## Preface

Thank you for using our products. This manual matches the RGOS Release 11.0(5)B9P11.

## Audience

This manual is intended for:

- Network engineers
- Technical support and servicing engineers
- Network administrators

## Obtaining Technical Assistance

- Ruijie Networks Website: <https://www.ruijienetworks.com/>
- Technical Support Website: <https://ruijienetworks.com/support>
- Case Portal: <http://caseportal.ruijienetworks.com>
- Community: <http://community.ruijienetworks.com>
- Technical Support Email: [service\\_rj@ruijienetworks.com](mailto:service_rj@ruijienetworks.com)
- Skype: [service\\_rj@ruijienetworks.com](https://www.ruijienetworks.com)

## Related Documents

Documents	Description
Command Reference	Describes the related configuration commands, including command modes, parameter descriptions, usage guides, and related examples.
Hardware Installation and Reference Guide	Describes the functional and physical features and provides the device installation steps, hardware troubleshooting, module technical specifications, and specifications and usage guidelines for cables and connectors.

## Conventions

This manual uses the following conventions:

Convention	Description
<b>boldface font</b>	Commands, command options, and keywords are in <b>boldface</b> .
<i>italic font</i>	Arguments for which you supply values are in <i>italics</i> .

[ ]	Elements in square brackets are optional.
{ x   y   z }	Alternative keywords are grouped in braces and separated by vertical bars.
[ x   y   z ]	Optional alternative keywords are grouped in brackets and separated by vertical bars.

## Symbols

Means reader take note. Notes contain helpful suggestions or references.

---

Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

---

## System Configuration

---

1. Configuring Command Line Interface
2. Configuring Basic Management
3. Configuring Lines
4. Configuring Time Range
5. Configuring USB
6. Configuring UFT
7. Configuring ZAM
8. Configuring Module Hot Swapping
9. Configuring Supervisor Module Redundancy
10. Configuring Syslog
11. Configuring MONITOR
12. Configuring Package Management
13. Configuring Python Shell

# 1 Configuring Command Line Interface

## 1.1 Overview

The command line interface (CLI) is a window used for text command interaction between users and network devices. You can enter commands in the CLI window to configure and manage network devices.

### Protocols and Standards

N/A

## 1.2 Applications

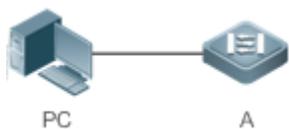

Application	Description
<a href="#">Configuring and Managing Network Devices Through CLI</a>	You can enter commands in the CLI window to configure and manage network devices

### 1.2.1 Configuring and Managing Network Devices Through CLI

#### Scenario

As shown in Figure 1-1, a user accesses network device A using a PC, and enter commands in the CLI window to configure and manage the network device.

Figure 1-1

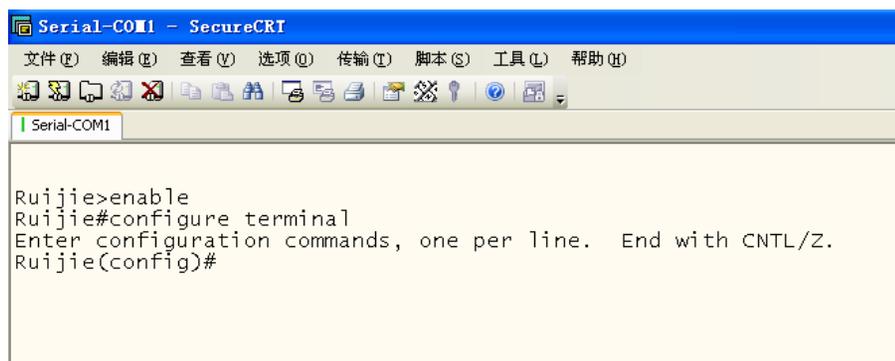

<b>Remarks</b>	A is the network device to be managed. PC is a terminal.
----------------	---

#### Deployment

As shown in Figure 1-2, the user uses the Secure CRT installed on a PC to set up a connection with network device A, and opens the CLI window to enter configuration commands.

Figure 1-2

## 1.3 Features

### Overview

Feature	Description
<a href="#">Accessing CLI</a>	You can log in to a network device for configuration and management.
<a href="#">Command Modes</a>	The CLI provides several command modes. Commands that can be used vary according to command modes.
<a href="#">System Help</a>	You can obtain the help information of the system during CLI configuration.
<a href="#">Abbreviated Commands</a>	If the entered string is sufficient to identify a unique command, you do not need to enter the full string of the command.
<a href="#">No and Default Options of Commands</a>	You can use the <b>no</b> option of a command to disable a function or perform the operation opposite to the command, or use the <b>default</b> option of the command to restore default settings.
<a href="#">Prompts Indicating Incorrect Commands</a>	An error prompt will be displayed if an incorrect command is entered.
<a href="#">History Commands</a>	You can use short-cut keys to display or call history commands.
<a href="#">Featured Editing</a>	The system provides short-cut keys for editing commands.
<a href="#">Searching and Filtering of the Show Command Output</a>	You can run the <b>show</b> command to search or filter specified commands.
<a href="#">Command Alias</a>	You can configure alias of a command to replace the command.

### 1.3.1 Accessing CLI

Before using the CLI, you need to connect a terminal or PC to a network device. You can use the CLI after starting the network device and finishing hardware and software initialization. When used for the first time, the network device can be connected only through the console port, which is called out band management. After performing relevant configuration, you can connect and manage the network device through Telnet.

### 1.3.2 Command Modes

Due to the large number of commands, these commands are classified by function to facilitate the use of commands. The CLI provides several commands modes, and all commands are registered in one or several command modes. You must first enter the command mode of a command before using this command. Different command modes are related with each other while distinguished from each other.

As soon as a new session is set up with the network device management interface, you enter User EXEC mode. In this mode, you can use only a small number of commands and the command functions are limited, such as the **show** commands. Execution results of commands in User EXEC mode are not saved.

To use more commands, you must first enter Privileged EXEC mode. Generally, you must enter a password to enter Privileged EXEC mode. In Privileged EXEC mode, you can use all commands registered in this command mode, and further enter global configuration mode.

Using commands of a certain configuration mode (such as global configuration mode and interface configuration mode) will affect configuration in use. If you save the configuration, these commands will be saved and executed next time the system is restarted. You must enter global configuration mode before entering another configuration mode, such as interface configuration mode.

