) Password life-cycle:           Enabled (90 days) Password no-repeat-times:      Enabled (max history record: 3)</pre>

## Common Errors

- The time configured for giving a pre-warning notice about password expiry to the user is greater than the password life cycle.

## 8.4 Monitoring

### Displaying the Running Status

---

Command	Function
<code>show password policy</code>	Displays user-configured password security policy information.

## 9 Configuring Port Security

### 9.1 Overview

Port security is used to restrict access to a port. Source MAC addresses of packets can be used to restrict the packets that enter the ports of a switch. You can set the number of static MAC addresses or the number of MAC addresses that are dynamically learned to restrict the packets that can enter the port. Ports enabled with port security are called secure ports.

### 9.2 Applications

Application	Description
<a href="#">Allowing Only Specified Hosts to Use Ports</a>	For network security, certain ports of a device can be used only by specified hosts.

#### 9.2.1 Allowing Only Specified Hosts to Use Ports

##### Scenario

In a scenario that has requirements for the network security, devices cannot be completely isolated physically. In this case, the devices need to be configured to restrict the PCs that connected to the ports of the devices.

- Only specified PCs can connect to the ports and normally use the network.
- Other PCs cannot use the network even if connected to the ports.
- After the configuration is complete, the administrator does not need to perform regular maintenance.

Figure 9-1

<b>Remarks</b>	S is the access device. A is a PC that can use the port F0/1. B is an unknown PC.
----------------	---

##### Deployment

- Enable ARP Check for port F0/1 (omitted).
- Enable port security on access device S and set the violation handling mode to protect.
- Set the maximum number of secure addresses allowed by port F0/1 to 1.
- Configure a static port security address on the port F0/1.

## 9.3 Features

### Basic Concepts

---

#### Secure Port

Ports configured with port security are called secure ports. At present, Ruijie devices require that secure ports cannot be destination ports of mirroring.

#### Secure Addresses

Addresses bound to secure ports are called secure addresses. Secure addresses can be layer-2 addresses, namely MAC addresses, and can also be layer-3 addresses, namely, IP or IP+MAC addresses. When a secure address is bound to IP+MAC and a static secure MAC address is configured, the static secure MAC address must be the same as the MAC address bound to IP+MAC; otherwise, communication may fail due to inconsistency with the binding. Similarly, if only IP binding is set, only packets whose secure MAC addresses are statically configured or learned and whose source IP addresses are the bound IP address can enter the device.

#### Dynamic Binding

A method for a device to automatically learn addresses and convert learned addresses into secure addresses.

#### Static Binding

A command for manually binding secure addresses.

#### Aging of Secure Addresses

Regularly delete secure address records. Secure addresses for port security support aging configuration. You can specify only dynamically learned addresses for aging or specify both statically configured and dynamically learned secure addresses for aging.

#### Sticky MAC Address

Convert dynamically learned secure addresses into statically configured addresses. Addresses will not age. After the configurations are saved, dynamic secure addresses will not be learned again upon restart. If this function is not enabled, the secure MAC addresses dynamically learned must be learned again after device restart.

#### Security Violation Events

When the number of learned MAC addresses learned by a port exceeds the maximum number of secure addresses, security violation events will be triggered. You can configure the following modes for handing security violation events:

- **protect**: When security violation occurs, a corresponding secure port will stop learning MAC addresses and discard all packets of newly accessed users. This is the default mode for handling violation.
- **restrict**: When violation occurs, a port violation trap notification will be sent in addition to the behavior in the protect mode.
- **shutdown**: When violation occurs, the port will be disabled in addition to the behaviors in the preceding two modes.

#### ↘ **Maximum Number of Secure Addresses**

The maximum number of secure addresses indicates the total number of secure addresses statically configured and dynamically learned. When the number of secure addresses under a secure port does not reach the maximum number of secure addresses, the secure port can dynamically learn new dynamic secure addresses. When the number of secure addresses reaches the maximum number, the secure port will not learn dynamic secure addresses any longer. If new users access the secure port in this case, security violation events will occur.

### Overview

Feature	Description
<a href="#">Enabling Port Security</a>	Creates a secure address list for a port.
<a href="#">Filtering Layer-2 Users</a>	Processes the packets received by a port from non-secure addresses.
<a href="#">Filtering Layer-3 Users</a>	Checks the layer-2 and layer-3 addresses of packets passing a port.
<a href="#">Aging of Secure Addresses</a>	Regularly deletes secure addresses.

## 9.3.1 Enabling Port Security

Enable port security for a port to restrict packets that access the network through the port.

### Working Principle

When port security is enabled, the device security module will check the sources of received packets. Only packets from addresses in the secure address list can be normally forwarded; otherwise, the packets will be discarded or the port performs other violation handling behaviors.

When the port security and 802.1x are configured at the same time, packets can enter a switch only when the MAC addresses of the packets meet the static MAC address configurations of 802.1x or port security. If a port is configured with a secure channel or is bound to global IP+MAC, packets in compliance with the secure channel or bound to global IP+MAC can avoid checking of port security.

### Related Configuration

#### ↘ **Enabling Port Security for a Port**

By default, port security is disabled.

You can run the **switchport port-security** command to enable or disable the port security function for a port.

You cannot enable this function for a destination port of SPAN.

### 📌 Setting the Maximum Number of Secure Addresses for a Port

By default, the maximum number of secure addresses for a port is 128.

You can run the **switchport port-security maximum** command to adjust the maximum number of secure addresses for the port.

A smaller number of secure addresses mean fewer users that access the network through this port.

### 📌 Setting the Mode for Handling Violation

By default, when the number of secure addresses reaches the maximum number, the secure port will discard packets from unknown addresses (none of the secure addresses of the port).

You can run the **switchport port-security violation** command to modify the violation handling mode.

### 📌 Setting Secure Addresses That Can Be Dynamically Saved

By default, no secure address dynamically learned will be saved.

You can run the **switchport port-security mac-address sticky** command to save dynamically learned addresses to the configuration file. As long as the configuration file is saved, the device does not need to re-learn the secure addresses after the device is restarted.

## 9.3.2 Filtering Layer-2 Users

Set the secure addresses on a port to ensure that only devices whose MAC addresses are the same as the secure addresses can access the network through this port.

### Working Principle

Add secure addresses for a secure port. When the number of secure addresses for a secure port does not reach the maximum number, the secure port can dynamically learn new dynamic secure addresses. When the number of secure addresses for the secure port reaches the maximum number, the secure port will not learn dynamic secure addresses any longer. The MAC addresses of users connecting to this port must be in the secure address list; otherwise, violation events will be triggered.

### Related Configuration

#### 📌 Adding Secure Addresses for a Secure port

By default, a port dynamically learns secure addresses. If an administrator has special requirements, the administrator can manually configure secure addresses.

You can run the **switch portport-security interface** command to add or delete secure addresses for a device.

### 9.3.3 Filtering Layer-3 Users

Add binding of secure addresses and check layer-2 and layer-3 addresses of packets passing a port.

#### Working Principle

Layer-3 secure addresses support only IP binding and IP+MAC binding, and supports only static binding (not dynamic binding).

When a layer-3 secure port receives packets, layer-2 and layer-3 addresses need to be parsed. Only packets whose addresses are bound are valid packets. Other packets are considered as invalid packets and will be discarded, but no violation event will be triggered.

#### Related Configuration

##### 📌 [Configuring Binding of Secure Addresses on Secure Ports](#)

Binding of layer-3 secure addresses must be added manually.

You can run the **switchport port-security binding** command to add binding of secure addresses.

If only IP addresses are input, only IP addresses are bound. If IP addresses and MAC addresses are input, IP+MAC will be bound.

### 9.3.4 Aging of Secure Addresses

Regularly delete secure addresses. When this function is enabled, you need to set the maximum number of secure addresses. In this way, the device can automatically add and delete secure addresses on this port.

#### Working Principle

Enable the aging timer to regularly query and delete secure addresses whose aging time expires.

#### Related Configuration

##### 📌 [Configuring Aging Time of Secure Addresses](#)

By default, no secure address of a port will be aged.

You can run the **switchport port-security aging** command to enable aging time.

The **static** parameter can be used to age static addresses.

## 9.4 Configuration

Configuration	Description and Command
<a href="#">Configuring Secure ports and Violation Handling Modes</a>	 (Mandatory) It is used to enable the port security service.
	<b>switchport port-security</b> Enables port security.

	<b>switchport port-security maximum</b>	Sets the maximum number of secure addresses for a port.
	<b>switchport port-security violation</b>	Configures the violation handling mode for port security.
	<b>switchport port-security mac-address sticky</b>	Configures automatic saving of dynamic addresses.
<a href="#">Configuring Secure Addresses on Secure Ports</a>	 (Optional) It is used to configure security filtering items.	
	<b>switchport port-security mac-address</b>	Configures the static secure addresses in the interface configuration mode.
	<b>switchport port-security interface mac-address</b>	Configures the static secure addresses in the global configuration mode.
	<b>switchport port-security binding</b>	Configures binding of secure addresses in the interface configuration mode.
	<b>switchport port-security interface binding</b>	Configures binding of secure addresses in the global configuration mode.
	<b>switchport port-security aging</b>	Configures aging time for all secure addresses on a port.

## 9.4.1 Configuring Secure ports and Violation Handling Modes

### Configuration Effect

- Restrict the number of MAC addresses that can be learned from a port.
- Filter invalid packets based on MAC addresses, IP addresses or IP+MAC.

### Notes

- A secure port cannot be the destination port of SPAN.
- The port security function cannot be configured for a DHCP Snooping trusted port.
- The port security function cannot be configured for excluded ports of global IP+MAC.
- The security function can be enabled only for wired switching ports and layer-2 AP ports in the interface configuration mode.
- The port security can work with other access control functions such as the 802.1x, global IP+MAC binding, and IP source guard. When these functions are used together, packets can enter a switch only when passing all security checks. If a security channel is configured for a port, packets in compliance with the security channel will avoid checking of the port security.

### Configuration Steps

#### ▾ Enabling the Port Security Service

- Mandatory.

- If there is no special requirement, enable the port security service for a port on the access device.

#### ↘ **Configuring the Maximum Number of Secure Addresses for a Port**

- Optional. To adjust the maximum number of secure addresses running on a secure port, you can configure this item.
- Configure this item on a port enabled with port security.

#### ↘ **Configuring Violation Handling Modes**

- Optional. If you hope that other handling modes except discarding packets are implemented in case of violation, you can configure other handling modes.
- Configure this item on a port enabled with port security.

#### ↘ **Saving Dynamically Learned Addresses**

- Optional. If you hope that secure addresses are not re-learned after the device is restarted, you can configure this item.
- Configure this item on a port enabled with port security.

### Verification

Run the command of the device for displaying the port security configurations to check whether the configurations take effect.

### Related Commands

#### ↘ **Setting Port Security**

<b>Command</b>	<b>switchport port-security</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By using the port security feature, you can strictly control the input of a port of a device by restricting the MAC addresses and IP addresses (optional) that access the port.

#### ↘ **Setting the Maximum Number of Secure Addresses for a Port**

<b>Command</b>	<b>switchport port-security maximum <i>value</i></b>
<b>Parameter Description</b>	<i>value</i> : Indicates the number of secure addresses, ranging from 1 to 128.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If you set the maximum number to 1 and configure a secure address for this port, the workstation (whose address is the configured secure address) connected to this port will exclusively use all bandwidth of the port.

#### ↘ **Configuring the Violation Handling Mode for Port Security**

<b>Command</b>	<b>switchport port-security violation { protect   restrict   shutdown }</b>
<b>Parameter</b>	<b>protect:</b> Discards violated packets.
<b>Description</b>	<b>restrict:</b> Discards violated packets and send trap notifications. <b>shutdown:</b> Discards packets and disables the port.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	-

➤ **Saving Dynamic Secure Addresses to a Configuration File**

<b>Command</b>	<b>switchport port-security mac-address sticky mac-address [ vlan vlan-id ]</b>
<b>Parameter</b>	<i>mac-address:</i> Indicates a static secure address.
<b>Description</b>	<i>vlan-id:</i> Indicates the VID of a MAC address.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	-

**Configuration Example**

➤ **Enabling Port Security for the Port gigabitethernet 0/3, Setting the Maximum Number of Addresses to 8, and Setting the Violation Handling Mode to protect**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable port security.</li> <li>● Set the maximum number of secure addresses.</li> <li>● Modify the violation handling mode.</li> </ul>
	<pre>Ruijie# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)# interface gigabitethernet 0/3 Ruijie(config-if-GigabitEthernet 0/3)# switchport mode access Ruijie(config-if-GigabitEthernet 0/3)# switchport port-security Ruijie(config-if-GigabitEthernet 0/3)# switchport port-security maximum 8 Ruijie(config-if-GigabitEthernet 0/3)# switchport port-security violation protect Ruijie(config-if-GigabitEthernet 0/3)# switchport port-security mac-address sticky Ruijie(config-if-GigabitEthernet 0/3)# end</pre>
<b>Verification</b>	Check the port security configuration on the device.
	<pre>Ruijie# show port-security interface gigabitethernet 0/3 Interface : Gi0/3 Port Security: Enabled</pre>

```
Port status : down
Violation mode: Protect
Maximum MAC Addresses:8
Total MAC Addresses:0
Configured MAC Addresses:0
Aging time : 0 mins
SecureStatic address aging : Disabled
```

### Common Errors

- Port security is enabled on a SPAN port.
- Port security is enabled on a DHCP trusted port.
- The configured maximum number of secure addresses is smaller than the number of existing secure addresses.

## 9.4.2 Configuring Secure Addresses on Secure Ports

### Configuration Effect

- Allow specified users to use ports.
- Regularly update secure addresses of users.

### Notes

- Sticky MAC addresses are special MAC addresses not affected by the aging mechanism. No matter dynamic or static aging is configured, sticky MAC addresses will not be aged.

### Configuration Steps

#### ↘ Configuring Secure Addresses

- Optional. You need to manually add secure addresses for configuration.
- Configure this item on a port enabled with port security.

#### ↘ Configuring Binding of Secure Addresses

- Optional. You need to add layer-3 secure addresses for configuration.
- Configure this item on a port enabled with port security.

#### ↘ Configuring Aging Time

- Optional.
- Configure this item on a port enabled with port security.

### Verification

- Run the command of the device for displaying the port security configurations to check whether the configurations take effect.

## Related Commands

### Adding Secure Addresses for Secure Ports in the Global Configuration Mode

<b>Command</b>	<b>switchport port-security interface</b> <i>interface-id</i> <b>mac-address</b> <i>mac-address</i> [ <b>vlan</b> <i>vlan-id</i> ]
<b>Parameter</b>	<i>interface-id</i> : Indicates the interface ID.
<b>Description</b>	<i>mac-address</i> : Indicates a static secure address. <i>vlan-id</i> : Indicates the VID of a MAC address.

Description	Command
Displays all secure addresses or all secure addresses of a specified port.	<b>show port-security address [ interface <i>interface-id</i> ]</b>
Displays all bindings or all bindings of a specified port.	<b>show port-security binding [ interface <i>interface-id</i> ]</b>
Displays all valid secure addresses of ports and the security binding records of the ports.	<b>show port-security all</b>
Displays the port security configurations of an interface.	<b>show port-security interface <i>interface-id</i></b>
Displays the statistics about port security.	<b>show port-security</b>

# 10 Configuring Storm Control

## 10.1 Overview

When a local area network (LAN) has excess broadcast data flows, multicast data flows, or unknown unicast data flows, the network speed will slow down and packet transmission will have an increased timeout probability. This situation is called a LAN storm. A storm may occur when topology protocol execution or network configuration is incorrect.

Storm control can be implemented to limit broadcast data flows, multicast data flows, or unknown unicast data flows. If the rate of data flows received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds. This prevents flood data from entering the LAN causing a storm.

## 10.2 Applications

Application	Description
<a href="#">Network Attack Prevention</a>	Enable storm control to prevent flooding.

### 10.2.1 Network Attack Prevention

#### Scenario

The application requirements of network attack prevention are described as follows:

- Protect devices from flooding of broadcast packets, multicast packets, or unknown unicast packets.

Figure 10-1

<b>Remarks</b>	Switch A and Switch B are access devices. PC 1, PC 2, PC 3, and PC 4 are desktop computers.
----------------	--

#### Deployment

- Enable storm control on the ports of all access devices (Switch A and Switch B).

## 10.3 Features

### Basic Concepts

#### Storm Control

If the rate of data flows (broadcast packets, multicast packets, or unknown unicast packets) received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds.

#### Storm Control Based on the Bandwidth Threshold

If the rate of data flows received by a device port is within the configured bandwidth threshold, the data flows are permitted to pass through. If the rate exceeds the threshold, excess data flows are discarded until the rate falls within the threshold.

#### Storm Control Based on the Packets-per-Second Threshold

If the rate of data flows received by a device port is within the configured packets-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the threshold, excess data flows are discarded until the rate falls within the threshold.

#### Storm Control Based on the Kilobits-per-Second Threshold

If the rate of data flows received by a device port is within the configured kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the threshold, excess data flows are discarded until the rate falls within the threshold.

### Overview

Feature	Description
<a href="#">Unicast Packet Storm Control</a>	Limits unknown unicast packets to prevent flooding.
<a href="#">Multicast Packet Storm Control</a>	Limits multicast packets to prevent flooding.
<a href="#">Broadcast Packet Storm Control</a>	Limits broadcast packets to prevent flooding.

#### 10.3.1 Unicast Packet Storm Control

The unicast packet storm control feature monitors the rate of unknown unicast data flows received by a device port to limit LAN traffic and prevent flooding caused by excess data flows.

#### Working Principle

If the rate of unknown unicast data flows received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds.

## Related Configuration

### ↳ Enabling Unicast Packet Storm Control on Ports

By default, unicast packet storm control is disabled on ports.

Run the **storm-control unicast** [ { **level percent** | **pps packets** | *rate-bps* } ] command to enable unicast packet storm control on ports.

Run the **no storm-control unicast** or **default storm-control unicast** command to disable unicast packet storm control on ports.

The default command parameters are determined by related products.

## 10.3.2 Multicast Packet Storm Control

The multicast packet storm control feature monitors the rate of multicast data flows received by a device port to limit LAN traffic and prevent flooding caused by excess data flows.

### Working Principle

If the rate of multicast data flows received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds.

## Related Configuration

### ↳ Enabling Multicast Packet Storm Control on Ports

By default, multicast packet storm control is disabled on ports.

Run the **storm-control multicast** [ { **level percent** | **pps packets** | *rate-bps* } ] command to enable multicast packet storm control on ports.

Run the **no storm-control multicast** or **default storm-control multicast** command to disable multicast packet storm control on ports.

The default command parameters are determined by related products.

## 10.3.3 Broadcast Packet Storm Control

The broadcast packet storm control feature monitors the rate of broadcast data flows received by a device port to limit LAN traffic and prevent flooding caused by excess data flows.

### Working Principle

If the rate of broadcast data flows received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds.

### Related Configuration

#### ▾ Enabling Broadcast Packet Storm Control on Ports

By default, broadcast packet storm control is disabled on ports.

Run the **storm-control broadcast** [ { *level percent* | **pps packets** | *rate-bps* } ] command to enable broadcast packet storm control on ports.

Run the **no storm-control broadcast** or **default storm-control broadcast** command to disable broadcast packet storm control on ports.

The default command parameters are determined by related products.

## 10.4 Configuration

Configuration	Description and Command
<a href="#">Configuring Basic Functions of Storm Control</a>	 (Mandatory) It is used to enable storm control.
	<b>storm-control</b> { <b>broadcast</b>   <b>multicast</b>   <b>unicast</b> } [ { <i>level percent</i>   <b>pps packets</b>   <i>rate-bps</i> } ] <span style="float: right;">Enables storm control.</span>

### 10.4.1 Configuring Basic Functions of Storm Control

#### Configuration Effect

- Prevent flooding caused by excess broadcast packets, multicast packets, and unknown unicast packets.

#### Notes

- When you run a command (for example, **storm-control unicast**) to enable storm control, if you do not set the parameters, the default values are used.

#### Configuration Steps

##### ▾ Enabling Unicast Packet Storm Control

- Mandatory.
- Enable unicast packet storm control on every device unless otherwise specified.

##### ▾ Enabling Multicast Packet Storm Control

- Mandatory.

- Enable multicast packet storm control on every device unless otherwise specified.

### ▾ Enabling Broadcast Packet Storm Control

- Mandatory.
- Enable broadcast packet storm control on every device unless otherwise specified.

### Verification

- Run the **show storm-control** command to check whether the configuration is successful.

### Related Commands

#### ▾ Enabling Unicast Packet Storm Control

<b>Command</b>	<b>storm-control unicast</b> [ { <i>level percent</i>   <b>pps packets</b>   <i>rate-bps</i> } ]
<b>Parameter</b>	<b>level percent</b> : Indicates the bandwidth percentage.
<b>Description</b>	<b>pps packets</b> : Indicates the number of packets per second. <i>rate-bps</i> : Indicates the packet rate.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Storm control can be enabled only on switch ports.

#### ▾ Enabling Multicast Packet Storm Control

<b>Command</b>	<b>storm-control multicast</b> [ { <i>level percent</i>   <b>pps packets</b>   <i>rate-bps</i> } ]
<b>Parameter</b>	<b>level percent</b> : Indicates the bandwidth percentage.
<b>Description</b>	<b>pps packets</b> : Indicates the number of packets per second. <i>rate-bps</i> : Indicates the packet rate.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Storm control can be enabled only on switch ports.

#### ▾ Enabling Broadcast Packet Storm Control

<b>Command</b>	<b>storm-control broadcast</b> [ { <i>level percent</i>   <b>pps packets</b>   <i>rate-bps</i> } ]
<b>Parameter</b>	<b>level percent</b> : Indicates the bandwidth percentage.
<b>Description</b>	<b>pps packets</b> : Indicates the number of packets per second. <i>rate-bps</i> : Indicates the packet rate.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Storm control can be enabled only on switch ports.

### Configuration Example

# 11 Configuring SSH

## 11.1 Overview

Secure Shell (SSH) connection is similar to a Telnet connection except that all data transmitted over SSH is encrypted. When a user in an insecure network environment logs into a device remotely, SSH helps ensure information security and powerful authentication, protecting the device against attacks such as IP address spoofing and plain-text password interception.

An SSH-capable device can be connected to multiple SSH clients. In addition, the device can also function as an SSH client, and allows users to set up an SSH connection with a SSH-server device. In this way, the local device can safely log in to a remote device through SSH to implement management.

**i** Currently, a device can work as either the SSH server or an SSH client, supporting SSHv1 and SSHv2 versions. Ruijie SSH service supports both IPv4 and IPv6.

**i** Unless otherwise specified, SSH in this document refers to SSHv2.

### Protocols and Standards

- RFC 4251: The Secure Shell (SSH) Protocol Architecture
- RFC 4252: The Secure Shell (SSH) Authentication Protocol
- RFC 4253: The Secure Shell (SSH) Transport Layer Protocol
- RFC 4254: The Secure Shell (SSH) Connection Protocol
- RFC 4419: Diffie-Hellman Group Exchange for the Secure Shell (SSH) Transport Layer Protocol
- RFC 4716: The Secure Shell (SSH) Public Key File Format
- RFC 4819: Secure Shell Public Key Subsystem
- RFC 3526: More Modular Exponential (MODP) Diffie-Hellman groups for Internet Key Exchange (IKE)
- RFC 2409: The Internet Key Exchange (IKE)
- RFC 1950: ZLIB Compressed Data Format Specification version 3.3
- draft-ietf-secsh-filexfer-05: SSH File Transfer Protocol
- draft-ylonen-ssh-protocol-00: The version of the SSH Remote Login Protocol is 1.5. Comware implements the SSH server functions, but not the SSH client functions.

## 11.2 Applications

Application	Description
<a href="#">SSH Device Management</a>	Use SSH to manage devices.
<a href="#">SSH Local Line Authentication</a>	Use the local line password authentication for SSH user authentication.

Application	Description
<a href="#">SSH AAA Authentication</a>	Use the authentication, authorization and accounting (AAA) mode for SSH user authentication.
<a href="#">SSH Public Key Authentication</a>	Use the public key authentication for SSH user authentication.
<a href="#">SSH File Transfer</a>	Use the Secure Copy (SCP) commands on the client to exchange data with the SSH server.

## 11.2.1 SSH Device Management

### Scenario

You can use SSH to manage devices on the precondition that the SSH server function is enabled. By default, this function is disabled. The Telnet component that comes with the Windows system does not support SSH. Therefore, a third-party client software must be used. Currently, well-compatible software includes PuTTY, Linux, and SecureCRT. The following takes the PuTTY as an example to introduce the configurations of the SSH client. Figure 11-1 shows the network topology.

Figure 11-1 Networking Topology of SSH Device Management

### Deployment

Configure the SSH client as follows:

- Start the PuTTY software.
- On the **Session** option tab of PuTTY, type in the host IP address of the SSH server and SSH port number **22**, and select the connection type **SSH**.
- On the **SSH** option tab of PuTTY, select the preferred SSH protocol version **2**.
- On the **SSH authentication** option tab of PuTTY, select the authentication method **Attempt "keyboard-interactive" auth**.
- Click **Open** to connect to the SSH server.
- Type in the correct user name and password to enter the terminal login interface.

## 11.2.2 SSH Local Line Authentication

### Scenario

SSH clients can use the local line password authentication mode, as shown in Figure 11-2. To ensure security of data exchange, PC 1 and PC 2 function as the SSH clients, and use the SSH protocol to log in to the network device where the SSH server function is enabled. The requirements are as follows:

- SSH users use the local line password authentication mode.

- Five lines, including Line 0 to Line 4, are activated concurrently. The login password is "passzero" for Line 0 and "pass" for the remaining lines. Any user name can be used.

Figure 11-2 Networking Topology of SSH Local Line Password Authentication

## Deployment

- Configure the SSH server as follows:
  1. Enable the SSH server function globally. By default, the SSH server supports two SSH versions: SSHv1 and SSHv2.
  2. Configure the key. With this key, the SSH server decrypts the encrypted password received from the SSH clients, compares the decrypted plain text with the password stored on the server, and returns a message indicating the successful or unsuccessful authentication. SSHv1 uses an RSA key, whereas SSHv2 adopts an RSA or DSA key.
  3. Configure the IP address of the FastEthernet 0/1 interface on the SSH server. The SSH client is connected to the SSH server using this IP address. The routes from the SSH clients to the SSH server are reachable.
- Configure the SSH client as follows:

Diversified SSH client software is available, including PuTTY, Linux, and OpenSSH. This document takes PuTTY as an example to explain the method for configuring the SSH clients.

1. Open the PuTTY connection tab, and select SSHv1 for authenticated login. (The method is similar if SSHv2 is selected.)
2. Set the IP address and connected port ID of the SSH server. As shown in the network topology, the IP address of the server is 192.168.23.122, and the port ID is 22. Click **Open** to start the connection. As the current authentication mode does not require a user name, you can type in any user name, but cannot be null. (In this example, the user name is "anyname".)

## 11.2.3 SSH AAA Authentication

### Scenario

SSH users can use the AAA authentication mode for user authentication, as shown in Figure 11-3. To ensure security of data exchange, the PCs function as the SSH clients, and uses the SSH protocol to log in to the network device where the SSH server is enabled. To better perform security management, the AAA authentication mode is used for user login on the SSH

clients. Two authentication methods, including Radius server authentication and local authentication, are provided in the AAA authentication method list to ensure reliability. The Radius server authentication method is preferred. If the Radius server does not respond, it turns to the local authentication.

Figure 11-3 Networking Topology of SSH AAA Authentication

## Deployment

- The routes from the SSH clients to the SSH server are reachable, and the route from the SSH server to the Radius server is also reachable.
- Configure the SSH server on the network device that functions as an SSH client.
- Configure the AAA parameters on the network device. When the AAA authentication mode is used, method lists are created to define the identity authentication and types, and applied to a specified service or interface.

## 11.2.4 SSH Public Key Authentication

### Scenario

SSH clients can use the public keys for authentication, and the public key algorithm can be RSA or DSA, as shown in Figure 11-4. SSH is configured on the client so that a secure connection is set up between the SSH client and the SSH server.

Figure 11-4 Network Topology for Public Key Authentication of SSH Users

## Deployment

- To implement public key authentication for the client, generate a key pair (RSA or DSA) on the client, configure the public key on the SSH server, and select the public key authentication mode.

- After the key is generated on the client, the SSH server will copy the file of the public key from the client to the flash and associates the file with the SSH user name. Each user can be associated with one RSA public key and one DSA public key.

## 11.2.5 SSH File Transfer

### Scenario

The SCP service is enabled on the server, and SCP commands are used on the client to transfer data to the server, as shown in Figure 11-5.

Figure 11-5 Networking Topology of SSH File Transfer

### Deployment

- Enable the SCP service on the server.
- On the client, use SCP commands to upload files to the server, or download files from the server.

## 11.3 Features

### Basic Concepts

#### ↘ User Authentication Mechanism

- Password authentication

During the password authentication, a client sends a user authentication request and encrypted user name and password to the server. The server decrypts the received information, compares the decrypted information with those stored on the server, and then returns a message indicating the successful or unsuccessful authentication.

- Public key authentication

During the public key authentication, digital signature algorithms, such as RSA and DSA, are used to authenticate a client. The client sends a public key authentication request to the server. This request contains information including the user name, public key, and public key algorithm. On receiving the request, the server checks whether the public key is correct. If wrong, the server directly sends an authentication failure message. If right, the server performs digital signature authentication on the client, and returns a message indicating the successful or unsuccessful authentication.

---

**i** Public key authentication is applicable only to the SSHv2 clients.

---

#### ↘ SSH Communication

To ensure secure communication, interaction between an SSH server and an SSH client undergoes the following seven stages:

- Connection setup

The server listens on Port 22 to the connection request from the client. After originating a socket initial connection request, the client sets up a TCP socket connection with the server.

- Version negotiation

If the connection is set up successfully, the server sends a version negotiation packet to the client. On receiving the packet, the client analyzes the packet and returns a selected protocol version to the server. The server analyzes the received information to determine whether version negotiation is successful.

- Key exchange and algorithm negotiation

If version negotiation is successful, key exchange and the algorithm negotiation are performed. The server and the client exchange the algorithm negotiation packet with each other, and determine the final algorithm based on their capacity. In addition, the server and the client work together to generate a session key and a session ID according to the key exchange algorithm and host key, which will be applied to subsequent user authentication, data encryption, and data decryption.

- User authentication

After the encrypted channel is set up, the client sends an authentication request to the server. The server repeatedly conducts authentication for the client until the authentication succeeds or the server shuts down the connection because the maximum number of authentication attempts is reached.

- Session request

After the successful authentication, the client sends a session request to the server. The server waits and processes the client request. After the session request is successfully processed, SSH enters the session interaction stage.

- Session interaction

After the session request is successfully processed, SSH enters the session interaction stage. Encrypted data can be transmitted and processed in both directions. The client sends a command to be executed to the client. The server decrypts, analyzes, and processes the received command, and then sends the encrypted execution result to the client. The client decrypts the execution result.

- Session ending

When the interaction between the server and the client is terminated, the socket connection disconnects, and the session ends.

## Overview

Feature	Description
<a href="#">SSH Server</a>	Enable the SSH server function on a network device, and you can set up a secure connection with the network device through the SSH client.
<a href="#">SCP Service</a>	After the SCP service is enabled, you can directly download files from the network device and upload local files to the network device. In addition, all interactive data is encrypted, featuring authentication and security.

SSH Client	You can use the SSH client on the device to set up a secure connection with the SSH server on a network device.
------------	---

### 11.3.1 SSH Server

Enable the SSH server function on a network device, and you can set up a secure connection with the network device through the SSH client. You can also shut down the SSH server function to disconnect from all SSH clients.

#### Working Principle

For details about the working principle of the SSH server, see the "SSH Communication" in "Basic Concepts." In practice, after enabling the SSH server function, you can configure the following parameters according to the application requirements:

- Version: Configure the SSH version as SSHv1 or SSHv2 to connect SSH clients.
- Authentication timeout: The SSH server starts the timer after receiving a user connection request. The SSH server is disconnected from the client either when the authentication succeeds or when the authentication timeout is reached.
- Maximum number of authentication retries: The SSH server starts authenticating the client after receiving its connection request. If authentication does not succeed when the maximum number of user authentication retries is reached, a message is sent, indicating the authentication failure.
- Public key authentication: The public key algorithm can be RSA or DSA. It provides a secure connection between the client and the server. The public key file on the client is associated with the user name. In addition, the public key authentication mode is configured on the client, and the corresponding private key file is specified. In this way, when the client attempts to log in to the server, public key authentication can be implemented to set up a secure connection.

#### Related Configuration

##### ▾ Enabling the SSH Server

By default, the SSH server is disabled.

In global configuration mode, run the **[no] enable service ssh-server** command to enable or disable the SSH server.

To generate the SSH key, you also need to enable the SSH server.

##### ▾ Specifying the SSH Version

By default, the SSH server supports both SSHv1 and SSHv2, connecting either SSHv1 clients or SSHv2 clients.

Run the **ip ssh version** command to configure the SSH version supported by the SSH server.

If only SSHv1 or SSHv2 is configured, only the SSH client of the configured version can be connected to the SSH server.

##### ▾ Configuring the SSH Authentication Timeout

By default, the user authentication timeout is 120s.

Run the **ip ssh time-out** command to configure the user authentication timeout of the SSH server. Use the **no** form of the command to restore the default timeout. The SSH server starts the timer after receiving a user connection request. If authentication does not succeed before the timeout is reached, authentication times out and fails.

### ↘ Configuring the Maximum Number of SSH Authentication Retries

By default, the maximum number of user authentication retries is 3.

Run the **ip ssh authentication-retries** command to configure the maximum number of user authentication retries on the SSH server. Use the **no** form of the command to restore the default number of user authentication retries. If authentication still does not succeed when the maximum number of user authentication retries is reached, user authentication fails.

### ↘ Specifying the SSH Encryption Mode

By default, the encryption mode supported by the SSH server is Compatible, that is, supporting cipher block chaining (CBC), counter (CTR) and other encryption modes.

Run the **ip ssh cipher-mode** command to configure the encryption mode supported by the SSH server. Use the **no** form of the command to restore the default encryption mode supported by the SSH server.

### ↘ Specifying the SSH Message Authentication Algorithm

By default, the message authentication algorithms supported by the SSH server are as follows: (1) For the SSHv1, no algorithm is supported; (2) For the SSHv2, four algorithms, including MD5,SHA1,SHA1-96, and MD5-96, are supported.

Run the **ip ssh hmac-algorithm** command to configure the message authentication algorithm supported by the SSH server. Use the **no** form of the command to restore the default message authentication algorithm supported by the SSH server.

### ↘ Enabling the Public Key Authentication on the SSH Server

Run the **ip ssh peer** command to associate the public key file on the client with the user name. When the client is authenticated upon login, a public key file is specified based on the user name.

## 11.3.2 SCP Service

The SSH server provides the SCP service to implement secure file transfer between the server and the client.

### Working Principle

- SCP is a protocol that supports online file transfer. It runs on Port 22 based on the BSC RCP protocol, whereas RCP provides the encryption and authentication functions based on the SSH protocol. RCP implements file transfer, and SSH implements authentication and encryption.
- Assume that the SCP service is enabled on the server. When you use an SCP client to upload or download files, the SCP client first analyzes the command parameters, sets up a connection with a remote server, and starts another SCP process based on this connection. This process may run in source or sink mode. (The process running in source mode is the data provider. The process running in sink mode is the destination of data.) The process running in source mode reads and sends files to the peer end through the SSH connection. The process running in sink mode receives files through the SSH connection.

## Related Configuration

### ▾ Enabling the SCP Server

By default, the SCP server function is disabled.

Run the **ip scp server enable** command to enable SCP server function on a network device.

## 11.4 Configuration

Configuration	Description and Command
<a href="#">Configuring the SSH Server</a>	 It is mandatory to enable the SSH server.
	<b>enable service ssh-server</b>   Enables the SSH server.
	<b>disconnect ssh</b> [vty] <i>session-id</i>   Disconnects an established SSH session.
	<b>crypto key generate</b> {rsa dsa}   Generates an SSH key.
	<b>ip ssh version</b> {1 2}   Specifies the SSH version.
	<b>ip ssh time-out</b> <i>time</i>   Configures the SSH authentication timeout.
	<b>ip ssh authentication-retries</b> <i>retry times</i>   Configures the maximum number of SSH authentication retries.
	<b>ip ssh cipher-mode</b> {cbc   ctr   others }   Specifies the SSH encryption mode.
	<b>ip ssh hmac-algorithm</b> {md5   md5-96   sha1   sha1-96}   Specifies the SSH message authentication algorithm.
	<b>ip ssh peer test public-key rsa flash</b> : <i>rsa.pub</i>   Associates an RSA public key file with a user.
<b>ip ssh peer test public-key dsa flash</b> : <i>dsa.pub</i>   Associates a DSA public key file with a user.	
<a href="#">Configuring the SCP Service</a>	 Mandatory.
	<b>ip scp server enable</b>   Enables the SCP server.

### 11.4.1 Configuring the SSH Server

#### Configuration Effect

- Enable the SSH server function on a network device so that you can set up a secure connection with a remote network device through the SSH client. All interactive data is encrypted before transmitted, featuring authentication and security.
- You can use diversified SSH user authentications modes, including local line password authentication, AAA authentication, and public key authentication.
- You can generate or delete an SSH key.
- You can specify the SSH version.
- You can configure the SSH authentication timeout.

- You can configure the maximum number of SSH authentication retries.
- You can specify the SSH encryption mode.
- You can specify the SSH message authentication algorithm.

## Notes

---

- The precondition of configuring a device as the SSH server is that communication is smooth on the network that the device resides, and the administrator can access the device management interface to configure related parameters.
- The **no crypto key generate** command does not exist. You need to run the **crypto key zeroize** command to delete a key.
- The SSH module does not support hot standby. Therefore, for products that supports hot standby on the supervisor modules, if no SSH key file exist on the new active module after failover, you must run the **crypto key generate** command to re-generate a key before using SSH.

## Configuration Steps

---

### ▾ Enabling the SSH Server

- Mandatory.
- By default, the SSH server is disabled. In global configuration mode, enable the SSH server and generate an SSH key so that the SSH server state changes to ENABLE.

### ▾ Specifying the SSH Version

- Optional.
- By default, the SSH server supports SSHv1 and SSHv2, connecting either SSHv1 or SSHv2clients. If only SSHv1 or SSHv2 is configured, only the SSH client of the configured version can be connected to the SSH server.

### ▾ Configuring the SSH Authentication Timeout

- Optional.
- By default, the SSH authentication timeout is 120s. You can configure the user authentication timeout as required. The value ranges from 1 to 120. The unit is second.

### ▾ Configuring the Maximum Number of SSH Authentication Retries

- Optional.
- Configure the maximum number of SSH authentication retries to prevent illegal behaviors such as malicious guessing. By default, the maximum number of SSH authentication retries is 3, that is, a user is allowed to enter the user name and password three times for authentication. You can configure the maximum number of retries as required. The value ranges from 0 to 5.

### ▾ Specifying the SSH Encryption Mode

- Optional.

- Specify the encryption mode supported by the SSH server. By default, the encryption mode supported by the SSH server is Compatible, that is, supporting CBC, CTR and other encryption modes.

#### ▾ Specifying the SSH Message Authentication Algorithm

- Optional.
- Specify the message authentication algorithm supported by the SSH server. By default, the message authentication algorithms supported by the SSH server are as follows: (1) For the SSHv1, no algorithm is supported; (2) For the SSHv2, four algorithms, including MD5, SHA1, SHA1-96, and MD5-96, are supported.

#### ▾ Enabling the Public Key Authentication for SSH Users

- Optional.
- Only SSHv2 supports authentication based on the public key. This configuration associates a public key file on the client with a user name. When a client is authenticated upon login, a public key file is specified based on the user name.

### Verification

- Run the **show ip ssh** command to display the current SSH version, authentication timeout, and maximum number of authentication retries of the SSH server.
- Run the **show crypto key mypubkey** command to display the public information of the public key to verify whether the key has been generated.
- Configure the public key authentication login mode on the SSH client and specify the private key file. Check whether you can successfully log in to the SSH server from the SSH client. If yes, the public key file on the client is successfully associated with the user name, and public key authentication succeeds.

### Related Commands

#### ▾ Enabling the SSH Server

<b>Command</b>	<b>enable service ssh-server</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To disable the SSH server, run the <b>no enable service ssh-server</b> command in global configuration mode. After this command is executed, the SSH server state changes to DISABLE.

#### ▾ Disconnecting an Established SSH Session

<b>Command</b>	<b>disconnect ssh[vty] session-id</b>
<b>Parameter</b>	<b>vty:</b> Indicates an established virtual teletype terminal (VTY) session.
<b>Description</b>	<b>session-id:</b> Indicates the ID of the established SSH session. The value ranges from 0 to 35.
<b>Command Mode</b>	Privileged EXEC mode

<b>Usage Guide</b>	Specify an SSH session ID to disconnect the established SSH session. Alternatively, specify a VTY session ID to disconnect a specified SSH session. Only an SSH session can be disconnected.
--------------------	--

### ↘ Generating an SSH Key

<b>Command</b>	<b>crypto key generate {rsa dsa}</b>
<b>Parameter</b>	<b>rsa:</b> Generates an RSA key.
<b>Description</b>	<b>dsa:</b> Generates a DSA key.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The <b>no crypto key generate</b> command does not exist. You need to run the <b>crypto key zeroize</b> command to delete a key. SSHv1 uses an RSA key, whereas SSHv2 uses an RSA or DSA key. If an RSA key is generated, both SSHv1 and SSHv2 are supported. If only a DSA key is generated, only SSHv2 can use the key.

### ↘ Specifying the SSH Version

<b>Command</b>	<b>ip ssh version {1 2}</b>
<b>Parameter</b>	<b>1:</b> Indicates that the SSH server only receives the connection requests sent by SSHv1 clients.
<b>Description</b>	<b>2:</b> Indicates that the SSH server only receives the connection requests sent by SSHv2 clients.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>no ip ssh version</b> command to restore the default settings. By default, the SSH server supports both SSHv1 and SSHv2.

### ↘ Configuring the SSH Authentication Timeout

<b>Command</b>	<b>ip ssh time-out <i>time</i></b>
<b>Parameter</b>	<i>time</i> : Indicates the SSH authentication timeout. The value ranges from 1 to 120. The unit is second.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>no ip ssh time-out</b> command to restore the default SSH authentication timeout, which is 120s.

### ↘ Configuring the Maximum Number of SSH Authentication Retries

<b>Command</b>	<b>ip ssh authentication-retries <i>retry times</i></b>
<b>Parameter</b>	<i>retry times</i> : Indicates the maximum number of user authentication retries. The value ranges from 0 to 5.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>no ip ssh authentication-retries</b> command to restore the default number of user authentication retries, which is 3.

### ▾ Specifying the SSH Encryption Mode

<b>Command</b>	<code>ip ssh cipher-mode{cbc   ctr   others }</code>
<b>Parameter Description</b>	<p><b>cbc:</b> Sets the encryption mode supported by the SSH server to the CBC mode. Corresponding algorithms include DES-CBC,3DES-CBC,AES-128-CBC,AES-192-CBC,AES-256-CBC, and Blowfish-CBC.</p> <p><b>ctr:</b> Sets the encryption mode supported by the SSH server to the CTR mode. Corresponding algorithms include AES128-CTR, AES192-CTR, and AES256-CTR.</p> <p><b>others:</b> Sets the encryption mode supported by the SSH server to others. The corresponding algorithm is RC4.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to configure the encryption mode supported by the SSH server.</p> <p>On Ruijie devices, the SSHv1 server supports the DES-CBC, 3DES-CBC, and Blowfish-CBC encryption algorithms; the SSHv2 server supports the AES128-CTR, AES192-CTR, AES256-CTR, DES-CBC, 3DES-CBC, AES-128-CBC, AES-192-CBC, AES-256-CBC, Blowfish-CBC, and RC4 encryption algorithms. These algorithms can be grouped into three encryption modes: CBC, CTR, and others.</p> <p>As the cryptography continuously develops, it is approved that encryption algorithms in the CBC and others modes can be decrypted in a limited period of time. Therefore, organizations or companies that have high security requirements can set the encryption mode supported by the SSH server to CTR to increase the security level of the SSH server.</p>

### ▾ Specifying the SSH Message Authentication Algorithm

<b>Command</b>	<code>ip ssh hmac-algorithm{md5   md5-96   sha1   sha1-96}</code>
<b>Parameter Description</b>	<p><b>md5:</b> Indicates that the message authentication algorithm supported by the SSH server is MD5.</p> <p><b>md5-96:</b> Indicates that the message authentication algorithm supported by the SSH server is MD5-96.</p> <p><b>sha1:</b> Indicates that the message authentication algorithm supported by the SSH server is SHA1.</p> <p><b>sha1-96:</b> Indicates that the message authentication algorithm supported by the SSH server is SHA1-96.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to configure the message authentication algorithm supported by the SSH server.</p> <p>On Ruijie devices, the SSHv1 server does support any message authentication algorithm; the SSHv2 server supports the MD5, SHA1, SHA1-96, <b>and</b> MD5-96 message authentication algorithms. You can select message authentication algorithms supported by the SSH server as required.</p>

### ▾ Configuring RSA Public Key Authentication

<b>Command</b>	<code>ip ssh peer test public-key rsaflash:rsa.pub</code>
<b>Parameter Description</b>	<p><i>test:</i> Indicates the user name.</p> <p><b>rsa:</b> Indicates that the public key type is RSA.</p> <p><i>rsa.pub:</i> Indicates the name of a public key file.</p>
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	This command is used to configure the RSA public key file associated with user <i>test</i> . Only SSHv2 supports authentication based on the public key. This command associates the public key file on the client with the user name. When the client is authenticated upon login, a public key file is specified based on the user name.
--------------------	---

### ↘ Configuring DSA Public Key Authentication

<b>Command</b>	<code>ip ssh peer test public-key dsaflash:dsa.pub</code>
<b>Parameter</b>	<i>test</i> : Indicates the user name.
<b>Description</b>	<b>dsa</b> : Indicates that the public key type is DSA. <i>dsa.pub</i> : Indicates the name of a public key file.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the DSA key file associated with user <b>test</b> . Only SSHv2 supports authentication based on the public key. This command associates the public key file on the client with the user name. When the client is authenticated upon login, a public key file is specified based on the user name.

### Configuration Example

**i** The following configuration examples describe only configurations related to SSH.

### ↘ Generating a Public Key on the SSH Server

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>crypto key generate { rsa   dsa }</b> command to generate a RSA public key for the server.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie#configure terminal Ruijie(config)# crypto key generate rsa Choose the size of the rsa key modulus in the range of 512 to 2048 and the size of the dsa key modulus in the range of 360 to 2048 for your Signature Keys. Choosing a key modulus greater than 512 may take a few minutes.  How many bits in the modulus [512]:</pre> <ul style="list-style-type: none"> <li>If the generation of the RSA key is successful, the following information is displayed: <pre>% Generating 512 bit RSA1 keys ... [ok] % Generating 512 bit RSA keys ... [ok]</pre> </li> <li>If the generation of the RSA key fails, the following information is displayed: <pre>% Generating 512 bit RSA1 keys ... [fail]</pre> </li> </ul>

	<pre>% Generating 512 bit RSA keys ... [fail]</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show crypto key mypubkey rsa</b> command to display the public information about the RSA key. If the public information about the RSA key exists, the RSA key has been generated.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie(config)#show crypto key mypubkey rsa  % Key pair was generated at: 1:49:47 UTC Jan 4 2013  Key name: RSA1 private Usage: SSH Purpose Key Key is not exportable.  Key Data: AAAAAwEA AQAAAHJM 6izXtlpp rUSOEGZ/ UhFpRRrW nngP4BU7 mG836apf jajSYwcU       803LojHL ayJ8G4pG 7j4T4ZSf FKg09kfr 92JpRNHQ gbwaPc5/ 9UnTtX9t qFIKDJ1j       0dKBcCfN tr0r/CT+ cs5t1GKV S0ICGifz oB+pYaE=  % Key pair was generated at: 1:49:47 UTC Jan 4 2013  Key name: RSA private Usage: SSH Purpose Key Key is not exportable.  Key Data: AAAAAwEAAQAAAHJfLwKnz0gO F3R1KhTN /7PmQYoE v0a2VXTX 8ZCa7S11 EghLDLJc       w3T5JQXk Rr3iBD5s b1EeOL4b 21ykZt/u UetQ0Q80 sISgIfZ9 8o5No3Zz MPMOLnQR       G4c7/28+ GOHzYkTk 4IiQuTIL HRgtbyEYXCfaaxU=</pre>

**Specifying the SSH Version**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh version { 1   2 }</b> command to set the version supported by the SSH server to SSHv2.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie#configure terminal Ruijie(config)#ip ssh version 2</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show ip ssh</b> command to display the SSH version currently supported by the SSH server.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie(config)#show ip ssh  SSH Enable - version 2.0  Authentication timeout: 120 secs</pre>

	<pre>Authentication retries: 3 SSH SCP Server: disabled</pre>
--	---

### ▾ Configuring the SSH Authentication Timeout

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh time-out</b> <i>time</i> command to set the SSH authentication timeout to 100s.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie#configure terminal Ruijie(config)#ip sstime-out100</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show ip ssh</b> command to display the configured SSH authentication timeout.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie(config)#show ip ssh SSH Enable - version 2.0 Authentication timeout: 100 secs Authentication retries: 3 SSH SCP Server: disabled</pre>

### ▾ Configuring the Maximum Number of SSH Authentication Retries

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh authentication-retries</b> <i>retry times</i> command to set the maximum number of user authentication retries on the SSH server to 2.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie#configure terminal Ruijie(config)#ip ssh authentication-retries 2</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show ip ssh</b> command to display the configured maximum number of authentication retries.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie(config)#show ip ssh SSH Enable - version 2.0 Authentication timeout: 100 secs Authentication retries: 3 SSH SCP Server: disabled</pre>

### ▾ Specifying the SSH Encryption Mode

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh cipher-mode</b> {<i>cbc   ctr   others</i>} command to set the encryption mode supported by the SSH server to CTR.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie#configure terminal</pre>

	<pre>Ruijie(config)# ip ssh cipher-mode ctr</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Select the CTR encryption mode on the SSH client, and verify whether you can successfully log in to the SSH server from the SSH client.</li> </ul>

➤ **Specifying the SSH Message Authentication Algorithm**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <code>ip ssh hmac-algorithm {md5   md5-96   sha1   sha1-96 }</code> command to set the message authentication algorithm supported by the SSH server to SHA1.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie#configure terminal Ruijie(config)# ip ssh hmac-algorithmsha1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Select the SHA1 message authentication algorithm on the SSH client, and verify whether you can successfully log in to the SSH server from the SSH client.</li> </ul>

➤ **Configuring the Public Key Authentication**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <code>ip ssh peer username public-key { rsa   dsa}filename</code> command to associate a public key file of the client with a user name. When the client is authenticated upon login, a public key file (for example, RSA)is specified based on the user name.</li> </ul>
<b>SSH Server</b>	<pre>Ruijie#configure terminal Ruijie(config)# ip ssh peer test public-key rsaflash:rsa.pub</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Configure the public key authentication login mode on the SSH client and specify the private key file. Check whether you can successfully log in to the SSH server from the SSH client. If yes, the public key file on the client is successfully associated with the user name, and public key authentication succeeds.</li> </ul>

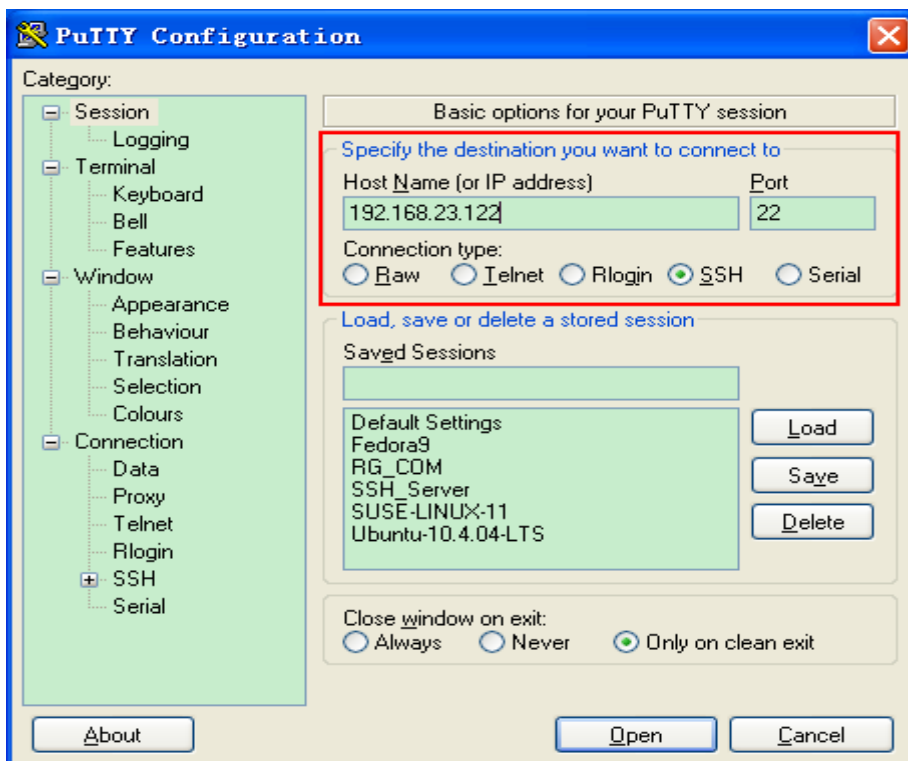

➤ **Configuring SSH Device Management**

<b>Scenario</b> Figure 11-6	 <p>The diagram illustrates the SSH device management scenario. On the left, an icon of a laptop represents the 'SSH Client' with IP address '192.168.23.83'. A line connects it to a central cloud icon representing the 'IP Network'. Another line connects the cloud to a server rack icon representing the 'SSH Server' with IP address '192.168.23.122'.</p> <p>You can use SSH to manage devices on the precondition that the SSH server function is enabled. By default, this function is disabled. The Telnet component that comes with the Windows does not support SSH. Therefore, a third-party client software must be used. Currently, well-compatible client software includes PuTTY, Linux, and SecureCRT. The following takes the PuTTY as an example to introduce the configurations of the SSH client.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Start the PuTTY software.</li> <li>On the <b>Session</b> option tab of PuTTY, type in the host IP address <b>192.168.23.122</b> and SSH port</li> </ul>

- number **22**, and select the connection type **SSH**.
- On the **SSH** option tab of PuTTY, select the preferred SSH protocol version **2**.
- On the **SSH authentication** option tab of PuTTY, select the authentication method **Attempt "keyboard-interactive" auth**.
- Click **Open** to connect to the SSH server.
- Type in the correct user name and password to enter the terminal login interface.

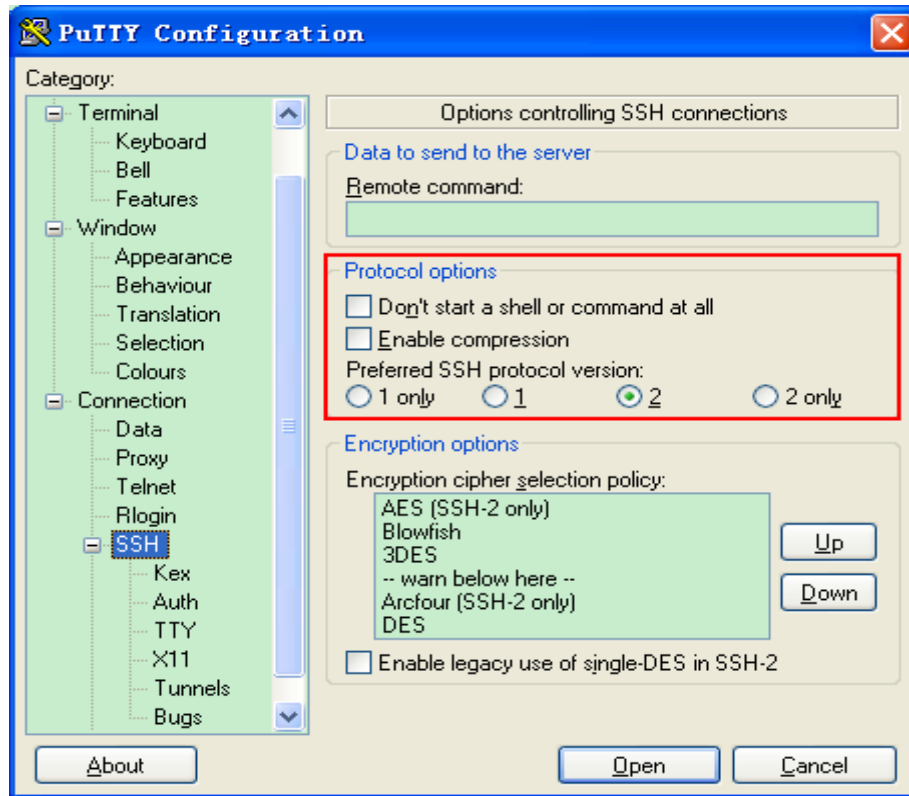

**SSH Client**

Figure 11-7

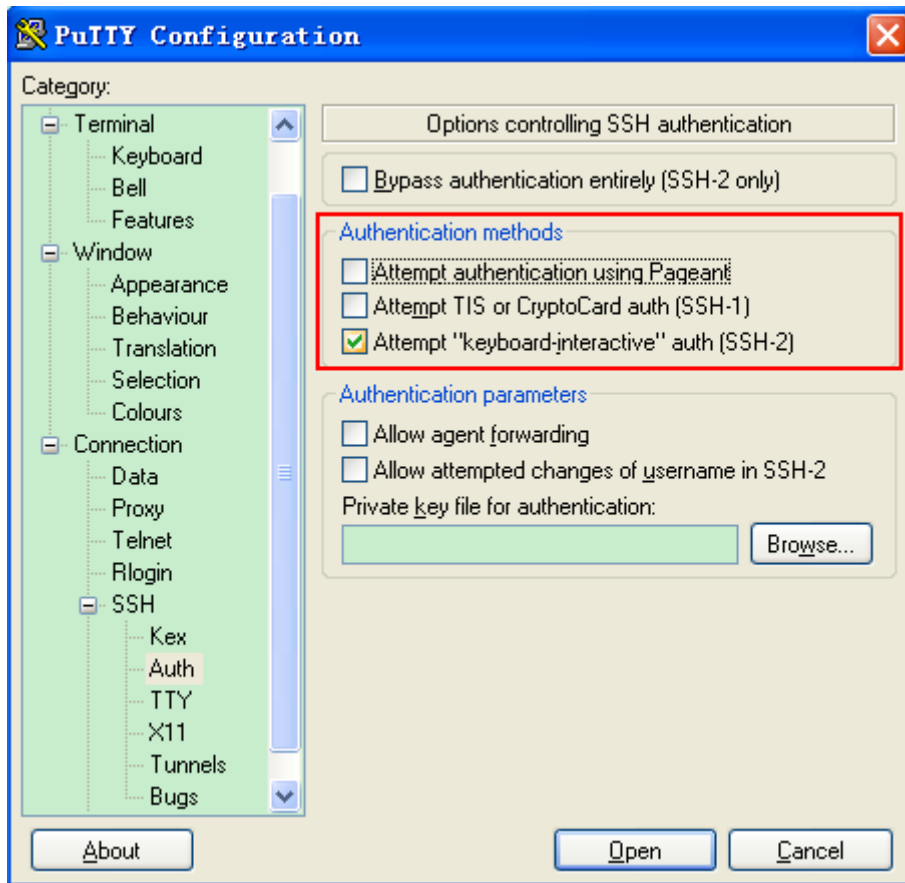

**Host Name (or IP address)** indicates the IP address of the host to be logged in. In this example, the IP address is **192.168.23.122**. **Port** indicates the port ID 22, that is, the default ID of the port listened by SSH. **Connection type** is **SSH**.

Figure 11-8

As shown in Figure 11-8, select **2** as the preferred SSH protocol version in the **Protocol options** pane because SSHv2 is used for login.

Figure 11-9

As shown in Figure 11-9, select **Attempt "keyboard-interactive" auth** as the authentication method to support authentication based on the user name and password.

Then, click **Open** to connect to the configured server host, as shown in Figure 11-10.

Figure 11-10

The **PuTTY Security Alert** box indicates that you are logging in to the client of the server 192.168.23.122, and asks you whether to receive the key sent from the server.

If you select **Yes**, a login dialog box is displayed, as shown in Figure 11-11.

Figure 11-11

Type in the correct user name and password, and you can log in to the SSH terminal interface, as shown in Figure 11-12.

Figure 11-12

- Verification**
- Run the **show ip ssh** command to display the configurations that are currently effective on the SSH server.
  - Run the **show ssh** command to display information about every SSH connection that has been established.

```
Ruijie#show ip ssh
SSH Enable - version 1.99
Authentication timeout: 120 secs
Authentication retries: 3
Ruijie#show ssh
Connection Version Encryption      Hmac      State      Username
          0      2.0 aes256-cbc      hmac-sha1  Session started test
```

➤ **Configuring SSH Local Line Authentication**

**Scenario**  
**Figure 11-13**

SSH users can use the local line password for user authentication, as shown in Figure 11-13. To ensure security of data exchange, PC 1 and PC 2 function as the SSH clients, and use the SSH protocol to log in to the network device where the SSH server is enabled. The requirements are as follows:

- SSH users use the local line password authentication mode.
- Five lines, including Line 0 to Line 4, are activated concurrently. The login password is "passzero" for Line 0 and "pass" for the remaining lines. Any user name can be used.

**Configuration Steps**

Configure the SSH server as follows:

- Enable the SSH server function globally. By default, the SSH server supports two SSH versions: SSHv1 and SSHv2.
- Configure the key. With this key, the SSH server decrypts the encrypted password received from the SSH client, compares the decrypted plain text with the password stored on the server, and returns a message indicating the successful or unsuccessful authentication. SSHv1 uses the RSA key, whereas SSHv2 uses the RSA or DSA key.
- Configure the IP address of the FastEthernet 0/1 interface on the SSH server. The SSH client is connected to the SSH server based on this IP address. The route from the SSH client to the SSH server is reachable.

Configure the SSH client as follows:

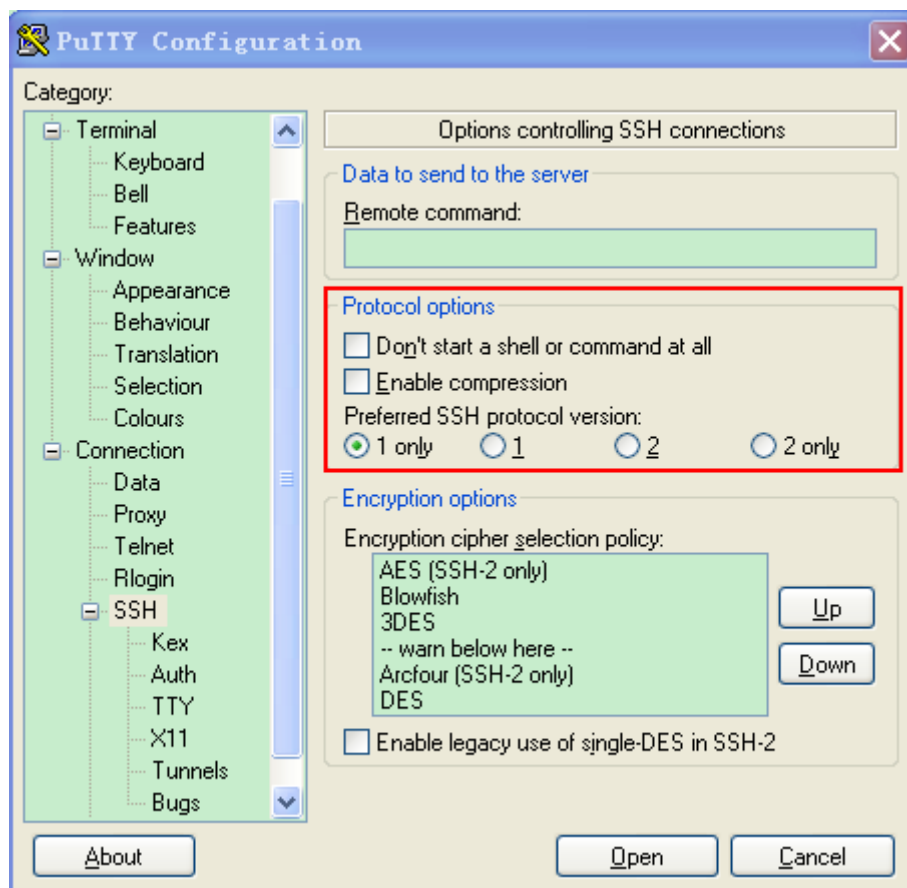

- Diversified SSH client software is available, including PuTTY, Linux, and SecureCRT. This document takes PuTTY as an example to explain the method for configuring the SSH client. For details about the configuration method, see "Configuration Steps."

**SSH Server**

Before configuring SSH-related function, ensure that the route from the SSH user to the network segment of the SSH server is reachable. The interface IP address configurations are shown in Figure 11-14. The detailed procedures for configuring IP addresses and routes are omitted.

```
Ruijie(config)# enable service ssh-server
Ruijie(config)#crypto key generate rsa
% You already have RSA keys.
% Do you really want to replace them? [yes/no]:
Choose the size of the key modulus in the range of 360 to 2048 for your
```

	<pre>Signature Keys. Choosing a key modulus greater than 512 may take a few minutes.  How many bits in the modulus [512]: % Generating 512 bit RSA1 keys ... [ok] % Generating 512 bit RSA keys ... [ok]  Ruijie(config)#interface fastEthernet0/1  Ruijie(config-if-fastEthernet0/1)#ip address 192.168.23.122 255.255.255.0  Ruijie(config-if-fastEthernet0/1)#exit  Ruijie(config)#line vty 0  Ruijie(config-line)#password passzero  Ruijie(config-line)#privilege level 15  Ruijie(config-line)#login  Ruijie(config-line)#exit  Ruijie(config)#line vtyl 4  Ruijie(config-line)#password pass  Ruijie(config-line)#privilege level 15  Ruijie(config-line)#login  Ruijie(config-line)#exit</pre>
<b>SSH Client(PC1/ PC2)</b>	Figure 11-14

Set the IP address and port ID of the SSH server. As shown in the network topology, the IP address of the server is 192.168.23.122, and the port ID is 22 (For details about the configuration method, see "Configuring SSH Device Management."). Click **Open** to start the SSH server. As the current authentication mode does not require a user name, you can type in any user name, but cannot leave the user name unspecified. (In this example, the user name is "anyname".)

**Verification**

- Run the **show running-config** command to display the current configurations.
- Verify that the SSH client configurations are correct.

**SSH Server**

```
Ruijie#show running-config
Building configuration...
!
enable secret 5 $1$eyy2$xs28FDw4s2q0tx97
enable service ssh-server
!
interface fastEthernet0/1
ip address 192.168.23.122 255.255.255.0
```

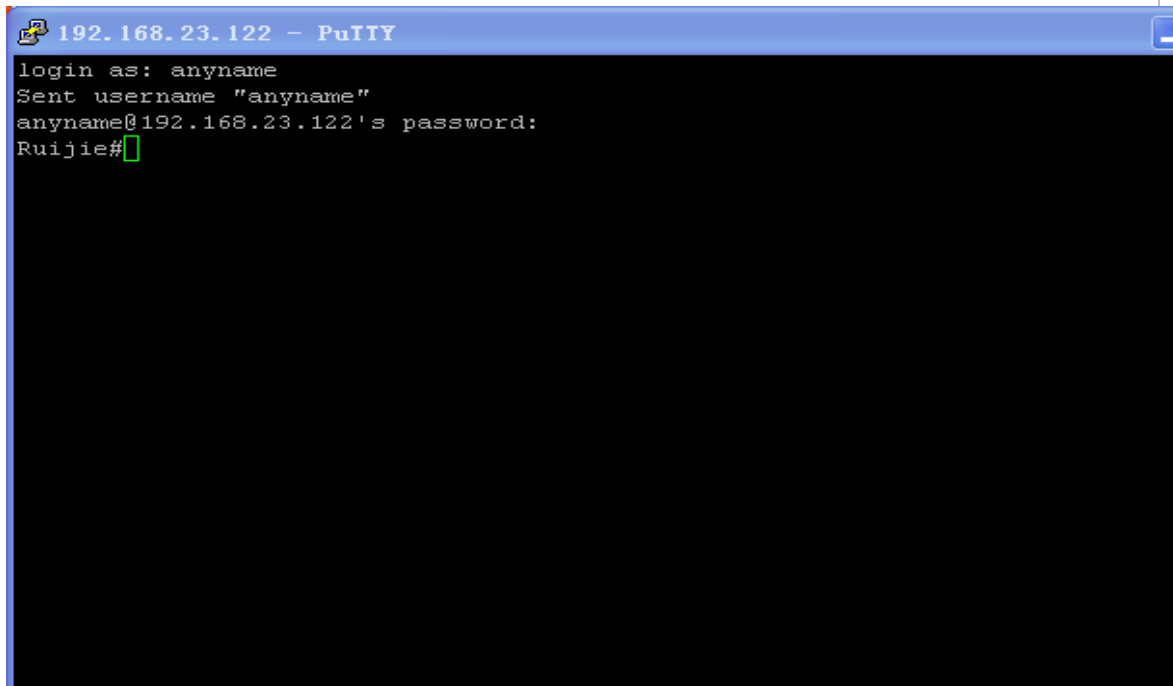

```

!
line vty 0
privilege level 15
login
password passzero
line vty 1 4
privilege level 15
login
password pass
!
end
    
```

**SSH Client**

Set up a connection, and enter the correct password. The login password is "passzero" for Line 0 and "pass" for the remaining lines. Then, the SSH server operation interface is displayed, as shown in Figure 11-15.

Figure 11-15

```
Ruijie#show users
```

Line	User	Host(s)	Idle	Location
* 0	con 0	---	idle	00:00:00 ---

1 vty 0	---	idle	00:08:02	192.168.23.83
2 vty 1	---	idle	00:00:58	192.168.23.121

➤ **Configuring AAA Authentication of SSH Users**

<p><b>Scenario</b> Figure 11-16</p>	 <p>SSH users can use the AAA authentication mode for user authentication, as shown in Figure 11-16. To ensure security of data exchange, the PC functions as the SSH client, and uses the SSH protocol to log in to the network device where the SSH server is enabled. To better perform security management, the AAA authentication mode is used on the user login interface of the SSH client. Two authentication methods, including Radius server authentication and local authentication, are provided in the AAA authentication method list to ensure reliability. The Radius server authentication method is preferred. If the Radius server does not respond, select the local authentication method.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● The route from the SSH client to the SSH server is reachable, and the route from the SSH server to the Radius server is also reachable.</li> <li>● Configure the SSH server on the network device. The configuration method is already described in the previous example, and therefore omitted here.</li> <li>● Configure the AAA parameters on the network device. When the AAA authentication mode is used, method lists are created to define the identity authentication and types, and applied to a specified service or interface.</li> </ul>
<p><b>SSH Server</b></p>	<pre>Ruijie(config)# enable service ssh-server Ruijie(config)#crypto key generate rsa % You already have RSA keys. % Do you really want to replace them? ip route 0.0.0.0 0.0.0.0 192.168.217.1  
  
!  
line con 0  
line vty 0 4  
  login authentication method  
  
!  
End
```

On the SSH client, choose **System Management>Device Management**, and add the device IP address **192.168.217.81** and the device key **aaaradius**.

Choose **Security Management>Device Management Rights**, and set the rights of the login user.

Choose **Security Management>Device Administrator**, and add the user name **user** and password **pass**.

Configure the SSH client and set up a connection to the SSH server. For details, see the previous example.

Type in the user name **user** and password **pass**. Verify that you can log in to the SSH server successfully.

```
Ruijie#show users
```

Line	User	Host(s)	Idle	Location
0 con 0		idle	00:00:31	
* 1 vty 0	user	idle	00:00:33	192.168.217.60

↘ **Configuring Public Key Authentication of SSH Users**

<p><b>Scenario</b> Figure 11-17</p>	 <p>SSH Client 192.168.23.83</p> <p>IP Network</p> <p>SSH Server 192.168.23.122</p> <p>SSH users can use the public key for user authentication, and the public key algorithm is RSA or DSA, as shown in Figure 11-17. SSH is configured on the client so that a secure connection is set up between the SSH client and the SSH server.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>To implement public key authentication on the client, generate a key pair (for example, RSA key) on the client, place the public key on the SSH server, and select the public key authentication mode.</li> </ul> <p><b>i</b> After the key pair is generated on the client, you must save and upload the public key file to the server and complete the server-related settings before you can continue to configure the client and connect the client with the server.</p> <ul style="list-style-type: none"> <li>After the key is generated on the client, copy the public key file from the client to the flash of the SSH server, and associate the file with an SSH user name. A user can be associated with one RSA public key and one DSA public key.</li> </ul>
<p><b>SSH Client</b></p>	<p>Run the <b>puttygen.exe</b> software on the client. Select <b>SSH-2 RSA</b> in the <b>Parameters</b> pane, and click <b>Generate</b> to generate a key, as shown in Figure 11-18.</p> <p>Figure 11-18</p>

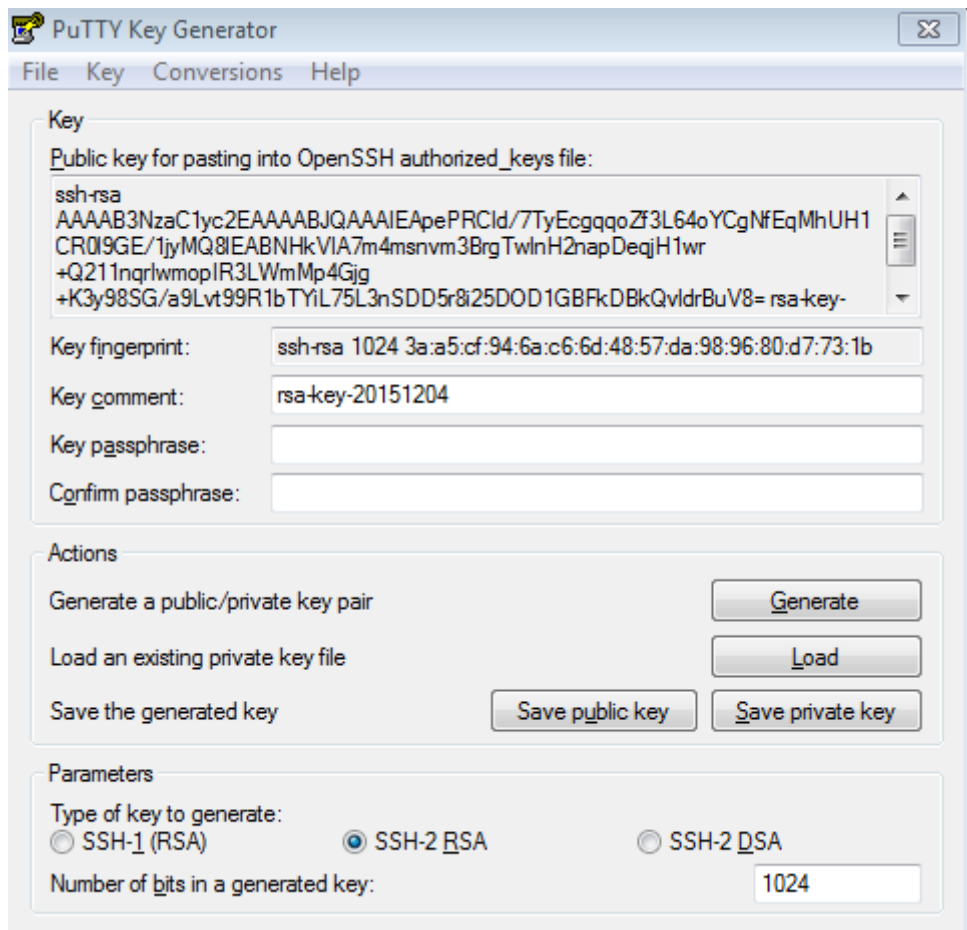

When a key is being generated, you need to constantly move the mouse over a blank area outside the green progress bar; otherwise, the progress bar does not move and key generation stops, as shown in Figure 11-19.

Figure 11-19

To ensure security of the RSA public key authentication, the length of the generated RSA key pair must be equal to or larger than 768 bits. In this example, the length is set to 1024 bits.

Figure 11-20

After the key pair is generated, click **Save public key**, type in the public key name **test\_key.pub**, select the storage path, and click **Save**. Then click **Save private key**. The following prompt box is displayed. Select **Yes**, type in the public key name **test\_private**, and click **Save**.

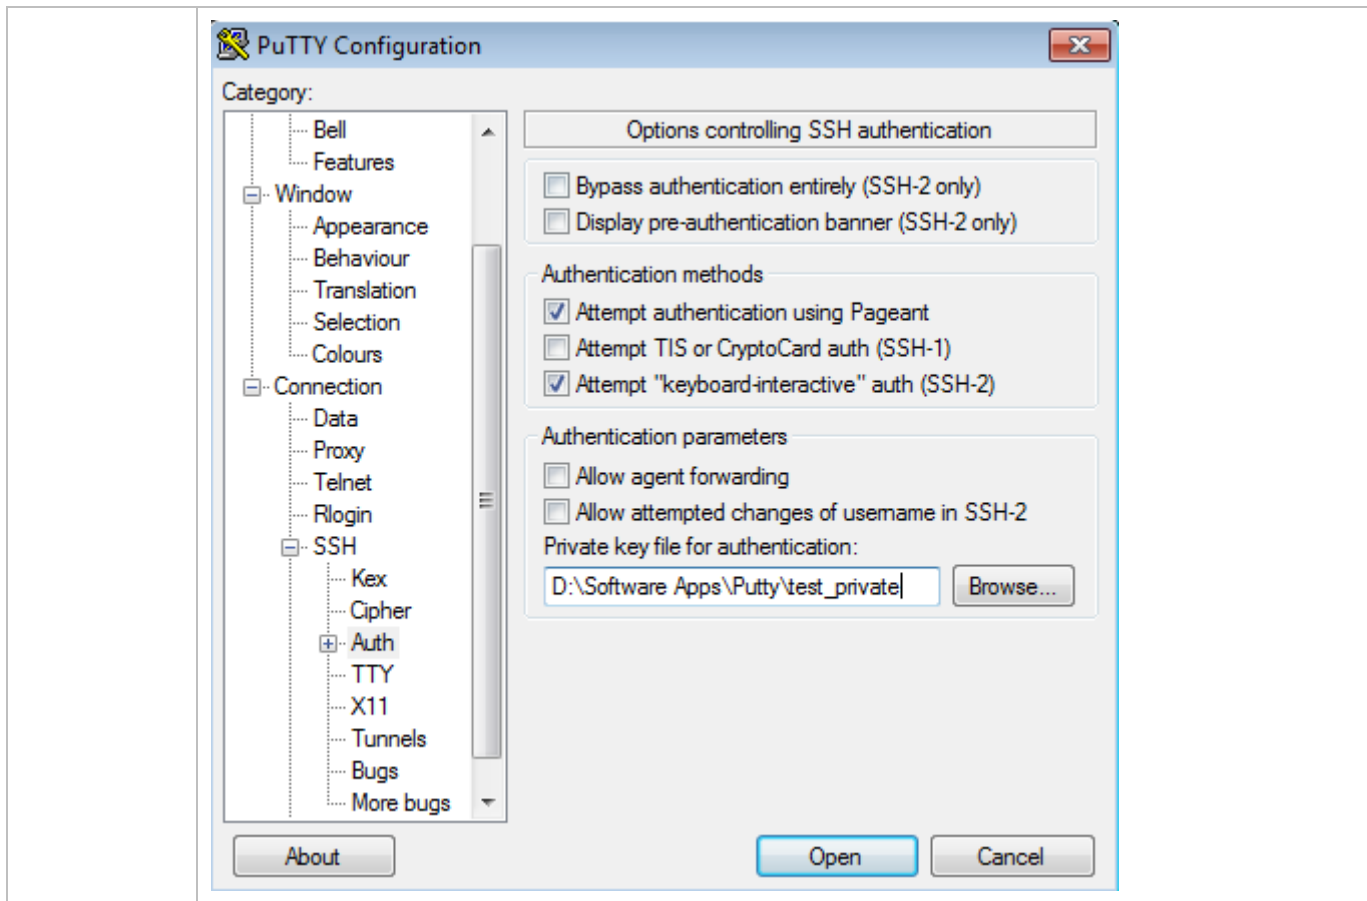

Figure 11-21

You must select the OpenSSH key file; otherwise, the key file cannot be used. The **puttygen.exe** software can be used to generate a key file in OpenSSH format, but this file cannot be directly used by the PuTTY client. You must use **puttygen.exe** to convert the private key to the PuTTY format. Format conversion is not required for the public key file stored on the server, and the format of this file is still OpenSSH, as shown in Figure 11-22.

Figure 11-22

	
<p><b>SSH Server</b></p>	<pre>Ruijie#configure terminal Ruijie(config)# ip ssh peer test public-key rsaflash:test_key.pub</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>After completing the basic configurations of the client and the server, specify the private key file <b>test_private</b> on the PuTTY client, and set the host IP address to <b>192.168.23.122</b> and port ID to <b>22</b> to set up a connection between the client and the server. In this way, the client can use the public key authentication mode to log in to the network device.</li> </ul>
	<p>Figure 11-23</p>

## Common Errors

- The **no crypto key generate** command is used to delete a key.

## 11.4.2 Configuring the SCP Service

### Configuration Effect

After the SCP function is enabled on a network device, you can directly download files from the network device and upload local files to the network device. In addition, all interactive data is encrypted, featuring authentication and security.

### Notes

- The SSH server must be enabled in advance.

### Configuration Steps

#### ▾ Enabling the SCP Server

- Mandatory.
- By default, the SCP server function is disabled. Run the **ip scp server enable** command to enable the SCP server function in global configuration mode.

## Verification

Run the **show ip ssh** command to check whether the SCP server function is enabled.

## Related Commands

### ↳ Enabling the SCP Server

<b>Command</b>	<b>ip scp server enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to enable the SCP server. Run the <b>no ip scp server enable</b> command to disable the SCP server.

## Configuration Example

### ↳ Enabling the SCP Server

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip scp server enable</b> command to enable the SCP server.</li> </ul> <pre>Ruijie#configure terminal Ruijie(config)#ip scp server enable</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show ip ssh</b> command to check whether the SCP server function is enabled.</li> </ul> <pre>Ruijie(config)#show ipssh SSH Enable - version 1.99 Authentication timeout: 120 secs Authentication retries: 3 SSH SCP Server: enabled</pre>

### ↳ Configuring SSH File Transfer

<b>Scenario</b> Figure 11-24	 <p>The diagram illustrates a network setup for SSH file transfer. On the left, an icon of a laptop represents the 'SSH Client' with IP address 192.168.23.83. A line connects it to a central cloud icon representing the 'IP Network'. Another line connects the cloud to a server rack icon representing the 'SSH Server' with IP address 192.168.23.122.</p>
	The SCP service is enabled on the server, and SCP commands are used on the client to transfer data to the server.
<b>Configuration</b>	<ul style="list-style-type: none"> <li>Enable the SCP service on the server.</li> </ul>

<b>Steps</b>	<p><b>i</b> The SCP server uses SSH threading. When connecting to a network device for SCP transmission, the client occupies a VTY session (You can find out that the user type is SSH by running the show user command).</p> <ul style="list-style-type: none"> <li>On the client, use SCP commands to upload files to the server, or download files from the server.</li> </ul> <p>Syntax of the SCP command:</p> <pre>scp [-l246BCpqr] [-c cipher] [-F ssh_config] [-i identity_file]     [-l limit] [-o ssh_option] [-P port] [-S program]     [[user@]host1:]file1 [...] [[user@]host2:]file2</pre> <p>Descriptions of some options:</p> <ul style="list-style-type: none"> <li>-l: Uses SSHv1 (If not specified, SSHv2 is used by default);</li> <li>-2: Uses SSHv2 (by default);</li> <li>-C: Uses compressed transmission.</li> <li>-c: Specifies the encryption algorithm to be used.</li> <li>-r: Transmits the whole directory;</li> <li>-i: Specifies the key file to be used.</li> <li>-l: Limits the transmission speed (unit: Kbit/s).</li> </ul> <p>For other parameters, see the filescp.0.</p>

<b>Verification</b>	<ul style="list-style-type: none"> <li>File transmission example on the Ubuntu 7.10 system:</li> </ul> <p>Set the username of a client to <b>test</b> and copy the <b>config.text</b> file from the network device with the IP address of 192.168.195.188 to the <b>/root</b> directory on the local device.</p>
	<pre>root@dhcpd:~#scp test@192.168.23.122:/config.text /root/config.text test@192.168.195.188's password: config.text          100% 1506    1.5KB/s   00:00 Read from remote host 192.168.195.188: Connection reset by peer</pre>

## 11.5 Monitoring

### Displaying

Description	Command
-------------	---------

Displays the effective SSH server configurations.	<b>show ipssh</b>
Displays the established SSH connection.	<b>show ssh</b>
Displays the public information of the SSH public key.	<b>show crypto key mypubkey</b>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs SSH sessions.	<b>debug ssh</b>

# 12 Configuring URPF

## 12.1 Overview

Unicast Reverse Path Forwarding (URPF) is a method that protects the network against source address spoofing.

URPF obtains the source address and inbound interface of a received packet, and searches a forwarding entry in the forwarding table based on the source address. If the entry does not exist, the packet is dropped. If the outbound interface of the forwarding entry does not match the inbound interface of the packet, the packet is also dropped. Otherwise, the packet is forwarded.

URPF is implemented in two modes:

- **Strict mode:** It is often deployed on a point-to-point (P2P) interface, and inbound and outbound data streams must go through the network of the P2P interface.
- **Loose mode:** It is applicable to the asymmetric routes or multihomed network that have the problem of asymmetric traffic.

### Protocols and Standards

- RFC 2827: Network Ingress Filtering: DDOS Attacks which employ IP Source Address Spoofing
- RFC 3704: Ingress Filtering for Multi-homed Networks

## 12.2 Applications

Application	Description
<a href="#">Strict Mode</a>	Block the packets with spoofed sourced addresses at the access layer or aggregation layer to prevent sending these packets from PCs to the core network.
<a href="#">Loose Mode</a>	On a multihomed network, the user network is connected to multiple Internet service providers (ISPs), and the inbound and outbound traffic is not symmetric. Deploy the URPF loose mode on the outbound interface connected to ISPs to prevent invalid packets from attacking the user network.

### 12.2.1 Strict Mode

#### Scenario

An attacker initiates an attack by sending packets with the spoofed source address 11.0.0.1. As a result, the server sends a lot of SYN or ACK packets to the hosts that do not initiate the attack, and the host with the real source address 11.0.0.1 is also affected. Even worse, if the network administrator determines that this address initiates an attack to the network, and therefore blocks all data streams coming from this source address, the denial of service (DoS) of this source address occurs.

Figure 12-1

**Remarks** The attacker sends spoofing packets using a spoofed address of the casualty.

**Deployment**

- Deploy the URPF strict mode on device A to protect the device against source address spoofing.

**12.2.2 Loose Mode**

**Scenario**

The asymmetric route is a common network application used to control the network traffic or to meet the routing policy requirements.

As shown in Figure 12-2, if the URPF strict mode is enabled on the G1/1 interface of R 1, R1 receives a packet from the network segment 192.168.20.0/24 on the G1/1 interface, but the interface obtained through the URPF check is G1/2. Therefore, this packet fails in the URPF check and is dropped.

Figure 12-2

## Deployment

- Reversely search a route based on the source IP address of a received packet. The purpose is to find a route, and it is not required that the outbound interface of the next hop on the route must be the inbound interface of the received packet.
- The URPF loose mode can resolve the asymmetric traffic problem of the asymmetric route and prevents access of invalid data streams.

## 12.3 Features

### Basic Concepts

#### ↳ URPF Strict Mode

Obtain the source address and inbound interface of a received packet, and search a forwarding entry in the forwarding table based on the source address. If the entry does not exist, the packet is dropped. If the outbound interface of the forwarding entry does not match the inbound interface of the packet, the packet is also dropped. The strict mode requires that the inbound interface of a received packet must be the outbound interface of the route entry to the source address of the packet.

#### ↳ URPF Loose Mode

Reversely search a route based on the source IP address of a received packet. The purpose is to find a route, and it is not required that the outbound interface of the next hop on the route must be the inbound interface of the received packet. However, the route cannot be a route of a host on the local network.

#### ↳ URPF Packet Loss Rate

The URPF packet loss rate is equal to the number of packets dropped due to the URPF check per second. The unit is packets/second, that is, pps.

#### ↳ Calculation Interval of the URPF Packet Loss Rate

It is the interval from the previous time the packet loss rate is calculated to the current time the packet loss rate is calculated.

#### ↳ Sampling Interval of the URPF Packet Loss Rate

It is the interval at which the number of lost packets is collected for calculating the packet loss rate. This interval must be equal to or longer than the calculation interval of the packet loss rate.

#### ↳ Threshold of the URPF Packet Loss Rate

It refers to the maximum packet loss rate that is acceptable. When the packet loss rate exceeds the threshold, alarms can be sent to users through syslogs or trap messages. You can adjust the threshold of the packet loss rate based on the actual conditions of the network.

#### ↳ Alarm Interval of the URPF Packet Loss Rate

It is the interval at which alarms are sent to users. You can adjust the alarm based on the actual conditions of the network to prevent frequently output of logs or trap messages.

### ↘ Calculation of the URPS Packet Loss Rate

Between the period of time from enabling of URPF to the time that the sampling interval arrives, the packet loss rate is equal to the number of lost packets measured within the sampling interval divided by the URPF enabling duration. After that, the packet loss rate is calculated as follows: Current packet loss rate = (Current number of lost packets measured at the calculation interval – Number of lost packets measured before the sampling interval)/Sampling interval

## Overview

Feature	Description
<a href="#">Enabling URPF</a>	Enable URPF to perform a URPF check, thus protecting the device against source address spoofing.
<a href="#">Notifying the URPF Packet Loss Rate</a>	To facilitate monitoring of information about lost packets after URPF is enabled, Ruijie devices support the use of syslogs and trap messages to proactively notify users of the packet loss information detected in the URPF check.

### 12.3.1 Enabling URPF

Enable URPF to perform a URPF check on IPv4 or IPv6 packets, thus protecting the device against source address spoofing.

#### Working Principle

URPF can be applied to IPv4/IPv6 packets based on configurations, but the following packets are not checked by URPF:

1. After URPF is enabled, the source address of a packet is checked only if the destination address of the packet is an IPv4/IPv6 unicast address, and is not checked if the packet is a multicast packet or an IPv4 broadcast packet.
2. If the source IP address of a DHCP/BOOTP packet is 0.0.0.0 and the destination IP address is 255.255.255.255, the packet is not checked by URPF.
3. If the source IP address of an IPv6 packet is a link local address, the packet is not checked by URPF.
4. A loopback packet sent by the local device to itself is not checked by URPF.

### ↘ URPF Configured in Interface configuration mode

URPF, including IPv4 URPF and IPv6 URPF, is performed on packets received on the configured interface.

- By default, the default route is not used for the URPF check. You can configure data to use the default route for the URPF check if necessary.
- By default, packets that fail in the URPF check will be dropped. If the ACL (*acl-name*) is configured, the packet is matched against the ACL after it fails in the URPF check. If no ACL exists, or a packet matches a deny ACL entry (ACE), the packet will be dropped. If the packet matches a permit ACE, the packet will be forwarded.
- After the URPF IPv4 command is configured to enable URPF, a switch will perform a URPF check on both IPv4 and IPv6 packets, and a router will perform a URPF check on IPv4 packets. Currently, a switch does not support the URPF IPv6 command. On a router, however, you can run the URPF IPv6 command to enable a URPF check on IPv6 packets.

- ✔ The IPv4/IPv6 strict mode of a router supports matching of equal-cost routes.
- ✔ A switch supports configuration of URPF only on a routed port of L3 aggregate port (AP). The following constraints exists:
  - URPF does not support association with the ACL option.
  - URPF does not support the use of IPv6 routes with a 65-bit to 127-bit prefix for a URPF check.
  - After URPF is enabled on interfaces, a URPF check is performed on all packets received on physical ports corresponding to these interfaces, which increase the scope of packets checked by URPF. If a packet received on a tunnel port is also received on the preceding physical ports, the packet is also checked by URPF. In such as scenario, be cautious in enabling URPF.
  - After URPF is enabled, the route forwarding capacity of the device will be reduced by half.
  - After the URPF strict mode is enabled, if a packet received on an interface matches an equal-cost route during the URPF check, the packet will be processed according to the URPF loose mode.

## Related Configuration

### ↳ Enabling URPF for a Specified Interface

By default, URPF is disabled for a specified interface.

Run the **ip verify unicast source reachable-via {rx | any } [ allow-default ] [ acl-name ]** command to enable or disable the IPv4 or IPv6 URPF function for a specified interface.

By default, the default route is not used for the URPF check. You can use the **allow-default** keyword to use the default route for the URPF check if necessary.

By default, packets that fail in the URPF check will be dropped. If the ACL (*acl-name*) is configured, the packet is matched against the ACL after it fails in routing. If no ACL exists, or a packet matches a deny ACE, the packet will be dropped. If the packet matches a permit ACE, the packet will be forwarded.

## 12.3.2 Notifying the URPF Packet Loss Rate

To facilitate monitoring of information about lost packets after URPF is enabled, Ruijie devices support the use of syslogs and trap messages to proactively notify users of the packet loss information detected in the URPF check.

### Working Principle

Between the period of time from enabling of URPF to the time that the sampling interval arrives, the packet loss rate is equal to the number of lost packets measured within the sampling interval divided by the URPF enabling duration. After that, the packet loss rate is calculated as follows: Current packet loss rate = (Current number of lost packets measured at the calculation interval – Number of lost packets measured before the sampling interval)/Sampling interval

After the function of monitoring the URPF packet loss information is enabled, the device can proactively send syslogs or trap messages to notify users of the packet loss information detected in the URPF check so that users can monitor the network status conveniently.

## Related Configuration

### Configuring the Calculation Interval of the URPF Packet Loss Rate

By default, the calculation interval of the URPF packet loss rate is 30s. If the calculation interval is found too short, run the **ip verify urpf drop-rate compute interval *seconds*** command to modify the calculation interval.

The calculation interval of the URPF packet loss rate ranges from 30 to 300.

### Configuring the Alarm Interval of the URPF Packet Loss Rate

By default, the alarm interval of the URPF packet loss rate is 300s. If the alarm interval is found inappropriate, run the **ip verify urpf drop-rate notify hold-down *seconds*** command to modify the alarm interval of the URPF packet loss rate.

The unit of the alarm interval is second. The value ranges from 30 to 300.

### Configuring the Function of Monitoring the URPF Packet Loss Information

By default, the function of monitoring the URPF packet loss information is disabled.

Run the **ip verify urpf drop-rate notify** command to enable or disable the function of monitoring the URPF packet loss information.

### Configuring the Threshold of the URPF Packet Loss Rate

By default, the threshold of the URPF packet loss rate is 1000 pps. If the threshold is found inappropriate, run the **ip verify urpf notification threshold *rate-value*** command to modify the threshold of the URPF packet loss rate.

The unit of the threshold is pps. The value ranges from 0 to 4,294,967,295.

## 12.4 Configuration

Configuration Item	Description and Command
<a href="#">Enabling URPF</a>	 (Mandatory) It is used to enable URPF.
	<b>ip verify unicast source reachable-via { rx   any } [ allow-default ] (Interface configuration mode)</b> Enables URPF for a specified interface.
<a href="#">Configuring the Function of Monitoring the URPF Packet Loss Information</a>	 (Optional) It is used to enable the function of monitoring the URPF packet loss information.
	<b>ip verify urpf drop-rate compute interval <i>seconds</i></b> Configures the calculation interval of the URPF packet loss rate.
	<b>ip verify urpf drop-rate notify</b> Configures the function of monitoring URPF packet loss information.
	<b>ip verify urpf drop-rate notify hold-down <i>seconds</i></b> Configures the alarm interval of the URPF packet loss rate.

	<b>ip verify urpf notification threshold</b> <i>rate-value</i>	Configures the threshold of the URPF packet loss rate.
--	---	--

## 12.4.1 Enabling URPF

### Configuration Effect

- Enable URPF to perform a URPF check on IPv4 or IPv6 packets, thus protecting the device against source address spoofing.
- URPF can be enabled in interface configuration mode.
- URPF is enabled in interface configuration mode supports both the strict and loose modes.

### Notes

- URPF is implemented with the help of the existing unicast routes on the network. Therefore, IPv4/IPv6 unicast routes must be configured on the network.

### Configuration Steps

#### ↳ Enabling IPv4 URPF for a Specified Interface

- Mandatory.
- Switches supports configuration of IPv4 URPF on a routed port or L3 AP port, other products supports configuration of IPv4 URPF on a routed port.

#### ↳ Enabling IPv6 URPF for a Specified Interface

- Mandatory.
- Switches supports configuration of IPv4 URPF on a routed port or L3 AP port, other products supports configuration of IPv4 URPF on a routed port.

### Verification

Enable URPF and check the source address as follows:

- If the strict mode is used, check whether a packet is forwarded only when the forwarding table contains the source address of the received IPv4 or IPv6 packet and the outbound interface of the searched forwarding entry matches the inbound interface of the packet; otherwise, the packet is dropped.
- If the loose mode is used, check whether a packet is forwarded when a forwarding entry can be found in the forwarding table for the source address of the received IPv4 or IPv6 packet; otherwise, the packet is dropped.

### Related Commands

#### ↳ Enabling IPv4 URPF for a Specified Interface

<b>Command</b>	<b>ip verify unicast source reachable-via { rx   any } [ allow-default ] [ acl-id ]</b>
<b>Parameter</b>	<b>rx:</b> Indicates that the URPF check is implemented in strict mode. The strict mode requires that the outbound

<b>Description</b>	<p>interface of the forwarding entry found in the forwarding table based on the source address of a received IP packet must match the inbound interface of the packet.</p> <p><b>any:</b> Indicates that the URPF check is implemented in loose mode. The loose mode only requires that a forwarding entry can be found in the forwarding table based on the source address of a received IP packet.</p> <p><b>allow-default:</b> (Optional) Indicates that the default route can be used for the URPF check.</p> <p><b>acl-id:</b> (Optional) Indicates the ID of the ACL. Values include 1 to 99 (IP standard access list), 100 to 199 (IP extended access list), 1300 to 1999 (IP standard access list, expanded range), and 2000 to 2699 (IP extended access list, expanded range).</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Based on the source address of a received IP packet, URPF checks whether any route to the source address exists in the forwarding table and accordingly determines whether the packet is valid. If no forwarding entry is matched, the packet is determined as invalid.</p> <p>You can enable URPF in interface configuration mode to perform a URPF check on packets received on the interface.</p> <p>By default, the default route is not used for the URPF check. You can use the <b>allow-default</b> keyword to use the default route for the URPF check if necessary.</p> <p>By default, packets that fail in the URPF check will be dropped. If the ACL (<i>acl-name</i>) is configured, the packet is matched against the ACL after it fails in the URPF check. If no ACL exists, or a packet matches a deny ACE, the packet will be dropped. If the packet matches a permit ACE, the packet will be forwarded.</p> <hr/> <p><b>i</b> After the command is configured to enable IPv4 URPF, a switch will perform a URPF check on both IPv4 and IPv6 packets, and a router will perform a URPF check on IPv4 packets.</p> <p><b>i</b> A switch supports configuration of URPF on a routed port or L3 AP port. In addition, the following constraints exists:</p> <hr/> <ul style="list-style-type: none"> <li>● URPF does not support association with the ACL option.</li> <li>● URPF does not support the use of IPv6 routes with a 65-bit to 127-bit prefix for a URPF check.</li> <li>● After URPF is enabled on interfaces, a URPF check is performed on all packets received on physical ports corresponding to these interfaces, which increase the scope of packets checked by URPF. In such as scenario, be cautious in enabling URPF.</li> <li>● After URPF is enabled, the route forwarding capacity of the device will be reduced by half.</li> <li>● After the URPF strict mode is enabled, if a packet received on an interface matches an equal-cost route during the URPF check, the packet will be processed according to the URPF loose mode.</li> </ul>

## Configuration Example

### 📌 Configuring the Strict Mode

	Block the packets with spoofed sourced addresses at the access layer or aggregation layer to prevent sending these packets from PCs to the core network.
--	--

To meet the preceding requirement, enable URPF in strict mode on the interface between the aggregation device and the access device.

**Scenario**  
**Figure 12-3**

**Verification**

As shown in Figure 12-3, enable URPF in strict mode on the aggregation devices, including Ruijie A and Ruijie B. The configurations are as follows:

**Ruijie-A**

```
Ruijie-A# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie-A (config)# interface gigabitEthernet0/1
Ruijie-A (config-if-GigabitEthernet 0/1)#ip address 195.52.1.1 255.255.255.0
Ruijie-A (config-if-GigabitEthernet 0/1)#ip verify unicast source reachable-via rx
Ruijie-A (config-if-GigabitEthernet 0/1)# ip verify urpf drop-rate notify
Ruijie-A (config-if-GigabitEthernet 0/1)#exit
Ruijie-A (config)# interface gigabitEthernet0/2
Ruijie-A (config-if-GigabitEthernet 0/2)#ip address 195.52.2.1 255.255.255.0
Ruijie-A (config-if-GigabitEthernet 0/2)#ip verify unicast source reachable-via rx
Ruijie-A (config-if-GigabitEthernet 0/2)# ip verify urpf drop-rate notify
Ruijie-A (config-if-GigabitEthernet 0/2)#exit
```

**Ruijie-B**

```
Ruijie-B# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie-B (config)# interface gigabitEthernet0/1
Ruijie-B (config-if-GigabitEthernet 0/1)#ip address 195.52.3.1 255.255.255.0
Ruijie-B (config-if-GigabitEthernet 0/1)#ip verify unicast source reachable-via rx
```

	<pre>Ruijie-B (config-if-GigabitEthernet 0/1)# ip verify urpf drop-rate notify Ruijie-B (config-if-GigabitEthernet 0/1)#exit Ruijie-B (config)# interface gigabitEthernet0/2 Ruijie-B (config-if-GigabitEthernet 0/2)#ip address 195.52.4.1 255.255.255.0 Ruijie-B (config-if-GigabitEthernet 0/2)#ip verify unicast source reachable-via rx Ruijie-B (config-if-GigabitEthernet 0/2)# ip verify urpf drop-rate notify Ruijie-B (config-if-GigabitEthernet 0/2)#exit</pre>
<b>Verification</b>	<p>If source address spoofing exists on the network, run the <b>show ip urpf</b> command to display the number of spoofing packets dropped by URPF.</p>
<b>A</b>	<pre>Ruijie-A#show ip urpf interface gigabitEthernet 0/1 IP verify source reachable-via RX IP verify URPF drop-rate notify enabled IP verify URPF notification threshold is 1000pps Number of drop packets in this interface is 124 Number of drop-rate notification counts in this interface is 0  Ruijie-A#show ip urpf interface gigabitEthernet 0/2 IP verify source reachable-via RX IP verify URPF drop-rate notify enabled IP verify URPF notification threshold is 1000pps Number of drop packets in this interface is 133 Number of drop-rate notification counts in this interface is 0</pre>
<b>B</b>	<pre>Ruijie-B#show ip urpf interface gigabitEthernet 0/1 IP verify source reachable-via RX IP verify URPF drop-rate notify enabled IP verify URPF notification threshold is 1000pps Number of drop packets in this interface is 124 Number of drop-rate notification counts in this interface is 0  Ruijie-B#show ip urpf interface gigabitEthernet 0/2</pre>

```

IP verify source reachable-via RX
IP verify URPF drop-rate notify enabled
IP verify URPF notification threshold is 1000pps
Number of drop packets in this interface is 250
Number of drop-rate notification counts in this interface is 0

```

### Configuring the Loose Mode

On the egress device Ruijie A of user network A, to prevent invalid packets from attacking the user network, enable URPF in loose mode on the outbound interfaces G3/1 and G3/2 that connect to two ISPs.

#### Scenario Figure 12-4

#### Ruijie-A

```

Ruijie-A# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Ruijie-A (config)# interface gigabitEthernet3/1
Ruijie-A (config-if-GigabitEthernet 3/1)# ip address 195.52.1.2 255.255.255.252
Ruijie-A (config-if-GigabitEthernet 3/1)# ip verify unicast source reachable-via any
Ruijie-A (config-if-GigabitEthernet 3/1)# ip verify urpf drop-rate notify
Ruijie-A (config-if-GigabitEthernet 3/1)# exit
Ruijie-A (config)# interface gigabitEthernet3/2
Ruijie-A (config-if-GigabitEthernet 3/2)# ip address 152.95.1.2 255.255.255.252
Ruijie-A (config-if-GigabitEthernet 3/2)# ip verify unicast source reachable-via any
Ruijie-A (config-if-GigabitEthernet 3/2)# ip verify urpf drop-rate notify
Ruijie-A (config-if-GigabitEthernet 3/2)# end

```

#### Verification

If source address spoofing exists on the network, run the **show ip urpf** command to display the number of spoofing packets dropped by URPF.

#### A

```

Ruijie #show ip urpf
IP verify URPF drop-rate compute interval is 300s
IP verify URPF drop-rate notify hold-down is 300s

```