The following table summarizes the command modes by assuming that the name of the network device is "Ruijie".

Command Mode	Access Method	Prompt	Exit or Entering Another Mode	About
User EXEC (User EXEC mode)	Enter User EXEC mode by default when accessing a network device.	Ruijie>	Run the <b>exit</b> command to exit User EXEC mode. Run the <b>enable</b> command to enter Privileged EXEC mode.	Use this command mode to conduct basic tests or display system information.
Privileged EXEC (Privileged EXEC mode)	In User EXEC mode, run the <b>enable</b> command to enter Privileged EXEC mode.	Ruijie#	Run the <b>disable</b> command to return to User EXEC mode. Run the <b>configure</b> command to enter global configuration mode.	Use this command mode to check whether the configuration takes effect. This mode is password protected.

Command Mode	Access Method	Prompt	Exit or Entering Another Mode	About
Global configuration (Global configuration mode)	In Privileged EXEC mode, run the <b>configure</b> command to enter global configuration mode.	Ruijie(config)#	Run the <b>exit</b> or <b>end</b> command, or press <b>Ctrl+C</b> to return to Privileged EXEC mode. Run the <b>interface</b> command to enter interface configuration mode. When using the <b>interface</b> command, you must specify the interface. Run the <b>vlan <i>vlan_id</i></b> command to enter VLAN configuration mode.	Using commands in this mode will affect the global parameters of the network device.
Interface configuration (Interface configuration mode)	In global configuration mode, run the <b>interface</b> command to enter interface configuration mode.	Ruijie(config-if)#	Run the <b>end</b> command, or press <b>Ctrl+C</b> to return to Privileged EXEC mode. Run the <b>exit</b> command to return to global configuration mode. When using the <b>interface</b> command, you must specify the interface.	Use this configuration mode to configure various interfaces of the network device.
Config-vlan (VLAN configuration mode)	In global configuration mode, run the <b>vlan <i>vlan_id</i></b> command to enter VLAN configuration mode.	Ruijie(config-vlan)#	Run the <b>end</b> command, or press <b>Ctrl+C</b> to return to the Privileged EXEC mode. Run the <b>exit</b> command to return to global configuration mode.	Use this configuration mode to configure VLAN parameters.

### 1.3.3 System Help

When entering commands in the CLI window, you can obtain the help information using the following methods:

- At the command prompt in any mode, enter a question mark (?) to list the commands supported by the current command mode and related command description.

For example

```
Ruijie>?
Exec commands:
<1-99>      Session number to resume
```

disable	Turn off privileged commands
disconnect	Disconnect an existing network connection
enable	Turn on privileged commands
exit	Exit from the EXEC
help	Description of the interactive help system
lock	Lock the terminal
ping	Send echo messages
show	Show running system information
telnet	Open a telnet connection
traceroute	Trace route to destination

2. Enter a space and a question mark (?) after a keyword of a command to list the next keyword or variable associated with the keyword.

For example

```
Ruijie(config)#interface ?
Aggregateport    Aggregate port interface
Dialer           Dialer interface
GigabitEthernet Gigabit Ethernet interface
Loopback        Loopback interface
Multilink        Multilink-group interface
Null            Null interface
Tunnel          Tunnel interface
Virtual-ppp     Virtual PPP interface
Virtual-template Virtual Template interface
Vlan            Vlan interface
range           Interface range command
```

-  If the keyword is followed by a parameter value, the value range and description of this parameter are displayed as follows:

```
Ruijie(config)#interface vlan ?
<1-4094> Vlan port number
```

3. Enter a question mark (?) after an incomplete string of a command keyword to list all command keywords starting with the string.

For example

```
Ruijie#d?  
debug delete diagnostic dir disable disconnect
```

4. After an incomplete command keyword is entered, if the suffix of this keyword is unique, press the **Tab** key to display the complete keyword.

For example

```
Ruijie# show conf<Tab>  
Ruijie# show configuration
```

5. In any command mode, run the **help** command to obtain brief description about the help system.

For example

```
Ruijie(config)#help  
Help may be requested at any point in a command by entering  
a question mark '?'. If nothing matches, the help list will  
be empty and you must backup until entering a '?' shows the  
available options.  
Two styles of help are provided:  
1. Full help is available when you are ready to enter a  
command argument (e.g. 'show ?') and describes each possible  
argument.  
2. Partial help is provided when an abbreviated argument is entered  
and you want to know what arguments match the input  
(e.g. 'show pr?'.)
```

### 1.3.4 Abbreviated Commands

If a command is long, you can enter a part of the command that is sufficient to identify the command keyword.

For example, to run the **interface** *gigabitEthernet 0/1* command in GigabitEthernet 0/1 interface configuration mode, enter the abbreviated command as follows:

```
Ruijie(config)#int g0/1  
Ruijie(config-if-GigabitEthernet 0/1)#
```

### 1.3.5 No and Default Options of Commands

Most commands have the **no** option. Generally, the **no** option is used to disable a feature or function, or perform the operation opposite to the command. For example, run the **no shutdown** command to perform the operation opposite to the **shutdown** command, that is, enabling the interface. The keyword without the **no** option is used to enable a disabled feature or a feature that is disabled by default.

Most configuration commands have the **default** option. The **default** option is used to restore default settings of the command. Default values of most commands are used to disable related functions. Therefore, the function of the **default** option is the same as that of the **no** option in most cases. For some commands, however, the default values are used to enable related functions. In this case, the function of the **default** option is opposite to that of the **no** option. At this time, the **default** option is used to enable the related function and set the variables to default values.

 For specific function of the **no** or **default** option of each command, see the command reference.

### 1.3.6 Prompts Indicating Incorrect Commands

When you enter an incorrect command, an error prompt is displayed.

The following table lists the common CLI error messages.

Error Message	Meaning	How to Obtain Help
% Ambiguous command: "show c"	The characters entered are insufficient for identifying a unique command.	Re-enter the command, and enter a question mark after the word that is ambiguous. All the possible keywords will be displayed.
% Incomplete command.	The mandatory keyword or variable is not entered in the command.	Re-enter the command, and enter a space and a question mark. All the possible keywords or variables will be displayed.
% Invalid input detected at '^' marker.	An incorrect command is entered. The sign (^) indicates the position of the word that causes the error.	At the current command mode prompt, enter a question mark. All the command keywords allowed in this command mode will be displayed.

### 1.3.7 History Commands

The system automatically saves commands that are entered recently. You can use short-cut keys to display or call history commands.