```
Interface gigabitEthernet3/1
IP verify source reachable-via ANY
IP verify URPF drop-rate notify enabled
IP verify URPF notification threshold is 1000pps
Number of drop packets in this interface is 4121
Number of drop-rate notification counts in this interface is 2
Interface gigabitEthernet3/2
IP verify source reachable-via ANY
IP verify URPF drop-rate notify enabled
IP verify URPF notification threshold is 1000pps
Number of drop packets in this interface is 352
Number of drop-rate notification counts in this interface is 0
```

## 12.4.2 Configuring the Function of Monitoring the URPF Packet Loss Information

### Configuration Effect

- After the function of monitoring the URPF packet loss information is enabled, the device can proactively send syslogs or trap messages to notify users of the packet loss information detected in the URPF check so that users can monitor the network status conveniently.

### Notes

- URPF must be enabled.

### Configuration Steps

#### ▾ Configuring the Calculation Interval of the URPF Packet Loss Rate

- Optional.
- The configuration takes effect on both IPv4 URPF and IPv6 URPF.
- Global configuration mode

#### ▾ Configuring the Alarm Interval of the URPF Packet Loss Rate

- Optional.
- The configuration takes effect on both IPv4 URPF and IPv6 URPF.
- Global configuration mode

#### ▾ Configuring the Function of Monitoring the URPF Packet Loss Information

- Optional.

- Interface configuration mode
- **Configuring the Threshold of the URPF Packet Loss Rate**

- Optional.
- Interface configuration mode

### Verification

Simulate a source address spoofing attack, enable URPF, and check as follows:

- Enable the alarm function. After the packet loss rate exceeds the threshold, check whether an alarm can be generated normally.

### Related Commands

#### ➤ Configuring the Calculation Interval of the URPF Packet Loss Rate

<b>Command</b>	<b>ip verify urpf drop-rate compute interval</b> <i>seconds</i>
<b>Parameter Description</b>	<b>interval seconds:</b> Indicates the calculation interval of the URPF packet loss rate. The unit is second. The value ranges from 30 to 300. The default value is 30s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The calculation interval of the URPF packet loss rate is configured in global configuration mode. The configuration is applied to the global and interface-based calculation of the URPF packet loss rate, and takes effect on both IPv4 URPF and IPv6 URPF.

#### ➤ Configuring the Alarm Interval of the URPF Packet Loss Rate

<b>Command</b>	<b>ip verify urpf drop-rate notify hold-down</b> <i>seconds</i>
<b>Parameter Description</b>	<b>hold-down seconds:</b> Indicates the alarm interval of the URPF packet loss rate. The unit is second. The value ranges from 30 to 300. The default value is 30s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The alarm interval of the URPF packet loss rate is configured in global configuration mode. The configuration is applied to the global and interface-based alarms of the URPF packet loss rate, and takes effect on both IPv4 URPF and IPv6 URPF.

#### ➤ Configuring the Function of Monitoring the IPv4 URPF Packet Loss Information

<b>Command</b>	<b>ip verify urpf drop-rate notify</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After the function of monitoring the URPF packet loss information is enabled, the device can proactively

	send syslogs or trap messages to notify users of the packet loss information detected in the URPF check so that users can monitor the network status conveniently.
--	--

### ▾ Configuring the Threshold of the IPv4 URPF Packet Loss Rate

<b>Command</b>	<b>ip verify urpf notification threshold</b> <i>rate-value</i>
<b>Parameter Description</b>	<b>threshold</b> <i>rate-value</i> : Indicates the threshold of the URPF packet loss rate. The unit is pps. The value ranges from 0 to 4,294,967,295. The default value is 1,000 pps.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If the threshold is 0, a notification is sent for every packet that is dropped because it fails in the URPF check. You can adjust the threshold based on the actual situation of the network.

## Configuration Example

### ▾ Setting the Calculation Interval of the URPF Packet Loss Rate to 120s

<b>Configuration Steps</b>	Set the calculation interval of the URPF packet loss rate to 120s in global configuration mode. The configuration takes effect on both IPv4 URPF and IPv6 URPF.
	<pre>Ruijie#configure terminal Ruijie(config)# ip verify urpf drop-rate compute interval 120 Ruijie(config)# end</pre>
<b>Verification</b>	Run the <b>show ip urpf</b> command to check whether the configuration takes effect.
	<pre>Ruijie# show ip urpf IP verify URPF drop-rate compute interval is 120s</pre>

### ▾ Setting the Alarm Interval of the URPF Packet Loss Rate to 120s

<b>Configuration Steps</b>	Set the alarm interval of the URPF packet loss rate to 120s in global configuration mode. The configuration takes effect on both IPv4 URPF and IPv6 URPF.
	<pre>Ruijie#configure terminal Ruijie(config)# ip verify urpf drop-rate notify hold-down 120 Ruijie(config)# end</pre>
<b>Verification</b>	Run the <b>show ip urpf</b> command to check whether the configuration takes effect.
	<pre>Ruijie# show ip urpf IP verify URPF drop-rate compute interval is 120s IP verify URPF drop-rate notify hold-down is 120s</pre>

### ➤ Enabling the Function of Monitoring the IPv4 and IPv6 URPF Packet Loss Information on the Interface GigabitEthernet 0/1

<b>Configuration</b>	Enable the function of monitoring the IPv4 and IPv6 URPF packet loss information on the interface GigabitEthernet 0/1.
	<pre>Ruijie#configure terminal Ruijie(config)# interface gigabitEthernet0/1 Ruijie(config-if-GigabitEthernet 0/1)# ip verify unicast source reachable-via rx Ruijie(config-if-GigabitEthernet 0/1)# ip verify urpf drop-rate notify</pre>
<b>Verification</b>	Run the <b>show ip urpf</b> and <b>show ipv6 urpf</b> commands to check whether the function of monitoring the IPv4 and IPv6 URPF packet loss information is enabled on the interface GigabitEthernet 0/1.
	<pre>Ruijie# show ip urpf interface gigabitEthernet 0/1 IP verify source reachable-via RX IP verify URPF drop-rate notify is enabled IP verify URPF notification threshold is 1000pps Number of drop packets in this interface is 0 Number of drop-rate notification counts in this interface is 0 Number of drop-rate notification counts in this interface is 0</pre>

### ➤ Setting the Threshold of the IPv4 URPF Packet Loss Rate to 2000 pps and the Threshold of the IPv6 URPF Packet Loss Rate to 3000 pps on the Interface GigabitEthernet 0/1

<b>Configuration</b>	Set the threshold of the IPv4 URPF packet loss rate to 2000 pps and the threshold of the IPv6 URPF packet loss rate to 3000 pps on the interface GigabitEthernet 0/1.
	<pre>Ruijie#configure terminal Ruijie(config)# interface gigabitEthernet0/1 Ruijie(config-if-GigabitEthernet 0/1)# ip verify unicast source reachable-via rx Ruijie(config-if-GigabitEthernet 0/1)#ip verify urpf notification threshold 2000</pre>
<b>Verification</b>	Run the <b>show ip urpf</b> and <b>show ipv6 urpf</b> commands to check the threshold of the IPv4 URPF packet loss rate and the threshold of the IPv6 URPF packet loss rate.
	<pre>Ruijie# show ip urpf interface gigabitEthernet 0/1 IP verify source reachable-via RX</pre>

```

IP verify URPF drop-rate notify is enabled

IP verify URPF notification threshold is 2000pps

Number of drop packets in this interface is 0

Number of drop-rate notification counts in this interface is 0

```

## 12.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears statistics of the number of packets dropped during the IPv4 URPF check.	<b>clear ip urpf</b> [ <b>interface</b> <i>interface-name</i> ]

### Displaying

Description	Command
Displays the IPv4 URPF configuration and statistics.	<b>show ip urpf</b> [ <b>interface</b> <i>interface-name</i> ]

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the URPF events.	<b>debug urpf event</b>
Debugs the URPF timers.	<b>debug urpf timer</b>

# 13 Configuring CPP

## 13.1 Overview

The CPU Protect Policy (CPP) provides policies for protecting the CPU of a switch.

In network environments, various attack packets spread, which may cause high CPU usages of the switches, affect protocol running and even difficulty in switch management. To this end, switch CPUs must be protected, that is, traffic control and priority-based processing must be performed for various incoming packets to ensure the processing capabilities of the switch CPUs.

CPP can effectively prevent malicious attacks in the network and provide a clean environment for legitimate protocol packets.

CPP is enabled by default. It provides protection during the entire operation of switches.

## 13.2 Applications

Application	Description
<a href="#">Preventing Malicious Attacks</a>	When various malicious attacks such as ARP attacks intrude in a network, CPP divides attack packets into queues of different priorities so that the attack packets will not affect other packets.
<a href="#">Preventing CPU Processing Bottlenecks</a>	Even when no attacks exist, it would become a bottleneck for CPU to handle excessive normal traffic. CPP can limit the rate of packets being sent to the CPU to ensure normal operation of switches.

### 13.2.1 Preventing Malicious Attacks

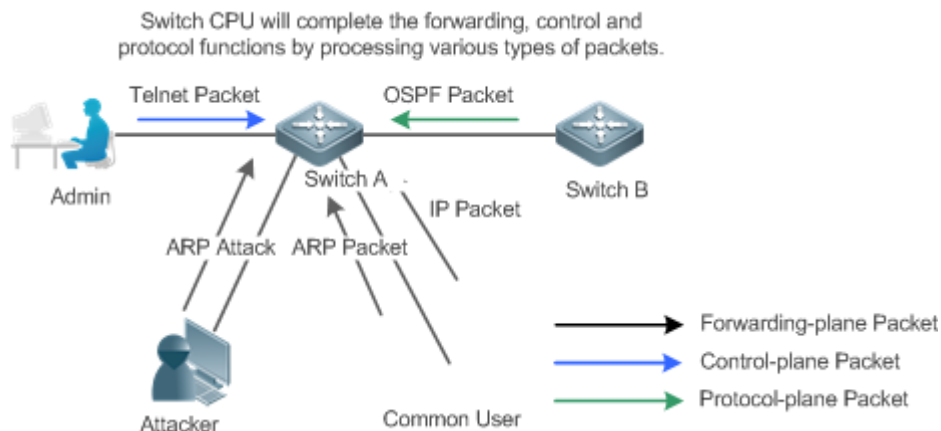

#### Scenario

Network switches at all levels may be attacked by malicious packets, typically ARP attacks.

As shown in Figure 13-1, switch CPUs process three types of packets: forwarding-plane, control-plane and protocol-plane. Forwarding-plane packets are used for routing, including ARP packets and IP route disconnection packets. Control-plane packets are used to manage services on switches, including Telnet packets and HTTP packets. Protocol-plane packets serve for running protocols, including BPDU packets and OSPF packets.

When an attacker initiates attacks by using ARP packets, the ARP packets will be sent to the CPU for processing. Since the CPU has limited processing capabilities, the ARP packets may force out other packets (which may be discarded) and consume many CPU resources (for processing ARP attack packets). Consequently, the CPU fails to work normally. In the scenario as shown in Figure 13-1, possible consequences include: common users fail to access the network; administrators fail to manage switches; the OSPF link between switch A and the neighbor B is disconnected and route learning fails.

Figure 13-1 Networking Topology of Switch Services and Attacks

### Deployment

- By default, CPP classifies ARP packets, Telnet packets, IP route disconnection packets, and OSFP packets into queues of different priorities. In this way, ARP packets will not affect other packets.
- By default, CPP limits the rates of ARP packets and the rates of the priority queue where the ARP packets reside to ensure that the attack packets do not occupy too many CPU resources.
- Packets in the same priority queue with ARP packets may be affected by ARP attack packets. You can divide the packets and the ARP packets into different priority queues by means of configuration.
- When ARP attack packets exist, CPP cannot prevent normal ARP packets from being affected. CPP can only differentiate the packet type but cannot distinguish attack packets from normal packets of the same type. In this case, the Network Foundation Protection Policy (NFPP) function can be used to provide higher-granularity attack prevention.

**i** For description of NFPP configurations, see the *Configuring NFPP*.

## 13.2.2 Preventing CPU Processing Bottlenecks

### Scenario

Even though no attacks exist, many packets may need to be sent to the CPU for processing at an instant.

For example, the accesses to the core device of a campus network are counted in ten thousands. The traffic of normal ARP packets may reach dozens of thousands packets per second (PPS). If all packets are sent to the CPU for processing, the CPU resources cannot support the processing, which may cause protocol flapping and abnormal CPU running.

### Deployment

- By default, the CPP function limits the rates of ARP packets and the rates of the priority queue where the APR packets reside to control the rate of ARP packets sent to the CPU and ensure that the CPU resource consumption is within a specified range and that the CPU can normally process other protocols.
- By default, the CPP function also limits the rates of other packets at the user level, such as Web authentication and 802.1X authentication packets.

## 13.3 Features

### Basic Concepts

---

#### ↳ QoS, DiffServ

Quality of Service (QoS) is a network security mechanism, a technology used to solve the problems of network delay and congestion.

DiffServ refers to the differentiated service model, which is a typical model implemented by QoS for classifying service streams to provide differentiated services.

#### ↳ Bandwidth, Rate

Bandwidth refers to the maximum allowable data rate, which refers to the rate threshold in this document. Packets whose rates exceed the threshold will be discarded.

The rate indicates an actual data rate. When the rate of packets exceeds the bandwidth, packets out of the limit will be discarded. The rate must be equal to or smaller than the bandwidth.

The bandwidth and rate units in this document are packets per second (pps).

#### ↳ L2, L3, L4

The structure of packets is hierarchical based on the TCP/IP model.

L2 refers to layer-2 headers, namely, the Ethernet encapsulation part; L3 refers to layer-3 headers, namely, the IP encapsulation part; L4 refers to layer-4 headers, usually, the TCP/UDP encapsulation part.

#### ↳ Priority Queue, SP

Packets are cached inside a switch and packets in the output direction are cached in queues. Priority queues are mapped to Strict Priorities (SPs). Queues are not equal but have different priorities.

The SP is a kind of QoS scheduling algorithm. When a higher priority queue has packets, the packets in this queue are scheduled first. Scheduling refers to selecting packets from queues for output and refers to selecting and sending the packets to the CPU in this document.

#### ↳ CPU interface

Before sending packets to the CPU, a switch will cache the packets. The process of sending packets to the CPU is similar to the process of packet output. The CPU interface is a virtual interface. When packets are sent to the CPU, the packets will be output from this virtual interface. The priority queue and SP mentioned above are based on the CPU interface.

### Overview

---

CPP protects the CPU by using the standard QoS DiffServ model.

Figure 13-2 CPP Implementation Model

Feature	Description
<a href="#">Classifier</a>	Classifies packet types and provides assurance for the subsequent implementation of QoS policies.
<a href="#">Meter</a>	Limits rates based on packet types and controls the bandwidth for a specific packet type.
<a href="#">Queue</a>	Queue packets to be sent to the CPU and select different queues based on packet types.
<a href="#">Scheduler</a>	Selects and schedules queues to be sent to the CPU.
<a href="#">Shaper</a>	Performs rate limit and bandwidth control on priority queues and the CPU interface.

### 13.3.1 Classifier

#### [Working Principle](#)

The Classifier classifies all packets to be sent to the CPU based on the L2, L3 and L4 information of the packets. Classifying packets is the basis for implementing QoS policies. In subsequent actions, different policies are implemented based on the classification to provide differentiated services. A switch provides fixed classification. The management function classifies packet types based on the protocols supported by the switch, for example, STP BPDU packets and ICMP packets. Packet types cannot be customized.

### 13.3.2 Meter

#### [Working Principle](#)

The Meter limits the rates of different packets based on the preset rate thresholds. You can set different rate thresholds for different packet types. When the rate of a packet type exceeds the corresponding threshold, the packets out of the limit will be discarded.

By using the Meter, you can control the rate of a packet type sent to the CPU within a threshold to prevent specific attack packets from exerting large impacts on the CPU resources. This is the level-1 protection of the CPP.

#### [Related Configuration](#)

- By default, each packet type corresponds to a rate threshold (bandwidth) and Meter policies are implemented based on the rate threshold.
- In application, you can run the **cpu-protect type packet-type bandwidth bandwidth-value** command to set Meter policies for specified packet types.

### 13.3.3 Queue

#### [Working Principle](#)

Queues are used to classify packets at level 2. You can select the same queue for different packet types; meanwhile, queues cache packets inside switches and provide services for the Scheduler and Shaper.

CPP queues are SP queues. The SPs of the packets are determined based on the time when they are added to a queue. Packets with a larger queue number have a higher priority.

### Related Configuration

- By default, each packet type is mapped to an SP queue.
- In application, you can run the **cpu-protect type** *packet-type* **traffic-class** *traffic-class-num* command to select SP queues for specific packet types.

## 13.3.4 Scheduler

### Working Principle

The Scheduler schedules packets based on SPs of queues. That is, packets in a queue with a higher priority are scheduled first.

Before being scheduled, packets to be sent to the CPU are cached in queues. When being scheduled, the packets are sent to the CPU for processing.

---

**i** Only the SP scheduling policy is supported and cannot be modified.

---

## 13.3.5 Shaper

### Working Principle

The Shaper is used to shape packets to be sent to the CPU, that is, when the actual rate of packets is greater than the shaping threshold, the packets must stay in the queue and cannot be scheduled. When packet rates fluctuate, the Shaper ensures that the rates of packets sent to the CPU are smooth (no more than the shaping threshold).

When the Shaper is available, packets in a queue with a lower priority may be scheduled before all packets in a queue with a higher priority are scheduled. If the rate of packets in a queue with certain priority exceeds the shaping threshold, scheduling of the packets in this queue may be stopped temporarily. Therefore, the Shaper can prevent packets in queues with lower priorities from starvation (which means that only packets in queues with higher priorities are scheduled and packets in queues with higher priorities are not scheduled).

Since the Shaper limits the scheduling rates of packets, it actually plays the rate limit function. The Shaper provides level-2 rate limit for priority queues and all packets sent to the CPU (CPU interface). The Shaper and Meter functions provide 3-level rate limit together and provide level-3 protection for the CPU.

Figure 13-3 3-Level Rate Limit of the CPP

### Related Configuration

#### Configuring the Shaper for priority queues

- By default, each priority queue determines a shaping threshold (bandwidth).
- In application, you can run the **cpu-protect traffic-class traffic-class-num bandwidth bandwidth\_value** command to perform Shaper configuration for a specific priority queue.

#### Configuring the Shaper for the CPU Interface

- By default, the CPU interface determines a shaping threshold (bandwidth).
- Run the **cpu-protect cpu bandwidth bandwidth\_value** command to perform Shaper configuration for the CPU interface.

## 13.4 Configuration

Configuration	Description and Command
<a href="#">Configuring CPP</a>	 (Optional and configured by default) It is used to adjust the configuration parameters of CPP.
	<b>cpu-protect type packet-type bandwidth</b> Configures the Meter for a packet type.
	<b>cpu-protect type packet-type traffic-class</b> Configures the priority queue for a packet type.
	<b>cpu-protect traffic-class traffic-class-num bandwidth</b> Configures the Shaper for a priority queue.
	<b>cpu-protect cpu bandwidth</b> Configures the Shaper for the CPU interface.

## 13.4.1 Configuring CPP

### Configuration Effect

- By configuring the Meter function, you can set the bandwidth and rate limit for a packet type. Packets out of the limit will be directly discarded.
- By configuring the Queue function, you can select a priority queue for a packet type. Packets in a queue with a higher priority will be scheduled first.
- By configuring the Shaper function, you can set the bandwidth and rate limit for a CPU interface and a priority queue. Packets out of the limit will be directly discarded.

### Notes

- Pay special attention when the bandwidth of a packet type is set to a smaller value, which may affect the normal traffic of the same type. To provide per-user CPP, combine the NFPP function.
- When the Meter and Shaper functions are combined, 3-level protection will be provided. Any level protection fights alone may bring negative effects. For example, if you want to increase the Meter of a packet type, you also need to adjust the Shaper of the corresponding priority queue. Otherwise, the packets of this type may affect other types of packets in the same priority queue.

### Configuration Steps

#### ▾ Configuring the Meter for a packet type

- You can use or modify the default value but cannot disable it.
- You need to modify the configuration in the following cases: when packets of a type are not attackers but are discarded, you need to increase the Meter of this packet type. If attacks of a packet type cause abnormal CPU running, you need to decrease the Meter of this packet type.
- This configuration is available on all switches in a network environment.

#### ▾ Configuring the priority queue for a packet type

- You can use or modify the default value but cannot disable it.
- You need to modify the configuration in the following cases: When attacks of a packet type cause abnormality of other packets in the same queue, you can put the packet type in an unused queue. If a packet type cannot be discarded but the packet type is in the same queue with other packet types in use, you can put this packet type in a queue with a higher priority.
- This configuration is available on all switches in a network environment.

#### ▾ Configuring the Shaper for a priority queue

- You can use or modify the default value and cannot disable it.
- You need to modify the configuration in the following cases: If the Meter value of a packet type is greater which causes that other packets in the corresponding priority queue do not have sufficient bandwidth, you need to increase the

Shaper for this priority queue. If attack packets are put in a priority queue and no other packets are in use, you need to increase the Shaper of this priority queue.

- This configuration is available on all switches in a network environment.

#### ↘ **Configuring the Shaper for the CPU interface**

- You can use or modify the default value and cannot disable it.
- You are not advised to change the Shaper of the CPU interface.
- This configuration is available on all switches in a network environment.

#### Verification

- Modify the configurations when the system runs abnormally, and view the system running after the modification to check whether the configurations take effect.
- Check whether the configurations take effect by viewing corresponding configurations and statistic values. For details, see the following commands.

## 13.5 Monitoring

### Clearing

Description	Command
Clears the CPP statistics.	<b>clear cpu-protect counters</b> [ <i>device device_num</i> ] [ <i>slot slot_num</i> ]
Clears the CPP statistics on the master device.	<b>clear cpu-protect counters mboard</b>

### Displaying

Description	Command
Displays the configuration and statistics of a packet type.	<b>show cpu-protect type</b> <i>packet-type</i> [ <i>device device_num</i> ] [ <i>slot slot_num</i> ]
Displays the configuration and statistics of a priority queue.	<b>show cpu-protect traffic-class</b> <i>traffic-class-num</i> [ <i>device device_num</i> ] [ <i>slot slot_num</i> ]
Displays the configuration on a CPU interface.	<b>show cpu-protect cpu</b>

Displays all configurations and statistics on the master device.	<b>show cpu-protect {mboard   summary }</b>
Displays all configurations and statistics of CPP.	<b>show cpu-protect [device <i>device_num</i>] [slot <i>slot_num</i>]</b>

## Debugging

---

N/A

- i** The preceding monitoring commands are available on both chassis and cassette devices in either the standalone mode or the VSU mode.
- i** If the **device** and **slot** values are not specified, the **clear** command is used to clear the statistics of all nodes in the system and the **show** command is used to display the configurations on the master device.
- i** In the standalone mode, the parameter **device** is unavailable. For chassis devices, the parameter **slot** is used to specify a line card; for cassette devices, **slot** is unavailable.
- i** In the VSU mode, the parameter **device** indicates a chassis or cassette device. If the **device** value is not specified, it indicates the master chassis or the master device. For chassis devices, if the **device** value is specified the **slot** value must also be specified to identify a line card in a chassis; for cassette devices, **slot** is unavailable.

# 14 Configuring DHCP Snooping

## 14.1 Overview

DHCP Snooping: DHCP Snooping snoops DHCP interactive packets between clients and servers to record and monitor users' IP addresses and filter out illegal DHCP packets, including client request packets and server response packets. The legal user database generated from DHCP Snooping records may serve security applications like IP Source Guard.

### Protocols and Standards

- RFC 2131: Dynamic Host Configuration Protocol
- RFC 2132: DHCP Options and BOOTP Vendor Extensions

## 14.2 Applications

Application	Description
<a href="#">Guarding against DHCP service spoofing</a>	In a network with multiple DHCP servers, DHCP clients are allowed to obtain network configurations only from legal DHCP servers.
<a href="#">Guarding against DHCP packet flooding</a>	Malicious network users may frequently send DHCP request packets.
<a href="#">Guarding against forged DHCP packets</a>	Malicious network users may send forged DHCP request packets, for example, DHCP-RELEASE packets.
<a href="#">Guarding against IP/MAC spoofing</a>	Malicious network users may send forged IP packets, for example, tampered source address fields of packets.
<a href="#">Preventing Lease of IP Addresses</a>	Network users may lease IP addresses rather than obtaining them from a DHCP server.
<a href="#">Detecting ARP attack</a>	Malicious users forge ARP response packets to intercept packets during normal users' communication.

### 14.2.1 Guarding Against DHCP Service Spoofing

#### Scenario

Multiple DHCP servers may exist in a network. It is essential to ensure that user PCs obtain network configurations only from the DHCP servers within a controlled area.

Take the following figure as an example. The DHCP client can only communicate with trusted DHCP servers.

- Request packets from the DHCP client can be transmitted only to trusted DHCP servers.
- Only the response packets from trusted DHCP servers can be transmitted to the client.

Figure 14-1

<b>Remarks:</b>	<p>S is an access device.</p> <p>A is a user PC.</p> <p>B is a DHCP server within the controlled area.</p> <p>C is a DHCP server out of the controlled area.</p>
-----------------	--

### Deployment

- Enable DHCP Snooping on S to realize DHCP packet monitoring.
- Set the port on S connecting to B as trusted to transfer response packets.
- Set the rest of ports on S as untrusted to filter response packets.

## 14.2.2 Guarding Against DHCP Packet Flooding

### Scenario

Potential malicious DHCP clients in a network may send high-rate DHCP packets. As a result, legitimate users cannot obtain IP addresses, and access devices are highly loaded or even break down. It is necessary to take actions to ensure network stability.

With the DHCP Snooping rate limit function for DHCP packets, a DHCP client can only send DHCP request packets at a rate below the limit.

- The request packets from a DHCP client are sent at a rate below the limit.
- Packets sent at rates beyond the limit will be discarded.

### Deployment

- Enable DHCP Snooping on S to realize DHCP monitoring.
- Limit the rates of DHCP packets from the untrusted ports.

## 14.2.3 Guarding Against Forged DHCP Packets

### Scenario

Potential malicious clients in a network may forge DHCP request packets, consuming applicable IP addresses from the servers and probably preempting legal users' IP addresses. Therefore, it is necessary to filter out illegal DHCP packets.

For example, as shown in the figure below, the DHCP request packets sent from DHCP clients will be checked.

- The source MAC address fields of the request packets from DHCP clients must match the **chaddr** fields of DHCP packets.
- The Release packets and Decline packets from clients must match the entries in the DHCP Snooping binding database.

Figure 14-2

<b>Remarks:</b>	S is an access device. A and C are user PCs. B is a DHCP server within the controlled area.
-----------------	---

### Deployment

- Enable DHCP Snooping on S to realize DHCP monitoring.
- Set the port on S connecting to B as trusted to transfer response packets.
- Set the rest of ports on S as untrusted to filter response packets.
- Enable DHCP Snooping Source MAC Verification on untrusted ports of S to filter out illegal packets.

## 14.2.4 Guarding Against IP/MAC Spoofing

### Scenario

Check IP packets from untrusted ports to filter out forged IP packets based on IP or IP-MAC fields.

For example, in the following figure, the IP packets sent by DHCP clients are validated.

- The source IP address fields of IP packets must match the IP addresses assigned by DHCP.
- The source MAC address fields of layer-2 packets must match the **chaddr** fields in DHCP request packets from clients.

Figure 14-3

<b>Remarks:</b>	<p>S is an access device.</p> <p>A and C are user PCs.</p> <p>B is a DHCP server within the controlled area.</p>
-----------------	--

### Deployment

- Enable DHCP Snooping on S to realize DHCP monitoring.
- Set all downlink ports on the S as DHCP Snooping untrusted.
- Enable IP Source Guard on S to filter IP packets.
- Enable IP Source Guard in IP-MAC based mode to check the source MAC and IP address fields of IP packets.

## 14.2.5 Preventing Lease of IP Addresses

### Scenario

Validate the source addresses of IP packets from untrusted ports compared with DHCP-assigned addresses.

If the source addresses, connected ports, and layer-2 source MAC addresses of ports in IP packets do not match the assignments of the DHCP server, such packets will be discarded.

The networking topology scenario is the same as that shown in the previous figure.

### Deployment

- The same as that in the section "Guarding Against IP/MAC Spoofing".

## 14.2.6 Detecting ARP Attacks

### Scenario

Check the ARP packets from untrusted ports and filter out the ARP packets unmatched with the assignments of the DHCP server.

For example, in the following figure, the ARP packets sent from DHCP clients will be checked.

- The ports receiving ARP packets, the layer-2 MAC addresses, and the source MAC addresses of ARP packets senders shall be consistent with the DHCP Snooping histories.

Figure 14-4

**Remarks:**

S is an access device.  
 A and C are user PCs.  
 B is a DHCP server within the controlled area.

### Deployment

- Enable DHCP Snooping on S to realize DHCP monitoring.
- Set all downlink ports on the S as untrusted.
- Enable IP Source Guard and ARP Check on all the untrusted ports on S to realize ARP packet filtering.

**⚠** All the above security control functions are only effective to DHCP Snooping untrusted ports.

## 14.3 Features

### Basic Concepts

#### ➤ DHCP Request Packets

Request packets are sent from a DHCP client to a DHCP server, including DHCP-DISCOVER packets, DHCP-REQUEST packets, DHCP-DECLINE packets, DHCP-RELEASE packets and DHCP-INFORM packets.

### ↘ DHCP Response Packets

Response packets are sent from a DHCP server to a DHCP client, including DHCP-OFFER packets, DHCP-ACK packets and DHCP-NAK packets.

### ↘ DHCP Snooping Trusted Ports

IP address request interaction is complete via broadcast. Therefore, illegal DHCP services will influence normal clients' acquisition of IP addresses and lead to service spoofing and stealing. To prevent illegal DHCP services, DHCP Snooping ports are divided into two types: trusted ports and untrusted ports. The access devices only transmit DHCP response packets received on trusted ports, while such packets from untrusted ports are discarded. In this way, we may configure the ports connected to a legal DHCP Server as trusted and the other ports as untrusted to shield illegal DHCP Servers.

On switches, all switching ports or layer-2 aggregate ports are defaulted as untrusted, while trusted ports can be specified.

### ↘ DHCP Snooping Packet Suppression

To shield all the DHCP packets on a specific client, we can enable DHCP Snooping packet suppression on its untrusted ports.

### ↘ VLAN-based DHCP Snooping

DHCP Snooping can work on a VLAN basis. By default, when DHCP Snooping is enabled, it is effective to all the VLANs of the current client. Specify VLANs help control the effective range of DHCP Snooping flexibly.

### ↘ DHCP Snooping Binding Database

In a DHCP network, clients may set static IP addresses randomly. This increases not only the difficulty of network maintenance but also the possibility that legal clients with IP addresses assigned by the DHCP server may fail to use the network normally due to address conflict. Through snooping packets between clients and servers, DHCP Snooping summarizes the user entries including IP addresses, MAC address, VLAN ID (VID), ports and lease time to build the DHCP Snooping binding database. Combined with ARP detection and ARP check, DHCP Snooping controls the reliable assignment of IP addresses for legal clients.

### ↘ DHCP Snooping Rate Limit

DHCP Snooping rate limit function can be configured through the rate limit command of Network Foundation Protection Policy (NFPP). For NFPP configuration, see the *Configuring NFPP*.

### ↘ DHCP Option82

DHCP Option82, an option for DHCP packets, is also called DHCP Relay Agent Information Option. As the option number is 82, it is known as Option82. Option82 is developed to enhance the security of DHCP servers and improve the strategies of IP address assignment. The option is often configured for the DHCP relay services of a network access device like DHCP Relay

and DHCP Snooping. This option is transparent to DHCP clients, and DHCP relay components realize the addition and deduction of the option.

➤ **Illegal DHCP Packets**

Through DHCP Snooping, validation is performed on the DHCP packets passing through a client. Illegal DHCP packets are discarded, user information is recorded into the DHCP Snooping binding database for further applications (for example, ARP detection). The following types of packets are considered illegal DHCP packets.

- The DHCP response packets received on untrusted ports, including DHCP-ACK, DHCP-NACK and DHCP-OFFER packets
- The DHCP request packets carrying gateway information **giaddr**, which are received on untrusted ports
- When MAC verification is enabled, packets with source MAC addresses different with the value of the **chaddr** field in DHCP packets
- DHCP-RELEASE packets with the entry in the DHCP Snooping binding database Snooping while with untrusted ports inconsistent with settings in this binding database
- DHCP packets in wrong formats, or incomplete

**Overview**

Feature	Description
<a href="#">Filtering DHCP packets</a>	Perform legality check on DHCP packets and discard illegal packets (see the previous section for the introduction of illegal packets). Transfer requests packets received on trusted ports only.
<a href="#">Building the DHCP Snooping binding database</a>	Snoop the interaction between DHCP clients and the server, and generate the DHCP Snooping binding database to provide basis for other filtering modules.

**14.3.1 Filtering DHCP Packets**

Perform validation on DHCP packets from untrusted ports. Filter out the illegal packets as introduced in the previous section "Basic Concepts".

**Working Principle**

During snooping, check the receiving ports and the packet fields of packets to realize packet filtering, and modify the destination ports of packets to realize control of transmit range of the packets.

➤ **Checking Ports**

In receipt of DHCP packets, a client first judges whether the packet receiving ports are DHCP Snooping trusted ports. If yes, legality check and binding entry addition are skipped, and packets are transferred directly. For not, both the check and addition are needed.

➤ **Checking Packet Encapsulation and Length**

A client checks whether packets are UDP packets and whether the destination port is 67 or 68. Check whether the packet length match the length field defined in protocols.

### ↘ Checking Packet Fields and Types

According to the types of illegal packet introduced in the section "Basic Concepts", check the fields **giaddr** and **chaddr** in packets and then check whether the restrictive conditions for the type of the packet are met.

## Related Configuration

### ↘ Enabling Global DHCP Snooping

By default, DHCP Snooping is disabled.

It can be enabled on a device using the **ip dhcp snooping** command.

Global DHCP Snooping must be enabled before VLAN-based DHCP Snooping is applied.

### ↘ Configuring VLAN-based DHCP Snooping

By default, when global DHCP Snooping is effective, DHCP Snooping is effective to all VLANs.

Use the [ **no** ] **ip dhcp snooping vlan** command to enable DHCP Snooping on specified VLANs or delete VLANs from the specified VLANs. The value range of the command parameter is the actual range of VLAN numbers.

### ↘ Configuring DHCP Snooping Source MAC Verification

By default, the layer-2 MAC addresses of packets and the **chaddr** fields of DHCP packets are not verified.

When the **ip dhcp snooping verify mac-address** command is used, the source MAC addresses and the **chaddr** fields of the DHCP request packets sent from untrusted ports are verified. The DHCP request packets with different MAC addresses will be discarded.

## 14.3.2 Building the Binding Database

DHCP Snooping detects the interactive packets between DHCP clients and the DHCP server, and generate entries of the DHCP Snooping binding database according to the information of legal DHCP packets. All these legal entries are provided to other security modules of a client as the basis of filtering packets from network.

## Working Principle

During snooping, the binding database is updated timely based on the types of DHCP packets.

### ↘ Generating Binding Entries

When a DHCP-ACK packet on a trusted port is snooped, the client's IP address, MAC address, and lease time field are extracted together with the port ID (a wired interface index) and VLAN ID. Then, a binding entry of it is generated.

### ↘ Deleting Binding Entries

When the recorded lease time of a binding entry is due, it will be deleted if a legal DHCP-RELEASE/DHCP-DECLINE packet sent by the client or a DHCP-NCK packet received on a trusted port is snooped, or the **clear** command is used.

## Related Configuration

No configuration is needed except enabling DHCP Snooping.

## 14.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring basic functions of DHCP Snooping</a>	 (Mandatory) It is used to enable DHCP Snooping.	
	<b>ip dhcp snooping</b>	Enables DHCP Snooping.
	<b>ip dhcp snooping suppression</b>	Enables DHCP Snooping packet suppression.
	<b>ip dhcp snooping vlan</b>	Enables VLAN-based DHCP Snooping.
	<b>ip dhcp snooping verify mac-address</b>	Configures DHCP Snooping source MAC verification.
	<b>ip dhcp snooping database write-delay</b>	Writes the DHCP Snooping binding database to Flash periodically.
	<b>ip dhcp snooping database write-to-flash</b>	Writes the DHCP Snooping binding database to Flash manually.
	<b>renew ip dhcp snooping database</b>	Imports Flash storage to the DHCP Snooping Binding database.
	<b>ip dhcp snooping trust</b>	Configures DHCP Snooping trusted ports.
	<b>ip dhcp snooping bootp</b>	Enables BOOTP support.
<a href="#">Configuring Option82</a>	 (Optional) It is used to optimize the address assignment by DHCP servers.	
	<b>ip dhcp snooping information option</b>	Adds Option82 functions to DHCP request packets.
	<b>ip dhcp snooping information option format remote-id</b>	Configures the sub-option <b>remote-id</b> of Option82 as a user-defined character string.
	<b>ip dhcp snooping vlan information option format-type circuit-id string</b>	Configures the sub-option <b>circuit-id</b> of Option82 as a user-defined character string.

### 14.4.1 Configuring Basic Features

#### Configuration Effect

- Enable DHCP Snooping.
- Generate the DHCP Snooping binding database.
- Control the transmit range of DHCP packets.
- Filter out illegal DHCP packets.

#### Notes

- The ports on clients connecting a trusted DHCP server must be configured as trusted.
- DHCP Snooping is effective on the wired switching ports, layer-2 aggregate ports, and layer-2 encapsulation sub-interfaces, as well as WLAN interfaces. The configuration is implemented in interface configuration mode.

## Configuration Steps

### ↘ Enabling Global DHCP Snooping

- Mandatory.
- Unless otherwise noted, the feature should be configured on access devices.

### ↘ Enabling or Disabling VLAN-based DHCP Snooping

- DHCP Snooping can be disabled if not necessary for some VLANs.
- Unless otherwise noted, the feature should be configured on access devices.

### ↘ Configuring DHCP Snooping Trusted Ports

- Mandatory.
- Configure the ports connecting a trusted DHCP server as trusted.

### ↘ Enabling DHCP Snooping Source MAC Validation

- This configuration is required if the **chaddr** fields of DHCP request packets match the layer-2 source MAC addresses of data packets.
- Unless otherwise noted, the feature should be enabled on all the untrusted ports of access devices.

### ↘ Writing the DHCP Snooping Binding Database to Flash Periodically

- Enable this feature to timely save the DHCP Snooping binding database information in case that client reboot.
- Unless otherwise noted, the feature should be configured on access devices.

### ↘ Enabling BOOTP Support

- Optional
- Unless otherwise noted, the feature should be configured on access devices.

## Verification

Configure a client to obtain network configurations through the DHCP protocol.

- Check whether the DHCP Snooping Binding database is generated with entries on the client.

## Related Commands

### ↘ Enabling or Disabling DHCP Snooping

Command	[ no ] ip dhcp snooping
---------	-------------------------

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After global DHCP Snooping is enabled, you can check DHCP Snooping using the <b>show ip dhcp snooping</b> command.

### ↘ Configuring VLAN-based DHCP Snooping

<b>Command</b>	[ no ] ip dhcp snooping vlan { <i>vlan-rng</i>   { <i>vlan-min</i> [ <i>vlan-max</i> ] } }
<b>Parameter Description</b>	<i>vlan-rng</i> : Indicates the range of VLANs <i>vlan-min</i> : The minimum VLAN ID <i>vlan-max</i> : The maximum VLAN ID
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to enable or disable DHCP Snooping on specified VLANs. This feature is available only after global DHCP Snooping is enabled.

### ↘ Configuring DHCP Snooping Packet Suppression

<b>Command</b>	[ no ] ip dhcp snooping suppression
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to reject all DHCP request packets at the port, that is, to forbid all users under the port to apply for addresses via DHCP.

### ↘ Configuring DHCP Snooping Source MAC Verification

<b>Command</b>	[ no ] ip dhcp snooping verify mac-address
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Through the source MAC address verification, the MAC addresses in link headers and the CLIENT MAC fields in the request packets sent by a DHCP CLIENT are checked for consistence. When the source MAC address verification fails, packets will be discarded.

### ↘ Writing DHCP Snooping Database to Flash Periodically

<b>Command</b>	[ no ] ip dhcp snooping database write-delay [ <i>time</i> ]
<b>Parameter Description</b>	<i>time</i> : Indicates the interval between two times of writing the DHCP Snooping database to the Flash.

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to write the DHCP Snooping database to FLASH document. This can avoid binding information loss which requires re-obtaining IP addresses to resume communication after the device restarts.

### ✚ Writing the DHCP Snooping Database to Flash Manually

<b>Command</b>	<b>ip dhcp snooping database write-to-flash</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to write the dynamic user information in the DHCP Snooping database in FLASH documents in real time.  If a device is upgraded from a non-QinQ version to a QinQ version (or vice versa), binding entries cannot be restored from FLASH documents because of version differences between FLASH documents.

### ✚ Importing Flash Storage to the DHCP Snooping Binding Database

<b>Command</b>	<b>renew ip dhcp snooping database</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged configuration mode
<b>Usage Guide</b>	Use this command to import the information from Flash documents to the DHCP Snooping binding database.

### ✚ Configuring DHCP Snooping Trusted Ports

<b>Command</b>	<b>[ no ] ip dhcp snooping trust</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure a port connected to a legal DHCP server as a trusted port. The DHCP response packets received by trusted ports are transferred, while those received by untrusted ports are discarded.

### ✚ Enabling or Disabling BOOTP Support

<b>Command</b>	<b>[ no ] ip dhcp snooping bootp</b>
<b>Parameter Description</b>	N/A

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to support the BOOTP protocol.

## Configuration Example

### DHCP Client Obtaining IP addresses Dynamically from a Legal DHCP Server

<p><b>Scenario</b></p> <p><b>Figure 14-5</b></p>	 <p>The diagram illustrates a network topology for DHCP snooping. At the top is a DHCP Server. Below it is Switch A, connected to the server. Switch A is connected to Switch B via a link labeled 'Gi 0/1' on both ends. Switch B is connected to a group of DHCP Clients, represented by a dashed oval containing several computer icons. The label 'DHCP Client' is placed below the oval.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable DHCP Snooping on an access device (Switch B in this case).</li> <li>● Configure the uplink port (port Gi 0/1 in this case) as a trusted port.</li> </ul>
<p><b>B</b></p>	<pre>B#configure terminal Enter configuration commands, one per line. End with CNTL/Z. B(config)#ip dhcp snooping B(config)#interface gigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)#ip dhcp snooping trust B(config-if-GigabitEthernet 0/1)#end</pre>
<p><b>Verification</b></p>	<p>Check the configuration on Switch B.</p> <ul style="list-style-type: none"> <li>● Check whether DHCP Snooping is enabled, and whether the configured DHCP Snooping trusted port is uplink.</li> <li>● Check the DHCP Snooping configuration on Switch B, and especially whether the trusted port is correct.</li> </ul>
<p><b>B</b></p>	<pre>B#show running-config ! ip dhcp snooping !</pre>

```

interface GigabitEthernet 0/1

B#show ip dhcp snooping

Switch DHCP Snooping status           :   ENABLE
DHCP Snooping Verification of hwaddr status :   DISABLE
DHCP Snooping database write-delay time  :   0 seconds
DHCP Snooping option 82 status          :   DISABLE
DHCP Snooping Support BOOTP bind status  :   DISABLE

Interface           Trusted           Rate limit (pps)
-----
GigabitEthernet 0/1   YES             unlimited

B#show ip dhcp snooping binding

Total number of bindings: 1

MacAddress           IPAddress           Lease(sec)   Type           VLAN   Interface
-----
0013.2049.9014      172.16.1.2      86207        dhcp-snooping 1      GigabitEthernet 0/11

```

### Common Errors

- The uplink port is not configured as a DHCP trusted port.
- Another access security option is already configured for the uplink port, so that a DHCP trusted port cannot be configured.

## 14.4.2 Configuring Option82

### Configuration Effect

- Enable a DHCP server to obtain more information and assign addresses better.
- The Option82 function is client-oblivious.

### Notes

- The Option82 functions for DHCP Snooping and DHCP Relay are mutually exclusive.

### Configuration Steps

- To realize optimization of address allocation, implement the configuration.
- Unless otherwise noted, enable this function on access devices with DHCP Snooping enabled.

### Verification

Check whether the DHCP Snooping configuration options are configured successfully.

## Related Commands

### Adding Option82 to DHCP Request Packets

<b>Command</b>	[ no ] ip dhcp snooping information option [ standard-format ]
<b>Parameter Description</b>	<b>standard-format</b> : Indicates a standard format of the Option82 options
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to add Option82 to DHCP request packets so that a DHCP server assigns addresses according to such information.

### Configuring Sub-option remote-id of Option82 as User-defined Character String

<b>Command</b>	[ no ] ip dhcp snooping information option format remote-id { string ASCII-string   hostname }
<b>Parameter Description</b>	<b>string ASCII-string</b> : Indicates the content of the extensible format, the Option82 option <b>remote-id</b> , is a user-defined character string <b>hostname</b> : Indicates the content of the extensible format, the Option82 option <b>remote-id</b> , is a host name.
<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure the sub-option <b>remote-id</b> of the Option82 as user-defined content, which is added to DHCP request packets. A DHCP server assigns addresses according to Option82 information.

### Configuring Sub-Option circuit -id of Option82 as User-defined Character String

<b>Command</b>	[ no ] ip dhcp snooping vlan <i>vlan-id</i> information option format-type circuit-id string <i>ascii-string</i>
<b>Parameter Description</b>	<i>vlan-id</i> : Indicates the VLAN where a DHCP request packet is <i>ascii-string</i> : Indicates the user-defined string
<b>Configuration mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure the sub-option <b>circuit-id</b> of the Option82 as user-defined content, which is added to DHCP request packets. A DHCP server assigns addresses according to Option82 information.

## Configuration Example

### Configuring Option82 to DHCP Request Packets

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configuring basic functions of DHCP Snooping.</li> <li>Configuring Option82.</li> </ul>
<b>B</b>	<pre>Ruijie# configure terminal Ruijie(config)# ip dhcp snooping information option Ruijie(config)# end</pre>

<b>Verification</b>	Check the DHCP Snooping configuration.
<b>B</b>	<pre> B#show ip dhcp snooping  Switch DHCP Snooping status           :  ENABLE DHCP Snooping Verification of hwaddr status :  DISABLE DHCP Snooping database write-delay time  :  0 seconds DHCP Snooping option 82 status          :  ENABLE DHCP Snooping Support bootp bind status  :  DISABLE  Interface           Trusted           Rate limit (pps) ----- GigabitEthernet 0/1  YES              unlimited                 </pre>

### Common Errors

- N/A

## 14.5 Monitoring

### Clearing

 Running the clear commands may lose vital information and thus interrupt services.

Description	Command
Clears the DHCP Snooping binding database.	<b>clear ip dhcp snooping binding [ ip ] [ mac ] [ vlan vlan-id ] [ interface interface-id ]</b>

### Displaying

Description	Command
Displays DHCP Snooping configuration.	<b>show ip dhcp snooping</b>
Displays the DHCP Snooping binding database.	<b>show ip dhcp snooping binding</b>

### Debugging

 System resources are occupied when debugging information is output. Disable the debugging switch immediately after use.

Description	Command
Debugs DHCP Snooping events.	<b>debug snooping ipv4 event</b>
Disables debugging DHCP Snooping	<b>no debug snooping ipv4 event</b>

events.	
Debugs DHCP Snooping packets.	<b>debug snooping ipv4 packet</b>
Disables debugging DHCP Snooping packets.	<b>no debug snooping ipv4 packet</b>

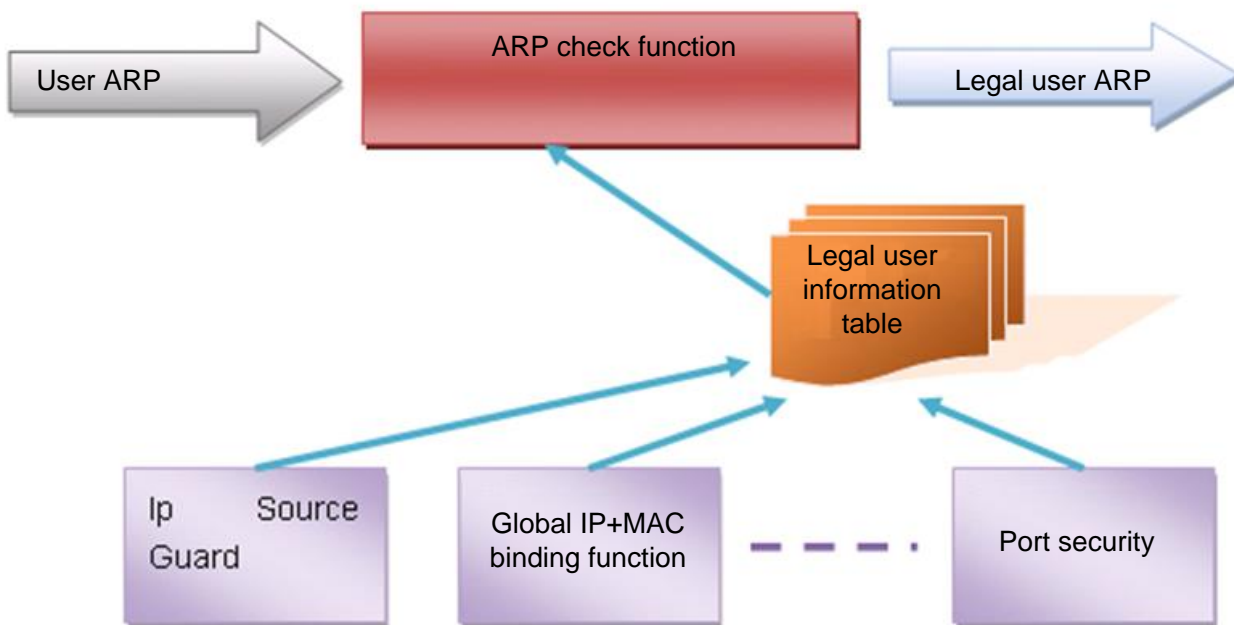

# 15 Configuring ARP Check

## 15.1 Overview

The Address Resolution Protocol (ARP) packet check filters all ARP packets under ports (including wired layer-2 switching ports, layer-2 aggregate ports (APs), and layer-2 encapsulation sub-interfaces) and discards illegal ARP packets, so as to effectively prevent ARP deception via networks and to promote network stability. On devices supporting ARP check, illegal ARP packets in networks will be ignored according to the legal user information (IP-based or IP-MAC based) generated by security application modules such as IP Source Guard, global IP+MAC binding, 802.1X authentication, GSN binding, Web authentication and port security.

Figure 15-1

The above figure shows that security modules generate legal user information (IP-based or IP-MAC based). ARP Check uses the information to detect whether the Sender IP fields or the <Sender IP, Sender MAC>fields in all ARP packets at ports matches those in the list of legal user information. If not, all unlisted ARP packets will be discarded.

### Protocols and Standards

- RFC826: An Ethernet Address Resolution Protocol or Converting Network Protocol Addresses

## 15.2 Applications

Application	Description
-------------	-------------

[Filtering ARP packets in Networks](#) | Illegal users in networks launch attacks using forged ARP packets.

### 15.2.1 Filtering ARP Packets in Networks

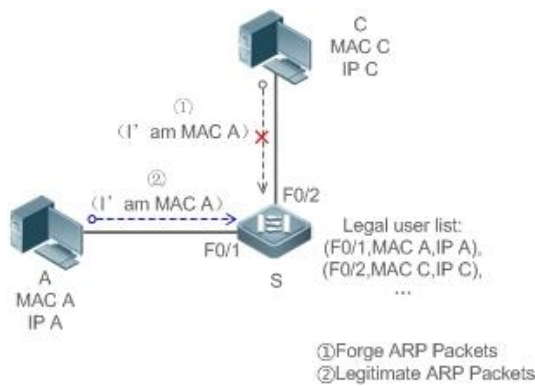

#### Scenario

Check ARP packets from distrusted ports and filter out ARP packets with addresses not matching the results assigned by the DHCP server.

For example, in the following figure, the ARP packets sent by DHCP clients are checked.

- The ports receiving ARP packets, the source MAC addresses of ARP packets, and the source IP addresses of ARP packets shall be consistent with the snooped DHCP-assigned records.

Figure 15-2

**Remarks:** S is an access device.  
 A and C are user PCs.

#### Deployment

- Enable DHCP Snooping on S to realize DHCP monitoring.
- Set all the downlink ports on S as DHCP distrusted ports.
- Enable IP Source Guard and ARP Check on all distrusted ports on S to realize ARP packet filtration.

## 15.3 Features

### Basic Concepts

#### Compatible Security Modules

Presently, the ARP Check supports the following security modules.

- IP-based: IP-based mode: port security, and static configuration of IP Source Guard.
- IP-MAC based: IP-MAC based mode: port security, global IP+MAC binding, 802.1X authorization, IP Source Guard, GSN binding, and Web authentication.

## Two Modes of APR Check

The ARP Check has two modes: Enabled and Disabled. The default is Enabled.

### 1. Enabled Mode

Through ARP Check, ARP packets are detected based on the IP/IP-MAC based binding information provided by the following modules.

- Global IP-MAC binding
- 802.1X authorization
- IP Source Guard
- GSN binding
- Port security
- Web authentication
- Port security IP+MAC binding or IP binding

 When only ARP Check is enabled on a port but the above-mentioned modules are not enabled, legal user information cannot be generated, and thereby all ARP packets from this port will be discarded.

 When the ARP Check and VRRP functions are enabled on an interface, if the physical IP address and virtual IP address of the interface can be used as the gateway address, the physical IP address and VRRP IP address need to be permitted to pass. Otherwise, ARP packets sent to the gateway will be filtered out.

### 2. Disabled Mode

ARP packets on a port are not checked.

## Overview

Feature	Description
<a href="#">Filtering ARP Packets</a>	Check the source IP and source MAC addresses of ARP packets to filter out illegal ARP packets.

### 15.3.1 Filtering ARP Packets

Enable ARP Check on specified ports to realize filtration of illegal ARP packets.

#### Working Principle

A device matches the source IP and source MAC addresses of the ARP packets received at its ports with the legal user information of the device. With successful matching, packets will be transferred, or otherwise they will be discarded.

#### Related Configuration

##### Enabling ARP Check on Ports

By default, the ARP Check is disabled on ports.

Use the `arp-check` command to enable ARP Check.

Unless otherwise noted, this function is usually configured on the ports of access devices.

## 15.4 Configuration

Configuration	Description and Command
<a href="#">Configuring ARP Check</a>	 (Mandatory) It is used to enable APR Check.
	<code>arp-check</code> Enables ARP Check.

### 15.4.1 Configuring ARP Check

#### Configuration Effect

- Illegal ARP packets are filtered out.

#### Notes

- When ARP Check is enabled, the number of policies or users of related security applications may decrease.
- ARP Check cannot be configured on mirrored destination ports.
- ARP Check cannot be configured on the trusted ports of DHCP Snooping.
- ARP Check cannot be configured on global IP+MAC exclude ports.
- ARP Check can be enabled only on wired switching ports, layer-2 APs, as well as layer-2 encapsulation sub-interfaces. Enable ARP check for the wired in interface configuration mode.

#### Configuration Steps

##### ▾ Enabling ARP Check

- (Mandatory) The function is disabled by default. To use the ARP Check function, an administrator needs to run a command to enable it.

#### Verification

- Use the `show run` command to display the system configuration.
- Use the `show interface { interface-type interface-number } arp-check list` command to display filtering entries.

#### Related Commands

##### ▾ Enabling ARP Check

Command	<code>arp-check</code>
Parameter	N/A
Description	

<b>Command</b>	Interface configuration mode
<b>Usage Guide</b>	Generate ARP filtration information according to the legal user information of security application modules to filter out illegal ARP packets in networks.

### Configuration Example

 The following configuration example introduces only ARP Check related configurations.

#### ↳ Enabling ARP Check on ports

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Enable ARP Check. Restricted ARP packets must conform to entries of IP Source Guard, port security, or global IP+MAC binding.</li> </ul>				
	<pre> Ruijie# configure terminal Ruijie(config)#address-bind 192.168.1.3 00D0.F800.0003 Ruijie(config)#address-bind install Ruijie(config)#ip source binding 00D0.F800.0002 vlan 1 192.168.1.4 interface gigabitEthernet 0/1 Ruijie(config)# interface GigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#arp-check Ruijie(config-if-GigabitEthernet 0/1)#ip verify source port-security Ruijie(config-if-GigabitEthernet 0/1)#switchport port-security Ruijie(config-if-GigabitEthernet 0/1)#switchport port-security binding 00D0.F800.0001 vlan 1 192.168.1.1 Ruijie(config-if-GigabitEthernet 0/1)#exit Ruijie(config)#interface gigabitEthernet 0/4 Ruijie(config-if-GigabitEthernet 0/4)#switchport port-security Ruijie(config-if-GigabitEthernet 0/4)#switchport port-security binding 192.168.1.5 Ruijie(config-if-GigabitEthernet 0/4)#arp-check Ruijie(config-if-GigabitEthernet 0/4)#exit Ruijie(config)#interface gigabitEthernet 0/5 Ruijie(config-if-GigabitEthernet 0/5)#arp-check Ruijie(config-if-GigabitEthernet 0/5)#end                     </pre>				
<b>Verification</b>	Use the <b>show interface arp-check list</b> command to display the effective ARP Check list for interfaces.				
	<pre> Ruijie# show interface arp-check list                     </pre> <table border="1"> <thead> <tr> <th>INTERFACE</th> <th>SENDER MAC</th> <th>SENDER IP</th> <th>POLICY SOURCE</th> </tr> </thead> </table>	INTERFACE	SENDER MAC	SENDER IP	POLICY SOURCE
INTERFACE	SENDER MAC	SENDER IP	POLICY SOURCE		

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable ARP Check. Restricted ARP packets must conform to entries of IP Source Guard, port security, or global IP+MAC binding.</li> </ul>
	<pre> Ruijie# configure terminal Ruijie(config)#address-bind 192.168.1.3 00D0.F800.0003 Ruijie(config)#address-bind install Ruijie(config)#ip source binding 00D0.F800.0002 vlan 1 192.168.1.4 interface gigabitEthernet 0/1 Ruijie(config)# interface GigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#arp-check Ruijie(config-if-GigabitEthernet 0/1)#ip verify source port-security Ruijie(config-if-GigabitEthernet 0/1)#switchport port-security Ruijie(config-if-GigabitEthernet 0/1)#switchport port-security binding 00D0.F800.0001 vlan 1 192.168.1.1 Ruijie(config-if-GigabitEthernet 0/1)#exit Ruijie(config)#interface gigabitEthernet 0/4 Ruijie(config-if-GigabitEthernet 0/4)#switchport port-security Ruijie(config-if-GigabitEthernet 0/4)#switchport port-security binding 192.168.1.5 Ruijie(config-if-GigabitEthernet 0/4)#arp-check Ruijie(config-if-GigabitEthernet 0/4)#exit Ruijie(config)#interface gigabitEthernet 0/5 Ruijie(config-if-GigabitEthernet 0/5)#arp-check Ruijie(config-if-GigabitEthernet 0/5)#end                     </pre>
<b>Verification</b>	<p>Use the <b>show interface arp-check list</b> command to display the effective ARP Check list for interfaces.</p>
	<pre> ----- GigabitEthernet 0/1      00d0.f800.0003      192.168.1.3      address-bind GigabitEthernet 0/1      00d0.f800.0001      192.168.1.1      port-security GigabitEthernet 0/1      00d0.f800.0002      192.168.1.4      DHCP snooping GigabitEthernet 0/4      00d0.f800.0003      192.168.1.3      address-bind GigabitEthernet 0/4      192.168.1.5        port-security GigabitEthernet 0/5      00d0.f800.0003      192.168.1.3      address-bind                     </pre>

### Common Errors

- If ARP packets at a port need to be checked but APR-Check is disabled, then APR-Check will not be effective.

## 15.5 Monitoring

### Displaying

Description	Command
Displays the effective ARP Check list based on ports.	<b>show interface</b> [ <i>interface-type interface-number</i> ] <b>arp-checklist</b>

# 16 Configuring Dynamic ARP Inspection

## 16.1 Overview

Dynamic Address Resolution Protocol (ARP) inspection (DAI) checks the validity of received ARP packets. Invalid ARP packets will be discarded.

DAI ensures that only valid ARP packets can be forwarded by devices. DAI mainly performs the following steps:

- Intercepts all ARP request packets and ARP reply packets on untrusted ports in the virtual local area networks (VLANs) where the DAI function is enabled.
- Checks the validity of intercepted ARP packets according to user records stored in a security database.
- Discards the ARP packets that do not pass the validity check.
- Sends the ARP packets that pass the validity check to the destination.
- The DAI validity criteria are the same as those of ARP Check. For details, see the *Configuring ARP Check*.

DAI and ARP Check have same functions. The only difference is that DAI takes effect by VLAN whereas ARP Check takes effect by port.

### Protocols and Standards

- RFC826: An Ethernet Address Resolution Protocol or Converting Network Protocol Addresses

## 16.2 Applications

Application	Description
<a href="#">ARP Spoofing Prevention</a>	Prevent ARP spoofing that is mounted by taking advantage of ARP defects.

### 16.2.1 ARP Spoofing Prevention

#### Scenario

Due to inherent defects, ARP does not check the validity of received ARP packets. Attackers can take advantage of the defects to mount ARP spoofing. A typical example is man-in-the-middle (MITM) attack. See Figure 16-1.

Figure 16-1

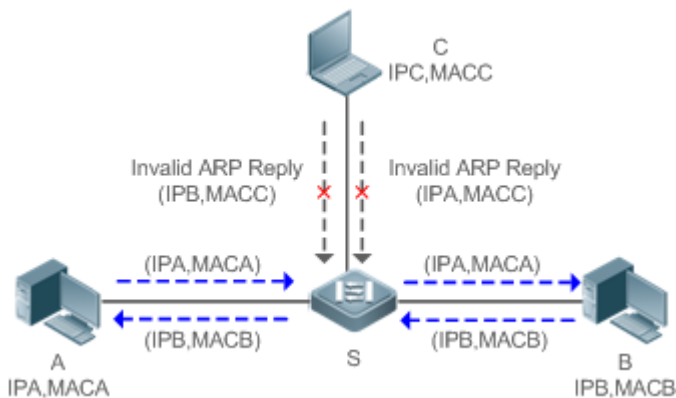

<b>Remarks</b>	<p>Device S is a Ruijie access switch enabled with DAI.</p> <p>User A and User B are connected to Device S, and they are in the same subnet.</p> <p>User C is a malicious user connected to Device S.</p> <p>IP A and MAC A are the IP address and MAC address of User A.</p> <p>IP B and MAC B are the IP address and MAC address of User B.</p> <p>IP C and MAC C are the IP address and MAC address of User C.</p>
----------------	---

When User A needs to initiate network layer communication with User B, User A broadcasts an ARP request in the subnet to query the MAC address of User B. Upon receiving the ARP request packet, User B updates its ARP cache with IP A and MAC A, and sends an ARP reply. Upon receiving the ARP reply packet, User A updates its ARP cache with IP B and MAC B.

In this model, User C can make the ARP entry mapping between User A and User B incorrect by continuously broadcasting ARP reply packets to the network. The reply packets contain IP A, IP B, and MAC C. After receiving these reply packets, User A stores the ARP entry (IP B, MAC C), and User B stores the ARP entry (IP A, MAC C). As a result, the communication between User A and User B is directed to User C, without the knowledge of User A and User B. Here User C acts as the man in the middle by modifying received packets and forwarding them to User A or User B.

If Device S is enabled with DAI, it will filter out forged ARP packets to prevent ARP spoofing as long as the IP and MAC addresses of User A and User B meet the validity criteria described in section 16.1 Overview. Figure 16-2 shows the working process of DAI.

Figure 16-2

<b>Remarks</b>	<p>Device S is a Ruijie access switch enabled with DAI.</p> <p>User A and User B are connected to Device S, and they are in the same subnet.</p> <p>User C is a malicious user connected to Device S.</p> <p>IP A and MAC A are the IP address and MAC address of User A.</p> <p>IP B and MAC B are the IP address and MAC address of User B.</p> <p>IP C and MAC C are the IP address and MAC address of User C.</p>
----------------	---

The ARP packets of User A and User B are forwarded normally by Device S. The forged ARP packets of User C are discarded because the packets do not match the records in the security database of Device S.

## Deployment

- Enable DHCP Snooping on Device S.
- Enable DAI and IP Source Guard on Device S.

## 16.3 Features

### Basic Concepts

#### Trust Status of Ports and Network Security

ARP packet check is performed according to the trust status of ports. DAI considers packets received from trusted ports as valid without checking their validity, but it checks the validity of packets received from untrusted ports.

For a typical network configuration, you should configure Layer-2 ports connected to network devices as trusted ports, and configure Layer-2 ports connected to hosts as untrusted ports.

 Network communication may be affected if a Layer-2 port connected to a network device is configured as an untrusted port.

### Overview

Feature	Description
<a href="#">Invalid ARP Packet Filter</a>	Checks the source IP addresses and MAC addresses of ARP packets to filter out invalid packets.
<a href="#">DAI Trusted Port</a>	Permits the ARP packets received from specific ports to pass through without checking their validity.

#### 16.3.1 Invalid ARP Packet Filter

Enable DAI in a specific VLAN to filter out invalid ARP packets. The DAI validity criteria are the same as those of ARP Check.

### Working Principle

Upon receiving an ARP packet, the device matches the IP address and MAC address of the packet with the valid user records in its security database. If the packet matches a record, it will be forwarded normally. If it does not match any record, it will be discarded.

DAI and ARP Check use the same set of valid user records. For details, see the packet validity check description in the *Configuring ARP Check*.

## Related Configuration

### ↳ Enabling DAI in a VLAN

By default, DAI is disabled in VLANs.

Run the **ip arp inspection vlan** *vlan-id* command to enable DAI in a specific VLAN.

 After DAI is enabled in a VLAN, DAI may not take effect on all ports in the VLAN. A DHCP Snooping trusted port does not perform DAI check.

### ↳ Disabling DAI in a VLAN

By default, DAI is disabled in VLANs.

After DAI is enabled in a VLAN, you can run the **no ip arp inspection vlan** *vlan-id* command to disable DAI.

 Disabling DAI in a VLAN does not mean disabling packet validity check on all ports in the VLAN. The ports with ARP Check effective still check the validity of received ARP packets.

## 16.3.2 DAI Trusted Port

Configure specific device ports as DAI trusted ports.

### Working Principle

The validity of ARP packets received from trusted ports is not checked. The ARP packets received from untrusted ports are checked against the user records in a security database.

## Related Configuration

### ↳ Configuring DAI Trusted Ports

By default, all ports are untrusted ports.

Run the **ip arp inspection trust** command to set ports to trusted state.

 A port already enabled with access security control cannot be set to DAI trusted state. To set the port to DAI trusted state, first disable access security control.

 In normal cases, uplink ports (ports connected to network devices) can be configured as DAI trusted ports.

## 16.4 Configuration

Configuration	Description and Command
<a href="#">Configuring DAI</a>	 (Optional) It is used to enable ARP packet validity check.
	<code>ip arp inspection vlan</code> Enables DAI.
	<code>ip arp inspection trust</code> Configures DAI trusted ports.

### 16.4.1 Configuring DAI

#### Configuration Effect

- Check the validity of incoming ARP packets in a specific VLAN.

#### Notes

- DAI cannot be enabled on DHCP Snooping trusted ports.

#### Configuration Steps

##### ▾ Enabling ARP Packet Validity Check in a Specific VLAN

- Optional.
- Perform this configuration when you need to enable ARP packet validity check on all ports in a VLAN.
- Perform this configuration on Ruijie access devices unless otherwise specified.

##### ▾ Configuring DAI Trusted Ports

- Optional.
- It is recommended to configure uplink ports as DAI trusted ports after DAI is enabled. Otherwise, the uplink ports enabled with other security features and set to trusted state accordingly may filter out valid ARP packets due to the absence of DAI user entries.
- Perform this configuration on Ruijie access devices unless otherwise specified.

##### ▾ Configuring the ARP Packet Reception Rate

- For details, see the rate limit command description in the *Configuring the NFPP*.

#### Verification

- Construct invalid ARP packets by using a packet transfer tool and check whether the packets are filtered out on DAI-enabled devices.
- Run the **show** command to check the device configuration.

#### Related Commands

### ▾ Enabling DAI

<b>Command</b>	<b>ip arp inspection vlan</b> { <i>vlan-id</i>   <i>word</i> }
<b>Parameter</b>	<i>vlan-id</i> : Indicates a VLAN ID.
<b>Description</b>	<i>word</i> : Indicates the VLAN range string, such as 1, 3–5, 7, and 9–11.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring DAI Trusted Ports

<b>Command</b>	<b>ip arp inspection trust</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure a DAI trusted port so that the ARP packets received by the port can pass through without validity check.

## Configuration Example

### ▾ Allowing Users' PCs to Use only Addresses Allocated by a DHCP Server to Prevent ARP Spoofing

<b>Scenario</b> Figure 16-3	 <p>The diagram illustrates a network setup for preventing ARP spoofing. A central switch, labeled 'Switch A', is connected to a 'DHCP Server' via its GigabitEthernet 0/3 (Gi 0/3) port. Switch A also has two other GigabitEthernet ports, Gi 0/1 and Gi 0/2, which are connected to two separate 'DHCP Client' devices. These two clients are grouped together within a dashed oval labeled 'VLAN 2'.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>⚠ Enable DHCP Snooping on the access switch (Switch A) and configure its uplink port (GigabitEthernet 0/3) connected to the valid DHCP server as a trusted port.</li> <li>⚠ Enable IP Source Guard on Switch A.</li> <li>⚠ Enable DAI.</li> </ul>
<b>Switch A</b>	<pre>A#configure terminal Enter configuration commands, one per line. End with CNTL/Z. A(config)#vlan 2</pre>

	<pre>A(config-vlan)#exit A(config)#interface range gigabitEthernet 0/1-2 A(config-if-range)#switchport access vlan 2 A(config-if-range)#ip verify source A(config-if-range)#exit A(config)#ip dhcp snooping A(config)#ip arp inspection vlan 2 A(config)#interface gigabitEthernet 0/3 A(config-if-GigabitEthernet 0/3)#switchport access vlan 2 A(config-if-GigabitEthernet 0/3)#ip dhcp snooping trust A(config-if-GigabitEthernet 0/3)#ip arp inspection trust</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether DHCP Snooping, IP Source Guard, and DAI are enabled and whether trusted ports are configured correctly.</li> <li>● Check whether the uplink port on Switch A is a DHCP Snooping trusted port.</li> <li>● Check whether DAI is enabled successfully in the VLAN and the uplink ports are DAI trusted ports.</li> </ul>
<b>Switch A</b>	<pre>A#show running-config A#show ip dhcp snooping A#show ip arp inspection vlan</pre>

### Common Errors

- A port with security control enabled is configured as a DAI trusted port.

## 16.5 Monitoring

### Displaying

Description	Command
Displays the DAI state of a specific VLAN.	<b>show ip arp inspection vlan</b> [ <i>vlan-id</i>   <i>word</i> ]
Displays the DAI configuration state of each Layer-2 port.	<b>show ip arp inspection interface</b>

# 17 Configuring IP Source Guard

## 17.1 Overview

**i** The IP Source Guard function realizes hardware-based IP packet filtering to ensure that only the users having their information in the binding database can access networks normally, preventing users from forging IP packets.

## 17.2 Applications

Application	Description
<a href="#">Guarding Against IP/MAC Spoofing Attack</a>	In network environments, users are not allowed to launch attacks by privately setting IP addresses or forging IP packets.

### 17.2.1 Guarding Against IP/MAC Spoofing Attack

#### Scenario

Check the IP packets from DHCP untrusted ports. Forged IP packets will be filtered out based on the IP or IP-MAC field.

For example, in the following figure, the IP packets sent by DHCP clients are checked.

- The Source IP Address fields of IP packets should match DHCP-assigned IP addresses.
- The Source MAC Address fields of layer-2 packets should match the MAC addresses in DHCP request packets from clients.

Figure 17-1

<b>Remarks:</b>	S is a network access server (NAS). A and C are user PCs. B is a DHCP server within the control area.
-----------------	---

#### Deployment

- Enable DHCP Snooping on S to realize DHCP monitoring.

- Set all downlink ports on S as DHCP untrusted ports.
- Enable IP Source Guard on S to realize IP packet filtering.
- Enable IP-MAC match mode for IP Source Guard on S, filtering IP packets based on IP and MAC addresses.

## 17.3 Features

### Basic Concepts

#### ↘ Source IP Address

Indicate the source IP address field of an IP packet.

#### ↘ Source MAC Address

Indicate the source MAC address field of an IP packet.

#### ↘ IP-based Filtering

Indicate a policy of IP packet filtering, where only the source IP addresses of all IP packets (except DHCP packets) passing through a port are checked. It is the default filtering policy of IP Source Guard.

#### ↘ IP-MAC based Filtering

A policy of IP packet filtering, where both the source IP addresses and source MAC addresses of all IP packets are checked, and only those user packets with these IP addresses and MAC addresses existing in the binding database are permitted.

#### ↘ Address Binding Database

As the basis of security control of the IP Source Guard function, the data in the address binding database comes from two ways: the DHCP Snooping binding database and static configuration. When IP Source Guard is enabled, the data of the DHCP Snooping binding database is synchronized to the address binding database of IP Source Guard, so that IP packets can be filtered strictly through IP Source Guard on a device with DHCP Snooping enabled.

#### ↘ Excluded VLAN

By default, when IP Source Guard is enabled on a port, it is effective to all the VLANs under the port. Users may specify excluded VLANs, within which IP packets are not checked and filtered, which means that such IP packets are not controlled by IP Source Guard. At most 32 excluded VLANs can be specified for a port.

### Overview

Feature	Description
<a href="#">Checking Source Address Fields of Packets</a>	Filter the IP packets passing through ports by IP-based or IP-MAC based filtering.

### 17.3.1 Checking Source Address Fields of Packets

Filter the IP packets passing through ports based on source IP addresses or on both source IP addresses and source MAC addresses to prevent malicious attack by forging packets. When there is no need to check and filter IP packets within a VLAN, an excluded VLAN can be specified to release such packets.

#### Working Principle

When IP Source Guard is enabled, the source addresses of packets passing through a port will be checked. The port can be a wired switching port, a layer-2 aggregate port (AP), or a layer-2 encapsulation sub-interface. Such packets will pass the port only when the source address fields of the packets match the set of the address binding records generated by DHCP Snooping, or the static configuration set by the administrator. There are two matching modes as below.

##### ↘ IP-based Filtering

Packets are allowed to pass a port only if the source IP address fields of them belong to the address binding database.

##### ↘ IP-MAC Based Filtering

Packets are allowed to pass a port only when both the layer-2 source MAC addresses and layer-3 source IP addresses of them match an entry in the address binding database.

##### ↘ Specifying Excluded VLAN

Packets within such a VLAN are allowed to pass a port without check or filtering.

#### Related Configuration

##### ↘ Enabling IP Source Guard on a Port

By default, the IP Source Guard is disabled on ports.

It can be enabled using the **ip verify source** command.

- 
- i** Usually IP Source Guard needs to work with DHCP Snooping. Therefore, DHCP Snooping should also be enabled. DHCP Snooping can be enabled at any time on Ruijie devices, either before or after IP Source Guard is enabled.
- 

##### ↘ Configuring a Static Binding

By default, legal users passing IP Source Guard check are all from the binding database of DHCP Snooping.

Bound users can be added using the **ip source binding** command.

##### ↘ Specifying an Excluded VLAN

By default, IP Source Guard is effective to all the VLANs under a port.

Excluded VLANs may be specified which are exempted from IP Source Guard using the **ip verify source exclude-vlan** command.

- 
- i** Excluded VLANs can be specified only after IP Source Guard is enabled on a port. Specified excluded VLANs will be deleted automatically when IP Source Guard is disabled on a port.
-

 The above-mentioned port can be a wired switching port, a layer-2 AP port or a layer-2 encapsulation sub-interface.

## 17.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring IP Source Guard</a>	 (Mandatory) It is used to enable IP Source Guard.	
	<b>ip verify source</b>	Enables IP Source Guard on a port.
	<b>ip source binding</b>	Configures a static binding.
	<b>ip verify source exclude-vlan</b>	Specifies an excluded VLAN for IP Source Guard.

### 17.4.1 Configuring IP Source Guard

#### Configuration Effect

- Check input IP packets to filter out invalid IP packets.

#### Notes

- The enabling of IP Source Guard may affect forwarding of IP packets. In general, this function needs to be used in combination with DHCP Snooping.
- IP Source Guard cannot be configured on DHCP Snooping trusted ports.
- IP Source Guard cannot be configured on global IP+MAC exclude ports.
- IP Source Guard can be configured only on wired exchange ports, Layer-2 AP ports and Layer-2 encapsulation subinterfaces. The function is configured in interface configuration mode in the case of wired access.

#### Configuration Steps

- Enable DHCP Snooping.
- Enable IP Source Guard.

#### Verification

Use the monitoring commands to display the address binding database of IP Source Guard.

#### Related Commands

##### Enabling IP Source Guard on a Port

<b>Command</b>	<b>ip verify source [port-security]</b>
<b>Parameter Description</b>	<b>port-security:</b> Enable IP-MAC based filtering.
<b>Command</b>	Interface configuration mode
<b>Usage Guide</b>	Detection of users based on IP address or both IP and MAC addresses can be realized by enabling IP

	Source Guard for a port.
--	--------------------------

### ▾ Configuring a Static Binding

<b>Command</b>	<b>ip source binding</b> <i>mac-address</i> <b>vlan</b> <i>vlan-id</i> <i>ip-address</i> { <b>interface</b> <i>interface-id</i>   <b>ip-mac</b>   <b>ip-only</b> }
<b>Parameter Description</b>	<p><b>mac-address:</b> The MAC address of a static binding</p> <p><b>Vlan-id:</b> The VLAN ID of a static binding.</p> <p><b>ip-address:</b> The IP address of a static binding</p> <p><i>interface-id:</i> The Port ID (PID) of a static binding</p> <p><b>ip-mac:</b> IP-MAC based mode</p> <p><b>ip-only:</b> IP-based mode</p>
<b>Configuration Mode</b>	Global configuration mode
<b>Usage Guide</b>	Through this command, legitimate users can pass IP Source Guard detection instead of being controlled by DHCP.

### ▾ Specifying an Exception VLAN for IP Source Guard

<b>Command</b>	<b>ip verify source exclude-vlan</b> <i>vlan-id</i>
<b>Parameter Description</b>	<b>vlan-id:</b> A VLAN ID exempted from IP Source Guard on a port
<b>Command</b>	Interface configuration mode
<b>Usage Guide</b>	By using this command, the specified VLANs under a port where IP Source Guard function is enabled can be exempted from check and filtering.

## Configuration Example

### ▾ Enabling IP Source Guard on Port 1

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable DHCP Snooping.</li> <li>● Enable IP Source Guard.</li> </ul>
	<pre>Ruijie(config)# interface GigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# ip verify source Ruijie(config-if-GigabitEthernet 0/1)# end</pre>
<b>Verification</b>	Displays the address filtering table of IP Source Guard.
	<pre>Ruijie# show ip verify source</pre>

### ▾ Configuring a Static Binding

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable DHCP Snooping.</li> <li>● Enable IP Source Guard.</li> <li>● Configure a static binding.</li> </ul>
----------------------------	---

	<pre>Ruijie# configure terminal Ruijie(config)# ip source binding 00d0.f801.0101 vlan 1 192.168.4.243 interface GigabitEthernet 0/3 Ruijie(config)# end</pre>																																				
<b>Verification</b>	Display the address filtering table of IP Source Guard.																																				
	<pre>Ruijie# show ip verify source</pre> <table border="1"> <thead> <tr> <th>NO.</th> <th>INTERFACE</th> <th>FilterType</th> <th>FilterStatus</th> <th>IPADDRESS</th> <th>MACADDRESS</th> </tr> </thead> <tbody> <tr> <td></td> <td>VLAN TYPE</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td colspan="6">-----</td> </tr> <tr> <td>1</td> <td>GigabitEthernet 0/3</td> <td>UNSET</td> <td>Inactive-restrict-off</td> <td>192.168.4.243</td> <td></td> </tr> <tr> <td></td> <td>00d0.f801.0101 1 Static</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>2</td> <td>GigabitEthernet 0/1</td> <td>IP-ONLY</td> <td>Active</td> <td>Deny-All</td> <td></td> </tr> </tbody> </table>	NO. ### 📌 Specifying an Excluded VLAN

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable DHCP Snooping.</li> <li>● Enable IP Source Guard.</li> </ul>
	<pre>Ruijie(config)# interface GigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# ip verify source Ruijie(config-if-GigabitEthernet 0/1)# ip verify exclude-vlan 1 Ruijie(config-if)# end</pre>
<b>Verification</b>	Display the configuration of excluded VLANs specified on a port.
	<pre>Ruijie# show run</pre>

### Common Errors

- Enable IP Source Guard on a trusted port under DHCP Snooping.
- Specify an excluded VLAN before IP Source Guard is enabled.

## 17.5 Monitoring

### Displaying

Description	Command
Displays the address filtering table of IP Source Guard.	<b>show ip verify source</b> [ <b>interface</b> <i>interface-id</i>   <b>wlan</b> <i>wlan-id</i> ]

Displays the address binding database of IP Source Guard.	<b>show ip source binding</b>
---	-------------------------------

## 18 Configuring NFPP

### 18.1 Overview

Network Foundation Protection Policy (NFPP) provides guards for switches.

Malicious attacks are always found in the network environment. These attacks bring heavy burdens to switches, resulting in high CPU usage and operational troubles. These attacks are as follows:

Denial of Service (DoS) attacks may consume lots of memory, entries, or other resources of a switch, which will cause system service termination.

Massive attack traffic is directed to the CPU, occupying the entire bandwidth of the CPU. In this case, normal protocol traffic and management traffic cannot be processed by the CPU, causing protocol flapping or management failure. The forwarding in the data plane will also be affected and the entire network will become abnormal.

A great number of attack packets directed to the CPU consume massive CPU resources, making the CPU highly loaded and thereby influencing device management and performance.

NFPP can effectively protect the system from these attacks. Facing attacks, NFPP maintains the proper running of various system services with a low CPU load, thereby ensuring the stability of the entire network.

### 18.2 Applications

Application	Description
<a href="#">Attack Rate Limiting</a>	Due to various malicious attacks such as ARP attacks and IP scanning attacks in the network, the CPU cannot process normal protocol and management traffics, causing protocol flapping or management failure. The NFPP attack rate limiting function is used to limit the rate of attack traffic or isolate attack traffic to recover the network.
<a href="#">CentralizedBandwidth Allocation</a>	If normal service traffics are too large, you need to classify and prioritize the traffics. When a large number of packets are directed to the CPU, the CPU will be highly loaded, thereby causing device management or device running failure. The centralized bandwidth distribution function is used to increase the priority of such traffics so that switches can run stably.

#### 18.2.1 Attack Rate Limiting

##### Scenario

NFPP supports attack detection and rate limiting for various types of packets, including Address Resolution Protocol (ARP), Internet Control Message Protocol (ICMP), and Dynamic Host Configuration Protocol (DHCP) packets. It also allows users to define packet matching characteristics and corresponding attack detection and rate limiting policies. The attack rate limiting

function takes effect based on types of packets. This section uses ARP packets as an example scenario to describe the application.

If an attacker floods ARP attack packets while CPU capability is insufficient, most of the CPU resources will be consumed for processing these ARP packets. If the rate of attacker's ARP packet rates exceeds the maximum ARP bandwidth specified in the CPU Protect Policy (CPP) of the switch, normal ARP packets may be dropped. As shown in Figure 18-1, normal hosts will fail to access the network, and the switch will fail to send ARP replies to other devices.

Figure18-1

## Deployment

- By default, the ARP attack detection and rate limiting function is enabled with corresponding policies configured. If the rate of an attacker's ARP packets exceeds the rate limit, the packets are discarded. If it exceeds the attack threshold, a monitoring user is generated and prompt information is exported.
- If the rate of an attacker's ARP packets exceeds the rate limit defined in CPP and affects normal ARP replies, you can enable attack isolation to discard ARP attack packets based on the hardware and recover the network.

**i** For details about CPP-related configurations, see the *Configuring CPU Protection*.

**i** To maximize the use of NFPP guard functions, modify the rate limits of various services in CPP based on the application environment or use the configurations recommended by the system. You can run the **show cpu-protect summary** command to display the configurations.

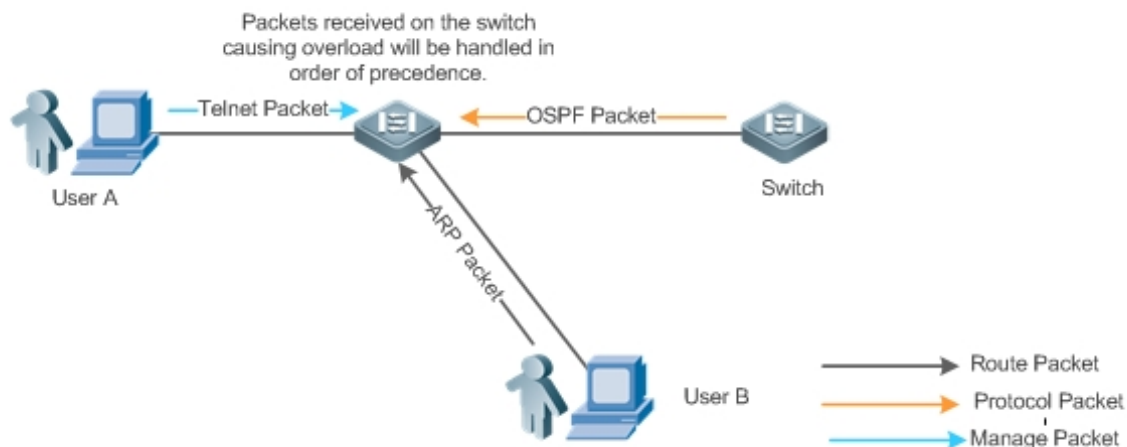

## 18.2.2 Centralized Bandwidth Allocation

### Scenario

A switch classifies services defined in CPP into three types: Manage, Route, and Protocol. Each type of services has an independent bandwidth. Different types of services cannot share their bandwidths. Traffics with bandwidths exceeding the thresholds will be discarded. By such service classification, service packets are processed by orders of precedence.

As shown in Figure 18-2, the switch receives a large number of Telnet packets, OSPF packets, and ARP packets, causing CPU overload. In this case, the CPU cannot process all packets, and a large quantity of packets are backlogged in the queue, causing various problems such as frequent Telnet disconnection, OSPF protocol flapping, and ARP access failure on hosts.

Figure 18-2

## Deployment

- By default, CPU centralized bandwidth allocation is enabled to assign an independent bandwidth and bandwidth ratio to each type of services. At the time, the CPU first processes Telnet packets to ensure uninterrupted connection of Telnet service, and then processes OSPF packets to maintain OSPF protocol stability, and finally processes ARP packets.
- If the preceding problems still occur in default configurations, you can accordingly adjust the bandwidths and bandwidth ratios of various types of services.

## 18.3 Features

### Basic Concepts

#### ↳ ARP Guard

In local area networks (LANs), IP addresses are mapped to MAC addresses through ARP, which has a significant role in safeguarding network security. ARP-based DoS attacks mean that a large number of unauthorized ARP packets are sent to the gateway through the network, causing the failure of the gateway to provide services for normal hosts. To prevent such attacks, limit the rate of ARP packets and identify and isolate the attack source.

#### ↳ IP Guard

Many hacker attacks and network virus intrusions start from scanning active hosts in the network. Therefore, many scanning packets rapidly occupy the network bandwidth, causing network communication failure.

To solve this problem, Ruijie Layer-3 switches provide IP guard function to prevent hacker scanning and Blaster Worm viruses and reduce the CPU load. Currently, there are mainly two types of IP attacks:

Scanning destination IP address changes: As the greatest threat to the network, this type of attacks not only consumes network bandwidth and increases device load but also is a prelude of most hacker attacks.

Sending IP packets to non-existing destination IP addresses at high rates: This type of attacks is mainly designed for consuming the CPU load. For a Layer-3 device, if the destination IP address exists, packets are directly forwarded by the switching chip without occupying CPU resources. If the destination IP address does not exist, IP packets are sent to the CPU, which then sends ARP requests to query the MAC address corresponding to the destination IP address. If too many packets are sent to the CPU, CPU resources will be consumed. This type of attack is less destructive than the former one.

To prevent the latter type of attack, limit the rate of IP packets and find and isolate the attack source.

### ↳ ICMP Guard

ICMP is a common approach to diagnose network failures. After receiving an ICMP echo request from a host, the router or switch returns an ICMP echo reply. The preceding process requires the CPU to process the packets, thereby definitely consuming part of CPU resources. If an attacker sends a large number of ICMP echo requests to the destination device, massive CPU resources on the device will be consumed heavily, and the device may even fail to work properly. This type of attacks is called ICMP flood. To prevent this type of attacks, limit the rate of ICMP packets and find and isolate the attack source.

### ↳ DHCP Guard

DHCP is widely used in LANs to dynamically assign IP addresses. It is significant to network security. Currently, the most common DHCP attack, also called DHCP exhaustion attack, uses faked MAC addresses to broadcast DHCP requests. Various attack tools on the Internet can easily complete this type of attack. A network attacker can send sufficient DHCP requests to use up the address space provided by the DHCP server within a period. In this case, authorized hosts will fail to request DHCP IP addresses and thereby fail to access the network. To prevent this type of attacks, limit the rate of DHCP packets and find and isolate the attack source.

### ↳ DHCPv6 Guard

DHCP version 6 (DHCPv6) is widely used in LANs to dynamically assign IPv6 addresses. Both DHCP version 4 (DHCPv4) and DHCPv6 have security problems. Attacks to DHCPv4 apply also to DHCPv6. A network attacker can send a large number of DHCPv6 requests to use up the address space provided by the DHCPv6 server within a period. In this case, authorized hosts will fail to request IPv6 addresses and thereby fail to access the network. To prevent this type of attacks, limit the rate of DHCPv6 packets and find and isolate the attack source.

### ↳ ND Guard

Neighbor Discovery (ND) is mainly used in IPv6 networks to perform address resolution, router discovery, prefix discovery, and redirection. ND uses five types of packets: Neighbor Solicitation (NS), Neighbor Advertisement (NA), Router Solicitation (RS), Router Advertisement (RA), and Redirect. These packets are called ND packets.

ND snooping listens to ND packets in the network to filter unauthorized ND packets. It also monitors IPv6 hosts in the network and bind monitored ones to ports to prevent IPv6 address stealing. ND snooping requires ND packets to be sent to the CPU. If ND packets are sent at a very high rate, the CPU will be attacked. Therefore, ND guard must be provided to limit the rate of ND packets.

### ↳ Self-Defined Guard

There are various types of network protocols, including routing protocols such as Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), and Routing Information Protocol (RIP). Various devices need to exchange packets through different protocols. These packets must be sent to the CPU and processed by appropriate protocols. Once the network device runs a protocol, it is like opening a window for attackers. If an attacker sends a large number of protocol packets to a network device, massive CPU resources will be consumed on the device, and what's worse, the device may fail to work properly.

Since various protocols are being continuously developed, protocols in use vary with the user environments. Ruijie devices hereby provide self-defined guard. Users can customize and flexibly configure guard types to meet guard requirements in different user environments.

## Overview

Feature	Description
<a href="#">Host-based Rate Limiting and Attack Identification</a>	Limits the rate according to the host-based rate limit and identify host attacks in the network.
<a href="#">Port-based Rate Limiting and Attack Identification</a>	Limits the rate according to the port-based rate limit and identify port attacks.
<a href="#">Monitoring Period</a>	Monitors host attackers in a specified period.
<a href="#">Isolation Period</a>	Uses hardware to isolate host attackers or port attackers in a specified period.
<a href="#">Trusted Hosts</a>	Trusts a host by not monitoring it.
<a href="#">Centralized BandwidthAllocation</a>	Classifies and prioritizes packets.

### 18.3.1 Host-based Rate Limiting and Attack Identification

Limit the rate of attack packets of hosts and identify the attacks.

Identify ARP scanning.

Identify IP scanning.

#### Working Principle

Hosts can be identified in two ways: based on the source IP address, VLAN ID, and port and based on the link-layer source MAC address, VLAN ID, and port. Each host has a rate limit and an attack threshold (also called alarm threshold). The rate limit must be lower than the attack threshold. If the attack packet rate exceeds the rate limit of a host, the host discards the packets beyond the rate limit. If the attack packet rate exceeds the attack threshold of a host, the host identifies and logs the host attacks, and sends traps.

ARP scanning attack may have occurred if ARP packets beyond the scanning threshold received in the configured period meet either of the following conditions:

- The link-layer source MAC address is fixed but the source IP address changes.
- The link-layer source MAC address and source IP address are fixed but the destination IP address continuously changes.

Among IP packets beyond the scanning threshold received in the configured period, if the source IP address remains the same while the destination IP address continuously changes, IP scanning attack may have occurred.

- i** When NFPP detects a specific type of attack packets under a service, it sends a trap to the administrator. If the attack traffic persists, NFPP will not resend the alarm until 60 seconds later.
- i** To prevent CPU resource consumption caused by frequent log printing, NFPP writes attack detection logs to the buffer, obtains them from the buffer at a specified rate, and prints them. NFPP does not limit the rate of traps.

## Related Configuration

Use ARP guard as an example:

### Configuring the Global Host-based Rate Limit, Attack Threshold, and Scanning Threshold

In NFPP configuration mode:

Run the **arp-guard rate-limit** {**per-src-ip** | **per-src-mac**} *pps* command to configure rate limits of hosts identified based on the source IP address, VLAN ID, and port and hosts identified based on the link-layer source MAC address, VLAN ID, and port.

Run the **arp-guard attack-threshold** {**per-src-ip** | **per-src-mac**} *pps* command to configure attack thresholds of hosts identified based on the source IP address, VLAN ID, and port and hosts identified based on the link-layer source MAC address, VLAN ID, and port.

Run the **arp-guard scan-threshold** *pkt-cnt* command to configure the ARP scanning threshold.

### Configuring Host-based Rate Limit and Attack Threshold, and Scanning Threshold on an Interface

In interface configuration mode:

Run the **nfpp arp-guard policy** {**per-src-ip** | **per-src-mac**} *rate-limit-pps attack-threshold-pps* command to configure rate limits and attack thresholds of hosts identified based on the source IP address, VLAN ID, and port and hosts identified based on the link-layer source MAC address, VLAN ID, and port on an interface.

Run the **nfpp arp-guard scan-threshold** *pkt-cnt* command to configure the scanning threshold on an interface.

- i** Only ARP guard and IP guard support anti-scanning at present.

## 18.3.2 Port-based Rate Limiting and Attack Identification

### Working Principle

Each port has a rate limit and an attack threshold. The rate limit must be lower than the attack threshold. If the packet rate exceeds the rate limit on a port, the port discards the packets. If the packet rate exceeds the attack threshold on a port, the port logs the attacks and sends traps.

## Related Configuration

Use ARP guard as an example:

### Configuring the Global Port-based Rate Limit and Attack Threshold

In NFPP configuration mode:

Run the **arp-guard rate-limit per-port** *pps* command to configure the rate limit of a port.

Run the **arp-guard attack-threshold per-port** *pps* command to configure the attack threshold of a port.

#### ▾ [Configuring Port-based Rate Limit and Attack Threshold on an Interface](#)

In interface configuration mode:

Run the **nfpp arp-guard policy per-port** *rate-limit-pps attack-threshold-pps* command to configure the rate limit and attack threshold of a port.

### 18.3.3 Monitoring Period

#### [Working Principle](#)

The monitoring user provides information about attackers in the current system. If the isolation period is 0 (that is, not isolated), the guard module automatically performs software monitoring on attackers in the configured monitoring period. If the isolation period is set to a non-zero value, the guard module automatically isolates the hosts monitored by software and sets the timeout period as the isolation period. The monitoring period is valid only when the isolation period is 0.

#### [Related Configuration](#)

Use ARP guard as an example:

#### ▾ [Configuring the Global Monitoring Period](#)

In NFPP configuration mode:

Run the **arp-guard monitor-period** *seconds* command to configure the monitoring period.

### 18.3.4 Isolation Period

#### [Working Principle](#)

Isolation is performed by the guard policies after attacks are detected. Isolation is implemented using the filter of the hardware to ensure that these attacks will not be sent to the CPU, thereby ensuring proper running of the device.

Hardware isolation supports two modes: host-based and port-based isolation. At present, only ARP guard supports port-based hardware isolation.

A policy is configured in the hardware to isolate attackers. However, hardware resources are limited. When hardware resources are used up, the system prints logs to notify the administrator.

#### [Related Configuration](#)

Use ARP guard as an example:

#### ▾ [Configuring the Global Isolation Period](#)

In NFPP configuration mode:

Run the **arp-guard isolate-period** [*seconds* | **permanent**] command to configure the isolation period. If the isolation period is set to 0, isolation is disabled. If it is set to a non-zero value, the value indicates the isolation period. If it is set to **permanent**, ARP attacks are permanently isolated.

#### 📌 Configuring the Isolation Period on an Interface

In interface configuration mode:

Run the **nfpp arp-guard isolate-period** [*seconds* | **permanent**] command to configure the isolation period. If the isolation period is set to 0, isolation is disabled. If it is set to a non-zero value, the value indicates the isolation period. If it is set to **permanent**, ARP attacks are permanently isolated.

#### 📌 Enabling Isolate Forwarding

In NFPP configuration mode:

Run the **arp-guard isolate-forwarding enable** command to enable isolate forwarding.

#### 📌 Enabling Port-based Ratelimit Forwarding

In NFPP configuration mode:

Run the **arp-guard ratelimit-forwarding enable** command to enable port-based ratelimit forwarding.

---

 At present, only ARP guard supports the configuration of isolate forwarding and ratelimit forwarding.

---

## 18.3.5 Trusted Hosts

### Working Principle

If you do not want to monitor a host, you can run related commands to trust the host. This trusted host will be allowed to send packets to the CPU.

### Related Configuration

Use IP anti-scanning as an example:

#### 📌 Configuring Trusted Hosts

In NFPP configuration mode:

Run the **ip-guard trusted-host** *ip mask* command to trust a host.

Run the **trusted-host** {*mac mac\_mask* | *ip mask* | *IPv6/prefixlen*} command to trust a host for a self-defined guard.

## 18.3.6 Centralized Bandwidth Allocation

### Working Principle

Services defined in CPP are classified into three types: Manage, Route, and Protocol. (For details, see the following table.) Each type of service has an independent bandwidth. Different types of services cannot share their bandwidths. Traffics

exceeding the bandwidth thresholds are discarded. By such service classification, service packets are processed by orders of precedence.

NFPP allows the administrator to flexibly assign bandwidth for three types of packets based on the actual network environment so that Protocol and Manage packets can be first processed. Prior processing of Protocol packets ensures proper running of protocols, and prior processing of Manage packets ensures proper management for the administrator, thereby ensuring proper running of important device functions and improving the guard capability of the device.

After classified rate limiting, all types of packets are centralized in a queue. When one type of service is processed inefficiently, packets of this service will be backlogged in the queue and may finally use up resources of the queue. NFPP allows the administrator to configure the percentages of these three types of packets in the queue. When the queue length occupied by one type of packets exceeds the value of the total queue length multiplied by the percentage of this packet type, the excessive packets will be discarded. This efficiently prevents one type of packets from exclusively occupying queue resources.

Packet Type	Service Type Defined in CPP
Protocol	tp-guard, dot1x, rldp, rerp, slow-packet, bpdu, isis dhcps, gvrp, ripng, dvmrp, igmp, mpls, ospf, pim, pimv6, rip, vrrp, ospf3, dhcp-relay-s, dhcp-relay-c, option82, tunnel-bpdu, tunnel-gvrp
Route	unknown-ipmc, unknown-ipmcv6, ttl1, ttl0, udp-helper, ip4-packet-other, ip6-packet-other, non-ip-packet-other, arp
Manage	ip4-packet-local, ip6-packet-local

 For the definitions of service types, see the Configuring CPU Protection.

## Related Configuration

### Configuring the Maximum Bandwidth of Specified Packets

In global configuration mode:

Run the **cpu-protect sub-interface { manage | protocol|route} pps pps\_value** command to configure the maximum bandwidth of specified packets.

### Configuring the Maximum Percentage of Specified Packets in the Queue

In global configuration mode:

Run the **cpu-protect sub-interface { manage | protocol | route} percent percent\_value** command to configure the maximum percentage of specified packets in the queue.

## 18.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring ARP Guard</a>	<b>arp-guard enable</b>	Enables ARP guard globally.
	<b>arp-guard isolate-period</b>	Configures the global ARP-guard isolation period.
	<b>arp-guard isolate-forwarding enable</b>	Enables ARP-guard isolate forwarding.

Configuration	Description and Command	
	<b>arp-guard ratelimit-forwarding enable</b>	Enables APR-guard ratelimit forwarding.
	<b>arp-guard monitor-period</b>	Configures the global ARP-guard monitoring period.
	<b>arp-guard monitored-host-limit</b>	Configures the maximum number of ARP-guard monitored hosts.
	<b>arp-guard rate-limit</b>	Configures the global ARP-guard rate limit.
	<b>arp-guard attack-threshold</b>	Configures the global ARP-guard attack threshold.
	<b>arp-guard scan-threshold</b>	Configures the global ARP-guard scanning threshold.
	<b>nfpp arp-guard enable</b>	Enables ARP guard on an interface.
	<b>nfpp arp-guard policy</b>	Configures the APR-guard rate limit and attack threshold on an interface.
	<b>nfpp arp-guard scan-threshold</b>	Configures the APR-guard scanning threshold on an interface.
	<b>nfpp arp-guard isolate-period</b>	Configures the APR-guard isolation period on an interface.
<a href="#">Configuring IP Guard</a>	<b>ip-guard enable</b>	Enables IP guard globally.
	<b>ip-guard isolate-period</b>	Configures the global IP-guard isolation period.
	<b>ip-guard monitor-period</b>	Configures the global IP-guard monitoring period.
	<b>ip-guard monitored-host-limit</b>	Configures the maximum number of IP-guard monitored hosts.
	<b>ip-guard rate-limit</b>	Configures the global IP-guard rate limit.
	<b>ip-guard attack-threshold</b>	Configures the global IP-guard attack threshold.
	<b>ip-guard scan-threshold</b>	Configures the global IP-guard scanning threshold.
	<b>ip-guard trusted-host</b>	Configures IP-guard trusted hosts.
	<b>nfpp ip-guard enable</b>	Enables IP guard on an interface.
	<b>nfpp ip-guard policy</b>	Configures the IP-guard rate limit and attack threshold on an interface.
	<b>nfpp ip-guard scan-threshold</b>	Configures the IP-guard scanning threshold on an interface.
<b>nfpp ip-guard isolate-period</b>	Configures the IP-guard isolation period on an interface.	
<a href="#">Configuring ICMP Guard</a>	<b>icmp-guard enable</b>	Enables ICMP guard globally.
	<b>icmp-guard isolate-period</b>	Configures the global ICMP-guard isolation period.
	<b>icmp-guard monitor-period</b>	Configures the global ICMP-guard monitoring period.

Configuration	Description and Command	
	<b>icmp-guard monitored-host-limit</b>	Configures the maximum number of ICMP-guard monitored hosts.
	<b>icmp-guard rate-limit</b>	Configures the global ICMP-guard rate limit.
	<b>icmp-guard attack-threshold</b>	Configures the global ICMP-guard attack threshold.
	<b>icmp-guard trusted-host</b>	Configures ICMP-guard trusted hosts.
	<b>nfpp icmp-guard enable</b>	Enables ICMP guard on an interface.
	<b>nfpp icmp-guard policy</b>	Configures the ICMP-guard rate limit and attack threshold on an interface.
	<b>nfpp icmp-guard isolate-period</b>	Configures the ICMP-guard isolation period on an interface.
<a href="#">Configuring DHCP Guard</a>	<b>dhcp-guard enable</b>	Enables DHCP guard globally.
	<b>dhcp-guard isolate-period</b>	Configures the global DHCP-guard isolation period.
	<b>dhcp-guard monitor-period</b>	Configures the global DHCP-guard monitoring period.
	<b>dhcp-guard monitored-host-limit</b>	Configures the maximum number of DHCP-guard monitored hosts.
	<b>dhcp-guard rate-limit</b>	Configures the global DHCP-guard rate limit.
	<b>dhcp-guard attack-threshold</b>	Configures the global DHCP-guard attack threshold.
	<b>nfpp dhcp-guard enable</b>	Enables DHCP guard on an interface.
	<b>nfpp dhcp-guard policy</b>	Configures the DHCP-guard rate limit and attack threshold on an interface.
<b>nfpp dhcp-guard isolate-period</b>	Configures the DHCP-guard isolation period on an interface.	
<a href="#">Configuring DHCPv6 Guard</a>	<b>dhcpv6-guard enable</b>	Enables DHCPv6 guard globally.
	<b>dhcpv6-guard monitor-period</b>	Configures the global DHCPv6-guard monitoring period.
	<b>dhcpv6-guard monitored-host-limit</b>	Configures the maximum number of DHCPv6-guard monitored hosts.
	<b>dhcpv6-guard rate-limit</b>	Configures the global DHCPv6-guard rate limit.
	<b>dhcpv6-guard attack-threshold</b> { per-src-mac   per-port} pps	Configures the global DHCPv6-guard attack threshold.
	<b>nfpp dhcpv6-guard enable</b>	Enables DHCPv6 guard on an interface.
	<b>nfpp dhcpv6-guard policy</b>	Configures the DHCPv6-guard rate limit and attack threshold on an interface.
<a href="#">Configuring ND Guard</a>	<b>nd-guard enable</b>	Enables ND guard globally.
	<b>nd-guard ratelimit-forwarding enable</b>	Enables ND-guard ratelimit forwarding.
	<b>nd-guard rate-limit per-port</b>	Configures the global ND-guard rate limit.

Configuration	Description and Command	
	<b>nd-guard attack-threshold per-port</b>	Configures the global ND-guard attack threshold.
	<b>nfpp nd-guard enable</b>	Enables ND guard on an interface.
	<b>nfpp nd-guard policy per-port</b>	Configures the ND-guard rate limit and attack threshold on an interface.
<a href="#">Configuring a Self-Defined Guard</a>	<b>define</b>	Configures the name of a self-defined guard.
	<b>match</b>	Configures <b>match</b> fields of a self-defined guard.
	<b>global-policy</b>	Configures the global rate limit and attack threshold of a self-defined guard.
	<b>monitor-period</b>	Configures the global monitoring period of a self-defined guard.
	<b>monitored-host-limit</b>	Configures the maximum number of monitored hosts of a self-defined guard.
	<b>trusted-host</b>	Configures trusted hosts of a self-defined guard.
	<b>define name enable</b>	Enables a self-defined guard globally.
	<b>nfpp define name enable</b>	Enables a self-defined guard on an interface.
<a href="#">Configuring NFPP Logging</a>	<b>nfpp define</b>	Configures the rate limit and attack threshold of a self-defined guard on an interface.
	<b>log-buffer entries</b>	Configures the log buffer size.
	<b>log-buffer logs</b>	Configures the log buffer rate.
	<b>logging vlan</b>	Configures VLAN-based logging filtering.
	<b>logging interface</b>	Configures interface-based logging filtering.

## 18.4.1 Configuring ARP Guard

### Configuration Effect

- ARP attacks are identified based on hosts or ports. Host-based ARP attack identification supports two modes: identification based on the source IP address, VLAN ID, and port and identification based on the link-layer source MAC address, VLAN ID, and port. Each type of attack identification has a rate limit and an attack threshold. If the ARP packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the ARP packet rate exceeds the attack threshold, the system prints alarm information and sends traps. In host-based attack identification, the system also isolates the attack source.
- ARP guard can also detect ARP scanning attacks. ARP scanning attacks indicate that the link-layer source MAC address is fixed but the source IP address changes, or that the link-layer source MAC address and source IP address are fixed but the destination IP address continuously changes. Due to the possibility of false positive, hosts possibly performing ARP scanning are not isolated and are provided for the administrator's reference only.
- Configure ARP-guard isolation to assign hardware-isolated entries against host attacks so that attack packets are neither sent to the CPU nor forwarded.

### Notes

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.
- ARP guard prevents only ARP DoS attacks to the switch, but not ARP spoofing or ARP attacks in the network.
- For trusted ports configured for Dynamic ARP Inspection (DAI), ARP guard does not take effect, preventing false positive of ARP traffic over the trusted ports. For details about DAI trusted ports, see the Configuring Dynamic ARP Inspection.

## Configuration Steps

### ↳ Enabling ARP Guard

- (Mandatory) ARP guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.
- If ARP guard is disabled, the system automatically clears monitored hosts, scanned hosts, and isolated entries on ports.

### ↳ Configuring the ARP-Guard Isolation Period

- (Optional) ARP-guard isolation is disabled by default.
- If the packet traffic of attackers exceeds the rate limit defined in CPP, you can configure the isolation period to discard packets and therefore to save bandwidth resources.
- The isolation period can be configured in NFPP configuration mode or interface configuration mode.
- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

### ↳ Enabling ARP-Guard Isolate Forwarding

- (Optional) ARP-guard isolate forwarding is enabled by default.
- To make isolation valid only at the management plane instead of the forwarding plane, you can enable this function.
- This function can be enabled in NFPP configuration mode.

### ↳ Enabling ARP-Guard Ratelimit Forwarding

- (Optional) This function is enabled by default.
- If the port-based isolation entry takes effect, you can enable this function to pass some of the packets while not discarding all of them.
- This function can be enabled in NFPP configuration mode.

### ↳ Configuring the ARP-Guard Monitoring Period

- (Mandatory) The default ARP-guard monitoring period is 600 seconds.
- If the ARP-guard isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in NFPP configuration mode.

### ↘ **Configuring the Maximum Number of ARP-Guard Monitored Hosts**

- (Mandatory) The maximum number of ARP-guard monitored hosts is 20,000 by default.
- Set the maximum number of ARP-guard monitored hosts reasonably. As the number of monitored hosts increases, more CPU resources are used.
- The maximum number of ARP-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_ARP\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

### ↘ **Configuring the ARP-Guard Attack Threshold**

- Mandatory.
- To achieve the best ARP-guard effect, you are advised to configure the host-based rate limit and attack threshold based on the following order: Source IP address-based rate limit < Source IP address-based attack threshold < Source MAC address-based rate limit < Source MAC address-based attack threshold.
- The attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_ARP\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.
- Source MAC address-based rate limiting takes priority over source IP address-based rate limiting while the latter takes priority over port-based rate limiting.

### ↘ **Configuring the ARP-Guard Scanning Threshold**

- Mandatory.
- The scanning threshold can be configured in NFPP configuration mode or interface configuration mode.
- The ARP scanning table stores only the latest 256 records. When the ARP scanning table is full, the latest record will overwrite the earliest record.
- ARP scanning attack may have occurred if ARP packets received within 10 seconds meet either of the following conditions:
  - The link-layer source MAC address is fixed but the source IP address changes.
  - The link-layer source MAC address and source IP address are fixed but the destination IP address continuously changes, and the change times exceed the scanning threshold.

## Verification

When a host in the network sends ARP attack packets to a switch configured with ARP guard, check whether these packets can be sent to the CPU.

- If the packets exceed the attack threshold or scanning threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

## Related Commands

### ▾ Enabling ARP Guard Globally

<b>Command</b>	<b>arp-guard enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Global ARP-Guard Isolation Period

<b>Command</b>	<b>arp-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400.
<b>Description</b>	<b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling ARP-Guard Isolate Forwarding

<b>Command</b>	<b>arp-guard isolate-forwarding enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling ARP-Guard Ratelimit Forwarding

<b>Command</b>	<b>arp-guard ratelimit-forwarding enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Global ARP-Guard Monitoring Period

<b>Command</b>	<b>arp-guard monitor-period</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Maximum Number of ARP-Guard Monitored Hosts

<b>Command</b>	<b>arp-guard monitored-host-limit</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Global ARP-Guard Rate Limit

<b>Command</b>	<b>arp-guard rate-limit</b> { <b>per-src-ip</b>   <b>per-src-mac</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Limits the rate of each source IP address. <b>per-src-mac</b> : Limits the rate of each source MAC address. <b>per-port</b> : Limits the rate of each port. <i>pps</i> : Indicates the rate limit, ranging from 1 to 19,999.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Global ARP-Guard Attack Threshold

<b>Command</b>	<b>arp-guard attack-threshold</b> { <b>per-src-ip</b>   <b>per-src-mac</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Configures the attack threshold of each source IP address. <b>per-src-mac</b> : Configures the attack threshold of each source MAC address. <b>per-port</b> : Configures the attack threshold of each port. <i>pps</i> : Indicates the attack threshold, ranging from 1 to 19,999. The unit is packets per second (pps).
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

### ↘ Configuring the Global ARP-Guard Scanning Threshold

<b>Command</b>	<b>arp-guard scan-threshold</b> <i>pkt-cnt</i>
<b>Parameter Description</b>	<i>pkt-cnt</i> : Indicates the scanning threshold, ranging from 1 to 19,999.

<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling ARP Guard on an Interface

<b>Command</b>	<b>nfpp arp-guard enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	ARP guard configured in interface configuration mode takes priority over that configured in NFPP configuration mode.

### ▾ Configuring the ARP-Guard Isolation Period on an Interface

<b>Command</b>	<b>nfpp arp-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation. <b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the ARP-Guard Rate Limit and Attack Threshold on an Interface

<b>Command</b>	<b>nfpp arp-guard policy</b> { <b>per-src-ip</b>   <b>per-src-mac</b>   <b>per-port</b> } <i>rate-limit-pps</i> <i>attack-threshold-pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Configures the rate limit and attack threshold of each source IP address. <b>per-src-mac</b> : Configures the rate limit and attack threshold of each source MAC address. <b>per-port</b> : Configures the rate limit and attack threshold of each port. <i>rate-limit-pps</i> : Indicates the rate limit, ranging from 1 to 19,999. <i>attack-threshold-pps</i> : Indicates the attack threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

### ▾ Configuring the ARP-Guard Scanning Threshold on an Interface

<b>Command</b>	<b>nfpp arp-guard scan-threshold</b> <i>pkt-cnt</i>
<b>Parameter Description</b>	<i>pkt-cnt</i> : Indicates the scanning threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## 18.4.2 Configuring IP Guard

### Configuration Effect

- IP attacks are identified based on hosts or physical interfaces. In host-based IP attack identification, IP attacks are identified based on the source IP address, VLAN ID, and port. Each type of attack identification has a rate limit and an attack threshold. If the IP packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the IP packet rate exceeds the attack threshold, the system prints alarm information and sends traps. In host-based attack identification, the system also isolates the attack source.
- IP guard can also detect IP scanning attacks. IP anti-scanning applies to IP packet attacks as follows: the destination IP address continuously changes but the source IP address remains the same, and the destination IP address is not the IP address of the local device.
- Configure IP guard isolation to assign hardware-isolated entries against host attacks so that attack packets are neither sent to the CPU nor forwarded.
- IP anti-scanning applies to IP packet attacks where the destination IP address is not the local IP address. The CPP limits the rate of IP packets where the destination IP address is the local IP address.

### Notes

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.

### Configuration Steps

#### ▾ Enabling IP Guard

- (Mandatory) IP guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.
- If IP guard is disabled, the system automatically clears monitored hosts.

#### ▾ Configuring the IP-Guard Isolation Period

- (Optional) IP-guard isolation is disabled by default.
- If the packet traffic of attackers exceeds the rate limit defined in CPP, you can configure the isolation period to discard packets and therefore to save bandwidth resources.
- The isolation period can be configured in NFPP configuration mode or interface configuration mode.

- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

#### ↘ **Configuring the IP-Guard Monitoring Period**

- (Mandatory) The default IP-guard monitoring period is 600 seconds.
- If the IP-guard isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in NFPP configuration mode.

#### ↘ **Configuring the Maximum Number of IP-Guard Monitored Hosts**

- (Mandatory) The maximum number of IP-guard monitored hosts is 20,000 by default.
- Set the maximum number of IP-guard monitored hosts reasonably. As the number of monitored hosts increases, more CPU resources are used.
- The maximum number of IP-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20,000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_IP\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

#### ↘ **Configuring the IP-Guard Attack Threshold**

- Mandatory.
- The attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_IP\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.
- Source IP address-based rate limiting takes priority over port-based rate limiting.

#### ↘ **Configuring the IP-Guard Scanning Threshold**

- Mandatory.
- The scanning threshold can be configured in NFPP configuration mode or interface configuration mode.
- ARP scanning attack may have occurred if ARP packets received within 10 seconds meet the following conditions:
  - The source IP address remains the same.

- The destination IP address continuously changes and is not the local IP address, and the change times exceed the scanning threshold.

▾ **Configuring IP-Guard Trusted Hosts**

- (Optional) No IP-guard trusted host is configured by default.
- For IP guard, you can only configure a maximum of 500 IP addresses not to be monitored.
- Trusted hosts can be configured in NFPP configuration mode.
- If any entry matching a trusted host (IP addresses are the same) exists in the table of monitored hosts, the system automatically deletes this entry.
- If the table of trusted hosts is full, the system prints the log "%ERROR: Attempt to exceed limit of 500 trusted hosts." to notify the administrator.
- If a trusted host cannot be deleted, the system prints the log "%ERROR: Failed to delete trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If a host cannot be trusted, the system prints the log "%ERROR: Failed to add trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If the host to trust already exists, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 has already been configured." to notify the administrator.
- If the host to delete from the trusted table does not exist, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 is not found." to notify the administrator.
- If the memory cannot be allocated to a trusted host, the system prints the log "%ERROR: Failed to alloc memory." to notify the administrator.

**Verification**

When a host in the network sends IP attack packets to a switch configured with IP guard, check whether these packets can be sent to the CPU.

- If the rate of packets from untrusted hosts exceeds the attack threshold or scanning threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

**Related Commands**

▾ **Enabling IP Guard Globally**

<b>Command</b>	<b>ip-guard enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Global IP-Guard Isolation Period

<b>Command</b>	<b>ip-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. <b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Global IP-Guard Monitoring Period

<b>Command</b>	<b>ip-guard monitor-period</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

### ▾ Configuring the Maximum Number of IP-Guard Monitored Hosts

<b>Command</b>	<b>ip-guard monitored-host-limit</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Global IP-Guard Rate Limit

<b>Command</b>	<b>ip-guard rate-limit</b> { <b>per-src-ip</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Limits the rate of each source IP address. <b>per-port</b> : Limits the rate of each port. <i>pps</i> : Indicates the rate limit, ranging from 1 to 19,999.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Global IP-Guard Attack Threshold

<b>Command</b>	<b>ip-guard attack-threshold</b> { <b>per-src-ip</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Configures the attack threshold of each source IP address. <b>per-port</b> : Configures the attack threshold of each port. <i>pps</i> : Indicates the attack threshold, ranging from 1 to 19,999. The unit is pps.

<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

### ↘ Configuring the Global IP-Guard Scanning Threshold

<b>Command</b>	<b>ip-guard scan-threshold</b> <i>pkt-cnt</i>
<b>Parameter Description</b>	<i>pkt-cnt</i> : Indicates the scanning threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring IP-Guard Trusted Hosts

<b>Command</b>	<b>ip-guard trusted-host</b> <i>ip mask</i>
<b>Parameter Description</b>	<i>ip</i> : Indicates the IP address. <i>mask</i> : Indicates the mask of an IP address. <b>all</b> : Used with <b>no</b> to delete all trusted hosts.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If you do not want to monitor a host, you can run this command to trust the host. This trusted host can send IP packets to the CPU, without any rate limiting or alarm reporting.

### ↘ Enabling IP Guard on an Interface

<b>Command</b>	<b>nfpp ip-guard enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	IP guard configured in interface configuration mode takes priority over that configured in NFPP configuration mode.

### ↘ Configuring the IP-Guard Isolation Period on an Interface

<b>Command</b>	<b>nfpp ip-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation. <b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the IP-Guard Rate Limit and Attack Threshold on an Interface

<b>Command</b>	<b>nfpp ip-guard policy {per-src-ip   per-port} rate-limit-pps attack-threshold-pps</b>
<b>Parameter Description</b>	<p><b>per-src-ip:</b> Configures the attack threshold of each source IP address.</p> <p><b>per-port:</b> Configures the attack threshold of each port.</p> <p><i>rate-limit-pps:</i> Indicates the rate limit, ranging from 1 to 19,999.</p> <p><i>attack-threshold-pps:</i> Indicates the attack threshold, ranging from 1 to 19,999.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

↘ **Configuring the IP-Guard Scanning Threshold on an Interface**

<b>Command</b>	<b>nfpp ip-guard scan-threshold pkt-cnt</b>
<b>Parameter Description</b>	<i>pkt-cnt:</i> Indicates the scanning threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## 18.4.3 Configuring ICMP Guard

### Configuration Effect

- ICMP attacks are identified based on hosts or ports. In host-based attack identification, ICMP attacks are identified based on the source IP address, VLAN ID, and port. Each type of attack identification has a rate limit and an attack threshold. If the ICMP packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the ICMP packet rate exceeds the attack threshold, the system prints alarm information and sends traps. In host-based attack identification, the system also isolates the attack source.
- Configure ICMP guard isolation to assign hardware-isolated entries against host attacks so that attack packets are neither sent to the CPU nor forwarded.

### Notes

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.

### Configuration Steps

#### ▾ Enabling ICMP Guard

- (Mandatory) ICMP guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.
- If ICMP guard is disabled, the system automatically clears monitored hosts.

#### ▾ **Configuring the ICMP-Guard Isolation Period**

- (Optional) ICMP-guard isolation is disabled by default.
- If the packet traffic of attackers exceeds the rate limit defined in CPP, you can configure the isolation period to discard packets and therefore to save bandwidth resources.
- The isolation period can be configured in NFPP configuration mode or interface configuration mode.
- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

#### ▾ **Configuring the ICMP-Guard Monitoring Period**

- (Mandatory) The default ICMP-guard monitoring period is 600 seconds.
- If the ICMP-guard isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in NFPP configuration mode.

#### ▾ **Configuring the Maximum Number of ICMP-Guard Monitored Hosts**

- (Mandatory) The maximum number of ICMP-guard monitored hosts is 20,000 by default.
- Set the maximum number of ICMP-guard monitored hosts reasonably. As the number of actually monitored hosts increases, more CPU resources are used.
- The maximum number of ICMP-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_ICMP\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

#### ▾ **Configuring the ICMP-Guard Attack Threshold**

- Mandatory.
- The attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.

- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_ICMP\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.
- Source IP address-based rate limiting takes priority over port-based rate limiting.

### 📌 Configuring ICMP-Guard Trusted Hosts

- (Optional) No ICMP-guard trusted host is configured by default.
- For ICMP guard, you can only configure a maximum of 500 IP addresses not to be monitored.
- Trusted hosts can be configured in NFPP configuration mode.
- If any entry matching a trusted host (IP addresses are the same) exists in the table of monitored hosts, the system automatically deletes this entry.
- If the table of trusted hosts is full, the system prints the log "%ERROR: Attempt to exceed limit of 500 trusted hosts." to notify the administrator.
- If a trusted host cannot be deleted, the system prints the log "%ERROR: Failed to delete trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If a host cannot be trusted, the system prints the log "%ERROR: Failed to add trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If the host to trust already exists, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 has already been configured." to notify the administrator.
- If the host to delete from the trusted table does not exist, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 is not found." to notify the administrator.
- If the memory cannot be allocated to a trusted host, the system prints the log "%ERROR: Failed to alloc memory." to notify the administrator.

### Verification

When a host in the network sends ICMP attack packets to a switch configured with ICMP guard, check whether these packets can be sent to the CPU.

- If the rate of packets from an untrusted host exceeds the attack threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

### Related Commands

#### 📌 Enabling ICMP Guard Globally

<b>Command</b>	<b>icmp-guard enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Global ICMP-Guard Isolation Period

<b>Command</b>	<b>icmp-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation. <b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	The attacker isolation period falls into two types: global isolation period and port-based isolation period (local isolation period). For a port, if the port-based isolation period is not configured, the global isolation period is used; otherwise, the port-based isolation period is used.

### ↘ Configuring the Global ICMP-Guard Monitoring Period

<b>Command</b>	<b>icmp-guard monitor-period</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If the isolation period is 0, the system performs software monitoring on detected attackers. The timeout period is the monitoring period. During software monitoring, if the isolation period is set to a non-zero value, the system automatically performs hardware isolation against monitored attackers and sets the timeout period as the monitoring period. The monitoring period is valid only when the isolation period is 0. If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

### ↘ Configuring the Maximum Number of ICMP-Guard Monitored Hosts

<b>Command</b>	<b>icmp-guard monitored-host-limit</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted. If the table of monitored hosts is full, the system prints the log "% NFPP_ICMP_GUARD-4-SESSION_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

### ↘ Configuring the Global ICMP-Guard Rate Limit

<b>Command</b>	<b>icmp-guard rate-limit</b> { <i>per-src-ip</i>   <i>per-port</i> } <i>pps</i>
----------------	---

<b>Parameter Description</b>	<b>per-src-ip</b> : Limits the rate of each source IP address. <b>per-port</b> : Limits the rate of each port. <i>pps</i> : Indicates the rate limit, ranging from 1 to 19,999.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Global ICMP-Guard Attack Threshold

<b>Command</b>	<b>icmp-guard attack-threshold</b> { <b>per-src-ip</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Configures the attack threshold of each source IP address. <b>per-port</b> : Configures the attack threshold of each port. <i>pps</i> : Indicates the attack threshold, ranging from 1 to 19,999. The unit is pps.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring ICMP-Guard Trusted Hosts

<b>Command</b>	<b>icmp-guard trusted-host</b> <i>ip mask</i>
<b>Parameter Description</b>	<i>ip</i> : Indicates the IP address. <i>mask</i> : Indicates the mask of an IP address. <b>all</b> : Used with <b>no</b> to delete all trusted hosts.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If you do not want to monitor a host, you can run this command to trust the host. This trusted host can send ICMP packets to the CPU, without any rate limiting or alarm reporting. You can configure the mask so that no host in one network segment is monitored. You can configure a maximum of 500 trusted hosts.

### ▾ Enabling ICMP Guard on an Interface

<b>Command</b>	<b>nfpp icmp-guard enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	ICMP guard configured in interface configuration mode takes priority over that configured in NFPP configuration mode.

### ▾ Configuring the ICMP-Guard Isolation Period on an Interface

## 18.4.4 Configuring DHCP Guard

### Configuration Effect

- DHCP attacks are identified based on hosts or ports. In host-based attack identification, DHCP attacks are identified based on the link-layer source IP address, VLAN ID, and port. Each type of attack identification has a rate limit and an attack threshold. If the DHCP packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the DHCP packet rate exceeds the attack threshold, the system prints alarm information and sends traps. In host-based attack identification, the system also isolates the attack source.
- Configure DHCP guard isolation to assign hardware-isolated entries against host attacks so that attack packets are neither sent to the CPU nor forwarded.

### Notes

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.
- For trusted ports configured for DHCP snooping, DHCP guard does not take effect, preventing false positive of DHCP traffic on the trusted ports. For details about trusted ports of DHCP snooping, see "Configuring Basic Functions of DHCP Snooping" in the Configuring DHCP Snooping.

### Configuration Steps

#### 📌 Enabling DHCP Guard

- (Mandatory) DHCP guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.
- If DHCP guard is disabled, the system automatically clears monitored hosts.

#### ▾ **Configuring the DHCP-Guard Isolation Period**

- (Optional) DHCP-guard isolation is disabled by default.
- If the packet traffic of attackers exceeds the rate limit defined in CPP, you can configure the isolation period to discard packets and therefore to save bandwidth resources.
- The isolation period can be configured in NFPP configuration mode or interface configuration mode.
- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

#### ▾ **Configuring the DHCP-Guard Monitoring Period**

- (Mandatory) DHCP-guard monitoring is enabled by default.
- If the DHCP-guard isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in NFPP configuration mode.

#### ▾ **Configuring the Maximum Number of DHCP-Guard Monitored Hosts**

- (Mandatory) The maximum number of DHCP-guard monitored hosts is 20,000 by default.
- Set the maximum number of DHCP-guard monitored hosts reasonably. As the number of monitored hosts increases, more CPU resources are used.
- The maximum number of DHCP-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_DHCP\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

#### ▾ **Configuring the DHCP-Guard Attack Threshold**

- Mandatory.
- The attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.

- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_DHCP\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.
- Source MAC address-based rate limiting takes priority over port-based rate limiting.

## Verification

When a host in the network sends DHCP attack packets to a switch configured with DHCP guard, check whether these packets can be sent to the CPU.

- If the parameter of the packets exceeds the attack threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

## Related Commands

### ▾ Enabling DHCP Guard Globally

<b>Usage Guide</b>	N/A

### ▾ Configuring the Global DHCP-Guard Isolation Period

<b>Command</b>	<b>dhcp-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation. <b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	The attacker isolation period falls into two types: global isolation period and port-based isolation period (local isolation period). For a port, if the port-based isolation period is not configured, the global isolation period is used; otherwise, the port-based isolation period is used.

### ▾ Configuring the Global DHCP-Guard Monitoring Period

<b>Command</b>	<b>dhcp-guard monitor-period</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If the isolation period is 0, the system performs software monitoring on detected attackers. The timeout period is the monitoring period. During software monitoring, if the isolation period is set to a non-zero value, the system automatically performs hardware isolation against monitored attackers and sets the timeout

	<p>period as the monitoring period. The monitoring period is valid only when the isolation period is 0.</p> <p>If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.</p>
--	--

### ↘ Configuring the Maximum Number of DHCP-Guard Monitored Hosts

<b>Command</b>	<b>dhcp-guard monitored-host-limit</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	<p>If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.</p> <p>If the table of monitored hosts is full, the system prints the log "%NFPP_DHCP_GUARD-4-SESSION_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.</p>

### ↘ Configuring the Global DHCP-Guard Rate Limit

<b>Command</b>	<b>dhcp-guard rate-limit</b> { <b>per-src-mac</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<p><b>per-src-mac</b>: Limits the rate of each source MAC address.</p> <p><b>per-port</b>: Limits the rate of each port.</p> <p><i>pps</i>: Indicates the rate limit, ranging from 1 to 19,999.</p>
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Global DHCP-Guard Attack Threshold

<b>Command</b>	<b>dhcp-guard attack-threshold</b> { <b>per-src-mac</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<p><b>per-src-mac</b>: Configures the attack threshold of each source MAC address.</p> <p><b>per-port</b>: Configures the attack threshold of each port.</p> <p><i>pps</i>: Indicates the attack threshold, ranging from 1 to 19,999. The unit is pps.</p>
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ↘ Enabling DHCP Guard on an Interface

<b>Command</b>	<b>nfpp dhcp-guard enable</b>
<b>Parameter Description</b>	N/A

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	DHCP guard configured in interface configuration mode takes priority over that configured in NFPP configuration mode.

### ↘ Configuring the DHCP-Guard Isolation Period on an Interface

<b>Command</b>	<b>nfpp dhcp-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation. <b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the DHCP-Guard Rate Limit and Attack Threshold on an Interface

<b>Command</b>	<b>nfpp dhcp-guard policy</b> { <b>per-src-mac</b>   <b>per-port</b> } <i>rate-limit-pps</i> <i>attack-threshold-pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Configures the rate limit and attack threshold of each source IP address. <b>per-port</b> : Configures the rate limit and attack threshold of each port. <i>rate-limit-pps</i> : Indicates the rate limit, ranging from 1 to 19,999. <i>attack-threshold-pps</i> : Indicates the attack threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

## 18.4.5 Configuring DHCPv6 Guard

### Configuration Effect

- DHCPv6 attacks are identified based on hosts or ports. In host-based attack identification, DHCPv6 attacks are identified based on the link-layer source IP address, VLAN ID, and port. Each type of attack identification has a rate limit and an attack threshold. If the DHCPv6 packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the DHCPv6 packet rate exceeds the attack threshold, the system prints alarm information and sends traps.
- In host-based attack identification, the system also isolates the attack source.

### Notes

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.
- For trusted ports configured for DHCPv6 snooping, DHCPv6 guard does not take effect, preventing false positive of DHCPv6 traffic on the trusted ports. For details about trusted ports of DHCPv6 snooping, see "Configuring Basic Functions of DHCPv6 Snooping" in the Configuring DHCPv6 Snooping.

### Configuration Steps

#### ▾ Enabling DHCPv6 Guard

- (Mandatory) DHCPv6 guard is enabled by default.
- DHCPv6 guard can be enabled in NFPP configuration mode or interface configuration mode.

- If DHCPv6 guard is disabled, the system automatically clears monitored hosts.

#### ↘ **Configuring the DHCPv6-Guard Monitoring Period**

- (Mandatory) The default DHCPv6-guard monitoring period is 600 seconds.
- If the DHCPv6-guard isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period does not take effect.
- The DHCPv6-guard monitoring period can be configured in NFPP configuration mode.

#### ↘ **Configuring the Maximum Number of DHCPv6-Guard Monitored Hosts**

- (Mandatory) The maximum number of DHCPv6-guard monitored hosts is 20,000 by default.
- Set the maximum number of DHCPv6-guard monitored hosts reasonably. As the number of monitored hosts increases, more CPU resources are used.
- The maximum number of DHCPv6-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_DHCPV6\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

#### ↘ **Configuring the DHCPv6-Guard Attack Threshold**

- Mandatory.
- The DHCPv6-guard attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_DHCPV6\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.
- Source MAC address-based rate limiting takes priority over port-based rate limiting.

### Verification

When a host in the network sends DHCPv6 attack packets to a switch configured with DHCPv6 guard, check whether these packets can be sent to the CPU.

- If the parameter of the packets exceeds the attack threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

**Common Errors**

N/A

**18.4.6 Configuring ND Guard**

**Configuration Effect**

- AR ND guard classifies ND packets into three types based on their purposes: 1. NS and NA; 2. RS; 3. RA and Redirect. Type 1 packets are used for address resolution. Type 2 packets are used by hosts to discover the gateway. Type 3 packets are related to routing: RAs are used to advertise the gateway and prefix while Redirect packets are used to advertise a better next hop.
- At present, only port-based ND packet attack identification is supported. You can configure the rate limits and attack thresholds for these three types of packets respectively. If the ND packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the ND packet rate exceeds the attack threshold, the system prints logs and sends traps.

**Notes**

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.

- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.

## Configuration Steps

### ↳ Enabling ND Guard

- (Mandatory) ND guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.

### ↳ Enabling ND-Guard Ratelimit Forwarding

- (Optional) This function is enabled by default.
- If the port-based isolation entry takes effect, you can enable this function to pass some of the packets while not discarding all of them.
- This function can be enabled in NFPP configuration mode.

### ↳ Configuring the ND-Guard Attack Threshold

- Mandatory.
- The ND-guard attack threshold can be enabled in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If memories cannot assigned to detected attackers, the system prints the log "%NFPP\_ND\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.

## Verification

When a host in the network sends ND attack packets to a switch configured with ND guard, check whether these packets can be sent to the CPU.

- If the parameter of the packets exceeds the attack threshold, an attack log is displayed.

## 18.4.7 Configuring a Self-Defined Guard

### Configuration Effect

- Configure a self-defined guard to resolve network attack problems in special scenarios.

### Notes

- For a command that is configured both in self-defined guard configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in self-defined guard configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.
- A self-defined guard takes priority over basic guards. When configuring the match fields of self-defined guards, see the Configuration Guide.

## Configuration Steps

### ▾ Configuring the Guard Name

- (Mandatory) Configure the name of a self-defined guard to create the self-defined guard.
- The guard name must be unique, and the match fields and values must be different from those of ARP, ICMP, DHCP, IP, and DHCPv6 guards. If the parameters you want to configure already exist, a message is displayed to indicate the configuration failure.

### ▾ Configuring the Match Fields

- Mandatory.
- Self-defined packets are classified based on the following fields: **etype** (Ethernet link-layer type), **smac** (source MAC address), **dmac** (destination MAC address), **protocol** (IPv4/IPv6 protocol number), **src-ip** (source IPv4/IPv6 address), **dip** (destination IPv4/IPv6 address), **sport** (source transport-layer port), and **dport** (destination transport-layer port).
- **protocol** is valid only when the value of **etype** is **ipv4** or **ipv6**. **src-ip** and **dst-ip** are valid only when the value of **etype** is **ipv4**. **src-ipv6** and **dst-ipv6** are valid only when the value of **etype** is **ipv6**. **src-port** and **dst-port** are valid only when the value of **protocol** is **tcp** or **udp**.
- If the **match** fields and values of a self-defined guard are totally the same as those of an existing guard, the system prints the log "%ERROR: the match type and value are the same with define name (name of an existing guard)." to notify the administrator of the configuration failure.
- If **protocol** is configured but **etype** is IPv4 or IPv6 in the **match** policy, the system prints the log "%ERROR: protocol is valid only when etype is IPv4(0x0800) or IPv6(0x86dd)."
- If **src-ip** and **dst-ip** are configured but **etype** is not IPv4 in the **match** policy, the system prints the log "%ERROR: IP address is valid only when etype is IPv4(0x0800)."
- If **src-ipv6** and **dst-ipv6** are configured but **etype** is not IPv6 in the **match** policy, the system prints the log "%ERROR: IPv6 address is valid only when etype is IPv6(0x86dd)."
- If **src-port** and **dst-port** are configured but **protocol** is not TCP or UDP in the **match** policy, the system prints the log "%ERROR: Port is valid only when protocol is TCP(6) or UDP(17)."
- The following table lists guard policies corresponding to some common network protocols. The rate limits and attack thresholds listed below can meet the requirements in most network scenarios and are for reference only. You can configure valid rate limits and attack thresholds based on actual scenarios.

Protocol	match	policy per-src-ip	policy per-src-mac	policy per-port
----------	-------	-------------------	--------------------	-----------------

Protocol	match	policy per-src-ip	policy per-src-mac	policy per-port
RIP	etype 0x0800 protocol 17 dst-port 520	rate-limit 100 attatch-threshold 150	Not applicable to this policy	rate-limit 300 attatch-threshold 500
RIPng	etype 0x86dd protocol 17 dst-port 521	rate-limit 100 attatch-threshold 150	Not applicable to this policy	rate-limit 300 attatch-threshold 500
BGP	etype 0x0800 protocol 6 dst-port 179	rate-limit 1000 attatch-threshold 1200	Not applicable to this policy	rate-limit 2000 attatch-threshold 3000
BPDU	dst-mac 0180.c200.0000	Not applicable to this policy	rate-limit 20 attatch-threshold 40	rate-limit 100 attatch-threshold 100
RERP	dst-mac 01d0.f800.0001	Not applicable to this policy	rate-limit 20 attatch-threshold 40	rate-limit 100 attatch-threshold 100
REUP	dst-mac 01d0.f800.0007	Not applicable to this policy	rate-limit 20 attatch-threshold 40	rate-limit 100 attatch-threshold 100
BGP	etype 0x0800 protocol 6 dst-port 179	Not applicable to this policy	Not applicable to this policy	Not applicable to this policy
OSPFv2	etype 0x0800 protocol 89	rate-limit 800 attatch-threshold 1200	Not applicable to this policy	rate-limit 2000 attatch-threshold 3000
OSPFv3	etype 0x86dd protocol 89	rate-limit 800 attatch-threshold 1200	Not applicable to this policy	rate-limit 2000 attatch-threshold 3000
VRRP	etype 0x0800 protocol 112	rate-limit 64 attatch-threshold 100	Not applicable to this policy	rate-limit 1024 attatch-threshold 1024
IPv6 VRRP	etype 0x86dd protocol 112	rate-limit 64 attatch-threshold 100	Not applicable to this policy	rate-limit 1024 attatch-threshold 1024
SNMP	etype 0x0800 protocol 17 dst-port 161	rate-limit 1000 attatch-threshold 1200	Not applicable to this policy	rate-limit 2000 attatch-threshold 3000
RSVP	etype 0x0800 protocol 46	rate-limit 800 attatch-threshold 1200	Not applicable to this policy	rate-limit 1200 attatch-threshold 1500
LDP (UDP hello)	etype 0x0800 protocol 17 dst-port 646	rate-limit 10 attatch-threshold 15	Not applicable to this policy	rate-limit 100 attatch-threshold 150

- To contain as many existing protocol types as possible and facilitate expansion of new protocol types, self-defined guards allow hosts to freely combine type fields of packets. If the configuration is inappropriate, the network may become abnormal. Therefore, the network administrator needs to have a good knowledge of network protocols. As a reference, the following table lists valid configurations of currently known protocols for common self-defined guard policies. For other protocols not listed in the table, configure them with caution.

### ▾ Configuring the Global Rate Limit and Attack Threshold

- (Mandatory) If these parameters are not configured, the self-defined guard cannot be enabled.
- You must configure one of the `per-src-ip`, `per-src-mac`, and `per-port` fields. Otherwise, the policy cannot take effect.
- `per-src-ip` is valid only when `etype` is IPv4 or IPv6.
- The rate limit configured based on the source MAC address, VLAN ID, and port takes priority over that configured based on the source IP address, VLAN ID, and port.
- The port-based host identification policy of a self-defined guard must be consistent with the global port-based host identification policy.
- If the **per-src-ip** policy is not configured globally but configured for a port, the system prints the log "%ERROR: name (name of a self-defined guard) has not per-src-ip policy." to notify the administrator of the configuration failure.
- If the **per-src-mac** policy is not configured globally but configured for a port, the system prints the log "%ERROR: name (name of a self-defined guard) has not per-src-mac policy." to notify the administrator of the configuration failure.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_DEFINE\_GUARD-4-NO\_MEMORY: Failed to allocate memory." to notify the administrator.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.

### ▾ Configuring the Global Monitoring Period

- (Mandatory) The default monitoring period is 600 seconds.
- If the isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in self-defined guard configuration mode.
- If the isolation period is 0, the system performs software monitoring on detected attackers. The timeout period is the monitoring period. During software monitoring, if the isolation period is set to a non-zero value, the system automatically performs hardware isolation against monitored attackers and sets the timeout period as the monitoring period. The monitoring period is valid only when the isolation period is 0.
- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

### ▾ Configuring the Maximum Number of Monitored Hosts

- (Mandatory) The maximum number of monitored hosts is 20,000 by default.
- Set the maximum number of monitored hosts reasonably. As the number of monitored hosts increases, more CPU resources are used.
- The maximum number of monitored hosts can be configured in self-defined guard configuration mode.

- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_DEFINE-4-SESSION\_LIMIT: Attempt to exceed limit of name's 20000 monitored hosts." to notify the administrator.

### ▾ Configuring Trusted Hosts

- (Optional) No trusted host is configured by default.
- You can configure a maximum of 500 trusted IP address or MAC address for a self-defined guard.
- Trusted hosts can be configured in self-defined guard configuration mode.
- If you do not want to monitor a host, you can run the following commands to trust the host. This trusted host can send ICMP packets to the CPU, without any rate limiting or alarm reporting. You can configure the mask so that no host in one network segment is monitored.
- You must configure the **match** type before configuring trusted hosts. If the packet type is IPv4 in the **match** policy, you are not allowed to configure trusted IPv6 addresses. If the packet type is IPv6 in the match policy, you are not allowed to configure trusted IPv4 addresses.
- If the **match** type is not configured, the system prints the log "%ERROR: Please configure match rule first."
- If a trusted IPv4 host is added but **etype** is not IPv4 in the **match** policy, the system prints the log "%ERROR: Match type can't support IPv4 trusted host."
- If a trusted IPv6 host is added but **etype** is not IPv6 in the **match** policy, the system prints the log "%ERROR: Match type can't support IPv6 trusted host."
- If the table of trusted hosts is full, the system prints the log "%ERROR: Attempt to exceed limit of 500 trusted hosts." to notify the administrator.
- If any entry matching a trusted host (IP addresses are the same) exists in the table of monitored hosts, the system automatically deletes this entry.
- If a trusted host cannot be deleted, the system prints the log "%ERROR: Failed to delete trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If a host cannot be trusted, the system prints the log "%ERROR: Failed to add trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If the host to trust already exists, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 has already been configured." to notify the administrator.
- If the host to delete from the trusted table does not exist, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 is not found." to notify the administrator.
- If the memory cannot be allocated to a trusted host, the system prints the log "%ERROR: Failed to allocate memory." to notify the administrator.

## ↘ Enabling a Self-Defined Guard

- Mandatory.
- You have to configure at least one policy between host-based self-defined guard policy and port-based self-defined guard policy. Otherwise, the self-defined guard cannot be enabled.
- If a self-defined guard is disabled, the system automatically clears monitored hosts.
- Self-defined guards can be configured in self-defined guard configuration mode or interface configuration mode.
- If a self-defined guard policy is not completely configured, the self-defined guard cannot be enabled and a prompt is displayed to notify hosts of the missing policy configurations.
- If the name of a self-defined guard does not exist, the system prints the log "%ERROR: The name is not exist."
- If the match type is not configured for a self-defined guard, the system prints the log "%ERROR: name (name of the self-defined guard) doesn't match any type."
- If no policy is configured for a self-defined guard, the system prints the log "%ERROR: name (name of the self-defined guard) doesn't specify any policy."

## Verification

When a host in the network sends packets to a switch configured with a self-defined NFPP guard, check whether these packets can be sent to the CPU.

- If the rate of packets from an untrusted host exceeds the attack threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

## Related Commands

### ↘ Configuring the Name of a Self-defined Guard

<b>Command</b>	<b>define name</b>
<b>Parameter Description</b>	<b>name:</b> Indicates the name of a self-defined guard.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring Match Fields of a Self-defined Guard

<b>Command</b>	<b>match [etype type] [ src-mac smac [src-mac-mask smac_mask] [dst-mac dmac [dst-mac-mask dst_mask]] [ protocol protocol ] [ src-ip sip [src-ip-mask sip-mask] ] [ src-ipv6 sipv6 [src-ipv6-mask len sipv6-mask len] ] [dst-ip dip [dst-ip-mask dip-mask] ] [dst-ipv6 dipv6 [dst-ipv6-mask len dipv6-mask len]] [src-port sport] [dst-port dport]</b>
<b>Parameter Description</b>	<i>type</i> : Indicates the type of Ethernet link-layer packets. <i>smac</i> : Indicates the source MAC address. <i>smac_mask</i> : Indicates the mask of the source MAC address.

	<p><i>dmac</i>: Indicates the destination MAC address.</p> <p><i>dst_mask</i>: Indicates the mask of the destination MAC address.</p> <p><i>protocol</i>: Indicates the protocol number of IPv4/IPv6 packets.</p> <p><i>sip</i>: Indicates the source IPv4 address.</p> <p><i>sip-mask</i>: Indicates the mask of the source IPv4 address.</p> <p><i>sip6</i>: Indicates the source IPv6 address.</p> <p><i>sip6-masklen</i>: Indicates the mask length of the source IPv6 address.</p> <p><i>dip</i>: Indicates the destination IPv4 address.</p> <p><i>dip-mask</i>: Indicates the mask of the destination IPv4 address.</p> <p><i>dip6</i>: Indicates the destination IPv6 address.</p> <p><i>dip6-masklen</i>: Indicates the mask length of the destination IPv6 address.</p> <p><i>sport</i>: Indicates the ID of the source transport-layer port.</p> <p><i>dsport</i>: Indicates the ID of the destination transport-layer port.</p>
<b>Command Mode</b>	Self-defined guard configuration mode
<b>Usage Guide</b>	Create a new self-defined guard and specify the packet fields matched by this guard.

#### 📌 Configuring the Global Rate Limit and Attack Threshold of a Self-defined Guard

<b>Command</b>	<b>global-policy {per-src-ip   per-src-mac   per-port} rate-limit-pps attack-threshold-pps</b>
<b>Parameter Description</b>	<p><b>per-src-ip</b>: Collects rate statistics for host identification based on the source IP address, VLAN ID, and port.</p> <p><b>per-src-mac</b>: Collects rate statistics for host identification based on the source MAC address, VLAN ID, and port.</p> <p><b>per-port</b>: Collects rate statistics based on each packet receiving port.</p> <p><i>rate-limit-pps</i>: Indicates the rate limit.</p> <p><i>attack-threshold-pps</i>: Indicates the attack threshold.</p>
<b>Command Mode</b>	Self-defined guard configuration mode
<b>Usage Guide</b>	Before creating a self-defined guard type, you must specify rate statistic classification rules for this type, namely, source IP address-based host identification, source MAC address-based host identification, host-based self-defined packet rate statistics, or port-based rate statistics, and specify the rate limits and attack thresholds for the specified rules.

#### 📌 Configuring the Global Monitoring Period of a Self-defined Guard

<b>Command</b>	<b>monitor-period seconds</b>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Command Mode</b>	Self-defined guard configuration mode
<b>Usage Guide</b>	N/A

#### 📌 Configuring the Maximum Number of Monitored Hosts of a Self-defined Guard

<b>Command</b>	<b>monitored-host-limit</b> <i>number</i>
<b>Parameter</b>	<i>number</i> : Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Description</b>	
<b>Command Mode</b>	Self-defined guard configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring Trusted Hosts of a Self-defined Guard

<b>Command</b>	<b>trusted-host</b> { <i>mac mac_mask</i>   <i>ip mask</i>   <i>IPv6/prefixlen</i> }
<b>Parameter</b>	<i>mac</i> : Indicates the MAC address.
<b>Description</b>	<i>mac_mask</i> : Indicates the mask of an MAC address. <i>ip</i> : Indicates the IP address. <i>mask</i> : Indicates the mask of an IP address. <i>IPv6/prefixlen</i> : Indicates the IPv6 address and its mask length. <b>all</b> : Used with <b>no</b> to delete all trusted hosts.
<b>Command Mode</b>	Self-defined guard configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling a Self-Defined Guard Globally

<b>Command</b>	<b>define</b> <i>name</i> <b>enable</b>
<b>Parameter</b>	<i>name</i> : Indicates the name of a self-defined guard.
<b>Description</b>	
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	The configuration takes effect only after you have configured <b>match</b> , <b>rate-count</b> , <b>rate-limit</b> , and <b>attack-threshold</b> . Otherwise, the configuration fails.

### ▾ Enabling a Self-defined Guard on an Interface

<b>Command</b>	<b>nfpp define</b> <i>name</i> <b>enable</b>
<b>Parameter</b>	<i>name</i> : Indicates the name of a self-defined guard.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The self-defined name must exist. The configuration takes effect only after you have configured <b>match</b> , <b>rate-count</b> , <b>rate-limit</b> , and <b>attack-threshold</b> . Otherwise, the configuration fails.

### ▾ Configuring the Rate Limit and Attack Threshold of a Self-defined Guard on an Interface

<b>Command</b>	<b>nfpp define</b> <i>name</i> <b>policy</b> { <i>per-src-ip</i>   <i>per-src-mac</i>   <i>per-port</i> } <i>rate-limit-pps</i> <i>attack-threshold-pps</i>
<b>Parameter</b>	<i>name</i> : Indicates the name of a self-defined guard.

<b>Description</b>	<p><b>per-src-ip:</b> Configures the rate limit and attack threshold of each source IP address.</p> <p><b>per-src-mac:</b> Configures the rate limit and attack threshold of each source MAC address.</p> <p><b>per-port:</b> Configures the rate limit and attack threshold of each port.</p> <p><i>rate-limit-pps:</i> Indicates the rate limit, ranging from 1 to 19,999.</p> <p><i>attack-threshold-pps:</i> Indicates the attack threshold, ranging from 1 to 19,999.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

### Configuration Example

#### 📌 CPU Protection Based on a Self-Defined Guard

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Basic guards cannot protect the system with RIP attacks.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure a self-defined guard, with the key fields matching RIP packets.</li> <li>● Configure the rate limit.</li> <li>● Configure the isolation period.</li> <li>● Configure trusted hosts.</li> </ul>

## 18.4.8 Configuring Centralized Bandwidth Allocation

### Configuration Effect

- Configure centralized bandwidth allocation so that Manage and Protocol packets are first processed when the network is busy.

### Notes

- The following condition must be met: Valid percentage range of a type of packets ≤ 100% – Percentage of the sum of the other two types

### Configuration Steps

#### ➤ Configuring the Maximum Bandwidth of Specified Packets

- (Mandatory) Manage, Route, and Protocol packets share the same default bandwidth.

#### ➤ Configuring the Maximum Percentage of Specified Packets in the Queue

- (Mandatory) By default, Manage packets occupy 30% of the bandwidth, Route packets occupy 25%, and Protocol packets occupy 45%.

### Verification

Send a large number of protocol packets such as OSPF packets to a switch, causing high CPU utilization.

- When the host pings the switch, the pinging must be successful and no packet is lost.

## Related Commands

### Configuring the Maximum Bandwidth of Specified Packets

<b>Command</b>	<b>cpu-protect sub-interface { manage   protocol route} pps <i>pps_value</i></b>
<b>Parameter Description</b>	<i>pps_value</i> : Indicates the rate limit, ranging from 1 to 100,000.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuring the Maximum Percentage of Specified Packets in the Queue

<b>Command</b>	<b>cpu-protect sub-interface { manage   protocol   route} percent <i>percent_value</i></b>
<b>Parameter Description</b>	<i>percent_value</i> : Indicates the percentage of a type of packets in the queue, ranging from 1 to 100.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The following condition must be met: Valid percentage range of a type of packets ≤ 100% – Percentage of the sum of the other two types

## Configuration Example

### Prioritizing Packets Sent to the CPU Through Centralized Bandwidth Allocation

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Various types of mass packets exist in the network and belong to different centralized types.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the maximum bandwidth of specified packets.</li> <li>● Configure the maximum percentage of specified packets in the queue.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# cpu-protect sub-interface manage pps 5000 Ruijie(config)# cpu-protect sub-interface manage percent 25</pre>
<b>Verification</b>	N/A

## Common Errors

## 18.4.9 Configuring NFPP Logging

### Configuration Effect

- NFPP obtains a log from the dedicated log buffer at a certain rate, generates a system message, and clears this log from the dedicated log buffer.

## Notes

---

- Logs are continuously printed in the log buffer, even if attacks have stopped.

## Configuration Steps

---

### ▾ Configuring the Log Buffer Size

- Mandatory.
- If the log buffer is full, new logs are discarded and a corresponding prompt is displayed.
- If the log buffer overflows, subsequent logs are discarded and an entry with all attributes marked with a hyphen (-) is displayed in the log buffer. The administrator needs to increase the log buffer size or the system message generation rate.

### ▾ Configuring the Log Buffer Rate

- Mandatory.
- The log buffer rate depends on two parameters: the time period and the number of system messages generated in the time period.
- If both of the preceding two parameters are set to 0, system messages are immediately generated for logs but are not stored in the log buffer.

### ▾ Enabling Log Filtering

- (Optional) Log filtering is disabled by default.
- Logs can be filtered based on an interface or VLAN.
- If log filtering is enabled, logs not meeting the filtering rule are discarded.

### ▾ Enabling Log Printing

- (Mandatory) Logs are stored in the buffer by default.
- If you want to monitor attacks in real time, you can configure logs to be printed on the screen to export the log information in real time.

## Verification

---

Check whether the configuration takes effect based on the log configuration and the number and interval of printed logs.

## Related Commands

---

### ▾ Configuring the Log Buffer Size

<b>Command</b>	<b>log-buffer entries</b> <i>number</i>
<b>Parameter</b>	<i>number</i> : Indicates the buffer size in the unit of the number of logs, ranging from 0 to 1,024.

<b>Description</b>	
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

### ↘ Configuring the Log Buffer Rate

<b>Command</b>	<b>log-buffer logs</b> <i>number_of_message interval length_in_seconds</i>
<b>Parameter</b>	<i>number_of_message</i> : Ranges from 0 to 1,024. The value 0 indicates that all logs are recorded in the log buffer and no system message is generated.
<b>Description</b>	<i>length_in_seconds</i> : Ranges from 0 to 86,400 (1 day). The value 0 indicates that logs are not recorded in the log buffer but system messages are instantly generated. This also applies to <i>number_of_message</i> and <i>length_in_seconds</i> . <i>number_of_message/length_in_second</i> indicates the system message generation rate.
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

### ↘ Configuring VLAN-based Log Filtering

<b>Command</b>	<b>logging vlan</b> <i>vlan-range</i>
<b>Parameter</b>	<i>vlan-range</i> : Records logs in a specified VLAN range. The value format is 1-3,5 for example.
<b>Description</b>	
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Run this command to filter logs so that only logs in the specified VLAN range are recorded. Between interface-based log filtering and VLAN-based log filtering, if either rule is met, logs are recorded in the log buffer.

### ↘ Configuring Interface-based Log Filtering

<b>Command</b>	<b>logging interface</b> <i>interface-id</i>
<b>Parameter</b>	<i>interface-id</i> : Records logs of a specified interface.
<b>Description</b>	
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Run this command to filter logs so that only logs of the specified interface are recorded. Between interface-based log filtering and VLAN-based log filtering, if either rule is met, logs are recorded in the log buffer.

### ↘ Enabling Log Printing

<b>Command</b>	<b>log-buffer enable</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### Configuring NFPP Logging

<b>Scenario</b>	<ul style="list-style-type: none"> <li>If attackers are too many, log printing will affect the usage of user interfaces, which requires restriction.</li> </ul>

# 19 Configuring DoS Protection

## 19.1 Overview

Denial of Service (DoS) attacks refer to attacks that cause DoS and aim to put computers or networks out of service.

DoS attacks are diversified in types and can be implemented in many ways, but have one common purpose, that is, prevent victim hosts or networks cannot receive, respond, or process external requests in time. In particular, on a layer-2 (L-2) network, DoS attack packets can be spread in the entire broadcast domain. If hackers maliciously initiate DoS attacks, some operating systems (OSs) may collapse. Ruijie products supports the following anti DoS attack functions:

- Denying land attacks
- Denying invalid TCP packets
- Denying invalid layer-4 (L4) ports

## 19.2 Applications

Application	Description
<a href="#">Protecting Servers Against DoS Attacks</a>	On a campus network, configure the anti DoS attack function on the devices connected to servers to effectively reduce the negative impacts brought by DoS attacks to servers.

### 19.2.1 Protecting Servers Against DoS Attacks

As show in Figure 19-1, servers are connected to the core switch. The anti DoS attack function is configured on the core switch to prevent malicious DoS attacks and ensure that servers can provide services normally.

Figure 19-1

## Deployment

Enable the function of denying land attacks on the core switch to protect servers against land attacks.

Enable the function of denying invalid TCP packets on the core switch to protect servers against invalid TCP packets.

Enable the function of denying invalid L4 ports on the core switch to protect servers against attacks caused by invalid L4 ports.

## 19.3 Features

### Overview

Feature	Description
<a href="#">Denying Land Attacks</a>	Drop packets with the same source and destination IP addresses or the same L4 source and destination port IDs on the device to prevent these packets from attacking OSs on the network.
<a href="#">Denying Invalid TCP Packets</a>	Drop invalid TCP packets on the device to prevent invalid TCP packets from attacking OSs on the network. (For details about the definition of invalid TCP packets, see "Denying Invalid TCP Packets".
<a href="#">Denying Invalid L4 Ports</a>	Drop packets with the same L4 source and destination port IDs on the device to prevent these packets from attacking OSs on the network.

### 19.3.1 Denying Land Attacks

This function protects servers against land attacks.

## Working Principle

In a land attack, the attacker sets the source and destination IP addresses or the L4 source and destination port IDs in a SYN packet to the same address of the target host. Consequently, the attacked host will be trapped in an infinite loop or even collapse when attempting to set up a TCP connection with itself.

If the function of denying land attacks is enabled, the device checks packets based on characteristics of land packets (that is, SYN packets with the same source and destination IP addresses), and drops invalid packets.

## Related Configuration

### 📄 Enabling the Function of Denying Land Attacks

By default, the function of denying land attacks is disabled.

Run the **ip deny land** command to enable or disable the function of denying land attacks.

## 19.3.2 Denying Invalid TCP Packets

This function protects servers against invalid TCP packets.

### Working Principle

There are several flag fields in the TCP packet header:

- SYN: Connection establishment flag. The TCP SYN packet is used to set this flag to 1 to request establishment of a connection.
- ACK: Acknowledgement flag. In a TCP connection, this field must be available in every flag (except the first packet, that is, the TCP SYN packet) as the acknowledgement of the previous packet.
- FIN: Finish flag. When a host receives the TCP packet with the FIN flag, the host disconnects the TCP connection.
- RST: Reset flag. When the IP protocol stack receives a TCP packet that contains a non-existent destination port, it responds with a packet with the RST flag.
- PSH: This flag notifies the protocol stack to submit TCP data to the upper-layer program for processing as soon as possible.

In invalid TCP packets, flag fields are set improperly so that the processing resources of hosts are exhausted or even the system collapses. The following lists several common methods for setting flag fields in invalid TCP packets:

- TCP packets with both the SYN and FIN flags

Normally, a TCP packet cannot contain both the SYN and FIN flags. In addition, RFC does not stipulate how the IP protocol stack should process such invalid packets containing both the SYN and FIN flags. Therefore, the protocol stack of each OS may process such packets in different ways when receiving these packets. Attackers can use this feature to send packets containing both the SYN and FIN flags to identify the OS type and initiate attacks on this OS.

- TCP packets without any flag

Normally, a TCP packet contains at least one of the five flags, including SYN, FIN, ACK, RST, and PSH. The first TCP packet (TCP SYN packet) must contain the SYN flag, and the subsequent packets contain the ACK flag. Based on such

assumptions, some protocol stack does not specify the method for processing TCP packets without any flag, and therefore may collapse if such protocol stack receives TCP packets without any flag. Attackers use this feature to initiate attacks on target hosts.

- TCP packets with the FIN flag but without the ACK flag

Normally, except the first packet (TCP SYN packet), all other packets, including the packets with the FIN flag, contain the ACK flag. Some attackers may send TCP packets with the FIN flag but without the ACK flag to the target hosts, causing breakdown of the target hosts.

- TCP packets with the SYN flag and the source port ID set to a value between 0 and 1,023

Port IDs 0 to 1,023 are known port IDs allocated by the Internet Assigned Numbers Authority (IANA). In most systems, these port IDs can be used only by the system (or root) processes or programs run by privileged users. These ports (0–1023) cannot be used as the source port IDs in the first TCP packets (with the SYN flag) sent by clients.

If the function of denying invalid TCP packets is enabled, the device checks packets based on characteristics of invalid TCP packets, and drops invalid TCP packets.

## [Related Configuration](#)

### 📌 [Enabling the Function of Denying Invalid TCP Packets](#)

By default, the function of denying invalid TCP packets is disabled.

Run the **ip deny invalid-tcp** command to enable or disable the function of denying invalid TCP packets.

## 19.3.3 Denying Invalid L4 Ports

This function protects servers against invalid L4 ports.

### [Working Principle](#)

Attackers sends packets in which the IP address of the target host is the same as the L4 port ID of the host to the host target. As a result, the target host sends TCP connection setup requests to itself. Under such attacks, resources of the target host will soon be exhausted and the system will collapse.

If the function of denying invalid L4 ports is enabled, the device checks the L4 source port ID and destination port ID in the packets. If they are the same, the device drops the packets.

## [Related Configuration](#)

### 📌 [Enabling the Function of Denying Invalid L4 Ports](#)

By default, the function of denying invalid L4 ports is disabled.

Run the **ip deny invalid-l4port** command to enable or disable the function of denying invalid L4 ports.

## 19.4 Configuration

Configuration Item	Description and Command	
<a href="#">Configuring the Function of Denying Land Attacks</a>	 Optional.	
	<code>ip deny land</code>	Enables the function of denying land attacks.
<a href="#">Configuring the Function of Denying Invalid TCP Packets</a>	 Optional.	
	<code>ipdeny invalid-tcp</code>	Enables the function of denying invalid TCP packets.

	<code>ip deny invalid-l4port</code>	Enables the function of denying invalid L4 ports.

### 19.4.1 Configuring the Function of Denying Land Attacks

#### Configuration Effect

Enable the function of denying land attacks. Then, the device checks packets based on characteristics of land packets, and drops land packets.

#### Configuration Steps

##### ▾ Enabling the Function of Denying Land Attacks

- Mandatory.
- Perform this configuration on a device connected to a server.

#### Verification

- Run the `showipdenyland` command to display the status of the function of denying land attacks.
- After this function is enabled, construct a land attack packet and confirm that this packet cannot be forwarded.

## ACL & QoS Configuration

---

1. Configuring ACL
2. Configuring QoS

# 1 Configuring ACL

## 1.1 Overview

Access control list (ACL) is also called access list or firewall. It is even called packet filtering in some documents. The ACL defines rules to determine whether to forward or drop data packets arriving at a network interface.

ACLs are classified by function into two types:

- Security ACLs: Used to control data flows that are allowed to pass through a network device.
- Quality of service (QoS) ACLs: Used to classify and process data flows by priority.

ACLs are configured for a lot of reasons. Major reasons include:

- Network access control: To ensure network security, rules are defined to limit access of users to some services (for example, only access to the WWW and email services is permitted, and access to other services such as Telnet is prohibited), or to allow users to access services in a specified period of time, or to allow only specified hosts to access the network.
- QoS: QoS ACLs are used to preferentially classify and process important data flows. For details about the use of QoS ALCs, see the configuration manual related to QoS.

## 1.2 Applications

Application	Description
<a href="#">Access Control of an Enterprise Network</a>	On an enterprise network, the network access rights of each department, for example, access rights of servers and use permissions of chatting tools (such as QQ and MSN), must be controlled according to requirements.

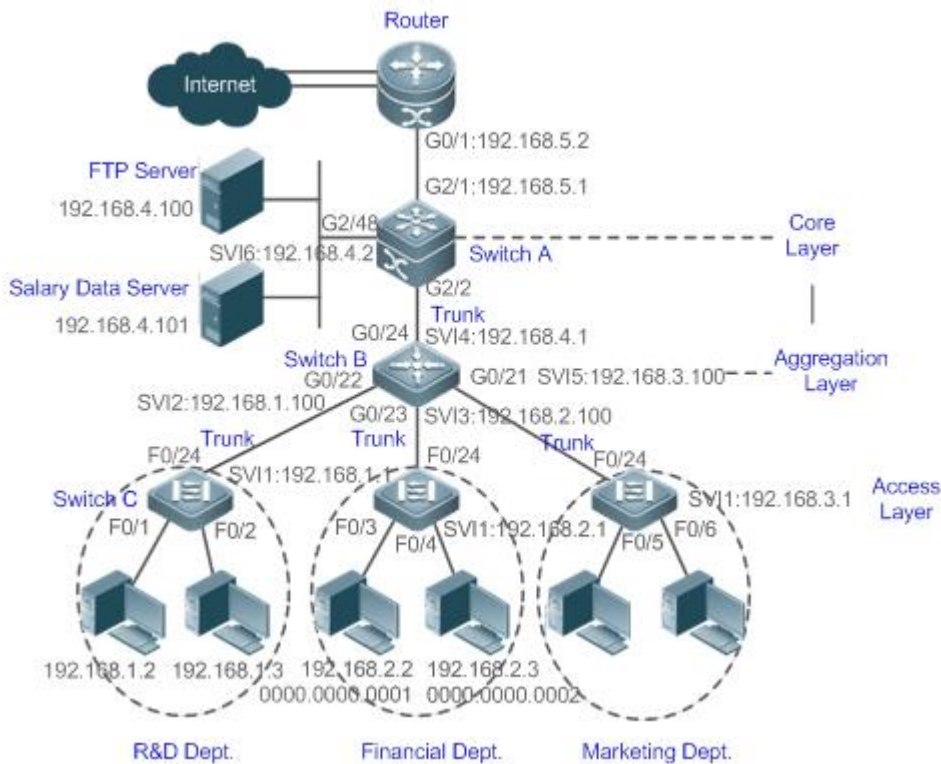

### 1.2.1 Access Control of an Enterprise Network

#### Scenario

Internet viruses can be found everywhere. Therefore, it is necessary to block ports that are often used by viruses to ensure security of an enterprise network as follows:

- Allow only internal PCs to access the server.
- Prohibit PCs of a non-financial department from accessing PCs of the financial department, and prohibit PCs of a non-R&D department from accessing PCs of the R&D department.
- Prohibit the staff of the R&D department from using chatting tools (such as QQ and MSN) during working hours from 09:00 to 18:00.

Figure 1-1

<b>Remarks</b>	<p>Switch C at the access layer: It is connected to PCs of each department and to Switch B at the aggregation layer through the gigabit optical fiber (trunk mode).</p> <p>Switch B at the aggregation layer: Multiple virtual local area networks (VLANs) are divided. One VLAN is defined for one department. These VLANs are connected to Switch A at the core layer through the 10-gigabit optical fiber (trunk mode).</p> <p>Switch A at the core layer: It is connected to various servers, such as the File Transfer Protocol (FTP) server and Hypertext Transfer Protocol (HTTP) server, and to the Internet through firewalls.</p>
----------------	---

## Deployment

- Configure an extended ACL on the port G2/1 to filter data packets, thus protecting the network against the viruses. This port is located on a core-layer device (Switch A) and used to connect Switch A to the uplink port G2/1 of a router.
- Allow only internal PCs to access servers, and prohibit external PCs from accessing servers. Define and apply the extended IP ACLs on G2/2 or switch virtual interface (SVI) 2 that is used to connect Switch A to an aggregation layer device or server.
- Prohibit mutual access between specified departments. Define and apply the extended IP ACLs on G0/22 and G0/23 of Switch B.
- Configure and apply the time-based extended IP ACLs on SVI 2 of Switch B to prohibit the R&D department from using chatting tools (such as QQ and MSN) in a specified period of time.

## 1.3 Features

### Basic Concepts

---

#### ACL

ACLs include basic ACLs and dynamic ACLs.

You can select basic or dynamic ACLs as required. Generally, basic ACLs can meet the security requirements. However, experienced hackers may use certain software to access the network by means of IP address spoofing. If dynamic ACLs are used, users are requested to pass identify authentication before accessing the network, which prevents hackers from intruding the network. Therefore, you can use dynamic ACLs in some sensitive areas to guarantee network security.

- 
- i** IP address spoofing is an inherent problem of all ACLs, including dynamic ACLs. Hackers may use forged IP addresses to access the network during the validity period of authenticated user identities. Two methods are available to resolve this problem. One is to set the idle time of user access to a smaller value, which increases the difficulty in intruding networks. The other is to encrypt network data using the IPSec protocol, which ensures that all data is encrypted when arriving at a device.
- 

ACLs are generally configured on the following network devices:

- Devices between the internal network and the external network (such as the Internet)
- Devices on the border of two network segments
- Devices connected to controlled ports

ACL statements must be executed in strict compliance with their sequence in the ACL. Comparison starts from the first statement. Once the header of a data packet matches a statement in the ACL, the subsequent statements are ignored and no longer checked.

#### Input/Output ACLs, Filtering Field Template, and Rules

When receiving a packet on an interface, the device checks whether the packet matches any access control entry (ACE) in the input ACL of this interface. Before sending a packet through a interface, the device checks whether the packet matches any ACE in the output ACL of this interface.

When different filtering rules are defined, all or only some rules may be applied simultaneously. If a packet matches an ACE, this packet is processed according to the action policy (permit or deny) defined in this ACE. ACEs in an ACL identify Ethernet packets based on the following fields in the Ethernet packets:

Layer 2 (L2) fields:

- 48-bit source MAC address (containing all 48 bits)
- 48-bit destination MAC address (containing all 48 bits)
- 16-bit L2 type field

Layer 3 (L3) fields:

- Source IP address field (All source IP address values can be specified, or the subnet can be used to define a type of data flows.)
- Destination IP address field (All destination IP address values can be specified, or the subnet can be used to define a type of data flows.)
- Protocol type field

Layer 4 (L4) fields:

- Either a TCP source or destination port is specified, or both are specified, or the range of the source or destination port is specified.
- Either a UDP source or destination port is specified, or both are specified, or the range of the source or destination port is specified.

Filtering fields refer to the fields in packets that can be used to identify or classify packets when an ACE is generated. A filtering field template is a combination of these fields. For example, when an ACE is generated, packets are identified and classified based on the destination IP address field in each packet; when another ACE is generated, packets are identified and classified based on the source IP address field and UDP source port field in each packet. The two ACEs use different filtering field templates.

Rules refer to values of fields in the filtering field template of an ACE. For example, the content of an ACE is as follows:

```
permit tcp host 192.168.12.2 any eq telnet
```

In this ACE, the filtering field template is a combination of the following fields: source IP address field, IP protocol field, and TCP destination port field. The corresponding values (rules) are as follows: source IP address = Host 192.168.12.2; IP protocol = TCP; TCP destination port = Telnet.

Figure 1-2 Analysis of the ACE: permit tcp host 192.168.12.2 any eq telnet

**i** A filtering field template can be a combination of L3 and L4 fields, or a combination of multiple L2 fields. The filtering field template of a standard or an extended ACL, however, cannot be a combination of L2 and L3 fields, a combination

of L2 and L4 fields, or a combination of L2, L3, and L4 fields. To use a combination of L2,L3, and L4 fields, you can use the expert ACLs.

-  An SVI associated with ACLs in the outgoing direction supports the IP standard, IP extended, MAC extended, and expert ACLs.
-  If an expert ACL is configured and applied to the outgoing direction of an interface, and some ACEs in this ACL contain the L3 matching information (e.g. the IP address and L4 port), non-IP packets sent to the device from this interface cannot be controlled by the permit and deny ACEs in this ACL.
-  If ACEs of an ACL (IP ACL or expert extended ACL) are configured to match non-L2 fields (such as SIP and DIP), the ACL does not take effect on tagged MPLS packets.

### 📄 ACL Logging

To allow users better learn the running status of ACLs on a device, you can determine whether to specify the ACL logging option as required when adding ACEs. If this option is specified, logs are output when packets matching ACEs are found. ACL logs are displayed based on ACEs. That is, the device periodically displays ACEs with matched packets and the number of matched packets. An example of the log is as follows:

```
*Sep 9 16:23:06: %ACL-6-MATCH: ACL 100 ACE 10 permit icmp any any, match 78 packets.
```

To control the amount of logs and output frequency, you can configure the log update interval respectively for the IPv4 ACL and the IPv6 ACL.

-  An ACE containing the ACL logging option consumes more hardware resources. If all configured ACEs contain this option, the ACE capacity of a device will be reduced by half.
-  By default, the log update interval is 0, that is, no log is output. After the ACL logging option is specified in an ACE, you need to configure the log update interval to output related logs.
-  For an ACE containing the ACL logging option, if no packet is matched in the specified interval, no packet matching log related to this ACE will be output. If matched packets are found in the specified interval, packet matching logs related to this ACE will be output when the interval expires. The number of matched packets is the total number of packets that match the ACE during the specified interval, that is, the period from the previous log output to the current log output.
-  Only switches support the ACL logging function.

### 📄 ACL Packet Matching Counters

To implement network management, users may want to know whether an ACE has any matched packets and how many packets are matched. ACLs provide the ACE-based packet matching counters. You can enable or disable packet matching counters for all ACEs in an ACL, which can be an IP ACL, MAC ACL, expert ACL, or IPv6 ACL. In addition, you can run the **clear counters access-list [ acl-id | acl-name ]** command to reset ACL counters for a new round of statistics.

-  Enabling ACL counters requires more hardware entries. In an extreme case, this will reduce by half the number of ACEs that can be configured on a device.
-  Only switches support the ACL packet matching counters.

## Overview

Feature	Description
<a href="#">IP ACL</a>	Control incoming or outgoing IPv4 packets of a device based on the L3 or L4 information in the IPv4 packet header.
<a href="#">MAC Extended ACL</a>	Control incoming or outgoing L2 packets of a device based on the L2 information in the Ethernet packet header.
<a href="#">Expert Extended ACL</a>	Combine the IP ACL and MAC extended ACL into an expert extended ACL, which controls (permits or denies) incoming or outgoing packets of a device using the same rule based on the L2, L3, and L4 information in the packet header.
<a href="#">IPv6 ACL</a>	Control incoming or outgoing IPv6 packets of a device based on the L3 or L4 information in the IPv6 packet header.
<a href="#">ACL80</a>	Customize the matching fields and mask for scenarios where fixed matching fields cannot meet the requirements.
<a href="#">ACL Redirection</a>	Redirect incoming packets of a device that match ACEs to a specified outgoing interface.
<a href="#">Global Security ACL</a>	Make an ACL take effect in the incoming direction of all interfaces, instead of applying the ACL on every interface.
<a href="#">Security Channel</a>	Allow packets to bypass the check of access control applications, such as DOT1X and Web authentication, to meet requirements of some special scenarios.
<a href="#">SVI Router ACL</a>	Enable users in the same VLAN to communicate with each other.
<a href="#">ACL Logging</a>	Output ACL packet matching logs at a specified interval according to requirements. The logs help users learn the packet matching result of a specified ACE.

### 1.3.1 IP ACL

The IP ACL implements refined control on incoming and outgoing IPv4 packets of a device. You can permit or deny the entry of specific IPv4 packets to a network according to actual requirements to control access of IP users to network resources.

#### Working Principle

Define a series of IP access rules in the IP ACL, and then apply the IP ACL either in the incoming or outgoing direction of an interface or globally. The device checks whether the incoming or outgoing IPv4 packets match the rules and accordingly forwards or blocks these packets.

To configure an IP ACL, you must specify a unique name or ID for the ACL of a protocol so that the protocol can uniquely identify each ACL. The following table lists the protocols that can use IDs to identify ACLs and the range of IDs.

Protocol	ID Range
Standard IP	1–99, 1300–1999
Extended IP	100–199, 2000–2699

Basic ACLs include the standard IP ACLs and extended IP ACLs. Typical rules defined in an ACL contain the following matching fields:

- Source IP address
- Destination IP address

- IP protocol number
- L4 source port ID or ICMP type
- L4 destination port ID or ICMP code

The standard IP ACL (ID range: 1–99, 1300–1999) is used to forward or block packets based on the source IP address, whereas the extended IP ACL (ID range: 100–199, 2000–2699) is used to forward or block packets based on a combination of the preceding matching fields.

For an individual ACL, multiple independent ACL statements can be used to define multiple rules. All statements reference the same ID or name so that these statements are bound with the same ACL. However, more statements mean that it is increasingly difficult to read and understand the ACL.

- ✔ For routing products, the ICMP code matching field in an ACL rule is ineffective for ICMP packets whose ICMP type is 3. If the ICMP code of ICMP packets to be matched is configured in an ACL rule, the ACL matching result of incoming ICMP packets of a device whose ICMP type is 3 may be different from the expected result.

### ↘ Implicit "Deny All Traffic" Rule Statement

At the end of every IP ACL is an implicit "deny all traffic" rule statement. Therefore, if a packet does not match any rule, the packet will be denied.

For example:

```
access-list 1 permit host 192.168.4.12
```

This ACL permits only packets sent from the source host 192.168.4.12, and denies packets sent from all other hosts. This is because the following statement exists at the end of this ACL: **access-list 1 deny any**.

If the ACL contains only the following statement:

```
access-list 1 deny host 192.168.4.12
```

Packets sent from any host will be denied when passing through this port.

- ❗ When defining an ACL, you must consider the routing update packets. As the implicit "deny all traffic" statement exists at the end of an ACL, all routing update packets may be blocked.

### ↘ Input Sequence of Rule Statements

Every new rule is added to the end of an ACL and in front of the default rule statement. The input sequence of statements in an ACL is very important. It determines the priority of each statement in the ACL. When determining whether to forward or block packets, a device compares packets with rule statements based on the sequence that rule statements are created. After locating a matched rule statement, the device does not check any other rule statement.

If a rule statement is created and denies all traffic, all subsequent statements will not be checked.

For example:

```
access-list 101 deny ip any any
access-list 101 permttcp 192.168.12.0 0.0.0.255 eqtelnetany
```

The first rule statement denies all IP packets. Therefore, Telnet packets from the host on the network 192.168.12.0/24 will be denied. After the device finds that packets match the first rule statement, it does not check the subsequent rule statements any more.

## Related Configuration

### 📄 Configuring an IP ACL

By default, no IP ACL is configured on a device.

Run the **ip access-list { standard | extended } {acl-name | acl-id}** command in global configuration mode to create a standard or an extended IP ACL and enter standard or extended IP ACL mode.

### 📄 Adding ACEs to an IP ACL

By default, a newly created IP ACL contains an implicit ACE that denies all IPv4 packets. This ACE is hidden from users, but takes effect when the ACL is applied to an interface. That is, all IPv4 packets will be discarded. Therefore, if you want the device to receive or send some specific IPv4 packets, add some ACEs to the ACL.

For a standard IP ACL, add ACEs as follows:

- No matter whether the standard IP ACL is a named or number ACL, you can run the following command in standard IP ACL mode to add an ACE:  
[ sn ] { **permit** | **deny** } {hostsource| any | sourcesource-wildcard } [ **time-range**time-range-name ]
- For a numbered standard IP ACL, you can also run the following command in global configuration mode to add an ACE:  
**access-list** acl-id { **permit** | **deny** } {hostsource| any | sourcesource-wildcard } [ **time-range**tm-rng-name ]

For an extended IP ACL, you can add ACEs as follows:

- No matter whether the extended IP ACL is a named or numbered ACL, you can run the following command in extended IP ACL mode to add an ACE:  
[ sn ] { **permit** | **deny** } protocol{hostsource| any | sourcesource-wildcard } {hostdestination | any | destination destination-wildcard } [ [ **precedence**precedence [ **tos** tos ] ] | **dscp**dscp ] [ **fragment** ] [ **time-range**time-range-name ]
- For a numbered extended IP ACL, you can also run the following command in global configuration mode to add an ACE:  
**access-list** acl-id { **permit** | **deny** } protocol{hostsource| any | sourcesource-wildcard } {hostdestination | any | destination destination-wildcard } [ [ **precedence**precedence [ **tos** tos ] ] | **dscp**dscp ] [ **fragment** ] [ **time-range**time-range-name ]

### 📄 Applying an IP ACL

By default, the IP ACL is not applied to any interface, that is, the IP ACL does not filter incoming or outgoing IP packets of the device.

Run the **ip access-group { acl-id | acl-name } { in | out }** command in interface configuration mode to apply a standard or an extended IP ACL to a specified interface.

### 1.3.2 MAC Extended ACL

The MAC extended ACL implements refined control on incoming and outgoing packets based on the L2 header of packets. You can permit or deny the entry of specific L2 packets to a network, thus protecting network resources against attacks or control users' access to network resources.

#### Working Principle

Define a series of MAC access rules in the MAC extended ACL, and then apply the ACL to the incoming or outgoing direction of an interface. The device checks whether the incoming or outgoing packets match the rules and accordingly forwards or blocks these packets.

To configure an MAC extended ACL, you must specify a unique name or ID for this ACL to uniquely identify the ACL. The following table lists the range of IDs that identify MAC extended ACLs.

Protocol	ID Range
MAC extended ACL	700–799

Typical rules defined in an MAC extended ACL include:

- Source MAC address
- Destination MAC address
- Ethernet protocol type

The MAC extended ACL (ID range: 700–799) is used to filter packets based on the source or destination MAC address and the Ethernet type in the packets.

For an individual MAC extended ACL, multiple independent ACL statements can be used to define multiple rules. All statements reference the same ID or name so that these statements are bound with the same ACL. However, more statements mean that it is increasingly difficult to read and understand the ACL.

- ✓ If ACEs in an MAC extended ACL are not defined specifically for IPv6 packets, that is, the Ethernet type is not specified or the value of the Ethernet type field is not 0x86dd, the MAC extended ACL does not filter IPv6 packets. If you want to filter IPv6 packets, use the IPv6 extended ACL.

#### Implicit "Deny All Traffic" Rule Statement

At the end of every MAC extended ACL is an implicit "deny all traffic" rule statement. Therefore, if a packet does not match any rule, the packet will be denied.

For example:

```
access-list 700 permit host 00d0.f800.0001 any
```

This ACL permits only packets from the host with the MAC address 00d0.f800.0001, and denies packets from all other hosts. This is because the following statement exists at the end of this ACL: **access-list 700 deny any any**.

#### Related Configuration

##### Configuring an MAC Extended ACL

By default, no MAC extended ACL is configured on a device.

Run the **mac access-list extended {acl-name | acl-id}** command in global configuration mode to create an MAC extended ACL and enter MAC extended ACL mode.

### Adding ACEs to an MAC Extended ACL

By default, a newly created MAC extended ACL contains an implicit ACE that denies all L2 packets. This ACE is hidden from users, but takes effect when the ACL is applied to an interface. That is, all L2 packets will be discarded. Therefore, if you want the device to receive or send some specific L2 packets, add some ACEs to the ACL.

You can add ACEs to an MAC extended ACL as follows:

- No matter whether the MAC extended ACL is a named or numbered ACL, you can run the following command in MAC extended ACL mode to add an ACE:

```
[sn] { permit | deny } { any | host src-mac-addr } { any | host dst-mac-addr } [ethernet-type] [coscos] [innercos]
[ time-range tm-rng-name ]
```

- For a numbered MAC extended ACL, you can also run the following command in global configuration mode to add an ACE:

```
access-list acl-id { permit | deny } { any | host src-mac-addr } { any | host dst-mac-addr } [ethernet-type] [coscos]
[innercos] [ time-range time-range-name ]
```

### Applying an MAC Extended ACL

By default, the MAC extended ACL is not applied to any interface, that is, the created MAC extended ACL does not filter incoming or outgoing L2 packets of a device.

Run the **mac access-group { acl-id | acl-name } { in | out }** command in interface configuration mode to apply an MAC extended ACL to a specified interface.

## 1.3.3 Expert Extended ACL

You can create an expert extended ACL to match the L2 and L3 information in packets using the same rule. The expert extended ACL can be treated as a combination and enhancement of the IP ACL and the MAC extended ACL because the expert extended ACL can contain ACEs in both the IP ACL and the MAC extended ACL. In addition, the VLAN ID can be specified in the expert extended ACL to filter packets.

### Working Principle

Define a series of access rules in the expert extended ACL, and then apply the ACL in the incoming or outgoing direction of an interface. The device checks whether incoming or outgoing packets match the rules and accordingly forwards or blocks these packets.

To configure an expert extended ACL, you must specify a unique name or ID for this ACL so that the protocol can uniquely identify each ACL. The following table lists the ID range of the expert extended ACL.

Protocol	ID Range
Expert extended ACL	2700–2899

When an expert extended ACL is created, defined rules can be applied to all packets. The device determines whether to forward or block packets by checking whether packets match these rules.

Typical rules defined in an expert extended ACL include:

- All information in the basic ACL and MAC extended ACL
- VLAN ID

The expert extended ACL (ID range: 2700–2899) is a combination of the basic ACL and MAC extended ACL, and can filter packets based on the VLAN ID.

For an individual expert extended ACL, multiple independent statements can be used to define multiple rules. All statements reference the same ID or name so that these statements are bound with the same ACL.

- ✓ If rules in an expert extended ACL are not defined specifically for IPv6 packets, that is, the Ethernet type is not specified or the value of the Ethernet type field is not 0x86dd, the expert extended ACL does not filter IPv6 packets. If you want to filter IPv6 packets, use the IPv6 extended ACL.

### ↘ Implicit "Deny All Traffic" Rule Statement

At the end of every expert extended ACL is an implicit "deny all traffic" rule statement. Therefore, if a packet does not match any rule, the packet will be denied.

For example:

```
access-list 2700 permit 0x0806 any any any any any
```

This ACL permits only ARP packets whose Ethernet type is 0x0806, and denies all other types of packets. This is because the following statement exists at the end of this ACL: **access-list 2700 deny any any any any**.

## Related Configuration

### ↘ Configuring an Expert Extended ACL

By default, no expert extended ACL is configured on a device.

Run the **expert access-list extended {acl-name | acl-id}** command in global configuration mode to create an expert extended ACL and enter expert extended ACL mode.

### ↘ Adding ACEs to an Expert Extended ACL

By default, a newly created expert extended ACL contains an implicit ACE that denies all packets. This ACE is hidden from users, but takes effect when the ACL is applied to an interface. That is, all L2 packets will be discarded. Therefore, if you want the device to receive or send some specific L2 packets, add some ACEs to the ACL.

You can add ACEs to an expert extended ACL as follows:

- No matter whether the expert extended ACL is a named or numbered ACL, you can run the following command in expert extended ACL mode to add an ACE:

```
[sn] { permit | deny } [ protocol ] [ ethernet-type ] [ cos [ out ] [ inner in ] ] [ [ VID [ out ] [ inner in ] ] ]
{ source source-wildcard | host source | any } { host source-mac-address | any } { destination destination-wildcard |
```

```

hostdestination | any } { host destination-mac-address | any } [ precedenceprecedence ] [ tos tos ] [ fragment ]
[ rangelowerupper ] [ time-rangetime-range-name ]

```

- For a numbered expert extended ACL, you can also run the following command in expert extended ACL mode to add an ACE:

```

access-list acl-id { permit | deny } [ protocol ] [ ethernet-type ] [ cos [ out ] [ inner in ] ] [ [ VID [ out ] [ inner in ] ] ]
{ sourcesource-wildcard | hostsource | any } { host source-mac-address | any } { destination destination-wildcard |
hostdestination | any } { host destination-mac-address | any } [ precedenceprecedence ] [ tos tos ] [ fragment ]

```

### 📌 Applying an Expert Extended ACL

By default, the expert extended ACL is not applied to any interface, that is, the created expert extended ACL does not filter incoming or outgoing L2 or L3 packets of a device.

Run the **expert access-group { acl-id | acl-name } { in | out }** command in interface configuration mode to apply an expert extended ACL to a specified interface.

## 1.3.4 IPv6 ACL

The IPv6 ACL implements refined control on incoming and outgoing IPv6 packets of a device. You can permit or deny the entry of specific IPv6 packets to a network according to actual requirements to control access of IPv6 users to network resources.

### Working Principle

Define a series of IPv6 access rules in the IPv6 ACL, and then apply the ACL in the incoming or outgoing direction of an interface. The device checks whether the incoming or outgoing IPv6 packets match the rules and accordingly forwards or blocks these packets.

To configure an IPv6 ACL, you must specify a unique name for this ACL.

- 📘 Unlike the IP ACL, MAC extended ACL, and expert extended ACL, you can specify only a name but not an ID for the IPv6 ACL created.
- 📘 Only one IP ACL, or one MAC extended ACL, or one expert extended ACL can be applied to the incoming or outgoing direction of an interface. Besides, one more IPv6 ACL can be applied.

### 📌 Implicit "Deny All Traffic" Rule Statement

At the end of every IPv6 ACL is an implicit "deny all IPv6 traffic" rule statement. Therefore, if a packet does not match any rule, the packet will be denied.

For example:

```

ipv6 access-list ipv6_acl
10 permit ipv6 host 200::1 any

```

This ACL permits only IPv6 packets from the source host 200::1, and denies IPv6 packets from all other hosts. This is because the following statement exists at the end of this ACL: deny ipv6 any any.

 Although the IPv6 ACL contains the implicit "deny all IPv6 traffic" rule statement by default, it does not filter ND packets.

### Input Sequence of Rule Statements

Every new rule is added to the end of an ACL and in front of the default rule statement. The input sequence of statements in an ACL is very important. It determines the priority of each statement in the ACL. When determining whether to forward or block packets, a device compares packets with rule statements based on the sequence that rule statements are created. After locating a matched rule statement, the device does not check any other rule statement.

If a rule statement is created and permits all IPv6 traffic, all subsequent statements will not be checked.

For example:

```
ipv6 access-list ipv6_acl
10 permit ipv6 any any
20 deny ipv6 host 200::1 any
```

As the first rule statement permits all IPv6 packets, all IPv6 packets sent from the host 200::1 does not match the subsequent deny rule with the serial number of 20, and therefore will not be denied. After the device finds that packets match the first rule statement, it does not check the subsequent rule statements any more.

## Related Configuration

### Configuring an IPv6 ACL

By default, no IPv6 ACL is configured on a device.

Run the **ipv6 access-list *acl-name*** command in global configuration mode to create an IPv6 ACL and enter IPv6 ACL mode.

### Adding ACEs to an IPv6 ACL

By default, a newly created IPv6 ACL contains an implicit ACE that denies all IPv6 packets. This ACE is hidden from users, but takes effect when the ACL is applied to an interface. That is, all IPv6 packets will be discarded. Therefore, if you want the device to receive or send some specific IPv6 packets, add some ACEs to the ACL.

Run the following command in IPv6 ACL mode to add an ACE:

```
[sn] {permit | deny } protocol{src-ipv6-prefix/prefix-len | hostsrc-ipv6-addr | any} {dst-ipv6-pfx/pfx-len | host dst-ipv6-addr | any} [range lower upper] [dscpdscp] [flow-label flow-label] [fragment] [time-range tm-rng-name]
```

### Applying an IPv6 ACL

By default, the IPv6 ACL is not applied to any interface, that is, the IPv6 ACL does not filter incoming or outgoing IPv6 packets of a device.

Run the **ipv6 traffic-filter *acl-name* { in | out }** command in interface configuration mode to apply an IPv6 ACL to a specified interface.

### 1.3.5 ACL80

ACL80 refers to the expert advanced ACL, and is also called custom ACL. It filters packets based on the first 80 bytes of every packet. Among these 80 bytes, the SMAC, DMAC, SIP, DIP, and ETYPE fields in a packet are mandatory, and you can specify the remaining 16 bytes.

#### Working Principle

A packet consists of a number of bytes. ACL80 allows you to match the specified 16 bytes by bit in the first 80 bytes of a packet. Any bit of a 16-byte field can be set to a value (0 or 1), indicating whether the bit is compared. When any byte is filtered, three factors are considered: content of the matching field, mask of the matching field, and the start position for matching. Bits of the matching field content are in one-to-one mapping relationship with bits of the matching field mask. The filtering rule specifies the value of the field to be filtered. The filtering field template specifies whether the corresponding field in the filtering rule should be filtered. (1 indicates that the bit specified in the filtering rule should be matched; 0 indicates that the bit specified in the filtering rule is not matched.) Therefore, when it is required to match a specific bit, you must set the corresponding bit to 1 in the filtering field template. For example, if the bit is set to 0 in the filtering field template, no bit is matched no matter which bit is specified in the filtering rule.

For example,

```
Ruijie(config)#expert access-list advanced name
Ruijie(config-exp-dacl)#permit 00d0f8123456 ffffffff 0
Ruijie(config-exp-dacl)#deny 00d0f8654321 ffffffff 6
```

The custom ACL matches any byte of the first 80 bytes in a L2 data frame according to user' definition, and filters packets accordingly. To properly use a custom ACL, you must have an in-depth understanding about the structure of a L2 data frame. The following shows the first 64 bytes of a L3 data frame (every letter represents a hexadecimal number, and every two letters represent one byte):

```
AA AA AA AA AA AA BB BB BB BB BB BB CC CC DD DD
DD DD EE FF GG HH HH HH II II JJ KK LL LL MM MM
NN NN OO PP QQ QQ RR RR RR RR SS SS SS SS TT TT
UU UU VV VV VV VV WW WW WW WW XY ZZ aa aa bb bb
```

The following table describes the meaning and offset of each letter:

Letter	Meaning	Offset	Letter	Meaning	Offset
A	Destination MAC address	0	O	Time To Live (TTL) field	34
B	Source MAC address	6	P	Protocol number	35
C	VLAN tag field	12	Q	IP checksum	36
D	Data frame length	16	R	Source IP address	38
E	Destination service access point (DSAP) field	18	S	Destination IP address	42
F	Source service access point (SSAP) field	19	T	TCP source port	46

Letter	Meaning	Offset	Letter	Meaning	Offset
G	Cntl field	20	U	TCP destination port	48
H	Org Code field	21	V	Serial number	50
I	Encapsulated data type	24	W	Acknowledgment field	54
J	IP version number	26	XY	IP header length and reserved bit	58
K	TOS field	27	Z	Reserved bit and flags bit	59
L	IP packet length	28	a	Windows size field	60
M	ID	30	b	Miscellaneous	62
N	Flags field	32			

In the above table, the offset of each field is the offset of this field in the tagged 802.3 SNAP packet. In a custom ACL, you can use the rule mask and offset jointly to extract any byte from the first 80 bytes of a data frame, compare the byte with the rule customized in the ACL, and then filter matched data frames for further processing. Customized rules may be some fixed attributes of data. For example, to obtain all TCP packets, you can define the rule as "06", rule mask as "FF", and offset as "35". Then, the device can use the rule mask and offset jointly to extract the content of TCP protocol number field in a received data frame, and compare the extracted content with the rule to obtain all TCP packets.

-  Only switches support the ACL80.
-  The ACL80 supports filtering of the Ethernet, 803.3 SNAP, and 802.3 LLC packets. If the values of the fields from DSAP to cntl are set to AAAA03, the ACL is used to filter the 803.3 SNAP packets. If the values of the fields from DSAP to cntl are set to E0E003, the ACL is used to filter the 803.3 LLC packets. The value of the cntl field cannot be configured to filter Ethernet packets.
-  The ACL80 can be configured to compare packets with any of the 16 bytes. If the 16 bytes are already used, no ACE can be configured to compare packets with fields in any other bytes.

## Related Configuration

### 📄 Configuring an Expert Advanced ACL

By default, no expert advanced ACL is configured on a device.

Run the **expert access-list advanced *acl-name*** command in global configuration mode to create an expert advanced ACL and enter expert advanced ACL mode.

### 📄 Adding ACEs to an Expert Advanced ACL

By default, a newly created expert advanced ACL contains an implicit ACE that denies all packets. This ACE is hidden from users, but takes effect when the ACL is applied to an interface. That is, all L2 packets will be discarded. Therefore, if you want the device to receive or send some specific L2 packets, add some ACEs to the ACL.

- Run the `[sn] { permit | deny } hex hex-mask offset` command in expert advanced ACL mode to add an ACE to the expert advanced ACL.

### 📄 Applying an Expert Advanced ACL

By default, the expert advanced ACL is not applied to any interface, that is, the created expert advanced ACL does not filter incoming or outgoing packets of a device.

Run the **expert access-group *acl-name* { in| out }** command in interface configuration mode to apply an expert advanced ACL to a specified interface.

### 1.3.6 ACL Redirection

ACL redirection allows a device to analyze received packets and redirect the packets to a specified port for forwarding. To analyze specific incoming packets of a device, you can configure the ACL redirection function to redirect packets meeting rules to a specified port and capture packets on this port for analysis.

#### Working Principle

Bind different ACL policy to an interface and specify an output destination interface for each policy. When receiving packets on this interface, the device searches ACL policies bound to this interface one by one. If packets match criteria described in a certain policy, the device forwards packets on the destination interface specified by the policy, thus redirecting packets based on traffic.

-  Only switches support the ACL redirection function.
-  ACL redirection takes effect only in the incoming direction of an interface.

#### Related Configuration

##### ▾ Configuring an ACL

Before configuring ACL redirection, configure an ACL. For details about how to configure an ACL, see the earlier descriptions about ACL configuration.

##### ▾ Adding ACEs to an ACL

For details about how to add ACEs to an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

##### ▾ Configuring ACL Redirection

By default, ACL redirection is not configured on a device.

Run the **redirect destinationinterface *interface-name* acl {*acl-id* | *acl-name* } in** command in interface configuration mode to configure ACL redirection.

-  You can configure the ACL redirection function only on an Ethernet interface, AP, or SVI.

### 1.3.7 Global Security ACL

To meet the requirements of security deployment, the port-based ACL is often configured to filter out virus packets and obtain packets with certain characteristics, for example, packets that attack the TCP port. Various virus packets exist in a global network environment, and the identification features of virus packets under each port are identical or similar. Therefore,

an ACL is generally created. After the deny ACE for matching virus signatures is added to the ACL, the port-based ACL is applied to each port on the switch to filter out virus packets.

For two reasons, it is not convenient to use the port-based ACLs in antivirus scenarios such as virus filtering. The first reason is that the port-based ACL must be configured on every port, which results in repeated configuration, poor operation performance, and over-consumption of ACL resources. The second reason is that the access control function of the ACL is weakened. As the port-based ACL is used for virus filtering, basic functions of the ACL, such as route update restriction and network access restriction, cannot be used properly. The global security ACL can be used for global antivirus deployment and defense without affecting the port-based ACL. By running only one command, you can make the global security ACL takes effect on all L2 interfaces. In contrast, the port-based ACL must be configured on every interface.

## Working Principle

The global security ACL takes effect on all L2 interfaces. When both the global security ACL and the port-based ACL are configured, both take effect. Packets that match the global security ACL are directly filtered out as virus packets. Packets that do not match the global security ACL are still controlled by the port-based ACL. You can disable the global security ACL on some ports so that these ports are not controlled by the global security ACL.

-  The global security ACL is mainly used for virus filtering. Therefore, in an ACL associated with the global security ACL, only the deny ACEs take effect, and the permit ACEs do not take effect.
-  Unlike the secure ACL applied to a port, the global security ACL does not contain the default "deny all traffic" ACE, that is, all packets that do not match the ACL are permitted.
-  A global secure ACL can take effect either on a L2 port or a routed port. That is, it takes effect on all the following types of ports: access port, trunk port, hibird port, routed port, and AP (L2 or L3). The global secure ACL does not take effect on an SVI.
-  You can disable the global security ACL on an individual physical port or AP, but not on a member port of an AP.
-  The global secure ACL supports only the associated IP standard ACL and IP extended ACL.
-  Currently, the global secure ACL takes effect only in the incoming direction of an interface.

## Related Configuration

For details about how to add ACEs to an ACL, see the earlier descriptions about the IP ACL.

### ↘ [Configuring a Global Security ACL](#)

By default, no global security ACL is configured on a device.

Run the **ip access-group *acl-id* { in | out }** command in global configuration mode to enable the global security ACL.

### ↘ [Configuring an Exclusive Interface of the Global Security ACL](#)

By default, no exclusive interface is configured for the global security ACL on a device.

Run the **no global ip access-group** command in interface configuration to disable the global security ACL on a specified interface.

### 1.3.8 Security Channel

In some application scenarios, packets meeting some characteristics may need to bypass the checks of access control applications. For example, before DOT1X authentication, users are allowed to log in to a specified website to download the DOT1X authentication client. The security channel can be used for this purpose. When the security channel configuration command is executed to apply a secure ACL globally or to an interface, this ACL becomes a security channel.

#### Working Principle

The security channel is also an ACL, and can be configured globally or for a specified interface. When arriving at an interface, packets are checked on the security channel. If meeting the matching conditions of the security channel, packets directly enter a switch without undergoing the access control, such as port security, Web authentication, 802.1x, and IP+MAC binding check. A globally applied security channel takes effect on all interfaces except exclusive interfaces.

-  The deny ACEs in an ACL that is applied to a security channel do not take effect. In addition, this ACL does not contain an implicit "deny all traffic" rule statement at the end of the ACL. If packets do not meet matching conditions of the security channel, they are checked according to the access control rules in compliance with the relevant process.
-  You can configure up to eight exclusive interfaces for the global security channel. In addition, you cannot configure interface-based security channel on these exclusive interfaces.
-  If a security channel is applied to an interface while a global security channel exists, this global security channel does not take effect on this interface.
-  If both port-based migratable authentication mode and security channel are applied to an interface, the security channel does not take effect.
-  An IPv6 ACL cannot be configured as a security channel.
-  Only switches support the security channel.

#### Related Configuration

##### ↳ Configuring an ACL

Before configuring the security channel, configure an ACL. For details about how to configure an ACL, see the earlier descriptions about ACL configuration.

By default, no security channel is configured on an interface of a device.

Run the **security access-group** `{acl-id | acl-name}` command in interface configuration mode to configure the security channel on an interface.

#### ↘ **Configuring a Global Security Channel**

By default, no global security channel is configured on a device.

Run the **security global access-group** `{acl-id | acl-name}` command in interface configuration mode to configure a global security channel.

#### ↘ **Configuring an Exclusive Interface for the Global Security Channel**

By default, no exclusive interface is configured for the global security channel on a device.

Run the **security uplink enable** command in interface configuration mode to configure a specified interface as the exclusive interface of the global security channel.

### 1.3.9 SVI Router ACL

By default, an ACL that is applied to an SVI also takes effect on L2 packets forwarded within a VLAN and L3 packets forwarded between VLANs. Consequently, users in the same VLAN may fail to communicate with each other. Therefore, a switchover method is provided so that the ACL that is applied to an SVI takes effect only on routing packets between VLANs.

#### Working Principle

By default, the SVI router ACL function is disabled, and an SVI ACL takes effect on L3 packets forwarded between VLANs and L2 packets forwarded within a VLAN. After the SVI router ACL function is enabled, the SVI ACL takes effect only on L3 packets forwarded between VLANs.

✔ Only switches support the SVI router ACL.

#### Related Configuration

##### ↘ **Configuring an ACL**

Before configuring the SVI router ACL, configure and apply an ACL. For details about how to configure an ACL, see the earlier descriptions about ACL configuration.

##### ↘ **Adding ACEs to an ACL**

For details about how to add ACEs to an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

##### ↘ **Applying an ACL**

For details about how to apply an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL. Apply the ACL in SVI configuration mode.

##### ↘ **Configuring the SVI Router ACL**

Run the **svi router-acls enable** command in global configuration mode to enable the SVI router ACL so that the ACL that is applied to an SVI takes effect only on packets forwarded at L3, and not on packets forwarded at L2 within a VLAN.

### 1.3.10 ACL Logging

ACL logging is used to monitor the running status of ACEs in an ACL and provide essential information for routine network maintenance and optimization.

#### Working Principle

To better learn the running status of ACLs on a device, you can determine whether to specify the ACL logging option as required when adding ACEs. If this option is specified, logs are output when packets matching ACEs are found. ACL logs are displayed based on ACEs. That is, the device periodically displays ACEs with matched packets and the number of matched packets. An example of the log is as follows:

```
*Sep 9 16:23:06: %ACL-6-MATCH: ACL 100 ACE 10 permit icmp any any, match 78 packets.
```

To control the amount of logs and output frequency, you can configure the log update interval.

-  An ACE containing the ACL logging option consumes more hardware resources. If all configured ACEs contain this option, the ACE capacity of a device will be reduced by half.
-  By default, the log update interval is 0, that is, no log is output. After the ACL logging option is specified in an ACE, you need to configure the log update interval to output related logs; otherwise, logs are not output.
-  For an ACE containing the ACL logging option, if no packet is matched in the specified interval, no packet matching log related to this ACE will be output. If matched packets are found in the specified interval, packet matching logs related to this ACE will be output when the interval expires. The number of matched packets is the total number of packets that match the ACE during the specified interval, that is, the period from the previous log output to the current log output.
-  Only switches support the ACL logging function.
-  You can configure the ACL logging option only for an IP ACL or an IPv6 ACL.

#### Related Configuration

##### Configuring an ACL

Configure an ACL before configuring ACEs containing the ACL logging option. For details about how to configure an ACL, see the earlier descriptions about ACL configuration.

##### Adding ACEs to an ACL

For details about how to add ACEs to an ACL, see the earlier descriptions about the IP ACL and IPv6 ACL. Note that the ACL logging option must be configured.

##### Configuring the Log Update Interval

Run the **{ip | ipv6} access-list log-update interval *time*** command in the configuration mode to configure the interval at which the ACL logs are output.

## ↘ Applying an ACL

For details about how to apply an ACL, see the earlier descriptions about the IP ACL and IPv6 ACL.

### 1.3.11 Packet Matching Counters

In addition to ACL logs, packet matching counters provide another choice for routine network maintenance and optimization.

#### Working Principle

To implement network management, users may want to know whether an ACE has any matched packets and how many packets are matched. ACLs provide the ACE-based packet matching counters. You can enable or disable packet matching counters for all ACEs in an ACL. When a packet matches the ACE, the corresponding counter increments by 1. You can run the **clear counters access-list [ *acl-id* | *acl-name* ]** command to reset counters of all ACEs in an ACL for a new round of statistics.

- ❗ Enabling ACL counters requires more hardware entries. In an extreme case, this will reduce by half the number of ACEs that can be configured on a device.
- ✅ You can enable packet matching counters on an IP ACL, MAC ACL, expert ACL, or IPv6 ACL.
- ✅ Only switches support the ACL packet matching counters.

#### Related Configuration

## ↘ Configuring an ACL

Configure an ACL before configuring ACEs containing the ACL logging option. For details about how to configure an ACL, see the earlier descriptions about ACL configuration.

## ↘ Adding ACEs to an ACL

For details about how to add ACEs to an ACL, see the earlier descriptions about the IP ACL and IPv6 ACL. Note that the ACL logging option must be configured.

## ↘ Enabling Packet Matching Counters

To enable packet matching counters on an IP ACL, MAC ACL, or expert ACL, run the **{*mac* | *expert* | *ip*} access-list counter { *acl-id* | *acl-name* }** command in global configuration mode.

To enable packet matching counters on an IPv6 ACL, run the **ipv6 access-list counter *acl-name*** command in global configuration mode.

## ↘ Applying an ACL

For details about how to apply an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

## ↘ Clearing Packet Matching Counters

Run the **clear counters access-list [ *acl-id* | *acl-name* ]** command in privileged EXEC mode to reset packet matching counters.

## 1.3.12 Fragmented Packet Matching Mode

In fragmented packet matching mode, an ACL can implement more refined control on fragmented packets.

### Working Principle

IP packets may be fragmented when transmitted on the network. When fragmentation occurs, only the first fragment of the packet contains the L4 information, such as the TCP/UDP port number, ICMP type, and ICMP code, and other fragmented packets do not contain the L4 information. By default, if an ACE contains the fragment flag, fragmented packets except the first fragments are filtered. If an ACE does not contain the fragment flag, all fragmented packets (including the first fragments) are filtered. In addition to this default fragmented packet matching mode, a new fragmented packet matching mode is provided. You can switch between the two fragmented packet matching modes as required on a specified ACL. In the new fragmented packet matching mode, if an ACE does not contain the fragment flag and packets are fragmented, the first fragments are compared with all the matching fields (including L3 and L4 information) defined in the ACE, and other fragmented packets are compared with only the non-L4 information defined in the ACE.

- ❗ In the new fragmented packet matching mode, if an ACE does not contain the fragment flag and the action is Permit, this type of ACE occupies more hardware entries. In an extreme case, this will reduce by half the number of hardware entries. If Established is configured for filter the TCP flag in an ACE, more hardware entries will be occupied.
- ❗ The ACL will be temporarily ineffective during switchover of the fragmented packet matching mode.
- ✅ In the new fragmented packet matching mode, if an ACE does not contain the fragment flag, the L4 information of packets needs to be compared, and the action is Permit, the ACE checks the L3 and L4 information of the first fragments of packets, and checks only the L3 information of other fragmented packets. If the action is Deny, the ACE checks only the first fragments of packets, and ignores other fragmented packets.
- ✅ In the new fragmented packet matching mode, if an ACE contains the fragment flag, the ACE checks only fragmented packets but not the first fragments of packets no matter whether the action in the ACE is Permit or Deny.
- ✅ Only the IP extended ACL and the expert extended ACL support switching between the two fragmented packet matching modes.
- ✅ Only switches support filtering of fragmented packets.

#### 📄 [Switching the Fragmented Packet Matching Mode](#)

Run the [ no ] { ip | expert } **access-list new-fragment-mode** { *acl-id* | *acl-name* } command in global configuration mode to switch the fragmented packet matching mode.

## ➤ Applying an ACL

For details about how to apply an ACL, see the earlier descriptions about the IP ACL and expert extended ACL.

## 1.4 Configuration

Configuration Item	Description and Command	
<a href="#">Configuring an IP ACL</a>	 (Optional) It is used to filter IPv4 packets.	
	<b>ip access-list standard</b>	Configures a standard IP ACL.
	<b>ip access-list extended</b>	Configures an extended IP ACL.
	<b>permit host any time-range log</b>	Adds a permit ACE to a standard IP ACL.
	<b>deny host any time-range log</b>	Adds a deny ACE to a standard IP ACL.
	<b>permit host any host any tos dscp precedence fragment time-range log</b>	Adds a permit ACE to an extended IP ACL.
	<b>deny host any host any tos dscp precedence fragment time-range log</b>	Adds a deny ACE to an extended IP ACL.
	<b>ip access-group in out</b>	Applies a standard or an extended IP ACL.
<a href="#">Configuring an MAC Extended ACL</a>	 (Optional) It is used to filter L2 packets.	
	<b>mac access-list extended</b>	Configures an MAC extended ACL.
	<b>permit any host any host cos inner time-range</b>	Adds a permit ACE to an MAC extended ACL.
	<b>deny any host any host cos inner time-range</b>	Adds a deny ACE to an MAC extended ACL.
<a href="#">Configuring an Expert Extended ACL</a>	 (Optional) It is used to filter L2 and L3 packets.	
	<b>expert access-list extended</b>	Configures an expert extended ACL.
	<b>permit cos inner VID inner host any host any host any precedence tos fragment range time-range</b>	Adds a permit ACE to an expert extended ACL.
	<b>deny cos inner VID inner host any host any host any precedence tos fragment range time-range</b>	Adds a deny ACE to an expert extended ACL.
<a href="#">Configuring an IPv6 Extended ACL</a>	 (Optional) It is used to filter IPv6 packets.	
	<b>ipv6 access-list</b>	Configures an IPv6 ACL.
	<b>permit host any host any range dscp flow-label fragment time-range log</b>	Adds a permit ACE to an IPv6 ACL.

Configuration Item	Description and Command	
	<b>deny host any host any range dscp flow-label fragment time-range log</b>	Adds a deny ACE to an IPv6 ACL.
	<b>ipv6 traffic-filter in out</b>	Applies an IPv6 ACL.
<a href="#">Configuring an ACL80</a>	 (Optional) It is used to customize the fields for filter L2 and L3 packets.	
	<b>expert access-list advanced</b>	Configures an expert advanced ACL.
	<b>permit</b>	Adds a permit ACE to an expert advanced ACL.
	<b>deny</b>	Adds a deny ACE to an expert advanced ACL.
	<b>expert access-group in out</b>	Applies an expert advanced ACL
<a href="#">Configuring ACL Redirection</a>	 (Optional) It is used to redirect packets meeting the rules to a specified interface.	
	<b>redirect destination interface acl in</b>	Configures ACL redirection.
<a href="#">Configuring a Global Security ACL</a>	 (Optional) It is used to make an ACL take effect globally.	
	<b>ip access-group in out</b>	Applies a global security ACL in global configuration mode.
	<b>no global ip access-group</b>	Configures an interface as the exclusive interface of the global security ACL in interface configuration mode.
<a href="#">Configuring a Security Channel</a>	 (Optional) It is used to enable packets meeting some characteristics to bypass the checks of access control applications, such as the DOT1X and Web authentication.	
	<b>security access-group</b>	Enables the security channel in interface configuration mode.
	<b>security global access-group</b>	Enables the security channel in global configuration mode.
	<b>security uplink enable</b>	Configures an interface as the exclusive interface of the global security channel in interface configuration mode.
<a href="#">Configuring Comments for ACLs</a>	 (Optional) It is used to configure comments for an ACL or ACE so that users can easily identify the functions of the ACL or ACE.	
	<b>list-remark</b>	Configures a comment for an ACL in ACL configuration mode.
	<b>access-list list-remark</b>	Configures a comment for an ACL in global configuration mode.
	<b>remark</b>	Configures a comment for an ACE in ACL configuration mode.

## 1.4.1 Configuring an IP ACL

### Configuration Effect

Configure and apply an IP ACL to an interface to control all incoming and outgoing IPv4 packets of this interface. You can permit or deny the entry of specific IPv4 packets to a network to control access of IP users to network resources.

### Notes

N/A

### Configuration Steps

#### ▾ Configuring an IP ACL

- (Mandatory) Configure an IP ACL if you want to control access of IPv4 users to network resources.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The IP ACL takes effect only on the local device, and does not affect other devices on the network.

#### ▾ Adding ACEs to an IP ACL

- (Optional) An ACL may contain zero or multiple ACEs. If no ACE is configured, all incoming IPv4 packets of the device are denied by default.

#### ▾ Applying an IP ACL

- (Mandatory) Apply an IP ACL to a specified interface if you want this ACL take effect.
- You can apply an IP ACL on a specified interface of an access, an aggregate, or a core device based on the distribution of users.

### Verification

- Use the following methods to verify the configuration effects of the IP ACL:
- Run the **ping** command to verify that the IP ACL takes effect on the specified interface. For example, if an IP ACL is configured to prohibit a host with a specified IP address or hosts in a specified IP address range from accessing the network, run the **ping** command to verify that the host(s) cannot be successfully pinged.
- Access related network resources to verify that the IP ACL takes effect on the specified interface. For example, access the Internet or access the FTP resources on the network through FTP.

### Related Commands

#### ▾ Configuring an IP ACL

<b>Command</b>	<b>ip access-list { standard   extended } {acl-name   acl-id }</b>
<b>Parameter</b>	<b>standard:</b> Indicates that a standard IP ACL is created.
<b>Description</b>	<b>extended:</b> Indicates that an extended IP ACL is created. <b>acl-name:</b> Indicates the name of a standard or an extended IP ACL. If this option is configured, a named ACL is created. The name is a string of 1 to 99 characters. The ACL name cannot start with numbers (0–9),

	<p>"in", or "out".</p> <p><i>acl-id</i>: Indicates the ID that uniquely identifies a standard or extended IP ACL. If this option is configured, a numbered ACL is created. If a standard IP ACL is created, the value range of <i>acl-id</i> is 1–99 and 1300–1999. If an extended IP ACL is created, the value range of <i>acl-id</i> is 100–199 and 2000–2699.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure a standard or an extended IP ACL and enter standard or extended IP ACL configuration mode. If you want to control access of users to network resources by checking the source IP address of each packet, configure a standard IP ACL. If you want to control access of users to network resources by checking the source or destination IP address, protocol number, and TCP/UDP source or destination port, configure an extended IP ACL.

➤ **Adding ACEs to an IP ACL**

- Add ACEs to a standard IP ACL.

Use either of the following methods to add ACEs to a standard IP ACL:

<b>Command</b>	[ <i>sn</i> ] { <b>permit</b>   <b>deny</b> } { <b>host</b> <i>source</i>   <b>any</b>   <i>source source-wildcard</i> } [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ]
<b>Parameter Description</b>	<p><i>sn</i>: Indicates the sequence number of an ACE. The value ranges from 1 to 2,147,483,647. This sequence number determines the priority of this ACE in the ACL. A smaller sequence number indicates a higher priority. An ACE with a higher priority will be preferentially used to match packets. If you do not specify the sequence number when adding an ACE, the system automatically allocates a sequence number, which is equal to an increment (10 by default) plus the sequence number of the last ACE in the current ACL. For example, if the sequence number of the last ACE is 100, the sequence number of a newly-added ACE will be 110 by default. You can adjust the increment using a command.</p> <p><b>permit</b>: Indicates that the ACE is a permit ACE.</p> <p><b>deny</b>: Indicates that the ACE is a deny ACE.</p> <p><b>host</b> <i>source</i>: Indicates that IP packets sent from a host with the specified source IP address are filtered.</p> <p><b>any</b>: Indicates that IP packets sent from any host are filtered.</p> <p><i>source source-wildcard</i>: Indicates that IP packets sent from hosts in the specified IP network segment are filtered.</p> <p><b>time-range</b> <i>time-range-name</i>: Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p> <p><b>log</b>: Indicates that logs will be periodically output if packets matching the ACEs are found. For details about logs, see "ACL Logging" in this document.</p>
<b>Command Mode</b>	Standard IP ACL configuration mode
<b>Usage Guide</b>	Run this command to add ACEs in standard IP ACL configuration mode. The ACL can be a named or numbered ACL.

<b>Command</b>	<b>access-list</b> <i>acl-id</i> { <b>permit</b>   <b>deny</b> } { <b>host</b> <i>source</i>   <b>any</b>   <i>source source-wildcard</i> } [ <b>time-range</b> <i>tm-rng-name</i> ] [ <b>log</b> ]
----------------	---

<p><b>Parameter Description</b></p>	<p><i>acl-id</i>: Indicates the ID of a numbered ACL. It uniquely identifies an ACL. The value range of <i>acl-id</i> is 100–199 and 1300–1999.</p> <p><b>permit</b>: Indicates that the ACE is a permit ACE.</p> <p><b>deny</b>: Indicates that the ACE is a deny ACE.</p> <p><b>host source</b>: Indicates that IP packets sent from a host with the specified source IP address are filtered.</p> <p><b>any</b>: Indicates that IP packets sent from any host are filtered.</p> <p><i>source source-wildcard</i>: Indicates that IP packets sent from hosts in the specified IP network segment are filtered.</p> <p><b>time-range time-range-name</b>: Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p> <p><b>log</b>: Indicates that logs will be periodically output if packets matching the ACEs are found. For details about logs, see "ACL Logging" in this document.</p>
<p><b>Command Mode</b></p>	<p>Standard IP ACL configuration mode</p>
<p><b>Usage Guide</b></p>	<p>Run this command to add ACEs to a numbered IP ACL in global configuration mode. It cannot be used to add ACEs to a named IP ACL.</p>

- Add ACEs to an extended IP ACL.

Use either of the following methods to add ACEs to an extended IP ACL:

<p><b>Command</b></p>	<p>[ <i>sn</i> ] { <b>permit</b>   <b>deny</b> } <i>protocol</i> { <b>host source</b>   <b>any</b>   <i>source source-wildcard</i> } { <b>host destination</b>   <b>any</b>   <i>destination destination-wildcard</i> } [ [ <b>precedence precedence</b> [ <b>tos tos</b> ] ]   <b>dscp dscp</b> ] [ <b>fragment</b> ] [ <b>time-range time-range-name</b> ] [ <b>log</b> ]</p>
<p><b>Parameter Description</b></p>	<p><i>sn</i>: Indicates the sequence number of an ACE. The value ranges from 1 to 2,147,483,647. This sequence number determines the priority of this ACE in the ACL. A smaller sequence number indicates a higher priority. An ACE with a higher priority will be preferentially used to match packets. If you do not specify the sequence number when adding an ACE, the system automatically allocates a sequence number, which is equal to an increment (10 by default) plus the sequence number of the last ACE in the current ACL. For example, if the sequence number of the last ACE is 100, the sequence number of a newly-added ACE will be 110 by default. You can adjust the increment using a command.</p> <p><b>permit</b>: Indicates that the ACE is a permit ACE.</p> <p><b>deny</b>: Indicates that the ACE is a deny ACE.</p> <p><i>protocol</i>: Indicates the IP protocol number. The value ranges from 0 to 255. To facilitate the use, the system provides frequently-used abbreviations to replace the specific IP protocol numbers, including eigrp, gre, icmp, igmp, ip, ipinip, nos, ospf, tcp, and udp.</p> <p><b>host source</b>: Indicates that IP packets sent from a host with the specified source IP address are filtered.</p> <p><i>source source-wildcard</i>: Indicates that IP packets sent from hosts in the specified IP network segment are filtered.</p> <p><b>host destination</b>: Indicates that IP packets sent to a host with the specified destination IP address are filtered. If the <b>any</b> keyword is configured, IP packets sent to any host are filtered.</p> <p><i>destination destination-wildcard</i>: Indicates that IP packets sent to hosts in a specified IP network segment are filtered.</p>

	<p><b>any:</b> Indicates that IP packets sent to or from any host are filtered.</p> <p><b>precedence</b> <i>precedence:</i> Indicates that IP packets with the specified precedence field in the header are filtered.</p> <p><b>tos</b> <i>tos:</i> Indicates that IP packets with the specified the type of service (TOS) field in the header are filtered.</p> <p><b>dscp</b> <i>dscp:</i> Indicates that IP packets with the specified the dcsp field in the header are filtered.</p> <p><b>fragment:</b> Indicates that only fragmented IP packets except the first fragments are filtered.</p> <p><b>time-range</b> <i>time-range-name:</i> Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p> <p><b>log:</b> Indicates that logs will be periodically output if packets matching the ACEs are found. For details about logs, see "ACL Logging" in this document.</p>
<b>Command Mode</b>	Extended IP ACL configuration mode
<b>Usage Guide</b>	Run this command to add ACEs in extended IP ACL configuration mode. The ACL can be a named or numbered ACL.

<b>Command</b>	<b>access-list</b> <i>acl-id</i> { <b>permit</b>   <b>deny</b> } <i>protocol</i> { <b>host</b> <i>source</i>   <b>any</b>   <i>source source-wildcard</i> } { <b>host</b> <i>destination</i>   <b>any</b>   <i>destination destination-wildcard</i> } [ [ <b>precedence</b> <i>precedence</i> [ <b>tos</b> <i>tos</i> ] ]   <b>dscp</b> <i>dscp</i> ] [ <b>fragment</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ]
<b>Parameter Description</b>	<p><i>acl-id:</i> Indicates the ID of a numbered ACL. It uniquely identifies an ACL. The value range of <i>acl-id</i> is 100–199 and 2000–1999.</p> <p><i>sn:</i> Indicates the sequence number of an ACE. The value ranges from 1 to 2,147,483,647. This sequence number determines the priority of this ACE in the ACL. A smaller sequence number indicates a higher priority. An ACE with a higher priority will be preferentially used to match packets. If you do not specify the sequence number when adding an ACE, the system automatically allocates a sequence number, which is equal to an increment (10 by default) plus the sequence number of the last ACE in the current ACL. For example, if the sequence number of the last ACE is 100, the sequence number of a newly-added ACE will be 110 by default. You can adjust the increment using a command.</p> <p><b>permit:</b> Indicates that the ACE is a permit ACE.</p> <p><b>deny:</b> Indicates that the ACE is a deny ACE.</p> <p><i>protocol:</i> Indicates the IP protocol number. The value ranges from 0 to 255. To facilitate the use, the system provides frequently-used abbreviations to replace the specific IP protocol numbers, including eigrp, gre, icmp, igmp, ip, ipinip, nos, ospf, tcp, and udp.</p> <p><b>host</b> <i>source:</i> Indicates that IP packets sent from a host with the specified source IP address are filtered.</p> <p><i>source source-wildcard:</i> Indicates that IP packets sent from hosts in the specified IP network segment are filtered.</p> <p><b>host</b> <i>destination:</i> Indicates that IP packets sent to a host with the specified destination IP address are filtered. If the <b>any</b> keyword is configured, IP packets sent to any host are filtered.</p> <p><i>destination destination-wildcard:</i> Indicates that IP packets sent to hosts in a specified IP network segment are filtered.</p> <p><b>any:</b> Indicates that IP packets sent to or from any host are filtered.</p>

	<p><b>precedence</b> <i>precedence</i>: Indicates that IP packets with the specified precedence field in the header are filtered.</p> <p><b>tos</b> <i>tos</i>: Indicates that IP packets with the specified the type of service (TOS) field in the header are filtered.</p> <p><b>dscp</b> <i>dscp</i>: Indicates that IP packets with the specified the dscp field in the header are filtered.</p> <p><b>fragment</b>: Indicates that only fragmented IP packets except the first fragments are filtered.</p> <p><b>time-range</b> <i>time-range-name</i>: Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p> <p><b>log</b>: Indicates that logs will be periodically output if packets matching the ACEs are found. For details about logs, see "ACL Logging" in this document.</p>
<b>Command Mode</b>	Extended IP ACL configuration mode
<b>Usage Guide</b>	Run this command to add ACEs to a numbered IP ACL in extended IP ACL configuration mode. It cannot be used to add ACEs to a named extended IP ACL.

📌 [Applying an IP ACL](#)

<b>Command</b>	<b>ip access-group</b> { <i>acl-id</i>   <i>acl-name</i> } { <b>in</b>   <b>out</b> }
<b>Parameter Description</b>	<p><i>acl-id</i>: Indicates that a numbered standard or extended IP ACL will be applied to the interface.</p> <p><i>acl-name</i>: Indicates that a named standard or extended IP ACL will be applied to the interface.</p> <p><b>in</b>: Indicates that this ACL controls incoming IP packets of the interface.</p> <p><b>out</b>: Indicates that this ACL controls outgoing IP packets of the interface.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command makes an IP ACL take effect on the incoming or outgoing packets of a specified interface.

[Configuration Example](#)

 The following configuration example describes only ACL-related configurations.

📌 [Configuring an IP ACL to Prohibit Departments Except the Financial Department from Accessing the Financial Data Server](#)

<p><b>Scenario</b> <b>Figure 1-3</b></p>

## 1.4.2 Configuring an MAC Extended ACL

### Configuration Effect

Configure and apply an MAC extended ACL to an interface to control all incoming and outgoing IPv4 packets of this interface. You can permit or deny the entry of specific L2 packets to a network to control access of users to network resources based on L2 packets.

### Notes

N/A

### Configuration Steps

#### ▾ Configuring an MAC Extended ACL

- (Mandatory) Configure an MAC extended ACL if you want to control users' access to network resources based on the L2 packet header, for example, the MAC address of each user's PC.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The MAC extended ACL takes effect only on the local device, and does not affect other devices on the network.

#### ▾ Adding ACEs to an MAC Extended ACL

- (Optional) An ACL may contain zero or multiple ACEs. If no ACE is configured, all incoming L2 Ethernet packets of the device are denied by default.

#### ▾ Applying an MAC extended ACL

- (Mandatory) Apply an MAC extended ACL to a specified interface if you want this ACL take effect.
- You can apply an MAC extended ACL on a specified interface of an access, an aggregate, or a core device based on the distribution of users.

### Verification

- Use the following methods to verify the configuration effects of the MAC extended ACL:
- If an MAC extended ACL is configured to permit or deny some IP packets, run the **ping** command to check whether ACEs of this ACL takes effect on the specified interface. For example, an MAC extended ACL is configured to prevent a device interface from receiving IP packets (Ethernet type is 0x0800), run the **ping** command for verification.
- If an MAC extended ACL is configured to permit or deny some non-IP packets (e.g. ARP packets), also run the **ping** command to check whether ACEs of this ACL takes effect on the specified interface. For example, to filter out ARP packets, run the **ping** command for verification.
- You can also construct L2 packets meeting some specified characteristics to check whether the MAC extended ACL takes effect. Typically, prepare two PCs, construct and send L2 packets on one PC, enable packet capturing on another PC, and check whether packets are forwarded as expected (forwarded or blocked) according to the action specified in the ACEs.

## Related Commands

### ▾ Configuring an MAC Extended ACL

<b>Command</b>	<b>mac access-list extended</b> { <i>acl-name</i>   <i>acl-id</i> }
<b>Parameter Description</b>	<p><i>acl-name</i>: Indicates the name of an MAC extended ACL. If this option is configured, a named ACL is created. The name is a string of 1 to 99 characters. The ACL name cannot start with numbers (0–9), "in", or "out".</p> <p><i>acl-id</i>: Indicates the ID that uniquely identifies an MAC extended ACL. If this option is configured, a numbered ACL is created. The value range of <i>acl-id</i> is 700–799.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure an MAC extended ACL and enter MAC extended ACL configuration mode. You can configure an MAC extended ACL to control users' access to network resources by checking the L2 information of Ethernet packets.

### ▾ Adding ACEs to an MAC Extended ACL

Use either of the following methods to add ACEs to an MAC extended ACL:

- Add ACEs in MAC extended ACL configuration mode.

<b>Command</b>	[ <i>sn</i> ] { <b>permit</b>   <b>deny</b> } { <b>any</b>   <b>host</b> <i>src-mac-addr</i> } { <b>any</b>   <b>host</b> <i>dst-mac-addr</i> } [ <i>ethernet-type</i> ] [ <b>cos</b> <i>cos</i> [ <b>inner</b> <i>cos</i> ]] [ <b>time-range</b> <i>tm-rng-name</i> ]
<b>Parameter Description</b>	<p><i>sn</i>: Indicates the sequence number of an ACE. The value ranges from 1 to 2,147,483,647. This sequence number determines the priority of this ACE in the ACL. A smaller sequence number indicates a higher priority. An ACE with a higher priority will be preferentially used to match packets. If you do not specify the sequence number when adding an ACE, the system automatically allocates a sequence number, which is equal to an increment (10 by default) plus the sequence number of the last ACE in the current ACL. For example, if the sequence number of the last ACE is 100, the sequence number of a newly-added ACE will be 110 by default. You can adjust the increment using a command.</p> <p><b>permit</b>: Indicates that the ACE is a permit ACE.</p> <p><b>deny</b>: Indicates that the ACE is a deny ACE.</p> <p><b>any</b>: Indicates that L2 packets sent from any host are filtered.</p> <p><b>host</b> <i>src-mac-addr</i>: Indicates that IP packets sent from a host with the specified source MAC address are filtered.</p> <p><b>any</b>: Indicates that L2 packets sent to any host are filtered.</p> <p><b>host</b> <i>dst-mac-addr</i>: Indicates that IP packets sent to a host with the specified destination MAC address are filtered.</p> <p><i>ethernet-type</i>: Indicates that L2 packets of the specified Ethernet type are filtered.</p> <p><b>cos</b> <i>cos</i>: Indicates that L2 packets with the specified class of service (cos) field in the outer tag are filtered.</p> <p><b>inner</b> <i>cos</i>: Indicates that L2 packets with the specified cos field in the inner tag are filtered.</p> <p><b>time-range</b> <i>time-range-name</i>: Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p>

<b>Command Mode</b>	MAC extended ACL configuration mode
<b>Usage Guide</b>	Run this command to add ACEs in MAC extended ACL configuration mode. The ACL can be a named or numbered ACL.

- Add ACEs to an MAC extended ACL in global configuration mode.

<b>Command</b>	<b>access-list</b> <i>acl-id</i> { <b>permit</b>   <b>deny</b> } { <b>any</b>   <b>host</b> <i>src-mac-addr</i> } { <b>any</b>   <b>host</b> <i>dst-mac-addr</i> } [ <i>ethernet-type</i> ] [ <b>cos</b> <i>cos</i> [ <b>inner</b> <i>cos</i> ]] [ <b>time-range</b> <i>tm-rng-name</i> ]
<b>Parameter Description</b>	<p><i>acl-id</i>: Indicates the ID of a numbered ACL. It uniquely identifies an ACL. The value range of <i>acl-id</i> is 700–799.</p> <p><b>permit</b>: Indicates that the ACE is a permit ACE.</p> <p><b>deny</b>: Indicates that the ACE is a deny ACE.</p> <p><b>host</b> <i>src-mac-addr</i>: Indicates that IP packets sent from a host with the specified source MAC address are filtered.</p> <p><b>any</b>: Indicates that L2 packets sent to any host are filtered.</p> <p><b>host</b> <i>dst-mac-addr</i>: Indicates that IP packets sent to a host with the specified destination MAC address are filtered.</p> <p><i>ethernet-type</i>: Indicates that L2 packets of the specified Ethernet type are filtered.</p> <p><b>cos</b> <i>cos</i>: Indicates that L2 packets with the specified cos field in the outer tag are filtered.</p> <p><b>inner</b> <i>cos</i>: Indicates that L2 packets with the specified cos field in the inner tag are filtered.</p> <p><b>time-range</b> <i>time-range-name</i>: Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to add ACEs to a numbered MAC extended ACL in global configuration mode. It cannot be used to add ACEs to a named MAC extended ACL.

### 📌 Applying an MAC Extended ACL

<b>Command</b>	<b>mac access-group</b> { <i>acl-id</i>   <i>acl-name</i> } { <b>in</b>   <b>out</b> }
<b>Parameter Description</b>	<p><i>acl-id</i>: Indicates that a numbered MAC extended IP ACL will be applied to the interface.</p> <p><i>acl-name</i>: Indicates that a named MAC extended IP ACL will be applied to the interface.</p> <p><b>in</b>: Indicates that this ACL controls incoming L2 packets of the interface.</p> <p><b>out</b>: Indicates that this ACL controls outgoing L2 packets of the interface.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command makes an MAC extended ACL take effect on the incoming or outgoing packets of a specified interface.

### Configuration Example

-  The following configuration example describes only ACL-related configurations.

➤ **Configuring an MAC Extended ACL to Restrict Resources Accessible by Visitors**

<p><b>Scenario</b> Figure 1-4</p>	<p>The diagram illustrates a network topology. A central switch, SW1, is connected to four different segments:         <ul style="list-style-type: none"> <li><b>Servers:</b> A dashed circle containing two server icons. One is labeled 'Financial Data Server' with MAC address '00e0.f800.000d'. The other is labeled 'Public Server' with MAC address '00e0.f800.000c'. SW1 is connected to this group via interface Gi 0/3.</li> <li><b>Internet:</b> A cloud icon representing the Internet. SW1 is connected to it via interface Gi 0/4.</li> <li><b>Employees:</b> A dashed circle containing two PC icons labeled 'PC1' and 'PC2'. SW1 is connected to this group via interface Gi 0/1.</li> <li><b>Visitors:</b> A dashed circle containing two PC icons labeled 'PC1' and 'PC2'. SW1 is connected to this group via interface Gi 0/2.</li> </ul> </p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an MAC extended ACL.</li> <li>● Add ACEs to the MAC extended ACL.</li> <li>● Apply the MAC extended ACL to the outgoing direction of the interface connected to the visitor area so that visitors are allowed to access Internet and the public server of the company, but prohibited from accessing the financial data server of the company. That is, visitors cannot access the server with the MAC address 00e0.f800.000d.</li> </ul>
<p><b>SW1</b></p>	<pre>sw1(config)#mac access-list extended 700 sw1(config-mac-nacl)#deny any host 00e0.f800.000d sw1(config-mac-nacl)#permit any any sw1(config-mac-nacl)#exit sw1(config)#int gigabitEthernet 0/2 sw1(config-if-GigabitEthernet 0/2)#mac access-group 700 in</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On a visitor's PC, ping the financial data server. Verify that the ping operation fails.</li> <li>● On a visitor's PC, ping the public resource server. Verify that the ping operation succeeds.</li> <li>● On a visitor's PC, access the Internet, for example, visit the Baidu website. Verify that the webpage can be opened.</li> </ul>
<p><b>SW1</b></p>	<pre>sw1(config)#show access-lists mac access-list extended 700  10 deny any host 00e0.f800.000d etype-any  20 permit any any etype-any sw1(config)#show access-group</pre>

```
mac access-group 700 in
Applied On interface GigabitEthernet 0/2
```

### 1.4.3 Configuring an Expert Extended ACL

#### Configuration Effect

Configure and apply an expert extended ACL to an interface to control incoming and outgoing packets of the interface based on the L2 and L3 information, and allow or prohibit the entry of specific packets to the network. In addition, you can configure an expert extended ACL to control all L2 packets based on the VLAN to permit or deny the access of users in some network segments to network resources. Generally, you can use an expert extended ACL if you want to incorporate ACEs of the IP ACL and MAC extended ACL into one ACL.

#### Configuration Steps

##### ↘ **Configuring an Expert Extended ACL**

- (Mandatory) Configure an expert extended ACL if you want to control users' access to network resources based on the L2 packet header, for example, the VLAN ID.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The expert extended ACL takes effect only on the local device, and does not affect other devices on the network.

##### ↘ **Adding ACEs to an Expert Extended ACL**

- (Optional) An ACL may contain zero or multiple ACEs. If no ACE is configured, all incoming packets of the device are denied by default.

##### ↘ **Applying an Expert Extended ACL**

- (Mandatory) Apply an expert extended ACL to a specified interface if you want this ACL take effect.
- You can apply an expert extended ACL in the incoming or outgoing direction of a specified interface of an access, an aggregate, or a core device based on the distribution of users.

#### Verification

- Use the following methods to verify the configuration effects of the expert extended ACL:
- If IP-based access rules are configured in an expert extended ACL to permit or deny some IP packets, run the **ping** command to verify whether these rules take effect.
- If MAC-based access rules are configured in an expert extended ACL to permit or deny some L2 packets (e.g. ARP packets), also run the **ping** command to check whether ACEs of this ACL takes effect on the specified interface. For example, to filter out ARP packets, run the **ping** command for verification.
- If VLAN ID-based access rules are configured in an expert extended ACL to permit or deny some L2 packets in some network segments (e.g., to prevent communication between VLAN 1 users and VLAN 2 users), ping PCs of VLAN 2 on a PC of VLAN 1. If the ping operation fails, the rules take effect.

## Related Commands

### ↘ Configuring an Expert Extended ACL

<b>Command</b>	<b>expert access-list extended</b> { <i>acl-name</i>   <i>acl-id</i> }
<b>Parameter Description</b>	<p><i>acl-name</i>: Indicates the name of an expert extended ACL. If this option is configured, a named ACL is created. The name is a string of 1 to 99 characters. The ACL name cannot start with numbers (0–9), "in", or "out".</p> <p><i>acl-id</i>: Indicates the ID of an expert extended ACL. If this option is configured, a numbered ACL is created. The value range of <i>acl-id</i> is 2700-2899.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure an expert extended ACL and enter expert extended ACL configuration mode.

### ↘ Adding ACEs to an Expert Extended ACL

Use either of the following methods to add ACEs to an expert extended ACL:

- Add ACEs in expert extended ACL configuration mode.

<b>Command</b>	[ <i>sn</i> ] { <b>permit</b>   <b>deny</b> } [ <i>protocol</i> ] [ <i>ethernet-type</i> ] [ <b>cos</b> [ <i>out</i> ] [ <b>inner</b> <i>in</i> ] ] [ [ <b>VID</b> [ <i>out</i> ] [ <b>inner</b> <i>in</i> ] ] ] { <i>source source-wildcard</i>   <b>host</b> <i>source</i>   <b>any</b> } { <b>host</b> <i>source-mac-address</i>   <b>any</b> } { <i>destination destination-wildcard</i>   <b>host</b> <i>destination</i>   <b>any</b> } { <b>host</b> <i>destination-mac-address</i>   <b>any</b> } [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>fragment</b> ] [ <b>range</b> <i>lower upper</i> ] [ <b>time-range</b> <i>time-range-name</i> ]
<b>Parameter Description</b>	<p><i>sn</i>: Indicates the sequence number of an ACE. The value ranges from 1 to 2,147,483,647. This sequence number determines the priority of this ACE in the ACL. A smaller sequence number indicates a higher priority. An ACE with a higher priority will be preferentially used to match packets. If you do not specify the sequence number when adding an ACE, the system automatically allocates a sequence number, which is equal to an increment (10 by default) plus the sequence number of the last ACE in the current ACL. For example, if the sequence number of the last ACE is 100, the sequence number of a newly-added ACE will be 110 by default. You can adjust the increment using a command.</p> <p><b>permit</b>: Indicates that the ACE is a permit ACE.</p> <p><b>deny</b>: Indicates that the ACE is a deny ACE.</p> <p><i>protocol</i>: Indicates the IP protocol number. The value ranges from 0 to 255. To facilitate the use, the system provides frequently-used abbreviations to replace the specific IP protocol numbers, including eigrp, gre, icmp, igmp, ip, ipinip, nos, ospf, tcp, and udp.</p> <p><i>ethernet-type</i>: Indicates that L2 packets of the specified Ethernet type are filtered.</p> <p><b>cos out</b>: Indicates that L2 packets with the specified cos field in the outer tag are filtered.</p> <p><b>cos inner in</b>: Indicates that L2 packets with the specified cos field in the inner tag are filtered.</p> <p><b>VID out</b>: Indicates that L2 packets with the specified VLAN ID field in the outer tag are filtered.</p> <p><b>VID inner in</b>: Indicates that L2 packets with the specified VLAN ID field in the inner tag are filtered.</p> <p><i>source source-wildcard</i>: Indicates that IP packets sent from hosts in the specified IP network segment are filtered.</p>

	<p><b>host source:</b> Indicates that IP packets sent from a host with the specified source IP address are filtered.</p> <p><b>any:</b> Indicates that IP packets sent from any host are filtered.</p> <p><b>host source-mac-address:</b> Indicates that IP packets sent from a host with the specified source MAC address are filtered.</p> <p><b>any:</b> Indicates that L2 packets sent to any host are filtered.</p> <p><b>destination destination-wildcard:</b> Indicates that IP packets sent to hosts in a specified IP network segment are filtered.</p> <p><b>host destination:</b> Indicates that IP packets sent to a host with the specified destination IP address are filtered.</p> <p><b>any:</b> Indicates that IP packets sent to any host are filtered.</p> <p><b>host destination-mac-address:</b> Indicates that IP packets sent to a host with the specified destination MAC address are filtered.</p> <p><b>any:</b> Indicates that L2 packets sent to any host are filtered.</p> <p><b>precedence precedence:</b> Indicates that IP packets with the specified precedence field in the header are filtered.</p> <p><b>tos tos:</b> Indicates that IP packets with the specified the TOS field in the header are filtered.</p> <p><b>dscp dscp:</b> Indicates that IP packets with the specified the dscp field in the header are filtered.</p> <p><b>fragment:</b> Indicates that only fragmented IP packets except the first fragments are filtered.</p> <p><b>time-range time-range-name:</b> Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p>
<b>Command Mode</b>	Expert extended ACL configuration mode
<b>Usage Guide</b>	Run this command to add ACEs in expert extended ACL configuration mode. The ACL can be a named or numbered ACL.

- Add ACEs to an expert extended ACL in global configuration mode.

<b>Command</b>	<b>access-list</b> <i>acl-id</i> { <b>permit</b>   <b>deny</b> } [ <i>protocol</i>   [ <i>ethernet-type</i> ] [ <b>cos</b> [ <i>out</i> ] [ <b>inner</b> <i>in</i> ] ] ] [ [ <b>VID</b> [ <i>out</i> ] [ <b>inner</b> <i>in</i> ] ] ] { <i>source source-wildcard</i>   <b>host source</b>   <b>any</b> } { <b>host source-mac-address</b>   <b>any</b> } { <i>destination destination-wildcard</i>   <b>host destination</b>   <b>any</b> } { <b>host destination-mac-address</b>   <b>any</b> } [ <b>precedence precedence</b> ] [ <b>tos tos</b> ] [ <b>fragment</b> ] [ <b>range lower upper</b> ] [ <b>time-range time-range-name</b> ]
<b>Parameter Description</b>	<p><b>acl-id:</b> Indicates the ID of a numbered ACL. It uniquely identifies an ACL. The value range of <i>acl-id</i> is 2700-2899.</p> <p><b>permit:</b> Indicates that the ACE is a permit ACE.</p> <p><b>deny:</b> Indicates that the ACE is a deny ACE.</p> <p><b>protocol:</b> Indicates the IP protocol number. The value ranges from 0 to 255. To facilitate the use, the system provides frequently-used abbreviations to replace the specific IP protocol numbers, including eigrp, gre, icmp, igmp, ip, ipinip, nos, ospf, tcp, and udp.</p> <p><b>ethernet-type:</b> Indicates that L2 packets of the specified Ethernet type are filtered.</p> <p><b>cos out:</b> Indicates that L2 packets with the specified cos field in the outer tag are filtered.</p> <p><b>cos inner in:</b> Indicates that L2 packets with the specified cos field in the inner tag are filtered.</p> <p><b>VID out:</b> Indicates that L2 packets with the specified VLAN ID field in the outer tag are filtered.</p>

	<p><b>VID inner in:</b> Indicates that L2 packets with the specified VLAN ID field in the inner tag are filtered.</p> <p><i>source source-wildcard:</i> Indicates that IP packets sent from hosts in the specified IP network segment are filtered.</p> <p><b>host source:</b> Indicates that IP packets sent from a host with the specified source IP address are filtered.</p> <p><b>any:</b> Indicates that IP packets sent from any host are filtered.</p> <p><b>host source-mac-address:</b> Indicates that IP packets sent from a host with the specified source MAC address are filtered.</p> <p><b>any:</b> Indicates that L2 packets sent to any host are filtered.</p> <p><i>destination destination-wildcard:</i> Indicates that IP packets sent to hosts in a specified IP network segment are filtered.</p> <p><b>host destination:</b> Indicates that IP packets sent to a host with the specified destination IP address are filtered.</p> <p><b>any:</b> Indicates that IP packets sent to any host are filtered.</p> <p><b>host destination-mac-address:</b> Indicates that IP packets sent to a host with the specified destination MAC address are filtered.</p> <p><b>any:</b> Indicates that L2 packets sent to any host are filtered.</p> <p><b>precedence precedence:</b> Indicates that IP packets with the specified precedence field in the header are filtered.</p> <p><b>tos tos:</b> Indicates that IP packets with the specified the TOS field in the header are filtered.</p> <p><b>dscp dscp:</b> Indicates that IP packets with the specified the dscp field in the header are filtered.</p> <p><b>fragment:</b> Indicates that only fragmented IP packets except the first fragments are filtered.</p> <p><b>time-range time-range-name:</b> Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to add ACEs to a numbered expert extended ACL in global configuration mode. It cannot be used to add ACEs to a named expert extended ACL.

↘ **Applying an Expert Extended ACL**

<b>Command</b>	<b>expert access-group</b> { <i>acl-id</i>   <i>acl-name</i> } { <b>in</b>   <b>out</b> }
<b>Parameter Description</b>	<ul style="list-style-type: none"> <li>● <i>acl-id:</i> Indicates that a numbered expert extended ACL will be applied to the interface.</li> <li>● <i>acl-name:</i> Indicates that a named expert extended ACL will be applied to the interface.</li> <li>● <b>in:</b> Indicates that this ACL controls incoming L2 packets of the interface.</li> </ul> <p><b>out:</b> Indicates that this ACL controls outgoing L2 packets of the interface.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command makes an expert extended ACL take effect on the incoming or outgoing packets of a specified interface.

**Configuration Example**

**i** The following configuration example describes only ACL-related configurations.

**Configuring an Expert Extended ACL to Restrict Resources Accessible by Visitors (It is required that visitors and employees cannot communicate with each other, visitors can access the public resource server but not the financial data server of the company.)**

<p><b>Scenario</b> <b>Figure 1-5</b></p>	<p>The diagram illustrates a network topology. At the center is a switch labeled SW1. SW1 has four Gigabit Ethernet interfaces: Gi 0/1, Gi 0/2, Gi 0/3, and Gi 0/4. Gi 0/3 is connected to a group of Servers, which includes a Financial Data Server (IP 10.1.1.1/24) and a Public Server (IP 10.1.1.2/24). Gi 0/4 is connected to the Internet. Gi 0/1 and Gi 0/2 are connected to two separate VLANs. VLAN 2, labeled 'Employees', has an IP segment of 192.168.1.0/24 and a gateway of 192.168.1.1/24. VLAN 3, labeled 'Visitors', has an IP segment of 192.168.2.0/24 and a gateway of 192.168.2.1/24. Each VLAN contains several PCs, specifically PC1 and PC2 are labeled in each group.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an expert extended ACL.</li> <li>● Add an ACE to deny packets sent from PCs in the visitor area (VLAN 3) to employee PCs in VLAN 2.</li> <li>● Add an ACE to prevent visitors from accessing the financial data server of the company.</li> <li>● Add an ACE to permit all packets.</li> <li>● Apply the ACL to the incoming direction of the interface of the switch that connects to the visitor area.</li> </ul>
<p><b>SW1</b></p>	<pre>sw1(config)#expert access-list extended 2700 sw1(config-exp-nacl)#deny ip any any 192.168.1.0 0.0.0.255 any sw1(config-exp-nacl)#deny ip any any host 10.1.1.1 any sw1(config-exp-nacl)#permit any any any any sw1(config-exp-nacl)#exit sw1(config)#int gigabitEthernet 0/2 sw1(config-if-GigabitEthernet 0/2)#expert access-group 2700 in</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On a visitor's PC, ping the financial data server. ## 1.4.4 Configuring an IPv6 Extended ACL

### Configuration Effect

Configure and apply an IPv6 ACL to an interface to control all incoming and outgoing IPv6 packets of this interface. You can permit or deny the entry of specific IPv6 packets to a network to control access of IPv6 users to network resources.

### Configuration Steps

#### ▾ Configuring an IPv6 ACL

- (Mandatory) Configure an IP ACL if you want to access of IPv4 users to network resources.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The IPv6 ACL takes effect only on the local device, and does not affect other devices on the network.

#### ▾ Adding ACEs to an IPv6 ACL

- (Optional) An ACL may contain zero or multiple ACEs. If no ACE is configured, all incoming IPv6 packets of the device are denied by default.

#### ▾ Applying an IPv6 ACL

- (Mandatory) Apply an IPv6 ACL to a specified interface on a device if you want this ACL take effect.
- You can apply an IPv6 ACL on a specified interface of an access, an aggregate, or a core device based on the distribution of users.

### Verification

- Use the following methods to verify the configuration effects of the IPv6 ACL:

- Run the **ping** command to verify that the IPv6 ACL takes effect on the specified interface. For example, if an IPv6 ACL is configured to prohibit a host with a specified IP address or hosts in a specified IPv6 address range from accessing the network, run the **ping** command to verify that the host(s) cannot be successfully pinged.
- Access network resources, for example, visit an IPv6 website, to check whether the IPv6 ACL takes effect on the specified interface.

## Related Commands

### ↳ Configuring an IPv6 ACL

<b>Command</b>	<b>ipv6 access-list</b> <i>acl-name</i>
<b>Parameter Description</b>	<i>acl-name</i> : Indicates the name of a standard or an extended IP ACL. The name is a string of 1 to 99 characters. The ACL name cannot start with numbers (0–9), "in", or "out".
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure an IPv6 ACL and enter IPv6 configuration mode.

### ↳ Adding ACEs to an IPv6 ACL

- To filter TCP or UDP packets, add ACEs to an IPv6 ACL as follows:

<b>Command</b>	<i>[sn]</i> { <b>permit</b>   <b>deny</b> } <i>protocol</i> { <i>src-ipv6-prefix/prefix-len</i>   <b>host</b> <i>src-ipv6-addr</i>   <b>any</b> } { <i>dst-ipv6-pfix/pfix-len</i>   <b>host</b> <i>dst-ipv6-addr</i>   <b>any</b> } [ <i>op dstport</i>   <b>range</b> <i>lower upper</i> ] [ <b>dscp</b> <i>dscp</i> ] [ <b>flow-label</b> <i>flow-label</i> ] [ <b>fragment</b> ] [ <b>time-range</b> <i>tm-rng-name</i> ] [ <b>log</b> ]
<b>Parameter Description</b>	<p><i>sn</i>: Indicates the sequence number of an ACE. The value ranges from 1 to 2,147,483,647. This sequence number determines the priority of this ACE in the ACL. A smaller sequence number indicates a higher priority. An ACE with a higher priority will be preferentially used to match packets. If you do not specify the sequence number when adding an ACE, the system automatically allocates a sequence number, which is equal to an increment (10 by default) plus the sequence number of the last ACE in the current ACL. For example, if the sequence number of the last ACE is 100, the sequence number of a newly-added ACE will be 110 by default. You can adjust the increment using a command.</p> <p><b>permit</b>: Indicates that the ACE is a permit ACE.</p> <p><b>deny</b>: Indicates that the ACE is a deny ACE.</p> <p><i>protocol</i>: Indicates the IPv6 protocol number. The value ranges from 0 to 255. To facilitate the use, the system provides frequently-used abbreviations of IPv6 protocol numbers to replace the specific IP protocol numbers, including icmp, ipv6, tcp, and udp.</p> <p><i>src-ipv6-prefix/prefix-len</i>: Indicates that IP packets sent from hosts in the specified IPv6 network segment are filtered.</p> <p><b>host</b> <i>src-ipv6-addr</i>: Indicates that IPv6 packets sent from a host with the specified source IP address are filtered.</p> <p><b>any</b>: Indicates that IPv6 packets sent from any host are filtered.</p> <p><i>dst-ipv6-pfix/pfix-len</i>: Indicates that IPv6 packets sent from hosts in the specified IPv6 network segment are filtered.</p> <p><b>host</b> <i>dst-ipv6-addr</i>: Indicates that IPv6 packets sent to a host with the specified destination IP address are</p>

	<p>filtered.</p> <p><b>any:</b> Indicates that IPv6 packets sent to any host are filtered.</p> <p><i>op dstport:</i> Indicates that TCP or UDP packets are filtered based on the L4 destination port number. The value of the <b>op</b> parameter can be <b>eq</b> (equal to), <b>neq</b> (not equal to), <b>gt</b> (greater than), or <b>lt</b> (smaller than).</p> <p><b>range lower upper:</b> Indicates that TCP or UDP packets with the L4 destination port number in the specified range are filtered.</p> <p><b>dscp dscp:</b> Indicates that IPv6 packets with the specified the dscp field in the header are filtered.</p> <p><b>flow-label flow-label:</b> Indicates that IPv6 packets with the specified the flow label field in the header are filtered.</p> <p><b>fragment:</b> Indicates that only fragmented IPv6 packets except the first fragments are filtered.</p> <p><b>time-range time-range-name:</b> Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p> <p><b>log:</b> Indicates that logs will be periodically output if packets matching the ACEs are found. For details about logs, see "ACL Logging" in this document.</p>
<b>Command Mode</b>	IPv6 ACL configuration mode
<b>Usage Guide</b>	Run this command to add ACEs in IPv6 ACL configuration mode.

- To filter IPv6 packets except for the TCP or UDP packets, add ACEs to an IPv6 ACL as follows:

<b>Command</b>	<pre>[ sn ] { permit   deny } protocol { src-ipv6-prefix/prefix-len   host src-ipv6-addr   any } { dst-ipv6-pfix/pfix-len   host dst-ipv6-addr   any } [ dscp dscp ] [ flow-label flow-label ] [ fragment ] [ time-range tm-rng-name ] [ log ]</pre>
<b>Parameter Description</b>	<p><i>sn:</i> Indicates the sequence number of an ACE. The value ranges from 1 to 2,147,483,647. This sequence number determines the priority of this ACE in the ACL. A smaller sequence number indicates a higher priority. An ACE with a higher priority will be preferentially used to match packets. If you do not specify the sequence number when adding an ACE, the system automatically allocates a sequence number, which is equal to an increment (10 by default) plus the sequence number of the last ACE in the current ACL. For example, if the sequence number of the last ACE is 100, the sequence number of a newly-added ACE will be 110 by default. You can adjust the increment using a command.</p> <p><b>permit:</b> Indicates that the ACE is a permit ACE.</p> <p><b>deny:</b> Indicates that the ACE is a deny ACE.</p> <p><i>protocol:</i> Indicates the IPv6 protocol number. The value ranges from 0 to 255. To facilitate the use, the system provides frequently-used abbreviations of IPv6 protocol numbers to replace the specific IP protocol numbers, including icmp, ipv6, tcp, and udp.</p> <p><i>src-ipv6-prefix/prefix-len:</i> Indicates that IP packets sent from hosts in the specified IPv6 network segment are filtered.</p> <p><b>host src-ipv6-addr:</b> Indicates that IPv6 packets sent from a host with the specified source IP address are filtered.</p> <p><b>any:</b> Indicates that IPv6 packets sent from any host are filtered.</p> <p><i>dst-ipv6-pfix/pfix-len:</i> Indicates that IPv6 packets sent from hosts in the specified IPv6 network segment are filtered.</p>

	<p><b>host</b> <i>dst-ipv6-addr</i>: Indicates that IPv6 packets sent to a host with the specified destination IP address are filtered.</p> <p><b>any</b>: Indicates that IPv6 packets sent to any host are filtered.</p> <p><b>dscp</b> <i>dscp</i>: Indicates that IPv6 packets with the specified the dscp field in the header are filtered.</p> <p><b>flow-label</b> <i>flow-label</i>: Indicates that IPv6 packets with the specified the flow label field in the header are filtered.</p> <p><b>fragment</b>: Indicates that only fragmented IPv6 packets except the first fragments are filtered.</p> <p><b>time-range</b> <i>time-range-name</i>: Indicates that this ACE is associated with a time range. The ACE takes effect only within this time range. For details about the time range, see the configuration manual of the time range.</p> <p><b>log</b>: Indicates that logs will be periodically output if packets matching the ACEs are found. For details about logs, see "ACL Logging" in this document.</p>
<b>Command Mode</b>	IPv6 ACL configuration mode
<b>Usage Guide</b>	Run this command to add ACEs in IPv6 ACL configuration mode.

➤ **Applying an IPv6 ACL**

<b>Command</b>	<b>ipv6 traffic-filter</b> <i>acl-name</i> { <b>in</b>   <b>out</b> }
<b>Parameter</b>	<i>acl-name</i> : Indicates the name of an IPv6 ACL.
<b>Description</b>	<p><b>in</b>: Indicates that this ACL controls incoming IPv6 packets of the interface.</p> <p><b>out</b>: Indicates that this ACL controls outgoing IPv6 packets of the interface.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command makes an IPv6 ACL take effect on the incoming or outgoing packets of the specified interface.

**Configuration Example**

➤ **Configuring an IPv6 ACL to Prohibit the R&D Department from Accessing the Video Server**

<p><b>Scenario</b></p> <p><b>Figure 1-6</b></p>	<p>The diagram illustrates a network topology. A central switch labeled SW1 is connected to a Video Server with IP address 200::1 through its Gi 0/3 interface. SW1 also has two other interfaces: Gi 0/1, which is connected to a group of PCs labeled 'Financial Dept.' (including PC1 and PC2), and Gi 0/2, which is connected to a group of PCs labeled 'R&amp;D Dept.' (including PC1 and PC2). Ellipses (...) indicate additional PCs in each department.</p>
<b>Configuration</b>	<ul style="list-style-type: none"> <li>● Configure an IPv6 ACL.</li> </ul>

<b>Steps</b>	<ul style="list-style-type: none"> <li>● Add an ACE to the IPv6 ACL to prevent access to the video server.</li> <li>● Add an ACE to the IPv6 ACL to permit all IPv6 packets.</li> <li>● Apply the IPv6 ACL to the incoming direction of the interface connected to the R&amp;D department.</li> </ul>
<b>SW1</b>	<pre>sw1(config)#ipv6 access-list dev_deny_ipv6video sw1(config-ipv6-nacl)#deny ipv6 any host 200::1 sw1(config-ipv6-nacl)#permit ipv6 any any sw1(config-ipv6-nacl)#exit sw1(config)#int gigabitEthernet 0/2 sw1(config-if-GigabitEthernet 0/2)# ipv6 traffic-filter dev_deny_ipv6video in</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On a PC of the R&amp;D department, ping the video server. Verify that the ping operation fails.</li> </ul>
<b>SW1</b>	<pre>sw1(config)#show access-lists  ipv6 access-list dev_deny_ipv6video 10 deny ipv6 any host 200::1 20 permit ipv6 any any  sw1(config)#show access-group  ipv6 traffic-filter dev_deny_ipv6video in Applied On interface GigabitEthernet 0/2</pre>

## 1.4.5 Configuring an ACL80

### Configuration Effect

When the IP ACL, MAC extended ACL, expert extended ACL, and IPv6 ACL with fixed matching fields cannot meet requirements, configure the ACL80 to customize the packet fields that need to be matched.

### Configuration Steps

#### 📌 **Configuring an Expert Advanced ACL**

- (Mandatory) Configure an expert advanced ACL if you want to implement the ACL80 function. For details about how to configure the expert advanced ACL, see the related descriptions.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The expert advanced ACL takes effect only on the local device, and does not affect other devices on the network.

### ➤ Adding ACEs to an Expert Advanced ACL

- (Mandatory) Add ACEs to an expert advanced ACL to customize matching fields. If no ACE is added to the expert advanced ACL, the deny ACEs will drop all packets by default. For details about how to add an ACE to an expert advanced ACL, see the related descriptions.

### ➤ Applying an Expert Advanced ACL

- (Mandatory) Apply an expert advanced ACL to a specified interface if you want this ACL take effect.
- You can apply an expert advanced ACL on a specified interface of an access, an aggregate, or a core device based on the distribution of users.

### Verification

- Use the following methods to verify the configuration effects of the expert advanced ACL:
- Run the **ping** command to check whether the configurations take effect.
- Construct packets matching the ACEs to check whether ACEs take effect.

### Related Commands

#### ➤ Configuring an Expert Advanced ACL

<b>Command</b>	<b>expert access-list advanced</b> <i>acl-name</i>
<b>Parameter Description</b>	<i>acl-name</i> : Indicates the name of an expert advanced ACL. The name is a string of 1 to 99 characters. The ACL name cannot start with numbers (0–9), "in", or "out".
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure an expert advanced ACL and enter expert advanced ACL configuration mode.

#### ➤ Adding ACEs to an Expert Advanced ACL

<b>Command</b>	[ <i>sn</i> ] { <b>permit</b>   <b>deny</b> } <i>hex hex-mask offset</i>
<b>Parameter Description</b>	<p><i>sn</i>: Indicates the sequence number of an ACE. The value ranges from 1 to 2,147,483,647. This sequence number determines the priority of this ACE in the ACL. A smaller sequence number indicates a higher priority. An ACE with a higher priority will be preferentially used to match packets. If you do not specify the sequence number when adding an ACE, the system automatically allocates a sequence number, which is equal to an increment (10 by default) plus the sequence number of the last ACE in the current ACL. For example, if the sequence number of the last ACE is 100, the sequence number of a newly-added ACE will be 110 by default. You can adjust the increment using a command.</p> <p><b>permit</b>: Indicates that the ACE is a permit ACE.</p> <p><b>deny</b>: Indicates that the ACE is a deny ACE.</p> <p><i>hex</i>: Indicates the customized matching rule expressed in hexadecimal format, for example, 00d0f800.</p>

	<p><i>hex-mask</i>: Indicates the matching mask.</p> <p><i>offset</i>: Indicates the start position of matching. For example, if the matching content is 00d0f800, the matching mask is 00ff0000, and start position is 6, the destination MAC address of each packet is compared. All packets whose second byte of the destination MAC address is d0 match this ACE.</p>
<b>Command Mode</b>	Expert advanced ACL configuration mode
<b>Usage Guide</b>	Run this command to add ACEs in expert advanced ACL configuration mode.

### 📌 Applying an Expert Advanced ACL

<b>Command</b>	<b>expert access-group</b> <i>acl-n</i> { <b>in</b>   <b>out</b> }
<b>Parameter Description</b>	<p><i>acl-id</i>: Indicates that a numbered expert advanced ACL will be applied to the interface.</p> <p><i>acl-name</i>: Indicates that a named expert advanced ACL will be applied to the interface.</p> <p><b>in</b>: Indicates that this ACL controls incoming L2 packets of the interface.</p> <p><b>out</b>: Indicates that this ACL controls outgoing L2 packets of the interface.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command makes an expert advanced ACL take effect on the incoming or outgoing packets of a specified interface.

### Configuration Example

**i** The following configuration example describes only ACL-related configurations.

- 📌 **Configuring an ACL80 to Restrict Resources Accessible by Visitors (It is required that visitors and employees cannot communicate with each other, visitors can access the public resource server but not the financial data server of the company.)**

<p><b>Scenario</b> <b>Figure 1-7</b></p>	<p>The diagram shows a central switch SW1 with four interfaces: Gi 0/1, Gi 0/2, Gi 0/3, and Gi 0/4. Gi 0/3 is connected to a group of Servers, including a Financial Data Server (10.1.1.1/24) and a Public Server (10.1.1.2/24). Gi 0/4 is connected to the Internet. Gi 0/1 and Gi 0/2 are connected to two separate VLANs: VLAN 2 (Employees) and VLAN 3 (Visitors). VLAN 2 has an IP Segment of 192.168.1.0/24 and a Gateway of 192.168.1.1/24. VLAN 3 has an IP Segment of 192.168.2.0/24 and a Gateway of 192.168.2.1/24. Each VLAN contains PC1 and PC2.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an expert advanced ACL.</li> <li>● Add an ACE to deny packets sent from PCs in the visitor area (VLAN 3) to employee PCs in VLAN 2.</li> <li>● Add an ACE to prevent visitors from accessing the financial data server of the company.</li> <li>● Add an ACE to permit all packets.</li> <li>● Apply the ACL to the incoming direction of the interface of the switch that connects to the visitor area.</li> </ul>
<p><b>SW1</b></p>	<pre>sw1(config)#expert access-list advanced acl80-guest sw1(config-exp-dacl)#deny COA801 FFFFFFFF 42 sw1(config-exp-dacl)#deny 0A010101 FFFFFFFF 42 sw1(config-exp-dacl)#permit 0806 FFFF 24 sw1(config-exp-dacl)#permit 0800 FFFF 24 sw1(config-exp-dacl)#exit sw1(config)#int gigabitEthernet 0/2 sw1(config-if-GigabitEthernet 0/2)#expert access-group acl80-guest in</pre>

```

## 1.4.6 Configuring ACL Redirection

### Configuration Effect

Configure the ACL redirection function on a specified interface to directly redirect specified packets on the interface to a specified port for further forwarding.

### Configuration Steps

#### ▾ Configuring an ACL

- (Mandatory) To implement ACL redirection, you must first configure an ACL, for example, an IP, MAC extended, or expert extended ACL. For details about how to configure an ACL, see the related descriptions.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The IPv6 ACL takes effect only on the local device, and does not affect other devices on the network.

#### ▾ Adding ACEs to an ACL

- (Optional) An ACL may contain zero or multiple ACEs. If no ACE is configured, the ACL redirection function is not available. For details about how to add an ACE to an ACL, see the related descriptions.

#### ▾ Configuring ACL Redirection

- (Mandatory) Enable ACL redirection on a specified interface if you want to implement ACL redirection.
- You can configure the ACL redirection function on a specified interface of an access, an aggregate, or a core device based on the distribution of users.

### Verification

Send packets matching ACEs on the port where ACL redirection is enabled, and then use the packet capturing software on the destination port to check whether the ACL redirection function takes effect.

### Related Commands

#### ▾ Configuring an ACL

For details about how to configure an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

➤ [Adding ACEs to an ACL](#)

For details about how to add ACEs to an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

➤ [Configuring ACL Redirection](#)

<b>Command</b>	<b>redirect destination interface</b> <i>interface-name</i> <b>acl</b> { <i>acl-id</i>   <i>acl-name</i> } <b>in</b>
<b>Parameter Description</b>	<b>interface</b> <i>interface-name</i> : Indicates the name of the destination port for redirection. <i>acl-id</i> : Indicates the ID of an ACL. <i>acl-name</i> : Indicates the name of an ACL. <b>in</b> : Indicates that incoming packets of the interface are redirected.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Run this command to redirect incoming packets of the interface that match ACEs to the destination port for further forwarding.

[Configuration Example](#)

**i** The following configuration example describes only ACL-related configurations.

➤ [Enabling ACL Redirection to Redirect Packets Sent from the Host 10.1.1.1 to the Packet Capturing Device for Analysis](#)

<b>Scenario</b> <b>Figure 1-8</b>	<p>The diagram shows a central switch labeled SW1. It has three interfaces: Gi 0/3 connected to a Video Server (IP 10.1.1.100/24), Gi 0/1 connected to PC1 (IP 10.1.1.1/24), and Gi 0/2 connected to PC2 (labeled as 'Packets Capturing').</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configures an IP ACL.</li> <li>● Add an ACE to the IP ACL to permit packets sent from the host 10.1.1.1.</li> <li>● Enable ACL redirection on the port Gi 0/1, and set the destination port to Gi 0/2.</li> </ul>
<b>SW1</b>	<pre>sw1(config)#ip access-list standard 1</pre>

	<pre>sw1 (config-std-nacl)#permit host 10.1.1.1 sw1(config-std-nacl)#exit sw1(config)#int gigabitEthernet 0/1 sw1(config-if-GigabitEthernet 0/1)# redirect destination interface gigabitEthernet 0/2 acl 1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Capture packets on PC 2. Ping the video server on PC 1. Verify that ICMP requests sent from PC 1 are captured on PC 2.</li> </ul>
<b>SW1</b>	<pre>sw1#show access-lists ip access-list standard 1  10 permit host 10.1.1.1 sw1#show redirect interface gigabitEthernet 0/1 acl redirect configuration on interface gigabitEthernet 0/1 redirect destination interface gigabitEthernet 0/2 acl 1 in</pre>

## 1.4.7 Configuring a Global Security ACL

### Configuration Effect

Configure a global security ACL to prevent internal PCs of a company from accessing illegal websites or prevent virus from attacking the company's internal network. You can also configure exclusive interfaces to allow specified departments of the company to access external websites.

### Configuration Steps

#### ↘ Configuring an IP ACL

- (Mandatory) Configure an IP ACL if you want to protect the internal network globally. For details about the configuration method, see the earlier descriptions about the IP ACL.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The configurations take effect only on the local device, and do not affect other devices on the network.

#### ↘ Adding ACEs to an IP ACL

- (Optional) An ACL may contain zero or multiple ACEs. If no ACE is configured, it is equivalent that the global security ACL does not exist. For details about how to add an ACE to an ACL, see the related descriptions.

#### ↘ Configuring a Global Security ACL

- (Mandatory) Enable the global security function if you want to make the global security ACL take effect.
- You can configure a global security ACL on an access, an aggregate, or a core device based on the distribution of users.

## Verification

On the internal network protected by the global security ACL, ping the website or device that are denied by ACEs to check whether the global security ACL takes effect.

## Related Commands

### ↘ Configuring an IP ACL

For details about the configuration method, see the earlier descriptions about the IP ACL.

### ↘ Adding ACEs to an IP ACL

For details about the configuration method, see the earlier descriptions about the IP ACL.

### ↘ Configuring a Global Security ACL

<b>Command</b>	<code>ip access-group <i>acl-id</i> { in   out }</code>
<b>Parameter Description</b>	<i>acl-id</i> : Indicates the ID of an IP ACL. <b>in</b> : Filters the incoming packets of the device. <b>out</b> : Filters the outgoing packets of the device.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to enable the global security ACL so that the ACL takes effect on all L2 interfaces of the device.

! Currently, the global secure ACL takes effect only in the incoming direction of an interface.

### ↘ Configuring an Exclusive Interface of the Global Security ACL

<b>Command</b>	<code>no global ip access-group</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Run this command to invalidate a global security ACL on a specified interface.

## Configuration Example

i The following configuration example describes only ACL-related configurations.

### ↘ Configuring a Global Security ACL to Prevent the R&D Department From Accessing the Server of the Sales Department but Allow the Sales Department to Access This Server

<p><b>Scenario</b> <b>Figure 1-9</b></p>	<p>Server of the Sales Dept. 10.1.1.3/24 Gateway: 10.1.1.1/24</p> <p>SW1</p> <p>SVI1:10.1.1.1 Gi 0/4</p> <p>SVI3:13.1.1.1 Gi 0/2</p> <p>SVI1:11.1.1.1 Gi 0/1</p> <p>SVI2:12.1.1.1 Gi 0/2</p> <p>Sales Dept.: VLAN 1 IP Segment:11.1.1.0/24 Gateway:11.1.1.1/24</p> <p>R&amp;D Dept. 1: VLAN 2 IP Segment:12.1.1.0/24 Gateway:12.1.1.1/24</p> <p>R&amp;D Dept. 2: VLAN 3 IP Segment:13.1.1.0/24 Gateway:13.1.1.1/24</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an extended IP ACL "ip_ext_deny_dst_sale_server".</li> <li>● Add the ACE that prevents the device to forward packets to the destination host 10.1.1.3/24.</li> <li>● Configure the ACL "ip_ext_deny_dst_sale_server" as a global security ACL.</li> <li>● Configure the interface directly connected to the sales department as the exclusive interface of the global security ACL.</li> </ul>
<p><b>SW1</b></p>	<pre>sw1(config)#ip access-list extended ip_ext_deny_dst_sale_server sw1(config-ext-nacl)# deny ip any host 10.1.1.3 sw1(config-ext-nacl)#exit sw1(config)#ip access-group ip_ext_deny_dst_sale_server in sw1(config)#int gigabitEthernet 0/1 sw1(config-if-GigabitEthernet 0/1)# no global ip access-group</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On a PC of the sales department, ping the server of the sales department. Verify that the ping operation succeeds.</li> <li>● On the PCs of R&amp;D department 1 and R&amp;D department 2, ping the server of the sales department. Verify that the ping operations fail.</li> </ul>

```

## 1.4.8 Configuring a Security Channel

### Configuration Effect

Configure a security channel to enable packets meeting the security channel rules to bypass the checks of access control applications. Configure the security channel if an access control application (such as DOT1X) is enabled on an uplink interface of a user, but the user should be allowed to log in to a website to download some resources (for example, downloading the Ruijie SU client) before the DOT1X authentication.

### Configuration Steps

#### ▾ **Configuring an ACL**

- (Mandatory) Configure an ACL before configuring the security channel. For details about the configuration method, see the earlier descriptions.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The configurations take effect only on the local device, and do not affect other devices on the network.

#### ▾ **Adding ACEs to an ACL**

- (Optional) An ACL may contain zero or multiple ACEs. If no ACE is configured for an ACL, it is equivalent that the security channel does not take effect. For details about how to add an ACE to an ACL, see the related descriptions.

#### ▾ **Configuring a Security Channel on a Specified Interface or Globally**

- Configure a security channel on an interface if you want this security channel take effect on the interface. Configure a global security channel if you want this security channel take effect globally. You must configure either the interface-based security channel or the global security channel.
- You can configure a security channel on an access, an aggregate, or a core device based on the distribution of users.

#### ▾ Configuring an Exclusive Interface for the Global Security Channel

- (Optional) Configure an interface as the exclusive interface for the global security channel if you do not want the global security channel to take effect on this interface.

#### ▾ Configuring an Access Control Application

- (Optional) You can enable the DOT1X or Web authentication function to verify the security channel function.
- You can configure the access control function on an access, an aggregate, or a core device based on the distribution of users.

### Verification

On a PC that is subject to the control of an access control application, ping the resources (devices or servers) that are allowed to bypass the check of the access control application to verify the configuration of the security channel.

### Related Commands

#### ▾ Configuring an ACL

For details about how to configure an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

#### ▾ Adding ACEs to an ACL

For details about how to add ACEs to an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

#### ▾ Configuring a Security Channel on an Interface

<b>Command</b>	<b>security access-group</b> { <i>acl-id</i>   <i>acl-name</i> }
<b>Parameter Description</b>	<i>acl-id</i> : Indicates that ID of the ACL that is configured as the security channel. <i>acl-name</i> : Indicates that name of the ACL that is configured as the security channel.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Run this command to configure a specified ACL as the security channel on the specified interface.

#### ▾ Configuring a Global Security Channel

<b>Command</b>	<b>security global access-group</b> { <i>acl-id</i>   <i>acl-name</i> }
<b>Parameter Description</b>	<i>acl-id</i> : Indicates that ID of the ACL that is configured as the security channel.

	<i>acl-name</i> : Indicates that name of the ACL that is configured as the security channel.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure the specified ACL as the global security channel.

📌 **Configuring an Exclusive Interface for the Global Security Channel**

<b>Command</b>	<b>security uplink enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Run this command to configure the specified interface as the exclusive interface of the global security channel.

Configuration Example

**i** The following configuration example describes only ACL-related configurations.

📌 **Enabling DOT1X Authentication and Configuring a Security Channel to Allow Users to Download the SU Software From the Server Before Authentication**

<p><b>Scenario</b> Figure 1-10</p>	 <p>Software Server 10.1.1.2/24 Gateway:10.1.1.1</p> <p>SVI:10.1.1.1 Gi 0/4 SW1</p> <p>SVI:11.1.1.1 Gi 0/1</p> <p>PC1 PC2 ...</p> <p>Dot1x-enabled Devices: VLAN 1 IP Segment : 11.1.1.0/24 Gateway:11.1.1.1/24</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an expert extended ACL "exp_ext_esc".</li> <li>● Add an ACE to allow forwarding packets to the destination host 10.1.1.2.</li> <li>● Add an ACE to permit the DHCP packets.</li> <li>● Add an ACE to permit the ARP packets.</li> <li>● On the interface where DOT1X authentication is enabled, configure the ACL "exp_ext_esc" as the security channel.</li> </ul>

## 1.4.9 Configuring the Time Range-Based ACEs

### Configuration Effect

Configure the time range-based ACEs if you want some ACEs to take effect or to become invalid in a specified period of time, for example, in some time ranges during a week.

### Configuration Steps

#### ➤ [Configuring an ACL](#)

- (Mandatory) Configure an ACL if you want ACEs to take effect in the specified time range. For details about the configuration method, see the earlier descriptions.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The configurations take effect only on the local device, and do not affect other devices on the network.

#### ▾ Adding an ACE with the Time Range Specified

- (Mandatory) Specify the time range when adding an ACE. For details about how to configure the time range, see the configuration manual related to the time range.

#### ▾ Applying an ACL

- (Mandatory) Apply the ACL to a specified interface if you want to make ACEs take effect in the specified time range.
- You can apply an IP ACL on a specified interface of an access, an aggregate, or a core device based on the distribution of users.

### Verification

---

In the time range that the configured ACE takes effect or becomes invalid, run the **ping** command or construct packets matching the ACE to check whether the ACE takes effect or becomes invalid.

### Related Commands

---

#### ▾ Configuring an ACL

For details about the ACL configuration commands, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

#### ▾ Adding an ACE with the Time Range Specified

For details about the ACE configuration commands, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

#### ▾ Applying an ACL

For details about the command for applying an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

### Configuration Example

---

**i** The following configuration example describes only ACL-related configurations.

#### ▾ Adding an ACE With the Time Range Specified to Allow the R&D Department to Access the Internet Between 12:00 and 13:30 Every Day

<p><b>Scenario</b> Figure 1-11</p>	 <p>R&amp;D Dept.: VLAN 1 IP Segment: 10.1.1.0/24 Gateway: 10.1.1.1</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure a time range named "access-internet", and add an entry of the time range between 12:00 and 13:30 every day.</li> <li>● Configure an IP ACL "ip_std_internet_acl".</li> <li>● Add an ACE to allow packets with the source IP address in the network segment 10.1.1.0/24, and associate this ACE with the time zone "access-internet".</li> <li>● Add an ACE to deny packets with the source IP address the network segment 10.1.1.0/24. Access to the Internet is not allowed except in the specified time range.</li> <li>● Add an ACE to permit all packets.</li> <li>● Apply the ACL to the outgoing direction of the interface connected to the breakout gateway.</li> </ul>
<p><b>SW1</b></p>	<pre>Ruijie(config)# time-range access-internet Ruijie(config-time-range)# periodic daily 12:00 to 13:30 Ruijie(config-time-range)# exit sw1(config)# ip access-list standard ip_std_internet_acl sw1(config-std-nacl)# permit 10.1.1.0 0.0.0.255 time-range access-internet sw1(config-std-nacl)# deny 10.1.1.0 0.0.0.255 sw1(config-std-nacl)# permit any sw1(config-std-nacl)# exit sw1(config)#int gigabitEthernet 0/2 sw1(config-if-GigabitEthernet 0/2)# ip access-group ip_std_internet_acl out</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Within the time range between 12:00 and 13:30, visit the Baidu website on a PC of the R&amp;D department. Verify that the website can be opened normally.</li> <li>● Beyond the time range between 12:00 and 13:30, visit the Baidu website on a PC of the R&amp;D department. Verify that the website cannot be opened.</li> </ul>

<b>SW1</b>	<pre>swl#show time-range  time-range entry: access-internet (inactive)   periodic Daily 12:00 to 13:30  swl#show access-lists  ip access-list standard ip_std_internet_acl   10 permit 10.1.1.0 0.0.0.255 time-range access-internet (inactive)   20 deny 10.1.1.0 0.0.0.255   30 permit any  swl#show access-group  ip access-group ip_std_internet_acl out  Applied On interface GigabitEthernet 0/2</pre>
------------	--

## 1.4.10 Configuring Comments for ACLs

### Configuration Effect

During network maintenance, if a lot of ACLs are configured without any comments, it is difficult to distinguish these ACLs later on. You can configure comments for ACLs to better understand the intended use of ACLs.

### Configuration Steps

#### ↘ **Configuring an ACL**

- (Mandatory) Configure an ACL before configuring the security channel. For details about the configuration method, see the earlier descriptions.
- You can configure this ACL on an access, an aggregate, or a core device based on the distribution of users. The configurations take effect only on the local device, and do not affect other devices on the network.

#### ↘ **Configuring Comments for ACLs**

- (Optional) Configure comments for ACLs so that it is easy to manage and understand the configured ACLs.

#### ↘ **Adding ACEs to an ACL**

- (Optional) An ACL may contain zero or multiple ACEs. If no ACE is configured, it is equivalent that the security channel does not take effect. For details about how to add an ACE to an ACL, see the related descriptions.

### ↘ Configuring Comments for ACEs

- (Optional) To facilitate understanding of a configured ACL, you can configure comments for ACEs in addition to comments for the ACL.

### Verification

Run the **show access-lists** command on the device to display the comments configured for ACLs.

### Related Commands

#### ↘ Configuring an ACL

For details about how to configure an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

#### ↘ Configuring a Comment for an ACL

Use either of the following two methods to configure a comment for an ACL:

<b>Command</b>	<b>list-remark</b> <i>comment</i>
<b>Parameter Description</b>	<b>comment:</b> Indicates the comment. The value is a string of 1 to 100 characters. A comment longer than 100 characters will be truncated to 100 characters.
<b>Command Mode</b>	ACL configuration mode
<b>Usage Guide</b>	Run this command to configure the comment for a specified ACL.

<b>Command</b>	<b>access-list</b> <i>acl-id</i> <b>list-remark</b> <i>comment</i>
<b>Parameter Description</b>	<b>acl-id:</b> Indicates the ID of an ACL. <b>comment:</b> Indicates the comment. The value is a string of 1 to 100 characters. A comment longer than 100 characters will be truncated to 100 characters.
<b>Command Mode</b>	Configuration mode
<b>Usage Guide</b>	Run this command to configure the comment for a specified ACL.

#### ↘ Adding ACEs to an ACL

For details about how to add ACEs to an ACL, see the earlier descriptions about the IP ACL, MAC extended ACL, expert extended ACL, or IPv6 ACL.

#### ↘ Configuring Comments for ACEs

Use either of the following two methods to configure a comment for an ACE:

<b>Command</b>	<b>remark</b> <i>comment</i>
----------------	------------------------------

<b>Parameter Description</b>	<b>comment:</b> Indicates the comment. The value is a string of 1 to 100 characters. A comment longer than 100 characters will be truncated to 100 characters.
<b>Command Mode</b>	ACL configuration mode
<b>Usage Guide</b>	Run this command to configure the comment for a specified ACE.

<b>Command</b>	<b>access-list</b> <i>acl-id</i> <b>remark</b> <i>comment</i>
<b>Parameter Description</b>	<b>acl-id:</b> Indicates the ID of an ACL. <b>comment:</b> Indicates the comment. The value is a string of 1 to 100 characters. A comment longer than 100 characters will be truncated to 100 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure the comment for a specified ACE.

## 1.5 Monitoring

### Clearing

Description	Command
Clears the ACL packet matching counters.	<b>clear counters access-list</b> [ <i>acl-id</i>   <i>acl-name</i> ]
Clears the counters of packets matching the deny ACEs.	<b>clear access-list counters</b> [ <i>acl-id</i>   <i>acl-name</i> ]

### Displaying

Description	Command
Displays the basic ACLs.	<b>show access-lists</b> [ <i>acl-id</i>   <i>acl-name</i> ] [ <b>summary</b> ]
Displays the redirection ACEs bound to a specified interface. If the interface is not specified, redirection ACEs bound to all interfaces are displayed.	<b>show redirect</b> [ <b>interface</b> <i>interface-name</i> ]
Displays the ACL configurations applied to an interface.	<b>show access-group</b> [ <b>interface</b> <i>interface-name</i> ]
Displays the IP ACL configurations applied to an interface.	<b>show ip access-group</b> [ <b>interface</b> <i>interface-name</i> ]
Displays the MAC extended ACL configurations applied to an interface.	<b>show mac access-group</b> [ <b>interface</b> <i>interface-name</i> ]
Displays the expert extended ACL configurations applied to an interface.	<b>show expert access-group</b> [ <b>interface</b> <i>interface-name</i> ]
Displays the IPv6 ACL configurations applied to an interface.	<b>show ipv6 traffic-filter</b> [ <b>interface</b> <i>interface-name</i> ]

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the ACL running process.	<b>debug acl acl event</b>
Debugs the ACL clients.	<b>debug acl acl client-show</b>
Debugs the ACLs created by all ACL clients.	<b>debug acl acl acl-show</b>

## 2 Configuring QoS

### 2.1 Overview

Quality of Service (QoS) indicates that a network can provide a good service capability for specified network communication by using various infrastructure technologies.

When the network bandwidth is sufficient, all data streams can be properly processed; when network congestion occurs, all data streams may be discarded. To meet users' requirements for different applications and different levels of service quality, a network must be able to allocate and schedule resources based on users' requirements and provide different levels of service quality for different data streams. To be specific, the network can process real-time and important data packets in higher priorities, and process non-real-time and common data packets in lower priorities and even discard the data packets upon network congestion.

The "doing the best" forwarding mechanism used by traditional networks cannot meet the requirements any longer and then QoS comes into being. QoS-enabled devices provide transmission QoS quality service. A transmission priority can be assigned to data streams of a type to identify the importance of the data streams. Then, the devices provide forwarding policies for different priorities, congestion mitigation and other mechanisms to provide special transmission services for these data streams. A network environment configured with QoS can provide predictability for network performance, effectively allocate network bandwidth, and reasonably utilize network resources.

### 2.2 Applications

Application	Description
<a href="#">Interface Rate Limit + Priority Relabeling</a>	Based on different service requirements for a campus network, provide rate control and priority-based processing for outgoing traffic of the teaching building, laboratories and dormitory building.
<a href="#">Priority Relabeling + Queue Scheduling</a>	Provide priority-based processing and bandwidth control for traffic of internal access to servers of an enterprise.

#### 2.2.1 Interface Rate Limit + Priority Relabeling

##### Scenario

To meet the service requirements of normal teaching, a school puts forwards the following requirements:

- Control the Internet access traffic under 100M and discard packets out of control.
- Control the outgoing traffic of the dormitory building under 50M and discard packets out of control.
- Control the rate of packets with DSCP priority 7 sent from laboratories under 20M, and change the DSCP priorities of these packets whose rates exceed 20M to 16.
- Control the outgoing traffic of the teaching building under 30M and discard packets out of control.

Figure 2-1

<b>Remarks</b>	A school connects GigabitEthernet 0/24 of Switch A to the Internet in the uplink and connects GigabitEthernet 0/1, GigabitEthernet 0/2 and GigabitEthernet 0/3 of Switch A to the teaching building, laboratory and dormitory building in the downlink respectively.
----------------	--

## Deployment

- Configure the QoS interface rate limit for the interface G0/24 of Switch A for connecting the Internet. Configure the QoS rate limit for packets sent from the dormitory building on Switch A.
- Set the rate limit for packets with the DSCP priority 7 sent from the laboratory to 20M and relabel the DSCP priority of packets out of the rate limit to 16.
- Configure the QoS rate limit for packets sent from the teaching building on Switch A.

## 2.2.2 Priority Relabeling + Queue Scheduling

### Scenario

Configure priority relabeling and queue scheduling to meet the following requirements:

- When the R&D department and market department access servers, the priorities of the server packets are as follows: mail server > file server > salary query server.
- No matter when the HR management department accesses the Internet or servers, the switch processes the corresponding packets in the highest priority.
- Since network congestion often occurs in switch running, in order to ensure smooth business operation, WRR queue scheduling must be used to schedule IP packets for the R&D and market departments to access the mail database, file database, and salary query database based on the ratio of 6:2:1.

Figure 2-2

<b>Remarks</b>	The R&D, market and HR management departments access the interfaces GigabitEthernet 0/1, GigabitEthernet 0/2 and GigabitEthernet 0/3 of Switch A respectively. The salary query server, mail server and file server are connected to GigabitEthernet 0/23 of Switch A.
----------------	--

## Deployment

- Configure the CoS values of data streams for accessing different servers to ensure that the switch processes packets for different servers in different priorities.
- Set the default CoS value of the interface to a specific value to ensure that the switch processes packets sent by the HR management department in the highest priority.
- Configure WRR queue scheduling to ensure that data packets are transmitted in a specific quantity ratio.

## 2.3 Features

### Basic Concept

#### DiffServ

The Differentiated Services (DiffServ) Mode is an IETF system based on which QoS is implemented in Ruijie products. The DiffServ system classifies all packets transmitted in a network into different types. The classification information is included in layer-2/3 packet headers, including 802.1P, IP and IP DSCP priorities.

In a DiffServ-compliant network, all devices apply the same transmission service policy to packets containing the same classification information and apply different transmission service policies to packets containing different classification information. Classification information of packets is either assigned by hosts or other devices in the network or assigned based on different application policies or different packet contents. Based on the classification information carried by packets, a device may provide different transmission priorities for different packet streams, reserve bandwidth for a kind of packet streams, discard certain packets with lower priorities, or take some other actions.

➤ **802.1P(PRI) priority**

The 802.1 P priority is located at the header of a layer-2 packet with the 802.1Q header, and is used in scenarios where layer-3 headers do not need to be analyzed and QoS needs to be implemented at layer 2. Figure 2-3 shows the structure of a layer-2 packet.

Figure 2-3

As shown in Figure 2-3, the 4-byte 802.1Q header contains 2-byte Tag Protocol Identifier (TPID) whose value is 0x8100 and 2-byte Tag Control Information (TCI). The first three bits of the TCI indicate the 802.1P priority.

➤ **IP priority (IP PRE) and DSCP priority**

The priorities of IP packets are identified by the IP PRE and DSCP priority. The Type Of Service (ToS) field of the IPv4 header comprises 8 bits; where the first three bits indicate the IP precedence (IP PRE), ranging from 0 to 7. RFC 2474 redefines the ToS field of the IPv4 header, which is called the Differentiated Services (DS) field. The Differentiated Services Code Point (DSCP) priority is identified by the first 6 bits (bits 0 to 5) of the DS field, and by the first 6 bits of the Traffic Class field in the IPv6 header. Figure 2-4 shows the locations of the IP PRE and DSCP priorities in IPv4/IPv6 packets.

Figure 2-4

➤ **CoS**

Class of Service (COS). Ruijie products convert packet priorities into CoS values to identify the local priorities of the packets and determine the input queue ID when packets are sent from the output interface.

## Overview

Feature	Description
<a href="#">Stream Classification</a>	Stream classification uses certain rules to identify packets with same characteristics and is the prerequisite and basis for distinguishing network services.
<a href="#">Priority Labeling and Mapping</a>	Label packet priorities with specified values and map the values to corresponding CoS values.
<a href="#">Traffic Supervision</a>	Supervise the specification of traffic flowing into a network, limit the traffic within a reasonable range, and discard the traffic out of the limit or modify the priority of the traffic.
<a href="#">Congestion Management</a>	Determine the sequence of data packets sent from an interface based on the priorities of the data packets and ensure that key services can be processed in time when congestion occurs.
<a href="#">Congestion Mitigation</a>	Monitor the usage of the output interface queue and reduce the network load by actively discarding packets and adjusting the network traffic when network congestion occurs.

### 2.3.1 Stream Classification

Stream classification uses certain rules to identify packets with same characteristics and is the prerequisite and basis for distinguishing network services. Stream classification rules are used to distinguish different packets in the network and specify different QoS parameters for packets at different service levels.

#### Working Principle

Stream classification rules can be matching the PRE or DSCP priorities of IP packets or classifying packets by identifying packet content through an ACL. You can define the binding between multiple streams and stream behaviors by using commands to form policies which can be applied to interfaces for stream classification and processing.

#### 📌 QoS policy

A QoS policy comprises three elements: class, stream behavior and policy.

- Class

A class identifies streams and comprises the class name and class rules. You can define the class rules by using commands to classify packets.
- Stream behavior

Stream behaviors define the QoS actions taken for packets, including priority labeling and traffic supervision for packets.
- Policy

A policy binds a specific class and specific stream behaviors and comprises the policy name, names of the classes bound, and stream behaviors. You can bind a specified class and stream behaviors by using a QoS policy and apply the policy to one or more interfaces.

#### 📌 QoS logical interface group

You can specify a series of interfaces as a QoS logical interface group (including both APs and Ethernet interfaces) and associate polices with the logical interface group for QoS processing. Take rate limit for stream behaviors for example. For packets that meet the rate limit conditions, all interfaces in the same logical interface group share the bandwidth specified by the policy.

## Related Configuration

### ↘ Creating a class

No class is defined by default.

You can run the **class-map** command to create a class and enter the class configuration mode.

### ↘ Matching an ACL

No rules are defined for a class by default.

In the class configuration mode, you can run the **match access-group** command to define a class rule as matching an ACL. You need to create ACL rules first.

### ↘ Matching PRE priorities of IP packets

No rules are defined for a class by default.

In the class configuration mode, you can run the **match ip precedence** command to define a class rule as matching PRE priorities of IP packets. The value range of IP PRE is 0 to 7.

### ↘ Matching DSCP priorities of IP packets

No rules are defined for a class by default.

In the class configuration mode, you can run the **match ip dscp** command to define a class rule as matching DSCP priorities of IP packets. The value range of DHCP priorities is 0 to 63.

### ↘ Creating a policy

No policy is defined by default.

You can run the **policy-map** command to create a policy and enter the policy configuration mode.

### ↘ Associating a class

A policy is not associated with any class by default.

In the policy configuration mode, you can run the **class** command to associate a class and enter the policy-class configuration mode.

### ↘ Binding a stream behavior

A class is not bound to any stream behavior by default.

In the policy-class configuration mode, you can run the **set** command to modify the CoS or DSCP of a specified stream; where, the CoS value ranges from 0 to 7, the DSCP value ranges from 0 to 63. You can run the **police** command to limit the

bandwidth and process streams out of the limit for specified streams. The bandwidth limit ranges are determined by products.

### ↘ Configuring a logical interface group

No logical interface group is defined and an interface is not added to any logical interface group by default.

In the global configuration mode, you can run the **virtual-group** command to create a logical interface group. In the interface configuration mode, you can run the **virtual-group** command to add an interface to a logical interface group. If this logical interface group is not created, you can create the logical interface group and add the interface to the group. You can create 128 logical interface groups, ranging from 1 to 128.

### ↘ Applying a policy to an interface

No policy is applied to an interface by default.

In the interface configuration mode, you can run the **service-policy** command to apply a policy in the input/output directions of the interface.

## 2.3.2 Priority Labeling and Mapping

Priorities are used to label the scheduling weights of packets or the priorities of the packets in forwarding. Different packet types have different priority types including 802.1P(PRI), IP PRE and DSCP priorities. Priority labeling and mapping refer to labeling packet priorities with specified values and mapping the values to corresponding CoS values.

### Working Principle

After data streams of packets enter a device interface, the device assigns priorities to the packets based on the trust mode configured for the interface. The following describes several trust modes:

- When the interface trust mode is untrust, which means not trusting the priority information carried in packets:  
Modify the CoS value according to the default CoS value (0, which is configurable), COS-DSCP mapping table and DSCP-COS mapping table of the interface and put the packets into queues based on the final CoS value. For output packets carrying the 802.1Q tag, the packet priority will be modified to the corresponding CoS value.
- When the interface trust mode is trusting CoS:  
For packets carrying the 802.1Q tag, modify the CoS value according to the PRI value, CoS-DSCP mapping table, and DSCP-CO mapping table, and put the packets into queues based on the final CoS value. For output packets carrying the 802.1Q tag, the packet priority will be modified to the corresponding CoS value.  
For packets not carrying the 802.1Q tag, modify the CoS value according to the default CoS value (0, which is configurable), COS-DSCP mapping table and DSCP-COS mapping table of the interface, and put the packets into queues based on the final CoS value. For output packets carrying the 802.1Q tag, the packet priority will be modified to the corresponding CoS value.
- When the interface trust mode is trusting DSCP:  
For non-IP packets, the processing is the same as that for trusting CoS.

For IP packets, modify the CoS value according to the DSCP value of the packets and the DSCP-CoS mapping table and put the packets into queues based on the final CoS value.

- When the interface trust mode is trusting IP PRE:

For non-IPv4 packets, the processing is the same as that for trusting CoS.

For IPv4 packets, obtain and modify the DSCP priority of the packets according to the IP PRE value of the packets and the IP-PRE-DSCP mapping table, obtain the CoS value according to the DSCP-CoS mapping table, and then put the packets into queues based on the final CoS value.

- When the trust mode and the applied policy of an interface work together:

When the trust mode and the applied policy of an interface work together, the trust mode has a lower priority than the policy and the CoS priority can be obtained according to the DSCP-CoS mapping table.

If a policy is applied to the interface but the policy does not have a configuration for modifying the DSCP and CoS values, the processing will be performed based on the trust mode of the interface.

## Related Configuration

### ▾ Configuring the trust mode of an interface

The default trust mode of an interface is untrust.

In the interface configuration mode, run the **mls qos trust** command to modify the trust mode. The trust mode can be trusting CoS, trusting DSCP or trusting IP PRE.

### ▾ Configuring the default CoS value of an interface

The default CoS value of an interface is 0.

In the interface configuration mode, run the **mls qos cos** command to modify the default CoS value of the interface, which ranges from 0 to 7.

### ▾ Labeling the priority of streams

The priorities of streams are not relabeled by default.

In the policy-class configuration mode, run the **set** command to modify the CoS and DSCP of streams. The CoS value ranges from 0 to 7; the DSCP value ranges from 0 to 63.

### ▾ Configuring CoS-to-DSCP Map

By default, the CoS values 0, 1, 2, 3, 4, 5, 6 and 7 are mapped to the DSCP values 0, 8, 16, 24, 32, 40, 48 and 56 respectively.

Run the **mls qos map cos-dscp** command to configure the CoS-DSCP mapping. The DSCP value ranges from 0 to 63.

### ▾ Configuring DSCP-to-CoS Map

By default, DSCP 0 to 7 are mapped to CoS 0, DSCP 8 to 15 mapped to CoS 1, DSCP 16 to 23 mapped to CoS 2, DSCP 24 to 31 mapped to CoS 3, DSCP 32 to 39 mapped to CoS 4, DSCP 40 to 47 mapped to CoS 5, DSCP 48 to 55 mapped to CoS 6, and DSCP 56 to 63 mapped to CoS 7.

Run the **mls qos map dscp-cos** command to configure the DSCP-CoS mapping. The CoS value ranges from 0 to 7 and the DSCP value ranges from 0 to 63.

#### ↘ [Configuring IP-PRE-to-DSCP Map](#)

By default, the IP PRE values 0, 1, 2, 3, 4, 5, 6 and 7 are mapped to the DSCP values 0, 8, 16, 24, 32, 40, 48 and 56 respectively.

Run the **mls qos map ip-prec-dscp** command to configure the IP PRE-DSCP mapping. The DSCP value ranges from 0 to 63.

### 2.3.3 Traffic Supervision

Supervise the specification of traffic flowing into a network, limit the traffic within a reasonable range, and discard the traffic out of the limit or modify the priority of packets. In addition, the total traffic of an interface can be monitored and the traffic out of the limit will be discarded.

#### Working Principle

Traffic supervision is used to monitor the specification of traffic flowing into a network and conduct preset supervision actions based on different assessment results. These actions can be:

- Forwarding: Normally forward packets within the traffic limit.
- Discarding: discard packets out of the traffic limit.
- Changing the priority and forwarding: modify the priorities of packets out of the traffic limit and then forward the packets.

Directly discard packets out of the total traffic limit of an interface.

#### Related Configuration

#### ↘ [Configuring the action to be conducted for traffic out of limit](#)

No action to be conducted for traffic out of limit is configured by default.

In the policy-class configuration mode, run the **police** command to configure the action to be conducted for traffic out of limit to discarding traffic out of limit, or modifying the CoS value or DSCP value. The traffic limit range is determined by products. When the traffic is out of the limit, you can modify the CoS value in the range of 0 to 7 and the DSCP value in the range of 0 to 63.

#### ↘ [Configuring the total traffic limit for an interface](#)

The total traffic limit for an interface is not configured by default.

In the interface configuration mode, run the **rate-limit** command to configure the total traffic limit for an interface in the input and output directions. The traffic limit range is determined by products.

### 2.3.4 Congestion Management

When the receiving rate of packets exceeds the sending rate of packets, congestion will occur on the sending interface. If no sufficient buffer is provided to store these packets, the packets may be lost. The congestion management mechanism

determines the sequence of data packets to be sent from an interface based on the priorities of the data packets. The congestion management function allows for congestion control by increasing the priorities of important data packets. When congestion occurs, the important data packets are sent in higher priorities to ensure that key services are implemented in time.

## Working Principle

A queue scheduling mechanism is used for congestion management and the process is as follows:

- After each packet passes all QoS processing in a switch, the packet will obtain a CoS value finally.
- At the output interface, the device classifies the packets into corresponding sending queues based on the CoS values.
- The output interface selects packets in a queue for sending based on various scheduling policies (SP, WRR, DRR, WFQ, SP+WRR, SP+DRR and SP+WFQ).

### ▾ Scheduling policy

The queue scheduling policies include SP, WRR, DRR, WFQ, SP+WRR, SP+DRR, and SP+WFQ.

- Strict-Priority (SP) scheduling means scheduling packets strictly following queue IDs. Before sending packets each time, check whether a queue with the first priority has packets to be sent. If yes, the packets in this queue are sent first. If not, check whether a queue with the second priority has packets. Follow the same rules for packets in other queues.
- Weighted Round Robin (WRR) scheduling means scheduling queues in turn to ensure that all queues have certain service time. For example, a 1000 Mbps interface has 8 output queues. The WRR configures a weighted value (5, 5, 10, 20, 20, 10, 20 and 10, which indicate the proportions of obtained resources) for each queue. This scheduling method ensures that a queue with the lowest priority is assigned with at least 50 Mbps bandwidth, which avoids that packets in the queue with the lowest priority are not served for long time when the SP scheduling method is used.
- Deficit Round Robin (DRR) scheduling is similar to the WRR, but applies weight values based on bytes, but not based on time slices.
- Weighted Fair Queueing (WFQ) scheduling provides dynamic and fair queuing and applies weighted values based on bytes, similar to the DRR. When encountering an empty queue, the DRR will shift to the next queue for transmission immediately. If a queue misses its transmission time, the queue must wait for the next time, which is the difference between the WFQ and DRR; therefore, the WFQ is more suitable for processing data packets with variable lengths than the DRR.
- SP+WRR scheduling means configuring the SP scheduling for one or more sending queues and configuring the WRR scheduling for the other queues. Among SP queues, only after all packets in the SP queue with the first priority are sent, the packets in the SP queue with the second priority can be sent. Among SP and WRR queues, only after the packets in all SP queues are sent, the packets in WRR queues can be sent.
- SP+DRR scheduling means configuring the SP scheduling for one or more sending queues and configuring the DRR scheduling for the other queues. Among SP queues, only after all packets in the SP queue with the first priority are sent, the packets in the SP queue with the second priority can be sent. Among SP and DRR queues, only after the packets in all SP queues are sent, the packets in DRR queues are sent.

- SP+WFQ scheduling means configuring the SP scheduling for one or more sending queues and configuring the WFQ scheduling for the other queues. Among SP queues, only after all packets in the SP queue with the first priority are sent, the packets in the SP queue with the second priority can be sent. Among SP and WFQ queues, only after the packets in all SP queues are sent, the packets in WFQ queues can be sent.

### ↳ Queue bandwidth

Some products allow for configuring the guaranteed minimum bandwidth and the limited maximum bandwidth for a queue. A queue configured with the guaranteed minimum bandwidth ensures that the bandwidth for this queue is not smaller than the configured value. A queue configured with the limited maximum bandwidth ensures that the bandwidth for this queue is not greater than the configured value and packets out of the bandwidth limit will be discarded.

## Related Configuration

### ↳ Configuring CoS-to-Queue Map

By default, the CoS values 0, 1, 2, 3, 4, 5, 6 and 7 are mapped to the queues 1, 2, 3, 4, 5, 6, 7 and 8 respectively.

Run the **priority-queue cos-map** command to configure the CoS-to-queue mapping. The CoS value ranges from 0 to 7 and the queue value ranges from 1 to 8.

### ↳ Configuring the scheduling policy for an output queue

By default, the scheduling policy for an output queue is WRR.

Run the **mls qos scheduler** command to configure the output scheduling policy for a queue. Configurable scheduling policies include SP, WRR, DRR and WFQ. You can also run the **priority-queue** command to configure the scheduling policy as SP.

### ↳ Configuring the round robin weight corresponding to the WRR scheduling policy for an output queue

By default, the weight of a queue is 1:1:1:1:1:1:1.

Run the **wrr-queue bandwidth** command to configure the round robin weight corresponding to the WRR scheduling policy for an output queue. The configurable weight range is determined by products.

A higher weight means longer output time.

### ↳ Configuring the round robin weight corresponding to the DRR scheduling policy for an output queue

By default, the weight of a queue is 1:1:1:1:1:1:1.

Run the **dr-queue bandwidth** command to configure the round robin weight corresponding to the DRR scheduling policy for an output queue. The configurable weight range is determined by products.

A higher weight means more packet bytes that can be sent.

### ↳ Configuring the round robin weight corresponding to the WFQ scheduling policy for an output queue

By default, the weight of a global or interface-based queue is 1:1:1:1:1:1:1.

Run the **wfq-queue bandwidth** command to configure the round robin weight corresponding to the WFQ scheduling policy for an output queue. The configurable weight range is determined by products.

A higher weight means more packet bytes that can be sent.

#### ↘ **Configuring the bandwidth for a queue**

Run the **qos queue** command to configure the guaranteed minimum bandwidth and the limited maximum bandwidth for each queue. The queue value ranges from 1 to 8 and the guaranteed minimum bandwidth and limited maximum bandwidth value ranges are determined by products.

### 2.3.5 Congestion Mitigation

Monitor the usage of the output interface queue and reduce the network load by actively discarding packets and adjusting the network traffic when network congestion occurs.

#### Working Principle

Mitigate congestion by effectively monitoring the network traffic and forecasting occurrence of congestion. Packets need to be discarded to mitigate congestion. Discarding policies include Tail-Drop, Random Early Detection (RED), and Weighted Random Early Detection (WRED).

#### ↘ **Tail-Drop**

Traditional packet loss policies include Tail-Drop. Tail-Drop is effective for all traffic and cannot distinguish service levels. When congestion occurs, data packets at the tail of a queue will be discarded until the congestion is removed.

#### ↘ **RED and WRED**

Hosts running TCP will decrease the rate of sending packets to respond to massive packet loss. After congestion is removed, the hosts increase the rate of sending packets. In this way, Tail-Drop may cause TCP Global Synchronization. When a queue discards multiple TCP packets simultaneously, multiple TCP connections enter the congestion mitigation and slow startup state simultaneously, and the traffic is reduced and adjusted. When congestion is removed, traffic peaks may appear. The process repeats constantly, the network traffic goes up and down suddenly, and the line traffic always fluctuates between the lowest quantity and the highest quantity. When TCP global synchronization occurs, the connection bandwidth cannot be adequately used, which causes bandwidth waste.

To avoid this circumstance, you can use the RED/WRED packet discarding policy. This policy provides a mechanism for discarding packets in random, which avoids TCP global synchronization. When packets of a TCP connection are discarded and sent at a lower rate, packets of other TCP connections are still sent at higher rates. In this way, there are always some TCP connections whose packets are sent at higher rates, which increases the utilization of line bandwidth.

When WRED is used, you can set the lower threshold value and maximum discarding probability for a queue. When the queue length is smaller than the lower threshold value (value range: 1 to 100), WRED does not discard packets. When the queue length is between the higher (100) and lower threshold values, WRED discards packets in random (the longer the queue length, the higher probability of packet discarding. There is a maximum discarding probability). When the queue length is greater than the higher threshold value, WRED discards packets at the maximum discarding probability.

Different from RED, WRED uses priorities to distinguish discarding policies. RED is a special example of WRED. When all CoS values of an interface are mapped to the same lower and higher threshold values, WRED becomes RED.

## Related Configuration

### ↳ Enabling the WRED function

The default packet discarding policy is Tail-Drop.

You can run the **queueing wred** command to enable the WRED function.

### ↳ Configuring the lower threshold value

When 2 groups of lower threshold values are supported, the default values are 100 and 80 (the number of threshold value groups are determined by products).

In the interface configuration mode, you can run the **wrr-queue random-detect min-threshold** command to configure the lower threshold values for packets discarded by WRED in each queue. The queue value ranges from 1 to 8. The lower threshold value ranges from 1 to 100.

When the queue length is smaller than the lower threshold value, WRED does not discard packets. When the queue length is between the lower and higher threshold values, WRED discards packets in random.

### ↳ Configuring the maximum discarding probability

When 2 groups of maximum discarding probabilities are supported, the default values are 100 and 80 (the number of threshold value groups are determined by products).

In the interface configuration mode, you can run the **wrr-queue random-detect probability** command to configure the maximum discarding probabilities for packets discarded by WRED in each queue. The queue value ranges from 1 to 8. The maximum discarding probability ranges from 1 to 100.

When the queue length is between the lower and higher threshold values, WRED discards packets in random. The longer the queue, the higher the discarding probability. The maximum discarding probability cannot be exceeded. When the queue length is greater than the higher threshold value, WRED discards packets at the maximum discarding probability.

### ↳ Configuring the CoS-to-threshold mapping

By default, all CoS values are mapped to the first group of threshold values (the number of threshold groups is determined by products).

In the interface configuration mode, you can run the **wrr-queue cos-map** command to configure the CoS-to-threshold group mapping. The CoS value ranges from 0 to 7 and the number of threshold groups is determined by products. Multiple groups of lower threshold values and maximum discarding probabilities can be configured. By configuring the CoS-to-threshold group mapping, you can select the effective threshold group mapped to a CoS value, for example, CoS 0 mapped to the first threshold group, and CoS 1 mapped to the second threshold group. If the packets of CoS 0 and 1 are added to queue 1 for scheduling, the packets of CoS 0 are processed based on the lower threshold values and maximum discarding probabilities in the first group and the packets of CoS 1 are processed based on the lower threshold values and maximum discarding probabilities of the second group.

When all CoS values of an interface are mapped to the same group of threshold values, the enabled WRED becomes RED.

## 2.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Stream Classification</a>	 (Optional) It is used to create stream classification information.	
	<b>class-map</b>	Creates a class.
	<b>match access-group</b>	Matches ACL rules.
	<b>match ip precedence</b>	Matches the PRE priorities of IP packets.
	<b>match ip dscp</b>	Matches the DSCP priorities of IP packets.
	<b>policy-map</b>	Creates a policy.
	<b>class</b>	Associates a class.
	<b>police</b>	Binds the bandwidth limit for streams and the action for processing packets out of the limit.
	<b>set</b>	Binds the behaviors for modifying the CoS and DSCP of streams.
	<b>virtual-group</b>	Creates a logical interface group and adds interfaces to the logical interface group.
	<b>service-policy</b>	Applies a policy to an interface.
<a href="#">Configuring Priority Labeling and Mapping for Packets</a>	 (Optional) It is used to configure the trust mode, default CoS value and various mappings for an interface.	
	<b>mls qos trust</b>	Modifies the trust mode of an interface.
	<b>mls qos cos</b>	Modifies the default CoS value of the interface.
	<b>mls qos map cos-dscp</b>	Configures the CoS-to-DSCP mapping.
	<b>mls qos map dscp-cos</b>	Configures the DSCP-to-CoS mapping.
	<b>mls qos map ip-precedence-dscp</b>	Configures the IP PRE-to-DSCP mapping.
<a href="#">Configuring Interface Rate Limit</a>	 (Optional) It is used to configure the rate limit for an interface.	
	<b>rate-limit</b>	Configures the traffic limit for an interface.
<a href="#">Configuring Congestion Management</a>	 (Optional) It is used to configure the CoS-to-queue mapping, queue scheduling policies and round robin weight.	
	<b>priority-queue cos-map</b>	Configures the CoS-to-queue mapping.
	<b>priority-queue</b>	Configures the output scheduling policy for a queue to SP.
	<b>mls qos scheduler</b>	Configures the output scheduling policy for a queue.

Configuration	Description and Command	
	<b>wrr-queue bandwidth</b>	Configures the round robin weight corresponding to the WRR scheduling policy for an output queue.
	<b>drr-queue bandwidth</b>	Configures the round robin weight corresponding to the DRR scheduling policy for an output queue.
	<b>wfq-queue bandwidth</b>	Configures the round robin weight corresponding to the WFQ scheduling policy for an output queue.
	<b>qos queue</b>	Configures the guaranteed minimum bandwidth and limited maximum bandwidth for a queue.
<a href="#">Configuring Congestion Mitigation</a>	 (Optional) It is used to prevent network congestion by setting packet discarding.	
	<b>queueing wred</b>	Enables the WRED function.
	<b>wrr-queue random-detect min-threshold</b>	Configures the lower threshold value for packets discarded by WRED.
	<b>wrr-queue random-detect probability</b>	Configures the maximum discarding probability for packets discarded by WRED.
	<b>wrr-queue cos-map</b>	Configures the threshold-to-CoS mapping.

## 2.4.1 Configuring Stream Classification

### Configuration Effect

- Create a class and match classification rules.
- Create a policy, bind a class and stream behaviors, and associate with an interface.

### Notes

- The class and policy names cannot comprise more than 31 characters.
- Interface configurations allow for only AP and Ethernet interface configurations.

### Configuration Steps

#### ➤ Creating a class and matching ACL rules

- Optional.
- Create a class. In the class configuration mode, match ACL, IP PRE or DSCP.

#### ➤ Creating a policy

- Optional.

- Create a policy. In the policy configuration mode, bind the class and stream behaviors.

#### ↘ Creating a logical interface group and adding interfaces to the logical interface group

- Optional.
- Create a logical interface group and add interfaces to the logical interface group.

#### ↘ Applying a policy to an interface

- Optional.
- Associate a configured policy with a specified interface or logical interface group.

### Verification

- Run the **show class-map** command to check whether the class is successfully created and whether rules are successfully matched.
- Run the **show policy-map** command to check whether the policy is successfully created and whether the class and stream behaviors are successfully bound.
- Run the **show mls qos interface** command to check whether the interface is associated with the policy.
- Run the **show virtual-group** command to check the interfaces in the logical interface group.
- Run the **show mls qos virtual-group** command to check whether the logical interface group is associated with the policy.

### Related Commands

#### ↘ Creating a class

<b>Command</b>	<b>class-map</b> <i>class-map-name</i>
<b>Parameter Description</b>	<i>class-map-name</i> : Indicates the name of a class to be created. The name cannot comprise more than 31 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

#### ↘ Matching an ACL

<b>Command</b>	<b>match access-group</b> <i>access-list-number</i>
<b>Parameter Description</b>	<i>access-list-number</i> : Indicates the number of the ACL to be matched.
<b>Command Mode</b>	Class configuration mode
<b>Usage Guide</b>	-

#### ↘ Matching PRE of IP packets

<b>Command</b>	<b>match ip precedence</b> <i>precedence-value...</i> [ <i>precedence-value...</i> ]
<b>Parameter Description</b>	<i>precedence -value</i> : Indicates the IP PRE to be matched, ranging from 0 to 7.
<b>Command Mode</b>	Class configuration mode
<b>Usage Guide</b>	-

#### ↘ Matching DSCP of IP packets

<b>Command</b>	<b>match ip dscp</b> <i>dscp-value...</i> [ <i>dscp-value...</i> ]
<b>Parameter Description</b>	<i>dscp -value</i> : Indicates the DSCP to be matched, ranging from 0 to 63.
<b>Command Mode</b>	Class configuration mode
<b>Usage Guide</b>	-

#### ↘ Creating a policy

<b>Command</b>	<b>policy-map</b> <i>policy-map-name</i>
<b>Parameter Description</b>	<i>policy-map-name</i> : Indicates the name of a policy to be created. The name cannot comprise more than 31 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

#### ↘ Associating a class

<b>Command</b>	<b>class</b> <i>class-map-name</i>
<b>Parameter Description</b>	<i>class-map-name</i> : Indicates the name of a class to be associated.
<b>Command Mode</b>	Policy configuration mode
<b>Usage Guide</b>	-

#### ↘ Binding the behaviors for modifying the CoS and DSCP of streams

<b>Command</b>	<b>set { ip dscp <i>new-dscp</i>   cos <i>new-cos</i>}</b>
<b>Parameter Description</b>	<b>ip dscp <i>new-dscp</i></b> : Changes the DSCP value of streams to <i>new-dscp</i> , ranging from 0 to 63. <b>cos <i>new-cos</i></b> : Changes the CoS value of streams to <i>new-cos</i> , ranging from 0 to 7.
<b>Command Mode</b>	Class configuration mode
<b>Usage Guide</b>	-

#### ↘ Binding the bandwidth limit for streams and the action for processing packets out of the limit

<b>Command</b>	<b>police</b> <i>rate-bps burst-byte</i> [ <b>exceed-action</b> { <b>drop</b>   <b>dscp</b> <i>new-dscp</i>   <b>cos</b> <i>new-cos</i> [ <b>none-tos</b> ] } ]
<b>Parameter</b>	<i>rate-bps</i> : Indicates the bandwidth limit per second (KBits). The value range is determined by products.
<b>Description</b>	<i>burst-byte</i> : Indicates the burst traffic limit (Kbytes). The value range is determined by products. <b>drop</b> : Discards packets out of the bandwidth limit. <b>dscp</b> <i>new-dscp</i> : Changes the DSCP value of packets out of the bandwidth limit to <i>new-dscp</i> , ranging from 0 to 63. <b>cos</b> <i>new-cos</i> : Changes the CoS value of packets out of the bandwidth limit to <i>new-cos</i> , ranging from 0 to 7. <b>none-tos</b> : Does not change the DSCP value of packets when changing the CoS value of the packets.
<b>Command Mode</b>	Class configuration mode
<b>Usage Guide</b>	-

### 📌 Creating a logical interface group and adding interfaces to the logical interface group

<b>Command</b>	<b>virtual-group</b> <i>virtual-group-number</i>
<b>Parameter</b>	<i>virtual-group-number</i> : Indicates the logical interface group number, ranging from 1 to 128.
<b>Description</b>	
<b>Command Mode</b>	Create the logical interface group in the global configuration mode, add the interface to the logical interface group in the interface configuration mode. If no logical interface group exists, you need to create a logical interface group first and then add interfaces to the logical interface group.
<b>Usage Guide</b>	-

### 📌 Applying a policy to an interface

<b>Command</b>	<b>service-policy</b> { <b>input</b>   <b>output</b> } <i>policy-map-name</i>
<b>Parameter</b>	<b>input</b> : Indicates the input direction of the interface.
<b>Description</b>	<b>output</b> : Indicates the output direction of the interface. <i>policy-map-name</i> : Indicates the name of the policy applied to the interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	-

## Configuration Example

### 📌 Creating four stream classes and matching ACL, IP PRE and DSCP

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Create ACL rules.</li> <li>● Create four stream classes and match ACL, IP PRE and DSCP.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# access-list 11 permit host 192.168.23.61</pre>
	<pre>Ruijie(config)# class-map cmap1 Ruijie(config-cmap)# match access-group 11</pre>

	<pre>Ruijie(config-cmap)# exit Ruijie(config)# class-map cmap2 Ruijie(config-cmap)# match ip dscp 21 Ruijie(config-cmap)# exit Ruijie(config)# class-map cmap3 Ruijie(config-cmap)# match ip precedence 5 Ruijie(config-cmap)# exit</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the created ACL rules and stream class rules are successful.</li> </ul>
	<pre>Ruijie# show access-lists ip access-list standard 11 10 permit host 192.168.23.61</pre>
	<pre>Ruijie# show class-map Class Map cmap1   Match access-group 11 Class Map cmap2   Match ip dscp 21 Class Map cmap3   Match ip precedence 5</pre>

📌 **Creating a policy, binding a class and stream behaviors, and associating with an interface**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Create the stream class cmap1, and match packets whose DSCP value is 18. Create cmap2 and match packets whose IP PRE is 7.</li> <li>● Create the policy pmap1, associate the policy with cmap1, and bind the behavior of changing the CoS value of the stream to 6. Associate the policy with cmap2, bind the behavior of changing the DSCP value of the stream to 16, limiting the traffic per second within 10,000 Kbits and trigger traffic within 1024 Kbits per second, and changing the DSCP value for traffic out of limit to 7.</li> <li>● Apply the policy pmap1 to the output direction of the interface gigabitEthernet 0/0.</li> <li>● Create virtual logical group 1, add the interfaces gigabitEthernet 0/1 and gigabitEthernet 0/2 to the group, and apply the policy pmap1 to the input interface of the virtual logical group.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# class-map cmap1 Ruijie(config-cmap)# match ip dscp 18</pre>

	<pre>Ruijie(config-cmap)# exit Ruijie(config)# class-map cmap2 Ruijie(config-cmap)# match ip precedence 7 Ruijie(config-cmap)# exit</pre>
	<pre>Ruijie(config)# policy-map pmap1 Ruijie(config-pmap)# class cmap1 Ruijie(config-pmap-c)# set cos 6 Ruijie(config-pmap-c)# exit Ruijie(config-cmap)# class cmap2 Ruijie(config-pmap-c)# set ip dscp 15 Ruijie(config-pmap-c)# police 10000 1024 exceed-action dscp 7 Ruijie(config-pmap-c)# exit Ruijie(config-pmap)# exit</pre>
	<pre>Ruijie(config)# interface gigabitEthernet 0/0 Ruijie(config-if-GigabitEthernet 0/0)# service-policy output pmap1 Ruijie(config-if-GigabitEthernet 0/0)# exit</pre>
	<pre>Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# virtual-group 1 Ruijie(config-if-GigabitEthernet 0/1)# exit Ruijie(config)# interface gigabitEthernet 0/2 Ruijie(config-if-GigabitEthernet 0/2)# virtual-group 1 Ruijie(config-if-GigabitEthernet 0/2)# exit Ruijie(config)# virtual-group 1 Ruijie(config-VirtualGroup)# service-policy input pmap1 Ruijie(config-VirtualGroup)# exit</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the stream class rules are successfully created.</li> <li>● Check whether the policy is successfully created, and whether the stream and stream behaviors are successfully bound.</li> <li>● Check whether the policy is applied to the interface.</li> <li>● Check whether the logical interface group is successfully created, whether interfaces are successfully associated and whether the policy is successfully applied to the interface.</li> </ul>

	<pre>Ruijie# show class-map Class Map cmap1   Match ip dscp 18 Class Map cmap2   Match ip precedence 7</pre>
	<pre>Ruijie# show policy-map Policy Map pmap1   Class cmap1     set cos 6   Class cmap2     set ip dscp 15     police 10000 1024 exceed-action dscp 7</pre>
	<pre>Ruijie# show mls qos interface gigabitEthernet 0/0 Interface: GigabitEthernet 0/0 Ratelimit input: Ratelimit output: Attached input  policy-map: Attached output policy-map: pmap1 Default trust: none Default cos: 0</pre>
	<pre>Ruijie# show virtual-group 1 virtual-group      member ----- 1                  Gi0/1 Gi0/2 Ruijie# show mls qos virtual-group 1 Virtual-group: 1 Attached input policy-map: pmap1</pre>

## 2.4.2 Configuring Priority Labeling and Mapping for Packets

### Configuration Effect

- Configure the trust mode and default CoS value of an interface.

- Configure the CoS-to-DSCP, DSCP-to-CoS, and IP-PRE-to-DSCP mappings.

## Notes

- Interface configurations allow for only AP and Ethernet interface configurations.

## Configuration Steps

### ↘ Configuring the trust mode and default CoS value of an interface

- Optional.
- In the interface configuration mode, configure the trust mode and default CoS value of an interface.

### ↘ Configuring the CoS-to-DSCP, DSCP-to-CoS, and IP-PRE-to-DSCP mappings

- Optional.
- Configure various mappings.

## Verification

- Run the **show mls qos interface** command to display the trust mode and default CoS value of the interface.
- Run the **show mls qos maps** command to display the CoS-to-DSCP, DSCP-to-CoS and IP-PRE-to-DSCP mappings.

## Related Commands

### ↘ Configuring the trust mode of an interface

<b>Command</b>	<b>mls qos trust { cos   ip-precedence   dscp }</b>
<b>Parameter</b>	<b>cos:</b> Configures the trust mode of an interface to CoS.
<b>Description</b>	<b>ip-precedence:</b> Configures the trust mode of an interface to IP PRE. <b>dscp:</b> Configures the trust mode of an interface to DSCP.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring the default CoS value of an interface

<b>Command</b>	<b>mls qos cos default-cos</b>
<b>Parameter</b>	<b>default-cos:</b> Configures the default CoS value, ranging from 0 to 7. The default value is 0.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring CoS-to-DSCP MAP

<b>Command</b>	<b>mls qos map cos-dscp dscp1...dscp8</b>
----------------	---

<b>Parameter Description</b>	<i>dscp1...dscp8</i> : Indicates the DSCP values mapped to the CoS values. The default CoS values 0~7 are mapped to DSCP 0, 8, 16, 24, 32, 40, 48 and 56 respectively. The DSCP value ranges from 0 to 63.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring DSCP-to-CoS MAP

<b>Command</b>	<b>mls qos map dscp-cos</b> <i>dscp-list to cos</i>
<b>Parameter Description</b>	<i>dscp-list</i> : Indicates the DSCP list mapped to the CoS values. The default DSCP 0~7 are mapped to CoS 0, DSCP 8~15 mapped to CoS 1, DSCP 16~23 mapped to CoS 2, DSCP 24~31 mapped to CoS 3, DSCP 32~39 mapped to CoS 4, DSCP 40~47 mapped to CoS 5, DSCP 48~55 mapped to CoS 6, and DSCP 56~63 mapped to CoS 7. The DSCP value ranges from 0 to 63. <i>cos</i> : Indicates the CoS values mapped to the dscp-list, ranging from 0 to 7.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring IP-PRE-to-DSCP MAP

<b>Command</b>	<b>mls qos map ip-prec-dscp</b> <i>dscp1...dscp8</i>
<b>Parameter Description</b>	<i>dscp1...dscp8</i> : Indicates the DSCP values mapped to the IP PRE values. The default IP PRE 0~7 are mapped to DSCP 0, 8, 16, 24, 32, 40, 48 and 56 respectively. The DSCP value ranges from 0 to 63.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

## Configuration Example

### ↘ Configuring the trust mode and default CoS value of an interface

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Modify the trust mode of the interface gigabitEthernet 0/0 to DSCP.</li> <li>● Change the default CoS value of the interface gigabitEthernet 0/1 to 7.</li> </ul>
	<pre> Ruijie# configure terminal Ruijie(config)# interface gigabitEthernet 0/0 Ruijie(config-if-GigabitEthernet 0/0)# mls qos trust dscp Ruijie(config-if-GigabitEthernet 0/0)# exit Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# mls qos cos 7 Ruijie(config-if-GigabitEthernet 0/1)# exit </pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the trust mode and default CoS value are successfully configured for the interface.</li> </ul>
	<pre>Ruijie# show mls qos interface gigabitEthernet 0/0 Interface: GigabitEthernet 0/0 Ratelimit input: Ratelimit output: Attached input policy-map: Attached output policy-map: Default trust: dscp Default cos: 0  Ruijie# show mls qos interface gigabitEthernet 0/1 Interface: GigabitEthernet 0/1 Ratelimit input: Ratelimit output: Attached input policy-map: Attached output policy-map: Default trust: none Default cos: 7</pre>

📌 **Configuring the CoS-to-DSCP, DSCP-to-CoS, and IP-PRE-to-DSCP mappings**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure CoS-to-DSCP to map CoS 0, 1, 2, 3, 4, 5, 6, and 7 to DSCP 7, 14, 21, 28, 35, 42, 49, and 56 respectively.</li> <li>● Configure DSCP-to-CoS to map DSCP 0, 1, 2, 3, and 4 to CoS 4 and DSCP 11, 12, 13 and 14 to CoS 7.</li> <li>● Configure IP-PRE-to-DSCP to map IP PRE 0, 1, 2, 3, 4, 5, 6, and 7 to DSCP 31, 26, 21, 15, 19, 45, 47, and 61 respectively.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# mls qos map cos-dscp 7 14 21 28 35 42 49 56</pre>

### 2.4.3 Configuring Interface Rate Limit

#### Configuration Effect

- Configure the traffic limit for an interface.

#### Notes

- The configuration is supported only by Ethernet interfaces.

#### Configuration Steps

##### ▾ Configuring the traffic limit for an interface

- Optional.
- Configure the limit on the traffic and burst traffic for an interface.

#### Verification

- Run the **show mls qos rate-limit** command to display the rate limit information about the interface.

#### Related Commands

##### ▾ Configuring the traffic limit for an interface

<b>Command</b>	<b>rate-limit { input   output } bps burst-size</b>
<b>Parameter</b>	<b>input:</b> Indicates the input direction of the interface.
<b>Description</b>	<b>output:</b> Indicates the output direction of the interface. <i>bps:</i> Indicates the bandwidth limit per second (Kbits). The value range is determined by products. <i>burst-size:</i> Indicates the burst traffic limit (Kbytes). The value range is determined by products.
<b>Command Mode</b>	Interface configuration mode

<b>Usage Guide</b>	-
--------------------	---

## Configuration Example

### ▾ Typical application – Interface rate limit + priority relabeling

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● For Internet access by using the output interface, configure the output traffic limit on the interface G0/24, and set the bandwidth limit to 102,400 Kbits per second and burst traffic limit to 256 Kbytes per second.</li> <li>● For the dormitory building, configure the input traffic limit on the interface G0/3, and set the bandwidth limit to 51,200 Kbits per second and burst traffic limit to 256 Kbytes per second.</li> <li>● For the teaching building, configure the input traffic limit on the interface G0/1, and set the bandwidth limit to 30,720 Kbits per second and burst traffic limit to 256 Kbytes per second.</li> <li>● For the laboratory, create the class cmap_dscp7 to match DSCP priority 7, create the policy pmap_shiyan to associate with cmap_dscp7, bind the stream behavior of changing the DSCP value for packets whose rates exceed 20M to 16, apply pmap_shiyan to the interface G0/2, and configure the interface to trusting DSCP.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# interface gigabitEthernet 0/24 Ruijie(config-if-GigabitEthernet 0/24)# rate-limit output 102400 256 Ruijie(config-if-GigabitEthernet 0/24)# exit Ruijie(config)# interface gigabitEthernet 0/3 Ruijie(config-if-GigabitEthernet 0/3# rate-limit input 51200 256 Ruijie(config-if-GigabitEthernet 0/3)# exit Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1# rate-limit input 30720 256 Ruijie(config-if-GigabitEthernet 0/1)# exit</pre>

## 2.4.4 Configuring Congestion Management

### Configuration Effect

- Configure the CoS-to-queue mapping.
- Configure the scheduling policy and round robin weight for an output queue.
- Configure the guaranteed minimum bandwidth and limited maximum bandwidth for a queue.

### Notes

- Interface configurations allow for only AP and Ethernet interface configurations.

### Configuration Steps

#### ↘ Configuring the CoS-to-queue mappings

- Optional.
- Configure the CoS-to-queue mappings.

#### ↘ Configuring the scheduling policies and round robin weight for output queues

- Optional.
- Configure the scheduling policy for an output queue and modify the round robin weight.

#### ↘ Configuring the guaranteed minimum bandwidth and limited maximum bandwidth for a queue

- Optional.
- Configure the guaranteed minimum bandwidth and limited maximum bandwidth for a queue.

### Verification

- Run the **show mls qos queueing** command to display the output queue information.
- Run the **show mls qos scheduler** command to display the scheduling policy for the output queue.
- Run the **show qos bandwidth** command to display the queue bandwidth.

### Related Commands

#### ↘ Configuring CoS-to-Queue MAP

<b>Command</b>	<b>priority-queue cos-map</b> <i>qid</i> <i>cos0</i> [ <i>cos1</i> [ <i>cos2</i> [ <i>cos3</i> [ <i>cos4</i> [ <i>cos5</i> [ <i>cos6</i> [ <i>cos7</i> ]]]]]]]]]
<b>Parameter</b>	<i>qid</i> : Indicates the queue ID to be mapped, ranging from 1 to 8.
<b>Description</b>	<i>cos0–cos7</i> : Indicates the CoS values to be mapped to the <i>qid</i> . The default CoS values 0–7 are mapped to queues 1–8. The value range is 0 to 7.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring the scheduling policy for an output queue to SP

<b>Command</b>	<b>priority-queue</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring the scheduling policy for an output queue

<b>Command</b>	<b>mls qos scheduler { sp   wrr   drr   wfq }</b>
<b>Parameter Description</b>	<b>sp</b> : Sets the scheduling algorithm for an output queue to SP. <b>wrr</b> : Sets the scheduling algorithm for an output queue to WRR. <b>drr</b> : Sets the scheduling algorithm for an output queue to DRR. <b>wfq</b> : Sets the scheduling algorithm for an output queue to WFQ.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↘ Configuring the scheduling policy and round robin weight for an output queue

<b>Command</b>	<b>{ drr-queue   wrr-queue   wfq-queue } bandwidth weight1...weight8</b>
<b>Parameter Description</b>	<b>drr-queue</b> : Configures the round robin weight corresponding to the DRR scheduling policy for an output queue. <b>wrr-queue</b> : Configures the round robin weight corresponding to the WRR scheduling policy for an output queue. <b>wfq-queue</b> : Configures the round robin weight corresponding to the WFQ scheduling policy for an output queue. <b>weight1...weight8</b> : Indicates the weight of queues 1 to 8. The value range is determined by products. The value 0 indicates that the queue uses the SP scheduling algorithm. The default weight for queues is 1:1.
<b>Command Mode</b>	Global configuration mode

### ↘ Configuring the guaranteed minimum bandwidth and limited maximum bandwidth for a queue

<b>Command</b>	<b>qos queue queue-id bandwidth { minimum   maximum } bandwidth</b>
<b>Parameter Description</b>	<b>queue-id</b> : Indicates the queue ID to be configured, ranging from 1 to 8. <b>minimum bandwidth</b> : Indicates the guaranteed minimum bandwidth Kbps. The value range is determined by products. It is not configured by default. <b>maximum bandwidth</b> : Indicates the limited maximum bandwidth Kbps. The value range is determined by

	products. It is not configured by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	-

### Configuration Example

## 2.4.5 Configuring Congestion Mitigation

### Configuration Effect

- Configure the lower threshold value for WRED. When the length of packets in a queue is smaller than the lower threshold value, WRED does not discard packets.
- Configure the maximum discarding probability. When the length of packets in the queue is between the lower and higher threshold values, WRED discards packets in random. The maximum probability for discarding packets is configured.
- Configure the CoS-to-threshold mapping.

### Notes

- Interface configurations allow for only AP and Ethernet interface configurations.

### Configuration Steps

### ↘ Enabling the WRED function

- Optional.
- Enable the WRED function if necessary.

### ↘ Configuring the lower threshold value

- Optional.
- Configure the lower threshold value if necessary.

### ↘ Configuring the maximum discarding probability

- Optional.
- Configure the maximum discarding probability if necessary.

### ↘ Configuring the CoS-to-threshold mapping

- Optional.
- Configure the CoS-to-threshold mapping if necessary.

## Verification

- Run the **show queueing wred interface** command to display the WRED configuration.

# 1 Configuring RLDP

## 1.1 Overview

The Rapid Link Detection Protocol (RLDP) achieves rapid detection of unidirectional link failures, directional forwarding failures and downlink loop failures of an Ethernet. When a failure is found, relevant ports will be closed automatically according to failure treatment configuration or the user will be notified to manually close the ports to avoid wrong flow forwarding or an Ethernet layer-2 loop.

## 1.2 Applications

Application	Description
<a href="#">Unidirectional Link Detection</a>	Detect a unidirectional link failure.
<a href="#">Bidirectional Forwarding Detection</a>	Detect a bidirectional link failure.
<a href="#">Downlink Loop Detection</a>	Detect a link loop.

### 1.2.1 Unidirectional Link Detection

#### Scenario

As shown in the following figure, A is connected to B via optical fiber. The two lines are the Tx and Rx lines of optical fiber. Unidirectional link detection is enabled on A and B. If any of the Tx of Port A, Rx of Port B, Tx of Port B and Rx of Port A fails, a unidirectional failure will be detected and treated under the RLDP. If the failure is eliminated, the administrator may manually restore the RLDP on A and B and resume detection.

Figure 1-1

<b>Remarks</b>	<p>A and B are layer-2 or layer-3 switches.</p> <p>The Tx of Port A of A is connected to the Rx of Port B of B.</p> <p>The Rx of Port A of A is connected to the Tx of Port B of B.</p>
----------------	---

#### Deployment

- Global RLDP is enabled.
- Configure unidirectional link detection under Port A and Port B and define a method for failure treatment.

## 1.2.2 Bidirectional Forwarding Detection

### Scenario

As shown in the following figure, A is connected to B via optical fiber, and the two lines are Tx and Rx lines of optical fiber. Unidirectional link detection is enabled on A and B. If the Tx of Port A, Rx of Port B, Rx of Port A and Tx of Port B all fail, a bidirectional failure will be detected and treated under the RLDP. If the failure is eliminated, the administrator may manually restore the RLDP on A and B and resume detection.

Figure 1-2

<b>Remarks</b>	<p>A and B are layer-2 or layer-3 switches.</p> <p>The Tx of Port A of A is connected to the Rx of Port B of B.</p> <p>The Rx of Port A of A is connected to the Tx of Port B of B.</p>
----------------	---

### Deployment

- Global RLDP is enabled.
- Configure BFD under Port A and Port B and define a method for failure treatment.

## 1.2.3 Downlink Loop Detection

### Scenario

As shown in the following figure, A, B and C are connect into a loop. Downlink loop detection is enabled on A, and a loop is detected and treated.

Figure 1-3

<b>Remarks</b>	<p>A, B and C are layer-2 or layer-3 switches.</p> <p>A, B and C are interconnected via exchange ports.</p>
----------------	---

## Deployment

- Global RLDP is enabled on A.
- Configure downlink loop detection on the Gi 2/0/1 and Gi 2/0/9 ports of A, and define a method for failure treatment.

## 1.3 Features

Most Ethernet link detection mechanisms detect link connectivity through automatic physical-layer negotiation. However, in some cases devices are connected on the physical layer and operate normally but layer-2 link communication is disabled or abnormal. The RLDP recognizes a neighbor device and detects a link failure through exchanging Prob packets, Echo packets or Loop packets with the device.

### Basic Concepts

#### ↘ Unidirectional Link Failure

A unidirectional link failure occurs in case of a cross-connected optical fiber, a disconnected optical fiber, an open-circuit optical fiber, one open-circuit line in a twisted-pair cable, or unidirectional open circuit of an intermediate device between two devices. In such cases, one end of a link is connected and the other disconnected so that flow is forwarded wrongly or a loop guard protocol (for example, the STP) fails.

#### ↘ Bidirectional Link Failure

A bidirectional link failure occurs in case of two optical fibers, two open-circuit lines in a twisted-pair cable, or bidirectional open circuit of an intermediate device between two devices. In such cases, the both ends of a link are disconnected so that flow is forwarded wrongly.

#### ↘ Loop Failure

A downlink device is wrongly connected to form a loop, resulting in a broadcast storm.

#### ↘ RLDP Packet

The RLDP defines three types of packets: Prob packets, Echo packets and Loop packets.

- Prob packets are layer-2 multicast packets for neighbor negotiation, and unidirectional or bidirectional link detection. The default encapsulation format is SNAP, which changes automatically to EthernetII if a neighbor sends EthernetII packets.
- Echo packets are layer-2 unicast packets as response to Prob packets and used for unidirectional or bidirectional link detection. The default encapsulation format is SNAP, which changes automatically to EthernetII if a neighbor sends EthernetII packets.
- Loop packets are layer-2 multicast packets for downlink loop detection. They can only be received. The default encapsulation format is SNAP.

### ↘ RLDP Detection Interval and Maximum Detection Times

A detection interval and the maximum detection times can be configured for the RLDP. A detection interval determines the period of sending Prob packets and Loop packets. When a device receives a Prob packet, it replies with an Echo packet immediately. A detection interval and the maximum detection times determine the maximum detection time (equal to a detection interval × the maximum detection times + 1) for unidirectional or bidirectional link detection. If neither Prob nor Echo packet from a neighbor can be received within the maximum detection time, the treatment of unidirectional or bidirectional failure will be triggered.

### ↘ RLDP Neighbor Negotiation

When configured with unidirectional or bidirectional link detection, a port can learn a peer-end device as its neighbor. One port may learn one neighbor, which is variable. If negotiation is enabled, unidirectional or bidirectional link detection starts after a port finds a neighbor through negotiation, which succeeds when a port receives a Prob packet from the neighbor. However, if the RLDP is enabled under a failure, the port cannot learn a neighbor so that detection cannot start. In this case, recover the link state before enabling the RLDP.

### ↘ Treatment for Failed Port under RLDP

- Warning: Only print Syslog to indicate a failed port and a failure type.
- Shutdown SVI: Print Syslog, and then inquire an SVI according to the Access VLAN or Native VLAN of a port and shut down the SVI if the port is a physical exchange port or layer-2 AP member port.
- Port violation: Print Syslog, and configure a failed port as in violation state, and the port will enter Linkdown state physically.
- Block: Print Syslog, and configure the forward state of a port as Block, and the port will not forward packets.

### ↘ Recovery of Failed Port under RLDP

- Manual reset: Manually reset all failed ports to initialized state and restart link detection.
- Manual or automatic errdisable recovery: Recover all failed ports to initialized state manually or regularly (30s by default and configurable) and restart link detection.
- Automatic recovery: Under unidirectional or bidirectional link detection, if the treatment for failed ports is not specified as port violation, recover ports to initialized state based on Prob packets and restart link detection.

### ↘ Port State under RLDP

- normal: Indicates the state of a port after link detection is enabled.
- error: Indicates the state of a port after a unidirectional or bidirectional link failure or a loop failure is detected.

### ↘ Overview

Feature	Description
---------	-------------

<a href="#">Deploying RLDP Detection</a>	Enable unidirectional or bidirectional link detection or downlink loop detection for failures and implement treatment.
--	--

### 1.3.1 Deploying RLDP Detection

The RLDP provides unidirectional link detection, bidirectional forwarding detection and downlink loop detection.

#### Working Principle

##### ↘ Unidirectional Link Detection

When this function is enabled, a port sends Prob packets and receives Echo packets from a neighbor regularly as well as receiving Prob packets from a neighbor and replying with Echo packets. Within the maximum detection time, if the port receives Prob packets but no Echo packets, or none of them, treatment for a unidirectional failure will be triggered and detection will stop.

##### ↘ Bidirectional Forwarding Detection

When this function is enabled, a port sends Prob packets and receives Echo packets from a neighbor regularly as well as receiving Prob packets from a neighbor and replying with Echo packets. Within the maximum detection time, if the port receives neither Prob packets nor Echo packets from a neighbor, treatment for a bidirectional failure will be triggered and detection will stop.

##### ↘ Downlink Loop Detection

When this function is enabled, a port sends Loop packets regularly. In the following cases, a loop failure will be triggered after the same port or a different port receives the packets: in one case, the egress and ingress ports are the same routed port or layer-3 AP member port; in another case, the egress and ingress ports are exchange ports or layer-2 AP member ports in a same default VLAN and in Forward state. Treatment for the failure will be implemented and detection will stop.

#### Related Configuration

- Configuring RLDP Detection

By default, RLDP detection is disabled.

You may run the global command **rldp enable** or the interface command **rldp port** to enable RLDP detection and specify a detection type and treatment.

You may run the **rldp neighbor-negotiation** command to neighbor negotiation, the **rldp detect-interval** to specify a detection interval, the **rldp detect-max** to specify detection times, or the **rldp reset** to recover a failed port.

## 1.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic RLDP Functions</a>	 (Mandatory) It is used to enable RLDP detection under global configuration mode.	
	<b>rldp enable</b>	Enables global RLDP detection on all ports.

 (Mandatory) It is used to specify under interface configuration mode a detection type and failure treatment for an interface.	
<b>rldp port</b>	Enables RLDP detection on a port and specifies a detection type and failure treatment.
 (Optional) It is used to configure a detection interval, detection times and neighbor negotiation under global configuration mode.	
<b>rldp detect-interval</b>	Modifies global RLDP parameters on all ports, such as the detection interval, maximum detection times and neighbor negotiation.
<b>rldp detect-max</b>	
<b>rldp neighbor-negotiation</b>	
 (Optional) It is used under privileged mode.	
<b>rldp reset</b>	Recovers all ports.

### 1.4.1 Configuring Basic RLDP Functions

#### Configuration Effect

- Enable RLDP unidirectional link detection, bidirectional forwarding detection, or downlink loop detection to discover failures.

#### Notes

- Loop detection is effective to all member ports of an AP when configured on one of the ports. Unidirectional link detection and bidirectional forwarding detection are effective only on an AP member port.
- The loop detection on a physical port added to an AP shall be configured the same as that of the other member ports. There are three cases. First, if loop detection is not configured on a newly-added port but on the existing member ports, the new port adopts the configuration and detection results of the existing ports. Second, if loop detection is configured on a newly-added port but not on the existing member ports, the new port clears loop detection and joins the AP. Third, if a newly-added port and the existing member ports have different loop detection configuration, the new port adopts the configuration and detection results of the existing ports.
- When configuring the RLDP on an AP port, you may configure failure treatment only as "shutdown-port", to which other configurations will be modified.
- When "shutdown-port" is configured on a port, RLDP detection cannot be restored in case of a failure. After troubleshooting, you may run the **rldp reset** or **errdisable recovery** command to restore the port and resume detection. For configuration of the **errdisable recovery** command, please refer to the *SWITCH-INTF-SCG.doc*.

#### Configuration Steps

### ↘ Enabling RLDP

- Mandatory.
- Enable RLDP detection on all ports under global configuration mode.

### ↘ Enabling Neighbor Negotiation

- Optional.
- Enable the function under global configuration mode, and port detection will be started under successful neighbor negotiation.

### ↘ Configuring Detection Interval

- Optional.
- Specify a detection interval under global configuration mode.

### ↘ Configuring Maximum Detection Times

- Optional.
- Specify the maximum detection times under global configuration mode.

### ↘ Configuring Detection under Port

- Mandatory.
- Configure unidirectional RLDP detection, bidirectional RLDP detection or downlink loop detection under interface configuration mode, and specify failure treatment.

### ↘ Restoring All Failed Ports

- Optional.
- Enable this function under privileged mode to restore all failed ports and resume detection.

## Verification

- Display the information of global RLDP, port and neighbor.

## Related Commands

### ↘ Enabling Global RLDP Detection

<b>Command</b>	<b>rldp enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	Enable global RLDP detection.
--------------------	-------------------------------

### ↘ Enabling RLDP Detection on Interface

<b>Command</b>	<code>rldp port { unidirection-detect   bidirection-detect   loop-detect } { warning   shutdown-svi   shutdown-port   block }</code>
<b>Parameter Description</b>	<p><b>unidirection-detect:</b> Indicates unidirectional link detection.</p> <p><b>bidirection-detect:</b> Indicates bidirectional forwarding detection.</p> <p><b>loop-detect:</b> Indicates downlink loop detection.</p> <p><b>warning:</b> Indicate the failure treatment is warning.</p> <p><b>shutdown-svi:</b> Indicate the failure treatment is closing the SVI that the interface is on.</p> <p><b>shutdown-port:</b> Indicates the failure treatment is port violation.</p> <p><b>block:</b> Indicates the failure treatment is disabling learning and forwarding of a port.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The interfaces include layer-2 switch ports, layer-3 routed ports, layer-2 AP member ports, and layer-3 AP member ports.

### ↘ Modifying Global RLDP Detection Parameters

<b>Command</b>	<code>rldp {detect-interval <i>interval</i>   detect-max <i>num</i>   neighbor-negotiation }</code>
<b>Parameter Description</b>	<p><b>detect-interval <i>interval</i>:</b> Indicates a detection interval.</p> <p><b>detect-max <i>num</i>:</b> Indicates detection times.</p> <p><b>neighbor-negotiation:</b> Indicates neighbor negotiation.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Modify all RLDP parameters on all ports when necessary.

### ↘ Recovering Failed Port

<b>Command</b>	<code>rldp reset</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged mode
<b>Usage Guide</b>	Recover all failed ports to initialized state and resume detection.

### ↘ Displaying RLDP State Information

<b>Command</b>	<code>show rldp [ interface <i>interface-name</i> ]</code>
<b>Parameter Description</b>	<i>interface-name</i> : Indicates the interface to display information of.
<b>Command</b>	Privileged mode, global configuration mode, or interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	Display RLDP state information.

### Configuration Example

#### Enabling RLDP Detection in Ring Topology

<p><b>Scenario</b></p> <p><b>Figure 1-4</b></p>	<p>As shown in the following figure, the aggregation and access sections are in a ring topology. The STP is enabled on all devices to prevent loop and provide redundancy protection. To avoid a unidirectional or bidirectional link failure resulting in STP failure, RLDP unidirectional and bidirectional link detection is enabled between aggregation devices as well as between an aggregation device and the access device. To avoid loop due to wrong downlink connection of the aggregation devices, enable RLDP downlink loop detection on the downlink ports of the aggregation devices and of the access device. To avoid loop due to wrong downlink connection of the access device, enable RLDP downlink loop detection on the downlink ports of the access device.</p> 
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● SW A and SW B are aggregation devices, and SW C is an access device. Users connected to SW C. SW A, SW B and SW C are structured in a ring topology, and the STP is enabled on each of them. For STP configuration, refer to relevant configuration guide.</li> <li>● Enable the RLDP on SW A, enable unidirectional and bidirectional link detection on the two ports, and enable loop detection on the downlink port.</li> <li>● Enable the RLDP on SW B, enable unidirectional and bidirectional link detection on the two ports, and enable loop detection on the downlink port.</li> <li>● Enable the RLDP on SW C, enable unidirectional and bidirectional link detection on the two uplink ports, and enable loop detection on the two downlink ports.</li> </ul>
<p><b>A</b></p>	<pre>A#configure terminal A(config)#rldp enable A(config)#interface GigabitEthernet 2/0/1 A(config-if-GigabitEthernet 2/0/1)#rldp port unidirection-detect shutdown-port A(config-if-GigabitEthernet 2/0/1)#rldp port bidirection-detect shutdown-port A(config-if-GigabitEthernet 2/0/1)# exit</pre>

	<pre>A(config)#interface GigabitEthernet 2/0/9 A(config-if-GigabitEthernet 2/0/1)#rldp port unidirection-detect shutdown-port A(config-if-GigabitEthernet 2/0/1)#rldp port bidirection-detect shutdown-port A(config-if-GigabitEthernet 2/0/1)#rldp port loop-detect shutdown-port A(config-if-GigabitEthernet 2/0/1)#exit</pre>
<b>B</b>	<p>Apply the configuration on SW A.</p>
<b>C</b>	<pre>C#configure terminal C(config)#rldp enable C(config)#interface GigabitEthernet 0/49 C(config-if-GigabitEthernet 0/49)#rldp port unidirection-detect shutdown-port C(config-if-GigabitEthernet 0/49)#rldp port bidirection-detect shutdown-port C(config-if-GigabitEthernet 0/49)# exit C(config)#interface GigabitEthernet 0/50 C(config-if-GigabitEthernet 0/50)#rldp port unidirection-detect shutdown-port C(config-if-GigabitEthernet 0/50)#rldp port bidirection-detect shutdown-port C(config-if-GigabitEthernet 0/50)#exit C(config)#interface GigabitEthernet 0/1 C(config-if-GigabitEthernet 0/1)# rldp port loop-detect shutdown-port C(config-if-GigabitEthernet 0/1)#exit C(config)#interface GigabitEthernet 0/2 C(config-if-GigabitEthernet 0/2)# rldp port loop-detect shutdown-port C(config-if-GigabitEthernet 0/2)#exit</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the RLDP information on SW A, SW B and SW C. Take SW A for example.</li> </ul>
<b>A</b>	<pre>A#show rldp rldp state          : enable rldp hello interval: 3 rldp max hello      : 2 rldp local bridge   : 00d0.f822.33aa ----- Interface GigabitEthernet 2/0/1 port state          : normal</pre>