The methods are described in the following table.

Operation	Result
Ctrl+P or the UP key	Display the previous command in the history command list. Starting from the latest record, you can repeatedly perform this operation to query earlier records.
Ctrl+N or the DOWN key	After pressing Ctrl+N or the DOWN key, you can return to a command that is recently executed in the history command list. You can repeatedly perform this operation to query recently executed commands.

The standard terminals, such as the VT100 series, support the direction keys.

### 1.3.8 Featured Editing

When editing the command line, you can use the keys or short-cut keys listed in the following table:

Function	Key or Short-Cut Key	Description
Move the cursor on the	Left key or Ctrl+B	Move the cursor to the previous character.

Function	Key or Short-Cut Key	Description
editing line.	Right key or Ctrl+B	Move the cursor to the next character.
	Ctrl+A	Move the cursor to the head of the command line.
	Ctrl+E	Move the cursor to the end of the command line.
Delete an entered character.	Backspace key	Delete one character to the left of the cursor.
	Delete key	Delete one character to the right of the cursor.
Move the output by one line or one page.	Return key	When displaying contents, press the <b>Return</b> key to move the output one line upward and display the next line. This operation is performed when the output does not end yet.
	Space key	When displaying contents, press the <b>Space</b> key to page down and display the next page. This operation is performed when the output does not end yet.

When the editing cursor is close to the right boundary, the entire command line will move to the left by 20 characters, and the hidden front part is replaced by the dollar (\$) signs. You can use the related keys or short-cut keys to move the cursor to the characters in the front or return to the head of the command line.

For example, the whole **access-list** may exceed the screen width. When the cursor is close to the end of the command line for the first time, the entire command line moves to the left by 20 characters, and the hidden front part is replaced by the dollar signs (\$). Each time the cursor is close to the right boundary, the entire command line moves to the left by 20 characters.

```
access-list 199 permit ip host 192.168.180.220 host
$ost 192.168.180.220 host 202.101.99.12
$.220 host 202.101.99.12 time-range tr
```

Press **Ctrl+A** to return to the head of the command line. At this time, the hidden tail part of the command line is replaced by the dollar signs (\$).

```
access-list 199 permit ip host 192.168.180.220 host 202.101.99.$
```

### 1.3.9 Searching and Filtering of the Show Command Output

To search specified contents from the output of the **show** command, run the following command:

Command	Description
<b>show</b> <i>any-command</i>   <b>begin</b> <i>regular-expression</i>	Searches specified contents from the output of the <b>show</b> command. The first line containing the contents and all information that follows this line will be output.

 The **show** command can be executed in any mode.

 Searched contents are case sensitive.

To filter specified contents from the output of the **show** command, run the following commands:

Command	Description
<b>show</b> <i>any-command</i>   <b>exclude</b> <i>regular-expression</i>	Filters the output of the <b>show</b> command. Except those containing the specified contents, all lines will be output.
<b>show</b> <i>any-command</i>   <b>include</b> <i>regular-expression</i>	Filters the output of the <b>show</b> command. Only the lines containing the specified contents will be output.

To search or filter the output of the **show** command, you must enter a vertical line (|). After the vertical line, select the searching or filtering rules and contents (character or string). Searched and filtered contents are case sensitive.

```
Ruijie#show running-config | include interface
interface GigabitEthernet 0/0
interface GigabitEthernet 0/1
interface GigabitEthernet 0/2
interface GigabitEthernet 0/3
interface GigabitEthernet 0/4
interface GigabitEthernet 0/5
interface GigabitEthernet 0/6
interface GigabitEthernet 0/7
interface Mgmt 0
```

### 1.3.10 Command Alias

You can configure any word as the alias of a command to simply the command input.

#### Configuration Effect

1. Replace a command with a word.

For example, configure "mygateway" as the alias of the **ip route** *0.0.0.0 0.0.0.0 192.1.1.1* command. To run this command, you only need to enter "mygateway".

2. Replace the front part of a command with a word, and enter the later part.

For example, configure "ia" as the alias of the **ip address** command. To run this command, you need to enter "ia" and then the specified IP address and subnet mask.

#### Configuration Steps

##### 📌 Displaying Default Alias

In User EXEC or Privileged EXEC mode, default alias are available for some commands. You can run the **show aliases** command to display these default aliases.

```
Ruijie(config)#show aliases
Exec mode alias:
```

h	help
p	ping
s	show
u	undebug
un	undebug

 These default aliases cannot be deleted.

### 📄 Configuring a Command Alias

<b>Command</b>	<b>alias</b> <i>mode command-alias original-command</i>
<b>Parameter</b>	<i>mode</i> : indicates the command mode of the command represented by the alias.
<b>Description</b>	<i>command-alias</i> : indicates the command alias. <i>original-command</i> : indicates the command represented by the alias.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In global configuration mode, run the <b>alias ?</b> command to list all command modes that can be configured with aliases.

### 📄 Displaying Settings of Command Aliases

Run the **show aliases** command to display alias settings in the system.

### Notes

The command replaced by an alias must start from the first character of the command line.

The command replaced by an alias must be complete.

The entire alias must be entered when the alias is used; otherwise, the alias cannot be identified.

### Configuration Example

#### 📄 Defining an Alias to Replace the Entire Command

<b>Configuration Steps</b>	In global configuration mode, configure the alias "ir" to represent the default route configuration command <b>ip route 0.0.0.0 0.0.0.0 192.168.1.1</b> .
	<pre>Ruijie#configure terminal Ruijie(config)#alias config ir ip route 0.0.0.0 0.0.0.0 192.168.1.1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show aliases</b> command to check whether the alias is configured successfully.</li> </ul> <pre>Ruijie(config)#show alias Exec mode alias: h                help</pre>

	<pre> p          ping s          show u          undebug un        undebug  Global configuration mode alias:  ir         ip route 0.0.0.0 0.0.0.0 192.168.1.1         </pre>
	<ul style="list-style-type: none"> <li>● Use the configured alias to run the command, and run the <b>show running-config</b> command to check whether the alias is configured successfully.</li> </ul>
	<pre> Ruijie(config)#ir Ruijie(config)#show running-config  Building configuration...  !  alias config ir ip route 0.0.0.0 0.0.0.0 192.168.1.1 //Configuring an alias  ...  ip route 0.0.0.0 0.0.0.0 192.168.1.1 //Configuration result after the alias "ir" is entered  !         </pre>