```
neighbor bridge : 00d0.f800.51b1
neighbor port   : GigabitEthernet 2/0/1

unidirection detect information:
    action: shutdown-port
    state : normal

bidirection detect information:
    action: shutdown-port
    state : normal

Interface GigabitEthernet 2/0/9
port state      : normal
neighbor bridge : 00d0.f800.41b0
neighbor port   : GigabitEthernet 0/49

unidirection detect information:
    action: shutdown-port
    state : normal

bidirection detect information:
    action: shutdown-port
    state : normal

loop detect information:
    action: shutdown-port
    state : normal
```

## Common Errors

- RLDP functions and private multicast address authentication or TPP are enabled at the same time.
- Neighbor negotiation is not enabled when configuring unidirectional or bidirectional link detection. The RLDP should be enabled on a neighbor device, or otherwise a unidirectional or bidirectional failure will be detected.
- If RLDP detection is configured to be implemented after neighbor negotiation while configuring unidirectional or bidirectional link detection, detection cannot be implemented as no neighbor can be learned due to a link failure. In this situation, you are suggested to recover the link state first.
- You are suggested not to specify the failure treatment as Shutdown SVI under a routed port.
- You are suggested not to specify the failure treatment as Block for a port, on which a loop protection protocol is enabled, for example, the STP.

## 1.5 Monitoring

### Displaying

---

Description	Command
Displays RLDP state.	<b>show rldp</b> [ interface <i>interface-name</i> ]

## 2 Configuring DLDP

### 2.1 Overview

The Data Link Detection Protocol (DLDP) is a protocol used to quickly detect faulty Ethernet links.

A typical Ethernet link detection mechanism detects physical link connectivity through autonegotiation at the physical layer. Such a mechanism has limitations when detecting Layer-3 data communication exceptions despite normal physical connections.

DLDP provides reliable Layer-3 link detection information. After detecting a faulty link, DLDP shuts down the logical state of Layer-3 ports to realize fast Layer-3 protocol convergence.

### 2.2 Applications

Application	Description
<a href="#">Intra-Network Segment DLDP Detection</a>	The source IP address of the detected port and the detected IP address are in the same network segment.
<a href="#">Inter-Network Segment DLDP Detection</a>	The source IP address of the detected port and the detected IP address are in different network segments.

#### 2.2.1 Intra-Network Segment DLDP Detection

##### Scenario

This section describes the basic DLDP application scenario where the source IP address of the detected port and the detected IP address are in the same network segment.

In Figure 2-1, the Gi 0/1 Layer-3 port on Switch A and the Gi 0/2 Layer-3 port on Switch C are in the same network segment. To detect the Layer-3 link connectivity from Gi 0/1 to Gi 0/2, enable DLDP on Gi 0/1 or Gi 0/2.

Figure 2-1

<b>Remarks</b>	<p>Device A and Device C are switches.</p> <p>Gi 0/1 and Gi 0/2 are Layer-3 ports in the same network segment.</p> <p>B is a network in the same network segment as Gi 0/1 and Gi 0/2.</p>
----------------	--

## Deployment

- Enable DLDP on Gi 0/1 or Gi 0/2.

### 2.2.2 Inter-Network Segment DLDP Detection

#### Scenario

This section describes the DLDP application scenario where the source IP address of the detected port and the detected IP address are in different network segments.

In Figure 2-2, the Gi 0/1 Layer-3 port on Switch A and the Gi 0/4 Layer-3 port on Switch D are in different network segments. To detect the Layer-3 link connectivity from Gi 0/1 to Gi 0/4, enable DLDP on Gi 0/1 and configure the DLDP next-hop IP address (IP address of the Gi 0/2 port on Switch B).

Figure 2-2

<b>Remarks</b>	Device A, Device B, and Device D are switches. Gi 0/1 and Gi 0/4 are Layer-3 ports in different network segments.
----------------	--

## Deployment

- Enable DLDP on Gi 0/1 and configure the DLDP next-hop IP address.

## 2.3 Features

### Basic Concepts

#### DLDP Detection Interval and Retransmission Times

Detection interval: Indicates the interval at which DLDP detection packets (ICMP echo) are transmitted.

Retransmission times: Indicate the maximum times DLDP detection packets can be retransmitted in the case of a DLDP detection failure.

When a network device does not receive a reply packet from the peer end within the period of the detection interval multiplied by the retransmission times, the device determines that a Layer-3 link failure occurs and shuts down the logical state of its Layer-3 port (despite the normal physical link connection). When Layer-3 link connectivity is recovered, the device restores its Layer-3 port to Up logical state.

#### DLDP Detection Modes

Active mode and passive mode are two DLDP detection modes.

Active mode (default): ICMP detection packets are sent actively.

Passive mode: ICMP detection packets are received passively.

### DLDP Next Hop

Next hop: Indicates the next node connected to the detected IP address in inter-network segment DLDP detection.

In some cases, DLDP needs to detect IP reachability in non-directly connected network segments. You need to configure the next-hop IP address for the detected port to allow DLDP to obtain the next-hop MAC address through an ARP packet before sending a correct ICMP packet.

In this situation, you need to avoid the return of the reply packet from another link; otherwise, DLDP will misjudge that the detected port does not receive an ICMP reply.

### DLDP Recovery Times

Recovery times: Indicate the times DLDP needs to receive consecutive reply packets (ICMP reply) before it can determine link failure recovery.

In some cases, link detection may be unstable. For example, a link is only intermittently pingable. In this case, DLDP repeatedly changes the link status between Up and Down, which may further destabilize the ring network.

Recovery times indicate the times DLDP needs to receive consecutive reply packets before DLDP can set the link in Down state to Up. The default recovery times are three times, indicating that the link needs to be successfully pinged three times before it is set to Up. The recovery times setting reduces link detection sensitivity but increases stability. Related parameters are adjustable according to the network condition.

### DLDP Bound MAC Address

Bound MAC address: Indicates the MAC address bound to the detected IP address.

In a complex network environment, DLDP may obtain an invalid MAC address if the detected link has abnormal ARP packets transmitted (causing ARP spoofing), which will make DLDP detection abnormal.

To address this problem, you can bind the detected IP address (or next-hop IP address) to a static MAC address to avoid a DLDP failure in the case of ARP spoofing.

## Overview

Feature	Description
<a href="#">DLDP Detection</a>	Detects Layer-3 link connectivity. When a Layer-3 link is abnormal, DLDP shuts down the Layer-3 port.
<a href="#">MAC Address Binding</a>	Binds the detected IP address to the MAC address of the detected device to avoid DLDP exceptions otherwise caused by ARP spoofing.
<a href="#">Passive DLDP Detection</a>	When both ends of the detected link are enabled with DLDP, you can configure one end in passive mode to save bandwidth and CPU resources.

### 2.3.1 DLDP Detection

DLDP detects Layer-3 link connectivity. When a Layer-3 link is abnormal, DLDP shuts down the corresponding Layer-3 port.

#### Working Principle

After DLDP detection is enabled, DLDP sends an ARP packet to obtain the MAC address and outbound port of the detected device or the next-hop device. Then DLDP periodically sends IPv4 ICMP echo packets to the MAC address and outbound port to detect link connectivity. If DLDP does not receive an IPv4 ICMP reply packet from the detected device within a specific period, DLDP determines that the link is abnormal and sets the Layer-3 port to Down.

#### Related Configuration

- Enabling DLDP Detection

By default, DLDP detection is disabled on ports.

Run the **lldp** command with the detected IP address specified to enable DLDP detection.

You can configure the next-hop IP address, MAC address of the detected device, transmission interval, retransmission times, and recovery times based on the actual environment.

### 2.3.2 MAC Address Binding

The MAC address binding feature is used to bind the detected IP address (or next-hop IP address) to the MAC address of the detected device (or next-hop device) to avoid DLDP exceptions otherwise caused by ARP spoofing

#### Working Principle

You can bind the detected IP address (or next-hop IP address) to a static MAC address to avoid a DLDP failure in the case of ARP spoofing.

#### Related Configuration

By default, no MAC address is bound in DLDP detection.

Bind the MAC address of the detected device when you run the **lldp** command to enable DLDP detection. If the next-hop IP address is specified, bind the MAC address of the next-hop device.

After DLDP detection is enabled, DLDP sends ARP packets and ICMP packets with a fixed destination IP address and a fixed destination MAC address. If the source IP address and MAC address in the received packet do not match the bound IP address and MAC address, DLDP will not process the packet.

### 2.3.3 Passive DLDP Detection

When both ends of the detected link are enabled with DLDP, you can configure one end in passive mode to save bandwidth and CPU resources.

#### Working Principle

After the device at the local end sends an ICMP echo packet, the peer device determines link connectivity according to the packet reception time by using specific detection parameters, which are the same as those at the local end, thus saving bandwidth and CPU resources.

### Related Configuration

By default, passive DLDP detection is disabled.

Run the **dldp passive** command to enable passive DLDP detection.

After passive DLDP detection is enabled, DLDP will return an ICMP reply packet upon receiving an ICMP echo packet, instead of actively sending ICMP echo packets to the peer end. If DLDP does not receive an ICMP echo packet within a specific period, it determines that the link to the peer port is abnormal.

## 2.4 Configuration

Configuration	Description and Command	
<a href="#">Enabling DLDP Detection</a>	 (Mandatory) It is used to enable DLDP detection in interface configuration mode.	
	<b>dldp</b> Enables DLDP detection.	
	 (Mandatory) It is used to enable passive DLDP detection in interface configuration mode.	
	<b>dldp passive</b> Enables passive DLDP detection.	
	 (Optional) It is used to configure the detection interval, retransmission times, and recovery times of DLDP detection in global configuration mode.	
	<b>dldp interval</b>	Modifies the DLDP parameters globally to apply the modifications to DLDP detection on all ports.
	<b>dldp retry</b>	
<b>dldp resume</b>		

### 2.4.1 Enabling DLDP Detection

#### Configuration Effect

- Detect Layer-3 link connectivity. When a Layer-3 link is abnormal, DLDP shuts down the Layer-3 port.

#### Notes

- DLDP supports the configuration of multiple IP addresses on a Layer-3 port. DLDP sets the port to Down when none of the IP addresses receives an ICMP reply. If one IP address resumes communication, DLDP sets the port to Up again.
- DLDP uses the first IP address of the Layer-3 port as the source IP address of detection packets.

#### Configuration Steps

- [Enabling DLDP Detection](#)

- Mandatory.
- When you enable DLDP detection in interface configuration mode, you can configure the next-hop IP address, MAC address, transmission interval, retransmission times, and recovery times based on the actual environment.

### ▾ Configuring a DLDP Detection Mode

- Optional.
- You can configure active or passive DLDP detection in interface configuration mode based on the actual environment.
- If DLDP detection needs to be enabled at both ends of a Layer-3 link, you can configure passive DLDP detection at one end to save bandwidth and CPU resources.

### ▾ Configuring DLDP Parameters Globally

- Optional.
- You can modify the parameters of DLDP detection on all ports in global configuration mode based on requirements. The parameters include the packet transmission interval, packet retransmission times, and recovery times.

## Verification

- Display the device DLDP information, including the status and statistics of DLDP detection on all ports.

## Related Commands

### ▾ Enabling DLDP Detection

<b>Command</b>	<b>dldp</b> <i>ip-address</i> [ <i>next-hop-ip</i> ] [ <b>mac-address</b> <i>mac-addr</i> ] [ <b>interval</b> <i>tick</i> ] [ <b>retry</b> <i>retry-num</i> ] [ <b>resume</b> <i>resume-num</i> ]
<b>Parameter Description</b>	<p><i>ip-address</i>: Indicates the detected IP address.</p> <p><b>next-hop-ip</b>: Indicates the next-hop IP address.</p> <p><i>mac-addr</i>: Indicates the MAC address of the detected device to be bound. If the next-hop IP address is specified, bind the MAC address of the next-hop device.</p> <p><i>tick</i>: Indicates the interval at which detection packets are transmitted. The value ranges from 5 to 6,000 ticks (1 tick = 10 ms). The default value is 100 ticks (1s).</p> <p><i>retry-num</i>: The value ranges from 1 to 3,600. The default value is 4.</p> <p><i>resume-num</i>: Indicates the recovery times. The value ranges from 1 to 200. The default value is 3.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The port to be enabled with DLDP detection must be a Layer-3 port, such as a router port, L3AP port, and SVI port.

### ▾ Configuring a DLDP Detection Mode

<b>Command</b>	<b>dldp passive</b>
----------------	---------------------

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	You need to enable DLDP detection before configuring a DLDP detection mode.

↘ **Modifying DLDP Detection Parameters Globally**

<b>Command</b>	<b>dl dp { interval tick   retry retry-num   resume resume-num }</b>
<b>Parameter Description</b>	<p><i>tick</i>: Indicates the interval at which detection packets are transmitted. The value ranges from 5 to 6,000 ticks (1 tick = 10 ms). The default value is 100 ticks (1s).</p> <p><i>retry-num</i>: Indicates the interval at which detection packets are retransmitted. The value ranges from 5 to 3,600. The default value is 4.</p> <p><i>resume-num</i>: Indicates the recovery times. The value ranges from 1 to 200. The default value is 3.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to quickly modify the parameters of DLDP detection on all ports when the actual environment is changed.

↘ **Displaying the DLDP Status**

<b>Command</b>	<b>show dldp statistic [ interface interface-name ]</b>
<b>Parameter Description</b>	<i>interface-name</i> : Indicates the Layer-3 port on which the DLDP status will be displayed.
<b>Command Mode</b>	Privileged mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	Use this command to display the DLDP status on a specific port. You can also use this command to display the DLDP status on all ports.

**Configuration Example**

↘ **Enabling DLDP Detection on Layer-3 Ports on Device A and Device B in a Layer-3 Network**

<b>Scenario</b> Figure 2-3	
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Enable DLDP detection on the Gi 0/1 and Gi 0/2 router ports on Device A to detect the Layer-3 link connectivity between Device A and Device B and that between Device A and Device D.</li> </ul>

Displays the DLDP statistics on the Up/Down port sates.	<b>show dldp statistic</b>

## 3 Configuring VRRP

### 3.1 Overview

Virtual Router Redundancy Protocol (VRRP) is a fault-tolerant routing protocol.

VRRP adopts the master-backup design to ensure migration of functions from a Master router to a Backup one when the Master failed, without influencing internal and external data communication or modifying Local Area Network (LAN) configuration. A VRRP group maps multiple routers into a virtual router. VRRP ensures only one router at a moment on behalf of a virtual router transfers packets, which is the elected Master. If the Master fails, one of the Backup routers will replace it. Under VRRP, it seems that a host in a LAN uses only one router, and the routing remains functional even when the first-hop router fails.

- VRRP is applicable to LAN scenarios which require the redundancy of routing egresses.

#### Protocols and Standards

- RFC2338: Virtual Router Redundancy Protocol
- RFC3768: Virtual Router Redundancy Protocol (VRRP)
- RFC5798: Virtual Router Redundancy Protocol (VRRP) Version 3 for IPv4 and IPv6

### 3.2 Applications

Application	Description
<a href="#">Routing Redundancy</a>	Configure routers in a LAN as one VRRP group to achieve simple routing redundancy.
<a href="#">Load Balancing</a>	Configure routers in a LAN as multiple VRRP groups to achieve traffic load balancing.

#### 3.2.1 Routing Redundancy

##### Scenario

Configure routers in a LAN as one VRRP group, where hosts take the virtual IP address of this group as the default gateway address.

- Packets from Host 1, Host 2 and Host 3 to other networks are forwarded by the elected Master router (Router A in Figure 3-1).
- If Router A fails, the Master will be re-elected between Router B and Router C to forward packets, achieving simple routing redundancy.

Figure 3-1

## Deployment

- Router A, Router B and Router C are connected to the LAN via Ethernet interfaces.
- On Router A, Router B and Router C, VRRP is configured on the Ethernet interfaces connected to the LAN.
- These Ethernet interfaces are in the same VRRP group whose virtual IP address is 192.168.12.1.
- The gateway address for Host 1, Host 2 and Host 3 is the IP address of the VRRP group, namely 192.168.12.1.

## 3.2.2 Load Balancing

### Scenario

Configure routers in a LAN as multiple VRRP groups. Hosts in the LAN take virtual IP addresses of the groups as their gateways, and each router backs up for other routers in different group.

- Packets from Host 1 and Host 2 to other networks with the default gateway address as the virtual IP address of virtual router 1 are forwarded by the Master of virtual router 1 (Router A in Figure 3-2).
- Packets from Host 3 and Host 4 to other networks with the default gateway address as the virtual IP address of virtual router 2 are forwarded by the Master of virtual router 2 (Router B in Figure 3-2).
- Routing redundancy is achieved on Router A and Router B, and the LAN traffic is shared to achieve load balancing.

Figure 3-2

## Deployment

- Router A and Router B are connected to the LAN via Ethernet interfaces.
- On Router A and Router B, two virtual routers are configured on the Ethernet interfaces connected to the LAN.

Router A takes the IP address 192.168.12.1 of Ethernet interface Gi0/0 as the IP address of virtual router 1. Thus for virtual router 1, Router A becomes the Master and Router B becomes the Backup.

- Router B takes the IP address 192.168.12.2 of Ethernet interface Gi0/0 as the IP address of virtual router 2. Thus for virtual router 2, Router B becomes the Master and Router A becomes the Backup.
- In the LAN, Host 1 and Host 2 take the IP address 192.168.12.1 of virtual router 1 as the default gateway address, while Host 3 and Host 4 take the IP address 192.168.12.2 of virtual router 2 as the default gateway address.

## 3.3 Features

### Basic Concepts

#### Virtual Router

A virtual router, also called a VRRP group, is regarded as a default gateway for hosts in a LAN. A VRRP group contains a Virtual Router Identifier (VRID) and a set of virtual IP addresses.

#### Virtual IP Address

Indicates the IP address of a virtual router. A virtual router can be configured with one or multiple IP addresses.

#### IP Address Owner

If a VRRP group has the virtual IP (including IPv6) address as that of an Ethernet interface on one real router, the router is regarded as the virtual IP address owner. In such case, the router priority is 255. If the owned Ethernet interface is available, the VRRP group will be in Master state automatically. The IP address owner receives and processes the packets with the destination IP address as that of the virtual router.

Virtual MAC Address

The virtual MAC address of a VRRP group is an IEEE 802 MAC address, formatted as **00-00-5E-00-01-{VRID}** with the first five octets assigned and the last two as a group VRID. A VRRP group responds to an Address Resolution Protocol (ARP) request with its virtual MAC address instead of a real MAC address.

Master Router

In a VRRP group, only the Master router answers ARP requests and forwards IP packets. If a real router is the IP Address Owner, it becomes the Master router.

Backup Router

In a VRRP group, Backup routers only monitor the state of the Master but do not respond to ARP requests or forward IP packets. When the Master fails, Backup routers will take the chance to compete for the position.

Preemption Mode

If a VRRP group runs in Preemption mode, a higher priority Backup router will replace the lower priority Master router.

Overview

Feature	Description
<a href="#">VRRP</a>	VRRP achieves redundancy for the default gateways of terminals on a multi-access media (for example, Ethernet). It enables a Backup router to forward packets when the Master router is down, providing transparent routing switch and promoting network service quality.

3.3.1 VRRP

In case that the Master router is faulty, VRRP achieves migration of functions from the Master router to a Backup one without influencing internal and external data communication or modifying LAN configuration.

Working Principle

Figure 3-3 Working Principle of VRRP

Working Mode of VRRP

The RFC2338, RFC3768 and RFC5798 protocols define the format and operating mechanism of VRRP packets. Multicast VRRP packets are sent periodically with specified destination addresses by the Master router to advertise normal operation or for Master election. VRRP allows a router in a LAN to automatically replace the Master who forwards IP packets when the latter fails. This helps achieve hot backup and fault tolerance of IP-based routing as well as ensure communication continuity and reliability for hosts in the LAN. A VRRP group achieves redundancy through multiple real routers. However, only one router acts as the Master to forward packets while the others are Backup routers. Router switching in a VRRP group is completely transparent to hosts in a LAN.

### 📌 Master Election Process

The RFC standards stipulate the master election process as follows:

- VRRP provides a simple mechanism for Master election. First, compare the VRRP priorities configured on the interfaces of the routers in a VRRP group. The router with the highest priority is elected as the Master. If these priorities are equal, compare the primary IP addresses of these routers. The router with the biggest IP address is elected as the Master.
- After the Master router is elected, the other routers become Backup routers (and enter the **Backup** state) and monitor the state of the master router through the VRRP packets the master router sends. If the master router is operational, it regularly sends VRRP multicast packets known as Advertisement packets to notify the Backup routers of its status. If the Backup routers do not receive such packets within a set period, all of them will enter the Master state. In such case, the previous step of Master election is repeated. In this way, a router with the highest priority will be elected as a new master, achieving VRRP backup.

Once the Master router of a VRRP group is elected, it is responsible to forward packets for hosts in a LAN.

### 📌 Communication Process

The VRRP communication process can be explained by Figure 3-3. The routers R1 and R2 are connected to the LAN segment 192.168.12.0/24 via the VRRP-enabled Ethernet interfaces Gi0/0. Hosts in the LAN take the virtual IP address of the VRRP group as the default gateway address. Only the virtual router is recognized by the hosts. The Master router in the group, however, is unknown. For example, when PC 1 plan to communicate with PC 2, PC 1 sends packets to the default gateway with the virtual IP address; The Master router in the group receives the packets and forwards them to PC 2. In this process, PC 1 only senses the virtual router instead of R1 or R2. The Master router in the group is elected between R1 and R2. When the Master fails, it will be replaced automatically by the other router.

## Related Configuration

### 📌 Enabling VRRP

By default, VRRP is disabled on an interface.

In the interface configuration mode, run the `vrrp group ip ipaddress [ secondary ]` or `vrrp group ipv6 ipv6-address` command to set the VRID and virtual IP address to enable VRRP.

VRRP must be enabled on an interface.

### 📌 Configuring the IPv4 VRRP Authentication String

By default, VRRP is in non-authentication mode.

Run the **vrrp group authentication *string*** command to set an authentication string in MD5 authentication mode or a plain text password in plain text mode for an IPv4 VRRP group. In the plain text authentication mode, a password contains 8 bytes at most.

Members of a VRRP group can communicate with each other only when they are in the same authentication mode. In the plain text authentication mode, all routers in a VRRP group should have the same authentication password. The plain text authentication password cannot guarantee security but only prevents/prompts wrong VRRP configurations.

### ▾ Configuring the VRRP Advertisement Interval

By default, the advertisement interval of the Master router is 1 second.

Run the **vrrp [ ipv6 ] group timers advertise { *advertise-interval* | *csec centisecond-interval* }** command to change the interval.

When VRRP learning timer is not configured, the same advertisement interval should be set for a VRRP group, otherwise routers in **Backup** state will discard received VRRP packets.

### ▾ Configuring the VRRP Preemption Mode

By default, a VRRP group operates in the Preemption mode.

To enable the Preemption mode for a VRRP group, run the **vrrp [ ipv6 ] group preempt [ *delay seconds* ]** command. The optional parameter **delay seconds** is 0 by default.

If a VRRP group operates in the Preemption mode, a router will become the Master of the group when it finds that its priority is higher than that of the current Master. If a VRRP group operates in Non-preemption mode, a router will not become the Master even when it finds that its priority is higher than that of the current Master. It makes little sense to configure the Preemption mode when the VRRP group uses the IP address of an Ethernet interface, in which case the group has the highest priority and automatically becomes the Master in the group. The optional parameter **Delay Seconds** defines the delay before a backup VRRP router declares its Master identity.

### ▾ Enabling the IPv6 VRRP Accept Mode

By default, the Accept mode is disabled for an IPv6 VRRP group.

To enable the Accept mode, run the **vrrp ipv6 group accept\_mode** command.

After the Accept mode is enabled, an IPv6 VRRP virtual router in **Master** state receives and processes packets with the virtual router IP address as the destination; when the Accept mode is disabled, the virtual router discards such packets except Neighbor Advertisement (NA) packets and Neighbor Solicitation (NS) packets. Besides, an IPv6 VRRP master virtual router in **Owner** state receives and processes packets with the virtual router IP address as the destination by default no matter whether the Accept mode is configured or not.

### ▾ Configuring the VRRP Router Priority

By default, the router priorities in a VRRP group are all 100.

To adjust the priority, run the **vrrp [ ipv6 ] group priority *level*** command.

If a router in the Preemption mode owns the group's virtual IP address and the highest priority, it becomes the group Master, while the other routers with lower priorities in the group become Backup (or monitoring) routers.

### ▾ Configuring the VRRP Tracked Interface

By default, no interface is tracked by a VRRP group.

To configure such an interface, run the **vrrp group track** { *interface-type interface-number* | **bfd** *interface-type interface-number ipv4-address* } [ *priority* ] or **vrrp ipv6 group track** *interface-type interface-number* [ *priority* ] command.

After an interface is configured for a VRRP group to monitor, the router priority will be adjusted dynamically based on the interface state. Once the interface becomes unavailable, the priority of the router in the group will be reduced by a set value, and another functional and higher priority router in this group will become the Master.

### ▾ Configuring the VRRP Tracked IP Address

By default, no IP address is tracked by a VRRP group.

To configure such an address, run the **vrrp group track** *ip-address* [ **interval** *interval-value* ] [ **timeout** *timeout-value* ] [ **retry** *retry-value* ] [ *priority* ] or **vrrp ipv6 group track** { *ipv6-global-address* | { *ipv6-linklocal-address interface-type interface-number* } } [ **interval** *interval-value* ] [ **timeout** *timeout-value* ] [ **retry** *retry-value* ] [ *priority* ] command.

After an IP address is configured for a VRRP group to monitor, the router priority will be adjusted dynamically based on the address accessibility. Once the address is inaccessible (the **ping** command fails), the priority of the router in the group will be reduced by a set value, and another higher priority router in this group will become the Master.

### ▾ Configuring the VRRP Learning Timer

By default, the learning timer is disabled for a VRRP group.

To enable it, run the **vrrp [ ipv6 ] group timers learn** command.

After the learning timer is configured, a VRRP Backup router learns the advertisement interval of NA packets from the Master. Based on this instead of a locally set interval, the Backup router calculates the interval for determining a failure of the Master. This command achieves the synchronization of advertisement intervals between Backup routers and the Master.

### ▾ Configuring the VRRP Group Description

By default, no description is configured for a VRRP group.

To configure such a string, run the **vrrp [ ipv6 ] group description** *text* command.

A VRRP description helps distinguishing VRRP groups.

### ▾ Configuring the VRRP Delay

By default, no delay is configured for a VRRP group.

To enable it, run the **vrrp delay** { **minimum** *min-seconds* | **reload** *reload-seconds* } command. The two types of delay range from 0 to 60 seconds.

The command configures the delay of starting a VRRP group on an interface. There are two types of VRRP delay: the delay after system startup and the delay after an interface resumes. You may configure them respectively or simultaneously. After

the delay is configured for a VRRP group on an interface, the VRRP group starts after the delay instead of immediately upon system startup or the interface's resumption, ensuring non-preemption. If the interface receives a VRRP packet during the delay, the delay will be canceled and the VRRP will be started immediately. This configuration will be effective for both IPv4 and IPv6 VRRP groups of an interface.

### 📌 Configuring the IPv4 VRRP Version

By default, IPv4 adopts the VRRPv2 standard.

To specify the version for IPv4 VRRP, run the **vrrp group version { 2 | 3 }** command.

When the parameter value is set to 2, VRRPv2 is adopted; when the parameter value is set to 3, VRRPv3 is adopted.

### 📌 Specifying a Sub VLAN of a Super VLAN to Receive the IPv4 VRRP Packets

By default, IPv4 VRRP packets are sent to the first **Up** Sub VLAN interface of a Super VLAN.

To specify the first Sub VLAN in Up state of a Super VLAN to receive IPv4 VRRP packets, run the **vrrp detection-vlan first-subvlan** command. If VRRP and VRRP Plus are enabled simultaneously on a Super VLAN interface, sending VRRP packets to the first Up Sub VLANs under the Super VLAN is not supported.

Both the above configurations reduce VRRP packets and avoids influencing router performance and occupying network bandwidth. Yet the routers constituting an IPv4 VRRP group should be interconnected within the first UP Sub VLAN interface.

### 📌 Configuring the BFD Support for IPv4 VRRP on an Interface

By default, the Bidirectional Forwarding Detection (BFD) protocol support for VRRP is not enabled on an interface.

To enable it, run the **vrrp group bfd ip-address** command.

For a Backup router, run this command to correlate an IPv4 VRRP group with BFD without caring the configured IP address. For the Master, as the primary IP address of a Backup router is not known, the router IP address can only be specified by the administrator.

To enable the BFD support, make sure that IP and BFD session parameters are configured on the target interface.

After the BFD support is enabled for a specified IPv4 VRRP group, when the Master fails, a Backup router may detect it within one second.

### 📌 Configuring Global IPv4 VRRP BFD

By default, the VRRP does not adopt the global IPv4 VRRP BFD mode in detecting the state of the Master.

To enable global IPv4 VRRP BFD, run the **vrrp bfd interface-type interface-number ip-address** command.

After global IPv4 VRRP BFD is enabled, multiple IPv4 VRRP groups may share BFD sessions, achieving fast detection and master-backup failover.

To enable the BFD support, make sure that IP and BFD session parameters are configured on the target interface.

### 3.4 Configuration

Configuration	Description and Command
<a href="#">Configuring IPv4 VRRP</a>	 (Mandatory) It is used to enable IPv4 VRRP.
	<b>vrrp group ip ipaddress [ secondary ]</b> Enables IPv4 VRRP.
	 (Optional) It is used to configure IPv4 VRRP parameters.
	<b>vrrp group authentication string</b> Configures the IPv4 VRRP authentication string.
	<b>vrrp group timers advertise</b> { advertise-interval   csec centisecond-interval }      Configures the IPv4 VRRP advertisement interval.
	<b>vrrp group preempt [ delay seconds ]</b> Configures the IPv4 VRRP Preemption mode.
	<b>vrrp group priority level</b> Configures the IPv4 VRRP router priority.
	<b>vrrp group track</b> { interface-type interface-number   bfd interface-type interface-number ip4-address } [ priority ]      Configures the IPv4 VRRP tracked interface.
	<b>vrrp group track ip-address [ interval interval-value ] [ timeout timeout-value ] [ retry retry-value ] [ priority ]</b> Configures the IPv4 VRRP tracked IP address.
	<b>vrrp group timers learn</b> Configures the IPv4 VRRP learning timer.
	<b>vrrp group description text</b> Configures the IPv4 VRRP group description.
	<b>vrrp delay { minimum min-seconds   reload reload-seconds }</b> Configures the IPv4 VRRP delay.
	<b>vrrp group version { 2   3 }</b> Configures the IPv4 VRRP version.
	<b>vrrp detection-vlan first-subvlan</b> Specifies a sub VLAN of a super VLAN to receive the IPv4 VRRP packets.
	<b>vrrp group bfd ip-address</b> Configures the BFD support for IPv4 VRRP on an Interface.
<b>vrrp bfd interface-type interface-number ip-address</b> Configures global IPv4 VRRP BFD.	
<a href="#">Configuring IPv6 VRRP</a>	 (Mandatory) It is used to enable IPv6 VRRP.
<b>vrrp group ipv6 ipv6-address</b> Enables IPv6 VRRP.	
 (Optional) It is used to configure IPv6 VRRP parameters.	

Configuration	Description and Command
	<b>vrrp ipv6 group timers advertise</b> { <i>advertise-interval</i>   <b>csec</b> <i>centisecond-interval</i> } Configures the IPv6 advertisement interval.
	<b>vrrp ipv6 group preempt [ delay seconds ]</b> Configures the IPv6 VRRP Preemption mode.
	<b>vrrp ipv6 group accept_mode</b> Enables the Accept mode for an IPv6 VRRP group.
	<b>vrrp ipv6 group priority level</b> Configures the IPv6 VRRP router priority.
	<b>vrrp ipv6 group track interface-type interface-number [ interface-priority ]</b> Configures the IPv6 VRRP tracked interface.
	<b>vrrp ipv6 group track { ipv6-global-address   { ipv6-linklocal-address interface-type interface-number } } [ interval interval-value ] [ timeout timeout-value ] [ retry retry-value ] [ priority ]</b> Configures the IPv6 VRRP tracked IP address.
	<b>vrrp ipv6 group timers learn</b> Configures the IPv6 VRRP learning timer.
	<b>vrrp ipv6 group description text</b> Configures the IPv6 VRRP group description.
	<b>vrrp delay { minimum min-seconds   reload reload-seconds }</b> Configures the IPv6 VRRP delay.
<a href="#">Configuring VRRP-MSTP</a>	 The configuration is the same as IPv4 VRRP configuration.

### 3.4.1 Configuring IPv4 VRRP

#### Configuration Effect

- Configure a VRRP group on an interface of a specific LAN segment by setting the VRID and virtual IP address.
- Configure multiple VRRP groups on an interface to achieve load balancing and offer more stable and reliable network services.
- Configure the VRRP tracked interfaces to monitor real-time failures, change interface priorities and realize master-backup failover dynamically.

#### Notes

- To achieve VRRP, the routers in a VRRP group should be configured with the same virtual IPv4 address.
- To achieve mutual backup between multiple IPv4 VRRP groups, configure multiple IPv4 VRRP groups with identical VRRP configuration on different interface and configure different priorities for them so that they act as the master and backup groups mutually.
- Enable VRRP on Layer-3 interfaces.

## Configuration Steps

### ↘ Enabling IPv4 VRRP

- By default, IPv4 VRRP is disabled on an interface. You can enable it based on your demand.

### ↘ Configuring the IPv4 VRRP Authentication String

- By default, VRRP is in non-authentication mode. You can enable plain text authentication mode based on your demand.

### ↘ Configuring the IPv4 VRRP Advertisement Interval

- By default, the Master router sends advertisement packets every one second. You can modify the interval based on your demand.

### ↘ Configuring the IPv4 VRRP Preemption Mode

- By default, a VRRP group operates in Preemption mode with a zero-second delay.

### ↘ Configuring the IPv4 VRRP Router Priority

- The default router priority for a VRRP group is 100. You can modify the priority based on your demand.

### ↘ Configuring the IPv4 VRRP Tracked Interface

- By default, an IPv4 VRRP group monitors no interface and the value of priority change is 10. To achieve fault monitoring through interface monitoring, please configure this item.

### ↘ Configuring the IPv4 VRRP Learning Timer

- By default, the learning timer is disabled for a VRRP group. Enable this function if the Backup routers need to learn the Master's advertisement interval.

### ↘ Configuring the IPv4 VRRP Group Description

- By default, no description is configured for a VRRP group. To distinguish VRRP groups clearly, configure descriptions.

### ↘ Configuring the IPv4 VRRP Delay

- By default, the IPv6 VRRP delay is not configured. To guarantee an effective non-preemption mode, configure the delay.

### ↘ Configuring the IPv4 VRRP Version

- By default, IPv4 adopts the VRRPv2 standard. To change it, use the corresponding command.

### ↘ Specifying a Sub VLAN of a Super VLAN to Receive the IPv4 VRRP Packets

- By default, IPv4 VRRP packets are only sent to the first **UP** Sub VLAN interface of a Super VLAN, but you may configure a specific Sub VLAN.

### ↘ Configuring the BFD Support for IPv4 VRRP on an Interface

- By default, the BFD support is not configured on an interface. To configure it, use the corresponding command.

### ↘ Configuring Global IPv4 VRRP BFD

- By default, global IPv4 VRRP BFD is not enabled. To implement it, use the corresponding command.

### Verification

- Run the **show vrrp** command to verify the configuration.

### Related Commands

#### ↘ Enabling IPv4 VRRP

<b>Command</b>	<b>vrrp group ip <i>ipaddress</i> [ <b>secondary</b> ]</b>
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group, the range of which varies with product models. <i>ipaddress</i> : Indicates the IP address of a VRRP group. <b>secondary</b> : Indicates the secondary IP address of a VRRP group.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If no virtual IP address is specified, routers cannot join a VRRP group. If no secondary IP address is applied, the configured IP address will be the primary IP address of a VRRP group.

#### ↘ Configuring the IPv4 VRRP Authentication String

<b>Command</b>	<b>vrrp group authentication <i>string</i></b>
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group. <i>string</i> : Indicates the authentication string of a VRRP group (a plain text password consists of 8 bytes at most).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	In a VRRP group, the same authentication password should be configured for routers. The plain text authentication password cannot guarantee security but only prevents/prompts wrong VRRP configurations. This command is only applicable to VRRPv2 instead of VRRPv3.  Authentication is abolished for VRRPv3 (IPv4 VRRP and IPv6 VRRP) packets. If VRRPv2 is chosen for an IPv4 VRRP group, the command is effective; if VRRPv3 is chosen, the command is ineffective.

#### ↘ Configuring the IPv4 VRRP Advertisement Interval

<b>Command</b>	<b>vrrp group timers advertise { <i>advertise-interval</i>   <b>csec</b> <i>centisecond-interval</i> }</b>
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group. <i>advertise-interval</i> : Indicates the advertisement interval of a VRRP group (unit: second). <b>csec centisecond-interval</b> : An interval for a master router in a backup group to send VRRP packets. It is an integer from 50 to 99. The unit is centisecond. No default value is provided. The command is only effective for VRRPv3 packets. If it is configured for VRRPv2 packets, the default interval is one second.

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>If a router is elected as the Master in a VRRP group, it sends VRRP advertisement packets at the set interval to announce its VRRP state, priority and other information.</p> <p>According to the RFC standards, if an IPv4 VRRP group adopts VRRPv3 for sending multicast packets, the maximum advertisement interval is 40 seconds. Therefore, if the interval is set longer than 40 seconds, this maximum interval will be applied, though the configuration is effective.</p>

### ↘ Configuring the IPv4 VRRP Preemption Mode

<b>Command</b>	<b>vrrp group preempt [ delay seconds ]</b>
<b>Parameter Description</b>	<p><i>group</i>: Indicates the VRID of a VRRP group.</p> <p><b>delay seconds</b>: Indicates the preemption delay for the Master router to claim its status. The default value is 0 second.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>If a VRRP group runs in Preemption mode, a higher priority router will take the place of the lower priority Master. If a VRRP group runs in Non-preemption mode, a router with the priority higher than that of the Master remains Backup. It makes little sense to configure the Preemption mode when the VRRP group uses the IP address of an Ethernet interface, in which case the group has the highest priority and automatically becomes the Master in the group.</p>

### ↘ Configuring the IPv4 VRRP Router Priority

<b>Command</b>	<b>vrrp group priority level</b>
<b>Parameter Description</b>	<p><i>group</i>: Indicates the VRID of a VRRP group.</p> <p><i>level</i>: Indicates the priority of an interface in a VRRP group.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to manually configure the VRRP router priority.

### ↘ Configuring the IPv4 VRRP Tracked Interface

<b>Command</b>	<b>vrrp group track { interface-type interface-number   bfd interface-type interface-number ipv4-address } [ priority ]</b>
<b>Parameter Description</b>	<p><i>group</i>: Indicates the VRID of a VRRP group.</p> <p><i>interface-type interface-number</i>: Indicates the interface to be tracked.</p> <p><b>bfd interface-type interface-number ipv4-address</b>: A specified adjacent IP address tracked through BFD.</p> <p><i>priority</i>: Indicates the scale of VRRP priority change when the state of a monitored interface changes. The default value is 10.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A tracked interface must be a routable Layer-3 logic interface (for example, a Routed port, an SVI interface, a Loopback interface, or a Tunnel interface).

	The priority of the router owns the virtual IP address associated with a VRRP group must be 255, and no tracked interface can be configured on it.
--	--

↘ **Configuring the IPv4 VRRP Tracked IP Address**

<b>Command</b>	<b>vrrp group track</b> <i>ipv4-address</i> [ <b>interval</b> <i>interval-value</i> ] [ <b>timeout</b> <i>timeout-value</i> ] [ <b>retry</b> <i>retry-value</i> ] [ <i>priority</i> ]
<b>Parameter Description</b>	<p><i>group</i>: Indicates the VRID of a VRRP group.</p> <p><i>ipv4-address</i>: Indicates the IPv4 address to be tracked.</p> <p><b>interval</b> <i>interval-value</i>: Indicates the probe interval. The unit is second. Unless configured manually, the value is 3 seconds by default.</p> <p><b>timeout</b> <i>timeout-value</i>: Indicates the probe timeout of waiting for responses. If no response is received when the timeout is up, it is regarded that the destination is inaccessible. The unit is second. Unless configured manually, the value is 1 second by default.</p> <p><b>retry</b> <i>retry-value</i>: Indicates the probe retries. If the probe packet is sent continually for <i>retry-value</i> times but no response is received, it is regarded that the destination is inaccessible. The unit is times. Unless configured, the value is 3 times by default.</p> <p><i>priority</i>: Indicates the scale of VRRP priority change when the state of a monitored interface changes. The default value is 10.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To monitor a host, specify its IPv4 address for an IPv4 VRRP group. If a VRRP group owns the actual IP address of an Ethernet interface, the group priority is 255, and no monitored IP address can be configured.

↘ **Configuring the IPv4 VRRP Learning Timer**

<b>Command</b>	<b>vrrp group timers learn</b>
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Once the learning timer is enabled on a VRRP router, a Backup router learns the advertisement interval of the Master during the timer. Based on this, the Backup router calculates the interval for determining the Master router as failed instead of using the locally configured advertisement interval. This command achieves synchronization with the learning timer between the Master and Backup routers.

↘ **Configuring the IPv4 VRRP Group Description**

<b>Command</b>	<b>vrrp group description</b> <i>text</i>
<b>Parameter Description</b>	<p><i>group</i>: Indicates the VRID of a VRRP group.</p> <p><i>text</i>: Indicates the description of a VRRP group.</p>
<b>Command Mode</b>	Interface configuration mode

<b>Usage Guide</b>	A VRRP description helps distinguishing VRRP groups.
--------------------	--

### ↘ Configuring the IPv4 VRRP Delay

<b>Command</b>	<code>vrrp delay { minimum <i>min-seconds</i>   reload <i>reload-seconds</i> }</code>
<b>Parameter</b>	<b>minimum</b> <i>min-seconds</i> : Indicates the VRRP delay after an interface state changes.
<b>Description</b>	<b>reload</b> <i>reload-seconds</i> : Indicates the VRRP delay after the system starts.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After the delay is configured for a VRRP group on an interface, the VRRP group starts after the delay instead of immediately upon system startup or the interface's resumption, ensuring non-preemption. If the interface receives a VRRP packet during the delay, the delay will be canceled and the VRRP will be started immediately. The two types of delay share a value range of 0 to 60 seconds. This configuration will be effective for both IPv4 and IPv6 VRRP groups of an interface.

### ↘ Configuring the IPv4 VRRP Version

<b>Command</b>	<code>vrrp group version { 2   3 }</code>
<b>Parameter</b>	<b>2</b> : Indicates VRRPv2.
<b>Description</b>	<b>3</b> : Indicates VRRPv3.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Considering the compatibility between VRRPv2 and VRRPv3, specify a standard for IPv4 VRRP based on the actual network condition. VRRPv2 is developed in RFC3768, while VRRPv3 is described in RFC5798. This command is only applicable to IPv4 VRRP.

### ↘ Specifying a Sub VLAN of a Super VLAN to Receive the IPv4 VRRP Packets

<b>Command</b>	<code>vrrp detection-vlan first-subvlan</code>
<b>Parameter</b>	<b>first-subvlan</b> : Sends IPv4 VRRP packets only to the first UP Sub VLAN interface in a Super VLAN.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to specify a Sub VLAN of a Super VLAN to receive the IPv4 VRRP packets. IPv4 VRRP packets are sent in a Super VLAN using the following two methods. Packets are sent to the first UP Sub VLAN interface in a Super VLAN, or to all the Sub VLAN interfaces in a Super VLAN. If VRRP and VRRP Plus are enabled simultaneously on a Super VLAN interface, sending VRRP packets to the first Up interfaces of the Sub VLANs under the Super VLAN is not supported. This command is configured on a VLAN interface and effective only to Super VLAN interfaces.

### ↘ Configuring the BFD Support for IPv4 VRRP on an Interface

<b>Command</b>	<code>vrrp group bfd <i>ip-address</i></code>
<b>Parameter</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Description</b>	<i>ip-address</i> : Indicates the interface IP address.

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>For a Backup router, run this command to correlate an IPv4 VRRP group with BFD without caring the configured IP address. For the Master, as the primary IP address of a Backup router is not known, the router IP address can only be specified by the administrator.</p> <p>If global IPv4 VRRP BFD is configured, this configuration cannot be performed.</p> <p>To enable the BFD support, make sure that IP and BFD session parameters are configured on the target interface.</p>

↘ **Configuring Global IPv4 VRRP BFD**

<b>Command</b>	<code>vrrp bfd interface-type interface-number ip-address</code>
<b>Parameter</b>	<i>interface-type interface-number</i> : Indicates interface type and ID.
<b>Description</b>	<i>ip-address</i> : Indicates the interface IP address..
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If global IPv4 VRRP BFD is configured, the configured BFD support will be deleted.</p> <p>To enable the BFD support, make sure that IP and BFD session parameters are configured on the target interface.</p> <p>A global IPv4 VRRP BFD session is only applicable to an IPv4 VRRP group consisting of two routers.</p>

**Configuration Example**

↘ **Configuring an IPv4 VRRP Group and Tracked Interface**

<p><b>Scenario</b> Figure 3-4</p>	<p>The diagram illustrates a network topology with three routers (R1, R2, R3) and three workstations (A, B, C) connected to a central Internet cloud. R1 and R2 are connected to WorkStation A and C, while R3 is connected to WorkStation B. The connections are as follows:</p> <ul style="list-style-type: none"> <li><b>R1:</b> Connected to WorkStation A (192.168.201.221/24) via Gi0/0 (192.168.201.217/24). Connected to Internet via Gi 2/1 (202.101.90.63/24).</li> <li><b>R2:</b> Connected to WorkStation C (192.168.201.227/24) via Gi0/0 (192.168.201.213/24). Connected to Internet via Gi 1/1 (60.154.101.3/24).</li> <li><b>R3:</b> Connected to WorkStation B (192.168.12.216/24) via Gi0/0 (192.168.12.0/24). Connected to Internet via Gi 1/1 (60.154.101.5/24).</li> </ul>
---------------------------------------	---

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● The cluster of Work Station A and Work Station B (192.168.201.0/24) uses the virtual IP address 192.168.201.1 of the VRRP group constituted by the routers R1 and R2 as the gateway address to communicate with Work Station B (192.168.12.0 /24).</li> <li>● GigabitEthernet 2/1 on R1 is configured as the tracked interface.</li> <li>● No VRRP but an ordinary routing function is configured on R3.</li> </ul>
<b>R3</b>	<pre> R3#configure terminal  R3(config)#interface GigabitEthernet 0/0  // The command “no switchport” is only required for a switch.  R3(config-if-GigabitEthernet 0/0)#no switchport  R3(config-if-GigabitEthernet 0/0)#ip address 192. 168. 12. 217 255. 255. 255. 0  R3(config-if-GigabitEthernet 0/0)#exit  R3(config)#interface GigabitEthernet 1/1  // The command “no switchport” is only required for a switch. <p><b>Verification</b></p>	<p>Run the <b>show vrrp</b> command to verify the configuration.</p> <ul style="list-style-type: none"> <li>● Check whether R1, which acts as the Master, reduces its VRRP priority from 120 to 90 when GigabitEthernet2/1 connected to the Wide Area Network (WAN) is unavailable. If yes, R2 becomes the Master.</li> <li>● Check whether R1 resumes its VRRP priority from 30 to 120 when GigabitEthernet 2/1 connected to the WAN recovers. If yes, R1 is re-elected as the Master.</li> </ul>
<p><b>R1</b></p>	<pre> R1#show vrrp GigabitEthernet 0/0 - Group 1 State is Master                     </pre>

	<pre>Virtual IP address is 192.168.201.1 configured Virtual MAC address is 0000.5e00.0101 VRRP standard version is V3 Advertisement interval is 3 sec Preemption is enabled   min delay is 0 sec Priority is 120 Master Router is 192.168.201.217 (local), priority is 120 Master Advertisement interval is 3 sec Master Down interval is 10.59 sec Tracking state of 1 interface, 1 up:   up  GigabitEthernet 2/1 priority decrement=30</pre>
<b>R2</b>	<pre>R2#show vrrp GigabitEthernet 0/0 - Group 1 State is Backup Virtual IP address is 192.168.201.1 configured Virtual MAC address is 0000.5e00.0101 VRRP standard version is V3 Advertisement interval is 3 sec Preemption is enabled   min delay is 0 sec Priority is 100 Master Router is 192.168.201.217 , priority is 120 Master Advertisement interval is 3 sec Master Down interval is 10.82 sec</pre>

## Common Errors

- Different virtual IP addresses are configured on the routers in a VRRP group, resulting in multiple Master routers in the group.
- Different VRRP advertisement intervals are configured on the routers in a VRRP group and the learning timer is not configured, resulting in multiple Master routers in the group.
- Different VRRP versions are configured on the routers in a VRRP group, resulting in multiple Master routers in the group.

- For VRRPv2, the Ethernet interfaces of the routers in a VRRP group are all in plain text authentication mode but inconsistent in authentication strings, resulting in multiple Master routers in the group.

## Configuration Example

### Configuring Multiple IPv4 VRRP Groups

<p><b>Scenario</b> Figure 3-5</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● The user workstation cluster (192.168.201.0/24) uses the backup group constituted by the routers R1 and R2. The gateway for partial workstations (A for example) points to the virtual IP address 192.168.201.1 of the backup group 1, while that for other partial workstations (C for example) points to the virtual IP address 192.168.201.2 of the backup group 2. IPv4 multicast routing is enabled on all the routers.</li> <li>● R1 acts as the master router in the group 2 and as a backup router in the group 1.</li> <li>● R2 acts as a backup router in the group 2 and as a master router in the group 1.</li> </ul>
<p><b>R3</b></p>	<pre>R3#configure terminal R3(config)#interface GigabitEthernet 0/0 // The command "no switchport" is only required for a switch. R3(config-if-GigabitEthernet 0/0)#no switchport R3(config-if-GigabitEthernet 0/0)#ip address 192.168.12.217 255.255.255.0</pre>

	<pre>R3(config-if-GigabitEthernet 0/0)#exit R3(config)#interface GigabitEthernet 1/1 // The command “no switchport” is only required for a switch. ```

## 3.4.2 Configuring IPv6 VRRP

### Configuration Effect

- Configure an IPv6 VRRP group on an interface of a specific LAN segment by setting the VRID and virtual IPv6 address.
- Configure multiple IPv6 VRRP groups on an interface to achieve load balance and achieve more stable and reliable network services.
- Configure the VRRP tracked interfaces to monitor real-time failures, change interface priorities and realize master-backup failover dynamically.

### Notes

- To achieve VRRP, the routers in a VRRP group should be configured with the same virtual IPv6 address.
- To achieve mutual backup for multiple IPv6 VRRP backup groups, you need to configure multiple IPv6 VRRP groups with identical VRRP configuration on an interface and configure different priorities for them to make routers master and backup mutually.
- VRRP must be enabled on Layer-3 interfaces.

### Configuration Steps

#### ▾ Enabling IPv6 VRRP

- By default, IPv6 VRRP is not enabled on an interface. You can enable it based on your demand.

#### ▾ Configuring the IPv6 VRRP Advertisement Interval

- By default, the Master router sends advertisement packets every one second. You can modify the interval based on your demand.

#### ▾ Configuring the IPv6 VRRP Preemption Mode

- By default, a VRRP group operates in Preemption mode with a zero-second delay.

#### ▾ Enabling the Accept Mode for an IPv6 VRRP Group

- By default, the Accept mode is disabled for an IPv6 VRRP group. To require an IPv6 VRRP VRRP group in Master state to receive and process packets with the destination IP address as that of the virtual router, enable Accept mode.

#### ↘ [Configuring the IPv6 VRRP Router Priority](#)

- The default router priority for a VRRP group is 100. You can modify the priority based on your demand.

#### ↘ [Configuring the IPv6 VRRP Tracked Interface](#)

- By default, no tracked interface is configured. You can modify the interval based on your demand.

#### ↘ [Configuring the IPv6 VRRP Tracked IP Address](#)

- By default, no tracked IPv6 address is configured and the value of priority change is 10. You can configure this function based on your demand.

#### ↘ [Configures the IPv6 VRRP Learning Timer](#)

- By default, the learning timer is disabled for a VRRP group. Enable this function if the Backup routers need to learn the Master's advertisement interval.

#### ↘ [Configuring the IPv6 VRRP Group Description](#)

- By default, no description is configured for a VRRP group. To distinguish VRRP groups clearly, configure descriptions.

#### ↘ [Configuring the IPv4 VRRP Delay](#)

- By default, the IPv6 VRRP delay is not configured. To guarantee an effective non-preemption mode, configure the delay.

## Verification

- Run the **show vrrp** command to verify the configuration.

## Related Commands

### ↘ [Enabling IPv6 VRRP](#)

<b>Command</b>	<b>vrrp group ipv6</b> <i>ipv6-address</i>
<b>Parameter</b>	<i>group</i> : Indicates the VRID of a VRRP group, the range of which varies with product models.
<b>Description</b>	<i>ipv6-address</i> : Indicates the IPv6 address of a VRRP group.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	IPv6 VRRP groups and IPv4 VRRP groups share a VRID range from 1 to 255. One VRID is applicable to an IPv4 VRRP group and an IPv6 VRRP group at the same time. The first configured address should be a link-local address, which can be deleted only after other virtual addresses.

### ↘ [Configuring the IPv6 VRRP Advertisement Interval](#)

<b>Command</b>	<b>vrrp ipv6 group timers advertise</b> { <i>advertise-interval</i>   <b>csec</b> <i>centisecond-interval</i> }
----------------	---

<b>Parameter Description</b>	<p><i>group</i>: Indicates the VRID of a VRRP group.</p> <p><i>advertise-interval</i>: Indicates the advertisement interval of a VRRP group (unit: second).</p> <p><i>csec centisecond-interval</i>: An interval for a master router in a backup group to send VRRP packets. It is an integer from 50 to 99. The unit is centisecond. No default value is provided. The command is only effective for VRRPv3 packets. If it is configured for VRRPv2 packets, the default interval is one second.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>If a router is elected as the Master in a VRRP group, it sends VRRP advertisement packets at the set interval to announce its VRRP state, priority and other information.</p> <p>According to the RFC standards, if an IPv6 VRRP group adopts VRRPv3 for sending multicast packets, the maximum advertisement interval is 40 seconds. Therefore, if the interval is set longer than 40 seconds, this maximum interval will be applied, though the configuration is effective.</p>

### ↘ Configuring the Preemption Mode

<b>Command</b>	<b>vrrp ipv6 group preempt [ delay seconds ]</b>
<b>Parameter Description</b>	<p><i>group</i>: Indicates the VRID of a VRRP group.</p> <p><b>delay seconds</b>: Indicates the preemption delay for the Master router to claim its status. The default value is 0 second.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>If a VRRP group runs in Preemption mode, a higher priority router will take the place of the lower priority Master. If a VRRP group runs in Non-preemption mode, a router with the priority higher than that of the Master remains Backup. It makes little sense to configure the Preemption mode when the VRRP group uses the IP address of an Ethernet interface, in which case the group has the highest priority and automatically becomes the Master in the group.</p>

### ↘ Enabling the Accept Mode for an IPv6 VRRP Group

<b>Command</b>	<b>vrrp ipv6 group accept_mode</b>
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>By default, an IPv6 VRRP group in <b>Master</b> state is not permitted to receive packets with the destination IPv6 address as that of the VRRP group. However, it receives NA and NS packets no matter whether Accept mode is configured. Besides, the IP Address Owner in Master state receives and processes the packets with the destination IPv6 address as that of the VRRP group no matter whether Accept mode is configured or not.</p>

### ↘ Configuring the IPv6 VRRP Router Priority

<b>Command</b>	<b>vrrp ipv6 group priority level</b>
<b>Parameter</b>	<i>group</i> : Indicates the VRID of a VRRP group.

<b>Description</b>	<i>level</i> : Indicates the priority of a VRRP router.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to manually configure the VRRP router priority.

### 📌 Configuring the IPv6 VRRP Tracked Interface

<b>Command</b>	<b>vrrp ipv6 group track</b> <i>interface-type interface-number</i> [ <i>priority</i> ]
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group. <i>interface-type interface-number</i> : Indicates the interface to be tracked. <i>priority</i> : Indicates the scale of VRRP priority change when the state of a monitored interface changes. The default value is 10.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A tracked interface must be a routable Layer-3 logic interface (for example, a Routed port, an SVI interface, a Loopback interface, or a Tunnel interface). The priority of the router owns the virtual IP address associated with a VRRP group must be 255, and no tracked interface can be configured on it.

### 📌 Configuring the IPv6 VRRP Tracked IP Address

<b>Command</b>	<b>vrrp ipv6 group track</b> { <i>ipv6-global-address</i>   <i>ipv6-linklocal-address</i> <i>interface-type interface-number</i> } [ <b>interval</b> <i>interval-value</i> ] [ <b>timeout</b> <i>timeout-value</i> ] [ <b>retry</b> <i>retry-value</i> ] [ <i>priority</i> ]
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group. <i>ipv6-global-address</i> : Indicates the IPv6 global unicast address. <i>ipv6-linklocal-address</i> : Indicates the IPv6 link-local address. <i>interface-type interface-number</i> : Indicates the interface to be tracked. <b>interval</b> <i>interval-value</i> : Indicates the probe interval. The unit is second. Unless configured manually, the value is 3 seconds by default. <b>timeout</b> <i>timeout-value</i> : Indicates the probe timeout of waiting for responses. If no response is received when the timeout is up, it is regarded that the destination is inaccessible. The unit is second. Unless configured manually, the value is 1 second by default. <b>retry</b> <i>retry-value</i> : Indicates the probe retries. If the probe packet is sent continually for <i>retry-value</i> times but no response is received, it is regarded that the destination is inaccessible. The unit is times. Unless configured, the value is 3 times by default. <i>priority</i> : Indicates the scale of VRRP priority change when the state of a monitored interface changes. The default value is 10.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To monitor a host, specify its IPv6 address for an IPv6 VRRP group. If the host IP address being tracked is a link-local address, specify a network interface. If a VRRP group owns the actual IP address of an Ethernet interface, the group priority is 255, and no monitored IP address can be configured.

### ↘ Configures the IPv6 VRRP Learning Timer

<b>Command</b>	<b>vrrip ipv6 group timers learn</b>
<b>Parameter</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Once the learning timer is enabled on a VRRP router, a Backup router learns the advertisement interval of the Master during the timer. Based on this, the Backup router calculates the interval for determining the Master router as failed instead of using the locally configured advertisement interval. This command achieves synchronization with the learning timer between the Master and Backup routers.

### ↘ Configuring the IPv6 VRRP Group Description

<b>Command</b>	<b>vrrip ipv6 group description text</b>
<b>Parameter</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Description</b>	<i>text</i> : Indicates the description of a VRRP group.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A VRRP description helps distinguishing VRRP groups.

### ↘ Configuring the IPv4 VRRP Delay

<b>Command</b>	<b>vrrip delay { minimum <i>min-seconds</i>   reload <i>reload-seconds</i> }</b>
<b>Parameter</b>	<b>minimum</b> <i>min-seconds</i> : Indicates the VRRP delay after an interface state changes.
<b>Description</b>	<b>reload</b> <i>reload-seconds</i> : Indicates the VRRP delay after the system starts.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After the delay is configured for a VRRP group on an interface, the VRRP group starts after the delay instead of immediately upon system startup or the interface's resumption, ensuring non-preemption. If the interface receives a VRRP packet during the delay, the delay will be canceled and the VRRP will be started immediately. The two types of delay share a value range of 0 to 60 seconds. This configuration will be effective for both IPv4 and IPv6 VRRP groups of an interface.

## Configuration Example

### ↘ Configuring an IPv6 VRRP Group and Tracked Interface

<p><b>Scenario</b> Figure 3-6</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Host A and Host B access the Internet resources through the default gateway 2000::1/64.</li> <li>● Ruijie A and Ruijie B belong to the IPv6 VRRP group 1, and their virtual addresses are 2000::1/64 and FE80::1 respectively.</li> <li>● Ruijie A tracks the interface GigabitEthernet 0/2 connected to the Internet. When GigabitEthernet 0/2 is unavailable, Ruijie A reduces its priority and Ruijie B acts as a gateway.</li> </ul>
<p><b>RuijieA</b></p>	<pre>RuijieA#configure terminal RuijieA(config)#interface GigabitEthernet 0/1 RuijieA(config-if-GigabitEthernet 0/1)#no switchport RuijieA(config-if-GigabitEthernet 0/1)#ipv6 address 2000::2/64 RuijieA(config-if-GigabitEthernet 0/1)#vrrp 1 ipv6 FE80::1 RuijieA(config-if-GigabitEthernet 0/1)#vrrp 1 ipv6 2000::1 RuijieA(config-if-GigabitEthernet 0/1)#vrrp ipv6 1 priority 120 RuijieA(config-if-GigabitEthernet 0/1)#vrrp ipv6 1 timers advertise 3 RuijieA(config-if-GigabitEthernet 0/1)#vrrp ipv6 1 track GigabitEthernet 0/2 50 RuijieA(config-if-GigabitEthernet 0/1)#vrrp ipv6 1 accept_mode</pre>
<p><b>RuijieB</b></p>	<pre>RuijieB#configure terminal RuijieB(config)#interface GigabitEthernet 0/1 RuijieB(config-if-GigabitEthernet 0/1)#no switchport RuijieB(config-if-GigabitEthernet 0/1)#ipv6 address 2000::3/64 RuijieB(config-if-GigabitEthernet 0/1)#vrrp 1 ipv6 FE80::1 RuijieB(config-if-GigabitEthernet 0/1)#vrrp 1 ipv6 2000::1 RuijieB(config-if-GigabitEthernet 0/1)#vrrp ipv6 1 priority 100 RuijieB(config-if-GigabitEthernet 0/1)#vrrp ipv6 1 timers advertise 3 RuijieB(config-if-GigabitEthernet 0/1)#vrrp ipv6 1 accept_mode</pre>

<p><b>Verification</b></p>	<p>Run the <b>show vrrp</b> command to verify the configuration.</p> <ul style="list-style-type: none"> <li>● Check whether Ruijie A, which acts as the Master router, reduces its VRRP group priority from 120 to 70 when it finds that the interface GigabitEthernet 0/2 connected to WAN is unavailable. If yes, Ruijie B becomes the Master.</li> <li>● Check whether Ruijie A increases its VRRP group priority from 50 to 120 when it finds the interface GigabitEthernet 0/2 connected to WAN becomes available again. If yes, Ruijie A becomes the Master again.</li> </ul>
<p><b>RuijieA</b></p>	<pre>RuijieA#show ipv6 vrrp 1 GigabitEthernet 0/1 - Group 1 State is Master Virtual IPv6 address is as follows: FE80::1 2000::1 Virtual MAC address is 0000.5e00.0201 Advertisement interval is 3 sec Accept_Mode is enabled Preemption is enabled min delay is 0 sec Priority is 120 Master Router is FE80::1234 (local), priority is 120 Master Advertisement interval is 3 sec Master Down interval is 10.59 sec Tracking state of 1 interface, 1 up: up GigabitEthernet 0/2 priority decrement=50</pre>

Priority is 120

Master Router is FE80::5678(local), priority is 120

Master Advertisement interval is 3 sec

Master Down interval is 10.59 sec
```

### 3.4.3 Configuring VRRP-MSTP

#### Configuration Effect

- Link-level and gateway-level backup are achieved and network robustness is improved greatly when MSTP and VRRP are applied simultaneously.

#### Notes

- configure the routers in a VRRP backup group with the same virtual IPv4 address.
- Enabled VRRP on a Layer 3 interface.

#### Configuration Steps

##### ▾ Enabling IPv4 VRRP

- By default, IPv4 VRRP is not enabled on an interface. To enable IPv4 VRRP, please configure this item.

### ↘ **Configuring the IPv4 VRRP Authentication String**

- By default, VRRP is in a non-authentication mode. To enable plain text password authentication for VRRP, please configure this item.

### ↘ **Configuring the IPv4 VRRP Advertisement Interval**

- By default, a master router sends VRRP GWADV packets at an interface of one second. To manually set a value, please configure this item.

### ↘ **Configuring the IPv4 VRRP Preemption Mode**

- By default, VRRP groups work in the preemption mode with zero-second delay.

### ↘ **Configuring the IPv4 VRRP Router Priority**

- The default router priority for a VRRP group is 100. You can modify the priority based on your demand.

### ↘ **Configuring the IPv4 VRRP Tracked Interface**

- By default, an IPv4 VRRP group monitors no interface. To achieve fault monitoring through monitoring an interface, please configure this item.

### ↘ **Configuring the IPv4 VRRP Learning Timer**

- By default, timed learning is not enabled for a VRRP backup group. To enable backup routers to learn the VRRP GWADV packets from a master router, please configure this item.

### ↘ **Configuring the IPv4 VRRP Group Description**

- By default, no description is configured for a VRRP group. To distinguish VRRP groups conveniently, please configure this item.

### ↘ **Configuring the IPv4 VRRP Delay**

- By default, the VRRP delay for a VRRP group is not configured. Configure the delay to guarantee a stable transition from Non-preemption mode to Preemption mode.

### ↘ **Configuring the IPv4 VRRP Version**

- By default, the VRRPv2 standard is adopted for IPv4 VRRP packets. To modify it manually, please configure this item.

### ↘ **Specifying a Sub VLAN of a Super VLAN to Receive the IPv4 VRRP Packets**

- By default, IPv4 VRRP packets are only sent to the first UP Sub VLAN interface in a Super VLAN, but you may configure a specific Sub VLAN interface to send such packets.

### ↘ **Configuring the BFD Support for IPv4 VRRP on an Interface**

- By default, the linkage between an IPv4 VRRP and BFD is not configured on an interface. To enable such linkage, please configure this item.

### ↘ Configuring Global IPv4 VRRP BFD

- By default, global IPv4 VRRP BFD is not used to detect whether a master router is active. To enable this, please configure this item.

### Verification

- Run the **show vrrp** command to verify the configuration.

### Related Commands

#### ↘ Enabling IPv4 VRRP

<b>Command</b>	<b>vrrp group ip <i>ipaddress</i> [ <b>secondary</b> ]</b>
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group, the range of which varies with product models. <i>ipaddress</i> : The IP address of a VRRP group. <b>secondary</b> : Indicates the secondary IP address of a VRRP group.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If no virtual IP address is specified, routers cannot join a VRRP group. If no secondary IP address is applied, the configured IP address will be the primary IP address of a VRRP group.

#### ↘ Configuring the IPv4 VRRP Authentication String

<b>Command</b>	<b>vrrp group authentication <i>string</i></b>
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group. <i>string</i> : Indicates the authentication string of a VRRP group (a plain text password consists of 8 bytes at most).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	In a VRRP group, the same authentication password should be configured for routers. The plain text authentication password cannot guarantee security but only prevents/prompts wrong VRRP configurations. This command is only applicable to VRRPv2 instead of VRRPv3.  Authentication is abolished for VRRPv3 (IPv4 VRRP and IPv6 VRRP) packets. If VRRPv2 is chosen for an IPv4 VRRP group, the command is effective; if VRRPv3 is chosen, the command is ineffective.

#### ↘ Configuring the IPv4 VRRP Advertisement Interval

<b>Command</b>	<b>vrrp group timers advertise { <i>advertise-interval</i>   <b>csec</b> <i>centisecond-interval</i> }</b>
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group. <i>advertise-interval</i> : Indicates the advertisement interval of a VRRP group (unit: second). <b>csec</b> <i>centisecond-interval</i> : An interval for a master router in a backup group to send VRRP packets. It is an integer from 50 to 99. The unit is centisecond. No default value is provided. The command is only effective for VRRPv3 packets. If it is configured for VRRPv2 packets, the default interval is one second.
<b>Command</b>	Interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>If a router is elected as the Master in a VRRP group, it sends VRRP advertisement packets at the set interval to announce its VRRP state, priority and other information.</p> <p>According to the RFC standards, if an IPv4 VRRP group adopts VRRPv3 for sending multicast packets, the maximum advertisement interval is 40 seconds. Therefore, if the interval is set longer than 40 seconds, this maximum interval will be applied, though the configuration is effective.</p>

### ▾ Configuring the IPv4 VRRP Preemption Mode

<b>Command</b>	<b>vrrp group preempt [ delay seconds ]</b>
<b>Parameter</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Description</b>	<b>delay seconds</b> : Indicates the preemption delay for the Master router to claim its status. The default value is 0 second.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>If a VRRP group runs in Preemption mode, a higher priority router will take the place of the lower priority Master. If a VRRP group runs in Non-preemption mode, a router with the priority higher than that of the Master remains Backup. It makes little sense to configure the Preemption mode when the VRRP group uses the IP address of an Ethernet interface, in which case the group has the highest priority and automatically becomes the Master in the group.</p>

### ▾ Configuring the IPv4 VRRP Router Priority

<b>Command</b>	<b>vrrp group priority level</b>
<b>Parameter</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Description</b>	<i>level</i> : Indicates the priority of an interface in a VRRP group.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to manually configure the priority of a VRRP group.

### ▾ Configuring the IPv4 VRRP Tracked Interface

<b>Command</b>	<b>vrrp group track { interface-type interface-number   bfd interface-type interface-number ipv4-address } [ priority ]</b>
<b>Parameter</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Description</b>	<p><i>interface-type interface-number</i>: Indicates the interface to be tracked.</p> <p><b>bfd interface-type interface-number ipv4-address</b>: A specified adjacent IP address tracked through BFD.</p> <p><i>priority</i>: Indicates the scale of VRRP priority change when the state of a monitored interface changes. The default value is 10.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>A tracked interface must be a routable Layer-3 logic interface (for example, a Routed port, an SVI interface, a Loopback interface, or a Tunnel interface).</p> <p>The priority of the router owns the virtual IP address associated with a VRRP group must be 255, and no</p>

	tracked interface can be configured on it.
--	--

➤ **Configuring the IPv4 VRRP Tracked IP Address**

<b>Command</b>	<code>vrrp group track ipv4-address [ interval interval-value ] [ timeout timeout-value ] [ retry retry-value ] [ priority ]</code>
<b>Parameter Description</b>	<p><i>group</i>: Indicates the VRID of a VRRP group.</p> <p><i>ipv4-address</i>: Indicates the IPv4 address to be tracked.</p> <p><i>interval interval-value</i>: Indicates the probe interval. The unit is second. Unless configured manually, the value is 3 seconds by default.</p> <p><i>timeout timeout-value</i>: Indicates the probe timeout of waiting for responses. If no response is received when the timeout is up, it is regarded that the destination is inaccessible. The unit is second. Unless configured manually, the value is 1 second by default.</p> <p><i>retry retry-value</i>: Indicates the probe retries. If the probe packet is sent continually for retry-value times but no response is received, it is regarded that the destination is inaccessible. The unit is times. Unless configured, the value is 3 times by default.</p> <p><i>priority</i>: Indicates the scale of VRRP priority change when the state of a monitored interface changes. The default value is 10.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>To monitor a host, specify its IPv4 address for an IPv4 VRRP group.</p> <p>If a VRRP group owns the actual IP address of an Ethernet interface, the group priority is 255, and no monitored IP address can be configured.</p>

➤ **Configuring the IPv4 VRRP Learning Timer**

<b>Command</b>	<code>vrrp group timers learn</code>
<b>Parameter Description</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Once the learning timer is enabled on a VRRP router, a Backup router learns the advertisement interval of the Master during the timer. Based on this, the Backup router calculates the interval for determining the Master router as failed instead of using the locally configured advertisement interval. This command achieves synchronization with the learning timer between the Master and Backup routers.

➤ **Configuring the IPv4 VRRP Group Description**

<b>Command</b>	<code>vrrp group description text</code>
<b>Parameter Description</b>	<p><i>group</i>: Indicates the VRID of a VRRP group.</p> <p><i>text</i>: Indicates the description of a VRRP group.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A VRRP description helps distinguishing VRRP groups.

### ↘ Configuring the IPv4 VRRP Delay

<b>Command</b>	<code>vrrp delay { minimum <i>min-seconds</i>   reload <i>reload-seconds</i> }</code>
<b>Parameter</b>	<b>minimum</b> <i>min-seconds</i> : Indicates the VRRP delay after an interface state changes.
<b>Description</b>	<b>reload</b> <i>reload-seconds</i> : Indicates the VRRP delay after the system starts.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After the delay is configured for a VRRP group on an interface, the VRRP group starts after the delay instead of immediately upon system startup or the interface's resumption, ensuring non-preemption. If the interface receives a VRRP packet during the delay, the delay will be canceled and the VRRP will be started immediately. The two types of delay share a value range of 0 to 60 seconds. This configuration will be effective for both IPv4 and IPv6 VRRP groups of an interface.

### ↘ Configuring the IPv4 VRRP Version

<b>Command</b>	<code>vrrp group version { 2   3 }</code>
<b>Parameter</b>	<b>2</b> : Indicates VRRPv2.
<b>Description</b>	<b>3</b> : Indicates VRRPv3.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Considering the compatibility between VRRPv2 and VRRPv3, specify a standard for IPv4 VRRP based on the actual network condition. VRRPv2 is developed in RFC3768, while VRRPv3 is described in RFC5798. This command is only applicable to IPv4 VRRP.

### ↘ Specifying a Sub VLAN of a Super VLAN to Receive the IPv4 VRRP Packets

<b>Command</b>	<code>vrrp detection-vlan first-subvlan</code>
<b>Parameter</b>	<b>first-subvlan</b> : Sends IPv4 VRRP packets only to the first UP Sub VLAN interface in a Super VLAN.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to specify a Sub VLAN of a Super VLAN to receive the IPv4 VRRP packets. IPv4 VRRP packets are sent in a Super VLAN using the following two methods. Packets are sent to the first UP Sub VLAN interface in a Super VLAN, or to all the Sub VLAN interfaces in a Super VLAN. If both VRRP and VRRP PLUS are enabled on a Super VLAN interface, sending VRRP packets to the first UP Sub VLAN interfaces of the Super VLAN interface is not supported. This command is configured on a VLAN interface and effective only to Super VLAN interfaces.

### ↘ Configuring the BFD Support for IPv4 VRRP on an Interface

<b>Command</b>	<code>vrrp group bfd ip-address</code>
<b>Parameter</b>	<i>group</i> : Indicates the VRID of a VRRP group.
<b>Description</b>	<i>ip-address</i> : Indicates the interface IP address.
<b>Command Mode</b>	Interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>For a Backup router, run this command to correlate an IPv4 VRRP group with BFD without caring the configured IP address. For the Master, as the primary IP address of a Backup router is not known, the router IP address can only be specified by the administrator.</p> <p>If global IPv4 VRRP BFD is configured, this configuration cannot be performed.</p> <p>To enable the BFD support, make sure that IP and BFD session parameters are configured on the target interface.</p>

↘ **Configuring Global IPv4 VRRP BFD**

<b>Command</b>	<code>vrrp bfd interface-type interface-number ip-address</code>
<b>Parameter</b>	<i>interface-type interface-number</i> : Indicates interface type and ID.
<b>Description</b>	<i>ip-address</i> : Indicates the interface IP address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If global IPv4 VRRP BFD is configured, the configured BFD support will be deleted.</p> <p>To enable the BFD support, make sure that IP and BFD session parameters are configured on the target interface.</p> <p>A global IPv4 VRRP BFD session is only applicable to an IPv4 VRRP group consisting of two routers.</p>

**Configuration Example**

↘ **Configuring VRRP+MSTP**

<b>Scenario</b> Figure 3-8	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable MSTP on routers (switches A, B, C, D, E and F in this example). Configure VLAN-Instance mapping (mapping VLAN 10 and VLAN 20 to Instance 1, VLAN 30 and VLAN 40 to Instance 2, and the rest VLANs to Instance 0), and configure gateways (Switch A and Switch B in this example) as the root bridges of corresponding instances.</li> <li>● Add the SVIs of all VLANs to corresponding VRRP backup groups, and configure gateways as the</li> </ul>

master and backup routers for corresponding backup groups See configuration details in the following table.

Gateway	VLAN ID	SVI	Backup Group	Virtual IP Address	State
Switch A	10	192.168.10.2	VRRP 10	192.168.10.1	Master
Switch B		192.168.10.3			Backup
Switch A	20	192.168.20.2	VRRP 20	192.168.20.1	Master
Switch B		192.168.20.3			Backup
Switch A	30	192.168.30.2	VRRP 30	192.168.30.1	Backup
Switch B		192.168.30.3			Master
Switch A	40	192.168.40.2	VRRP 40	192.168.40.1	Backup
Switch B		192.168.40.3			Master

- Configure the uplink port (port Gi 0/1 of Switch A and Switch B) of master routers as a monitored interface of master router.
- Step 1: Create VLAN. Create VLAN 10, VLAN 20, VLAN 30 and VLAN 40 respectively on Switch A and Switch B.
- Step 2: Configure MST regions. Map VLAN 10 and VLAN 20 to Instance 1, VLAN 30 and VLAN 40 to Instance 2, and the rest VLANs to Instance 0.
- Step 3: Configure Switch A as the root bridge for MST 0 and MST 1, and Switch B as the root bridge for MST 2.
- Step 4: Enable MSTP.
- Step 5: Configure SVIs of all the VLANs, add the SVIs to corresponding backup groups, and configure virtual IP addresses for the groups. See configuration in the above table.
- Step 6: Configure master routers and backup routers for all the groups.
- Step 7: Configure the uplink ports of master routers as monitored ports of VRRP groups. Caution: Monitored ports should be Layer 3 ports.

Step 8: Configure the Internet interfaces of the core routers as AP interfaces.

**Switch A**

```
//Create VLAN 10, VLAN 20, VLAN 30 and VLAN 40 on Switch A.
SwitchA#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchA(config)#vlan range 10,20,30,40
SwitchA(config-vlan-range)#exit

//Map VLAN 10 and VLAN 20 to Instance 1, VLAN 30 and VLAN 40 to Instance 2, and the rest VLANs to Instance 0.

## 4 Configuring VRRP Plus

### 4.1 Overview

Virtual Router Redundancy Protocol Plus (VRRP Plus) is an extension of VRRP. It uses VRRP to implement gateway backup and load balancing in the IEEE 802.3 local area network (LAN).

A disadvantage of VRRP is that the router in backup state cannot forward packets. To use VRRP to implement load balancing, you need to manually configure multiple VRRP groups and set the gateway addresses of hosts in the LAN to virtual IP addresses of different VRRP groups. This increases the workload of the network administrator. VRRP Plus is designed to address this issue.

With VRRP Plus, load balancing is automatically implemented. That is, traffic of different hosts is automatically distributed to members of the VRRP Plus group, and it is unnecessary to configure multiple VRRP groups or set the gateway addresses of hosts in the LAN to virtual IP addresses of different VRRP groups. This greatly reduces the workload of the network administrator.

### 4.2 Applications

Application	Description
<a href="#">Enabling Load Balancing Within a VRRP Group</a>	Implement load balancing within a VRRP group without configuring multiple groups or configuring different default gateways for hosts.

#### 4.2.1 Enabling Load Balancing Within a VRRP Group

##### Scenario

Enable load balancing within a VRRP group without configuring without configuring multiple VRRP groups or configuring different default gateways for hosts.

As shown in Figure 4-1, configure data as follows:

- Configure a VRRP group that consists of Router A and Router B, and enable the VRRP Plus function.
- Configure the default gateway of each host as the master virtual IP address of the VRRP group.

Figure 4-1 Application topology of IPv4 VRRP Plus

1. Two layer-3 (L3) devices, Router A and Router B, form a VRRP Plus group, and the virtual IP address of the group is 192.168.12.1. Router A is the master device of VRRP and functions as a balancing virtual gateway (BVG). Router B is the backup device of VRRP and functions as a balancing virtual forwarder (BVF).
2. Host 1 to Host 4 are hosts in the LAN with the network segment 192.168.12.0/24. Their default gateway addresses are set to the virtual IP address 192.168.12.1 of the VRRP Plus group.
3. The load balancing policy is configured on the device to respond to the ARP requests sent from different hosts. For example, when Host 1 and Host 2 request the gateway ARP, the MAC address 0000.5e00.0101 is returned to Host 1 and Host 2. When Host 3 and Host 4 request the gateway ARP, the MAC address 001A.A916.0201 is returned to Host 3 and Host 4. In this way, packets exchanged between Host 1/Host 2 and the external network are sent to Router A, and packets exchanged between Host 3/Host 4 and the external network are sent to Router B, thereby implementing load balancing.

## 4.3 Features

### Basic Concepts

#### ↳ BVG

The BVG allocates virtual MAC addresses to members of the VRRP Plus group. It responds to the gateway ARP requests in the LAN, and forwards packets of hosts in the LAN.

#### ↳ BVF

The BVF forwards packets of hosts in the LAN. If a virtual MAC address is allocated to a BVF, the BVF participates in packet forwarding; otherwise, the BVF does not participate in packet forwarding.

## Overview

Feature	Description
<a href="#">VRRP Plus</a>	Extend VRRP and use VRRP to implement gateway backup and load balancing in the IEEE 802.3 LAN.

### 4.3.1 VRRP Plus

With VRRP Plus, load balancing is automatically implemented. That is, traffic of different hosts is automatically distributed to members of the VRRP Plus group, and it is unnecessary to configure multiple VRRP groups or set the gateway addresses of hosts in the LAN to the virtual IPv4 addresses of different VRRP groups.

#### Basic Principles

Hosts in a LAN use the unified gateway IPv4 address (that is, virtual IP address of the VRRP group). When different hosts request the gateway ARP, the BVG responds with different virtual MAC addresses. In this way, traffic of different hosts are distributed to different members of the VRRP Plus group, thereby implementing load balancing.

##### Relationship Between VRRP Plus and VRRP

VRRP Plus relies on VRRP, and runs in the following way:

A master device in VRRP corresponds to a BVG in VRRP Plus, and a backup device in VRRP corresponds to a BVF in VRRP Plus. Gateway addresses of hosts in the LAN are set to the virtual IPv4 address of VRRP.

##### MAC Address Allocation Rules of the BVG and BVF

The BVG allocates virtual MAC addresses to BVFs. For an IPv4 VRRP Plus group, the BVG directly uses the virtual MAC address of VRRP to ensure compatibility between IPv4 VRRP Plus and VRRP. That is, the virtual MAC address used by the BVG is 00-00-5E-00-01- $\{VRID\}$ , where VRID is the VRRP group number. The virtual MAC address used by a BVF is 00-1A-A9-16- $\{MemberID\}$ - $\{VRID\}$ , where MemberID is the member ID of the BVF in the VRRP Plus group. Currently, a VRRP Plus group can have up to four members. The BVG uses the member ID 01, and the other BVFs use the member IDs 02 to 04.

##### Load Balancing Policy of VRRP Plus

The BVG responds to the gateway ARP requests sent from hosts in a LAN. Based on the specific load balancing policy, the BVG responds hosts with different virtual MAC addresses. There are three types of load balancing policies:

- Host-dependent policy: A specified virtual MAC address is used to respond to the requests sent by aspecified host.
- Round-robin policy: Virtual MAC addresses in the backup group are used in a cyclic manner to respond to the gateway ARP requests sent by hosts.
- Weighted policy: The ARP requests are responded based on the forwarding capability of each device.

If the load balancing mode is changed, load balancing is always implemented in the new load balancing mode. For example, if the polling response mode is previously used, and later the weighted mode is used, load balancing is implemented in weighted mode regardless of the earlier responses of the device. If the weighted policy is used, and the total weight of virtual routers in a VRRP Plus group is 0, the ARP requests are not responded.

➤ Proxy of the Virtual MAC Address

When a device with a virtual MAC address becomes faulty in the backup group, traffic of hosts that use this virtual MAC address as the gateway MAC address will be interrupted.

The BVG in the VRRP Plus backup group can quickly detect the fault, and automatically allocates the virtual MAC address of the faulty BVF to another device in the backup group. The new device acts as the proxy of the faulty device to forward packets of the virtual MAC address. In addition, this proxy device takes over traffic of original hosts to prevent traffic interruption. The virtual MAC address allocated to a device in the backup group can be called master virtual MAC address, and the virtual MAC address used by this device on behalf of another device is called proxy virtual MAC address.

➤ Redirection Time and Timeout of the Proxy Virtual MAC Address

VRRP Plus provides the proxy function for the virtual MAC address so that another device can take the place of a faulty device with a virtual MAC address to forward packets. If the BVF is recovered from the fault, its forwarding role is recovered and the BVF continues to forward packets of the virtual MAC address allocated to this BVF. If the faulty BVF is not recovered, the backup group stops redirecting traffic to this virtual MAC address. That is, when ARP requests are received again, this virtual MAC address is no longer responded. After a sufficient long period of time, it is believed that hosts that use the MAC address as the gateway MAC address already update the ARP table entry of the gateway address, and the traffic is already taken over by other devices. At this time, this virtual MAC address can be deleted, and packets sent to this virtual MAC address are dropped.

VRRP Plus supports configuration of the redirection time and timeout of the backup group. When a device is faulty, the backup group allocates the virtual MAC address of the faulty device to another device. Within the redirection time, the backup group continues to use this virtual MAC address to respond the ARP requests. When the redirection time expires, the backup group no longer uses this virtual MAC address to respond the requests. When the timeout elapses, the backup group deletes this virtual MAC address and stops using this virtual MAC address for proxy forwarding. Figure 4-2 shows the changes to the role of the virtual MAC address within the redirection time and timeout.

Figure 4-2 Changes to the Role of the Virtual MAC Address Within the Redirection Time and Timeout

➤ Weight-based Forwarding

VRRP Plus supports the weight configuration of the backup group. Different weights are configured for different devices. In this way, more traffic is distributed to the device with a greater weight and less traffic is distributed to the device with a smaller weight, thereby fully utilizing the forwarding performance of different devices. When the weight of a BVF in the backup group is smaller than the lower threshold, the BVF automatically exits from the forwarding role. When the weight recovers and is greater than the upper threshold, the BVF automatically applies for the forwarding role. The forwarding role can be recovered when one or more remaining virtual MAC addresses or proxy virtual MAC addresses exist.

### ↘ Association of VRRP Plus with BFD

VRRP Plus supports association with bidirectional forwarding detection (BFD) to adjust the weight based on the link status. Each device in a backup group can associate its weight with the link status. When a link is abnormal or interrupted, the device automatically decreases its weight. When the weight is too low, the device automatically exits from the forwarding role. If the backup group is currently using the weighted load balancing policy, traffic can be distributed based on the new weight. When the associated link recovers, the device can automatically restore its original weight and the forwarding role. If the backup group is currently using the weighted load balancing policy, traffic can be distributed based on the recovered weight.

### ↘ Weight-based Forwarding Seizure

VRRP Plus supports the function of seizing the forwarding role. In VRRP Plus, at most four devices can participate in load balancing. That is, a VRRP Plus backup group generates at most four virtual MAC addresses. If more than four devices are added to a VRRP Plus group, only four devices participate in packet forwarding. The remaining devices only listen to the status of other devices and do not participate in packet forwarding. Only when a device participating in packet forwarding is faulty, another device that originally does not participate in packet forwarding will take the place of the faulty device to forward packets. Assume that a VRRP Plus backup group already has four devices and all these devices participate in packet forwarding; a fifth device is added to the VRRP Plus group, and the forwarding capability of this device is strong or the original forwarding role encounters a link failure and consequently degradation of forwarding performance. In this case, if the seizure mode is enabled, the fifth device can seize the forwarding role from a device with a smaller weight (that is, with lower forwarding capability). A greater weight is configured for a device with stronger forwarding capability. When the weight of a device in listening state is found greater than that of a forwarding device, the device in listening state automatically seizes the forwarding role from the forwarding device. That is, the device with stronger forwarding capability forwards packets, whereas the device with lower forwarding capability is in listening state. This can minimize the waste of resources.

The BVG in a backup group is responsible for allocation of virtual MAC addresses. Therefore, the BVG role cannot be seized, and only the forwarding role of a BVF can be seized. If the BVG device is faulty, VRRP re-elects a new master device, which assumes the BVG role.

### ↘ Factors Affecting the Forwarding Policy

1. After VRRP Plus is configured, the ARP requests are received from hosts can be responded based on different load balancing policies to implement load balancing among these hosts. However, load balancing cannot be implemented for hosts that have learned the VRRP virtual gateway addresses before configuration of VRRP Plus. Therefore, if VRRP Plus is configured after the VRRP state is changed to Master, real load balancing cannot be implemented before aging of the ARP learned by hosts. Load balancing is implemented only after the gateway ARP recorded by the hosts age and the hosts request for new gateway addresses.

2. Periodical sending of gratuitous ARPs on an interface also affect the load balancing function of VRRP Plus. When VRRP Plus is enabled, the function of sending gratuitous ARPs of VRRP virtual IP addresses will be disabled. When an virtual IP address overlaps with an actual IP address, gratuitous ARPs of this address are no longer sent.
3. When an address conflict occurs between a host and the local device, the ARP module will broadcast gratuitous ARP packets of this address. If a conflict of the VRRP Plus virtual address occurs, sending gratuitous ARP packet will result re-learning of the host's gateway MAC address, which negatively affects the load balancing function of VRRP Plus. Therefore, the load balancing function of VRRP Plus is currently not supported in this scenario.

## 4.4 Configuration

Configuration Item	Description and Command	
<a href="#">Configuring VRRP Plus</a>	 (Mandatory) It is used to enable the VRRP Plus function.	
	<b>vrrp balance</b>	Enables the VRRP Plus function of a VRRP backup group with the specified group ID in interface configuration mode.
	 (Optional) It is used to configure parameters of a VRRP Plus backup group.	
	<b>vrrp load-balancing</b>	Configures the load balancing policy of VRRP Plus in interface configuration mode.
	<b>vrrp timers redirect</b>	Configures the redirection time and timeout of the proxy virtual MAC address in a VRRP Plus backup group in interface configuration mode.
	<b>vrrp weighting</b>	Configures the weight and upper and lower thresholds of a VRRP Plus backup group in interface configuration mode.
	<b>vrrp forwarder preempt</b>	Configures the forwarding seizure function of a VRRP Plus backup group in interface configuration mode.

### 4.4.1 Configure VRRP Plus

#### Configuration Effect

- Enable the VRRP Plus function. (By default, this function is disabled.)

#### Notes

- To enable the VRRP Plus function, you must configure the VRRP virtual IP address for the corresponding backup group.

#### Configuration Steps

##### ▾ Enabling VRRP Plus

- By default, VRRP Plus is enabled. Perform this configuration if VRRP Plus is required.

➤ **Configuring the Load Balancing Policy of VRRP Plus**

- After VRRP Plus is enabled, the host-dependent load balancing policy is used by default.

➤ **Configuring the Redirection Time and Timeout of the Proxy Virtual MAC Address in a VRRP Plus Backup Group**

- After VRRP Plus is enabled, the redirection time is set to 300s and timeout is set to 14,400s by default.

➤ **Configuring the Weight and Upper and Lower Thresholds of a VRRP Plus Backup Group**

- After VRRP Plus is enabled, the weight of the backup group is set to 100, the lower threshold to 1, and the upper threshold to 100 by default.

➤ **Configuring the Forwarding Seizure Function of a VRRP Plus Backup Group**

- After VRRP Plus is enabled, the forwarding seizure function is enabled by default.

**Verification**

- Run the **show [ ipv6 ]group vrrp balance** command to display the VRRP backup group configuration. If the backup group has the packet forwarding tasks, "local" is displayed in the **forwarders** column, and the virtual MAC address allocated to this backup group is also displayed.

**Related Commands**

➤ **Enabling VRRP Plus on an Interface**

<b>Command</b>	<b>vrrp group balance</b>
<b>Parameter Description</b>	<i>group</i> : Indicates the ID of the VRRP group. The value range of the group ID varies according to the product model.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	VRRP Plus can be enabled only after a VRRP group is configured.

➤ **Configuring the Load Balancing Policy of a VRRP Plus Backup Group**

<b>Command</b>	<b>vrrp group load-balancing{host-dependent   round-robin   weighted }</b>
<b>Parameter Description</b>	<i>group</i> : Indicates the ID of the VRRP group. <b>host-dependent</b> : Indicates the host-dependent load balancing policy. <b>round-robin</b> : Indicates the round-robin load balancing policy. <b>weighted</b> : Indicates the weighted load balancing policy.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After VRRP Plus is enabled, the host-dependent load balancing policy is used by default. The load balancing policy of the entire backup group is determined by the policy configured on the BVG. If you wish to use the same load balancing policy after the role of the BVG device changes, configure the same policy on all devices in the backup group.

### 📌 Configuring the Redirection Time and Timeout of the Proxy Virtual MAC Address in a VRRP Plus Backup Group

<b>Command</b>	<code>vrrp group timers redirect redirect timeout</code>
<b>Parameter Description</b>	<p><i>group</i>: Indicates the ID of the VRRP group.</p> <p><i>redirect</i>: Indicates the redirection time. The value ranges from 0 to 3,600s. The default value is 300s, that is, 5 minutes.</p> <p><i>timeout</i>: Indicates the timeout time. The value ranges from (redirect + 600) to 64,800s. The default value is 14400, that is, 4 hours.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After VRRP Plus is enabled, the redirection time is set to 300s and timeout is set to 14,400s by default. When a device is faulty, the backup group allocates the virtual MAC address of the faulty device to another device. Within the redirection time, the backup group continues to use this virtual MAC address to respond the ARP requests. When the redirection time expires, the backup group no longer uses this virtual MAC address to respond the requests. When the timeout elapses, the backup group deletes this virtual MAC address.

### 📌 Configuring the Weight and Upper and Lower Thresholds of a VRRP Plus Backup Group

<b>Command</b>	<code>vrrp group weighting maximum [ lower lower ] [ upper upper ]</code>
<b>Parameter Description</b>	<p><i>maximum</i>: Indicates the weight of the backup group. The value ranges from 2 to 254. The default value is 100.</p> <p><b>lower lower</b>: Indicates the lower threshold of the backup group. The value ranges from 1 to (<b>maximum</b> - 1). The default value is 1.</p> <p><b>upper upper</b>: Indicates the upper threshold of the backup group. The value ranges from <b>lower</b> to <b>maximum</b>. The default value is 100.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After VRRP Plus is enabled, the weight and upper and lower thresholds of a VRRP Plus backup group are configured by default. You can use this command to configure different weights for different devices so that more traffic is distributed to the device with a greater weight and less traffic is distributed to the device with a smaller weight. When the weight of a BVF in the backup group is lower than the lower threshold, the BVF automatically exits from the forwarding role. When the weight recovers and is higher than the upper threshold, the forwarding role of the BVF is automatically restored.

### 📌 Configuring the Forwarding Seizure Function of a VRRP Plus Backup Group

<b>Command</b>	<code>vrrp group forwarder preempt</code>
<b>Parameter Description</b>	<i>group</i> : Indicates the ID of the VRRP group.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After VRRP Plus is enabled, the forwarding seizure function is enabled by default. VRRP Plus supports

configuration of the forwarding seizure function of a backup group. When the weight of a device in listening state is found greater than that of a forwarding device, the device in listening state automatically seizes the forwarding role from the forwarding device. That is, the device with stronger forwarding capability forwards packets, whereas the device with lower forwarding capability is in listening state.

### Configuration Example

#### Enabling Load Balancing Within an IPv4 VRRP Group

<p><b>Scenario</b></p> <p>Figure 4-3</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Configure a VRRP group and enable VRRP Plus respectively on Router A and Router B. Configure the local IP addresses so that Router A becomes a BVG (master) device, and Router B becomes a BVF (backup) device.</li> <li>Retain default configurations of the weight, upper and lower thresholds, redirection time, timeout, and forwarding seizure of the backup group.</li> <li>Set the default gateway addresses of Host 1 to Host 4 in the LAN to the virtual IP address of VRRP, that is, 192.168.12.1.</li> </ul>
<p><b>Router A</b></p>	<pre>RuijieA#config RuijieA(config)#interface GigabitEthernet0/0 // 'no switchport' is used on the switch. RuijieA(config-if-GigabitEthernet 0/0)#no switchport RuijieA(config-if-GigabitEthernet 0/0)#ip address 192.168.12.3 255.255.255.0 RuijieA(config-if-GigabitEthernet 0/0)#vrrp 1 ip 192.168.12.1 RuijieA(config-if-GigabitEthernet 0/0)#vrrp 1 balance RuijieA(config-if-GigabitEthernet 0/0)#vrrp 1 load-balancing weighted</pre>
<p><b>Router B</b></p>	<pre>RuijieB#config</pre>

	<pre>RuijieB(config)#interface GigabitEthernet0/0 RuijieB(config-if-GigabitEthernet 0/0)#no switchport RuijieB(config-if-GigabitEthernet 0/0)#ip address 192.168.12.2 255.255.255.0 RuijieB(config-if-GigabitEthernet 0/0)#vrrp 1 ip 192.168.12.1 RuijieB(config-if-GigabitEthernet 0/0)#vrrp 1 balance RuijieB(config-if-GigabitEthernet 0/0)#vrrp 1 load-balancing weighted</pre>
<p><b>Verification</b></p>	<p>Run the <b>show vrrp balance</b> command to display the configuration of the VRRP Plus group. If the backup group has the packet forwarding tasks, "local" is displayed in the <b>forwarders</b> column, and the virtual MAC address allocated to this backup group is also displayed.</p>
<p><b>Router A</b></p>	<pre>RuijieA# show vrrp balance interface GigabitEthernet0/0 State is BVG Virtual IP address is 192.168.12.1 Hello time 1 sec, hold time 3 sec Load balancing: weighted Redirect time 300 sec, forwarder time-out 14400 sec Weighting 100 (configured 100), thresholds: lower 1, upper 100 There are 2 forwarders Forwarder 1 (local) MAC address: 0000.5e00.0101 Owner ID is 0000.0001.0006 Preemption disabled (BVG cannot be preempted) Forwarder 2 MAC address: 001a.a916.0201 Owner ID is 00d0.f822.33a3 Preemption enabled</pre>
<p><b>Router B</b></p>	<pre>RuijieB# show vrrp balance interface GigabitEthernet0/0 State is BVF Virtual IP address is 192.168.12.1 Hello time 1 sec, hold time 3 sec</pre>

```

Load balancing: weighted

Redirect time 300 sec, forwarder time-out 14400 sec

Weighting 100 (configured 100), thresholds: lower 1, upper 100

    There are 2 forwarders

Forwarder 1

    MAC address:

        0000.5e00.0101

    Owner ID is 0000.0001.0006

    Preemption disabled (BVG cannot be preempted)

Forwarder 2 (local)

    MAC address:

        001a.a916.0201

    Owner ID is 00d0.f822.33a3

    Preemption enabled
    
```

### Common Errors

- VRRP Plus does not take effect because the VRRP virtual IP address is not configured for the related group.

## 4.5 Monitoring

### Displaying

Description	Command
Displays the brief or detailed configuration of VRRP Plus.	<b>show vrrp balance</b>
Displays the actions of the VRRP Plus group on a specified interface.	<b>show vrrp balance interface</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the VRRP Plus function.	<b>debug vrrp balance</b>
Debugs errors.	<b>debug vrrp balance error</b>
Debugs events of the VRRP Plus group.	<b>debug vrrp balance event</b>
Debugs the messages between the VRRP	<b>debug vrrp balance messages</b>

Description	Command
module and the track module.	
Debugs the VRRP Plus packets.	<b>debug vrrp balance packets</b>
Debugs the VRRP Plus group status.	<b>debug vrrp balance state</b>
Debugs the timers of the VRRP Plus group.	<b>debug vrrp balance timer</b>

## 5 Configuring BFD

### 5.1 Overview

Communication failures will interrupt networking and thus affect services. Therefore, it is essential to rapidly locate communication failures on links with adjacent devices to ensure a timely action and service availability. Bidirectional Forwarding Detection (BFD) provides a method of rapidly detecting connectivity of the forwarding path between two adjacent routers in an underloaded way. It can quickly spot faults on the bidirectional forwarding path between two routers for upper-layer protocols such as routing protocols and Multi-Protocol Label Switching (MPLS). As a result, a standby forwarding path is adopted to maintain the performance of the existing network.

#### Protocols and Standards

- draft-ietf-bfd-base-09: Bidirectional Forwarding Detection
- draft-ietf-bfd-generic-05: Generic Application of BFD
- draft-ietf-bfd-v4v6-1hop-09: BFD for IPv4 and IPv6 (Single Hop)
- draft-ietf-bfd-mpls-07: BFD For MPLS LSPs

### 5.2 Applications

Application	Description
<a href="#">BFD Support for OSPF</a>	OSPF utilizes BFD to rapidly detect the neighbor status.
<a href="#">BFD Support for Static Routing</a>	Static routing utilizes BFD to rapidly detect the next-hop reachability of a route.

#### 5.2.1 BFD Support for OSPF

##### Scenario

The Open Shortest Path First (OSPF) protocol dynamically discovers a neighbor by using hello packets. After BFD is enabled, a BFD session is established with the neighbor in the full adjacency to detect the neighbor status. When the neighbor fails, OSPF immediately performs network convergence. The convergence time can be shortened from 120 seconds (by default, on a non-broadcast network, OSPF hello packets are transmitted at an interval of 30 seconds and the neighbor failure time is four times the interval, that is, 120 seconds) to 1 second.

Use the following figure as an example. Router A and Router B are connected through a Layer-2 switch, OSPF is configured on the routers to establish routes, and BFD support for OSPF is enabled on the interfaces of Router A and Router B. When the link between Router B and the Layer-2 switch malfunctions, BFD can rapidly detect the fault and advertise it to OSPF, so as to trigger fast OSPF convergence.

Figure 5-1

<b>Remarks</b>	A and B are routers. Switch is a Layer-2 switch. A and B are connected through the Layer-2 switch.
----------------	--

### Deployment

- Configure IP addresses for interconnected interfaces of Router A and Router B.
- Run OSPF on Router A and Router B.
- Set BFD parameters on interconnected interfaces of Router A and Router B.
- Enable BFD support for OSPF on Router A and Router B.

## 5.2.2 BFD Support for Static Routing

### Scenario

BFD support for static routing prevents routers from selecting a faulty static route as the forwarding path and enables rapid routing failover by using an available backup forwarding path.

Different from dynamic routing protocols, static routing does not have the neighbor discovery (ND) mechanism. When BFD support for static routing is configured, the next-hop reachability of a static route relies on the BFD session status. If a BFD session fails, the next hop of a static route is thought unreachable and will not be added to the routing information base (RIB).

Use the following figure as an example. Router A and Router B are connected through a Layer-2 switch, static routing is configured on the routers to establish forwarding paths, and BFD support for static routing is enabled on the interfaces of Router A and Router B. When the link between Router B and the Layer-2 switch malfunctions, BFD can rapidly detect the fault and advertise it to static routing, so as to trigger the system to delete the static route from the RIB, thereby preventing routing errors.

Figure 5-2

<b>Remarks</b>	A and B are routers. Switch is a Layer-2 switch. A and B are connected through the Layer-2 switch.
----------------	--

## Deployment

- Configure IP addresses for interconnected interfaces of Router A and Router B.
- Configure static routing on Router A and Router B.
- Set BFD parameters for interconnected interfaces of Router A and Router B.
- Enable BFD support for static routing on Router A and Router B.

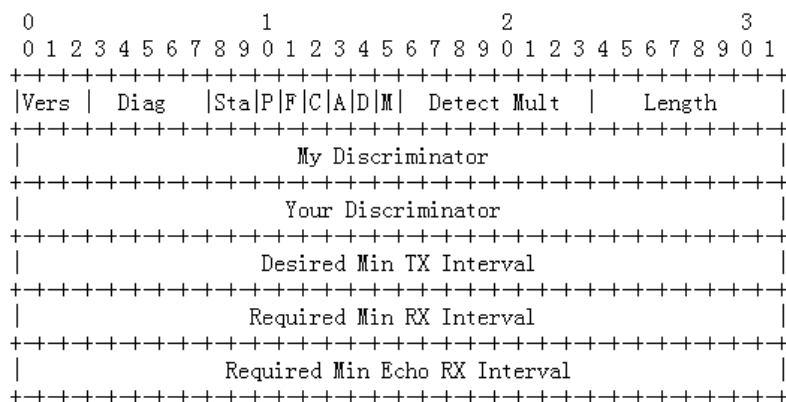

## 5.3 Features

### Basic Concepts

#### Packet Format

Detection packets transmitted by BFD are User Datagram Protocol (UDP) packets, which are classified into control packets and echo packets. Echo packets concern only the local system of a BFD session. Therefore, their formats are not specified. BFD specifies the format of only control packets. Currently, there are two versions (version 0 and version 1) for the format of control packets. Version 1 is adopted by default for establishing a BFD session. If a device receives packets of version 0 from the peer system, the device automatically switches to version 0.

Figure 5-3

Field	Description
Vers	Indicates the BFD protocol version number, which is 1 currently.
Diag	Indicates the cause for the local system's last change in session state, including: 0 -- No Diagnostic. 1 -- Control Detection Time Expired 2 -- Echo Function Failed 3 -- Neighbor Signaled Session Down 4 -- Forwarding Plane Reset 5 --Path Down 6 -- Concatenated Path Down

Field	Description
	7 --Administratively Down
Sta	Indicates the BFD local session state, including: 0 -- AdminDown. 1 -- Down. 2 -- Init. 3 -- Up.
P	Indicates that the transmitter in a BFD session adds this bit in a verification request upon parameter changes, waiting for the peer response.
F	Indicates the bit that must be set in the response packet for responding to the P bit.
C	Indicates the control plane independent. If set, changes of the control plane do not affect BFD detection. For example, if the control plane is OSPF, when OSPF is restarted or experiences graceful restart (GR), BFD can continue to detect the link status.
A	Indicates the authentication present. If set, a session is to be authenticated.
D	Indicates the demand request. If set, the transmitter desires to detect links in Demand mode.
M	Indicates the multipoint bit to be used in point-to-multipoint extensions. It must be set to 0 currently.
Detect Mult	Indicates the detection timeout multiplier. It is used by the detector to calculate the detection timeout time.
Length	Indicates the packet length.
My Discriminator	Indicates the discriminator of the local end connected by a BFD session.
Your Discriminator	Indicates the discriminator of the remote end connected by a BFD session.
Desired Min Tx Interval	Indicates the minimum interval of transmitting BFD packets supported by the local end.
Required Min RX Interval	Indicates the minimum interval of receiving BFD packets supported by the local end.
Required Min Echo RX Interval	Indicates the minimum interval of receiving echo packets supported by the local end. It is set to 0 if the local end does not support the echo function.
Auth Type	(Optional) Indicates the authentication type, including: Simple Password Keyed MD5 Meticulous Keyed MD5 Keyed SHA1 Meticulous Keyed SHA1
Auth Length	Indicates the authentication data length.
Authentication Data	Indicates the authentication data area.

## 📌 Session Status

A BFD session can be in any of the four basic states: Down, Init, Up, and AdminDown.

1. Down: Indicates that a session is in the Down state or is established just now.
2. Init: Indicates that the local system has communicated with the peer system and desires to bring the session to the Up state.

- 3. Up: Indicates that a session has been negotiated successfully.
- 4. AdminDown: Indicates that a session is in the AdminDown state.

BFD migrates the state machine based on the local session state and received BFD packets from the peer end.

A BFD state machine is established and torn down using a three-way handshake mechanism, to ensure that both ends know the status change.

↳ **Transmission Interval and Detection Time**

Both ends negotiate BFD parameters during the establishment of a BFD session, to determine the transmission interval and detection time.

After a BFD session is established, both ends can dynamically negotiate BFD parameters (for example, minimum transmission interval and minimum receiving interval). After protocols at both ends transmit relevant negotiation packets, they adopt the new transmission interval and detection time, without affecting the current state of the session.

**Overview**

Feature	Description
<a href="#">BFD Session Establishment</a>	Establishes a BFD session.
<a href="#">BFD Session Detection</a>	Rapidly detects a bidirectional forwarding path.
<a href="#">BFD Support for Applications</a>	Rapidly advertises the BFD detection result.
<a href="#">BFD Protection</a>	Protects BFD from attacks for stability.
<a href="#">BFD Flapping Dampening</a>	Protects stability of associated applications in the case of line instability.

**5.3.1 BFD Session Establishment**

BFD detection starts from the establishment of a BFD session.

**Working Principle**

↳ **Session Establishment Process**

BFD itself is unable to discover neighbors. It needs an upper-layer protocol to specify a neighbor to establish a session.

As shown in the following figure, two routers running OSPF and BFD are connected through a Layer-2 switch.

Figure 5-4

BFD session establishment process:

1. OSPF discovers a neighbor and establishes a connection with the neighbor.
2. OSPF instructs BFD to establish a session with the neighbor.
3. BFD establishes a session with the neighbor.

#### ↘ BFD Session Establishment Mode

The BFD protocol specifies that a BFD session can be established in two modes:

- Active mode

Before the establishment of a session, BFD actively transmits a control packet for establishing a BFD session regardless of whether it receives a control packet for establishing a BFD session from the peer end.

- Passive mode

BFD does not actively transmit a control packet for establishing a BFD session before a session is established but wait till it receives a control packet for establishing a BFD session from the peer end.

---

**i** The passive mode is not supported currently.

---

#### ↘ Negotiation of BFD Session Parameters

Both ends negotiate BFD session parameters during the establishment of a BFD session, to determine the transmission interval and detection time. Pay attention to the following points:

1. BFD session parameters (including **Desired Min Tx Interval**, **Required Min RX Interval**, and **Detect Mult**) must be set for interfaces at both ends. Otherwise, a BFD session cannot be established.
2. Interfaces at both ends negotiate BFD session parameters and detect the session based on the parameters during the establishment of a BFD session.
3. After a BFD session is established, both ends can dynamically negotiate BFD parameters (for example, minimum transmission interval and minimum receiving interval). After protocols at both ends transmit relevant negotiation packets, they adopt the new transmission interval and detection time, without affecting the current state of the session.

## 5.3.2 BFD Session Detection

Link detection starts after the establishment of a BFD session. BFD periodically transmits BFD control packets. If it fails to receive BFD packets from the peer end within the detection time, it deems that the session is Down and notifies the associated application to accelerate the convergence.

### Working Principle

---

#### ↘ Detection Process

As shown in the following figure, two routers running OSPF and BFD are connected through a Layer-2 switch.

Figure 5-5

Handling procedure after a BFD session is Down:

1. The link between Router A and Switch fails.
2. The BFD session between Router A and Router B is Down.
3. BFD notifies the local OSPF that the forwarding path to the neighbor is faulty.
4. OSPF processes the neighbor Down situation. If a backup forwarding path is available, it starts protocol convergence to enable the alternative forwarding path.

### ↘ Detection Mode

BFD supports the following detection modes:

- Asynchronous mode

In asynchronous mode, systems transmit BFD control packets periodically to each other. If a system fails to receive BFD control packets from the peer end within the detection time, it advertises that the session is Down.

- Query mode

In query mode, it is assumed that each system has an independent method for confirming its connection with other systems. After a BFD session is established, the system stops transmitting BFD control packets unless it needs to explicitly verify the connectivity. In such a case, the system transmits a shot-sequence BFD control packet. If a system fails to receive a returned packet within the detection time, it advertises that the session is Down. If it receives a response from the peer end, the forwarding path is reachable.

- Echo mode

In echo mode, the local system periodically transmits BFD echo packets and a remote system receives and loops back the packets through the forwarding path. If the local system fails to receive several consecutive echo packets within the detection time, it advertises that the session is Down. The echo function can be used together the preceding two detection modes. The echo packet detection function does not require the involvement of the control plane of the remote system. Packets are returned by the forwarding plane of the remote system, which reduces the delay and ensures faster fault detection in comparison with transmission of control packets. The enabling of the echo function in asynchronous mode can greatly reduce transmission of control packets because the detection is accomplished by the echo function. The enabling of the echo function in query mode can thoroughly cancel transmission of control packets after a session is established. The echo function must be enabled at both ends of a BFD session. Otherwise, the echo function does not take effect.

**i** The query mode is not supported and cannot be configured at present.

**i** Only BFD session version 1 supports the BFD echo mode.

- 
- **i** The echo mode is not supported for an IPv6 BFD session with the link-local address as the source or destination address.
- 

### 5.3.3 BFD Support for Applications

By BFD support, the associated applications can utilize the fast fault detection of BFD to improve the protocol convergence performance. In general, the fault detection time can be shortened within 1 second.

#### Working Principle

---

After BFD support for a certain application is enabled, a BFD session is established based on the BFD configuration. When a link fault occurs, BFD can rapidly identify the fault and notify the associated application to process, thereby improving its convergence. Currently, BFD supports the following applications:

- BFD support for RIP

After BFD support for the Routing Information Protocol (RIP) is enabled, RIP can utilize the BFD fault detection, which is faster than the ND mechanism of RIP, to improve the protocol convergence. In general, the fault detection time can be shortened within 1 second.

- 
- **i** For more details about BFD support for RIP, see *Configuring RIP*.
- 

- BFD support for OSPF

After BFD support for OSPF is enabled, OSPF can utilize the BFD fault detection, which is faster than the ND mechanism of OSPF, to improve the protocol convergence. In general, the fault detection time can be shortened within 1 second.

- 
- **i** For more details about BFD support for OSPF, see *Configuring OSPF*.
- 

- BFD support for OSPFv3

After BFD support for OSPFv3 is enabled, OSPFv3 can utilize the BFD fault detection, which is faster than the ND mechanism of OSPFv3, to improve the protocol convergence. In general, the fault detection time can be shortened within 1 second.

- 
- **i** For more details about BFD support for OSPFv3, see *Configuring OSPFv3*.
- 

- BFD support for BGP

After BFD support for the Border Gateway Protocol (BGP) is enabled, BGP can utilize the BFD fault detection, which is faster than the ND mechanism of BGP, to improve the protocol convergence. In general, the fault detection time can be shortened within 1 second.

- 
- **i** For more details about BFD support for BGP, see *Configuring BGP*.
- 

- BFD support for IS-IS

The Intermediate System to Intermediate System (IS-IS) protocol dynamically discovers a neighbor by using hello packets. After BFD is enabled, IS-IS uses BFD to establish a BFD session with a neighbor that is in the Up state and detect the neighbor status. When a BFD neighbor fails, IS-IS immediately performs network convergence. The convergence time can be shortened from 30 seconds (by default, on a point-to-point network, IS-IS hello packets are

transmitted at an interval of 10 seconds and the neighbor failure time is triple the interval, that is, 30 seconds) to 1 second.

---

 For more details about BFD support for IS-IS, see *Configuring IS-IS*.

---

- BFD support for static routing

After BFD support for static routing is enabled, BFD prevents routers from selecting an unavailable static route as the forwarding path during routing and enables routers to rapidly switch to an available backup forwarding path.

Different from dynamic routing protocols, static routing does not have the ND mechanism. Therefore, after BFD support for static routing is configured, the next-hop reachability of a static route relies on the BFD session state. If a BFD session detects a fault, the next hop of a static route is unreachable and the static route is not added to the RIB.

If the remote system deletes a BFD session during the establishment of a BFD session, the BFD session becomes Down. In this case, the system ensures that the forwarding behavior of static routing is not affected.

---

 For more details about BFD support for static routing, see *Configuring NSM*.

---

- BFD support for PBR

After BFD support for PBR is configured, BFD prevents routers from selecting an unavailable policy route as the forwarding path during routing and enables routers to rapidly switch to an available backup forwarding path.

BFD support for PBR is equivalent to that for static routing. BFD tracks and detects the forwarding path to a specified neighbor. When a BFD session fails, BFD notifies the PBR that the next hop is unreachable. Then, the policy route to the next hop does not take effect.

If the remote system deletes a BFD session during the establishment of a BFD session, the BFD session becomes Down. In this case, the system ensures that the PBR forwarding behavior is not affected.

---

 For more details about BFD support for PBR, see *Configuring PBR*.

---

- BFD support for VRRP

The BFD support for the Virtual Router Redundancy Protocol (VRRP) can replace the ND mechanism of VRRP to rapidly detect the running status of the active and standby routers. When a fault occurs, it accelerates the active/standby router switching and improves network performance. In general, the fault detection time can be shortened within 1 second.

VRRP can also utilize BFD to track a specified neighbor. If the forwarding path to the neighbor fails during a BFD session, it automatically lowers the VRRP priority to a certain extent to trigger active/standby router switching. This configuration takes effect only when the dynamic routing protocol or other applications notify BFD to establish a session with a neighbor.

---

 For more details about BFD support for VRRP, see *Configuring VRRP*.

---

- BFD support for VRRP Plus

The BFD support for VRRP Plus can replace the BVF detection conducted by the balancing virtual gateway (BVG) of VRRP Plus to rapidly detect the running status of balancing virtual functions (BVs). When a fault occurs, it accelerates the forwarding entity switching and improves network performance. In general, the fault detection time can be shortened within 1 second.

VRRP Plus is based on the VRRP protocol. Therefore, no additional configuration is required for BFD support and only VRRP needs to be enabled on devices at both ends and a BFD session is correctly associated.

---

 For more details about BFD support for VRRP Plus, see *Configuring VRRP Plus*.

---

- BFD support for MPLS

The BFD support for Multiple protocol Label Switching (MPLS) refers that label switched paths (LSPs) use BFD to rapidly detect the neighbor status. The following detection modes are supported:

1. BFD detects static LSPs.
2. BFD detects LSPs generated by the Label Distribution Protocol (LDP).
3. BFD can detect reverse links of LSPs by using the IP protocols.

---

 For more details about BFD support for MPLS, see *Configuring MPLS*.

---

- BFD support for Layer-3 interfaces

BFD supports changing status of Layer-3 interfaces. In interface configuration mode, use the **bfd bind peer-ip** command to detect the direct address of a specified Layer-3 interface. After this CLI command is executed, a BFD session is created and the status of a Layer-3 interface can be changed based on the detection result of the BFD session, for example, BFD Down or BFD Up. This function is often used in various types of fast reroute (FRR), which uses BFD to detect the interface status to implement fast FRR switching.

---

 Only LDP FRR switching is supported in BFD support for Layer-3 interfaces.

---

### 5.3.4 BFD Protection

The BFD protection is used to protect BFD against session flapping caused by attacks (for example, a large number of ping packets attack devices).

#### Working Principle

The BFD protocol is very sensitive. If a BFD-enabled device is attacked (for example, attacked by a large number of ping packets) and BFD sessions flap, the BFD protection can be configured to provide protection. If both BFD and BFD protection are enabled on a device, the device discards the BFD packet from the previous hop, affecting the establishment of a BFD session between the previous-hop device and other devices.

### 5.3.5 BFD Flapping Dampening

A BFD session may frequently switch over between Down and Up due to link instability. As a result, an associated application (such as static routing) may frequently switch forwarding paths and the running services are affected. The BFD flapping dampening can solve this problem.

#### Working Principle

A BFD session may frequently switch over between Down and Up. This function allows users to set the delay for status change advertisement. After a BFD session is Up for a certain period of time, BFD notifies an associated application of BFD Up. Otherwise, BFD notifies an associated application of BFD Down.

## 5.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring BFD Basic Functions</a>	 (Mandatory) It is used to establish a BFD session.	
	<b>bfd interval</b>	Sets BFD parameters.
	N/A	Configures the BFD support for applications.  The configuration command varies with the associated applications. For details, see their configuration guides.
	 (Optional) It is used to configure the BFD detection mode, slow timer, and BDF support for Layer-3 interfaces.	
	<b>bfd echo</b>	Configures the BFD echo mode.
	<b>bfd slow-timer</b>	Configures the BFD slow timer.
	<b>bfd bind peer-ip</b>	Configures the BFD support for Layer-3 interfaces.
<a href="#">Configuring BFD Protection</a>	 (Optional) It is used to protect BFD against attacks. 	
	<b>bfd cpp</b>	Enables BFD protection.
<a href="#">Configuring BFD Flapping Dampening</a>	 (Optional) It is used to protect associated protocols against BFD flapping.	
	<b>bfd up-dampening</b>	Configures BFD flapping dampening.

### 5.4.1 Configuring BFD Basic Functions

#### Configuration Effect

- Configure BFD support for applications.
- Establish a BFD session.
- A BFD session detects link faults.

#### Notes

- Pay attention to the following points when setting BFD session parameters:
  1. It is recommended that parameter settings be consistent at both ends of a BFD session, to ensure that application protocols associated with BFD take effect simultaneously and prevent occurrence of one-way forwarding due to different dampening time at both ends.
  2. Take into account of transmission bandwidth differences of different interfaces when setting parameters. If the minimum transmission interval and minimum receiving interval are set to very small values, data transmission may be affected due to very large BFD bandwidth occupancy.

- Pay attention to the following points when configuring BFD support for applications:
  1. Ensure that it is enabled on neighbors of a BFD session. Otherwise, a BFD session cannot be established. If a dynamic routing protocol or another application requires BFD to establish a session with a neighbor, the BFD session can also be established.
  2. If the interface specified by a BFD session is different from the actual BFD packet outbound interface because of IP routing, or if the interface specified during BFD session creation is different from the actual BFD packet inbound interface, a BFD session cannot be established.
- Pay attention to the following points when configuring the BFD detection mode:
  1. In the process that the forwarding plane of the peer device returns echo packets transmitted by the local end to the local end, the echo packets may be lost due to congestion of the peer device, causing a session detection failure. In this case, configure Quality of Service (QoS) policies to ensure that echo packets are processed preferentially or disable the echo function.
  2. The echo detection function of BFD does not support multi-hop detection. Ensure that the echo function is disabled when configuring multi-hops.
  3. The echo mode takes effect only after this mode is enabled at both ends of a BFD session.
  4. Before enabling the echo mode of BFD, run the **no ip redirects** command on the neighbors of a BFD session to disable the function of ICMP packet redirection, and run the **no ip deny land** command to disable the Distributed Denial of Service (DDoS) function (prevent the Land-based attack).

## Configuration Steps

### ▾ Setting BFD Parameters

- Mandatory.
- BFD parameters need to be set at BFD session egresses of routers at both ends detected by BFD if no special requirements are raised.
- Take into account of transmission bandwidth differences of different interfaces when setting parameters. If the minimum transmission interval and minimum receiving interval are set to very small values, data transmission may be affected due to very large BFD bandwidth occupancy.

<b>Command</b>	<b>bfd interval</b> <i>milliseconds</i> <b>min_rx</b> <i>milliseconds</i> <b>multiplier</b> <i>interval-multiplier</i>
<b>Parameter Description</b>	<b>interval</b> <i>milliseconds</i> : Indicates the minimum TX interval, with the unit of milliseconds. <b>min_rx</b> <i>milliseconds</i> : Indicates the minimum RX interval, with the unit of milliseconds. <b>multiplier</b> <i>interval-multiplier</i> : Indicates the detection timeout multiplier.
<b>Defaults</b>	No BFD session parameter is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The fast forwarding function must be enabled before the BFD function is enabled on routers. This command must not be configured on the L3 AP ports.

### ▾ Enabling the BFD Echo Mode

- (Optional) Ports run in asynchronous mode by default. If a BFD session needs to run in echo mode, the echo mode needs to be configured.
- Complete the configuration on ports of switches or routers.
- A session runs in asynchronous mode as long as either of routers at both ends is configured to run in asynchronous mode. If routers at both ends are configured to run in echo mode by default, a BFD session finally runs in echo mode.

<b>Command</b>	<b>bfd echo</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	The BFD echo mode is disabled.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>This command cannot be configured on Layer-3 AP interfaces.</p> <p>By default, when BFD session parameters are set, the system automatically enables the echo mode.</p> <p>The minimum TX interval and minimum RX interval of echo packets adopt the <b>Interval milliseconds</b> and <b>min_rx milliseconds</b> parameters of a session.</p> <p>Before enabling the echo mode of BFD, run the <b>no ip redirects</b> command on the neighbors of a BFD session to disable the function of ICMP packet redirection, and run the <b>no ip deny land</b> command to disable the Distributed Denial of Service (DDoS) function (prevent the Land-based attack).</p>

### ↘ Configuring the BFD Slow Timer

- (Optional) The default slow timer is 3,000 milliseconds. The value can be changed as required.
- Configure this function in global configuration mode of switches or routers.
- In BFD echo mode or session building, the slow timer is used to control packets. If the value increases, the required time for negotiating and establishing a BFD session becomes longer, and the time required for transmitting slow BFD packets in echo mode is longer.

<b>Command</b>	<b>bfd slow-timer [ milliseconds ]</b>
<b>Parameter</b>	<i>milliseconds</i> : Indicates the BFD slow timer, with the unit of milliseconds. The value ranges from 1,000 to 30,000 and the default value 3,000 is adopted if it is not set.
<b>Description</b>	
<b>Defaults</b>	The transmission interval of slow control packets is 3,000 milliseconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to specify the slow timer in echo mode.

### ↘ Configuring the BFD Support for Layer-3 Interfaces

- (Optional) Currently, this function is used only when MPLS LDP is used for FRR.
- Configure this function on interfaces of switches or routers.

<b>Command</b>	<b>bfd bind peer-ip src-address [source-ip dst-address] process-pst</b>
<b>Parameter</b>	<i>src-address</i> : Indicates the peer IP address of an interface.

<b>Description</b>	<i>dst-address</i> : Indicates the local IP address of an interface.
<b>Defaults</b>	BFD support for Layer-3 interfaces is not configured by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to enable BFD support for Layer-3 interfaces so as to rapidly detect connectivity of Layer-3 interfaces.

### ↘ Configuring the BFD Support for Applications

- Mandatory.
- This function is disabled by default.
- The configuration command varies with the associated applications. For details, see their configuration guides.
- This function must be configured at both ends so that a BFD session can be established.
- In RIP routing configuration mode, run the **bfd all interfaces** command to enable BFD support for RIP on all interfaces. For details, see *Configuring RIP*.
- In OSPF routing configuration mode, run the **bfd all interfaces** command to enable BFD support for OSPF on all interfaces. For details, see *Configuring OSPF*.
- In OSPFv3 routing configuration mode, run the **bfd all interfaces** command to enable BFD support for OSPFv3 on all interfaces. For details, see *Configuring OSPFv3*.
- In BGP routing configuration mode, run the **neighbor address fall-over bfd** command to enable BFD support for BGP. For details, see *Configuring BGP*.
- In IS-IS routing configuration mode, run the **bfd all interfaces** command to enable BFD support for IS-IS on all interfaces. For details, see *Configuring IS-IS*.
- In global configuration mode, run the **ip route static bfd [ vrf vrf-name ] interface-type interface-number gateway [ source ip-address ]** command to enable BFD support for static routing. For details, see *Configuring NSM*.
- In global configuration mode, run the **ipv6 route static bfd [ vrf vrf-name ] interface-type interface-number gateway [ source ip-address ]** command to enable BFD support for IPv6 static routing. For details, see *Configuring NSM*.
- Run the **set ip next-hop verify-availability next-hop-address bfd [ vrf vrf-name ] interface-type interface-number gateway** command to enable BFD support for PBR. For details, see *Configuring PBR*.
- Run the **set ipv6 next-hop verify-availability next-hop-address bfd [ vrf vrf-name ] interface-type interface-number gateway** command to enable BFD support for IPv6 PBR. For details, see *Configuring PBR*.
- Run the **vrrp bfd interface-type interface-number ip-address** command to enable BFD support for VRRP. For details, see *Configuring VRRP*.
- VRRP Plus is based on the VRRP protocol. Therefore, no additional configuration is required for BFD support for VRRP Plus. Only VRRP needs to be enabled on devices at both ends and a BFD session is correctly associated.

- Run the **bfd bind static-lsp peer-ip** *ip-address* **source-ip** *ip-address* [ **local-discriminator** *discr-value* **remote-discriminator** *discr-value* ] [ **process-state** ] command to enable BFD support for static LSP. For details, see *Configuring MPLS*.
- Run the **bfd bind ldp-lsp peer-ip** *ip-address* **nexthop** *ip-address* [ **interface** *interface-type interface-number* ] **source-ip** *ip-address* [ **local-discriminator** *discr-value* **remote-discriminator** *discr-value* ] [ **process-state** ] command to enable BFD for LDP LSP. For details, see *Configuring MPLS*.
- Run the **bfd bind backward-lsp-with-ip peer-ip** *ip-address* [ **vrf** *vrf-name* ] **interface** *interface-type interface-number* [ **source-ip** *ip-address* ] { **local-discriminator** *discr-value* **remote-discriminator** *discr-value* } command to enable BFD support for dynamic LSP. For details, see *Configuring MPLS*.

### Verification

- The verification command varies with the associated applications. For details, see their configuration guides.

### Configuration Example

#### Configuring BFD support for OSPF

<p><b>Scenario</b> Figure 5-6</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IP addresses for interconnected interfaces of Router A and Router B.</li> <li>● Run OSPF on Router A and Router B.</li> <li>● Set BFD parameters for interconnected interfaces of Router A and Router B.</li> <li>● Enable BFD support for OSPF on Router A and Router B.</li> </ul>
<p><b>A</b></p>	<pre>A#configure terminal A(config)#interface GigabitEthernet2/1 A(config-if-GigabitEthernet2/1)# no switchport //The configuration is not required on routers. **Common Errors**

- BFD parameters are not set for device interfaces at one end.
- The BFD support for applications is disabled.
- The BFD support for applications is enabled only at one end.

## 5.4.2 Configuring BFD Protection

### Configuration Effect

- If a BFD-enabled device is attacked (for example, attacked by a large number of ping packets) and BFD session flaps accordingly, the BFD protection can be enabled to provide protection.

### Notes

- The BFD basic functions must be configured.
- If both BFD and BFD protection are enabled on a device, the device discards the BFD packet from the previous hop, affecting the establishment of a BFD session between the previous-hop device and other devices.
- This function and limitations are applicable only to switches.

### Configuration Steps

#### ▾ Enabling BFD Protection

- Optional.
- Configure this function in global configuration mode on switches or routers.
- The BFD protection function raises the processing priority of BFD packets and ensures normal running of BFD services in a scenario in which devices are attacked.

<b>Command</b>	<b>bfd cpp</b>
<b>Parameter</b>	<b>N/A</b>
<b>Description</b>	
<b>Defaults</b>	The BFD protection function is enabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Enable the BFD protection function to provide protection if a device encounters BFD flapping due to attacks.

### Verification

Run the **show running-config** command to verify the configuration on an interface.

### Configuration Example

#### ▾ Enabling BFD Protection

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure this function on a switch on a network where attacks exist.</li> <li>● Configure the BFD protection function.</li> </ul>
----------------------------	---

	<pre>Ruijie#configure terminal Ruijie(config)# bfd cpp Ruijie(config)# end</pre>
<b>Verification</b>	N/A

### 5.4.3 Configuring BFD Flapping Dampening

#### Configuration Effect

- A BFD session may frequently switch over between Down and Up due to link instability. As a result, a relevant application (such as static routing) may frequently switch forwarding paths and the running services are affected.
- Users can set the delay for status change advertisement, after which BFD notifies an associated application of BFD Up. After a BFD session is Up for a certain period of time, BFD notifies an associated application of BFD Up. Otherwise, BFD notifies it of BFD Down. The purpose is to reduce flapping of associated protocols caused by instable links.

#### Notes

- The BFD basic functions must be configured.
- If a BFD session does not frequently switch over between Down and Up, the enabling of BFD flapping dampening will delay notifying an associated application of BFD Up.

#### Configuration Steps

##### ▾ Configuring BFD Flapping Dampening

- (Optional) The BFD flapping dampening is disabled on ports by default. If a BFD session frequently switches over between Down and Up, it is advised to enable this function.
- Configure this function on ports of switches or routers.
- With BFD flapping dampening enabled, it is relieved that associated applications, such as route re-calculation, process quantities of advertisements because of frequent status BFD change. The larger the configured time is, the longer the required BFD stability time is. BFD notifies an application module of BFD Up only after the stability time reaches the configured time.

<b>Command</b>	<b>bfd up-dampening</b> <i>[milliseconds]</i>
<b>Parameter Description</b>	<i>milliseconds</i> : Indicates the delay for status change advertisement, after which BFD notifies an associated application of BFD Up, with the unit of milliseconds. The value ranges from 0 to 300,000. The value 0 indicates that BFD notifies the application layer immediately when a session switches over from Down to Up and the default value is 0.
<b>Defaults</b>	The BFD flapping dampening function is disabled by default.
<b>Command Mode</b>	Interface configuration mode

<b>Usage Guide</b>	This function needs to be enabled only when the link is instable. If a BFD session does not frequently switch over between Down and Up, the enabling of BFD flapping dampening will delay notifying an associated application of BFD Up.
--------------------	---

## Verification

Run the **show running-config** command to verify the configuration on an interface.

## Configuration Example

### Configuring BFD Flapping Dampening with the Advertisement Delay as 60,000 Milliseconds

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure this function in an environment where BFD frequent flaps due to link instability.</li> <li>Set the delay for status change advertisement to 60,000 milliseconds.</li> </ul>
	<pre>Ruijie#configure terminal Ruijie(config)# interface fastEthernet 0/2 Ruijie(config)# bfd up-dampening 60000 Ruijie(config)# end</pre>
<b>Verification</b>	N/A

## 5.5 Monitoring

### Displaying

Description	Command
Displays BFD session information.	<b>show bfd neighbors</b> [ <i>vrf vrf-name</i> ] [ <i>client</i> { <i>bgp ospf rip vrrp static-route</i>   <i>pbr vrrp-balance</i>   <i>ldp-lsp</i>   <i>static-lsp</i>   <i>backward-lsp-with-ip</i>   <i>pst</i> } ] [ <i>ipv4 ip-address</i>   <i>ipv6 ip-address</i> ][ <i>details</i> ]

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs BFD events.	<b>debug bfd event</b> [ <i>interface interface-type interface-number</i>   <i>ipv4 ip-address</i>   <i>ipv6 ipv6-address</i> ]
Debugs BFD packets.	<b>debug bfd packet</b> [ <i>interface interface-type interface-number</i>   <i>ipv4 ip-address</i>   <i>ipv6 ipv6-address</i> ]

## 6 Configuring IP Event Dampening

### 6.1 Overview

When the Layer-3 port on a Layer-3 device frequently goes Up and Down due to manual enabling/disabling or other external causes, the routing table on the device will flap repeatedly. If a routing protocol is configured, the protocol may propagate the flap to the entire network, causing repeated updates and recalculation of neighboring routes, which wastes network bandwidths and destabilizes the network. Repeated route updates and recalculation on devices consume many CPU resources, which affects the normal running of customer networks.

IP Event Dampening detects abnormal Up/Down flapping and automatically suppresses frequent port state changes, which prevents the propagation of single-point link failures by a routing protocol. When the port is restored, it will be automatically unsuppressed, thus reducing network flaps and CPU resource consumption while improving network stability.

#### Protocols and Standards

- RFC2439: BGP Route Flap Dampening

**i** At its core, the suppression algorithm used by IP Event Dampening is the same as that used by BGP Route Flap Dampening.

### 6.2 Applications

Application	Description
<a href="#">Routed Port Flap Dampening</a>	Monitors the state change of the Layer-3 port on a router, and suppresses frequent port flapping.

#### 6.2.1 Routed Port Flap Dampening

##### Scenario

In a network that runs a routing protocol, when a port on a router connected to another router frequently goes Up and Down, neighboring routes will be repeatedly updated and recalculated. The routing protocol may propagate the flap to the entire network, causing a network flap. IP Event Dampening can be enabled on the connected routers to monitor port state changes and suppress frequent port flapping, thus reducing network flaps and CPU resource consumption while improving network stability.

Figure 6-1

<b>Remarks</b>	A and B are routers.
----------------	----------------------

## Deployment

Configure IP Event Dampening on portGE0/1 on Router A and portGE0/1 on Router B respectively.

 The subinterfaces and the virtual templates of interfaces on routers do not support the dampening feature.

## 6.3 Features

### Basic Concepts

#### ↳ Penalty

A port that goes Up or Down gets a penalty for each state change, but the penalty decays exponentially when the port is stable. In this way, port behaviors can be sensed and controlled intelligently.

#### ↳ Suppress Threshold

When the cumulative penalty of a port exceeds a suppress threshold, the port is considered to flap and will be suppressed.

#### ↳ Half-Life Period

The half-life period is the period required for the penalty to decrease to half of the original value when the port is stable. It defines the speed at which the penalty decays exponentially. The shorter the half-life period, the faster the penalty decays, and the faster the port is detected to be stable, but the flap detection sensitivity is reduced.

#### ↳ Reuse Threshold

When the port no longer flaps and its penalty decays to a certain degree (below the suppress threshold), the port is considered to be stable and is unsuppressed.

#### ↳ Maximum Suppress Time

When a port keeps flapping and reaches a very large penalty, the port will not be usable for a long time. To avoid this problem, the maximum suppress time is defined to always maintain the port suppression duration below a certain value no matter how long the port has flapped.

### Overview

Feature	Description
<a href="#">Port Flap Suppression</a>	Configure the criteria and parameters of flap suppression on ports to enable switches to identify and suppress frequently flapping ports, which ensures route stability and avoids route flap propagation.

### 6.3.1 Port Flap Suppression

#### Working Principle

A port configured with IP Event Dampening is assigned a penalty. The port gets a penalty of 1,000 each time when it goes Down, but the penalty decreases with time. If the port goes Down again, the penalty increases accordingly. When the cumulative penalty exceeds the suppress threshold, the port will be suppressed. For the affected upper-layer protocol, the suppressed port is always Down no matter what the actual port state is. When the penalty decreases to the reuse threshold, the port will be unsuppressed, and the upper-layer protocol can sense the actual port state.

If a Layer-3 port is not configured with IP Event Dampening, or is not suppressed by it, the routing protocol or other protocol concerned about the port status still work normally. When the port is suppressed, the upper-layer protocol considers the port to be Down. Any state change of the port before the port is unsuppressed does not affect the routing table and the route calculation and advertisement performed by the upper-layer routing protocol.

#### Related Configuration

##### ▾ [Configuring IP Event Dampening](#)

- By default, IP Event Dampening is disabled on Layer-3 ports.
- Run the **dampening** [ *half-life-period* [ *reuse-threshold* *suppress-threshold* *max-suppress* [ **restart** [ *restart-penalty* ] ] ] ] command to enable or disable IP Event Dampening on Layer-3 ports.

## 6.4 Configuration

Configuration	Description and Command
<a href="#">Enabling IP Event Dampening</a>	 (Mandatory)It is used to suppress Layer-3 port flapping.
	<b>dampening</b> Configures IP Event Dampening.

### 6.4.1 Enabling IP Event Dampening

#### Configuration Effect

When a port configured with IP Event Dampening keeps flapping until the predefined threshold is exceeded, the port is set to Down.

#### Notes

- When a Layer-3 port on a switch is converted to a Layer-2 port (for example, from a routed port to a switch port), the IP Event Dampening configuration on the port will be deleted.

## Configuration Steps

### Configuring IP Event Dampening

- Mandatory.
- Perform the configuration in Layer-3 interface configuration mode.
- You can specify the half-life period, reuse threshold, suppress threshold, maximum suppress time, and initial penalty. If you do not set these parameters, their default values will be used.

## Verification

Use any one of the following commands to check whether the configuration takes effect:

- **show running-config**
- **show interfaces [ interface-id ] dampening**, which is used to check the IP Event Dampening configuration on a specified port

## Related Commands

### Enabling IP Event Dampening on a Port

<b>Command</b>	<b>dampening</b> [ <i>half-life-period</i> [ <i>reuse-threshold</i> <i>suppress-threshold</i> <i>max-suppress</i> [ <b>restart</b> [ <i>restart-penalty</i> ] ] ] ]
<b>Parameter Description</b>	<p><i>half-life-period</i>: Indicates the half-life period. Value range: &lt;1–30&gt;; default value: 5s.</p> <p><i>reuse-threshold</i>: Indicates the reuse threshold. Value range: &lt;1–20,000&gt;; default value: 1,000.</p> <p><i>suppress-threshold</i>: Indicates the suppress threshold. Value range: &lt;1–20,000&gt;; default value: 2,000.</p> <p><i>max-suppress</i>: Indicates the maximum suppress time. Value range: &lt;1–255&gt;; default value: four times the half-life period.</p> <p><b>restart</b> <i>restart-penalty</i>: Indicates the initial penalty. Value range: &lt;1–20,000&gt;; default value: 2,000.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>IP Event Dampening can affect direct routes, host routes, static routes, dynamic routes, and VRRP. When a port is suppressed based on the configured criteria, the affected modules determine that the port is Down and therefore delete corresponding routes. No data packet will be transmitted through the port.</p> <p>When the <b>dampening</b> command is rerun on a port configured with IP Event Dampening, the dampening information on the port will be cleared, but the flap count is retained, unless you use the <b>clear counters</b> command to clear the counters on the port.</p> <p>If the <b>max-suppress</b> parameter is set to a very small value, making the maximum penalty smaller than the suppress threshold, the port will never be suppressed. When such a configuration error occurs, the following message indicating a configuration failure will be printed:</p> <pre>% Maximum penalty (10) is less than suppress penalty (2000). Increase maximum suppress time</pre> <p>If the available system memory is insufficient to run the <b>dampening</b> command, the following message indicating a configuration failure will be printed:</p>

```
% No memory, configure dampening fail!
```

### Configuration Example

#### Configuring IP Event Dampening on Layer-3 Ports

<p><b>Scenario</b> Figure 6-2</p>	
<p><b>Configuration Steps</b></p>	<p>Enable IP Event Dampening on port GigabitEthernet 0/1 on Router A and on port GigabitEthernet 0/1 on Router B respectively, and set <b>half-time-period</b> to 30s, <b>reuse-threshold</b> to 1,500, <b>suppress-threshold</b> to 10,000, and <b>max-suppress</b> to 120s.</p>
<p><b>A</b></p>	<pre>Ruijie(config)#interface GigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#dampening 30 1500 10000 100</pre>
<p><b>B</b></p>	<pre>Ruijie(config)#interface GigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#dampening 30 1500 10000 100</pre>
<p><b>Verification</b></p>	<p>Run the <b>show interfaces dampening</b> command to check the IP Event Dampening configuration on the corresponding ports.</p>
	<pre>Ruijie#show interfaces dampening  GigabitEthernet 0/1    Flaps Penalty Supp   ReuseTm HalfL   ReuseV  SuppV   MaxSTm  MaxP   Restart   0      0      FALSE  0      30      1500   1000   100    15119  0</pre>

### Common Errors

- The port on a Layer-3 switch is not converted to a routed port by using the **no switchport** command before IP Event Dampening is configured.

## 6.5 Monitoring

### Clearing

Description	Command
Clears the interface counters.	<b>clear counters</b>

**i** For details about the **clear counter** command, see the related chapter for the "Interface" command.

## Displaying

Description	Command
Displays the counters on suppressed ports.	<b>show dampening interface</b>
Displays the IP Event Dampening configuration on ports.	<b>show interfaces dampening</b>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Enables debugging of IP Event Dampening.	<b>debug dampening interface</b>

## 7 Configuring VSU

### 7.1 Overview

In order to improve the reliability of networks, the two devices at core layer and convergence layer of traditional networks are configured with two cores to provide redundancy. Access and convergence devices are respectively connected to the cores through two links. The following figure shows a typical traditional network architecture. Redundant network architecture increases the complexity of network design and operation. At the same time, a large number of redundant links reduce the utilization of network resources and return on investment.

Figure 7-1 Traditional network architecture

Virtual Switching Unit (VSU) is a kind of network system virtualization technology that supports combining multiple devices into a single virtualized device. As shown in Figure 7-2, access, convergence and core layer devices can respectively form VSUs, and then these VSUs connect to one another to form an end-to-end VSU network. Compared with traditional network, this networking can:

- Simplify the network topology.
- Reduce the costs of network management and maintenance.
- Shorten application recovery time and service interruption time.
- Enhance the utilization of network resources.

Figure 7-2 End-to-End VSU Networking

## 7.2 Applications

Application	Description
<a href="#">Managing Multiple Devices in a Unified Manner</a>	Uses multiple physical devices as a logical device for unified management.
<a href="#">Simplifying Networking Topology</a>	Uses a VSU as a logical device to simplify the networking topology.

### 7.2.1 Managing Multiple Devices in a Unified Manner

#### Scenario

When multiple physical devices form a VSU system, the physical devices can be viewed as a logical device. All configurations are managed on the global master device.

As shown in Figure 7-3, four devices (numbered as 1, 2, 3, and 4 from left to right) form a VSU system. Device 1 is the global master device, device 2 is the global slave device, and devices 3 and 4 are the global candidate devices.

- All devices are configured simply on the global master device.

Figure 7-3

<b>Remarks</b>	The devices from left to right in Figure 7-3 are Device 1, Device 2, Device 3 and Device 4. For details on VSL, see the description in section 1.3.1.
----------------	---

<p>Device 1 is the global master device.</p> <p>Device 2 is the global slave device.</p> <p>Devices 3 and 4 are the global candidate devices.</p>
---

## Deployment

- The global master device controls the entire VSU system, runs control-plane protocols and is involved in data forwarding.
- The global slave device is involved in data forwarding, does not run control-plane protocols, and works as the backup and takes over the work of the global master device when faulty.
- The global candidate devices are involved in data forwarding and do not run control-plane protocols. When the global slave device is faulty, a global candidate device can take over the work of the global slave device. In this case, when the global master and slave devices are faulty, the VSU system will restart.

## 7.2.2 Simplifying Networking Topology

### Scenario

In traditional networks as shown in Figure 7-4, redundant devices and lines need to be added to increase the networking reliability; however, many algorithms also need to be introduced to prevent loops, which make the networking more complex. In the VSU system, all devices are viewed as a logical device. Different devices back up each other, and no loop prevention algorithm needs to be introduced, which can simplify the network.

- Two aggregate switches form a VSU system. It is unnecessary to configure a loop prevention algorithm. The two switches are redundant mutually.
- The access switch is connected to the aggregate switches through the uplink AP.
- When a switch in the VSU system is faulty, the other link still works.

Figure 7-4

## Deployment

- The global master device controls the entire VSU system, runs control-plane protocols and is involved in data forwarding.

- The global slave device is involved in data forwarding, does not run control-plane protocols, and works as the backup and takes over the work of the global master device when the global master device is faulty.
- The access switch is oriented to users and allows access by users' devices.

## 7.3 Features

### Basic Concepts

#### VSU System

VSU system is a single logical entity consisting of two or multiple devices in traditional network architecture. For example, the convergence layer VSU system as shown in the following figure can be seen as a single device that interacts with the core layer and access layer.

Figure 7-5 Convergence layer VSU

In the above VSU network structure, the member devices form a logical entity through internal links and the access layer devices are connected to the VSU through aggregated links. In this way, there is no layer 2 loop between the access and convergence layers.

Figure 7-6 Access layer VSU

Except the core and convergence layer devices, the access layer devices can also form a VSU system. A server that requires high availability can adopt multiple network cards to form an Aggregate Port (AP) to connect access layer devices. Since AP can only connect to the same access device, the risk of single device fault increases. In this case, VSU can be used to solve the problem. In the VSU mode, a server adopts multiple network cards and binds them into an AP to connect different member devices in the same VSU group. This way can prevent single point failure and network interruption caused by single link failure.

## ↘ VSU Domain ID

A VSU domain has only one ID. Only the devices with the same domain IDs can form a VSU system.

## ↘ Member Device ID

Every member device in a VSU system has a unique ID, namely, Switch ID. Switch IDs can be used in device management or configuring interfaces on member devices. You need to configure an ID for a device when adding the device to a VSU system and ensure that the ID is unique in the same VSU system. If an ID conflict occurs, the VSU system will reserve one device according to priority.

## ↘ Member Device Role

A VSU system consists of several devices. When establishing a VSU system, you need to select a global master device and a global slave device. All other devices are global candidate devices. A global master device is elected from multiple devices based on an election protocol. All other devices are global slave devices in the 1: N hot standby mode. When the 1:1 hot standby mode is supported, one device is the global master device, one device is the global slave device, and all other devices are global candidate devices.

The global master device is responsible for controlling the entire VSU system, running control plane protocols and participating in data forwarding. Other devices, including the global slave devices and candidate devices, participate in data forwarding but do not run control plane protocols. All received control plane data flows are forwarded to the global master device for processing.

The global slave device also receives the statuses of the global master device in real-time and provides 1:1 or 1:N redundancy with the global master device. If the global master device becomes faulty, the global slave device will take over services from the master device and manage the entire VSU system.

---

**i** The following is the method for selecting the master device of a VSU system:

---

1. Rules for selecting the master device of a VSU system include (Continue with the next rule if the previous rule does not help in selecting the master device): a) Select the currently running host as the master device with the highest priority (All devices are not master devices during startup). b) Select the device with the highest priority as the master device. c) Select the device with the lowest device No. as the host. d) Select the device with the smallest MAC address as the master device.
2. In the 1:N hot standby mode, select the device that has the most familiar configurations with the master device as the slave device to prevent dual active devices. The selection order is: the nearest/the highest priority/the smallest MAC address.
3. VSU system supports hot adding a support device. Even the hot added device has a higher priority than the master device has, the VSU system does not perform active/standby switch.
4. The startup order of member device may affect the election of master device. A member device may not join in the VSU system because it starts up too slowly. In this case, the device will be hot added to the VSU system. Even the device has a higher priority than the master device, the VSU system does not perform active/standby switchover.

## Overview

---

Feature	Description
---------	-------------

<a href="#">Virtual Switching Link (VSL)</a>	In a VSU system, a virtual link is used to connect all devices.
<a href="#">Topology</a>	Describes the internal topology of a VSU system.
<a href="#">Dual-Active Detection (DAD)</a>	Avoids that dual master switches coexist in a VSU domain.
<a href="#">System Management</a>	Describes possible connections between external devices and VSU devices.
<a href="#">Quick Blinking Location</a>	Manages devices in the VSU system.

### 7.3.1 Virtual Switching Link (VSL)

#### Working Principle

##### ↘ VSL

The VSU system is a network entity that consists of multiple devices. These devices need to share control information and part of data streams. The VSL is a special link used for transmission of control information and data streams among devices of the VSU system. For example, the VSL can be established between two devices through 10 Gigabit Ethernet interfaces. Figure 7-7 shows the position of the VSL in the VSU system.

Figure 7-7 VSL

The VSL exists in the form of AP groups. The data streams transmitted through the VSL balance load among the aggregation port members according to the traffic balancing algorithm.

##### ↘ VSL Traffic

The control streams transmitted through the VSL between devices include:

1. The protocol packets received by the member devices: These protocol packets need to be forwarded through the VSL to the global master device for processing.
2. The protocol packets processed by the global master device: These protocol packets need to be forwarded through the VSL to the interfaces of other member devices and then sent to the peer devices by these interfaces.

The data streams transmitted through the VSL between devices include:

1. The data stream flooded on the VLAN
2. The data streams that need to be forwarded across devices and transmitted through the VSL

Furthermore, the internal management packets of the VSU system are also transmitted through the VSL. The management packets include the protocol information switched by the hot backup and configuration information delivered by the host to other member devices.

**i** In terms of the switched port analyzer (SPAN) function, the interface associated with the VSL cannot be regarded as the source port or destination port of the SPAN.

### ↘ VSL Failure

If a certain member link connected to the VSL AP group fails to work, the VSU will adjust the configurations of the VSL aggregation port automatically to prevent the traffic from being transmitted through the faulty member link.

If all member links are disconnected to the VSL AP group, the VSU topology will change. If the original VSU topology is a ring topology, the ring will convert into a line. For details, see topology ring and line conversion in the section of *Topology Changes*.

### ↘ Detecting Error Frames on a VSL Interface

When a large number of consecutive error frames are detected on a VSL interface, the interface must be disabled and switched to another VSL interface. The detection method is as follows:

If error frames are found on a VSL interface, perform error frame correction. The system detects the VSL interface every 5 seconds by default. If the number of error frames is greater than the value of *num* as compared with that detected last time, it is assumed that error frames are detected once. If error frames are detected consecutively for the value of *times*, it is assumed that the interface is abnormal. If multiple VSL links are available when error frames are detected, the VSL will be switched. The last VSL will not be switched in order to prevent topology splitting.

Different user scenarios have different requirements for *num* and *times*. The default value of *num* is 3 and that of *times* is 10. If users have strict requirements on the scenarios, select smaller values for *num* and *times*; if reverse, select greater values.

## 7.3.2 Topology

The VSU system supports line topology and ring topology. Devices are connected through a VSL to form a line that is called the line topology.

### Working Principle

#### ↘ Topology

The line topology is simple. It uses a very few ports and cables. Two devices are connected with a communication link only. Therefore, the VSL has low reliability.

Figure 7-8 Line topology

Except for the line topology, devices can also form a ring topology, as shown in Figure 7-9. In the ring topology, the two communication links between devices can back up for each other and perform link redundancy to improve the reliability of the VSU system.

Figure 7-9 Ring Topology

- i** You are advised to select the ring topology for the VSU system, thus the normal operation of the whole VSU system will not be affected by any single faulty device or VSL.
- i** Besides selecting the ring topology networking, you are advised to configure multiple VSLs for every VSL member to improve the reliability of a single VSL. At least two links are recommended and a maximum of four links can be configured. A reasonable configuration comprises more than two VSLs crossing different cards.

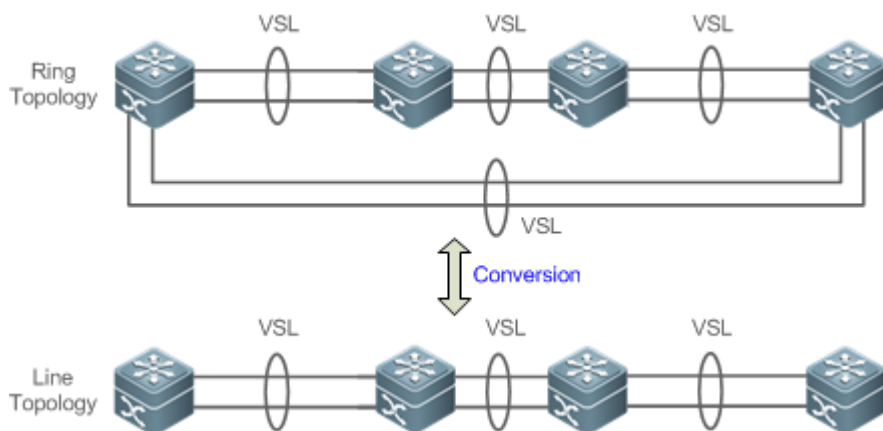

### Topology Convergence

Before the establishment of the VSU, the member devices need to discover neighbors through topology discovery protocols and check devices in the VSU system to confirm the range of the management domain. Then a global master device is selected to manage the whole VSU system and a global slave device is selected for backup of the master device. Then the whole VSU topology is converged. As the start up time differs for different devices, the first convergence time of the topology is also different.

### Topology ring and Line Conversion

In a ring topology, if a VSL link is disconnected, the ring topology will convert into a line topology. The whole VSU system will still run normally without network disconnection. To prevent other VSL links and nodes from being faulty, you are advised to locate the VSL failures and recover the availability of the VSL. After the VSL link is recovered, the line topology will convert into the ring topology.

Figure 7-10 Ring-to-line and line-to-ring

### Topology Splitting

In the line topology, if the VSL link is disconnected, the line topology will be split, as shown in Figure 7-11. A VSU group is split into two groups. In this condition, two devices with the absolutely same configurations may exist on the network, which will cause abnormal operation of the network. Therefore, the multi-active detection (MAD) function (for details, see 1.1.4.6 Multi-Active Detection) needs to be deployed to solve the problem of topology splitting.

Figure 7-11 Topology splitting

Topology Combining

If the two VSU groups are connected through the VSL link, the line topology will be combined. During the topology combining, restart one VSU group and then hot add the other VSU group.

The principle of topology combining: Minimizing influences on the services during topology combining. The rules are as follows (Judge from the first item. If you cannot select the optimal topology, continue to judge the next item):

- Use the device priority as the first criteria for judging topology combining. Reserve the VSU group containing a device with the highest priority.
- If the previous item cannot help make a judgment, select the VSU group with a smaller switch ID (that of the two global master switches).
- If the previous item cannot help make a judgment, reserve the VSU group with a smaller MAC address (that of the global master switches).

Figure 7-12 Topology combining

- 
-  During topology combining of two VSU groups, the two VSU groups need to be elected. The VSU group that fails the election will restart automatically and hot add to the other VSU group.
- 

### 7.3.3 Dual-Active Detection (DAD)

#### Working Principle

When the VSL is disconnected, the slave device switches to the master device. If the original master device is still running, a series of problems including IP address conflict on the LAN will be caused due to there are two master devices and their configurations are the same completely. In this condition, the VSU system must detect the two devices and take recovery measures. The VSU system provides two methods to perform MAD as follows:

- Bidirectional forwarding detection (BFD)
- AP-based detection

#### MAD Rules

1. Select the VSU group with the highest priority.
2. If the previous item cannot help make a judgment, select the VSU group with more physical devices.
3. If the previous item cannot help make a judgment, select the VSU group with a higher health. (Health: total bandwidth of all physical interfaces (except for management and VSL interfaces) in the UP state in the topology.)
4. If the previous item cannot help make a judgment, select the VSU group with a smaller switch ID (that of the two global master switches).
5. If the previous item cannot help make a judgment, reserve the VSU group with a smaller MAC address (that of the two global master switches).
6. If the previous item cannot help make a judgment, reserve the VSU group with a greater startup time (that of the global master switches).

---

 If DAD is not configured, network interruption may be caused after topology splitting.

---

#### BFD

The VSU system supports the BFD to detect multiple master devices. Figure 7-13 shows the topology. A link is added for the two devices on the edges for MAD specially. When the VSL link is disconnected between the global master and slave devices, two master devices exist concurrently. If the BFD function is set, the two master devices will send the BFD packets to each other through the BFD link. Thereby the same devices are detected on the current system. Finally shut down the VSU system of a master device according to some rules (for details, see the topology combining rules in the section 1.1.4.4 *Topology Changes*) and enter the recovery state to avoid network abnormality.

Figure 7-13 BFD

- ⚠ When there is a pair of BFD links, you are advised to deploy the detection links at the two ends of the topology.
- ⚠ You need to adopt the extension BFD and you cannot configure the dual-active detection port by using the existing BFD configurations and commands.

↘ MAD

The VSU system also supports the MAD dual-active detection mechanism. Figure 7-14 shows the topology. The VSU system and the upstream device both need to support the MAD function. When the VSL link is disconnected, two master devices exist concurrently. The two master devices respectively send the MAD packets to the member ports of the MAD-APs and then the MAD packets are forwarded to each other through the upstream device. As shown in Figure 7-14, the MAD-AP has four member ports. Each member port is connected to a different device of the VSU system. When the topology splitting occurs, the four member ports all send and receive the MAD packets. Thereby the same devices are detected on the current system. Finally shut down the VSU system of a master device according to some rules (for details, see the topology combining rules in the section 1.1.4.4 *Topology Changes*) and enter the recovery state to avoid network abnormality.

Figure 7-14 MAD based on upstream and downstream devices

- ✔ In the topology above, the upstream device must be Ruijie device and support the MAD packet forwarding function.

### 7.3.4 VSU Traffic Forwarding

#### Working Principle

↘ Cross-device AP Group

An AP binds multiple physical links together to form a logical link. The VSU system supports the AP across the member devices.

As shown in Figure 7-15, two devices form a VSU group. The external access device Switch A is connected to the VSU in the form of the AP. In terms of Switch A, there is no difference between the AP in Figure 7-15 and the common AP group.

Figure 7-15 Cross-device aggregation port

### ▾ Troubleshooting

You are advised to configure the cross-device AP with the physical link between the peripheral device and each VSU device. On the one hand, the VSL bandwidth can be reserved (prioritize the AP member of the same chassis as the egress to transmitted the cross-chassis AP traffic and prevent unnecessary traffic from being transmitted through the VSL link). On the other hand, the network reliability can be improved (if a certain chassis is faulty, the member ports of normal devices can work normally).

The follows sections describe the possible faults of the cross-device AP and the consequences.

- Single link failure

If a single link of the cross-device AP is faulty but other links still work normally, the cross-device AP will reallocate the traffic for the remaining normal links.

- Link failure of all cross-device AP member ports on the global master device

If the links of all cross-device AP member ports on the global master device fail to work, only the member ports of other member devices continue working normally. In terms of the data stream transmitted through the AP to the VSU system, if the data stream forwarding egress is on the global master device, the system will forward the data stream to the corresponding egress on the global master device through the VSL link.

The control plane protocols are still running on the global master device. Therefore, the protocol packets that enter the VSU system need to be forwarded to the global master device through the VSL link for protocol computing.

- Failure of all links of other member devices

If all links of the cross-device AP and a single device A fail to work, only the member ports of other member devices continue working normally. In terms of the data stream transmitted through the AP to the VSU system, if the data stream forwarding egress is on the member device A, the system will forward the data stream to the corresponding egress on the member device A through the VSL.

- Global master device fault

If the global master device is faulty, the hot backup switching is performed to switch the original slave device to the master device. Meanwhile, the member ports on other member devices continue working. The link failure is detected on the peer device connected to the VSU through this AP. Therefore, the traffic balancing algorithm needs to be adjusted to allocate the data stream to normal links.

- Member device fault

If a member device is faulty, the AP member link connected to this member device is disconnected. However, other member links still work normally. The link failure is detected on the peer device connected to the VSU through this AP. Therefore, the traffic balancing algorithm needs to be adjusted to allocate the data stream forwarding paths to normal links.

### ↘ Traffic Balancing

In a VSU system, traffic may have multiple egresses. The AP and ECMP have their own traffic balancing algorithms, for example, using destination or source MAC addresses. For details, see the *Configuring Aggregate Port*. The local forwarding first (LFF) can be configured detailed in this configuration manual. Packets received by a device are forwarded on this device first. In this way, packets can be forwarded to other devices without using a VSL.

## 7.3.5 System Management

### Working Principle

#### ↘ Access to the Console

The master device console of VSU system manages multiple devices on the system simultaneously. The consoles of the slave and candidate devices do not support command line input. However, you can configure the VSU system on the master device for a specified member device and log in to the master device console through the serial port of the slave device. A session can be used to redirect to the master console of a device.

#### ↘ Slot Naming

In terms of the chassis device, in the VSU mode, the slot is named with the device number (Switch ID). Therefore, the slot number turns from one-dimensional into two-dimensional. For example, cable clip 1/1 indicates the slot numbered 1 of the slot 1 on a member device.

#### ↘ Interface Naming

In the VSU working mode, a slot number may occur in multiple devices. Therefore, the interface is named with the device number (Switch ID).

For example, interface gigabitEthernet 1/0/1 indicates the Gigabit port 1 on the slot 0 of the device whose ID is 1; interface gigabitEthernet 2/0/2 indicates the Gigabit port 2 on the slot 0 of the device whose ID is 2.

#### ↘ Access to the File System

In the VSU working mode, you can access to the file system on other member devices from the master device. The detailed access method is the same to that of the local file system. The unique difference is that different URL prefixes are used.

#### ↘ System Upgrade

Generally the VSU system requires version consistency of the main program version numbers of the member devices. However, there are so many member devices that it takes too much time and energy to perform upgrade one by one in the standalone mode and it is also easy to make mistakes. Ruijie switches provide consummate system upgrade solution to help you with system upgrade by adopting the two methods as follows:

- When the VSU system is being established: the system will automatically align the main program version numbers of all member devices. Once the main program versions are discovered inconsistency, the main program of the master device will be selected to be synchronized to all member devices.
- After the VSU system is established: the main program version will be synchronized to all member devices automatically by using the file that is downloaded by the TFTP.

➤ **SYSLOG**

All member devices of the VSU system can display the SYSLOG. The SYSLOG generated by the master device is displayed on the master device console with the same format to that in the standalone mode. The SYSLOG generated by other member devices is also displayed on the master device console, but the message format is different from that in the standalone mode because the device number information is added.

For example, the SYSLOG information generated in the standalone state is "%VSU-5-DTM\_TOPO\_CVG:Node discovery done. Topology converged." The SYSLOG information generated by the member device numbered 3 is "%VSU-5-DTM\_TOPO\_CVG:(3) Node discovery done. Topology converged."

## 7.4 Configuration

Configuration		Configuration and Command	
<a href="#">Configuring VSU in the Standalone Mode</a>	 (Mandatory) It is used to configure VSU in the standalone mode.		
	<b>switch virtual domain</b>	Configures the domain ID.	
	<b>switch</b>	Configures the switch ID.	
	<b>switch priority</b>	Configures the switch priority.	
	<b>vsl-port</b>	Enters the VSL interface configuration mode.	
	<b>port-member interface</b>	Configures the VSL member interface.	
	<b>switch convert mode virtual</b>	Changes the standalone mode to the VSU mode.	
	 (Optional) It is used to configure the device attributes in the VSU mode.		
	<b>switch description</b>	Configures the device description.	
	<b>switch crc</b>	Configures error frame check.	
<a href="#">Configuring VSU in the VSU Mode</a>	<a href="#">Configuring VSU Attributes</a>	 (Optional) It is used to configure the device attributes in the VSU mode.	
		<b>switch domain</b>	Changes the domain ID.
		<b>switch renumber</b>	Changes the switch ID.
		<b>switch description</b>	Configures the device description.
	<b>switch crc</b>	Configures error frame check.	
	<a href="#">Configuring the VSL</a>	 (Optional) It is used to configure a VSL.	

Configuration		Configuration and Command	
		<b>vsl-port</b>	Enters the VSL interface configuration mode.
		<b>port-member interface</b>	Configures a VSL member interface.
	<a href="#">Configuring Dual-Active Detection</a>	 (Mandatory) It is used to configure DAD.	
		<b>dual-active detection</b>	Configures DAD.
		<b>dual-active bfd interface</b>	Configures the BFD DAD interface.
		<b>dual-active interface</b>	Configures an AP as a DAD interface.
		<b>dual-active exclude interface</b>	Configures an excluded interface.
	<a href="#">Configuring Traffic Balancing</a>	 (Optional) It is used to configure traffic balancing in the VSU mode.	
		<b>switch virtual aggregateport-lff enable</b>	Configures the AP LFF mode.
		<b>switch virtual ecmp-lff enable</b>	Configures the ECMP LFF mode.
	<a href="#">Changing the VSU Mode to the Standalone Mode</a>	 (Optional) It is used to change the VSU mode to the standalone mode.	
		<b>switch convert mode standalone</b>	Changes the VSU mode to the standalone mode.

## 7.4.1 Configuring VSU in the Standalone Mode

### Configuration Effect

Start up the switch in the standalone mode to set relevant VSU parameters to establish the VSU system.

### Configuration Steps

#### 📌 **Configuring VSU Attributes**

- A switch starts in the standalone mode by default. You need to set the same domain ID on the two chassis of the established VSU system. The domain ID must be unique within the local area network (LAN). Furthermore, you need to set the ID of each chassis in the VSU.
- Run the **switch virtual domain** *domain\_id* command to configure the domain ID. This command is mandatory.
- Run the **switch** *switch\_id* command to configure the device ID in the VSU. This command is mandatory. For devices with the same priorities in the VSU system, a device with the smallest device ID is selected as the global master device.
- Run the **switch** *switch\_id* **priority** *priority\_num* command to configure the device priority. This command is mandatory.
- The value ranges from 1 to 255. A larger value means a higher priority.
- Run the **switch** *switch\_id* **description** *switch1* command to configure the device alias. This command is optional. The default name is Ruijie. For easy identification of devices in the network environment, this item can be selected to set the device alias.

- A maximum of 32 characters are allowed.

<b>Command</b>	<b>switch virtual domain</b> <i>number</i>
<b>Parameter Description</b>	<i>Number</i> : Indicates domain ID of the VSU
<b>Defaults</b>	The default domain ID is 100.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Only two devices with the same domain ID can form a VSU. The domain ID must be unique within the LAN.

<b>Command</b>	<b>switch</b> <i>switch_id</i>
<b>Parameter Description</b>	<i>switch_id</i> : indicates the switch ID in the VSU system. Range: 1-2.
<b>Defaults</b>	The default device ID is 1.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	<p>The device ID identifies each virtual device member. In VSU mode, the interface name format changes to "switch/slot/port" from "slot/port", in which "switch" is the device ID.</p> <p>If either chassis are active or if the role of the just started chassis is uncertain and both have the same priority, the chassis with a smaller ID is elected as the active one.</p> <p>This command can be only used to modify the device ID in standalone mode. In VSU mode, run the <b>switch renumber</b> command to modify the device ID. The modified device ID takes effect only after you restart the device, regardless of in standalone mode or in VSU mode.</p>

<b>Command</b>	<b>switch</b> <i>switch_id</i> <b>priority</b> <i>priority_num</i>
<b>Parameter Description</b>	<p><i>switch_id</i>: Indicates a switch ID for which a priority needs to be configured.</p> <p><i>priority_num</i>: Indicates the switch priority, ranging from 1 to 255.</p>
<b>Defaults</b>	The default device priority is 100.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	<p>A larger value means a higher priority. A device with the highest priority is chosen as the master device. You can run this command in the standalone or VSU mode. The modified priority takes effect only after you restart the device.</p> <p>This command is not used to modify the value of <i>switch_id</i>. In the standalone mode, if <i>switch_id</i> is set to 1, running the <b>switch 2 priority 200</b> command does not work. You can first set <i>switch_id</i> to 2 and then run the <b>switch 2 priority 200</b> command. In the VSU mode, <i>switch_id</i> indicates the ID of the currently running switch. If the ID does not exist, the configuration does not take effect.</p>

<b>Command</b>	<b>switch</b> <i>switch_id</i> <b>description</b> <i>dev-name</i>
----------------	---

<b>Parameter</b>	<i>switch_id</i> : Indicates the device ID.
<b>Description</b>	<i>dev-name</i> : Indicates the device description, no greater than 32 characters.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	This command is configured on a device in whether standalone or VSU mode and takes effect immediately after configuration.

 The command used for configuring a priority can modify the priority only rather than modify a switch ID. Therefore, you must enter the current switch ID correctly for the configuration. For example, you have set the switch ID to 1. If you enter **switch 2 priority 100**, the priority configuration cannot take effect.

 **Configuring the VSL**

- To establish the VSU system, you need to decide which ports are configured as the VSL member ports.
- Run the **vsl-port** command to enter the VSL interface configuration mode. This command is mandatory.
- Run the **port-member interface** *interface-name* [**copper** | **fiber** ] command to add a VSL interface. This command is mandatory.
- When the device enters the VSL interface configuration mode, the VSL interface can be configured or deleted.

<b>Command</b>	<b>vsl-port</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	You can run this command in the standalone or VSU mode.

<b>Command</b>	<b>port-member interface</b> <i>interface-name</i> [ <b>copper</b>   <b>fiber</b> ]
<b>Parameter Description</b>	<i>interface-name</i> : Indicates a two-dimensional interface name, such as Tengigabitethernet 1/1 and Tengigabitethernet 1/3. <b>copper</b> : Indicates the copper interface attribute. <b>fiber</b> : Indicates the optical interface attribute.
<b>Defaults</b>	N/A
<b>Command Mode</b>	VSL interface configuration mode
<b>Usage Guide</b>	Add a member interface of the VSL link. <i>interface-name</i> indicates the two-dimensional interface name in the standalone mode. The two-dimensional interface can be the 10 Gigabit interface or Gigabit interface. (The Gigabit interface can be an opto-copper interface. If the media type is not specified, the Gigabit copper interface is adopted by default.) For an opto-copper interface, you must specify its optical or copper interface

	<p>attribute. A VSL interface for a chassis device must be a 10 Gigabit interface.</p> <p>You can run this command in the VSU mode or standalone mode. The command can take effect after the command configuration is saved and the device where the VSL member interface resides is restarted.</p>
--	---

 In the standalone mode, the VSL configurations cannot take effect immediately unless the device shifts into the VSU mode and restart.

 **Configuring Error Frame Check**

- Run the **switch crc** command to configure error frame check. This command is optional. Run this command to modify the default method for checking error frames.
- If error frames are found on a VSL interface, perform error frame correction. The system detects the VSL interfaces every 5 seconds by default. If the number of error frames is greater than 3 as compared with that detected last time, it is assumed that error frames are detected once. If error frames are detected consecutively for 10 times, it is assumed that the interface is abnormal. If multiple VSL links are available when error frames are detected, the VSL will be switched. The last VSL will not be switched in order to prevent topology splitting.

<b>Command</b>	<b>switch crc errors</b> <i>error_num</i> <b>times</b> <i>time_num</i>
<b>Parameter Description</b>	<p><i>error_num</i>: Configures the increase of error frames between two detections. When the number of error frames is greater than the increase, it is assumed that error frames are detected once.</p> <p><i>time_num</i>: Configures the number of times after which an action needs to be taken (the action can be displaying a prompt or disabling the interface).</p>
<b>Defaults</b>	The default value of <b>errors</b> is 3; the default value of <b>times</b> is 10.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	The system detects the VSL interfaces every 5 seconds by default. If the number of error frames is greater than 3 as compared with that detected last time, it is assumed that error frames are detected once. If error frames are detected consecutively for 10 times, it is assumed that the interface is abnormal. The default action for an abnormal interface is displaying a log prompt. You can set the action to disabling the interface. If the interface is disabled, you must recover it by unplugging and plugging it.

 Different products have different requirements for error frame check and different processing for VSL interfaces. In version 11.0, error frame check is configurable.

 **Changing the Standalone Mode to the VSU Mode**

- Use the **switch convert mode virtual** command to change the standalone mode to the VSU Mode.
- In the standalone mode, the software will take the following actions after you run the **switch convert mode virtual** command.

Back up the global configuration file *config.text* in the standalone mode as *standalone.text* for subsequent use.

Clear the contents of the configuration file *config.text*.

Write the relevant VSU configurations to the special configuration file *config\_vsu.dat*.

- If there is a *virtual\_switch.text* file on the switch, the system will prompt you whether to overwrite the contents of the file *virtual\_switch.text* to the file *config.text* (the file *virtual\_switch.text* is a backup file for the file *config.text* when the switch shifts from the VSU mode to the standalone mode). Then you can click **Yes** or **No**. Finally the switch restarts in the VSU mode and reads VSU parameters in the file *config\_vsu.dat*.

<b>Command</b>	<b>switch convert mode virtual</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The switch is in the standalone mode by default.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Change the standalone mode to the VSU mode.

### Verification

Run the **show switch virtual config [ switch\_id ]** command to check the VSU configuration of the current switch in the standalone mode.

<b>Command</b>	<b>show switch virtual config [ switch_id ]</b>
<b>Parameter Description</b>	<i>switch_id</i> : Indicates the switch ID. After this parameter is specified, only the VSU configuration of the specified device is displayed.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Use this command to display the VSU configuration in the standalone or VSU mode.

**!** The relevant VSU configurations are set for a single physical switch and the configurations are stored in the special configuration file *config\_vsu.dat*. Therefore, you can view the current VSU configurations by running the **show switch virtual config** command rather than the **show running config** command.

In the standalone mode, the VSU running information is null. When you enter commands such as **show switch virtual**, the system will prompt you that the switch is in the standalone mode and there is no VSU running information.

### Configuration Example

#### Configuring VSU in the Standalone Mode

<p><b>Scenario</b> Figure 7-16</p>	<p>The diagram shows two network switches connected by a horizontal line representing a VSU system. The left switch is labeled 'Switch-1 Chassis 1 Priority 200' and the right switch is labeled 'Switch-2 Chassis 2 Priority 100'. The connection between them is labeled with '1/1' on the top and '1/2' on the bottom for both switches, indicating the VSL interfaces.</p>
	<p>Switch 1 and Switch 2 form a VSU system. The domain ID is 100. The chassis on the left side is configured as Chassis 1, with the priority of 200, alias of Switch 1, and the VSL interfaces of 1/1 and 1/2. The chassis on the right side is configured as Chassis 2, with the priority of 100, alias of Switch 2, and the VSL interfaces of 1/1 and 1/2.</p>

<b>Configuration Steps</b>	<ol style="list-style-type: none"> <li>5. Perform the following configuration on the Switch 1: <ul style="list-style-type: none"> <li>● Configure VSU attributes and VSL interfaces.</li> <li>● Change the standalone mode to the VSU mode.</li> </ul> </li> <li>6. Perform the following configuration on the Switch 2: <ul style="list-style-type: none"> <li>● Configure VSU attributes and VSL interfaces.</li> <li>● Change the standalone mode to the VSU mode.</li> </ul> </li> </ol>
<b>Switch-1</b>	<pre>Ruijie# configure terminal Ruijie(config)# switch virtual domain 100 Ruijie(config-vs-domain)#switch 1 Ruijie(config-vs-domain)#switch 1 priority 200 Ruijie(config-vs-domain)#witch 1 description switch-1 Ruijie(config-vs-domain)# switch crc errors 10 times 20 Ruijie(config-vs-domain)#exit Ruijie(config)#vsl-port Ruijie(config-vsl-port)#port-member interface Tengigabitethernet 1/1 Ruijie(config-vsl-port)#port-member interface Tengigabitethernet 1/2 Ruijie(config)#exit Ruijie#switch convert mode virtual</pre>
<b>Switch-2</b>	<pre>Ruijie# configure terminal Ruijie(config)# switch virtual domain 100 Ruijie(config-vs-domain)# switch 2 Ruijie(config-vs-domain)# switch 2 priority 200 Ruijie(config-vs-domain)# switch 2 description switch-2 Ruijie(config-vs-domain)# switch crc errors 10 times 20 Ruijie(config-vs-domain)#exit Ruijie(config)#vsl-port Ruijie(config-vsl-port)#port-member interface Tengigabitethernet 1/1 Ruijie(config-vsl-port)#port-member interface Tengigabitethernet 1/2 Ruijie(config-vsl-port)#exit Ruijie#switch convert mode virtual</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show switch virtual config</b> command to view the VSU attributes of Switch 1 and Switch 2.</li> </ul>
<b>Switch-1</b>	<pre>Ruijie#show switch virtual config</pre>

```
switch_id: 1 (mac: 0x1201aeda0M)
!
switch virtual domain 100
!
switch 1
switch 1 priority 100
!
switch convert mode virtual
!
port-member interface Tengigabitethernet 1/1
!
port-member interface Tengigabitethernet 1/2
!
switch crc errors 10 times 20
!
```

**Switch-2**

```
Ruijie#show switch virtual config
switch_id: 2 (mac: 0x1201aeda0E)
!
switch virtual domain 100
!
switch 2
switch 2 priority 100
!
switch convert mode virtual
!
port-member interface Tengigabitethernet 1/1
!
port-member interface Tengigabitethernet 1/2
!
switch crc errors 10 times 20
```

### Common Errors

- ✔ A VSL interface of a chassis device must be 10 Gigabit or higher.

## 7.4.2 Configuring VSU in the VSU Mode

### 7.4.2.1 Configuring VSU Attributes

#### Configuration Effect

During the VSU system running, you can modify the parameters, such as domain ID, switch ID, and priority of the master device or the slave device. However, you can only log in to the VSU master device console to modify these parameters, but cannot enter the global configuration mode from the slave device console.

#### Notes

- Among the commands above, the all configuration commands take effect only after the switch restarts except the **switch sw\_id description switch1** command that can take effect immediately.

#### Configuration Steps

##### ↘ Entering the Domain Configuration Mode

- Optional.
- Run this command in the VSU mode to enter the domain configuration mode. Switches with the same domain ID form a VSU system. You can modify or configure the domain ID, switch priority, and switch ID only after entering the domain configuration mode in the VSU mode.

<b>Command</b>	<b>switch virtual domain</b> <i>domain_id</i>
<b>Parameter Description</b>	<i>domain_id</i> : Indicates the virtual domain ID of the VSU system.
<b>Defaults</b>	The default domain ID is 100.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Only two devices with the same domain ID can form a VSU system. The domain ID must be unique on a LAN.

##### ↘ Changing the Domain ID

- Optional.
- To modify the value of *domain\_id* for a device, you can configure this item on the master device console of the VSU system.

<b>Command</b>	<b>switch</b> <i>switch_id</i> <b>domain</b> <i>new_domain_id</i>
<b>Parameter</b>	<i>switch_id</i> : Indicates the ID of the currently running switch in the VSU mode, ranging from 1 to 2.
<b>Description</b>	<i>new_domain_id</i> : Indicates the modified domain ID, ranging from 1 to 255.
<b>Defaults</b>	The default domain ID is 100.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Run this command only in the VSU mode. In addition, the setting can take effect only after the device is restarted.

### ↘ Changing the Switch ID

- Optional.
- To modify the value of *switch\_id* for a device, you can configure this item on the master device console of the VSU system.

<b>Command</b>	<b>switch</b> <i>switch_id</i> <b>renumber</b> <i>new_switch_id</i>
<b>Parameter</b>	<i>switch_id</i> : Indicates the ID of a switch. In a VSU system, the switch ID ranges from 1 to 2 for chassis switches.
<b>Description</b>	<i>new_switch_id</i> : Indicates the modified switch ID.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Run this command only in the VSU mode. In addition, the setting can take effect only after the device is restarted.

### ↘ Changing the Switch Priority

- Optional.
- To modify the priority of a device, you can configure this item on the master device console of the VSU system.
- A larger value means a higher priority. Select the device with the highest priority as the master device.

<b>Command</b>	<b>switch</b> <i>switch_id</i> <b>priority</b> <i>priority_num</i>
<b>Parameter</b>	<i>switch_id</i> : Indicates a switch ID for which a priority needs to be configured.
<b>Description</b>	<i>priority_num</i> : Indicates the switch priority, ranging from 1 to -255.
<b>Defaults</b>	The default priority is 100.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	<p>A larger value means a higher priority. Select the device with the highest priority as the master device. You can run this command in the standalone or VSU mode. The modified priority takes effect only after you restart the device.</p> <p>This command is not used to modify the value of <b>switch_id</b>. In the standalone mode, if <b>switch_id</b> is set to <b>1</b>, running the <b>switch 2 priority 200</b> command does not work. You can first set <b>switch_id</b> to <b>2</b> and then run the <b>switch 2 priority 200</b> command. In the VSU mode, <b>switch_id</b> indicates the ID of the currently running</p>

switch. If the ID does not exist, the configuration does not take effect.
---

### ↘ Configuring the Device Description

- Optional.
- To configure the description for a device, you can configure this item on the master device console of the VSU system.
- Run the **switch** *switch\_id* **description** *switch1* command to configure the device description. A maximum of 32 characters are allowed.

<b>Command</b>	<b>switch</b> <i>switch_id</i> <b>description</b> <i>dev-name</i>
<b>Parameter</b>	<i>switch_id</i> : Indicates a switch ID for which a priority needs to be configured.
<b>Description</b>	<i>dev_name</i> : Indicates the device name.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	You can run this command in the standalone or VSU mode. The configuration takes effect immediately in the VSU mode.

### ↘ Configuring Error Frame Check

- Optional.
- Run the **switch crc errors** *error\_num* **times** *time\_num* command to configure the conditions for triggering error frame check.

<b>Command</b>	<b>switch crc errors</b> <i>error_num</i> <b>times</b> <i>time_num</i>
<b>Parameter Description</b>	<i>error_num</i> : Configures the increase of error frames between two detections. When the number of error frames is greater than the increase, it is assumed that error frames are detected once. <i>time_num</i> : Configures the number of times after which an action needs to be taken (the action can be displaying a prompt or disabling the interface).
<b>Defaults</b>	The default value of <b>errors</b> is <b>3</b> ; the default value of <b>times</b> is <b>10</b> .
<b>Command Mode</b>	Domain configuration mode
<b>Default Level</b>	14
<b>Usage Guide</b>	N/A

### ↘ Saving the Configuration File

Run the **exit** command to exit from the virtual device configuration mode and run the **write** command to save the configurations to the *config\_vsu.dat* file.

### Verification

Use the **show switch virtual [ topology | config ]** command to display the current VSU running information, topology or configuration parameters.

<b>Command</b>	<b>show switch virtual [ topology   config ]</b>
----------------	--

<b>Parameter Description</b>	<b>Topology:</b> Indicates topology information. <b>Config:</b> Indicates the VSU configurations.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	View the domain ID, and the device ID, status and role of each device.

### Configuration Example

#### Configuring VSU Attributes

<p><b>Scenario</b> Figure 7-17</p>	 <p>Switch 1 and Switch 2 form a VSU system. Modify the chassis ID of Switch 2 to 3 and its priority to 150. Assume that Switch 1 is the global master switch and perform the configuration on the global master switch.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Modify the configurations of Switch 2.</li> </ul>
<p><b>Switch-1</b></p>	<pre>Ruijie#config Ruijie(config)# switch virtual domain 100 Ruijie(config-vs-domain)# switch 2 renumber 3 Ruijie(config-vs-domain)# switch 2 priority 150 Ruijie(config-vs-domain)# switch 2 description switch-3</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>Run the <b>show switch virtual config</b> command for verification.</li> </ul>
<p><b>Switch-1</b></p>	<pre>Ruijie#show switch virtual config switch_id: 1 (mac: 0x1201aeda0M) ! switch virtual domain 100 ! switch 1 switch 1 priority 100 ! switch convert mode virtual ! port-member interface Tengigabitethernet 1/1</pre>

```
!  
port-member interface Tengigabitethernet 1/2  
!  
  
switch_id: 3 (mac: 0x1201aeda0E)  
!  
switch virtual domain 100  
!  
switch 3  
switch 3 priority 150  
!  
switch convert mode virtual  
!  
port-member interface Tengigabitethernet 1/1  
!  
port-member interface Tengigabitethernet 1/2  
!  
switch 3 description switch-3  
!
```

## 7.4.2.2 Configuring the VSL

### Configuration Effect

When switches form a VSU system or when the VSU system is running, you can shift between common interfaces and VSL interfaces. However, you can only log in to the master device console of the VSU system for modification, but cannot enter the global configuration mode from the slave device console.

### Notes

- You can log in to the console of the VSU system by using a serial port or telnet, in order to add or delete the configurations of VSL member interfaces.
- To prevent incorrect connections in actual scenarios, the VSL AP uses dynamic negotiation. You need to configure the VSL interface pool first, and then add the VSL interface pool to the same AP after successful negotiation. Interfaces connecting to the same device are within the same AP.

### Configuration Steps

#### ➤ Entering the VSL Interface Configuration mode

- Run the **vsl-port** command to enter the VSL-PORT configuration mode. This command is optional.
- When the device enters the VSL-PORT configuration mode, the VSL interface can be configured or deleted.

<b>Command</b>	<b>vsl-port</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	You can run this command in the standalone or VSU mode.

### ↘ Configuring a VSL Member Interface

- Run the **port-member interface** *interface-name* [ **copper** | **fiber** ] command to add a VSL interface. This command is optional.
- Run the **port-member interface** command to configure a VSL member interface.

<b>Command</b>	<b>port-member interface</b> <i>interface-name</i> [ <b>copper</b>   <b>fiber</b> ]
<b>Parameter</b>	<i>interface-name</i> : Indicates a two-dimensional interface name, such as GigabitEthernet 0/1 and GigabitEthernet 0/3.
<b>Description</b>	<b>copper</b> : Indicates the copper interface attribute. <b>fiber</b> : Indicates the optical interface attribute.
<b>Defaults</b>	N/A
<b>Command Mode</b>	VSL interface configuration mode
<b>Usage Guide</b>	You can run this command in the VSU mode or standalone mode. The command can take effect after the command configuration is saved and the device where the VSL member interface resides is restarted.

During the VSU system running, the configured VSL member links take effect immediately. VSL interfaces need to be configured for all devices.

For chassis devices, VSL interfaces must be optical interfaces of 10 Gigabit or higher.

Modules on chassis devices must be modules of 10 Gigabit or higher.

40G one-to-four interfaces cannot be configured as VSL interfaces.

- ⚠ For a 40G port (no matter whether splitting is performed for the interface), its member interfaces (namely, four 10G interfaces) cannot be shifted to VSL member interfaces.
- ❗ If an interface has been configured as an NLB reflex interface, this interface can be shifted to a VSL member interface only after the NLB reflex interface configuration is deleted.
- ⚠ To prevent a loop that may occur when a VSL member interface exits from the VSL AP, the system automatically sets the member interface to the shutdown state when the command is executed to make the VSL member interface exit from the VSL AP. After the VSL member interface exits from the VSL AP, you can reconnect the link and run the **no shutdown** command to enable this interface again. When you configure a VSL interface, the system will shut it down first. If the configuration fails and you want to use it as a common interface, you can run the **no shutdown** command to

enable this interface again. Add a member interface number that must be a three-dimensional interface number. For example, in the VSL-PORT configuration mode, if you run the **port-member interface** Tengigabitethernet 1/1/1 command, it indicates that you configure the global three-dimensional interface 1/1/1 as a VSL interface.

- ❗ If VSU topology splitting occurs when you change a VSL interface to a common interface, the VSL interface cannot be deleted. You can disconnect the physical interface first and then delete the VSL interface.

### Verification

- Use the show switch virtual link [ port ] to display the current VSL link running information in the VSU mode.

<b>Command</b>	<b>show switch virtual link [ port ]</b>
<b>Parameter Description</b>	<b>port:</b> Displays the status information of the VSL member interfaces.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### Configuring the VSL

<b>Scenario</b> Figure 7-18	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Add interface 1/1/3 as the VSL interface for Switch 1 and delete interface 1/1/2 from the VSL interface.</li> </ul>
<b>Switch-1</b>	<pre>Ruijie#config Ruijie(config)# vsl-port Ruijie(config-vsl-port)# port-member interface Tengigabitethernet 1/1/3 Ruijie(config-vsl-port)# no port-member interface Tengigabitethernet 1/1/2</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show switch virtual config</b> command to view the VSL. Assume that Switch 1 is the global master switch and run the command on the global master switch.</li> </ul>
<b>Switch-1</b>	<pre>Ruijie#show switch virtual config switch_id: 1 (mac: 0x1201aeda0M) ! switch virtual domain 100</pre>

!
```

### 7.4.2.3 Configuring Dual-Active Detection

#### Configuration Effect

Configure the relevant detection mechanism to prevent the dual-active is being generated.