➤ **Defining an Alias to Replace the Front Part of a Command**

<b>Configuration Steps</b>	<p>In global configuration mode, configure the alias "ir" to represent the front part "ip route" of the default route configuration command.</p> <pre> Ruijie#configure terminal Ruijie(config)#alias config ir ip route         </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show alias</b> command to check whether the alias is configured successfully.</li> </ul> <pre> Ruijie(config)#show alias  Exec mode alias:  h          help p          ping s          show         </pre>

	<pre> u                undebug un               undebug Global configuration mode alias: ir              ip route </pre>
	<ul style="list-style-type: none"> <li>● Enter the alias "ir" and then the later part of the command "0.0.0.0 0.0.0.0 192.168.1.1".</li> <li>● Run the <b>show ap-config running</b> command to check whether the configuration is successful.</li> </ul>
	<pre> Ruijie(config)#ir 0.0.0.0 0.0.0.0 192.168.1.1 Ruijie(config)#show running  Building configuration...  ! alias config ir ip route //Configuring an alias ! ip route 0.0.0.0 0.0.0.0 192.168.1.1 //Configuration result after the alias "ir" and the later part of the command are entered ! </pre>

## System Help

1. The system provides help information for command alias. An asterisk (\*) will be displayed in front of an alias. The format is as follows:

```
*command-alias=original-command
```

For example, in Privileged EXEC mode, the default command alias "s" represents the **show** keyword. If you enter "s?", the keywords starting by "s" and alias information are displayed.

```
Ruijie#s?
```

```
*s=show show start-chat start-terminal-service
```

2. If the command represented by an alias contains more than one word, the command is displayed in a pair of quotation marks.

For example, in Privileged EXEC mode, configure the alias "sv" to replace the **show version** command. If you enter "s?", the keywords starting by "s" and alias information are displayed.

```
Ruijie#s?
```

```
*s=show *sv="show version" show start-chat
```

```
start-terminal-service
```

3. You can use the alias to obtain help information about the command represented by the alias.

For example, configure the alias "ia" to represent the **ip address** command in interface configuration mode. If you enter "ia?" in interface configuration mode, the help information on "ip address?" is displayed, and the alias is replaced by the command.

```
Ruijie(config-if)#ia ?  
A.B.C.D IP address  
dhcp IP Address via DHCP  
Ruijie(config-if)#ip address
```

 If you enter a space in front of a command, the command represented by this alias will not be displayed.

## 2 Configuring Basic Management

### 2.1 Overview

This document is a getting started guide to network device management. It describes how to manage, monitor, and maintain network devices.

### 2.2 Applications

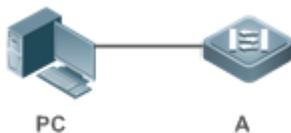

Application	Description
<a href="#">Network Device Management</a>	A user logs in to a network device from a terminal and runs commands on a command line interface (CLI) to manage device configurations.

#### 2.2.1 Network Device Management

##### Scenario

Network device management described in this document is performed through the CLI. A user logs in to Network Device A from a terminal and runs commands on the CLI to manage device configurations. See Figure 2-1.

Figure 2-1

### 2.3 Features

#### Basic Concepts

##### ↳ TFTP

Trivial File Transfer Protocol (TFTP) is a TCP/IP protocol which allows a client to transfer a file to a server or get a file from a server.

##### ↳ AAA

AAA is short for Authentication, Authorization and Accounting.

Authentication refers to the verification of user identities and the related network services.

Authorization refers to the granting of network services to users according to authentication results.

Accounting refers to the tracking of network service consumption by users. A billing system charges users based on consumption records.

AAA provides effective means of network management and security protection.

### ↘ RADIUS

Remote Authentication Dial In User Service (RADIUS) is the most widely used AAA protocol at present.

### ↘ Telnet

Telnet is a terminal emulation protocol in the TCP/IP protocol stack which provides access to a remote host through a virtual terminal connection. It is a standard protocol located at Layer 7 (application layer) of the Open System Interconnection (OSI) model and used on the internet for remote login. Telnet sets up a connection between the local PC and a remote host.

### ↘ System Information

System information includes the system description, power-on time, hardware and software versions, control-layer software version, and boot-layer software version.

### ↘ Hardware Information

Hardware information includes the physical device information as well as slot and module information. The device information includes the device description and slot quantity. The slot information includes the slot ID, module description (which is empty if a slot does not have a module), and actual and maximum number of physical ports.

## Overview

Feature	Description
<a href="#">User Access Control</a>	Controls the terminal access to network devices on the internet based on passwords and privileges.
<a href="#">Login Authentication Control</a>	Performs username-password authentication to grant access to network devices when AAA is enabled. (Authentication is performed by a dedicated server.)
<a href="#">Basic System Parameters</a>	Refer to the parameters of a system, such as the clock, banner, and Console baud rate.
<a href="#">Displaying Configurations</a>	Displays the system configurations, including the configurations that the system is currently running and the device configurations stored in the nonvolatile random access memory (NVRAM).
<a href="#">Telnet</a>	Telnet is an application-layer protocol in the TCP/IP protocol stack. It provides the standard governing remote login and virtual terminal communication on the internet.
<a href="#">Restart</a>	Introduces system restart.

### 2.3.1 User Access Control

User access control refers to the control of terminal access to network devices on the internet based on passwords and privileges.

#### Working Principle

## ▾ Privilege Level

16 privilege levels are defined ranging from 0 to 15 for CLI on network devices to grant users access to different commands. Level 0 is the lowest level granting access to just a few commands, whereas level 15 is the highest level granting access to all commands. Levels 0 and 1 are common user levels without the device configuration permission (users are not allowed to enter global configuration mode by default). Levels 2–15 are privileged user levels with the device configuration permission.

## ▾ Password Classification

Passwords are classified into two types: password and security. The first type refers to simple encrypted passwords at level 15. The second type refers to secure encrypted passwords at levels 0–15. If a level is configured with both simple and secure encrypted passwords, the simple encrypted password will not take effect. If you configure a non-15 level simple encrypted password, a warning is displayed and the password is automatically converted into a secure encrypted password. If you configure the same simple encrypted password and secure encrypted password at level 15, a warning is displayed.

## ▾ Password Protection

Each privilege level on a network device has a password. An increase in privilege level requires the input of the target level password, whereas a reduction in privilege level does not require password input.

By default, only two privilege levels are password-protected, namely, level 1 (common user level) and level 15 (privileged user level). Sixteen privilege levels with password protection can be assigned to the commands in each mode to grant access to different commands.

If no password is configured for a privileged user level, access to this level does not require password input. It is recommended that a password be configured for security purposes.

## ▾ Command Authorization

Each command has its lowest execution level. A user with a privilege level lower than this level is not allowed to run the command. After the command is assigned a privilege level, users at this level and higher have access to the command.

## Related Configuration

### ▾ Configuring a Simple Encrypted Password

Run the **enable password** command.

### ▾ Configuring a Secure Encrypted Password

Run the **enable secret** command.

A secure encrypted password is used to control the switching between user levels. It has the same function as a simple encrypted password but uses an enhanced password encryption algorithm. Therefore, secure encrypted passwords are recommended out of security consideration.

### ▾ Configuring Command Privilege Levels

Run the **privilege** command to assign a privilege level to a command.

A command at a lower level is accessible by more users than a command at a higher level.

### ↘ Raising/Lowering a User Privilege Level

Run the **enable** command or the **disable** command to raise or lower a user privilege level respectively.

After logging in to a network device, the user can change his/her level to obtain access to commands at different privilege levels.

To enable level increase logging, run the **login privilege log** command.

### ↘ Enabling Line Password Protection

Line password protection is required for remote login (such as login through Telnet).

Run the **password [ 0 | 7 ] line** command to configure a line password, and then run the **login** command to enable password protection.

By default, terminals do not support the **lock** command.

## 2.3.2 Login Authentication Control

In login authentication with AAA disabled, the password entered by a user is checked against the configured line password. If they are consistent, the user can access the network device. In local authentication, the username and password entered by a user are checked against those stored in the local user database. If they are matched, the user can access the network device with proper management permissions.

In AAA, the username and password entered by a user are authenticated by a server. If authentication is successful, the user can access the network device and enjoy certain management permissions.

For example, a RADIUS server can be used to authenticate usernames and passwords and control users' management permissions on network devices. Network devices no longer store users' passwords, but send encrypted user information to the RADIUS server, including usernames, passwords, shared passwords, and access policies. This provides a convenient way to manage and control user access and improve user information security.

### Working Principle

#### ↘ Line Password

If AAA is disabled, you can configure a line password used to verify user identities during login. After AAA is enabled, line password verification does not take effect.

#### ↘ Local Authentication

If AAA is disabled, you can configure local authentication to verify user identities and control management permissions by using the local user database. After AAA is enabled, local authentication does not take effect.

#### ↘ AAA

AAA provides three independent security functions, namely, Authentication, Authorization and Accounting. A server (or the local user database) is used to perform authentication based on the configured login authentication method list and control users' management permissions. For details about AAA, see *Configuring AAA*.

## Related Configuration

### ↘ Configuring Local User Information

Run the **username** command to configure the account used for local identity authentication and authorization, including usernames, passwords, and optional authorization information.

### ↘ Configuring Local Authentication for Line-Based Login

Run the **login local** command (in the case that AAA is disabled).

Perform this configuration on every device.

### ↘ Configuring AAA Authentication for Line-Based Login

The default authentication method is used after AAA is enabled.

Run the **login authentication** command to configure a login authentication method list for a line.

Perform this configuration when the local AAA authentication is required.

### ↘ Configuring the Connection Timeout Time

The default connection timeout time is 10 minutes.

Run the **exec-timeout** command to change the default connection timeout time. An established connection will be closed if no output is detected during the timeout time.

Perform this configuration when you need to increase or reduce the connection timeout time.

### ↘ Configuring the Session Timeout Time

The default session timeout time is 0 minutes, indicating no timeout.

Run the **session-timeout** command to change the default session timeout time.

The session established to a remote host through a line will be disconnected if no output is detected during the timeout time. Then the remote host is restored to Idle. Perform this configuration when you need to increase or reduce the session timeout time.

### ↘ Locking a Session

By default, terminals do not support the **lock** command.

Run the **lockable** command to lock the terminals connected to the current line.

To lock a session, first enable terminal lock in line configuration mode, and then run the **lock** command in terminal EXEC mode to lock the terminal.

## 2.3.3 Basic System Parameters

### ↘ System Time

The network device system clock records the time of events on the device. For example, the time shown in system logs is obtained from the system clock. Time is recorded in the format of *year-month-day, hour.minute:second, day of the week*.

When you use a network device for the first time, set its system clock to the current date and time manually.

### ↘ **Configuring a System Name and Command Prompt**

You can configure a system name to identify a network device. The default system name is **Ruijie**. A name with more than 32 characters will be truncated to keep only the first 32 characters. The command prompt keeps consistent with the system name.

### ↘ **Banner**

A banner is used to display login prompt information. There are two types of banner: Daily notification and login banner.

Daily notification is displayed on all terminals connected to network devices soon after login. Urgent messages (such as immediate system shutdown) can be delivered to users through daily notification.

A login banner appears after daily notification to display login information.

### ↘ **Configuring the Console Baud Rate**

You can manage network device through a Console port. The first configuration on the network device must be performed through the Console port. The serial port baud rate can be changed based on actual requirements. Note that the management terminal must have consistent baud rate setting with the device console.

### ↘ **Configuring the Connection Timeout Time**

The connection timeout time is used to control device connections (including established connections and sessions established to remote hosts). A connection will be closed when no input is detected during the timeout time.

## Related Configuration

### ↘ **Configuring the System Date and Clock**

Run the **clock set** command to configure the system time of a network device manually. The device clock starts from the configured time and keeps running even when the device is powered off.

### ↘ **Updating the Hardware Clock**

If the hardware clock and software clock are not synchronized, run the **clock update-calendar** command to copy the date and time of the software clock to the hardware clock.

### ↘ **Configuring a System Name**

Run the **hostname** command to change the default system name.

The default host name is **Ruijie**.

### ↘ **Configuring a Command Prompt**

Run the **prompt** command.

### ↘ **Configuring Daily Notification**

By default, no daily notification is configured.

Run the **banner motd** command to configure daily notification.

Daily notification is displayed on all terminals connected to network devices soon after login. Urgent messages (such as immediate system shutdown) can be delivered to users through daily notification.

#### ↘ [Configuring a Login Banner](#)

By default, no login banner is configured.

Run the **banner login** command to configure a login banner to display login information.

#### ↘ [Configuring the Console Baud Rate](#)

Run the **speed** command.