#### Notes

- The DAD can be configured only in the VSU mode. You are not allowed to configure the DAD mechanism in the standalone mode.
- All DAD configurations will take effect immediately after being configured on the master or slave devices in global configuration mode by running the **show running-config** command.
- The BFD-detected configuration information can be displayed only by running the dual-active detection display command rather than the BFD display command.

## Configuration Steps

### ↳ Configuring the BFD DAD

- The BFD DAD requires establishing a directly connected link between two switches. The interfaces on the two ends must be physical routing interfaces. The following configuration must be performed on both chassis.
- Enter the interface configuration mode of the DAD interface and configure the DAD interface as a routing interface.
- After exiting from the interface configuration mode, run the **switch virtual domain *domain\_id*** command to enter the domain configuration mode.
- In the domain mode, run the **dual-active detection bfd** command to enable BFD. This command is optional and can be used when BFD DAD needs to be configured.
- In the domain configuration mode, run the **dual-active bfd interface *interface-name*** command to configure the BFD DAD interface. This command is optional and can be used to configure the BFD DAD interface when BFD DAD is configured.
- Delete the BFD DAD interface. If no BFD DAD interface is available, BFD detection cannot be used.

<b>Command</b>	<b>switch virtual domain <i>domain_id</i></b>
<b>Parameter Description</b>	<i>domain_id</i> : Indicates the domain ID.
<b>Defaults</b>	The default domain ID is 100.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Only two devices with the same domain ID can form a VSU system. The domain ID must be unique on a LAN.

<b>Command</b>	<b>dual-active detection { aggregateport   bfd }</b>
<b>Parameter Description</b>	<b>Aggregateport</b> : Specifies the AP detection mode. <b>bfd</b> : Specifies the BFD detection mode.
<b>Defaults</b>	The DAD is disabled.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Configure this command only in the VSU mode.

<b>Command</b>	<b>dual-active bfd interface</b> <i>interface-name</i>
<b>Parameter</b>	<i>interface-name</i> : Indicates the interface type and ID.
<b>Description</b>	
<b>Defaults</b>	N/A
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	A BFD DAD interface must be a routing interface and on different switches.

The BFD detection interfaces must be directly connected physical routing ports. The two ports must be on different devices.

The interface type is not limited. The dual-active detection link is only used to transmit BFD packets with a small amount of traffic. Therefore, you are advised to adopt the Gigabit interface or 100 M interface as the dual-active detection interface.

After the layer 3 routing interface that is configured with two master devices is converted into a layer 2 switch interface (run the switchport command under this interface), the BFD dual-active detection will be cleared automatically.

You are advised to directly connect BFD detection interfaces only to the master and slave devices.

-  When the VSU system detects dual-active conflict and brings another VSU group to the recovery state, you can resolve the problem only by rectifying the VSL fault, but not directly restoring the VSU group in the recovery state; otherwise, dual-active conflict may be caused on the network.

### ↘ Configuring the AP-based DAD

- To configure the AP-based DAD, you must configure an aggregate port (AP) first and then specify the AP port as the DAD interface.
- Run the **port-group** *ap-num* command to add a physical member interface to the AP.
- After entering the domain configuration mode, run the **dual-active detection aggregateport** command to enable AP detection mode. This command is optional. You can run this command when AP detection needs to be configured.
- Run the **dual-active interface** *interface-name* command to configure the AP as the DAD interface. This command is optional. You can run this command to configure the AP as the DAD interface when AP detection needs to be configured.
- Run the **dad relay enable** command to enable dual-active detection packet relay for upstream and downstream interfaces. This command is optional. You can run this command to relay DAD packets (dual-active detection packets) when AP-based DAD is configured.
- Disabling AP-based DAD will inactivate DAD.
- Delete the detected interface. If no AP-based DAD interface is available, AP-based DAD cannot be used.
- The AP-based DAD packet relay is disabled by default.

<b>Command</b>	<b>dual-active detection</b> { <b>aggregateport</b>   <b>bfd</b> }
<b>Parameter</b>	<b>aggregateport</b> : Specifies the AP detection mode.
<b>Description</b>	<b>bfd</b> : Specifies the BFD detection mode.
<b>Defaults</b>	The DAD is disabled.
<b>Command Mode</b>	Domain configuration mode

<b>Usage Guide</b>	Configure this command only in the VSU mode.
--------------------	--

<b>Command</b>	<b>dual-active interface</b> <i>interface-name</i>
<b>Parameter Description</b>	<i>interface-name</i> : Indicates the interface type and interface ID. An AP-based DAD interface must be specified.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Only one AP-based DAD interface can be configured. This interface must be created before you configure an AP as a DAD interface. Subsequently configured DAD interfaces will overwrite the previous ones.

<b>Command</b>	<b>dad relay enable</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The AP-based DAD packet relay is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command can only be executed on the AP.

-  You are advised to distribute the physical interfaces that are added to the AP-based detection interface to different devices.

#### **Configuring the excluded interface in the recovery mode**

- When two master devices are detected, one of them must enter the recovery mode. In the recovery mode, you need to disable all service interfaces. For some special usages (for example, configuring a management switch from which you can log in to a remote interface), you can set some ports to excluded interfaces that are not disabled in the recovery mode.
- In the domain configuration mode, run the **dual-active exclude interface** *interface-name* command to specify an excluded interface that will not be disabled in the recovery mode. This command is optional.

<b>Command</b>	<b>dual-active exclude interface</b> <i>interface-name</i>
<b>Parameter Description</b>	<i>interface-name</i> : Indicates the interface type and interface ID.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Configure this command only in the VSU mode. An excluded interface must be a routing interface instead of a VSL interface. You can configure multiple excluded interfaces.

-  The excluded interface must be routing rather than VSL.

**!** After the excluded interface is converted from a routing one into a switch interface (run the **switchport** command under this interface), the configurations of the excluded interface that is associated with this interface will be cleared automatically.

### Verification

Use the **show switch virtual dual-active { aggregateport | bfd | summary }** to display the current DAD configuration.

<b>Command</b>	<b>show switch virtual dual-active { aggregateport   bfd   summary }</b>
<b>Parameter Description</b>	<b>aggregateport:</b> Displays DAD information on the AP. <b>bfd:</b> Displays BFD-based DAD information. <b>summary:</b> Displays DAD summary.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### Configuring the BFD DAD

<p><b>Scenario</b> Figure 7-19</p>	 <ul style="list-style-type: none"> <li>● Switch 1 and Switch 2 form a VSU (The domain ID is 1) system. The priorities of Switch 1 and Switch 2 are 200 and 150 respectively. The links between Te1/3/1 and Te1/3/2 of Switch 1 and Te2/3/1 and Te2/3/2 of Switch 2 are established respectively to form a VSL between Switch 1 and Switch 2. The G0/1, G0/2, G0/3 and G0/4 interfaces of Switch A are connected to G1/1/1 and G1/2/1 of Switch 1 and G2/1/1 and G2/2/1 of Switch 2 to form an AP group including four member links. The ID of the AP group is 1. All members of AP group 1 are Gigabit optical interfaces. G1/1/2 and G2/1/2 are routing interfaces.</li> <li>● G1/1/2 and G2/1/2 are a pair of BFD DAD interfaces.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure G1/1/2 and G2/1/2 as routing interfaces.</li> <li>● Enable the BFD DAD.</li> <li>● Configure G1/1/2 and G2/1/2 as BFD DAD interfaces.</li> </ul>

	<p>Since Switch 1 and Switch 2 are in a VSU system, the preceding configuration can be performed on either Switch 1 or Switch 2. on the following example configures the functions on Switch 1.</p>
<b>Switch 1</b>	<pre>Ruijie(config)# interface GigabitEthernet 1/1/2 Ruijie(config-if-GigabitEthernet 1/1/2)# no switchport Ruijie(config)# interface GigabitEthernet 2/1/2 Ruijie(config-if-GigabitEthernet 2/1/2)# no switchport Ruijie(config-if)# switch virtual domain 1 Ruijie(c config-vs-domain)# dual-active detection bfd Ruijie(config-vs-domain)# dual-active bfd interface GigabitEthernet 1/1/2 Ruijie(config-vs-domain)# dual-active bfd interface GigabitEthernet 2/1/2</pre>
<b>Switch A</b>	<pre>Ruijie# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)# interface aggregateport 1 Ruijie(config-if-aggregateport 1)# interface range GigabitEthernet 0/1-4 Ruijie(config-if-aggregateport 1)# port-group 1 Ruijie(config)# interface vlan 1 Ruijie(config-if-vlan 1)#ip address 1.1.1.2 255.255.255.0 Ruijie(config-if-vlan 1)#exit Ruijie(config)#interface aggregateport 1 Ruijie(config-if-AggregatePort 1)# dad relay enable Ruijie(config-if-AggregatePort 1)# exit</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● View the DAD configuration.</li> <li>● View the BFD DAD configuration.</li> </ul>
<b>Switch 1</b>	<pre>Ruijie# show switch virtual dual-active summary BFD dual-active detection enabled: No Aggregateport dual-active detection enabled: Yes Interfaces excluded from shutdown in recovery mode: In dual-active recovery mode: NO Ruijie# show switch virtual dual-active bfd BFD dual-active detection enabled: Yes</pre>

```
BFD dual-active interface configured:

GigabitEthernet 1/1/2: UP

GigabitEthernet 2/1/2: UP
```

### Common Errors

- A BFD DAD interface is not a routing interface.
- Neither BFD DAD nor AP-based DAD are enabled and activated.

## 7.4.2.4 Configuring Traffic Balancing

### Configuration Effect

In the VSU system, if egresses are distributed on multiple devices, the Local Forward First (LFF) can be configured.

### Notes

The default configuration is LFF.

### Configuration Steps

#### ▾ Configuring the AP LFF mode

- In the domain configuration mode, run the **switch virtual aggregateport-lff enable** command to enable the AP LFF mode. This command is optional.
- The member ports of AP can be distributed on two chassis of the VSU system. You can configure whether the AP egress traffic is forwarded through local member ports first based on actual traffic conditions.
- If this function is disabled, traffic is forwarded based on the AP configuration rules. For details, see the *Configuring Aggregate Port*.

<b>Command</b>	<b>switch virtual aggregateport-lff enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	This function is enabled by default.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Enable the AP LFF in the VSU mode.

#### ▾ Configuring the ECMP LFF mode

- In the domain configuration mode, run the **switch virtual ecmp-lff enable** command to enable the ECMP LFF mode. This command is optional.
- The Equal-Cost MultiPath (ECMP) routing egress can be distributed on two chassis of the VSU system. You can configure whether the ECMP egress traffic is forwarded through local member ports first based on actual traffic conditions.

- If this function is disabled, traffic is forwarded based on the ECMP configuration rules. For details, see the *Configuring Aggregate Port*.

<b>Command</b>	<b>switch virtual ecmp-lff enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	This function is enabled by default.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Enable the ECMP LFF in the VSU mode.

- ⚠ In the VSU mode, the across-chassis AP LFF mode and the ECMP LFF mode are disabled by default.
- ⚠ To deploy a VSU system for layer-3 switches, you are advised to configure the IP-based AP load balancing (src-ip, dst-ip abd src-dst-ip).

### Verification

Use the **show switch virtual balance** command to display the current traffic balancing mode of the VSU system.

<b>Command</b>	<b>show switch virtual balance</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Use this command to display the configuration of the traffic balancing mode in the VSU mode.

### Configuration Example

#### Configuring the LFF

<b>Scenario</b> Figure 7-20	
	In Figure 7-20, Switch 1 and Switch 2 form a VSU system. It is assumed that Switch 1 is the global master switch and configuration is performed on Switch 1.
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the AP LFF.</li> </ul>
<b>Switch-1</b>	<pre>Ruijie#config Ruijie(config)# switch virtual domain 100 Ruijie(config-vs-domain)# switch virtual aggregateport-lff enable</pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show switch virtual balance</b> command for verification.</li> </ul>
<b>Switch-1</b>	<pre>Ruijie#show switch virtual balance Aggregate port LFF: enable Ecmp lff enable</pre>

### 7.4.2.5 Changing the VSU Mode to the Standalone Mode

#### Configuration Effect

Dismiss the VSU system into individual devices that can operate in the standalone mode.

#### Configuration Steps

- Run the **switch convert mode standalone** [*switch\_id*] command to change the VSU mode to the standalone mode. This command is optional.
- After you run this command, the system will prompt you as follows: Whether to restore the configuration file to standalone text? If **yes**, the configuration file will be restored; if **no**, the configuration of virtual device mode will be cleared.

<b>Command</b>	<b>switch convert mode standalone</b> [ <i>switch_id</i> ]
<b>Parameter</b>	<i>switch_id</i> : Indicates the switch ID.
<b>Description</b>	
<b>Defaults</b>	The switch is in the standalone mode by default.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	<p>After you run the <b>switch convert mode standalone</b> command, the master switch backs up the global configuration files of all VSDs in the VSU mode as <i>vsd.virtual_switch.text.vsd</i> ID. Then, the master switch clears the global configuration files <i>config.text</i> of all VSDs in the VSU mode, and asks you whether to overwrite the global configuration files <i>config.text</i> with <i>vsd.standalone.text.vsd</i> ID. If you select <b>yes</b>, the content of <i>vsd.standalone.text.vsd</i> ID will overwrite the global configuration file <i>config.text</i> of all VSDs; otherwise, the master switch does not recover <i>config.text</i>. Finally, restart the switch.</p> <p>This command can be used in the standalone mode or VSU mode. If the command is executed in the standalone mode, the mode switching is performed on the current switch. If the command contains the <i>sw_id</i> parameter and is executed in the VSU mode, the mode switching is performed on the switch with the ID specified by <i>sw_id</i>. If the command does not contain the <i>sw_id</i> parameter, the mode switching is performed on the master switch. You are advised to switch the mode of the slave switch and then that of the master switch.</p>

#### Configuration Example

##### ↘ Changing the VSU Mode to the Standalone Mode

<p><b>Scenario</b> Figure 7-21</p>	<div style="text-align: center;">  </div> <p>In Figure 7-21, it is assumed that Switch 1 and Switch 2 form a VSU system and Switch 1 is the global master switch.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Change the mode of Switch 1 to the standalone mode.</li> <li>● Change the mode of Switch 2 to the standalone mode.</li> </ul>
<p><b>Switch-1</b></p>	<pre>Ruijie# switch convert mode standalone 1 Ruijie# switch convert mode standalone 2</pre>
<p><b>Verification</b></p>	<p>Run the <b>show switch virtual config</b> command to display the switch status.</p>
<p><b>Switch-1</b></p>	<pre>Ruijie#show switch virtual config switch_id: 1 (mac: 0x1201aeda0M) ! switch virtual domain 100 ! switch 1 switch 1 priority 100 ! switch convert mode standalone ! port-member interface Tengigabitethernet 1/1 ! port-member interface Tengigabitethernet 1/3 !</pre>
	<pre>switch_id: 2 (mac: 0x1201aeda0E) ! switch virtual domain 100 ! switch 2</pre>

```

switch 2 priority 150
!
switch convert mode standalone
!
port-member interface Tengigabitethernet 1/1
!
port-member interface Tengigabitethernet 1/2
!
switch 2 description switch-2

```

## 7.5 Monitoring and Maintenance

### Displaying

Description	Command
Displays the current VSU operation, topology or configuration.	<b>show switch virtual [ topology   config   role ]</b>
Displays the current dual-active configuration.	<b>show switch virtual dual-active { bfd   aggregateport   summary }</b>
Displays the current VSL running information in the VSU mode.	<b>show switch virtual link [ port ]</b>
Redirects to the console of the master switch or any switch.	<b>session { device <i>switch_id</i>   master }</b>
Displays the current switch ID.	<b>show switch id</b>

## 8 Configuring VSD

### 8.1 Overview

As Information Communication Technology (ICT) networks especially data center networks keep growing, service types emerge one after another. On one hand, network management becomes increasingly complicated. On the other hand, increasingly-higher requirements are posed on network properties such as service isolation, security and reliability. In addition, with the rapid improvement of hardware capacity and the maturity of multi-shelf, cluster, distributed routing & switching systems, the service processing capacity of a single physical network device has been raised to a new level. It becomes imperative to make full use of the powerful service processing capacity to resiliently meet present service demands while promoting expansibility smoothly in the future.

A Virtual Switch Device (VSD) is a network virtualization technology that divides one physical device into several logical devices. Each logical device is called a VSD, which has independent hardware and software resources, including interfaces, CPU, a routing table and a forwarding table to be separately maintained, and configuration files managed by specific administrators. From users' perspective, each VSD is an independent device.

A physical device can be virtualized into several logical devices using the VSD technology, as shown in Figure 8-1. A physical device bears several network nodes on the logical topology to maximize the utilization of existing resources and reduce operation costs. Meanwhile, different VSDs are deployed with different services to shield services from faults, thereby improving network security and reliability.

Figure 8-1 VSD

As shown in Figure 8-1, VSD0 is the system default VSD while VSD1 and VSD2 are non-default VSDs created by users.

- VSD0: administrative domain, also the default VSD. It exists by default and cannot be deleted. It creates and deletes non-default VSDs, and manages all physical resources of the device, including physical ports, CPU, and memory resources.
- VSD1: client domain, also called the non-default VSD (the same as VSD2). It is created and deleted by VSD0, with its physical resources assigned by VSD0. The client domain can use only the resources assigned by VSD0. It cannot use or obtain other resources.

- Physical port resources: physical Ethernet ports on line cards only, excluding any other types of ports such as console and management ports.

### Advantages

- The VSD technology divides physical ports based on service chips to ensure superposition of service capacity, which means service specifications are exclusively shared among VSDs. For example, if the VLAN service specifications are 4063 VLANs, the VLAN service specifications are 4063 VLANs for both VSD 1 and VSD2.
- Each VSD works independently. If isolated, VSDs cannot communicate with each other, thereby achieving relatively high security.
- VSD supports flexible resource scheduling. For example, if there are new branches, the administrator can divide VSDs on demand to reduce costs in the purchase and hardware upgrade of network devices, so as to enhance utilization of present network resources.

### Management

- Out-of-band management: VSDs are managed via a management (MGMT) port. All VSDs share a MGMT port on the supervisor module, and have different MGMT ports of their own with IP addresses configured. Users can log in to the VSD CLI corresponding to the specified IP address of a MGMT port.

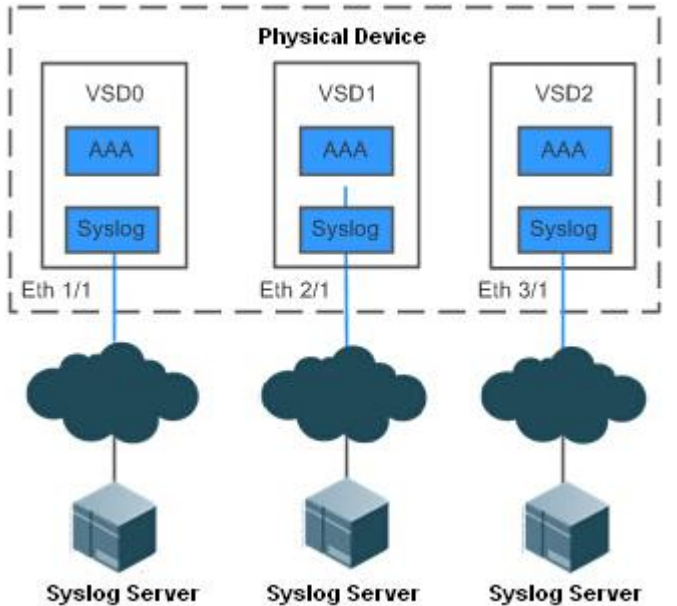

Figure 8-2 Out-of-band Management

- In-band management: VSDs are managed via a physical Ethernet port. Users can log in to the VSD console corresponding to the specified VSD port. For example, Eth 2/1 port can only place you in the VSD1 CLI, as shown in Figure 8-3.

Figure 8-3 In-band Management

- CLI management: VSDs are managed via a serial port on the supervisor module. By default, you log in to the VSD0 CLI via the serial port.

### Protocols and Standards

- VSD is a Ruijie-proprietary protocol.

## 8.2 Applications

Application	Description
<a href="#">Providing isolated services within a physical device</a>	Virtualize a physical device into several logical devices that provide isolated services.

### 8.2.1 Providing Isolated Services within a Physical Service

#### Scenario

The VSD technology can be used to virtualize one physical device into several logical devices that provide independent services.

As shown in Figure 8-4, a convergence device is virtualized into three logical devices that provide isolated services to areas A, B, and C.

- VSD1 is the uplink device of area A, VSD2 is the uplink device of area B, and VSD3 is the uplink device of area C.
- VSD1, VSD2, and VSD3 respectively connect to devices in the corresponding areas via their own links.

Figure 8-4

## Deployment

- VSD1, VSD2, and VSD3 are independent logical devices, deployed with services based on requirements of areas A, B, and C.

## 8.3 Features

### Basic Concepts

#### ↘ Default VSD

The VSD-capable physical device is the default VSD. Therefore, login to such a device is actually login to the default VSD. Any configuration on the physical device is applied to the default VSD. The default VSD exists originally and cannot be deleted. It has all permissions of the physical device, and uses and manages all hardware resources of the device. The default VSD not only creates and deletes non-default VSDs, but also assigns hardware resources to the non-default VSDs. By default, hardware resources that are not assigned to the non-default VSDs are used by the default VSD. The default VSD is called Ruijie and numbered 0.

#### ↘ Non-Default VSD

In comparison, a non-default VSD has to be created by the default VSD before use. It is created without physical port resources (other resources of the physical device such as CPU and memory shared with the default VSD), and has no available physical port resources until assigned by the default VSD. Non-default VSDs cannot be created or deleted by another non-default VSD.

#### ↘ Physical Device Resources

Physical device resources include:

- **Physical ports:** physical port resources that exclude virtual ports and serial ports.
- **CPU:** CPU time that each VSD can use.
- **SD cards:** storage resources of external storage SD cards.
- **Memory:** physical device memory which normally means board memory.

**i** By default, physical port resources belong to the default VSD while other physical resources are shared between the default VSD and non-default VSDs.

#### ↘ MAC Address

A physical switch normally has a system MAC address. When a physical device is virtualized into several logical devices, each logical device requires a system MAC address. Therefore, each VSD will be automatically assigned a MAC address (while the system MAC of the default VSD is that of the physical device).

### ↘ VSD's Master/Slave Role

A classis-type device is normally equipped with two supervisor modules to ensure high availability. When working properly, one of the supervisor modules plays the master role while the other serves as the salve. Service data of the master supervisor module will be backed up to the slave supervisor module. Once divided, each VSD is distributed on both the master supervisor module and the slave supervisor module to play roles. To prevent other VSD users from being affected by the master/slave switching executed by non-default VSD users, only the VSDO administrator can execute the master/slave switching command.

### Features

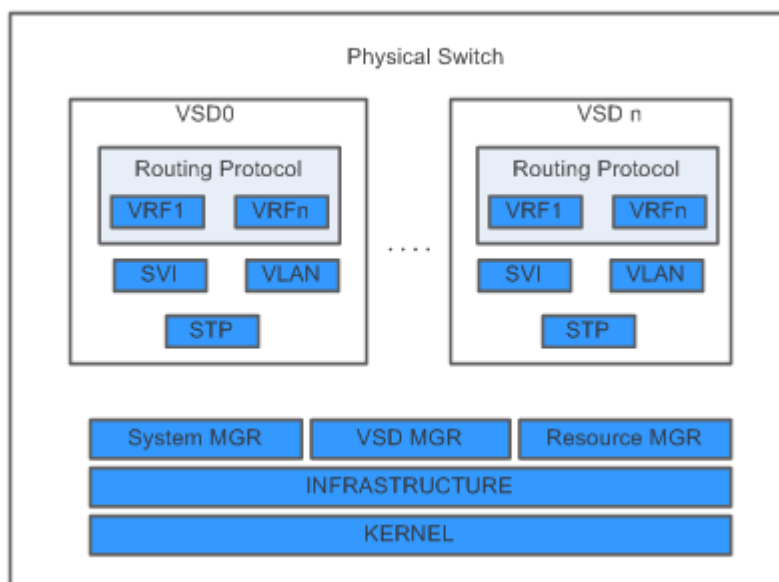

Feature	Function
<a href="#">VSD</a>	Virtualize a physical device into several logical devices.

## 8.3.1 VSD

### Working Principle

VSD can be regarded as a kind of virtualization technology that virtualizes a physical device into several logical devices. VSD virtualization is constructed based on the virtualization technology for operating systems. Different from the virtual machine technology, it utilizes system services provided by the operating system kernel to ensure mutually isolated user space services. Operating systems that adopt this virtualization include Linux Containers (Linux LXC), OpenVZ, Linux-VServer, and FreeBSD jails.

Figure 8-5 Structure of VSD 1:N Virtualization

As shown in Figure 8-5, the default VSD is VSD0 while the non-default ones created by users are VSD1 to VSDn.

- System MGR: When a VSD is created, the System MGR will initiate all processes required to start the VSD. When a VSD needs to enable a new service, the System MGR will initiate the corresponding service process (for example, when VSD2 starts the OSPF service, the System MGR will initiate a corresponding OSPF process). When a VSD is deleted, the System MGR will delete all service processes belonging to the VSD.
- VSD MGR: The VSD MGR is used to support non-default VSD management to create and delete non-default VSDs. More importantly, the VSD MGR provides the System MGR or Resource MGR with related APIs to achieve system management or resource management of non-default VSDs.
- Resource MGR: It allocates resources such as VLANs and VRFs to various VSDs during resource management.
- INFRASTRUCTURE layer: It provides interfaces between upper-layer applications and hardware resources.
- KERNEL: There is only one kernel as VSD is light-weight virtualization.

## 8.4 Configuration

Configuration	Suggestions and Related Commands	
<a href="#">Configuring a VSD</a>	 Mandatory configuration, which is used to create a VSD.	
	<b>vsd</b> <i>vsd_name</i> [ <i>id vsd_number</i> ]	Creates a VSD.
	<b>allocate interface</b> <i>int_index</i>	Allocates physical ports to the VSD.
	<b>allocate slot</b> <i>slot_id</i>	Allocates multi-service cards to the VSD.
	<b>cpu weight</b> <i>weight_value</i>	Allocates the CPU weight to a VSD.
	<b>memory ratio</b> <i>limit_ratio</i>	Allocates the maximum memory ratio to a VSD.
<a href="#">Restarting a VSD</a>	 Optional configuration, which is used to restart a VSD as necessary.	
	<b>reset vsd</b> [ <i>vsd_name</i> ]	Restarts a non-default VSD.
<a href="#">Switching Between VSDs</a>	 Optional configuration, which is used to switch between the default VSD and a non-default VSD.	
	<b>switchto vsd</b> <i>vsd_name</i>	Switches from the default VSD to a non-default VSD.
	<b>switchback</b>	Switches back from the non-default VSD to the default VSD.

### 8.4.1 Configuring a VSD

#### Configuration Effect

- Create a non-default VSD.
- Allocate physical port resources to the newly created non-default VSD.
- Allocate multi-service cards to the newly created non-default VSD.

## Precautions

- Users can use the VSD function in a VSU environment. When allocating ports to the VSD, the line card where the ports are located will be reset, thereby disconnecting the VSL link on the line card. As there is only one VSL link in the system, the VSU will also be topologically split. It is recommended that you use the VSD function in the VSU environment and configure VSL ports on several line cards to ensure the stability of the VSU and prevent the VSU from being affected by allocating VSD ports or restarting the VSD.
- The VSD0 administrator can set any eligible port of any VSD as a VSL port to be centrally managed by VSD0. The VSD0 administrator can switch any VSL port back to a normal port that will return to the VSD of the chip where the port is located. For example, all ports on a line card are under VSD2, and only one port is set as a VSL port. When the administrator switches the VSL port to a normal port, it will return to VSD2.
- The dual-host detection port in the VSD environment must be set in VSD0. When VSD0 detects the dual host status, all VSDs enter the recovery status.

## Configuration Steps

### ↳ Creating a VSD

- To use the VSD function, you must configure it first.

<b>Command</b>	<b>vsd</b> <i>vsd_name</i> [ <b>id</b> <i>vsd_number</i> ]
<b>Parameter</b>	<i>vsd_name</i> : VSD name
<b>Description</b>	<i>vsd_number</i> : VSD ID. If not specified, the minimum available ID will be used.
<b>Defaults</b>	No VSD is created by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to create a VSD and enter the VSD configuration mode. If a VSD has been created, use this command to enter the VSD configuration mode.</p> <p>When entering the specified VSD configuration mode, you do not need to enter the <i>vsd_number</i>. If you enter the <i>vsd_number</i>, make sure that it is consistent with the current VSD number; otherwise, an error message appears.</p> <p> Get a corresponding license before you create a non-default VSD, with the total number of non-default VSDs created not greater than the total authorized number. The name of a VSD is independent from and irrelevant to the hostname of the device.</p>

### ↳ Allocating Physical Port Resources

- The configuration is mandatory.

<b>Command</b>	<b>allocate interface</b> <i>int_index</i>
<b>Parameter</b>	<i>int_index</i> : Interface index
<b>Description</b>	
<b>Defaults</b>	All physical ports belong to VSD 0.
<b>Command Mode</b>	VSD configuration mode

<b>Usage Guide</b>	This command is used to allocate or reclaim physical ports to or from a non-default VSD.
	 If no physical port is available for a non-default VSD, the VSD can only be managed but not used. If all physical ports are allocated to a non-default VSD, the default VSD will have no physical port available. The VSL interface cannot be allocated.

➤ **Allocating Multi-Service Card Resources**

- The configuration is optional.
- To use a multi-service card such as a firewall card in a certain non-default VSD environment, users have to perform this configuration in VSD mode. If a multi-service card is used by a non-default VSD, other non-default VSDs cannot use this multi-service card. For example, a firewall card is used in a non-default VSD2, and then other VSDs cannot use it.

<b>Command</b>	<code>allocate slot slot_id</code>
<b>Parameter</b>	<code>slot_id</code> : Multi-service slot ID
<b>Description</b>	
<b>Defaultls</b>	The multi-service card belongs to VSD 0.
<b>Command Mode</b>	VSD configuration mode
<b>Usage Guide</b>	This command is used to allocate multi-service card resources to a non-default VSD or to reclaim multi-service card resources from the non-default VSD.

**Verification**

A newly created VSD is an independent logical device, and its configuration can be verified after you log in to the VSD.

- Check whether you can log in to the newly created VSD.
- Check whether you can configure ports after logging in to the VSD.

**Configuration Example**

➤ **Creating Three Logical Devices on a Physical Device**

<b>Network Environment</b> Figure 8-6	
<b>Configuration Method</b>	Create VSD A; <ul style="list-style-type: none"> <li>● Allocate physical port 1/1-24 to VSD A;</li> <li>● Allocate multi-service card 3 to VSD A.</li> </ul> Create VSD B; <ul style="list-style-type: none"> <li>● Allocate physical port 1/25-48 to VSD B;</li> <li>● Allocate multi-service card 4 to VSD B.</li> </ul>

	<p>Create VSD C;</p> <ul style="list-style-type: none"> <li>● Allocate physical port 2/1-12 to VSD C;</li> <li>● Allocate multi-service card 5 to VSD C.</li> </ul>
<b>VSD A</b>	<pre>Ruijie# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)# vsd VSDA Ruijie(config-vsd)# allocate int gi 1/1 Interface-group[1/1 ~ 1/24] and their config will be removed from vsd[0]. Are you sure to continue(y/n)? [no]y Ruijie(config-vsd)# allocate slot 3 Allocating slot 3 may cause some service in source vsd to stop. Are you sure to continue (y/n)? [no]y Ruijie(config-vsd)#</pre>
<b>VSD B</b>	<pre>Ruijie# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)# vsd VSDB Ruijie(config-vsd)# allocate int gi 1/25 Interface-group[1/25 ~ 1/48] and their config will be removed from vsd[0]. Are you sure to continue(y/n)? [no]y Ruijie(config-vsd)# allocate slot 4 Allocating slot 4 may cause some service in source vsd to stop. Are you sure to continue (y/n)? [no]y Ruijie(config-vsd)#</pre>
<b>VSD C</b>	<pre>Ruijie# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)# vsd VSDC Ruijie(config-vsd)# allocate int gi 2/1 Interface-group[2/1 ~ 2/12] and their config will be removed from vsd[0]. Are you sure to continue(y/n)? [no]y Ruijie(config-vsd)# allocate slot 5 Allocating slot 5 may cause some service in source vsd to stop. Are you sure to continue (y/n)? [no]y Ruijie(config-vsd)#</pre>
<b>Verification</b>	Log in to the corresponding VSD to perform relevant port configuration.

<p><b>VSD A</b></p>	<pre>Ruijie# switchto vsd VSDA ***** Ruijie General Operating System Software Copyright (c) 1998-2013s by Ruijie Networks. All Rights Reserved. Neither Decompiling Nor Reverse Engineering Shall Be Allowed. ***** Ruijie-VSDA&gt; enable Ruijie-VSDA# show int</pre>
<p><b>VSD B</b></p>	<pre>Ruijie# switchto vsd VSDB ***** Ruijie General Operating System Software Copyright (c) 1998-2013s by Ruijie Networks. All Rights Reserved. Neither Decompiling Nor Reverse Engineering Shall Be Allowed. ***** Ruijie-VSDA&gt; enable Ruijie-VSDA# show int</pre>
<p><b>VSD C</b></p>	<pre>Ruijie# switchto vsd VSDC ***** Ruijie General Operating System Software Copyright (c) 1998-2013s by Ruijie Networks. All Rights Reserved. Neither Decompiling Nor Reverse Engineering Shall Be Allowed. ***** Ruijie-VSDA&gt; enable Ruijie-VSDA# show int</pre>

**Common Errors**

- You create a VSD without any valid license.
- The total number of non-default VSDs created exceeds the maximum number authorized.

- You reclaim a port that does not belong to a non-default VSD.
- You allocate a physical port belonging to a non-default VSD to another non-default VSD.
- No new physical port resources are available for allocation.

## 8.4.2 Restarting a VSD

### Configuration Effect

- Restarting a single non-default VSD will only affect services in the non-default VSD.

### Notes

- The interface card of the non-default VSD will be reset. If a VSL port is involved on the line card where the VSD port is located, the VSU might be topologically split. Therefore, it is recommended that the restart operation be performed only when services are not busy.
- The default VSD cannot be restarted.

### Configuration Method

- To restart a VSD, perform this configuration.

<b>Command</b>	Use this command to log in from the default VSD to a non-default VSD. <b>switchto vsd</b> <i>vsd_name</i>	
<b>Parameter Description</b>	<b>Parameter</b>	<b>Description</b>
	<b>vsd</b> <i>vsd_name</i>	Name of a non-default VSD
<b>Command Mode</b>	Privileged EXEC mode	
<b>Usage Guide</b>	This command is used to log in from the default VSD to a non-default VSD.	

<b>Command</b>	Use this command to switch back from the non-default VSD to the default VSD. <b>switchback</b>	
<b>Parameter Description</b>	<b>Parameter</b>	<b>Description</b>
	N/A	N/A
<b>Command Mode</b>	Privileged EXEC mode	
<b>Usage Guide</b>	This command is used to switch back from a non-default VSD to the default VSD. This command does not support login to the non-default VSD via Telnet, which means that this command is effective only when switching from the default VSD to the non-default VSD (that is to say, switchto shall go before switchback).	

### Verification

When a VSD is restarted, only its services will be interrupted. Other VSDs will not be affected unless the port on the interface card is shared by two VSDs.

### 8.4.3 VSD Switching

#### Configuration Effect

- Switch from VSD0 to a non-default VSD or vice versa.

#### Notes

- Users cannot switch between VSDs if directly logging in via the out-of-band or in-band port.

#### Configuration Method

- To switch between VSDs, perform this configuration. The switching between non-default VSDs has to be performed via the default VSD. For example, to switch from non-default VSD1 to VSD2, you have to switch first from VSD1 to the default VSD0 and then from VSD0 to VSD2.

#### Verification

Check the current VSD ID after logging in.

#### Configuration Example

- **Switching to a Non-default VSD**

<b>Configuration Method</b>	<ul style="list-style-type: none"> <li>● Switch from VSD0 to a non-default VSD;</li> <li>● Switch from the non-default VSD back to VSD0.</li> </ul>

## 9 Configuring NLB Group

### 9.1 Overview

NLB Group, also called the cluster service, is a cluster technology developed to support Network Load Balance (NLB) of Microsoft®.

NLB Group allows all member servers in a cluster to receive IP packets sent to the cluster. As compared with common cluster technologies, switches enabled with NLB Group can directly connect to servers without using layer-2 switches. In addition, data packets can be sent to the server only from specified ports to prevent flooding in the broadcast domains.

When setting up a cluster to provide external services, you can enable NLB Group on the switch to improve service reliability.

### 9.2 Applications

Application	Description
<a href="#">Supporting Web Server NLB Group</a>	Uses NLB to set up a web server cluster with the support of NLB Group on layer-3 switches.

#### 9.2.1 Supporting Web Server NLB Group

##### Scenario

As shown in Figure 9-1, a web server is set up using NLB Group to provide website services externally. By default, NLB Group is disabled on layer-3 switches, that is, IP packets sent to the cluster cannot be sent to the active and standby servers at the same time. Normally, a layer-2 switch is needed between the cluster server and layer-3 switch. In this way, IP packets can be sent to the active and standby servers at the same time but a unicast data packet has only one next-hop address. To allow the active and standby servers to receive IP data packets sent to the cluster, you need to configure the cluster service on the layer-3 switch. After this, packets sent to the NLB Group with IP address 192.168.1.10 are sent to the active and standby servers through ports Gi 1/1 and Gi 1/2 at the same time.

Figure 9-1 NLB Group Application Diagram

## Deployment

- Enable NLB Group on layer-3 switches.

## 9.3 Features

### Basic Concepts

#### ↳ NLB

NLB is a cluster technology built in Windows Server by Microsoft®. It provides network load balance for TCP/IP-based services and applications to improve availability and extensibility.

**i** For details about the NLB service, visit Microsoft® website <http://technet.microsoft.com>.

#### ↳ VRF

NLB Group supports VPN Routing and Forwarding (VRF). VPN refers to the VPN to which the NLB Group belongs on the layer-3 switch.

#### ↳ NLB-Address

NLB Group IP address. NLB allows all PCs in an NLB Group to share the same IP address to provide external services.

### ↘ Reflector-Port

Reflector port. To implement the NLB Group service, the layer-3 switch sends IP packets sent to the NLB Group to all member hosts of the NLB Group server through a reflector port.

 A reflector port must be configured. It can only be a layer-2 switching port and no configuration is allowed on the reflector port. To ensure normal NLB Group service, the reflector port must be idle, that is, no network cable or optical fiber cable can be inserted into the port.

### ↘ Destination-Port

Destination port to which packets are sent, that is, the port that connects the member host in the NLB Group and layer-3 switch, for example, Gi 1/1 and Gi 1/2 in Figure 9-1.

 The NLB Group server communicates with the layer-3 switch using SVI, but not the routed port.

## Overview

Feature	Description
<a href="#">NLB Group</a>	Supports NLB Group of Microsoft.

## 9.3.1 NLB Group

### Working Principle

Using Figure 9-1 for example, the following describes the working principle of NLB Group:

1. A user sends an IP packet whose destination IP address is the NLB Group IP address, 192.168.1.10.
2. The IP packet reaches the layer-3 switch through routing.
3. After reaching the layer-3 switch through Gi 2/1, the IP packet is sent to the reflector port and then forwarded to the destination ports Gi 1/1 and Gi 1/2 by the reflector port.
4. The active and standby servers in the NLB Group receive the IP packet.

### Related Configuration

#### ↘ Enabling NLB Group

- By default, NLB Group is disabled.
- After NLB Group attributes are configured, the NLB Group service is automatically enabled.

#### ↘ Configuring NLB Group Attributes

- By default, no NLB Group attribute is configured.
- Run the **nlb-group** *group-number* [ **vrf** *vrf-name* ] **ip** *nlb-address* **reflector-port** *interface-name* command to configure NLB Group attributes. The value of **group-number** ranges from 1 to 100. If **vrf** is not specified, a global VRF is used.

#### ↘ Configuring the NLB Group Destination Port

- By default, no NLB Group destination port is configured.
- Run the **nlb-group** *group-number* **destination-port** *interface-name* command to configure the NLB Group destination port. A maximum of 32 destination ports can be configured.

## 9.4 Configuration

Configuration	Description and Command
<a href="#">Configuring NLB Group Attributes</a>	 (Mandatory) It is used to enable NLB Group.
	<b>nlb-group</b> <i>group-number</i> [ <b>vrf</b> <i>vrf-name</i> ] <b>ip</b> <i>nlb-address</i> <b>reflector-port</b> <i>interface-name</i> <span style="float: right;">Configures NLB Group attributes.</span>
<a href="#">Configuring the NLB Group Destination Port</a>	 (Optional) By default, all ports in the VLAN where the NLB Group resides are used as the NLB Group destination ports.
	<b>nlb-group</b> <i>group-number</i> <b>destination-port</b> <i>interface-name</i> <span style="float: right;">Configures the NLB Group destination port.</span>

### 9.4.1 Configuring NLB Group Attributes

#### Configuration Effect

- Enable NLB Group to send IP packets sent to the NLB Group to all member hosts in the NLB Group.

#### Notes

- NLB Group does not support dynamic switching of the operation mode in the NLB Group.
- When the NLB cluster server works in IGMP multicast mode, layer-3 multicast cannot be enabled on the layer-3 switch; otherwise, NLB Group may be abnormal. If layer-3 multicast must be enabled, configure the NLB Group server to work in non-IGMP multicast mode, that is, unicast mode or multicast mode.

#### Configuration Steps

##### ▾ Configuring NLB Group Attributes

- Mandatory.
- Configure the attributes on the switch.

#### Verification

Use a client to access the NLB Group and send a service request.

- Check whether a response is received to the request.
- Check whether all member hosts receive the request.

#### Related Commands

## ↘ Configuring NLB Group Attributes

<b>Command</b>	<code>nlb-group group-number [ vrf vrf-name ] ip nlb-address reflector-port interface-name</code>
<b>Parameter</b>	<i>group-number</i> : Specifies the NLB Group number.
<b>Description</b>	<i>vrf-name</i> : Specifies the VRF. <i>nlb-address</i> : Specifies the NLB Group IP address. <i>interface-name</i> : Specifies the interface name.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To remove NLB group attributes, run the <code>no nlb-group group-number [ vrf vrf-name ] ip nlb-address reflector-port interface-name</code> or <code>no nlb-group group-number</code> command. To delete all NLB groups, run <code>no nlb-group all</code> .

## Common Errors

- A layer-3 port is configured as the reflector port.

## 9.4.2 Configuring the NLB Group Destination Port

### Configuration Effect

- Configure NLB Group so that IP packets sent to the NLB Group are sent to the NLB Group server through specified ports.

### Notes

- When the NLB Group server works in NLB IGMP multicast mode, you can configure NLB Group attributes as well as selecting whether to enable IGMP Snooping. If IGMP Snooping is enabled, the switch automatically learns the NLB Group destination port through IGMP Snooping and users do not need to manually configure the port. If the NLB Group destination port is configured and IGMP Snooping is enabled, only the destination ports receiving IGMP Report messages can receive the packet to access NLB Group, that is, the ports not only configured by users but also learned through IGMP Snooping. If IGMP Snooping is disabled, the switch cannot automatically learn the NLB Group destination port, which is the same as that when NLB Group works in unicast mode.

## Configuration Steps

### ↘ Configuring the NLB Group Destination Port

- Optional.
- When the NLB Group server works in unicast or multicast mode, it is advised to configure the ports directly connected to member hosts as NLB Group destination ports.
- Destination ports are configured on the switch.

## Verification

- Check whether the configurations are successful.

## Related Commands

### Configuring the NLB Group Destination Port

<b>Command</b>	<code>nlb-group group-number destination-port interface-name</code>
<b>Parameter</b>	<i>group-number</i> : Specifies the NLB Group number.
<b>Description</b>	<i>interface-name</i> : Specifies the interface name.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To delete NLB Group destination ports, run the <b>no nlb-group group-number destination-port interface-name</b> or <b>no nlb-group group-number</b> command.

## Configuration Example

### Configuring NLB Group Attributes and Specifying Connection Ports

<p><b>Scenario</b> Figure 9-2</p>	<p>The diagram illustrates an NLB Cluster configuration. A dashed box labeled 'NLB Cluster' contains two member hosts: 'Member Host 1/2' with IP 192.168.1.8 and 'Member Host 2/2' with IP 192.168.1.9. A dotted line between them is labeled 'NLB Interaction'. The cluster IP is 192.168.1.10. Both member hosts are connected to a 'Core Switch' at interfaces Gi 1/1 and Gi 1/2 respectively. The Core Switch is also connected to a 'User' at interface Gi 2/1.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure VLAN 10 and add Gi 1/1 and Gi 1/2 to VLAN 10.</li> <li>● Configure SVI 10 and assign IP address 192.168.1.1 to SVI 10.</li> <li>● Configure the routing port Gi 2/1 and assign IP address 192.168.2.1 to Gi 2/1.</li> <li>● Configure NLB Group attributes and specify connection ports.</li> </ul>
<p><b>A</b></p>	<pre>Ruijie#configure Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#interface range gigabitEthernet 1/1-2 Ruijie(config-if-range)#switchport access vlan 10 Ruijie(config-if-range)#exit</pre>
<p><b>B</b></p>	<pre>Ruijie(config)#interface vlan 10</pre>

	<pre>Ruijie(config-if-VLAN 10)#ip address 192.168.1.1/24 Ruijie(config-if-VLAN 10)#end</pre>
<b>C</b>	<pre>Ruijie(config)#interface gigabitEthernet 2/1 Ruijie(config-if-GigabitEthernet 2/1)#no switchport Ruijie(config-if-GigabitEthernet 2/1)#ip address 192.168.2.1/24 Ruijie(config-if-GigabitEthernet 2/1)#exit</pre>
<b>D</b>	<pre>Ruijie(config)#nlb-group 1 ip 192.168.1.10 reflector-port gigabitEthernet 1/3 Ruijie(config)#nlb-group 1 destination-port gigabitEthernet 1/1-2</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Send a packet from user 192.168.2.2 to NLB Group 192.168.1.10 and check whether all member hosts receive the request packet.</li> <li>In privileged mode, run the <b>show nlb-group</b> command to display the current status of NLB Group 1.</li> </ul>

### Common Errors

- The reflector port is configured as the NLB Group destination port.

## 9.5 Monitoring

6. Configuring sFlow

# 1 Configuring SNMP

## 1.1 Overview

Simple Network Management Protocol (SNMP) became a network management standard RFC1157 in August 1988. At present, because many vendors support SNMP, SNMP has in fact become a network management standard and is applicable to the environment where systems of multiple vendors are interconnected. By using SNMP, the network administrator can implement basic functions such as information query for network nodes, network configuration, fault locating, capacity planning, and network monitoring and management.

### ↳ SNMP Versions

Currently, the following SNMP versions are supported:

- SNMPv1: The first official version of SNMP, which is defined in RFC1157.
- SNMPv2C: Community-based SNMPv2 management architecture, which is defined in RFC1901.
- SNMPv3: SNMPv3 provides the following security features by identifying and encrypting data.
  1. Ensuring that data is not tampered during transmission.
  2. Ensuring that data is transmitted from legal data sources.
  3. Encrypting packets and ensuring data confidentiality.

### Protocols and Standards

- RFC 1157, Simple Network Management Protocol (SNMP)
- RFC 1901, Introduction to Community-based SNMPv2
- RFC 2578, Structure of Management Information Version 2 (SMIv2)
- RFC 2579, Textual Conventions for SMIv2
- RFC 3411, An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks
- RFC 3412, Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)
- RFC 3413, Simple Network Management Protocol (SNMP) Applications
- RFC 3414, User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)
- RFC 3415, View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)
- RFC 3416, Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)
- RFC 3417, Transport Mappings for the Simple Network Management Protocol (SNMP)
- RFC 3418, Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)
- RFC 3419, Textual Conventions for Transport Addresses

## 1.2 Applications

Application	Description
<a href="#">Managing Network Devices Based on SNMP</a>	Network devices are managed and monitored based on SNMP.

### 1.2.1 Managing Network Devices Based on SNMP

#### Scenario

Take the following figure as an example. Network device A is managed and monitored based on SNMP network manager.

Figure 1-1

<b>Remarks</b>	A is a network device that needs to be managed. PC is a network management station.
----------------	--

#### Deployment

The network management station is connected to the managed network devices. On the network management station, users access the Management Information Base (MIB) on the network devices through the SNMP network manager and receive messages actively sent by the network devices to manage and monitor the network devices.

## 1.3 Features

#### Basic Concepts

SNMP is an application layer protocol that works in C/S mode. It consists of three parts:

- SNMP network manager
- SNMP agent
- MIB

Figure 1-2 shows the relationship between the network management system (NMS) and the network management agent.

↳ **SNMP Network Manager**

The SNMP network manager is a system that controls and monitors the network based on SNMP and is also called the NMS.

↳ **SNMP Agent**

The SNMP agent (hereinafter referred to as the agent) is software running on the managed devices. It is responsible for receiving, processing, and responding to monitoring and control packets from the NMS. The agent may also actively send messages to the NMS.

↳ **MIB**

The MIB is a virtual network management information base. The managed network devices contain lots of information. To uniquely identify a specific management unit among SNMP packets, the MIB adopts the tree hierarchical structure. Nodes in the tree indicate specific management units. A string of digits may be used to uniquely identify a management unit system among network devices. The MIB is a collection of unit identifiers of network devices.

Figure 1-3 Tree Hierarchical Structure

### ↳ Operation Types

Six operation types are defined for information exchange between the NMS and the agent based on SNMP:

- Get-request: The NMS extracts one or more parameter values from the agent.
- Get-next-request: The NMS extracts the parameter value next to one or more parameters from the agent.
- Get-bulk: The NMS extracts a batch of parameter values from the agent.
- Set-request: The NMS sets one or more parameter values of the agent.
- Get-response: The agent returns one or more parameter values, which are the operations in response to the three operations performed by the agent on the NMS.
- Trap: The agent actively sends a message to notify the NMS of something that happens.

The first four packets are sent by the NMS to the agent and the last two packets are sent by the agent to the NMS. (Note: SNMPv1 does not support the Get-bulk operation.) Figure 1-4 describes the operations.

Figure 1-4 SNMP Packet Types

The three operations performed by the NMS on the agent and the response operations of the agent are based on UDP port 161. The trap operation performed by the agent is based on UDP port 162.

### Overview

Feature	Description
<a href="#">Basic SNMP Functions</a>	The SNMP agent is configured on network devices to implement basic functions such as information query for network nodes, network configuration, fault locating, and capacity planning.
<a href="#">SNMPv1 and SNMPv2C</a>	SNMPv1 and SNMPv2C adopt the community-based security architecture, including authentication name and access permission.

<a href="#">SNMPv3</a>	SNMPv3 redefines the SNMP architecture, namely, it enhances security functions, including the security model based on users and access control model based on views. The SNMPv3 architecture already includes all functions of SNMPv1 and SNMPv2C.
------------------------	--

## 1.3.1 Basic SNMP Functions

### Working Principle

#### Working Process

SNMP protocol interaction is response interaction (for exchange of packets, see Figure 1-4). The NMS actively sends requests to the agent, including Get-request, Get-next-request, Get-bulk, and Set-request. The agent receives the requests, completes operations, and returns a Get-response. Sometimes, the agent actively sends a trap message and an Inform message to the NMS. The NMS does not need to respond to the trap message but needs to return an Inform-response to the agent. Otherwise, the agent re-sends the Inform message.

### Related Configuration

#### Shielding or Disabling the SNMP Agent

By default, the SNMP function is enabled.

The **no snmp-server** command is used to disable the SNMP agent.

The **no enable service snmp-agent** command is used to directly disable all SNMP services.

#### Setting Basic SNMP Parameters

By default, the system contact mode, system location, and device Network Element (NE) information are empty. The default serial number is 60FF60, the default maximum packet length is 1,572 bytes, and the default UDP port ID of the SNMP service is 161.

The **snmp-server contact** command is used to configure or delete the system contact mode.

The **snmp-server location** command is used to configure or delete the system location.

The **snmp-server chassis-id** command is used to configure the system serial number or restore the default value.

The **snmp-server packetsize** command is used to configure the maximum packet length of the agent or restore the default value.

The **snmp-server net-id** command is used to configure or delete the device NE information.

The **snmp-server udp-port** command is used to set the UDP port ID of the SNMP service or restore the default value.

#### Configuring the SNMP Host Address

By default, no SNMP host is configured.

The **snmp-server host** command is used to configure the NMS host address to which the agent actively sends messages or to delete the specified SNMP host address. In the messages sent to the host, the SNMP version, receiving port,

authentication name, or user can be bound. This command is used with the **snmp-server enable traps** command to actively send trap messages to the NMS.

### 📌 Setting Trap Message Parameters

By default, SNMP is not allowed to actively send a trap message to the NMS, the function of sending a Link Trap message on an interface is enabled, the function of sending a system reboot trap message is disabled, and a trap message does not carry any private field.

By default, the IP address of the interface where SNMP packets are sent is used as the source address.

By default, the length of a trap message queue is 10 and the interval for sending a trap message is 30s.

The **snmp-server enable traps** command is used to enable or disable the agent to actively send a trap message to the NMS.

The **snmp trap link-status** command is used to enable or disable the function of sending a Link Trap message on an interface.

The **snmp-server trap-source** command is used to specify the source address for sending messages or to restore the default value.

The **snmp-server queue-length** command is used to set the length of a trap message queue or to restore the default value.

The **snmp-server trap-timeout** command is used to set the interval for sending a trap message or to restore the default value.

The **snmp-server trap-format private** command is used to set or disable the function of carrying private fields in a trap message when the message is sent.

The **snmp-server system-shutdown** command is used to enable or disable the function of sending a system reboot trap message.

### 📌 Setting the SNMP Logging Function to Record the Get, Get-Next, and Set Operations Performed by the NMS on the SNMP Agent

By default, SNMP logging is disabled.

The **snmp-server logging { get-operation | set-operation }** command is used to enable the function of recording the Get and Set operations. **get-operation** controls the Get and Get-Next operations records, and **set-operation** controls the Set operation records.

## 1.3.2 SNMPv1 and SNMPv2C

SNMPv1 and SNMPv2C adopt the community-based security architecture. The administrator who can perform operations on the MIB of the agent is limited by defining the host address and authentication name (community string).

### Working Principle

SNMPv1 and SNMPv2 determine whether the administrator has the right to use MIB objects by using the authentication name. The authentication name of the NMS must be the same as an authentication name defined in devices.

SNMPv2C adds the Get-bulk operation mechanism and can return more detailed error message types to the management workstation. The Get-bulk operation is performed to obtain all information from a table or obtain lots of data at a time, so as to reduce the number of request responses. The enhanced error handling capabilities of SNMPv2C include extension of error codes to differentiate error types. In SNMPv1, however, only one error code is provided for errors. Now, errors can be differentiated based on error codes. Because management workstations supporting SNMPv1 and SNMPv2C may exist on the network, the SNMP agent must be able to identify SNMPv1 and SNMPv2C packets and return packets of the corresponding versions.

## 📌 Security

One authentication name has the following attributes:

- Read-only: Provides the read permission of all MIB variables for authorized management workstations.
- Read-write: Provide the read/write permission of all MIB variables for authorized management workstations.

## Related Configuration

### 📌 Setting Authentication Names and Access Permissions

The default access permission of all authentication names is read-only.

The **snmp-server community** command is used to configure or delete an authentication name and access permission.

This command is the first important command for enabling the SNMP agent function. It specifies community attributes and NMS scope where access to the MIB is allowed.

## 1.3.3 SNMPv3

SNMPv3 redefines the SNMP architecture and includes functions of SNMPv1 and SNMPv2 into the SNMPv3 system.

### Working Principle

The NMS and SNMP agent are SNMP entities. In the SNMPv3 architecture, SNMP entities consist of the SNMP engine and SNMP applications. The SNMP engine is used to send and receive messages, identify and encrypt information, and control access to managed objects. SNMP applications refer to internal applications of SNMP, which work by using the services provided by the SNMP engine.

SNMPv3v determines whether a user has the right to use MIB objects by using the User-based Security Model (USM). The security level of the NMS user must be the same as that of an SNMP user defined in devices so as to manage devices.

SNMPv3 requires the NMS to obtain the SNMP agent engine IDs on devices when the NMS manages devices. SNMPv3 defines the discover and report operation mechanisms. When the NMS does not know agent engine IDs, the NMS may first send a discover message to the agent and the agent returns a report message carrying an engine ID. Later, management operations between the NMS and the agent must carry the engine ID.

## 📌 Security

- SNMPv3 determines the data security mechanism based on the security model and security level. At present, security models include: SNMPv1, SNMPv2C, and SNMPv3. SNMPv3 includes SNMPv1 and SNMPv2C into the security model.

SNMPv1 and SNMPv2C Security Models and Security Levels

Security Model	Security Level	Authentication	Encryption	Description
SNMPv1	noAuthNoPriv	Authentication name	N/A	Data validity is confirmed through authentication name.
SNMPv2c	noAuthNoPriv	Authentication name	N/A	Data validity is confirmed through authentication name.

SNMPv3 Security Model and Security Level

Security Model	Security Level	Authentication	Encryption	Description
SNMPv3	noAuthNoPriv	User name.	N/A	Data validity is confirmed through user name.
SNMPv3	authNoPriv	MD5 or SHA	N/A	The data authentication mechanism based on HMAC-MD5 or HMAC-SHA is provided.
SNMPv3	authPriv	MD5 or SHA	DES	The data authentication mechanism based on HMAC-MD5 or HMAC-SHA and data encryption mechanism based on CBC-DES are provided.

↘ Engine ID

An engine ID is used to uniquely identify an SNMP engine. Because each SNMP entity includes only one SNMP engine, one SNMP engine uniquely identifies an SNMP entity in a management domain. Therefore, the SNMPv3 agent as an entity must has a unique engine ID, that is, SnpEngineID.

An engine ID is an octet string that consists of 5 to 32 bytes. RFC3411 defines the format of an engine ID:

- The first four bytes indicate the private enterprise ID (allocated by IANA) of a vendor, which is expressed in hexadecimal.
- The fifth byte indicates remaining bytes:
- 0: Reserved.
- 1: The later four bytes indicate an IPv4 address.
- 2: The later 16 bytes indicate an IPv6 address.
- 3: The later six bytes indicate a MAC address.
- 4: Text consisting of 27 bytes, which is defined by the vendor.
- 5: Hexadecimal value consisting of 27 bytes, which is defined by the vendor.

- 6-127: Reserved.
- 128-255: Formats specified by the vendor.

### Related Configuration

#### ▾ [Configuring an MIB View and a Group](#)

By default, one view is configured and all MIB objects can be accessed.

By default, no user group is configured.

The **snmp-server view** command is used to configure or delete a view and the **snmp-server group** command is used to configure or delete a user group.

One or more instructions can be configured to specify different community names so that network devices can be managed by NMSs of different permissions.

#### ▾ [Configuring an SNMP User](#)

By default, no user is configured.

The **snmp-server user** command is used to configure or delete a user.

The NMS can communicate with the agent by using only legal users.

An SNMPv3 user can specify the security level (whether authentication and encryption are required), authentication algorithm (MD5 or SHA), authentication password, encryption password (only DES is available currently), and encryption password.

## 1.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic SNMP Functions</a>	 (Mandatory) It is used to enable users to access the agent through the NMS.	
	<b>enable service snmp-agent</b>	Enables the agent function.
	<b>snmp-server community</b>	Sets an authentication name and access permission.
	<b>snmp-server logging</b>	Enables SNMP logging.
	<b>snmp-server user</b>	Configures an SNMP user.
	<b>snmp-server view</b>	Configures an SNMP view.
	<b>snmp-server group</b>	Configures an SNMP user group.
<a href="#">Enabling the Trap Function</a>	 (Optional) It is used to enable the agent to actively send a trap message to the NMS.	
	<b>snmp-server host</b>	Configures the NMS host address.
	<b>snmp-server enable traps</b>	Enables the agent to actively send a trap message to the NMS.

Configuration	Description and Command	
	<b>snmp trap link-status</b>	Enables the function of sending a Link Trap message on an interface.
	<b>snmp-server system-shutdown</b>	Enables the function of sending a system reboot trap message.
	<b>snmp-server trap-source</b>	Specifies the source address for sending a trap message.
	<b>snmp-server trap-format private</b>	Enables a trap message to carry private fields when the message is sent.
<a href="#">Shielding the Agent Function</a>	 (Optional) It is used to shield the agent function when the agent service is not required.	
	<b>no snmp-server</b>	Shields the agent function.
<a href="#">Setting SNMP Control Parameters</a>	 (Optional) It is used to set or modify SNMP control parameters.	
	<b>snmp-server contact</b>	Sets the device contact mode.
	<b>snmp-server location</b>	Sets the device location.
	<b>snmp-server chassis-id</b>	Sets the serial number of the device.
	<b>snmp-server net-id</b>	Sets NE information about the device.
	<b>snmp-server packetsize</b>	Modifies the maximum packet length.
	<b>snmp-server udp-port</b>	Modifies the UDP port ID of the SNMP service.
	<b>snmp-server queue-length</b>	Modifies the length of a trap message queue.
	<b>snmp-server trap-timeout</b>	Modifies the interval for sending a trap message.

### 1.4.1 Configuring Basic SNMP Functions

#### Configuration Effect

Enable users to access the agent through the NMS.

#### Notes

- By default, no authentication name is set on network devices and SNMPv1 or SNMPv2C cannot be used to access the MIB of network devices. When an authentication name is set, if no access permission is specified, the default access permission is read-only.

#### Configuration Steps

##### ➤ [Configuring an SNMP View](#)

- Optional
- An SNMP view needs to be configured when the View-based Access Control Model (VACM) is used.

##### ➤ [Configuring an SNMP User Group](#)

- Optional
- An SNMP user group needs to be configured when the VACM is used.
- ↳ **Configuring an Authentication Name and Access Permission**
- Mandatory
- An authentication name must be set on the agent when SNMPv1 and SNMPv2C are used to manage network devices.
- ↳ **Configuring an SNMP User**
- Mandatory
- A user must be set when SNMPv3 is used to manage network devices.
- ↳ **Enabling the Agent Function**
- Optional
- By default, the agent function is enabled. When the agent function needs to be enabled again after it is disabled, this command must be used.
- ↳ **Setting the SNMP Logging Function to Record the Get, Get-Next, and Set Operations Performed by the NMS on the SNMP Agent**
- Optional
- The SNMP logging function is used to record the Get, Get-Next, and Set Operations performed by the NMS on the SNMP agent. When the Get and Get-Next operations are performed, the agent records the IP address of the NMS user, operation type, and OID of the operation node. When the Set operation is performed, the agent records the IP address of the NMS user, operation type, OID of the operation node, and set value. These logs are sent to the information center of devices. The level of these logs is informational, that is, the logs are used as prompt information of devices.

## Verification

Run the **show snmp** command to check the SNMP function on devices.

## Related Commands

### ↳ Configuring an SNMP View

<b>Command</b>	<b>snmp-server view</b> <i>view-name oid-tree</i> { <b>include</b>   <b>exclude</b> }
<b>Parameter</b>	<i>view-name</i> : View name
<b>Description</b>	<i>oid-tree</i> : MIB objects associated with a view, which are displayed as an MIB subtree. <b>include</b> : Indicates that the MIB object subtree is included in the view. <b>exclude</b> : Indicates that the MIB object subtree is not included in the view.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Specify a view name and use it for view-based management.

↳ **Configuring an SNMP User Group**

<b>Command</b>	<b>snmp-server group</b> <i>groupname</i> { <b>v1</b>   <b>v2c</b>   <b>v3</b> { <b>auth</b>   <b>noauth</b>   <b>priv</b> } } [ <b>read</b> <i>readview</i> ] [ <b>write</b> <i>writeview</i> ] [ <b>access</b> { <b>ipv6</b> <i>ipv6-aclname</i>   <i>aclnum</i>   <i>aclname</i> } ]
<b>Parameter Description</b>	<p><b>v1</b>   <b>v2c</b>   <b>v3</b>: Specifies the SNMP version.</p> <p><b>auth</b>: Messages sent by users in the group need to be verified but data confidentiality is not required. This configuration is valid for SNMPv3 only.</p> <p><b>noauth</b>: Messages sent by users in the group do not need to be verified and data confidentiality is not required. This configuration is valid for SNMPv3 only.</p> <p><b>priv</b>: Messages sent by users in the group need to be verified and confidentiality of transmitted data is required. This configuration is valid for SNMPv3 only.</p> <p><i>readview</i>: Associates one read-only view.</p> <p><i>writeview</i>: Associates one read/write view.</p> <p><i>aclnum</i>: ACL number. The specified ACL is associated and the range of IPv4 NMS addresses from which access to the MIB is allowed is specified.</p> <p><i>aclname</i>: ACL name. The specified ACL is associated and the range of IPv4 NMS addresses from which access to the MIB is allowed is specified.</p> <p><i>ipv6-aclname</i>: IPv6 ACL name. The specified ACL is associated and the range of IPv6 NMS addresses from which access to the MIB is allowed is specified.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Associate certain users with a group and associate the group with a view. Users in a group have the same access permission. In this way, you can determine whether managed objects associated with an operation are in the allowable range of a view. Only managed objects in the range of a view can be accessed.

↳ **Configuring an Authentication Name and Access Permission**

<b>Command</b>	<b>snmp-server community</b> [ <i>0</i>   <i>7</i> ] <i>string</i> [ <b>view</b> <i>view-name</i> ] [ [ <b>ro</b>   <b>rw</b> ] ] [ <b>host</b> <i>ipaddr</i> ] [ <b>ipv6</b> <i>ipv6-aclname</i> ] [ <i>aclnum</i>   <i>aclname</i> ]
<b>Parameter Description</b>	<p><i>0</i>: Indicates that the input community string is a plaintext string.</p> <p><i>7</i>: Indicates that the input community string is a ciphertext string.</p> <p><i>string</i>: Community string, which is equivalent to the communication password between the NMS and the SNMP agent.</p> <p><i>view-name</i>: Specifies a view name for view-based management.</p> <p><b>ro</b>: Indicates that the NMS can only read variables of the MIB.</p> <p><b>rw</b>: The NMS can read and write variables of the MIB.</p> <p><i>aclnum</i>: ACL number. The specified ACL is associated and the range of IPv4 NMS addresses from which access to the MIB is allowed is specified.</p> <p><i>aclname</i>: ACL name. The specified ACL is associated and the range of IPv4 NMS addresses from which access to the MIB is allowed is specified.</p> <p><i>ipv6-aclname</i>: ACL name. The specified ACL is associated and the range of IPv6 NMS addresses from which access to the MIB is allowed is specified.</p>

	<i>ipaddr</i> : Associates NMS addresses and specifies NMS addresses for accessing the MIB.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is the first important command for enabling the SNMP agent function. It specifies community attributes and NMS scope where access to the MIB is allowed.  To disable the SNMP agent function, run the <b>no snmp-server</b> command.

↳ **Configuring an SNMP User**

<b>Command</b>	<b>snmp-server user</b> <i>username groupname</i> { <b>v1</b>   <b>v2c</b>   <b>v3</b> [ <b>encrypted</b> ] [ <b>auth</b> { <b>md5</b>   <b>sha</b> } <i>auth-password</i> ] [ <b>priv</b> <b>des56</b> <i>priv-password</i> ] } [ <b>access</b> { <b>ipv6</b> <i>ipv6-aclname</i>   <i>aclnum</i>   <i>aclname</i> } ]
<b>Parameter Description</b>	<p><i>username</i>: User name.</p> <p><i>groupname</i>: Specifies the group name for a user.</p> <p><b>v1</b>   <b>v2c</b>   <b>v3</b>: Specifies the SNMP version. Only SNMPv3 supports later security parameters.</p> <p><b>encrypted</b>: The specified password input mode is ciphertext input. Otherwise, plaintext is used for input. If ciphertext input is selected, enter a key consisting of continuous hexadecimal digits. An MD5 protocol authentication key consists of 16 bytes and an SHA authentication protocol key consists of 20 bytes. Two characters stand for one byte. Encrypted keys are valid for this engine only.</p> <p><b>auth</b>: Specifies whether authentication is used.</p> <p><b>md5</b>: Specifies the MD5 authentication protocol. <b>sha</b> specifies the SHA authentication protocol.</p> <p><i>auth-password</i>: Configures a password string (not more than 32 characters) used by the authentication protocol. The system converts the passwords into the corresponding authentication keys.</p> <p><b>priv</b>: Specifies whether confidentiality is used. <b>des56</b> specifies the use of the 56-bit DES encryption protocol.</p> <p><i>priv-password</i>: Configures a password string (not more than 32 characters) used for encryption. The system converts the password into the corresponding encryption key.</p> <p><i>aclnum</i>: ACL number. The specified ACL is associated and the range of IPv4 NMS addresses from which access to the MIB is allowed is specified.</p> <p><i>aclname</i>: ACL name. The specified ACL is associated and the range of IPv4 NMS addresses from which access to the MIB is allowed is specified.</p> <p><i>ipv6-aclname</i>: IPv6 ACL name. The specified ACL is associated and the range of IPv6 NMS addresses from which access to the MIB is allowed is specified.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure user information so that the NMS can communicate with the agent by using a valid user. For an SNMPv3 user, you can specify the security level, authentication algorithm (MD5 or SHA), authentication password, encryption algorithm (at present, only DES is available), and encryption password.

↳ **Enabling the Agent Function**

<b>Command</b>	<b>enable service snmp-agent</b>
<b>Parameter Description</b>	

<b>Configuration mode</b>	Privileged mode.
<b>Usage Guide</b>	This command is used to enable the SNMP agent function of a device.

➤ **Setting the SNMP Logging Function to Record the Get, Get-Next, and Set Operations Performed by the NMS on the SNMP Agent**

<b>Command</b>	<b>snmp-server logging { get-operation   set-operation }</b>
<b>Parameter Description</b>	<b>get-operation:</b> Enables the logging of Get and Get-Next operations. <b>set-operation:</b> Enables the logging of the Set operation.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to record the Get, Get-Next, and Set operations performed by the NMS on the SNMP agent. When the Get and Get-Next operations are performed, the agent records the IP address of the NMS user, operation type, and OID of the operation node. When the Set operation is performed, the agent records the IP address of the NMS user, operation type, OID of the operation node, and set value.</p> <p> A large number of logs will affect device performance. In normal conditions, you are advised to disable the SNMP logging function. Exercise caution when using the GET operation logging function; otherwise, spamming may occur due to a large number of requests.</p>

➤ **Displaying the SNMP Status Information**

<b>Command</b>	<b>show snmp [ mib   user   view   group   host ]</b>
<b>Parameter Description</b>	<b>mib:</b> Displays information about the SNMP MIB supported in the system. <b>user:</b> Displays information about an SNMP user. <b>view:</b> Displays information about an SNMP view. <b>group:</b> Displays information about an SNMP user group. <b>host:</b> Displays information about user configuration.
<b>Configuration mode</b>	Privileged mode.
<b>Usage Guide</b>	N/A

➤ **Configuration Example Configuring SNMP v1/2c**

<p><b>Scenario</b> <b>Figure 1-5</b></p>	 <p>The diagram illustrates a network connection between an Agent and an NMS. The Agent is represented by a blue square icon with a crosshair, and the NMS is represented by a blue server rack icon. They are connected by a horizontal line representing an Ethernet link. The Agent's IP address is labeled as IP:192.168.3.1/24, and the NMS's IP address is labeled as IP:192.168.3.2/24. The interface on the Agent side is labeled Gi0/1.</p> <ul style="list-style-type: none"> <li>The NMS is connected to an agent through the Ethernet. The IP address of the agent is 192.168.3.1/24, and the IP address of the NMS is 192.168.3.2/24.</li> </ul>
--	--

	<ul style="list-style-type: none"> <li>The NMS monitors and manages the agent through SNMP v1 or SNMP v2c.</li> </ul>
	<ul style="list-style-type: none"> <li>When the agent is faulty or an error occurs, the agent can actively reports the related information to the NMS.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the SNMP basic information, including the version and community name.</li> <li>Allow the NMS (192.168.3.2/24) to send Trap messages.</li> <li>Configure the IP address of the agent, and set the IP address of the Gi0/1 interface to 192.168.3.1/24.</li> </ul>
<b>Agent</b>	<pre>Ruijie(config)#snmp-server community public rw Ruijie(config)#snmp-server host 192.168.3.2 traps version 2c public Ruijie(config)#snmp-server enable traps Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-gigabitEthernet 0/1)#ip address 192.168.3.1 255.255.255.0 Ruijie(config-if-gigabitEthernet 0/1)#exit</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show running-config</b> command to display configuration information of the device.</li> <li>Run the <b>show snmp host</b> command to display the host information configured by the user.</li> </ul>
<b>NMS</b>	<p>On the NMS that uses the SNMP v1/v2c, configure the read/write community name, timeout time, and retry times. You can use the NMS to query and configure the device.</p> <p> Configurations on the NMS must be consistent with those on the device; otherwise, related operations cannot be performed.</p>

📄 [Configuring SNMP v3 \(Default View\)](#)

<p><b>Scenario</b> <b>Figure 1-6</b></p>	 <pre> graph LR     Agent[Agent] --- Gi0/1[Gi0/1] --- NMS[NMS]     subgraph IP         Agent --- IP_A[IP:192.168.3.1/24]         NMS --- IP_N[IP:192.168.3.2/24]     end     </pre> <ul style="list-style-type: none"> <li>The NMS manages network devices (agents) based on the user authentication and encryption mode, for example, the NMS uses user1 as the user name, MD5 as the authentication mode, 123 as the authentication password, DES56 as the encryption algorithm, and 321 as the encryption password.</li> <li>You can access all MIB nodes. ("read default write default" indicates that all MIB nodes can be accessed.)</li> <li>Network devices can actively send authentication and encryption messages to the NMS.</li> </ul>
--	--

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an MIB group. Create a group “g1”, select the version “v3”, set the security level to the authentication and encryption mode “priv”, and configure permissions to read and write the view “default”. "Default" indicates that all MIB nodes can be accessed.</li> <li>● Configure an SNMP user. Create a user named “user1” under group “g1”, select “v3” as the version, and set the authentication mode to “md5”, authentication password to “123”, encryption mode to “DES56”, and encryption password to “321”.</li> <li>● Configure the SNMP host address. Set the host address to 192.168.3.2, select “3” as the version, set the security level to the authentication and encryption mode “priv”, and associate the user name “user1”. Enable the agent to actively send a trap message to the NMS.</li> <li>● Configure the IP address of the agent. Set the address of the Gi0/1 interface to 192.168.3.1/24.</li> </ul>
<p><b>Agent</b></p>	<pre>Ruijie(config)#snmp-server group g1 v3 priv read default write default Ruijie(config)#snmp-server user user1 g1 v3 auth md5 123 priv des56 321 Ruijie(config)#snmp-server host 192.168.3.2 traps version 3 priv user1 Ruijie(config)#snmp-server enable traps Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-gigabitEthernet 0/1)#ip address 192.168.3.1 255.255.255.0 Ruijie(config-if-gigabitEthernet 0/1)#exit</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run the <b>show running-config</b> command to display configuration information of the device.</li> <li>● Run the <b>show snmp user</b> command to display the SNMP user.</li> <li>● Run the <b>show snmp view</b> command to display the SNMP view.</li> <li>● Run the <b>show snmp group</b> command to display the SNMP group.</li> <li>● Run the <b>show snmp host</b> command to display the host information configured by the user.</li> <li>● Install MIB-Browser.</li> </ul>
<p><b>NMS</b></p>	<p>SNMP v3 adopts the authentication and encryption security mechanisms. On the NMS, configure the user name, and select a security level. Based on the selected security level, configure the authentication mode, authentication password, encryption mode, and encryption password. In addition, configure the timeout time and retry times. You can use the NMS to query and configure the device. For details about the configuration, see Figure 1-7.</p> <p> Configurations on the NMS must be consistent with those on the device; otherwise, related operations cannot be performed.</p>

➤ **Configuring SNMPv3 Configuration (Specified View)**

<p><b>Scenario</b> Figure 1-7</p>	<div style="text-align: center;"> <p>Agent IP:192.168.3.1/24      NMS IP:192.168.3.2/24</p> </div> <ul style="list-style-type: none"> <li>● The NMS manages network devices (agents) based on the user authentication and encryption mode, for example, the NMS uses user1 as the user name, MD5 as the authentication mode, 123 as the authentication password, DES56 as the encryption algorithm, and 321 as the encryption password.</li> <li>● Network devices can control the operation permission of users to access MIB objects. For example, the user named user1 can read MIB objects under the system node (1.3.6.1.2.1.1) and can only write MIB objects under the SysContact node (1.3.6.1.2.1.1.4.0).</li> <li>● Network devices can actively send authentication and encryption messages to the NMS.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure a MIB view and a MIB group. Create a MIB view “view1”, which includes the associated MIB object (1.3.6.1.2.1.1); then create a MIB view “view2”, which includes the associated MIB object (1.3.6.1.2.1.1.4.0). Create a group “g1”, select the version “v3”, set the security level to the authentication and encryption mode “priv”, and configure permissions to read the view “view1” and</li> </ul>

	<p>write the view “view2”.</p> <ul style="list-style-type: none"> <li>● Configure an SNMP user. Create a user named “user1” under group “g1”, select “v3” as the version, and set the authentication mode to “md5”, authentication password to “123”, encryption mode to “DES56”, and encryption password to “321”.</li> <li>● Configure the SNMP host address. Set the host address to 192.168.3.2, select “3” as the version, set the security level to the authentication and encryption mode “priv”, and associate the user name “user1”. Enable the agent to actively send a trap message to the NMS.</li> <li>● Set the IP address of the agent. Set the address of the Gi0/1 interface to 192.168.3.1/24.</li> </ul>
<p><b>Agent</b></p>	<pre>Ruijie(config)#snmp-server view view1 1.3.6.1.2.1.1 include Ruijie(config)#snmp-server view view2 1.3.6.1.2.1.1.4.0 include Ruijie(config)#snmp-server group g1 v3 priv read view1 write view2 Ruijie(config)#snmp-server user user1 g1 v3 auth md5 123 priv des56 321 Ruijie(config)#snmp-server host 192.168.3.2 traps version 3 priv user1 Ruijie(config)#snmp-server enable traps Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-gigabitEthernet 0/1)#ip address 192.168.3.1 255.255.255.0 Ruijie(config-if-gigabitEthernet 0/1)#exit</pre>

Install MIB-Browser, enter IP address **192.168.3.1** in **IP Address** and **user1** in **UserName**, select **AuthPriv** for **Security Level**, enter **123** in **AuthPassWord**, select **MD5** for **AuthProtocol**, and enter **321** in **PrivPassWord**. Click **Add Item** and select a management unit for which the MIB needs to be queried, for

example, **System** in the following figure. Click **Start**. The MIB is queried for network devices. The lowest pane in the following figure shows query results.

## Common Errors

-

## 1.4.2 Enabling the Trap Function

### Configuration Effect

Enable the agent to actively send a trap message to the NMS.

### Notes

N/A

### Configuration Steps

#### ➤ Configuring the SNMP Host Address

- Optional
- Configure the host address of the NMS when the agent is required to actively send messages.

#### ➤ Enabling the Agent to Actively Send a Trap Message to the NMS

- Optional

- Configure this item on the agent when the agent is required to actively send a trap message to the NMS.

▾ **Enabling the Function of Sending a Link Trap Message on an Interface**

- Optional
- Configure this item on the agent when a link trap message needs to be sent on an interface.

▾ **Enabling the Function of Sending a System Reboot Trap Message**

- Optional
- Configure this item on the agent when the RGOS system is required to send a trap message to the NMS to notify system reboot before reloading or reboot of the device.

▾ **Specifying the Source Address for Sending a Trap Message**

- Optional
- Configure this item on the agent when it is required to permanently use a local IP address as the source SNMP address to facilitate management.

▾ **Enabling a Trap Message to Carry Private Fields when the Message Is Sent**

- Optional
- Configure this item on the agent when private fields need to be carried in a trap message.

**Verification**

Run the **show snmp** command to display the SNMP status.

Run the **show running-config** command to display configuration information of the device.

**Related Commands**

▾ **Setting the NMS Host Address**

<b>Command</b>	<b>snmp-server host</b> { <i>host-addr</i>   <b>ipv6</b> <i>ipv6-addr</i> } [ <b>vrf</b> <i>vrfname</i> ] [ <b>traps</b>   <b>informs</b> ] [ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> } { <b>auth</b>   <b>noauth</b>   <b>priv</b> } ] <i>community-string</i> [ <b>udp-port</b> <i>port-num</i> ] [ <i>notification-type</i> ]
<b>Parameter Description</b>	<p><i>host-addr</i>: Address of the SNMP host.</p> <p><i>ipv6-addr</i>: (IPv6) address of the SNMP host.</p> <p><i>Vrfname</i>: Configures a VRF forwarding table name.</p> <p><b>traps</b>   <b>informs</b>: Configures the host to send a trap message or an inform message.</p> <p><b>version</b>: SNMP version, which can be set to <b>V1</b>, <b>V2C</b>, or <b>V3</b>.</p> <p><b>auth</b>   <b>noauth</b>   <b>priv</b>: Sets the security level of V3 users.</p> <p><i>community-string</i>: Community string or user name (V3).</p> <p><i>port-num</i>: Configures the port ID of the SNMP host.</p> <p><i>notification-type</i>: Type of trap messages that are actively sent, for example, snmp.</p> <hr/> <p> If no trap type is specified, all trap messages are sent.</p>

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used with the <b>snmp-server enable traps</b> command to actively send trap messages to the NMS.</p> <p>You can configure different SNMP hosts to receive trap messages. A host can support different traps, ports, and VRF forwarding tables. If the same host is configured (the port and VRF configuration are the same), the last configuration is combined with the previous configurations, that is, to send different trap messages to the same host, configure one type of trap messages each time. These configurations are finally combined.</p>

### ▾ Enabling the Agent to Actively Send a Trap Message to the NMS

<b>Command</b>	<b>snmp-server enable traps</b> [ <i>notification-type</i> ]
<b>Parameter Description</b>	<p><i>notification-type</i>: Enables trap notification for the corresponding events, including the following types:</p> <p>snmp: Enables trap notification for SNMP events.</p> <p>bgp: Enables trap notification for BGP events.</p> <p>bridge: Enables trap notification for bridge events.</p> <p>isis: Enables trap notification for ISIS events.</p> <p>mac-notification: Enables trap notification for MAC events.</p> <p>ospf: Enables trap notification for OSPF events.</p> <p>urpf: Enables trap notification for URPF events.</p> <p>vrrp: Enables trap notification for VRRP events.</p> <p>web-auth: Enables trap notification for Web authentication events.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command must be used with the <b>snmp-server host</b> command to so that trap messages can be actively sent.

### ▾ Enabling the Function of Sending a Link Trap Message on an Interface

<b>Command</b>	<b>snmp trap link-status</b>
<b>Parameter Description</b>	-
<b>Configuration mode</b>	Interface configuration mode
<b>Usage Guide</b>	For interfaces (Ethernet interface, AP interface, and SVI interface), when this function is enabled, the SNMP sends a Link Trap message if the link status on the interfaces changes. Otherwise, the SNMP does not send the message.

### ▾ Enabling the Function of Sending a System Reboot Trap Message

<b>Command</b>	<b>snmp-server system-shutdown</b>
----------------	------------------------------------

<b>Parameter Description</b>	-
<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	When the function of notification upon SNMP system reboot is enabled, a trap message is sent to the NMS to notify system reboot before reloading or reboot of the device.

↘ **Specifying the Source Address for Sending a Trap Message**

<b>Command</b>	<b>snmp-server trap-source</b> <i>interface</i>
<b>Parameter Description</b>	<i>interface</i> : Used as the interface for the SNMP source address.
<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, the IP address of the interface where SNMP packets are sent is used as the source address. To facilitate management and identification, this command can be run to permanently use one local IP address as the source SNMP address.

↘ **Enabling a Trap message to Carry Private Fields when the Message Is Sent**

<b>Command</b>	<b>snmp-server trap-format private</b>
<b>Parameter Description</b>	-
<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	This command can be used to enable a trap message to carry private fields when the message is sent. At present, supported private fields include the alarm generation time. For the specific data types and data ranges of the fields, see RUIJIE-TRAP-FORMAT-MIB.mib.

**Configuration Example**

↘ **Enabling the Trap Function**

<b>Scenario</b> Figure 1-8	 <p>The diagram illustrates a network connection between an Agent and an NMS. The Agent is represented by a blue square icon with a crosshair, labeled 'Agent' and 'IP: 192.168.3.1/24'. The NMS is represented by a blue server rack icon, labeled 'NMS' and 'IP: 192.168.3.2/24'. A line connects the two, with 'Gi0/1' written above it.</p> <ul style="list-style-type: none"> <li>The NMS manages network devices (agents) based on the community authentication mode, and network devices can actively send messages to the NMS.</li> </ul>
<b>Configuration Steps</b>	<ol style="list-style-type: none"> <li>1. Perform configuration to enable the agent to actively send messages to the NMS. Set the SNMP host address to 192.168.3.2, the message format to Version2c, and the authentication name to user1.</li> </ol>

	<p>Enable the agent to actively send trap messages.</p> <p>2. Set the IP address of the agent. Set the address of the Gi0/1 interface to 192.168.3.1/24.</p>

### 1.4.3 Shielding the Agent Function

#### Configuration Effect

Shield the agent function when the agent service is not required.

#### Notes

- Run the **no snmp-server** command to shield the SNMP agent function when the agent service is not required.
- Different from the shielding command, after the **no enable service snmp-agent** command is run, all SNMP services are directly disabled (that is, the SNMP agent function is disabled, no packet is received, and no response packet or trap packet is sent), but configuration information of the agent is not shielded.

#### Configuration Steps

##### Shielding the SNMP Agent Function for the Device

- Optional
- To shield the configuration of all SNMP agent services, use this configuration.

##### Disabling the SNMP Agent Function for the Device

- Optional
- To directly disable all services, use this configuration.

## Verification

Run the **show services** command to check whether SNMP services are enabled or disabled.

Run the **show snmp** command to display the SNMP status.

Run the **show running-config** command to display configuration information of the device.

## Related Commands

### Shielding the SNMP Agent Function for the Device

<b>Command</b>	<b>no snmp-server</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, the SNMP agent function is disabled. When SNMP agent parameters (for example, NMS host address, authentication name, and access permission) are set, the SNMP agent service is automatically enabled. The <b>enable service snmp-agent</b> command must also be run at the same time so that the SNMP agent service can take effect. If the SNMP agent service is disabled or the <b>enable service snmp-agent</b> command is not run, the SNMP agent service does not take effect. Run the <b>no snmp-server</b> command to disable SNMP agent services of all versions supported by the device. After this command is run, all SNMP agent service configurations are shielded (that is, after the <b>show running-config</b> command is run, no configuration is displayed. Configurations are restored after the SNMP agent service is enabled again). After the <b>enable service snmp-agent</b> command is run, the SNMP agent configurations are not shielded.

### Disabling the SNMP Agent Function for the Device

<b>Command</b>	<b>no enable service snmp-agent</b>
<b>Parameter Description</b>	N/A
<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	This command can be used to disable the SNMP service, but it will not shield SNMP agent parameters.

## Configuration Example

### Enabling the SNMP Service

<p><b>Scenario</b> <b>Figure 1-1</b></p>	 <p>After the SNMP service is enabled and the SNMP agent server is set, the NMS can access devices based on SNMP.</p>
<p><b>Configuration Steps</b></p>	<ol style="list-style-type: none"> <li>1. Enable the SNMP service.</li> <li>2. Set parameters for the SNMP agent server to make the SNMP service take effect.</li> </ol>
<p><b>A gent</b></p>	<pre>Ruijie(config)#enable service snmp-agent</pre>
<p><b>Verification</b></p>	<ol style="list-style-type: none"> <li>1. Run the <b>show services</b> command to check whether the SNMP service is enabled or disabled.</li> </ol>
<p><b>Agent</b></p>	<pre>Ruijie#show service web-server      : disabled web-server(https): disabled snmp-agent      : enabled ssh-server      : disabled telnet-server   : enabled</pre>

**1.4.4 Setting SNMP Control Parameters**

**Configuration Effect**

Set basic parameters of the SNMP agent, including the device contact mode, device location, serial number, and parameters for sending a trap message. By accessing the parameters, the NMS can obtain the contact person of the device and physical location of the device.

**Notes**

N/A

**Configuration Steps**

📌 **Setting the System Contact Mode**

- Optional

- When the contact mode of the system needs to be modified, configure this item on the agent.

#### ▾ Setting the System Location

- Optional
- When the system location needs to be modified, configure this item on the agent.

#### ▾ Setting the System Serial Number

- Optional
- When the system serial number needs to be modified, configure this item on the agent.

#### ▾ Setting NE Information about the Device

- Optional
- When the NE code needs to be modified, configure this item on the agent.

#### ▾ Setting the Maximum Packet Length of the SNMP Agent

- Optional
- When the maximum packet length of the SNMP agent needs to be modified, configure this item on the agent.

#### ▾ Setting the UDP Port ID of the SNMP Service

- Optional
- When the UDP port ID of the SNMP service needs to be modified, configure this item on the agent.

#### ▾ Setting the Queue Length of Trap Messages

- Optional
- When the size of the message queue needs to be adjusted to control the message sending speed, configure this item on the agent.

#### ▾ Setting the Interval for Sending a Trap Message

- Optional
- When the interval for sending a trap message needs to be modified, configure this item on the agent.

### Verification

Run the **show snmp** command to display the SNMP status.

Run the **show running-config** command to display configuration information of the device.

### Related Commands

#### ▾ Setting the System Contact Mode

Command	<code>snmp-server contact text</code>
---------	---------------------------------------

<b>Parameter Description</b>	<i>text</i> : String that describes the system contact mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Setting the System Location

<b>Command</b>	<b>snmp-server location</b> <i>text</i>
<b>Parameter Description</b>	<i>text</i> : String that describes system information.
<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Setting the System Serial Number

<b>Command</b>	<b>snmp-server chassis-id</b> <i>text</i>
<b>Parameter Description</b>	<i>text</i> : Text of the system serial number, which may be digits or characters.
<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	In general, the device serial number is used as the SNMP serial number to facilitate identification of the device.

### ▾ Setting NE Information about the Device

<b>Command</b>	<b>snmp-server net-id</b> <i>text</i>
<b>Parameter Description</b>	<i>text</i> : Text that is used to set the device NE code. The text is a string that consists of 1 to 255 characters that are case-sensitive and may include spaces.
<b>Configuration mode</b>	Global mode.
<b>Usage Guide</b>	Set the NE code of the device.

### ▾ Setting the Maximum Packet Length of the SNMP Agent

<b>Command</b>	<b>snmp-server packetsize</b> <i>byte-count</i>
<b>Parameter Description</b>	<i>byte-count</i> : Packet size, ranging from 484 bytes to 17,876 bytes.
<b>Configuration mode</b>	Global mode.
<b>Usage Guide</b>	N/A

### ▾ Setting the UDP Port ID of the SNMP Service

<b>Command</b>	<b>snmp-server udp-port</b> <i>port-num</i>
<b>Parameter Description</b>	<i>port-num</i> : Specifies the UDP port ID of the SNMP service, that is, the ID of the protocol port that receives SNMP packets.
<b>Configuration mode</b>	Global mode.
<b>Usage Guide</b>	Specify the protocol port ID for receiving SNMP packets.

#### ▾ Setting the Length of a Trap Message Queue

<b>Command</b>	<b>snmp-server queue-length</b> <i>length</i>
<b>Parameter Description</b>	<i>length</i> : Queue length, ranging from 1 to 1,000.
<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	Adjust the size of the message queue to control the message sending speed.

#### ▾ Setting the Interval for Sending a Trap Message

<b>Command</b>	<b>snmp-server trap-timeout</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Interval (unit: second). The value range is 1 to 1,000.
<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	Adjust the interval for sending a message to control the message sending speed.

### Configuration Example

#### ▾ Setting SNMP Control Parameters

## 2 Configuring RMON

### 2.1 Overview

The Remote Network Monitoring (RMON) aims at resolving problems of managing local area networks (LANs) and remote sites by using one central point. In RMON, network monitoring data consists of a group of statistics and performance indicators, which can be used for monitoring the network utilization, so as to facilitate network planning, performance optimization, and network error diagnosis.

RMON is mainly used by a managing device to remotely monitor and manage managed devices.

#### Protocols and Standards

STD 0059 / RFC 2819: Remote Network Monitoring Management Information Base

RFC4502: Remote Network Monitoring Management Information Base Version 2

RFC 3919: Remote Network Monitoring (RMON) Protocol Identifiers for IPv6 and Multi Protocol Label Switching (MPLS)

RFC 3737: IANA Guidelines for the Registry of Remote Monitoring (RMON) MIB Modules

RFC 3434: Remote Monitoring MIB Extensions for High Capacity Alarms

RFC 3395: Remote Network Monitoring MIB Protocol Identifier Reference Extensions

RFC 3287: Remote Monitoring MIB Extensions for Differentiated Services

RFC 3273: Remote Network Monitoring Management Information Base for High Capacity Networks

RFC 2896: Remote Network Monitoring MIB Protocol Identifier Macros

RFC 2895: Remote Network Monitoring MIB Protocol Identifier Reference

### 2.2 Applications

Application	Description
<a href="#">Collecting Statistics on Information of a Monitored Interface</a>	Applies four functions of RMON to an interface to monitor the network communication of the interface.

#### 2.2.1 Collecting Statistics on Information of a Monitored Interface

##### Scenario

The RMON Ethernet statistics function is used to monitor accumulated information of an interface, the history statistics function is used to monitor the packet count of an interface within each monitoring interval, and the alarm function is used to immediately acquire packet count exceptions of an interface. The following figure shows the networking topology.

Figure 2-1

## Deployment

Interface x is monitored to accumulatively collect statistics on the packet count of the interface and collect statistics on the packet count and bandwidth utilization of the interface within the monitoring interval. If a packet count exception occurs on the interface, an alarm is reported to the network management system (NMS). The configuration key points are as follows:

- Configure the RMON Ethernet statistics function on interface x.
- Configure the RMON history statistics function on interface x.
- Configure the RMON alarm table and define RMON event processing actions in configuration mode. Monitored objects of alarms are the object identifier (OID) values of specific fields in the RMON Ethernet statistical table configured for interface x.

## 2.3 Features

### Basic Concepts

RMON defines multiple RMON groups. Ruijie products support the statistics group, history group, alarm group, and event group, which are described as follows:

#### Statistics Group

The statistics group is used to monitor and collect statistics on Ethernet interface traffic information, which is accumulated from the entry creation time to the current time. The statistical items include discarded data packets, broadcast data packets, cyclic redundancy check (CRC) errors, large and small blocks, and collisions. Statistical results are stored in the Ethernet statistical table.

#### History Group

The history group is used to periodically collect network traffic information. It records accumulated values of network traffic information and the bandwidth utilization within each interval, and saves them in the history control table. It includes two small groups:

- The HistoryControl group is used to set the sampling interval, sampling data source, and other control information.
- The EthernetHistory group provides administrators with historical data, including statistics on network segment traffic, error packets, broadcast packets, utilization, and number of collisions.

### Alarm Group

The alarm group is used to monitor a specified Management Information Base (MIB) object. When the value of a MIB object exceeds the preset upper limit or is lower than the preset lower limit, an alarm is triggered and the alarm is processed as an event.

### Event Group

The event group is used to define the event processing mode. When a monitored MIB object meets alarm conditions, an event is triggered. An event can be processed in any of the following modes:

- none: No action is taken.
- log: Event-relevant information is recorded in the log record table so that administrators can view it at any time.
- snmp-trap: A trap message is transmitted to the NMS to notify the NMS of the event occurrence.
- log-and-trap: Event-relevant information is recorded in the log record table and a trap message is transmitted to the NMS.

## Working Principle

RMON supports multiple monitors and two data collection methods. Method 1: A dedicated RMON probe is used to collect data and the NMS can directly acquire all information about the RMON MIB from the RMON probe. Method 2: RMON agents are built into network devices so that the devices have the RMON probe function. The NMS uses basic commands of the Simple Network Management Protocol (SNMP) to exchange data with the RMON agents and collect network management information. This method, however, is limited by device resources and information of only four groups rather than all data of the RMON MIB is acquired.

The following figure shows an example of communication between the NMS and RMON agents. The NMS, through the RMON agents running on devices, can acquire information about overall traffic, error statistics, and performance statistics of the network segment where a managed network device interface is, thereby implementing remote management of network devices.

Figure 2-2

## Overview

Feature	Description
<a href="#">RMON Ethernet Statistics</a>	Collects statistics on the packet count, byte count, and other data of a monitored Ethernet interface accumulatively.
<a href="#">RMON History Statistics</a>	Records the counts of packets, bytes, and other data communicated by an Ethernet interface within the configured interval and calculates the bandwidth utilization within the interval.
<a href="#">RMON Alarm</a>	Samples values of monitored variables at intervals. The alarm table is used in combination with the event table. When the upper or lower limit is reached, a relevant event table is triggered to perform event processing or no processing is performed.