The default baud rate is 9,600 bps.

## 2.3.4 Displaying Configurations

Displays the system configurations, including the configurations that the system is currently running and the device configurations stored in the NVRAM.

### Working Principle

#### ↘ [Running Configurations](#)

Running configurations, namely, running-config, are the configurations that individual component modules run in real time. A request can be made to all running components to collect configurations, which will be orchestrated before being displayed to users. Only running components may provide real-time configurations, whereas unloaded components do not display configurations. In the case that the system is started, a component process is restarted, and a hot patch is executed, the configurations collected during this period may be inaccurate due to the component unstable state. For example, the configurations of a component may not be missing initially but can be displayed later.

#### ↘ [Startup Configurations](#)

The configurations stored in the NVRAM, namely, startup-config, are the configurations executed during device startup. When the system is restarted, startup-config is loaded to become new running-config. To display permanent configurations, the system needs to read the **startup-config** file in the NVRAM.

---

 The startup-config file copied to the device only supports UTF-8 encoding without BOM.

---

### Related Configuration

#### ↘ [Displaying Running Configurations](#)

Run the **show running-config [ interface *interface* ]** command to display the configurations that the system is currently running or the configurations on an interface.

#### ↘ [Displaying Startup Configurations](#)

Run the **show startup-config** command.

## ➤ Storing Startup Configurations

Run the **write** or **copy running-config startup-config** command to store the current running configurations as new startup configurations.

## 2.3.5 Telnet

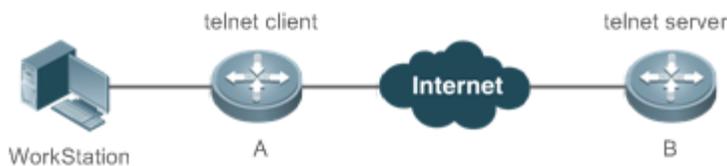

### Working Principle

Telnet is an application-layer protocol in the TCP/IP protocol stack. It provides the standard governing remote login and virtual terminal communication on the internet.

The Telnet Client service allows a local or remote user who has logged in to a network device to use its Telnet Client program to access other remote system resources on the internet. In Figure 2-2, a user with a PC connects to Network Device A by using the terminal emulation or Telnet program and then logs in to Network Device B by using the **telnet** command to perform configuration management.

Ruijie Telnet program supports the use of IPv4 and IPv6 addresses. A Telnet server accepts Telnet connection requests that carry IPv4 and IPv6 addresses. A Telnet client can send connection requests to hosts identified by IPv4 and IPv6 addresses.

Figure 2-2

### Related Configuration

#### ➤ Enabling the Telnet Client Service

Run the **telnet** command to log in to a remote device.

#### ➤ Restoring a Telnet Client Session

Run the **<1-99>** command.

#### ➤ Disconnecting a Suspended Telnet Client Session

Run the **disconnect session-id** command.

#### ➤ Enabling the Telnet Server Service

Run the **enable service telnet-server** command.

Perform this configuration when you need to enable Telnet login.

## 2.3.6 Restart

The timed restart feature makes user operation easier in some scenarios (such as tests).

If you configure a time interval, the system will restart after the interval. The interval is in the format of *mmm* or *hhh:mm*, in the unit of minutes. You can specify the interval name to reflect the restart purpose.

If you define a future time, the system will restart when the time is reached.

The clock feature must be supported by the system if you want to use the **at** option. It is recommended that you configure the system clock in advance. A new restart plan will overwrite the existing one. A restart plan will be invalid if the system is restarted before the plan takes effect.

The span between the restart time and current time must not exceed 31 days, and the restart time must be later than the current system time. After you configure a restart plan, do not to change the system clock; otherwise, the plan may fail (for example, the system time is changed to a time after the restart time.)

### [Related Configuration](#)

#### ↳ [Configuring Restart](#)

Run the **reload** command to configure a restart policy.

Perform this configuration when you need to restart a device at a specific time.

## 2.4 Configuration

<a href="#">Configuring Passwords and Privileges</a>	(Optional) It is used to configure passwords and command privilege levels.	
	<b>enable password</b>	Configures a simple encrypted password.
	<b>enable secret</b>	Configures a secure encrypted password.
	<b>enable</b>	Raises a user privilege level.
	<b>login privilege log</b>	Outputs log information of user privilege level increase.
	<b>disable</b>	Lowers a user privilege level.
	<b>privilege</b>	Configures command privilege levels.
	<b>password</b>	Specifies a line password.
	<b>login</b>	Enables line password protection.
<a href="#">Configuring Login and Authentication</a>	(Optional) It is used to configure different login modes and authentication methods.	
	<b>username</b>	Configures local user account information and optional authorization information.
	<b>login local</b>	Configures local authentication for line-based login.

	<b>login authentication</b>	Configures AAA authentication for line-based login.
	<b>telnet</b>	Enables the Telnet Client service.
	<b>enable service telnet-server</b>	Enables the Telnet Server service.
	<b>exec-timeout</b>	Configures the connection timeout time.
	<b>session-timeout</b>	Configures the session timeout time.
	<b>lockable</b>	Enables line-based terminal lock.
	<b>lock</b>	Locks a terminal connected to the current line.
<a href="#">Configuring Basic System Parameters</a>	(Optional) It is used to configure basic system parameters.	
	<b>clock set</b>	Configures the system date and clock.
	<b>clock update-calendar</b>	Updates the hardware clock.
	<b>hostname</b>	Configures a system name.
	<b>prompt</b>	Configures a command prompt.
	<b>banner motd</b>	Configures daily notification.
	<b>bannerlogin</b>	Configures a login banner.
<a href="#">Enabling and Disabling a Specific Service</a>	(Optional) It is used to enable and disable a specific service.	
	<b>enable service</b>	Enables a service.
<a href="#">Configuring a Restart Policy</a>	(Optional) It is used to configure a system restart policy.	
	<b>reload</b>	Restarts a device.

## 2.4.1 Configuring Passwords and Privileges

### Configuration Effect

Configure passwords to control users' access to network devices.

Assign a privilege level to a command to grant the command access to only the users at or higher than the level.

Lower the command privilege level to grant more users access to the command.

Raise the command privilege level to limit the command access to a few users.

### Notes

You can use the password configuration command with the **level** option to configure a password for a specific privilege level. After you specify the level and the password, the password works for the users who need to access this level.

By default, no password is configured for any level. The default level is 15.

If you configure a simple encrypted password with a non-15 level, a warning is displayed and the password is automatically converted into a secure encrypted password.

The system chooses the secure encrypted password over the simple encrypted password if both of them are configured.

## Configuration Steps

---

### ↘ Configuring a Simple Encrypted Password

(Optional) Perform this configuration when you need to establish simple encrypted password verification when users switch between different privilege levels.

Run the **enable password** command to configure a simple encrypted password.

### ↘ Configuring a Secure Encrypted Password

(Optional) Perform this configuration when you need to establish secure encrypted password verification when users switch between different privilege levels.

Run the **enable secret** command to configure a secure encrypted password.

A secure encrypted password has the same function as a simple encrypted password but uses an enhanced password encryption algorithm. Therefore, secure encrypted passwords are recommended out of security consideration.

### ↘ Configuring Command Privilege Levels

Optional.

A command at a lower level is accessible by more users than a command at a higher level.

### ↘ Raising/Lowering a User Privilege Level

After logging in to a network device, the user can change his/her level to obtain access to commands at different privilege levels.

Run the **enable** command or the **disable** command to raise or lower a user privilege level respectively.

To enable level increase logging, run the **login privilege log** command.

### ↘ Enabling Line Password Protection

(Optional) Line password protection is required for remote login (such as login through Telnet).

Run the **password [ 0 | 7 ] line** command to configure a line password, and then run the **login** command to enable login authentication.

---

If a line password is configured but login authentication is not configured, the system does not display password prompt.

---

## Verification

---

Run the **show privilege** command to display the current user level.

Run the **show running-config** command to display the configuration.

## Related Commands

---

### ↘ Configuring a Simple Encrypted Password

<b>Command</b>	<b>enable password</b> [ level <i>level</i> ] { <i>password</i>   [ 0   7 ] <i>encrypted-password</i> }
<b>Parameter</b>	<i>level</i> : Indicates a specific user level.
<b>Description</b>	<p><i>password</i>: Indicates the password used to enter privileged EXEC mode.</p> <p>0: Indicates that the password is entered in plaintext.</p> <p>7: Indicates that the password is entered in cyphertext.</p> <p><i>encrypted-password</i>: Indicates the password text, which must contain case-sensitive English letters and digits.</p> <hr/> <p> Leading spaces are allowed, but will be ignored. However, intermediate and trailing spaces are recognized.</p> <hr/>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Currently, simple encrypted passwords can be configured with only level 15 and take effect only when no secure encrypted password is configured.</p> <p>If you configure a simple encrypted password with a non-15 level, a warning is displayed and the password is automatically converted into a secure encrypted password.</p> <p>If the level 15 simple encrypted password and secure encrypted password are configured the same, a warning is displayed.</p> <hr/> <p>If you specify an encryption type and enter a password in plaintext, you cannot re-enter privileged EXEC mode. An encrypted password cannot be retrieved once lost. You have to configure a new password.</p> <hr/>

### ↘ Configuring a Secure Encrypted Password

<b>Command</b>	<b>enable secret</b> [ level <i>level</i> ] { <i>secret</i>   [ 0   5 ] <i>encrypted-secret</i> }
<b>Parameter</b>	<i>level</i> : Indicates a specific user level.
<b>Description</b>	<p><i>secret</i>: Indicates the password used to enter privileged EXEC mode.</p> <p>0   5: Indicates the password encryption type. 0 indicates no encryption, and 5 indicates secure encryption.</p> <p><i>encrypted-password</i>: Indicates the password text.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure passwords for different privilege levels.

### ↘ Raising a User Privilege Level

<b>Command</b>	<b>enable</b> [ <i>privilege-level</i> ]
<b>Parameter</b>	<i>privilege-level</i> : Indicates a specific privilege level.
<b>Description</b>	
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	An increase in privilege level requires the input of the target level password.

### ↘ Lowering a User Privilege Level

<b>Command</b>	<b>disable</b> [ <i>privilege-level</i> ]
<b>Parameter Description</b>	<i>privilege-level</i> : Indicates a specific privilege level.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	<p>A reduction in privilege level does not require password input.</p> <p>Use this command to exit Privileged EXEC mode and return to user EXEC mode. If <i>privilege-level</i> is specified, the current privilege level is reduced to the specified level.</p> <hr/> <p> <i>privilege-level</i> must be lower than the current level.</p>

### ↘ Enabling Level Increase Logging

<b>Command</b>	<b>login privilege log</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to enable logging of privilege level increase. The configuration takes effect for all terminals.

### ↘ Configuring Command Privilege Levels

<b>Command</b>	<b>privilege mode</b> [ <b>all</b> ] { <b>level level</b>   <b>reset</b> } <i>command-string</i>
<b>Parameter Description</b>	<p><i>mode</i>: Indicates the CLI mode of the command. For example, <b>config</b> indicates the global configuration mode, <b>EXEC</b> indicates the privileged command mode, and <b>interface</b> indicates the interface configuration mode.</p> <p><b>all</b>: Changes the subcommand privilege levels of a specific command to the same level.</p> <p><b>level level</b>: Indicates a privilege level, ranging from 0 to 15.</p> <p><b>reset</b>: Restores the command privilege level to the default.</p> <p><i>command-string</i>: Indicates the command to be assigned a privilege level.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To restore a command privilege level, run the <b>no privilege mode</b> [ <b>all</b> ] <b>level level</b> <i>command</i> command in global configuration mode.

### ↘ Specifying a Line Password

<b>Command</b>	<b>password</b> [ <b>0</b>   <b>7</b> ] <i>line</i>
<b>Parameter Description</b>	<p><b>0</b>: Indicates to configure a password in plaintext.</p> <p><b>7</b>: Indicates to configure a password in cyphertext.</p> <p><i>line</i>: Indicates the password string.</p>
<b>Command Mode</b>	Line configuration mode

<b>Usage Guide</b>	N/A
--------------------	-----

### ↘ Enabling Line Password Protection

<b>Command</b>	<b>login</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Line configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ↘ Configuring Command Authorization

<b>Scenario</b>	Assign privilege level 1 to the <b>reload</b> command and its subcommands and configure level 1 as the valid level (by configuring the <b>test</b> password).
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Assign privilege level 1 to the <b>reload</b> command and its subcommands.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# privilege exec all level 1 reload Ruijie(config)# enable secret level 1 0 test Ruijie(config)# end</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the <b>reload</b> command and its subcommands are accessible at level 1.</li> </ul> <pre>Ruijie# disable 1 Ruijie&gt; reload ? at                reload at  &lt;cr&gt;</pre>

## 2.4.2 Configuring Login and Authentication

### Configuration Effect

Establish line-based login identity authentication.