### 2.3.1 RMON Ethernet Statistics

#### Working Principle

The RMON Ethernet statistics function accumulatively collects statistics on network traffic information of an Ethernet interface from the entry creation time to the current time.

#### Related Configuration

##### ▾ [Configuring RMON Statistical Entries](#)

- The RMON Ethernet statistics function is disabled by default.
- Run the **rmon collection stats** command to create Ethernet statistical entries on a specified Ethernet interface.
- After statistical entries are successfully created on a specified interface, the statistics group collects statistics on the traffic information of the current interface. The statistical items are variables defined in the RMON Ethernet statistical table, and recorded information is the accumulated values of variables from the creation time of the RMON statistical table to the current time.

### 2.3.2 RMON History Statistics

#### Working Principle

The RMON history statistics function records accumulated statistics on traffic information of an Ethernet interface within each interval.

#### Related Configuration

##### ▾ [Configuring RMON Historical Control Entries](#)

- The RMON history statistics function is disabled by default.
- Run the **rmon collection history** command to create historical control entries on an Ethernet interface.
- The RMON history group collects statistics on variables defined in the RMON history table and records accumulated values of variables within each interval.

### 2.3.3 RMON Alarm

#### Working Principle

The RMON alarm function periodically monitors value changes of alarm variables. If the value of an alarm variable reaches the specified upper threshold or lower threshold, a corresponding event is triggered for processing, for example, a trap message is transmitted or one logTable entry record is generated. If a lower threshold or upper threshold is reached multiple times consecutively, only one corresponding event is triggered and another event is triggered till a reverse threshold is reached.

#### Related Configuration

##### Configuring the Event Table

- The RMON event group function is disabled by default.
- Run the **rmon event** command to configure the event table.

##### Configuring Alarm Entries

- The RMON alarm group function is disabled by default.
- Run the **rmon event** command to configure the event table and run the **rmon alarm** command to configure the RMON alarm table.
- The RMON alarm function is implemented by the alarm table and event table jointly. If a trap message needs to be transmitted to a managing device in the case of an alarm event, the SNMP agent must be correctly configured first. For the configuration of the SNMP agent, see the *Configuring SNMP*.
- If a configured alarm object is a field node in the RMON statistics group or history group, the RMON Ethernet statistics function or RMON history statistics function need to be configured on a monitored Ethernet interface first.

## 2.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring RMON Ethernet Statistics</a>	 (Mandatory) It is used to accumulatively collect statistics on traffic information of an Ethernet interface.	
	<b>rmon collection stats</b>	Configures Ethernet statistical entries.
<a href="#">Configuring RMON History Statistics</a>	 (Mandatory) It is used to collect, at intervals, statistics on traffic information of an Ethernet interface and the bandwidth utilization within the interval.	
	<b>rmon collection history</b>	Configures historical control entries.
<a href="#">Configuring RMON Alarm</a>	 (Mandatory) It is used to monitor whether data changes of a variable is within the valid range.	
	<b>rmon event</b>	Configures event entries.

Configuration	Description and Command	
	<b>rmon alarm</b>	Configures alarm entries.

## 2.4.1 Configuring RMON Ethernet Statistics

### Configuration Effect

Acquire accumulated statistics on traffic information of a monitored Ethernet interface from the entry creation time to the current time.

### Notes

This function cannot be configured in batch interface configuration mode.

### Configuration Steps

#### ▾ Configuring RMON Statistical Entries

- Mandatory.
- If statistics and monitoring are required for a specified interface, Ethernet statistical entries must be configured on this interface.

### Verification

Run the **show rmon stats** command to display Ethernet statistics.

### Related Commands

#### ▾ Configuring RMON Statistical Entries

<b>Command</b>	<b>rmon collection stats</b> <i>index</i> [ <b>owner</b> <i>ownername</i> ]
<b>Parameter</b>	<i>index</i> : Indicates the index number of a statistical entry, with the value ranging from 1 to 65,535.
<b>Description</b>	<b>owner</b> <i>ownername</i> : Indicates the entry creator, that is, <i>ownername</i> , which is a case-sensitive string of 1-63 characters.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The values of statistical entry parameters cannot be changed.

### Configuration Example

#### ▾ Configuring RMON Ethernet Statistics

<p><b>Scenario</b></p> <p><b>Figure 2-3</b></p>	
	<p>As shown in the preceding figure, the RMON agent is connected to the server, and the NMS requires the RMON statistics group to conduct performance statistics on received packets of interface Gi0/1. Administrators can view the statistics at any time to understand data about received packets of an interface and take measures in a timely manner to handle network exceptions.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure a statistical table instance on interface GigabitEthernet 0/1 to collect statistics on the traffic of this interface.</li> </ul>
<p><b>Agent</b></p>	<pre>Ruijie# configure terminal Ruijie (config)# interface gigabitEthernet 0/1 Ruijie (config-if-GigabitEthernet 0/1)# rmon collection stats 1 owner admin</pre>
<p><b>Verification</b></p>	<p>Run the <b>show rmon stats</b> command to display Ethernet statistics.</p>
<p><b>Agent</b></p>	<pre>Ruijie# show rmon stats ether statistic table:     index = 1     interface = GigabitEthernet 0/1     owner = admin     status = 1     dropEvents = 0     octets = 25696     pkts = 293     broadcastPkts = 3     multiPkts = 0     crcAlignErrors = 0     underSizePkts = 0     overSizePkts = 0     fragments = 0</pre>

```

jabbers = 0

collisions = 0

packets640ctets = 3815

packets65To1270ctets = 1695

packets128To2550ctets = 365

packets512To10230ctets = 152

packets1024To15180ctets = 685
    
```

### Common Errors

Statistical table entries are re-configured or configured statistical table entries are modified.

## 2.4.2 Configuring RMON History Statistics

### Configuration Effect

Acquire accumulated statistics on the traffic of a monitored Ethernet interface and the bandwidth utilization within each interval.

### Notes

This function cannot be configured in batch interface configuration mode.

### Configuration Steps

- Mandatory.
- If network statistics on a specified interface need to be collected, RMON historical control entries must be configured on the interface.

### Verification

Run the **show rmon history** command to display history group statistics.

### Related Commands

#### Configuring RMON Historical Control Entries

<b>Command</b>	<b>rmon collection history</b> <i>index</i> [ <b>owner</b> <i>ownername</i> ] [ <b>buckets</b> <i>bucket-number</i> ] [ <b>interval</b> <i>seconds</i> ]
<b>Parameter</b>	<i>index</i> : Indicates the index number of a history statistical entry, with the value ranging from 1 to 65,535.
<b>Description</b>	<b>owner</b> <i>ownername</i> : Indicates the entry creator, that is, <i>ownername</i> , which is a case-sensitive string of 1-63 characters. <b>buckets</b> <i>bucket-number</i> : Sets the capacity of the history table in which a history statistical entry exists, that is, sets the maximum number of records ( <i>bucket-number</i> ) that can be accommodated in the history table.

	The value of <i>bucket-number</i> ranges from 1 to 65,535 and the default value is <b>10</b> . <b>interval seconds</b> : Sets the statistical interval, with the unit of seconds. The value ranges from 1 second to 3,600 seconds and the default value is <b>1,800</b> seconds.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The values of history statistical entry parameters cannot be changed.

### Configuration Example

#### Configuring RMON History Statistics

<b>Scenario</b> Figure 2-4	
	As shown in the preceding figure, the RMON agent is connected to the server, and the NMS needs to collect statistics on received packets of interface Gi0/1 through the RMON history group at an interval of 60 seconds, in an effort to monitor the network and understand emergency data.
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the history control table on interface GigabitEthernet 0/1 to periodically collect statistics on the traffic of this interface.</li> </ul>
<b>Agent</b>	<pre>Ruijie# configure terminal Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# rmon collection history 1 buckets 5 interval 300 owner admin</pre>
<b>Verification</b>	Run the <b>show rmon history</b> command to display history group statistics.
<b>Agent</b>	<pre>Ruijie# show rmon history rmon history control table:     index = 1     interface = GigabitEthernet 0/1     bucketsRequested = 5     bucketsGranted = 5     interval = 60     owner = admin</pre>

```

## Common Errors

History control table entries are re-configured or configured history control table entries are modified.

### 2.4.3 Configuring RMON Alarm

#### Configuration Effect

Periodically monitor whether value changes of alarm variables are within the specified valid range.

#### Notes

If a trap message needs to be transmitted to a managing device when an alarm event is triggered, the SNMP agent must be correctly configured. For the configuration of the SNMP agent, see the *Configuring SNMP*.

If an alarm variable is a MIB variable defined in the RMON statistics group or history group, the RMON Ethernet statistics function or RMON history statistics function must be configured on the monitored Ethernet interface. Otherwise, an alarm table fails to be created.

## Configuration Steps

### Configuring Event Entries

- Mandatory.
- Complete the configuration in global configuration mode.

### Configuring Alarm Entries

- Mandatory.
- Complete the configuration in global configuration mode.

## Verification

- Run the **show rmon event** command to display the event table.
- Run the **show rmon alarm** command to display the alarm table.

## Related Commands

### Configuring the Event Table

<b>Command</b>	<b>rmon event</b> <i>number</i> [ <b>log</b> ] [ <b>trap</b> <i>community</i> ] [ <b>description</b> <i>description-string</i> ] [ <b>owner</b> <i>ownername</i> ]
<b>Parameter</b>	<i>number</i> : Indicates the index number of an event table, with the value ranging from 1 to 65,535.
<b>Description</b>	<b>log</b> : Indicates a log event. The system logs a triggered event. <b>trap</b> <i>community</i> : Indicates a trap event. When an event is triggered, the system transmits a trap message with the community name of <i>community</i> . <b>description</b> <i>description-string</i> : Sets the description information about an event, that is, <i>description-string</i> . The value is a string of 1-127 characters. <b>owner</b> <i>ownername</i> : Indicates the entry creator, that is, <i>ownername</i> , which is a case-sensitive string of 1-63 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The values of configured event entry parameters can be changed, including the event type, trap community name, event description, and event creator.

### Configuring the RMON Alarm Group

<b>Command</b>	<b>rmon alarm</b> <i>number</i> <i>variable</i> <i>interval</i> { <b>absolute</b>   <b>delta</b> } <b>rising-threshold</b> <i>value</i> [ <i>event-number</i> ] <b>falling-threshold</b> <i>value</i> [ <i>event-number</i> ] [ <b>owner</b> <i>ownername</i> ]
<b>Parameter</b>	<i>number</i> : Indicates the index number of an alarm entry, with the value ranging from 1 to 65,535.
<b>Description</b>	<i>variable</i> : Indicates an alarm variable, which is a string of 1-255 characters and is represented in dotted format using the node OID (format: entry.integer.instance; example: 1.3.6.1.2.1.2.1.10.1). <i>Interval</i> : Indicates the sampling interval, with the unit of seconds and the value ranging from 1 to 2,147,483,647. <b>absolute</b> : Indicates that the sampling type is absolute value sampling, that is, variable values are directly

	<p>extracted when the sampling time is up.</p> <p><b>delta:</b> Indicates that the sampling type is changing value sampling, that is, changes in the variable values within the sampling interval are extracted when the sampling time is up.</p> <p><b>rising-threshold value:</b> Sets the upper limit of the sampling quantity (<i>value</i>), with the value ranging from -2,147,483,648 to +2,147,483,647.</p> <p><b>event-number:</b> Indicates that an event with the event number of <i>event-number</i> is triggered when the upper limit or lower limit is reached.</p> <p><b>falling-threshold value:</b> Sets the lower limit of the sampling quantity (<i>value</i>), with the value ranging from -2,147,483,648 to +2,147,483,647.</p> <p><b>owner ownername:</b> Indicates the entry creator, that is, <i>ownername</i>, which is a case-sensitive string of 1-63 characters.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Values of configured alarm entry parameters can be changed, including alarm variables, sampling type, entry creator, sampling interval, upper/lower limit of the sampling quantity, and relevant trigger events.

### Configuration Example

#### Configuring RMON Alarm

<p><b>Scenario</b> Figure 2-5</p>	
	<p>Assume that SNMPv1 runs on the NMS, the community name used for accessing the settings is public, with the attribute of read-write, and the IP address used by the NMS to receive trap messages is 3.3.3.3.</p> <p>Assume that the OID value of unknown protocol packets received by monitored interface GigabitEthernet0/3 is 1.3.6.1.2.1.2.2.1.15.3, the sampling mode is relative sampling, and the sampling interval is 60 seconds.</p> <p>When the relative sampling value is larger than 100 or lower than 10, event 1 and event 2 are triggered respectively. In event 1, a trap message is transmitted and the event is logged. In event 2, the event is only logged.</p> <p>The configuration of the RMON agent is completed on the terminal. The RMON agent is connected to the NMS and is connected to the server through interface Gi0/1. The RMON agent needs to monitor the count of unknown protocol packets received by interface Gi0/1. The sampling interval is 60 seconds. When the absolute sampling value is smaller than 10, the event is only logged. When the absolute sampling value is larger than 100, the event is logged and a trap message is transmitted to the NMS.</p>

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the host address for receiving trap messages.</li> <li>● Configure an event group to process alarm trigger.</li> <li>● Configure the alarm function.</li> </ul>
<p><b>Agent</b></p>	<pre>Ruijie# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)# snmp-server community public rw Ruijie(config)# snmp-server host 3.3.3.3 trap public Ruijie(config)# rmon event 1 description rising-threshold-event log trap public owner admin Ruijie(config)# rmon event 2 description falling-threshold-event log owner admin Ruijie(config)# rmon alarm 1 1.3.6.1.2.1.2.1.15.3 60 delta rising-threshold 100 1 falling-threshold 10 2 owner admin</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run the <b>show rmon event</b> command to display the event table.</li> <li>● Run the <b>show rmon alarm</b> command to display the alarm table.</li> </ul>
<p><b>Agent</b></p>	<pre>Ruijie# show rmon event rmon event table:         index = 1         description = rising-threshold-event         type = 4         community = public         lastTimeSent = 0d:0h:0m:0s         owner = admin         status = 1          index = 2         description = falling-threshold-event         type = 2         community =         lastTimeSent = 6d:19h:21m:48s         owner = admin</pre>

```

        status = 1

rmon log table:

        eventIndex = 2
        index = 1
        logTime = 6d:19h:21m:48s
        logDescription = falling-threshold-event

Ruijie# show rmon alarm
rmon alarm table:

        index: 1,
        interval: 60,
        oid = 1.3.6.1.2.1.2.2.1.15.3
        sampleType: 2,
        alarmValue: 0,
        startupAlarm: 3,
        risingThreshold: 100,
        fallingThreshold: 10,
        risingEventIndex: 1,
        fallingEventIndex: 2,
        owner: admin,
        stauts: 1
    
```

### Common Errors

- The entered OID of a monitored object is incorrect, the variable corresponding to the OID does not exist, or the type is not an integer or unsigned integer.
- The upper threshold is smaller than or equal to the lower threshold.

## 2.5 Monitoring

### Displaying

Description	Command
Displays all RMON configuration information.	<b>show rmon</b>

Description	Command
Displays the Ethernet statistical table.	<b>show rmon stats</b>
Displays the history control table.	<b>show rmon history</b>
Displays the alarm table.	<b>show rmon alarm</b>
Displays the event table.	<b>show rmon event</b>

## 3 Configuring NTP

### 3.1 Overview

The Network Time Protocol (NTP) is an application-layer protocol that enables network devices to synchronize time. NTP enables network devices to synchronize time with their servers or clock sources and provides high-precision time correction (the difference from the standard time is smaller than one millisecond in a LAN and smaller than decades of milliseconds in a WAN). In addition, NTP can prevent attacks by using encrypted acknowledgment.

Currently, Ruijie devices can be used both as NTP clients and NTP servers. In other words, a Ruijie device can synchronize time with a time server, and be used as a time server to provide time synchronization for other devices. When a Ruijie device is used as a server, it supports only the unicast server mode.

#### Protocols and Standards

- RFC 1305 : Network Time Protocol (Version 3)

### 3.2 Applications

Application	Description
<a href="#">Synchronizing Time Based on an External Reference Clock Source</a>	A device is used as a client that synchronizes time with an external clock source. After successful synchronization, it is used as a server to provide time synchronization for other devices.
<a href="#">Synchronizing Time Based on a Local Reference Clock Source</a>	A device uses a local clock as a reliable NTP reference clock source and is also used as a server to provide time synchronization for other devices.

#### 3.2.1 Synchronizing Time Based on an External Reference Clock Source

##### Scenario

As shown in Figure 3-1:

- DEVICE-A is used as a reliable reference clock source to provide time synchronization for external devices.
- DEVICE-B specifies DEVICE-A as the NTP server and synchronizes time with DEVICE-A.
- After successful synchronization, DEVICE-B provides time synchronization for DEVICE-C.

Figure 3-1

## Deployment

Configure DEVICE-B to the NTP external reference clock mode.

### 3.2.2 Synchronizing Time Based on a Local Reference Clock Source

#### Scenario

As shown in Figure 3-2, DEVICE-B uses a local clock as the NTP reference clock source and provides time synchronization for DEVICE-C.

Figure 3-2

## Deployment

Configure DEVICE-B to the NTP local reference clock mode.

## 3.3 Features

### Basic Concepts

#### 📄 NTP Packet

As defined in RFC1305, NTP uses User Datagram Protocol (UDP) packets for transmission and the used UDP port ID is 123.

Figure 3-3 shows the format of an NTP time synchronization packet.

Figure 3-3 Format of an NTP Time Synchronization Packet

- Leap Indicator(LI): indicates a 2-bit leap second indicator.
- 
- **i** 00: indicates no warning information; 01: indicates that there are 61 seconds in the previous minute; 10: indicates that there are 59 seconds in the previous minute; 11: indicates that the clock is not synchronized.
- 
- Version Number(VN): indicates a 3-bit NTP version number. The current version number is 3.
  - Mode: indicates a 3-bit NTP working mode.
- 
- **i** 0: indicates no definition; 1: indicates symmetric active; 2: indicates symmetric passive; 3: indicates a client; 4: indicates a server; 5: indicates broadcasting; 6: indicates control information; 7: reserved.
- 
- Stratum: indicates the 8-bit stratum of a local clock. 0: indicates no definition; 1: indicates the master reference clock source; other values: indicate slave reference clock sources.
  - Poll Interval: indicates the poll interval (seconds), which is a 8-bit integer.
  - Precision: indicates the time precision (seconds) of a local clock, which is a 8-bit integer.
  - Root Delay: indicates the round-trip time to the master reference clock source, which is a 32-bit integer.
  - Root Dispersion: indicates the largest difference from the master reference clock source, which is a 32-bit integer.
  - Reference Clock Identifier: indicates the 32-bit identifier of a reference clock source.
  - Reference Timestamp: indicates a 64-bit timestamp, namely, the time that is set or corrected at the last time.
  - Originate Timestamp: indicates a 64-bit timestamp, namely, the local time when a time synchronization request leaves from a client.
  - Receive Timestamp: indicates a 64-bit timestamp, namely, the local time when a time synchronization request packet arrives at a server.
  - Transmit Timestamp: indicates a 64-bit timestamp, namely, the local time when a time synchronization response packet leaves from a server.
  - Authenticator (optional): indicates authentication information.

### ↘ NTP Server

A device uses a local clock as the reference clock source to provide time synchronization for other devices in the network.

### ↘ NTP Client

A device is used as an NTP client that synchronizes time with an NTP server in the network.

### ↘ Stratum

In NTP, "stratum" is used to describe the hops from a device to an authority clock source. An NTP server whose stratum is 1 has a directly connected atomic clock or radio controlled clock; an NTP server whose stratum is 2 obtains time from the server whose stratum is 1; an NTP server whose stratum is 3 obtains time from the server whose stratum is 2; and so on. Therefore, clock sources with lower stratums have higher clock precisions.

### ↘ Hardware Clock

A hardware clock operates based on the frequency of the quartz crystal resonator on a device and is powered by the device battery. After the device is shut down, the hardware clock continues running. After the device is started, the device obtains time information from the hardware clock as the software time of the device.

## Overview

Feature	Description
<a href="#">NTP Time Synchronization</a>	Network devices synchronize time with their servers or reliable clock sources to implement high-precision time correction.
<a href="#">NTP Security Authentication</a>	The NTP packet encryption authentication is used to prevent unreliable clock sources from time synchronization interference on a device.
<a href="#">NTP Access Control</a>	An Access Control List (ACL) is used to filter sources of received NTP packets.

## 3.3.1 NTP Time Synchronization

### Working Principle

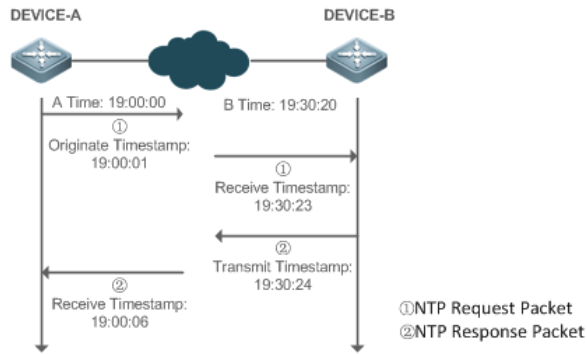

NTP time synchronization is implemented by interaction of NTP packets between a client and a server:

- The client sends a time synchronization packet to all servers every 64 seconds. After receiving response packets from the servers, the client filters and selects the response packets from all servers, and synchronizes time with an optimum server.
- After receiving the time synchronization request packet, a server uses the local clock as the reference source, and fills the local time information into the response packet to be sent to the client based on the protocol requirement.

Figure 3-4 shows the format of an NTP time synchronization packet.

Figure 3-4 Working Principle of NTP

DEVICE-B (B for short) is used as an NTP reference clock source, DEVICE-A (A for short) is used as an NTP client that synchronizes time with DEVICE-B. At a time point, the local clock of A is 19:00:00 and the local clock of B is 19:30:20.

1. A sends an NTP request packet. The local time (T0) when the packet leaves from A is 19:00:00 and is filled in Originate Timestamp.
2. After a 2-second network delay, the local time (T1) when B receives the request packet is 19:30:23 and is filled in Receive Timestamp.
3. B processes the NTP request and sends an NTP response packet one second later. The local time (T2) when the response packet leaves from B is 19:30:24 and is filled in Transmit Timestamp.
4. After a 2-second network delay, A receives the response packet. The local time (T3) when the response packet arrives at A is 19:00:06.

The specific calculations for time synchronization are as follows:

- A obtains the time difference of 30 minutes and 20 seconds between B and A by using the formula  $((T1-T0)+(T2-T3))/2$ .
- A obtains the packet round-trip delay of four seconds between A and B by using the formula  $(T3-T0)-(T2-T1)$ .

### 📌 NTP Working Mode

- External clock reference mode

In this mode, a device is used as both a server and a client. If receiving time synchronization requests from other clients, the device must synchronize time with the specified server first and provide time synchronization for the clients after successful synchronization.

- Local clock reference mode

In this mode, a device uses the default local clock as the reliable clock source and provides time synchronization directly for other clients.

## Related Configuration

### 📌 Configuring an NTP Server

- The NTP function is disabled by default.
- Run the **ntp server** command to specify an NTP server (external clock reference source), which can enable NTP.
- After the configuration, the device works in the external clock reference mode.

### ↘ Real-time Synchronization

- A device performs time synchronization every 64 seconds by default.

### ↘ Updating a Hardware Clock

- By default, a device does not update synchronized time to the hardware clock.
- Run the **ntp update-calendar** command to enable a device to automatically update the hardware clock after successfully synchronizing time each time.

### ↘ Configuring the NTP Master Clock

- By default, a device works in the external clock reference mode.
- Run the **ntp master** command to configure a device to the local clock reference mode.

## 3.3.2 NTP Security Authentication

To prevent malicious damage on an NTP server, NTP uses the authentication mechanism to check whether the time synchronization information is really from the announced server and check the information return path to provide an anti-interference protection mechanism.

### Working Principle

An NTP client and an NTP server are configured with the same key. When sending request and response packets, a device calculates the hash values of the packets by using the MD5 algorithm based on the specified key and NTP packet content, and fills the hash values into the packet authentication information. The receiving device checks whether the packets are sent by a trusted device or modified based on the authentication information.

### Related Configuration

#### ↘ Configuring a Global Security Authentication Mechanism for NTP

- By default, no NTP security authentication mechanism is enabled.
- Run the **ntp authenticate** command to enable the NTP security authentication mechanism.

#### ↘ Configuring a Global Authentication Key for NTP

- By default, no global authentication key is configured.
- Run the **ntp authentication-key** command to enable an NTP global authentication key.

#### ↘ Configuring a Globally Trusted Key ID for NTP

- By default, no globally trusted key is configured.
- Run the **ntp trusted-key** command to configure a device as the reference clock source to provide a trusted key for time synchronization externally.

#### ↘ Configuring a Trusted Key ID for an External Reference Clock Source

- Run the **ntp server** command to specify an external reference source and the trusted key of this clock source as well.

### 3.3.3 NTP Access Control

#### Working Principle

Provide a minimum security measure by using an ACL.

#### Related Configuration

##### ▾ [Configuring the Access Control Rights for NTP Services](#)

- By default, there is no access control right for NTP.
- Run the **ntp access-group** command to configure the access control rights for NTP.

## 3.4 Configuration

Configuration	Description and Command
<a href="#">Configuring Basic Functions of NTP</a>	 (Mandatory) It is used to enable NTP. After NTP is enabled, a device works in the external clock reference mode.
	<b>ntp server</b>   Configures an NTP server.
	<b>ntp update-calendar</b>   Automatically updates a hardware clock.
	 (Optional) It is used to configure a device to the local clock reference mode.
	<b>ntp master</b>   Configures the NTP master clock.
	 (Optional) It is used to disable NTP.
	<b>no ntp</b>   Disables all functions of NTP and clears all NTP configurations.
<a href="#">Configuring NTP Security Authentication</a>	<b>ntp disable</b>   Disables receiving of NTP packets from a specified interface.
	 (Optional) It is used to prevent unreliable clock sources from performing time synchronization interference on a device.
	<b>ntp authenticate</b>   Enables a security authentication mechanism.
	<b>ntp authentication-key</b>   Configures a global authentication key.
	<b>ntp trusted-key</b>   Configures a trusted key for time synchronization.
<b>ntp server</b>   Configures a trusted key for an external reference clock source.	

<a href="#">Configuring NTP Access Control</a>	 (Optional) It is used to filter the sources of received NTP packets.	
	<table border="1"> <tr> <td><code>ntp access-group</code></td> <td>Configures the access control rights for NTP.</td> </tr> </table>	<code>ntp access-group</code>
<code>ntp access-group</code>	Configures the access control rights for NTP.	

### 3.4.1 Configuring Basic Functions of NTP

#### Configuration Effect

##### External Clock Reference Mode

- Use a device as a client to synchronize time from an external reference clock source to the local clock.
- After the time synchronization is successful, use the device as a time synchronization server to provide time synchronization.

##### Local Clock Reference Mode

- Use the local clock of a device as the NTP reference clock source to provide time synchronization.

#### Notes

- In the client/server mode, a device can be used as a time synchronization server to provide time synchronization only after successfully synchronizing time with a reliable external clock source.
- Once the local clock reference mode is configured, the system will not synchronize time with a clock source with a higher stratum.
- Configuring a local clock as the master clock (especially when specifying a lower stratum) may overwrite an effective clock source. If this command is used for multiple devices in a network, the clock difference between the devices may cause unstable time synchronization of the network.
- Before a local clock is configured as the master clock, if the system never synchronizes time with an external clock source, you may need to manually calibrate the system clock to ensure that there is no excessive difference. For details about how to manually calibrate the system clock, refer to the system time configuration section in the configuration guide.

#### Configuration Steps

##### Configuring an NTP Server

- (Mandatory) At least one external reference clock source must be specified (A maximum of 20 different external reference clock sources can be configured).
- If it is necessary to configure an NTP key, you must configure NTP security authentication before configuring the NTP server.

##### Automatically Updating a Hardware Clock

- Optional.

- By default, the system updates only the system clock, but not the hardware clock after successful time synchronization.
- After this command is configured, the system automatically updates the hardware clock after successful time synchronization.

### ↘ Configuring the NTP Master Clock

- To switch a device to the local clock reference mode, run this command.

### ↘ Disabling NTP

- To disable NTP and clear NTP configurations, run the **no ntp** command.
- By default, all interfaces can receive NTP packets after NTP is enabled. To disable NTP for a specified interface, run the **ntp disable** command.

## Verification

- Run the **show ntp status** command to display the NTP configuration.
- Run the **show clock** command to check whether time synchronization is completed.

## Related Commands

### ↘ Configuring an NTP Server

<b>Command</b>	<b>ntp server</b> [ <i>oob</i>   <i>vrf vrf-name</i> ]{ <i>ip-addr</i>   <i>domain</i>   <i>ip domain</i>   <i>ipv6 domain</i> }[ <b>version</b> <i>version</i> ][ <b>source</b> <i>if-name</i> ][ <b>key</b> <i>keyid</i> ][ <b>prefer</b> ] [ <b>via</b> <i>mgmt-name</i> ]
<b>Parameter Description</b>	<p><i>oob</i>: Indicates whether a reference clock source is bound to the MGMT interface.</p> <p><i>vrf-name</i>: Indicates the name of the VRF that is bound to the reference clock source.</p> <p><i>ip-addr</i>: Indicates the IPv4/IPv6 address of the reference clock source.</p> <p><i>domain</i>: Indicates the IPv4/IPv6 domain name of the reference clock source.</p> <p><i>version</i>: Indicates the NTP version number, ranging from 1 to 3.</p> <p><i>if-name</i>: Indicates the interface type, including AggregatePort, Dialer GigabitEthernet, Loopback, Multilink, Null, Tunnel, Virtual-ppp, Virtual-template and Vlan.</p> <p><i>keyid</i>: Indicates the key used for communicating with the reference clock source, ranging from 1 to 4294967295.</p> <p><b>prefer</b>: Indicates whether the reference clock source has a high priority.</p> <p><i>mgmt-name</i>: Specifies the egress management interface for packets in the oob mode.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>By default, no NTP server is configured. Ruijie client system supports interaction with up to 20 NTP servers. You can configure an authentication key for each server (after configuring global authentication and the related key) to initiate encrypted communication with the servers.</p> <hr/> <p> If it is necessary to configure an authentication key, you must configure NTP security authentication before configuring an NTP server.</p>

	The default version of NTP for communicating with a server is NTP version 3. In addition, you can configure the source interface for transmitting NTP packets and specify that the NTP packets from a corresponding server can be received only on the transmitting interface.
--	--

### ↘ Updating a Hardware Clock

<b>Command</b>	<b>ntp update-calendar</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring a Local Reference Clock Source

<b>Command</b>	<b>ntp master</b> [ <i>stratum</i> ]
<b>Parameter Description</b>	<i>stratum</i> : specifies the stratum of a local clock, ranging from 1 to 15. The default value is 8.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Disabling NTP

<b>Command</b>	<b>no ntp</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command can be used to fast disable all functions of NTP and clear all NTP configurations.

### ↘ Disabling Receiving of NTP Packets on an Interface

<b>Command</b>	<b>ntp disable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ↘ External Clock Reference Mode of NTP

<p><b>Scenario</b> Figure 3-5</p>	
	<ul style="list-style-type: none"> <li>● DEVICE-B is configured to the NTP external clock reference mode.</li> <li>● DEVICE-A is used as the reference clock source of DEVICE-B.</li> <li>● DEVICE-C synchronizes time with DEVICE-B.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● DEVICE-A configures the local clock as the NTP reference clock source.</li> <li>● DEVICE-B configures DEVICE-A as the reference clock source.</li> <li>● DEVICE-C configures DEVICE-B as the reference clock source.</li> </ul>
<p><b>DEVICE-A</b></p>	<pre>A#configure terminal A(config)# ntp master A(config)#exit</pre>
<p><b>DEVICE-B</b></p>	<pre>B#configure terminal B(config)# ntp server 192.168.1.1 B(config)# exit</pre>
<p><b>DEVICE-C</b></p>	<pre>C#configure terminal C(config)# ntp server 192.168.2.1 C(config)# exit</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run the <b>show ntp status</b> command on DEVICE-B to display the NTP configuration.</li> <li>● DEVICE-B sends a time synchronization packet to 192.168.1.1 in order to synchronize time with DEVICE-A.</li> <li>● After successfully synchronizing time with DEVICE-A, DEVICE-B can respond to the time synchronization request from DEVICE-C.</li> <li>● Run the <b>show clock</b> command on DEVICE-B and DEVICE-C to check whether the time synchronization is successful.</li> </ul>

Local Clock Reference Mode of NTP

<p><b>Scenario</b> Figure 3-6</p>	
	<ul style="list-style-type: none"> <li>● DEVICE-B configures the local clock as the NTP reference clock source.</li> <li>● DEVICE-C synchronizes time with DEVICE-B.</li> </ul>
<p><b>Configuration</b></p>	<ul style="list-style-type: none"> <li>● DEVICE-B configures the local clock as the NTP reference clock source.</li> </ul>

<b>Steps</b>	<ul style="list-style-type: none"> <li>● DEVICE-C configures DEVICE-B as the reference clock source.</li> </ul>
<b>DEVICE-B</b>	<pre>B#configure terminal B(config)# ntp master B(config)# exit</pre>
<b>DEVICE-C</b>	<pre>C#configure terminal C(config)# ntp server 192.168.2.1 C(config)# exit</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show clock</b> command on DEVICE-C to check whether the time synchronization is successful.</li> </ul>

### 3.4.2 Configuring NTP Security Authentication

#### Configuration Effect

##### ↘ Synchronizing Time from a Trusted Reference Clock Source

Use a device as a client to synchronize time only from a trusted external reference clock source to the local clock.

##### ↘ Providing Time Synchronization for a Trusted Device

Use the local clock of a device as the NTP reference clock source to provide time synchronization for only a trusted device.

#### Notes

The authentication keys of the client and server must be the same.

#### Configuration Steps

##### ↘ Configuring a Global Security Authentication Mechanism for NTP

- Mandatory.
- By default, a device disables the security authentication mechanism.

##### ↘ Configuring a Global Authentication Key for NTP

- Mandatory.
- By default, a device is not configured with an authentication key.

##### ↘ Configuring a Globally Trusted Key ID for NTP

- Optional.
- To provide time synchronization for a trusted device, you must specify a trusted authentication key by using the key ID.
- Only one trusted key can be configured. The specified authentication key must be consistent with that of the trusted device.

### ▾ Configuring an Authentication Key ID for an External Reference Clock Source

- Optional.
- To synchronize time with a trusted reference clock source, you must specify a trusted authentication key by using the key ID.
- Each trusted reference clock source is mapped to an authentication key. The authentication keys must be consistent with the keys of trusted reference clock sources.

### Verification

- Run the **show run** command to verify the NTP configuration.
- Run the **show clock** command to check whether time is synchronized only with a trusted device.

### Related Commands

#### ▾ Enabling a Security Authentication Mechanism

<b>Command</b>	<b>ntp authenticate</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, a client does not use a global security authentication mechanism. If no security authentication mechanism is used, communication will not be encrypted. A global security indicator is not enough to imply that the communication between the client and server is implemented in an encrypted manner. Other global keys and an encryption key for the server must also be configured for initiating encrypted communication between the client and server.

#### ▾ Configuring a Global Authentication Key

<b>Command</b>	<b>ntp authentication-key</b> <i>key-id</i> <b>md5</b> <i>key-string</i> [ <i>enc-type</i> ]
<b>Parameter Description</b>	<i>key-id</i> : indicates the ID of a global authentication key, ranging from 1 to 4294967295. <i>key-string</i> : indicates a key string. <i>enc-type</i> : (optional) indicates whether an entered key is encrypted. 0 indicates no encryption, and 7 indicates simple encryption. The default setting is no encryption.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring a Trusted Key for NTP

<b>Command</b>	<b>ntp trusted-key</b> <i>key-id</i>
<b>Parameter Description</b>	<i>key-id</i> : Indicates the ID of a trusted key, ranging from 1 to 4294967295.

<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

➤ **Configuring a Trusted Key for an External Reference Clock Source**

Refer to the section “Related Commands”.

**Configuration Example**

➤ **Security Authentication**

<p><b>Scenario</b> Figure 3-7</p>	
	<ul style="list-style-type: none"> <li>● DEVICE-B is configured to the NTP client/server mode and provides NTP services requiring security authentication for DEVICE-C. The authentication key is "abcd".</li> <li>● DEVICE-A is used as the reference clock source of DEVICE-B.</li> <li>● DEVICE-C synchronizes time with DEVICE-B.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● DEVICE-B configures DEVICE-A as the reference clock source.</li> <li>● DEVICE-C configures DEVICE-B as the reference clock source.</li> </ul>
<p><b>DEVICE-B</b></p>	<pre>B#configure terminal B(config)# ntp authentication-key 1 md5 abcd B(config)# ntp trusted-key 1 B(config)# ntp server 192.168.1.1 B(config)# exit</pre>
<p><b>DEVICE-C</b></p>	<pre>C#configure terminal C(config)# ntp authentication-key 1 md5 abcd C(config)# ntp server 192.168.2.1 key 1 C(config)# exit</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● DEVICE-B sends a time synchronization packet that carries authentication information to 192.168.1.1 in order to synchronize time with DEVICE-A.</li> <li>● Run the <b>show clock</b> command on DEVICE-B to check whether the time synchronization is successful.</li> </ul>

**3.4.3 Configuring NTP Access Control**

**Configuration Effect**

Access control for NTP services provides a minimum security measure. A more secure method is to use an NTP authentication mechanism.

## Notes

- Currently, the system does not support control query (used to control NTP servers by using network management devices, such as setting the leap second indicator or monitoring its working status). Though rule matching is implemented in the preceding sequence, no request related to control query is supported.
- If no access control rule is configured, all accesses are allowed. If any access control rule is configured, only accesses allowed by the rule can be implemented.

## Related Configuration

### ▾ Configuring the Access Control Rights for NTP

- Optional.
- Run the **ntp access-group** command to configure the access control rights and a corresponding ACL for NTP.

## Verification

Run the **show run** command to verify the NTP configuration.

## Related Commands

### ▾ Configuring the Access Control Rights for NTP Services

<b>Command</b>	<b>ntp access-group</b> { <b>peer</b>   <b>serve</b>   <b>serve-only</b>   <b>query-only</b> } <i>access-list-number</i>   <i>access-list-name</i>
<b>Parameter Description</b>	<p><b>peer</b>: allows time request and control query for local NTP services, and allows a local device to synchronize time with a remote system (full access rights).</p> <p><b>serve</b>: allows time request and control query for local NTP services, but does not allow a local device to synchronize time with a remote system.</p> <p><b>serve-only</b>: allows only time request for local NTP services.</p> <p><b>query-only</b>: allows only control query for local NTP services.</p> <p><i>access-list-number</i>: indicates the number of an IP ACL, ranging from 1 to 99 and from 1300 to 1999. For details about how to create an IP ACL, refer to the <i>Configuring ACL</i>.</p> <p><i>access-list-name</i>: indicates the name of an IP ACL. For details about how to create an IP ACL, refer to the <i>Configuring ACL</i>.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Configure NTP access control rights.</p> <p>When an access request arrives, the NTP service matches rules in the sequence from the minimum access restriction to the maximum access restriction and uses the first matched rule. The matching sequence is peer, serve, serve-only, and query-only.</p>

## Configuration Example

### Configuring NTP Access Control Rights

<b>Configuration Steps</b>	Allow only the device with the IP address of 192.168.1.1 to send a time synchronization request to a local device.
	<pre>Ruijie(config)# access-list 1 permit 192.168.1.1 Ruijie(config)# ntp access-group serve-only 1</pre>

## 3.5 Monitoring

### Displaying

Description	Command
<b>show ntp status</b>	Displays the current NTP information.

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
<b>debug ntp</b>	Enables debugging.
<b>no debug ntp</b>	Disables debugging.

## 4 CConfiguring SNTP

### 4.1 Overview

The Simple Network Time Protocol (SNTP) is a simplified version of Network Time Protocol (NTP), which is used to synchronize the clocks of computers on the Internet. SNTP is applied in scenarios where it is unnecessary to use all NTP functions.

NTP uses a complex algorithm and has higher requirements for the system whereas SNTP uses a simpler algorithm and provides higher performance. Generally, SNTP precision can reach about 1s, which meets the basic requirements of most scenarios. Since SNTP packets are the same as NTP packets, the SNTP client implemented on a device is fully compatible with an NTP server.

#### Protocols and Standards

- RFC 2030: Simple Network Time Protocol (SNTP) Version 4 for IPv4, IPv6 and OSI

### 4.2 Applications

Application	Description
<a href="#">Synchronizing Time with an NTP Server</a>	A device is used as a client to synchronize time with an NTP server.

#### 4.2.1 Synchronizing Time with an NTP Server

##### Scenario

As shown in Figure 4-1, DEVICE-B uses a local clock as the NTP clock reference source and provides time synchronization for DEVICE-C.

DEVICE-C is used as an SNTP client to synchronize time with DEVICE-B.

Figure 4-1

##### Deployment

- Specify DEVICE-B as the SNTP server of DEVICE-C.
- Enable SNTP for DEVICE-C.

## 4.3 Features

### Basic Concepts

#### SNTP Packet

SNTPV4 is developed from NTP, which is intended to simplify the functions of NTP. It does not change the NTP specifications and the original implementation of NTP. The message format of SNTPV4 is the same as that of NTP defined in RFC1305, with only some data fields initialized into preset values.

As defined in RFC1305, SNTP uses User Datagram Protocol (UDP) packets for transmission and the used UDP port ID is 123.

Figure 4-2 shows the format of an SNTP time synchronization packet.

Figure 4-2 Format of an SNTP Time Synchronization Packet

- Leap Indicator(LI): indicates a 2-bit leap second indicator.
- 
- **i** 00: indicates no warning information; 01: indicates that there are 61 seconds in the previous minute; 10: indicates that there are 59 seconds in the previous minute; 11: indicates that the clock is not synchronized.
- 
- Version Number(VN): indicates a 3-bit NTP/SNTP version number. The current version number is 3.
  - Mode: indicates a 3-bit SNTP/NTP working mode.
- 
- **i** 0: indicates no definition; 1: indicates symmetric active; 2: indicates symmetric passive; 3: indicates a client; 4: indicates a server; 5: indicates broadcasting; 6: indicates control information; 7: reserved.
- 
- Stratum: indicates the 8-bit stratum of a local clock. 0: indicates no definition; 1: indicates the master clock reference source; other values: indicate slave clock reference sources.
  - Poll Interval: indicates the poll interval (seconds), which is a 8-bit integer.
  - Precision: indicates the time precision (seconds) of a local clock, which is a 8-bit integer.

- Root Delay: indicates the round-trip time to the master clock reference source, which is a 32-bit integer.
- Root Dispersion: indicates the largest difference from the master reference clock source, which is a 32-bit integer.
- Reference Clock Identifier: indicates the 32-bit identifier of a reference clock source.
- Reference Timestamp: indicates a 64-bit timestamp, namely, the time that is set or corrected at the last time.
- Originate Timestamp: indicates a 64-bit timestamp, namely, the local time when a time synchronization request leaves from a client.
- Receive Timestamp: indicates a 64-bit timestamp, namely, the local time when a time synchronization request packet arrives at a server.
- Transmit Timestamp: indicates a 64-bit timestamp, namely, the local time when a time synchronization response packet leaves from a server.
- Authenticator (optional): indicates authentication information.

### Overview

Feature	Description
<a href="#">SNTP Time Synchronization</a>	Synchronizes time from an SNTP/NTP server to a local device.

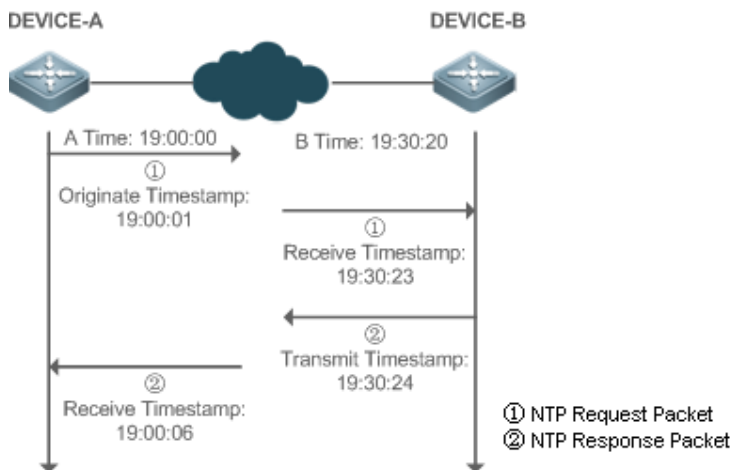

### 4.3.1 SNTP Time Synchronization

#### Working Principle

SNTP time synchronization is implemented by interaction of SNTP/NTP packets between a client and a server. The client sends a time synchronization packet to the server at intervals (half an hour by default). After receiving a response packet from the server, the client synchronizes time.

Figure 4-3 shows the format of an SNTP time synchronization packet.

Figure 4-3 Working Principle of SNTP

DEVICE-B (B for short) is used as an NTP reference clock source, DEVICE-A (A for short) is used as an SNTP client that synchronizes time with DEVICE-B. At a time point, the local clock of A is 19:00:00 and the local clock of B is 19:30:20.

1. A sends an SNTP/NTP request packet. The local time (T0) when the packet leaves from A is 19:00:00 and is filled in Originate Timestamp.
2. After a 2-second network delay, the local time (T1) when B receives the request packet is 19:30:23 and is filled in Receive Timestamp.
3. B processes the NTP request and sends an NTP response packet one second later. The local time (T2) when the response packet leaves from B is 19:30:24 and is filled in Transmit Timestamp.
4. After a 2-second network delay, A receives the response packet. The local time (T3) when the response packet arrives at A is 19:00:06.

The specific calculations for time synchronization are as follows:

- A obtains the time difference of 30 minutes and 20 seconds between B and A by using the formula  $((T1-T0)+(T2-T3))/2$ .
- A obtains the packet round-trip delay of four seconds between A and B by using the formula  $(T3-T0)-(T2-T1)$ .

## Related Configuration

### ↘ Enabling SNTP

- SNTP is disabled by default.
- Run the **sntp enable** command to enable SNTP.

### ↘ Configuring an SNTP Server

- By default, no SNTP server is configured.
- Run the **sntp server** command to specify an SNTP server.

### ↘ Configuring the SNTP Time Synchronization Interval

- By default, the SNTP time synchronization interval is 1,800s.
- Run the **sntp interval** command to specify the time synchronization interval.

## 4.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring SNTP</a>	 (Mandatory) It is used to enable SNTP.	
	<b>sntp enable</b>	Enables SNTP.
	<b>sntp server</b>	Configures the IP address of an SNTP server.
	 (Optional) It is used to configure the SNTP time synchronization interval.	

Configuration	Description and Command	
	<b>sntp interval</b>	Configures the SNTP time synchronization interval.

### 4.4.1 Configuring SNTP

#### Configuration Effect

An SNTP client accesses an NTP server at fixed intervals to correct the clock regularly.

#### Notes

All time obtained through SNTP communication is Greenwich Mean Time (GMT). To obtain precise local time, you need to set the local time zone for alignment with GMT.

#### Configuration Steps

##### ↳ Enabling SNTP

- (Mandatory) SNTP is disabled by default.

##### ↳ Configuring the IP address of an SNTP Server

- (Mandatory) No SNTP/NTP server is configured by default.

##### ↳ Configuring the SNTP Time Synchronization Interval

- Optional.
- By default, a device synchronizes time every half an hour.

#### Verification

Run the **show sntp** command to display SNTP-related parameters.

#### Related Commands

##### ↳ Enabling SNTP

<b>Command</b>	<b>sntp enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	SNTP is disabled by default. Run the <b>no sntp enable</b> global configuration command to disable SNTP.

##### ↳ Configuring the IP address of an SNTP/NTP Server

<b>Command</b>	<b>sntp server [ oob ] ip-address [ via mgmt-name ]</b>
----------------	---

<b>Parameter Description</b>	<i>ip-address</i> : indicates the IP address of an NTP/SNTP server. No NTP/SNTP server is configured by default.
	<b>oob</b> : indicates that the NTP/SNTP server supports an out-band management interface (interface of mgmt).
	<i>mgmt-name</i> : Specifies the egress management interface for packets in the oob mode.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Since SNTP is fully compatible with NTP, the server can be configured as a public NTP server on the Internet.</p> <p>Since SNTP packets are the same as NTP packets, the SNTP client is fully compatible with the NTP server.</p> <p>There are many NTP servers on the Internet. You can select an NTP server with a shorter delay as the SNTP server on your device.</p>

↘ **Configuring the SNTP Time Synchronization Interval**

<b>Command</b>	<b>sntp interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the time synchronization interval, ranging from 60s to 65,535s. The default value is 1,800s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Run this command to set the interval for an SNTP client to synchronize time with an NTP/SNTP server.</p> <p> The interval configured here does not take effect immediately. To make it take effect immediately, run the <b>sntp enable</b> command.</p>

**Configuration Example**

↘ **SNTP Time Synchronization**

<b>Scenario</b> Figure 4-4	
	<ul style="list-style-type: none"> <li>● DEVICE-B indicates an NTP server on the Internet.</li> <li>● DEVICE-C synchronizes time with DEVICE-B.</li> </ul>
<b>Configuration Steps</b>	Enable SNTP for DEVICE-C and configure DEVICE-B as an NTP server.
<b>DEVICE-C</b>	<pre>C#configure terminal C(config)# sntp server 192.168.2.1 C(config)# sntp enable C(config)# exit</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show clock</b> command on DEVICE-C to check whether the time synchronization is successful.</li> </ul>

- Run the **show sntp** command on DEVICE-C to display the SNTP status and check whether the server is successfully configured.

## 4.5 Monitoring

### Displaying

Description	Command
<b>show sntp</b>	Displays SNTP-related parameters.

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
<b>debug sntp</b>	Enables debugging.

## 5 Configuring SPAN-RSPAN

### 5.1 Overview

The Switched Port Analyzer (SPAN) is to copy packets of a specified port to another switch port that is connected to a network monitoring device, so as to achieve network monitoring and troubleshooting.

All input and output packets of a source port can be monitored through SPAN. For example, as shown in the following figure, all packets on Port 5 are mapped to Port 10, and the network analyzer connected to Port 10 receives all packets that pass through Port 5.

Figure 5-1 SPAN Configuration Instance

The SPAN function is mainly applied in network monitoring and troubleshooting scenarios, to monitor network information and rectify network faults.

The Remote SPAN (RSPAN), an extension to SPAN, is capable of remotely monitoring multiple devices. Each RSPAN session is established in a specified remote VLAN. RSPAN breaks through the limitation that a mirrored port and a mirroring port must reside on the same device, and allows a mirrored port to be several network devices away from a mirroring port. Users can observe data packets of the remote mirrored port by using an analyzer in the central equipment room.

The application scenarios of RSPAN are similar to those of SPAN. RSPAN allows users to conduct real-time data monitoring without staying in the equipment room, providing great convenience for users.

VLAN SPAN (VSPAN) considers data streams of some VLANs as data sources and mirrors them to a destination port. The configuration is similar to that of the port-based SPAN. VSPAN has the following features:

- A VLAN that is not a remote VLAN can be specified as the data source of VSPAN.
- Some VLANs that are not remote VLANs can be specified as the data sources of VSPAN.
- When a VLAN is configured as a data source, packets only in the Rx direction can be mirrored.

## 5.2 Applications

Application	Description
<a href="#">Stream-based SPAN</a>	Data streams with certain characteristics need to be monitored, for example, data streams using a specified access control list (ACL) policy need to be monitored.
<a href="#">One-to-Many RSPAN</a>	Multiple users need to monitor data of the same port.
<a href="#">RSPAN Basic Applications</a>	Packets on the mirroring source device need to be mirrored to the destination device for monitoring.

### 5.2.1 Stream-based SPAN

#### Scenario

As shown in the following figure, the network analyzer can be configured to can monitor all data streams forwarded by Switch A to Switch B and specific data streams of Switch B (for example, data streams from PC1 and PC2).

Figure 5-2 SPAN Simple Application Topology

<b>Remarks</b>	0000.0000.0001 is the MAC address of PC1. 0000.0000.0002 is the MAC address of PC2.
----------------	--

#### Deployment

- In the preceding figure, configure the SPAN function on Switch A connected to the network analyzer, set port Gi 0/1 connected to Switch B as the SPAN source port, and set port Gi 0/2 that is directly connected to the network analyzer as the SPAN destination port.
- Configure stream-based SPAN (only data streams of PC1 and PC2 are allowed) for the source port Gi 0/1 of SPAN.

## 5.2.2 One-to-Many RSPAN

### Scenario

As shown in the following figure, one-to-many RSPAN can be implemented on a single device, that is, both PC 1 and PC 2 can be configured to monitor the transmitted and received traffic of the port connected to the server. Users can make proper configuration (for example, remote VLAN and port MAC loopback) to monitor data streams that pass through port Gi 4/1 on PC 1 and PC 2, thereby monitoring data streams of the server.

Figure 5-3 Application Topology of One-to-Many RSPAN

### Deployment

- Create a remote VLAN on Switch A.
- Configure Switch A as the source device of RSPAN and configure the port Gi 4/1 that is directly connected to the server as the RSPAN source port. Select a port that is in the Down state, Gi 4/2 in this example, as the RSPAN output port, add this port to the remote VLAN, and configure MAC loopback (run the **mac-loopback** command in interface configuration mode).
- Add ports that are directly connected to PC 1 and PC 2 to the remote VLAN.

## 5.2.3 RSPAN Basic Applications

### Scenario

As shown in the following figure, the RSPAN function enables the network analyzer to monitor the STA connected to the source device Switch A from the destination device Switch C through the intermediate device Switch B. The devices can normally exchange data with each other.

Figure 5-4 Basic Application Topology of RSPAN

## Deployment

- Configure a remote VLAN on Switch A, Switch B, and Switch C.
- On Switch A, configure port Gi 0/1 directly connected to the STA as the source port, configure port Gi 0/2 connected to Switch B as the output port, and configure the switching function for the output port.
- On Switch B, configure port Gi 0/1 connected to Switch A and port Gi 0/2 connected to Switch C as common ports.
- On Switch C, configure port Gi0/1 connected to Switch B as a common source port, configure port Gi 0/2 connected to the network analyzer as the RSPAN destination port, and configure the switching function for the RSPAN destination port.

## 5.3 Features

### Basic Concepts

#### ▾ SPAN Session

A SPAN session is data streams between the SPAN source port and the destination port, which can be used to monitor the packets of one or more ports in the input, output, or both directions. Switched ports, routed ports, and aggregate ports (APs) can be configured as source ports or destination ports of SPAN sessions. Normal operations on a switch are not affected after ports of the switch are added to a SPAN session.

Users can configure a SPAN session on a disabled port but the SPAN session is inactive. A SPAN session is in the active state only after the port on which the SPAN session is configured is enabled. In addition, a SPAN session does not take effect after a switch is powered on. It is active only after the destination port is in the operational state. Users can run the **show monitor [ session session-num]** command to display the operation status of a SPAN session.

#### ▾ SPAN Data Streams

A SPAN session covers data streams in three directions:

- **Input data streams:** All packets received by a source port are copied to the destination port. Users can monitor input packets of one or more source ports in a SPAN session. Some input packets of a source port may be discarded for some reasons (for example, for the sake of port security). It does not affect the SPAN function and such packets are still mirrored to the destination port.

- Output data streams: All packets transmitted by a source port are copied to the destination port. Users can monitor output packets of one or more source ports in a SPAN session. Packets transmitted from other ports to a source port may be discarded for some reasons and such packets will not be transmitted to the destination port. The format of output packets of a source port may be changed for some reasons. For example, after routing, packets transmitted from the source port are changed in source MAC addresses, destination MAC addresses, VLAN IDs, and TTLs, and their formats are also changed after copied to the destination port.
- Bidirectional data streams: Bidirectional data streams include input data streams and output data streams. In a SPAN session, users can monitor data streams of one or more source ports in the input and output directions.

### Source Port

A source port is called a monitored port. In a SPAN session, data streams of the source port are monitored for network analysis and troubleshooting. In a single SPAN session, users can monitor the input, output, and bidirectional data streams, and the number of source ports is not restricted.

A source port has the following features:

- A source port can be a switched port, routed port, or AP.
- A source port cannot be used as a destination port simultaneously.
- A source port and a destination port can belong to the same VLAN or different VLANs.

### Destination Port

A SPAN session has one destination port (called a monitoring port) for receiving packets copied from a source port.

A destination port has the following features:

- A destination port can be a switched port, routed port, or AP.
- A destination port cannot be used as a source port simultaneously.

## Overview

Feature	Description
<a href="#">SPAN</a>	Configures mirroring of ports on the same device.
<a href="#">RSPAN</a>	Configures mirroring of ports on different devices.

### 5.3.1 SPAN

SPAN is used to monitor data streams on switches. It copies frames on one port to another switch port that is connected to a network analyzer or RMON analyzer so as to analyze the communication of the port.

#### Working Principle

When a port transmits or receive packets, SPAN, after checking that the port is configured as a SPAN source port, copies the packets transmitted and received by the port to the destination port.

### ↘ Configuring a SPAN Source Port

Users need to specify a SPAN session ID and source port ID to configure a SPAN source port, and set the optional SPAN direction item to determine the direction of SPAN data streams or specify an ACL policy to mirror specific data streams.

### ↘ Configuring a SPAN Destination Port

Users need to specify a SPAN session ID and destination port ID to configure a SPAN destination port, and set the optional switching function item to determine whether to enable the switching function and tag removal function on the SPAN destination port.

## Related Configuration

The SPAN function is disabled by default. It is enabled only after a session is created, and the SPAN source and destination ports are configured. A SPAN session can be created when a SPAN source port or destination port is configured.

### ↘ Configuring a SPAN Source Port

A SPAN session does not have a SPAN source port by default. Users can run the following command to configure a SPAN source port:

```
monitor session session-num source interface interface-id [ both | rx | tx ] [ acl name ]
```

In the preceding command:

*session-num*: Indicates the SPAN session ID. The number of supported SPAN sessions varies with products.

*interface-id*: Indicates the SPAN source port to be configured.

**rx**: Indicates that only packets received by the source port are monitored after **rx** is configured.

**tx**: Indicates that only packets transmitted by the source port are monitored after **tx** is configured.

**both**: Indicates that packets transmitted and received by the source port are copied to the destination port for monitoring after **both** is configured, that is, **both** includes **rx** and **tx**. If none of **rx**, **tx**, and **both** is selected, **both** is enabled by default.

**acl**: Specifies an ACL policy. After this option is configured, packets allowed by the ACL policy on the source port are monitored. This function is disabled by default.

### ↘ Configuring a SPAN Destination Port

A SPAN session does not have a SPAN destination port by default. Users can run the following command to configure a SPAN destination port:

```
monitor session session-num destination interface interface-id [switch ]
```

In the preceding command:

**switch**: Indicates that the SPAN destination port only receives packets mirrored from the SPAN source port and discards other packets if this option is disabled, and receives both packets mirrored from the SPAN source port and packets from non-source ports if this option is enabled, that is, the communication between this destination port and other devices is not affected.

When the SPAN destination port is configured, the relevant function is disabled by default if **switch** is not configured.

### ▾ Configuring Stream-based SPAN

This function is disabled by default. Users can run the **monitor session** *session-num* **source interface** *interface-id* **rx** *acl-name* command to configure stream-based SPAN.

- ⚠ Pay attention to the following points when using SPAN:
- ⚠ The SPAN destination port is used for the Spanning Tree Protocol (STP) calculation.
- ⚠ SPAN is unavailable if a source port or destination port is disabled.
- ⚠ If a source port or destination port is added to an AP, the source port or destination port exits from a SPAN session.
- ⚠ If a VLAN (or VLAN list) is used as a SPAN source, ensure that the destination port has sufficient bandwidth for receiving mirrored data of the VLAN (or VLAN list).
- ⚠ Not all products support all options of the preceding commands because of product differences.

## 5.3.2 RSPAN

RSPAN is capable of monitoring multiple devices. Each RSPAN session is established in a specified remote VLAN. RSPAN breaks through the limitation that a mirrored port and a mirroring port must reside on the same device, and allows a mirrored port to be several network devices away from a mirroring port.

### Working Principle

A remote VLAN is created for the source device, intermediate device, and destination device, all ports involved in an RSPAN session need to be added to the remote VLAN. Mirrored packets are broadcasted in the remote VLAN so that they are transmitted from the source port of the source switch to the destination port of the destination switch.

### ▾ Configuring a Remote VLAN

Packets from an RSPAN source port are broadcasted in a remote VLAN so as to be copied from the local switch to the remote switch. The RSPAN source port, output port, reflection port, transparent transmission ports of the intermediate device (packet input port and output port of the intermediate device), destination port and input port of the destination port must be added to the remote VLAN. The RSPAN function requires configuring a VLAN as a remote VLAN in VLAN mode.

### ▾ Configuring an RSPAN Session

The configuration of the RSPAN source port and destination port are similar to that of the SPAN source port and destination port, but the mirroring session ID specified during configuration must be the ID of an RSPAN session.

### ▾ Configuring an RSPAN Source Port

The configuration of an RSPAN source port is the same as that of a SPAN source port, but the specified mirroring session ID must be the ID of an RSPAN session.

### ▾ Configuring an RSPAN Output Port

The output port is located on the source device and must be added to a remote VLAN. Mirrored packets of a source port are broadcasted in this remote VLAN. The source device transmits packets to the intermediate switch or destination switch through the output port.

### ↘ **Configuring an RSPAN Destination Port**

When an RSPAN destination port is configured, an RSPAN session ID, remote VLAN, and port name must be specified so that packets from the source port are copied to the destination port through the remote VLAN.

### ↘ **Configuring Stream-based RSPAN**

RSPAN is an extension to SPAN and also supports stream-based mirroring. The configuration is the same as that of stream-based SPAN. Stream-based RSPAN does not affect normal communication.

Users can configure an ACL in the input direction of a source port on an RSPAN source device. Standard ACLs, extended ACLs, MAC ACLs, and user-defined ACLs are supported.

Users can configure a port ACL in the input direction of a source port on an RSPAN source device, and configure a port ACL in the output direction of the destination port on the RSPAN destination device. Users can also configure an ACL in the output direction of a remote VLAN on an RSPAN source switch and configure an ACL in the input direction of the remote VLAN on the RSPAN destination switch.

### ↘ **Configuring One-to-Many RSPAN**

If data streams of one source port need to be mirrored to multiple destination ports, users can configure an RSPAN session, configure the source port of the RSPAN session as a one-to-many mirroring source port and select another Ethernet port as the forwarding port (output port on the source device). In addition, the MAC loopback function needs to be configured on the RSPAN forwarding port in interface configuration mode, the expected RSPAN output port and RSPAN forwarding port need to be added to the remote VLAN. Then, mirrored packets are looped back on the RSPAN forwarding port and then broadcasted in the remote VLAN, thereby implementing one-to-many RSPAN.

## Related Configuration

The RSPAN function is disabled by default. It is enabled only after an RSPAN session is created, and a remote VLAN, RSPAN source port, and RSPAN destination port are configured.

### ↘ **Configuring a Remote VLAN**

No remote VLAN is specified for RSPAN by default. Users can run the **remote-span** command in VLAN mode to configure a VLAN as a remote VLAN. One remote VLAN corresponds to one RSPAN session.

### ↘ **Configuring an RSPAN Source Device**

This function is disabled by default. Users can run the **monitor session session-num remote-source** command in global configuration mode to configure a device as the remote source device of a specified RSPAN session.

### ↘ **Configuring an RSPAN Destination Device**

This function is disabled by default. Users can run the **monitor session *session-num* remote-destination** command in global configuration mode to configure a device as the remote destination device of a specified RSPAN session.

### ↘ **Configuring an RSPAN Source Port**

A source port of an RSPAN session is configured on the source device. The configuration is the same as that of a SPAN source port but an RSPAN session ID needs to be specified. This function is disabled by default.

### ↘ **Configuring an Output Port on the RSPAN Source Device**

This function is disabled by default. Users can run the **monitor session *session-num* destination remote vlan *remote-vlan* interface *interface-name* [ switch ]** command in global configuration mode to configure an output port on the RSPAN source device. If the option **switch** is configured, the output port can participate in normal data packet switching. It is not configured by default. The output port must be added to a remote VLAN.

### ↘ **Configuring a Destination Port on the RSPAN Destination Device**

This function is disabled by default. Users can run the **monitor session *session-num* destination remote vlan *remote-vlan* interface *interface-name* [ switch ]** command in global configuration mode to configure a destination port on the RSPAN destination device. If the option **switch** is configured, the destination port can participate in normal data packet switching. It is not configured by default. The destination port must be added to a remote VLAN.

### ↘ **Configuring Port MAC Loopback**

This function is disabled by default. Users can run the **mac-loopback** command in interface configuration mode to configure MAC loopback on a port, to implement one-to-many RSPAN. The RSPAN destination port and expected RSPAN output port must be added to a remote VLAN.

- 
-  Pay attention to the following points when using RSPAN:
  -  A remote VLAN must be configured on each device, their VLAN IDs must be consistent, and all ports that participate in a session must be added to the VLAN.
  -  It is not recommended that common ports be added to a remote VLAN.
  -  Do not configure a port that is connected to an intermediate switch or destination switch as an RSPAN source port. Otherwise, traffic on the network may be in chaos.
- 

## 5.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring SPAN Basic Functions</a>	 (Mandatory) It is used to create SPAN.	
	<b>monitor session <i>session-num</i> source interface <i>interface-id</i> [ both   rx   tx ]</b>	Configures a SPAN source port.
	<b>monitor session <i>session-num</i> destination interface <i>interface-id</i> [ switch ]</b>	Configures a SPAN destination port.

	<b>monitor session</b> <i>session-num</i> <b>source interface</b> <i>interface-id</i> <b>rx acl</b> <i>acl-name</i>	Configures stream-based SPAN.
	<b>monitor session</b> <i>session-num</i> <b>source vlan</b> <i>vlan-id</i> [ <b>rx</b> ]	Specifies a VLAN as the data source of SPAN.
	<b>monitor session</b> <i>session-num</i> <b>source filter vlan</b> <i>vlan-id-list</i> [ <b>rx</b> ]	Specifies some VLANs as the data sources of SPAN.
<a href="#">Configuring RSPAN Basic Functions</a>	 (Mandatory) It is used to create RSPAN.	
	<b>monitor session</b> <i>session-num</i> <b>remote-source</b>	Configures an RSPAN session ID and specifies a source device.
	<b>monitor session</b> <i>session-num</i> <b>remote-destination</b>	Configures an RSPAN session ID and specifies a destination device.
	<b>remote-span</b>	Configures a remote VLAN.
	<b>monitor session</b> <i>session-num</i> <b>source interface</b> <i>interface-id</i> [ <b>both</b>   <b>rx</b>   <b>tx</b> ]	Configures an RSPAN source port.
	<b>mac-loopback</b>	Configures port MAC loopback.
	<b>monitor session</b> <i>session-num</i> <b>destination remote vlan</b> <i>remote-vlan-id</i> <b>interface</b> <i>interface-id</i> [ <b>switch</b> ]	Configures an output port on the RSPAN source device or a destination port on the RSPAN destination device.

### 5.4.1 Configuring SPAN Basic Functions

#### Configuration Effect

- Configure a source and destination ports for a SPAN session.
- Configure a destination port to monitor any packets transmitted and received by a source port.

#### Notes

- If a source port or destination port is added to an AP, the source port or destination port exits from a SPAN session.
- If the switch function is disabled on a SPAN destination port, the destination port receives only mirrored packets and discards other packets that pass through the port. After the switch function is enabled, the destination port can receive non-mirrored packets.

#### Configuration Steps

### ▾ Configuring a SPAN Session

- Global configuration mode. Mandatory.
- You can configure a SPAN session when configuring a SPAN source port or destination port, or when configuring a specified VLAN or some VLANs as a data source or data sources of SPAN.

### ▾ Configuring a SPAN Source Port

- Global configuration mode. Mandatory.
- You can select the SPAN direction when configuring a SPAN source port. The **both** direction is configured by default, that is, both transmitted and received packets are monitored.

### ▾ Configuring a SPAN Destination Port

Global configuration mode. Mandatory.

A SPAN session is active only when a SPAN source port is configured (or a VLAN is specified as the data source of SPAN) and a SPAN destination port is configured.

## Verification

- Run the **show monitor** command or the **show running** command to verify the SPAN configuration. Alternatively, conduct packet capture analysis on the SPAN destination port and check whether the SPAN function takes effect according to the captured packets.

## Related Commands

### ▾ Configuring a SPAN Source Port

<b>Command</b>	<b>monitor session</b> <i>session-num</i> <b>source interface</b> <i>interface-id</i> [ <b>both</b>   <b>rx</b>   <b>tx</b> ]
<b>Parameter Description</b>	<p><i>session-num</i>: Indicates the ID of a SPAN session.</p> <p><i>interface-id</i>: Indicates the interface ID.</p> <p><b>both</b>: Indicates that packets in the input and output directions are monitored. It is the default value.</p> <p><b>rx</b>: Indicates that packets in the input direction are monitored.</p> <p><b>tx</b>: Indicates that packets in the output direction are monitored.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring a SPAN Destination Port

<b>Command</b>	<b>monitor session</b> <i>session-num</i> <b>destination interface</b> <i>interface-id</i> [ <b>switch</b> ]
<b>Parameter Description</b>	<p><i>session-num</i>: Indicates the ID of a SPAN session.</p> <p><i>interface-id</i>: Indicates the interface ID.</p>

	<b>switch:</b> Indicates that the switching function is enabled on the SPAN destination port. It is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring Stream-based SPAN

<b>Command</b>	<b>monitor session</b> <i>session-num</i> <b>source interface</b> <i>interface-id</i> <b>rx acl</b> <i>acl-name</i>
<b>Parameter Description</b>	<i>session-num</i> : Indicates the ID of a SPAN session. <i>interface-id</i> : Indicates the interface ID. <i>acl-name</i> : Indicates an ACL name.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Specifying a VLAN as the Data Source of SPAN

<b>Command</b>	<b>monitor session</b> <i>session-num</i> <b>source vlan</b> <i>vlan-id</i> [ <b>rx</b> ]
<b>Parameter Description</b>	<i>session-num</i> : Indicates the ID of a SPAN session. <i>vlan-id</i> : Indicates a specified VLAN ID. <b>rx</b> : Indicates that packets in the input direction are monitored.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Specifying Some VLANs as the Data Sources of SPAN

<b>Command</b>	<b>monitor session</b> <i>session-num</i> <b>source filter vlan</b> <i>vlan-id-list</i> [ <b>rx</b> ]
<b>Parameter Description</b>	<i>session-num</i> : Indicates the ID of a SPAN session. <i>vlan-id-list</i> : Indicates some specified VLAN IDs.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

▾ The following uses SPAN as an example.

<p><b>Scenario</b> Figure 5-5</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>As shown in Figure 5-5, add ports Gi 0/1 and Gi 0/2 of Device A to VLAN 1.</li> <li>Create SVI 1 and set the address of SVI 1 to 10.10.10.10/24.</li> <li>Set IP addresses of PC 1 and PC 2 to 10.10.10.1/24 and 10.10.10.2/24 respectively.</li> <li>Configure SPAN for Device A and configure ports Gi 0/1 and Gi 0/2 as the source port and destination port of SPAN respectively.</li> </ul>
<p><b>A</b></p>	<pre>Ruijie# configure Ruijie(config)# vlan 1 Ruijie(config-vlan)# exit Ruijie(config)# interface vlan 1 Ruijie(config-if-VLAN 1)# ip address 10.10.10.10 255.255.255.0 Ruijie(config-if-VLAN 1)# exit Ruijie(config)# monitor session 1 source interface gigabitEthernet 0/1 Ruijie(config)# monitor session 1 destination interface gigabitEthernet 0/2</pre>
<p><b>Verification</b></p>	<p>Run the <b>show monitor</b> command to check whether SPAN is configured correctly. After successful configuration, PC 1 sends ping packets to SVI 1 and PC 2 conducts monitoring by using the packet capture tool.</p>
<p><b>A</b></p>	<pre>Ruijie# show monitor sess-num: 1 span-type: LOCAL_SPAN src-intf: GigabitEthernet 0/1      frame-type Both dest-intf: GigabitEthernet 0/2</pre>

**Common Errors**

- The session ID specified during configuration of the SPAN source port is inconsistent with that specified during configuration of the SPAN destination port.
- Packet loss may occur if packets of a port with large bandwidth are mirrored to a port with small bandwidth.

## 5.4.2 Configuring RSPAN Basic Functions

### Configuration Effect

- Configure a source port and destination port on the source device of an RSPAN session and configure the destination port on the destination device.
- Configure the destination port on the RSPAN destination device to monitor any packets that are transmitted or received by the source port.

### Notes

- If a source port or destination port is added to an AP, the source port or destination port exits from a SPAN session.
- If the switch function is disabled on an RSPAN destination port, the destination port receives only mirrored packets and discards other packets that pass through the port. After the switch function is enabled, the destination port can receive non-mirrored packets.
- All ports involved in RSPAN must be added to a remote VLAN.
- A remote VLAN must be created on an intermediate device and transparent transmission ports must be added to the remote VLAN.

### Configuration Steps

#### ▾ Configuring an RSPAN Session

- Global configuration mode. Mandatory.
- The same session ID needs to be configured on the RSPAN source device and RSPAN destination device.

#### ▾ Configuring an RSPAN Source Device

- Global configuration mode. Mandatory.
- It is used to specify a device to be monitored by RSPAN.

#### ▾ Configuring an RSPAN Destination Device

- Global configuration mode. Mandatory.
- It is used to specify the destination device for outputting RSPAN packets.

#### ▾ Configuring an RSPAN Source Port

- Global configuration mode. Mandatory.

- Complete the configuration on an RSPAN source device. After configuration, RSPAN monitoring can be conducted on packets of the RSPAN source port. You can specify RSPAN to monitor remote VLAN packets in the input direction, output direction, or both directions of the RSPAN source port.

↘ **Configuring an RSPAN Output Port**

- Global configuration mode. Mandatory.
- Complete the configuration on an RSPAN source device. After configuration, mirrored packets received by the ports added to the remote VLAN can be transmitted to the RSPAN destination device through the output port.

↘ **Configuring an RSPAN Destination Port**

- Global configuration mode. Mandatory.
- Complete the configuration on the RSPAN destination device. After configuration, the RSPAN destination device forwards mirrored packets received by the ports added to the remote VLAN to the monitoring device through the destination port.

↘ **Configuring Port MAC Loopback**

- Interface configuration mode. Optional.
- Complete the configuration on an RSPAN device. After this function is configured on the RSPAN destination port and other ports are added to the remote VLAN, RSPAN packets loop back on the destination port, and then broadcasted in the remote VLAN on the source device, implementing one-to-many RSPAN.

**Verification**

- Run the **show monitor** command or the **show running** command to check whether RSPAN is successfully configured on each device, or conduct packet capture on the destination mirroring port on the RSPAN destination device to check whether packets mirrored from the source port of the RSPAN source device are captured.

**Related Commands**

↘ **Configuring an RSPAN Source Device**

↘ **Configuring an RSPAN Source Port**

<b>Command</b>	<b>monitor session</b> <i>session-num</i> <b>source interface</b> <i>interface-id</i> [ <b>both</b>   <b>rx</b>   <b>tx</b> ][ <b>acl</b> <i>acl-name</i> ]
<b>Parameter</b>	<i>session-num</i> : Indicates the ID of an RSPAN session.
<b>Description</b>	<i>interface-id</i> : Indicates the interface ID. <b>both</b> : Indicates that packets in the input and output directions are monitored. It is the default value. <b>rx</b> : Indicates that packets in the input direction are monitored. <b>tx</b> : Indicates that packets in the output direction are monitored. <i>acl-name</i> : Indicates an ACL name.
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	The configuration is the same as that of a SPAN source port but an RSPAN session ID needs to be specified.

↘ **Configuring an Output Port on the RSPAN Source Device**

<b>Command</b>	<b>monitor session</b> <i>session-num</i> <b>destination remote vlan</b> <i>remote-vlan</i> <b>interface</b> <i>interface-id</i> [ <b>switch</b> ]
<b>Parameter</b>	<i>session-num</i> : Indicates the ID of an RSPAN session.
<b>Description</b>	<i>remote-vlan</i> : Indicates a remote VLAN. <i>interface-id</i> : Indicates the interface ID. <b>switch</b> : Indicates whether the port participates in packet switching.
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

↘ **Configuring a Destination Port on the RSPAN Destination Device**

<b>Command</b>	<b>monitor session</b> <i>session-num</i> <b>destination remote vlan</b> <i>remote-vlan</i> <b>interface</b> <i>interface-id</i> [ <b>switch</b> ]
<b>Parameter</b>	<i>session-num</i> : Indicates the ID of an RSPAN session.

<b>Description</b>	<i>remote-vlan</i> : Indicates a remote VLAN. <i>interface-id</i> : Indicates the interface ID. <b>switch</b> : Indicates whether the port participates in packet switching.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

➤ **Configuring Port MAC Loopback**

<b>Command</b>	<b>mac-loopback</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To implement one-to-many RSPAN, enable the MAC loopback function on a port (select a port that is in the Down state as the MAC loopback port and do not add any configuration to this port).

**Configuration Example**

➤ **Configuring RSPAN**

<p><b>Scenario</b> Figure 5-6</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>As shown in the preceding figure, configure a remote VLAN on the source device Switch A, intermediate device Switch B, and destination device Switch C.</li> <li>Configure the RSPAN source device, specify the source port and output port on Switch A.</li> <li>Add ports Gi0/1 and Gi0/2 to the remote VLAN on Switch B.</li> <li>Configure the RSPAN destination device and specify the destination port on Switch C.</li> </ul>
<p><b>A</b></p>	<pre>Ruijie# configure</pre>

	<pre>Ruijie(config)# vlan 7 Ruijie(config-vlan)# remote-span Ruijie(config-vlan)# exit Ruijie(config)# monitor session 1 remote-source Ruijie(config)# monitor session 1 source interface Gi 0/1 both Ruijie(config)# monitor session 1 destination remote vlan 7 interfaceGi 0/2 switch</pre>
<b>B</b>	<pre>Ruijie(config)# vlan 7 Ruijie(config-vlan)# remote-span Ruijie(config-vlan)# exit Ruijie(config)# interface range Gi0/1-2 Ruijie(config-if-range)#switchport mode trunk</pre>
<b>C</b>	<pre>Ruijie(config)# vlan 7 Ruijie(config-vlan)# remote-span Ruijie(config-vlan)# exit Ruijie(config)# monitor session 1 remote-destination Ruijie(config)# monitor session 1 destination remote vlan 7 interface Gi 0/2</pre>
<b>Verification</b>	<p>Run the <b>show monitor</b> command or the <b>show running</b> command on Switch A, Switch B, and Switch C to check whether RSPAN is configured successfully.</p>
<b>A</b>	<pre>Ruijie# show monitor sess-num: 1 span-type: SOURCE_SPAN src-intf: GigabitEthernet 0/1      frame-type Both dest-intf: GigabitEthernet 0/2 Remote vlan 7 mtp_switch on</pre>
<b>B</b>	<pre>! vlan 1     remote-span</pre>

	<pre> ! ! interface GigabitEthernet 0/1 switchport mode trunk ! Interface GigabitEthernet 0/2 switchport mode trunk ! </pre>
<p><b>C</b></p>	<pre> Ruijie# show monitor sess-num: 1 span-type: DEST_SPAN dest-intf: GigabitEthernet 0/2 Remote vlan 7 mtp_switch on </pre>

**Common Errors**

- A remote VLAN must be configured on the source device, intermediate device, and destination device, and their VLAN IDs must be consistent.
- Packet loss may occur if packets of a port with large bandwidth are mirrored to a port with small bandwidth.

**Configuring One-to-Many RSPAN**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● As shown in the preceding figure, configure a remote VLAN on Switch A, Switch B, and Switch C.</li> <li>● Configure the source port, output port, and MAC loopback port on Switch A.</li> <li>● Configure the destination port on Switch B and Switch C.</li> </ul>
<b>A</b>	<pre> Ruijie# configure Ruijie(config)# vlan 7 Ruijie(config-vlan)# remote-span Ruijie(config-vlan)# exit Ruijie(config)# monitor session 1 remote-source Ruijie(config)# monitor session 1 source interface fa 0/1 both Ruijie(config)# monitor session 1 destination remote vlan 7 interface fa 0/2 switch Ruijie(config)# interface fa0/2 Ruijie(config-if-FastEthernet 0/2)# mac-loopback Ruijie(config-if-range)# exit Ruijie(config)# interface range fa0/3-4 Ruijie(config-if-range)# switchport mode trunk </pre>
<b>B, C</b>	<pre> Ruijie(config)# vlan 7 Ruijie(config-vlan)# remote-span Ruijie(config-vlan)# exit Ruijie(config)# monitor session 1 remote-destination Ruijie(config)# monitor session 1 destination remote vlan 7 interface fa 0/2 Ruijie(config)# interface fa0/1 Ruijie(config-if)#switchport mode trunk </pre>
<b>Verification</b>	Run the <b>show monitor</b> command or the <b>show running</b> command on Switch A, Switch B, and Switch C to check whether RSPAN is configured successfully.
<b>A</b>	<pre> Ruijie# show monitor sess-num: 1 span-type: SOURCE_SPAN src-intf: FastEthernet 0/1      frame-type Both dest-intf: </pre>

	<pre>FastEthernet 0/2 Remote vlan 7 mtp_switch on</pre>
<b>B</b>	<pre>Ruijie# show monitor sess-num: 1 span-type: DEST_SPAN dest-intf: FastEthernet 0/2 Remote vlan 7 mtp_switch on</pre>
<b>C</b>	<pre>Ruijie# show monitor sess-num: 1 span-type: DEST_SPAN dest-intf: FastEthernet 0/2 Remote vlan 7 mtp_switch on</pre>

### Common Errors

- A remote VLAN must be configured on the source device, intermediate device, and destination device, and their VLAN IDs must be consistent.
- Packet loss may occur if packets of a port with large bandwidth are mirrored to a port with small bandwidth.
- One MAC loopback port and multiple output ports need to be configured to implement one-to-many RSPAN.

## 5.5 Monitoring

### Displaying

Description	Command
Displays all mirroring sessions existing in the system.	<b>show monitor</b>
Displays a specified mirroring session.	<b>show monitor session <i>session-id</i></b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs SPAN.	<b>debug span</b>

## 6 Configuring sFlow

### 6.1 Overview

sFlow is a network monitoring technology jointly developed by InMon, HP, and FoundryNetworks in 2001. This technology has been standardized. It can provide complete traffic flows of Layer 2 to Layer 4, and it is applicable to traffic analysis in the extra-large network. This technology helps users analyze the performance, trend, and existence of network traffic flows in a detailed manner in real time.

sFlow has the following advantages:

- Accurate: sFlow supports accurate monitoring of traffic on a Gigabit network or a network with higher bandwidth.
- Scalable: One sFlow Collector can monitor thousands of sFlow Agents, and it has high scalability.
- Low cost: sFlow Agent is embedded in a network device, and its cost is low.

#### Protocol Specification

- sFlow Version 5
- RFC 1014

### 6.2 Typical Application

Typical Application	Scenario
<a href="#">Monitoring the LAN Traffic</a>	Regard the device as an sFlow Agent, perform sampling of interface traffic in the LAN, and send the sFlow datagrams to an sFlow Collector for traffic analysis, thereby achieving the purpose of network monitoring.

#### 6.2.1 Monitoring the LAN Traffic

##### Application Scenario

As shown in Figure 6-1, start switch A that serves as an sFlow Agent, enable flow sampling and counter sampling on port Te 0/1, monitor the traffic in the 192.168.1.0 network segment, encapsulate the sampling data into sFlow datagrams at regular intervals or when the buffer is full, and sent the sFlow data to the sFlow Collector for traffic analysis.

Figure 6-1

## Function Deployment

- Configure the addresses of sFlow Agent and sFlow Collector on switch A.
- Enable flow sampling and counter sampling on port Te 0/1 of switch A.

**i** Lots of server software supports sFlow. You can obtain software supporting sFlow at <http://www.sflow.org/products/collectors.php>. The software sflowtrend is free of charge.

## 6.3 Function Details

### Basic Concepts

#### ↳ sFlow Agent

sFlow Agent is embedded in a network device. Generally, one network device can serve as an sFlow Agent. sFlow Agent can perform flow sampling and counter sampling, encapsulate sampled data into sFlow datagrams, and send the sFlow datagrams to the sFlow Collector.

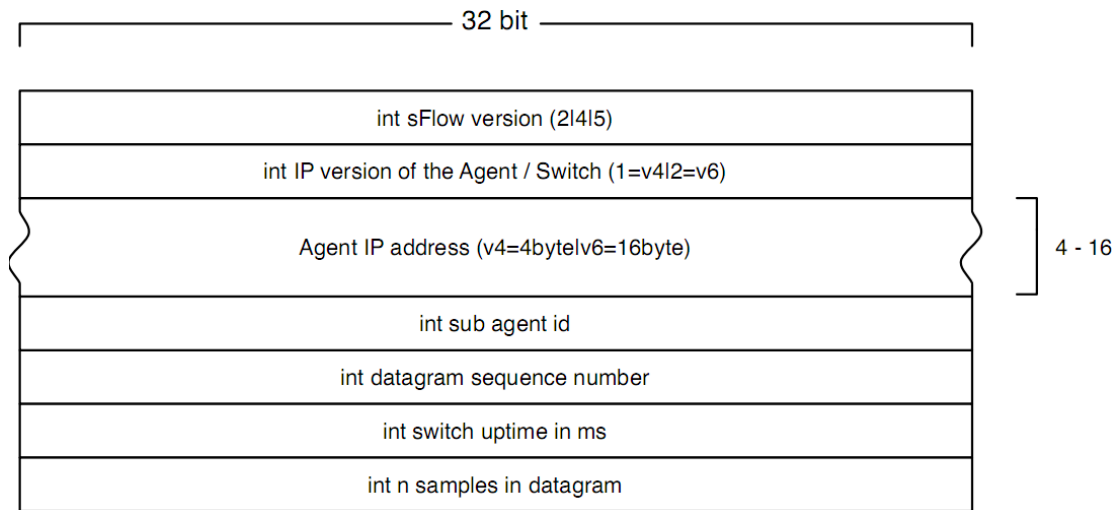

sFlow datagrams are encapsulated in UDP. Figure 6-2 shows the sFlow datagram format.

Figure 6-2 sFlow Datagram Format

One sFlow datagram may contain one or multiple flow samples and counter samples.

Figure 6-3 sFlow Header

sFlow Geader Description:

Field	Description
sFlow version	sFlow version. V2, V4, and V5 are available. Currently, Ruijie supports V5 only.
IP version of the agent/switch	IP address version of the sFlow Agent
Agent IP address	IP address of the sFlow Agent
Sub agent id	Sub-agent ID
Datagram sequence number	Serial number of the sFlow datagram

Switch uptime	Duration from the startup time of the switch to the current time
n samples in datagram	The number of samples in the an sFlow datagram. One sFlow datagram may contain one or multiple flow samples and counter samples.

↘ **sFlow Collector**

sFlow Collector receives and analyzes the sFlow datagram sent from the sFlow Agent. sFlow Collector may be a PC or server. A PC or server installed with the application software for sFlow datagram analysis can be regarded as an sFlow Collector.

↘ **Flow Sampling**

Based on the specified sampling rate, the sFlow Agent device performs flow sampling on the traffic flowing through an interface, including copying the header of the packet, extracting the Ethernet header and IP header of the packet, and obtaining the route information of the packet.

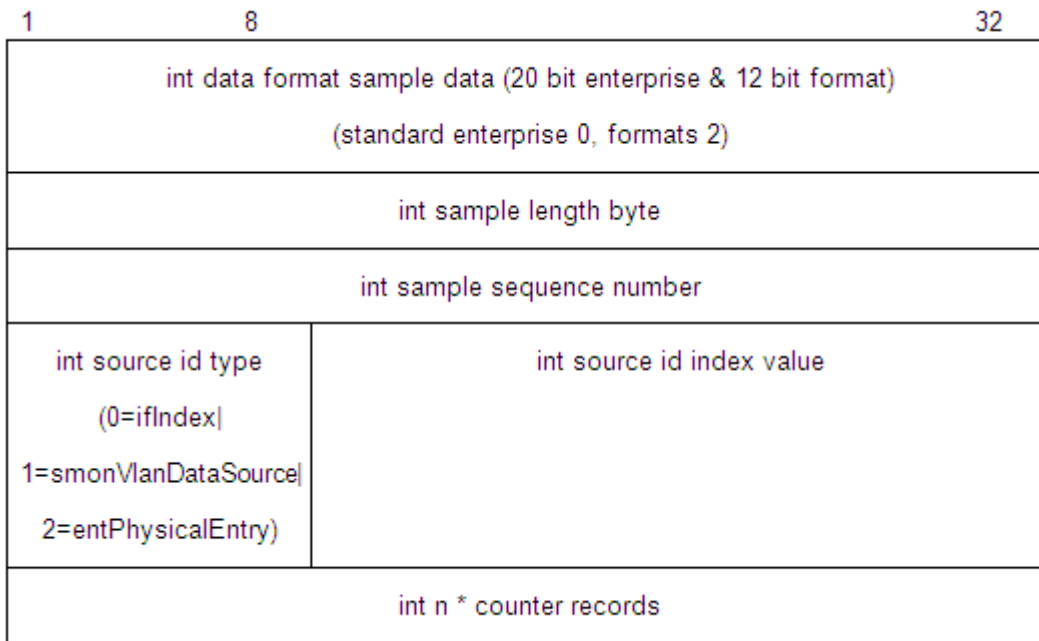

Figure 6-4 Flow Sample Header

1	8	32
int data format sample data (20 bit enterprise & 12 bit format) (standard enterprise 0, formats 1)		
int sample length byte		
int sample sequence number		
int source id type (0=ifIndex) 1=smonVlanDataSource 2=entPhysicalEntry)	int source id index value	
int sampling rate		
int sample pool (total number of packets that could have been sampled)		
int drops (packets dropped due to a lack of resources)		
int input (SNMP ifIndex of input interface, 0 if not known)		
int output (SNMP ifIndex of output interface, 0 if not known) broadcast or multicast are handled as follows: the first bit indicates multiple destinations, the lower order bits number of interfaces		
int n * flow records		

↳ Counter Sampling

In counter sampling, an sFlow Agent periodically obtains the statistics and CPU usage on a specified interface. The statistics on the interface include the number of packets input through the interface and the number of packets output through the interface.

Figure 6-5 Counter Sample Header

### Functions and Features

Feature	Description
<a href="#">Flow Sampling</a>	Sample the traffic flowing through the interface, and send the encapsulated sFlow datagram to the sFlow Collector for analysis.
<a href="#">Counter Sampling</a>	Periodically send the statistics on the interface to the sFlow Collector for analysis.

#### 6.3.1 Flow Sampling

Sample the traffic flowing through the interface, and send the encapsulated sFlow datagram to the sFlow Collector for analysis.

##### Working Principle

Based on the specified sampling rate, the sFlow Agent device performs flow sampling on the traffic flowing through an interface, including copying the header of the packet, extracting the Ethernet header and IP header of the packet, and obtaining the route information of the packet. Then, the sFlow Agent encapsulates the flow sampling data into an sFlow datagram and sends the datagram to the sFlow Collector for analysis.

#### 6.3.2 Counter Sampling

Periodically send the statistics on the interface to the sFlow Collector for analysis.

##### Working Principle

The sFlow Agent performs interface polling on a regular basis. For an interface whose counter sampling interval expires, the sFlow Agent obtains the statistics on this interface, encapsulates the statistics into an sFlow datagram, and sends the datagram to the sFlow Collector for analysis.

## 6.4 Configuration Details

Configuration Item	Suggestion & Related Command	
<a href="#">Configuring Basic Functions of sFlow</a>	 Mandatory configuration. Establish communication connections between sFlow Agent and sFlow Collector.	
	<b>sflow agent {address   interface}</b>	Configures the sFlow Agent address.
	<b>sflow collector collector-id destination</b>	Configures the sFlow Collector address.
	 Mandatory configuration. Enable flow sampling and counter sampling.	
	<b>sflow counter collector</b>	Enables the sFlow Agent to send counter samples to the sFlow Collector.
	<b>sflow flow collector</b>	Enables the sFlow Agent to send flow samples to the sFlow Collector .
	<b>sflow enable</b>	Enables sFlow sampling for the configuration interface, that is, enables counter sampling and flow sampling.
<a href="#">Configuring Optional Parameters of sFlow</a>	 Optional configuration. Sets the optional parameter attributes of sFlow.	
	<b>sflow collector collector-id max-datagram-size</b>	Configures the maximum length of the sFlow datagram.
	<b>sflow counter interval</b>	Configures the counter sampling interval.
	<b>sflow flow max-header</b>	Configures the maximum length of the packet header copied during flow sampling.
	<b>sflow sampling-rate</b>	Configures the sampling rate of flow sampling.

### 6.4.1 Configuring Basic Functions of sFlow

#### Configuration Effect

- sFlow Agent and sFlow Collector can communicate with each other.
- Traffic flowing through the interface are sampled based on the default sampling rate and sent to the sFlow Collector for analysis.
- Statistics of the interface are periodically sent to the sFlow Collector based on the default sampling interval for analysis.

## Notes

- Flow sampling can be configured on only physical interfaces.
- To enable the sFlow Collector to analyze the flow sampling results, the IP address of the sFlow Collector on the sFlow Agent device is required.

## Configuration Method

### ▾ Configuring sFlow Agent Address

- Mandatory configuration.
- Use the **sflow agent address** command to configure the address of the sFlow Agent.
- The sFlow Agent address must be a valid address. That is, the sFlow Agent address must not be a multicast or broadcast address. It is recommended that the IP address of the sFlow Agent device be used.

<b>Command Syntax</b>	<b>sflow agent { address { <i>ip-address</i>   ipv6 <i>ipv6-address</i> } }   { interface { <i>interface-name</i>   ipv6 <i>interface-name</i> } }</b>
<b>Parameter Description</b>	<b>address:</b> Configures the IP address of the sFlow agent. <i>ip-address:</i> sFlow Agent IPv4 address <b>ipv6 <i>ipv6-address</i>:</b> sFlow Agent IPv6 address <b>interface:</b> Configures the interface of the sFlow agent. <i>interface-name:</i> Interface of IPv4 address. <b>ipv6 <i>interface-name</i>:</b> Interface of IPv6 address.
<b>Defaults</b>	No sFlow Agent address is configured by default
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	This command is used to configure the <b>Agent IP address</b> field in the output sFlow datagram. The datagram not configured with this field cannot be output. The sFlow Agent address shall be a host address. When a non-host address (for example, a multicast or broadcast address) is configured as the sFlow Agent address, a message indicating configuration failure is displayed. It is recommended that the IP address of the sFlow Agent device be configured as the sFlow Agent address.

### ▾ Configuring sFlow Collector Address

- Mandatory configuration.
- Use the **sflow collector** command to configure the address of the sFlow Collector.
- The sFlow Collector address must be a valid address. That is, the sFlow Collector address must not be a multicast or broadcast address. sFlow Collector must exist, and the route to it must be reachable.

<b>Command Syntax</b>	<b>sflow collector <i>collector-id</i> destination { <i>ip-address</i>   ipv6 <i>ipv6_address</i> } udp-port [ [ vrf <i>vrf-name</i> ]   [ oob ] ]</b>
<b>Parameter</b>	<i>collector-id:</i> sFlow Collector ID. The range is from 1 to 2.

<b>Description</b>	<p><i>ip-address</i>: sFlow Agent IPv4 address. It is not configured by default</p> <p><b>ipv6</b> <i>ipv6-address</i>: sFlow Agent IPv6 address. It is not configured by default</p> <p><i>udp-port</i>: sFlow Collector listening port number</p> <p><b>vrf</b> <i>vrf-name</i>: VRF instance name. It is not configured by default</p> <p><b>oob</b>: The sampled traffics are output through the management interface. By default, this parameter is not configured.</p>
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>This command is used to configure the sFlow Collector address. The sFlow Collector address shall be a host address. When a non-host address (for example, a multicast or broadcast address) is configured as the sFlow Collector address, a message indicating configuration failure is displayed. The sFlow Collector monitors the sFlow datagram on the specified port. When the <b>vrf</b> parameter is configured, the corresponding VRF instance must exist. When you remove the a VRF instance, the sFlow Collector address will be removed if this VRF instance is also configured for an sFlow Collector address. When the <b>oob</b> parameter is configured, a datagram is sent to the sFlow Collector through the management interface.</p>

▾ **Enabling sFlow Samples Output to the sFlow Collector**

- Mandatory configuration.
- You can use the **sflow flow collector** command to enable the sFlow Agent to send flow samples to the sFlow Collector.
- This function must be enabled on the interface to send flow samples to the sFlow Collector. In addition, sFlow Collector must exist, the route to it must be reachable, and the IP address of the corresponding sFlow Collector has been configured on the sFlow Agent device.

<b>Command Syntax</b>	<b>sflow flow collector</b> <i>collector-id</i>
<b>Parameter Description</b>	<i>collector-id</i> : sFlow Collector ID. The range is from 1 to 2.
<b>Defaults</b>	Sending the flow samples to the sFlow Collector is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	<p>This command can be used for physical ports and aggregate ports.</p> <p>sFlow datagrams can be output only when an IP address is configured for the corresponding sFlow Collector.</p>

▾ **Enabling Counter Samples Output to the sFlow Collector**

- Mandatory configuration.

- You can use the **sflow counter collector** command to enable the sFlow Agent to send counter samples to the sFlow Collector.
- This must be enabled on the interface to send counter samples to the sFlow Collector. In addition, sFlow Collector must exist, the route to it must be reachable, and the IP address of the corresponding sFlow Collector has been configured on the sFlow Agent device.

<b>Command Syntax</b>	<b>sflow counter collector</b> <i>collector-id</i>
<b>Parameter Description</b>	<i>collector-id</i> : sFlow Collector ID. The range is from 1 to 2.
<b>Defaults</b>	Sending counter samples to the sFlow Collector is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	This command can be used for physical ports and aggregate ports. sFlow datagrams can be output only when an IP address is configured for the corresponding sFlow Collector.

### ↘ Enabling Counter Sampling and Flow Sampling

- Mandatory configuration.
- You can use the **sflow enable** command to enable the flow sampling and counter sampling on an interface.
- The forwarding performance of an interface may be affected after flow sampling is enabled.

<b>Command Syntax</b>	<b>sflow enable</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The sFlow sampling function on an interface is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	This command can be used for physical ports and aggregate ports.

### Check Method

- Use the **show sflow** command to display the sFlow configuration, and check whether the displayed information is consistent with the configuration.

### Configuration Examples

#### ↘ Configuring Flow Sampling and Counter Sampling for sFlow Agent

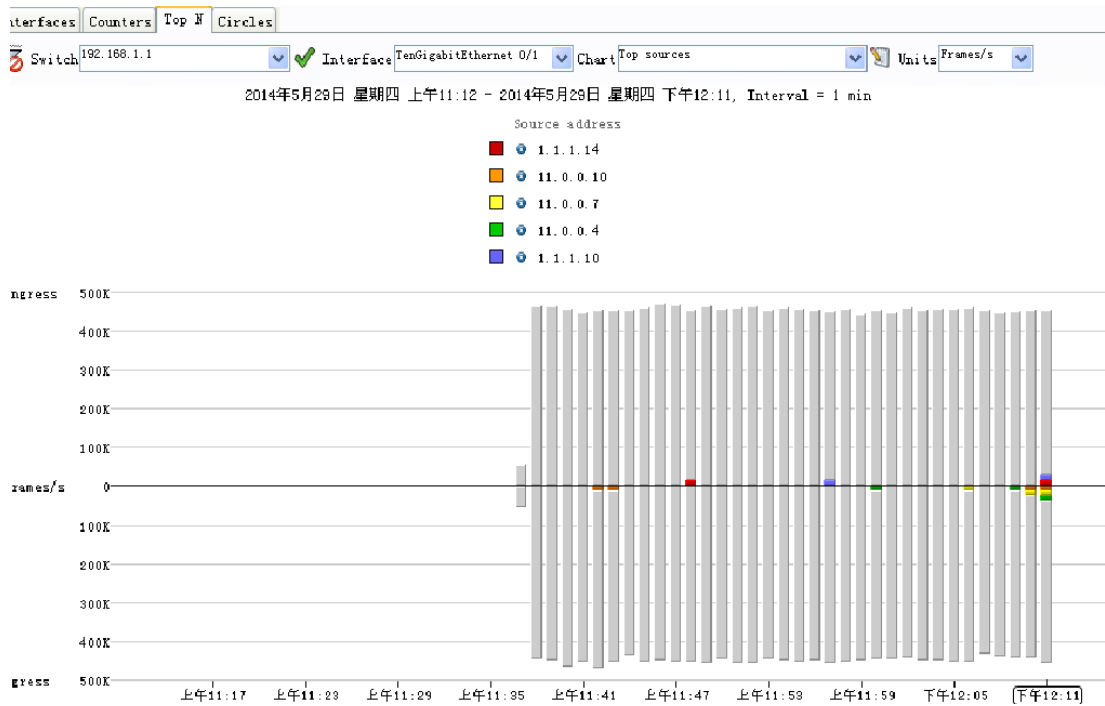

1	192.168.3.100	6343	1400
2	NULL	0	1400

Port information

Interface	CID	FID	Enable
TenGigabitEthernet 0/1	1	1	Y

Information displayed on the sFlowTrend software:

The preceding figure shows the Top N page of the sFlowTrend software. This page displays the flow sampling results and displays the top 5 source IP addresses that involve the largest traffic. The total incoming traffic is about 450 Kpps and the total outgoing traffic is 450 Kpps, which are consistent with the actual traffic.

## 6.4.2 Configuring Optional Parameters of sFlow

### Configuration Effect

You can adjust the data sampling accuracy by modifying relevant parameter attributes of sFlow.

### Notes

- The forwarding performance may be affected when the sampling rate is too low.

### Configuration Method

#### ▾ Configuring the Maximum Length of the Output sFlow Datagram

- Optional configuration.
- You can use the **sflow collector** command to configure the length of the sFlow datagram, excluding the Ethernet header, IP header, and UDP header. An sFlow datagram may contain one or multiple flow samples and counter samples. Configuration of the output sFlow datagram's maximum length may lead to the result that the number of sFlow datagrams output during processing of a certain number of flow samples differs from the number of sFlow datagrams output during processing of the same number of counter packets. If the maximum length is greater than MTU, the output sFlow datagrams will be segmented.

<b>Command Syntax</b>	<b>sflow collector</b> <i>collector-id</i> <b>max-datagram-size</b> <i>datagram-size</i>
<b>Parameter Description</b>	<i>collector-id</i> : sFlow Collector ID. The range is from 1 to 2 <b>max-datagram-size</b> <i>datagram-size</i> : maximum length of the output sFlow datagram. The range is from 200 to 9,000.
<b>Defaults</b>	The default value is 1,400.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	-

### ▾ Configuring the Flow Sampling Rate

- Optional configuration.
- You can use the **sflow sampling-rate** command to configure the global flow sampling rate.
- Configuration of flow sampling rate may affect the sFlow sampling accuracy. A lower sampling rate means a higher accuracy and larger CPU consumption. Therefore, the forwarding performance of the interface may be affected when the sampling rate is low.

<b>Command Syntax</b>	<b>sflow sampling-rate</b> <i>rate</i>
<b>Parameter Description</b>	<i>rate</i> : Sampling rate of sFlow sampling. One packet is sampled from every <i>n</i> packets ( <i>n</i> equals the value of <b>rate</b> ). The range is from 4,096 to 16,777,215.
<b>Defaults</b>	The default global flow sampling rate is 8,192.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	This command is used to configure the global sampling rate of sFlow flow sampling, and sFlow flow sampling of all interfaces uses this sampling rate.

### ▾ Configuring the Maximum Length of the Packet Header Copied During Flow Sampling

- Optional configuration.
- You can use the **sflow flow max-header** command to configure the length of the packet header copied during flow sampling globally.
- Users can use this command to modify the datagram information to be sent to the sFlow Collector. For example, if a user concerns about the IP header, this user can configure the length to 56 bytes. During encapsulation of flow samples, the first 56 bytes of the sample packet are copied to the sFlow datagram.

<b>Command Syntax</b>	<b>sflow flow max-header</b> <i>length</i>
<b>Parameter Description</b>	<i>length</i> : maximum length of the packet header to be copied. The range is from 18 to 256.
<b>Defaults</b>	The default length of the packet header to be copied during global flow sampling is 64 bytes.

<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	Configure the maximum number of bytes of the packet content copied from the header of the original packet. The copied content is recorded in the generated sample.

### ↘ Configuring the Sampling Interval

- Optional configuration.
- You can use the **sflow counter interval** command to configure the global counter sampling interval.
- Enable the counter sampling interface to send the statistics on it to the sFlow Collector at the sampling interval.

<b>Command Syntax</b>	<b>sflow counter interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : time interval. The range is form 3 to 2,147,483,647. The unit is second.
<b>Defaults</b>	The default global counter sampling interval is 30 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	This command is used to configure the global sFlow counter sampling interval, and sFlow Counter sampling of all interfaces uses this sampling interval.

### Check Method

- Check whether an sFlow datagram with the flow samples is received on the sFlow Collector.
- Use the **show sflow** command to display the sFlow configuration, and check whether the displayed information is consistent with the configuration.

### Configuration Examples

#### ↘ Configuring Optional Parameters of sFlow

<b>Network Environment</b>	See Figure 6-6.
	<ul style="list-style-type: none"> <li>● Set the flow sampling rate to 4,096 in global configuration mode.</li> <li>● Configure the length of the packet header copied during flow sampling to 128 bytes in global configuration mode.</li> <li>● Set the sampling interval to 10 in global configuration mode.</li> </ul>

<p><b>Configuration Method</b></p>	<pre>Ruijie# configure terminal Ruijie(config)# sflow sampling-rate 4096 Ruijie(config)# sflow flow max-header 128 Ruijie(config)# sflow counter interval 10</pre>
	<p>Make traffic pass through interface <b>TenGigabitEthernet 0/1</b>.</p> <ul style="list-style-type: none"> <li>● Check whether there is traffic on interface TenGigabitEthernet 0/1 on sFlow Collector 1.</li> <li>● Use the <b>show sflow</b> command to check whether the command output is consistent with the configuration.</li> </ul>
<p><b>Check Method</b></p>	<pre>Ruijie# show sflow sFlow datagram version 5 Global information: Agent IP: 10.10.10.10 sflow counter interval:10 sflow flow max-header:128 sflow sampling-rate:4096 Collector information: ID  IP                               Port Size VPN 1   192.168.2.100                     6343 1400 2   NULL                               0    1400 Port information Interface                               CID  FID  Enable TenGigabitEthernet 0/1                 0    1    Y</pre>

## 6.5 Monitoring and Maintenance

### Displaying the Running Status

Function	Command
Displays the sFlow configuration.	<b>show sflow</b>