Run the **telnet** command on a network device to log in to a remote device.

Close an established connection if no output is detected during the timeout time.

Disconnect an established session connecting to a remote host and restore the host to Idle if no output is detected during the timeout time.

Lock a terminal to deny access. When a user enters any character on the locked terminal, the password prompt is displayed. The terminal will be automatically unlocked if the entered password is correct.

## Configuration Steps

### ↳ **Configuring Local User Information**

Mandatory.

Run the **username** command to configure the account used for local identity authentication and authorization, including usernames, passwords, and optional authorization information.

Perform this configuration on every device.

### ↳ **Configuring Local Authentication for Line-Based Login**

Mandatory.

Configure local authentication for line-based login in the case that AAA is disabled.

Perform this configuration on every device.

### ↳ **Configuring AAA Authentication for Line-Based Login**

(Optional) Perform this configuration to configure AAA authentication for line-based login.

Configure AAA authentication for line-based login in the case that AAA is enabled.

Perform this configuration on every device.

### ↳ **Enabling the Telnet Client Service**

Run the **telnet** command to log in to a remote device.

### ↳ **Restoring a Telnet Client Connection**

(Optional) Perform this configuration to restore the connection on a Telnet client.

### ↳ **Closing a Suspended Telnet Client Connection**

(Optional) Perform this configuration to close the suspended connection on a Telnet client.

### ↳ **Enabling the Telnet Server Service**

Optional.

Enable the Telnet Server service when you need to enable Telnet login.

### ↳ **Configuring the Connection Timeout Time**

Optional.

An established connection will be closed if no output is detected during the timeout time.

Perform this configuration when you need to increase or reduce the connection timeout time.

### ▾ Configuring the Session Timeout Time

Optional.

The session connecting to a remote host will be disconnected and the host be restored to Idle if no output is detected during the timeout time.

Perform this configuration when you need to increase or reduce the session timeout time.

### ▾ Locking a Session

(Optional) Perform this configuration when you need to temporarily exit a session on a device.

To lock a session, first enable terminal lock in line configuration mode, and then run the **lock** command to lock the terminal.

### Verification

Run the **show running-config** command to display the configuration.

In the case that AAA is disabled, after local user information and line-based local authentication are configured, check whether users are prompted for username and password input for access to the CLI.

In the case that AAA is enabled, after local user information and local AAA authentication are configured, check whether users are prompted for username and password input for access to the CLI.

Run the **show user** command to display the information about the users who have logged in to the CLI.

Telnet clients can connect to devices enabled with the Telnet Server service.

When a user presses **Enter** on a locked CLI, the user is prompted for password input. The session is unlocked only when the entered password is the same as the configured one.

Run the **show sessions** command to display every established Telnet client instance.

### Related Commands

#### ▾ Configuring Local User Information

<b>Command</b>	<b>username</b> <i>name</i> [ <b>login mode</b> { <b>aux</b>   <b>console</b>   <b>ssh</b>   <b>telnet</b> } ] [ <b>online amount</b> <i>number</i> ] [ <b>permission</b> <i>oper-mode path</i> ] [ <b>privilege</b> <i>privilege-level</i> ] [ <b>reject remote-login</b> ] [ <b>web-auth</b> ] [ <b>pwd-modify</b> ] [ <b>nopassword</b>   <b>password</b> [ <b>0</b>   <b>7</b> ] <i>text-string</i> ]
<b>Parameter Description</b>	<p><b>name</b>: Indicates a user name.</p> <p><b>login mode</b>: Indicates the login mode.</p> <p><b>aux</b>: Indicates the aux mode.</p> <p><b>console</b>: Sets the login mode to Console.</p> <p><b>ssh</b>: Sets the login mode to SSH.</p> <p><b>telnet</b>: Sets the login mode to Telnet.</p> <p><b>online amount</b> <i>number</i>: Indicates the maximum number of online accounts.</p> <p><b>permission</b> <i>oper-mode path</i>: Configures the file operation permission. <i>op-mode</i> indicates the operation mode, and <i>path</i> indicates the directory or path of a specific file.</p>

	<p><b>privilege <i>privilege-level</i></b>: Indicates the account privilege level, ranging from 0 to 15.</p> <p><b>reject remote-login</b>: Rejects remote login by using the account.</p> <p><b>web-auth</b>: Allows only Web authentication for the account.</p> <p><b>pwd-modify</b>: Allows the account owner to change the password. This option is available only when <b>web-auth</b> is configured.</p> <p><b>nopassword</b>: Indicates that no password is configured for the account.</p> <p><b>password [ 0   7 ] <i>text-string</i></b>: Indicates the password configured for the account. 0 indicates that the password is input in plaintext, and 7 indicates that the password is input in cyphertext. The default is plaintext.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Use this command to create a local user database to be used by authentication.</p> <p>If the value 7 is selected for the encryption type, the entered cyphertext string must consist of an even number of characters.</p> <p>This setting is applicable to the scenario where encrypted passwords may be copied and pasted. In other cases, the value 7 is not selected.</p>

### ↘ Configuring Local Authentication for Line-Based Login

<b>Command</b>	<b>login local</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Line configuration mode
<b>Usage Guide</b>	<p>Use this command to configure local authentication for line-based login in the case that AAA is disabled.</p> <p>Local user information is configured by using the <b>username</b> command.</p>

### ↘ Configuring AAA Authentication for Line-Based Login

<b>Command</b>	<b>login authentication { default   <i>list-name</i> }</b>
<b>Parameter Description</b>	<p><b>default</b>: Indicates the default authentication method list name.</p> <p><i>list-name</i>: Indicates the optional method list name.</p>
<b>Command Mode</b>	Line configuration mode
<b>Usage Guide</b>	<p>Use this command to configure AAA authentication for line-based login in the case that AAA is enabled. The AAA authentication methods, including RADIUS authentication, local authentication, and no authentication, are used during the authentication process.</p>

### ↘ Enabling the Telnet Client Service

<b>Command</b>	<b>telnet [ oob ] host [ port ] [ /source { ip A.B.C.D   ipv6 X:X:X::X   interface <i>interface-name</i> } ] [ /vrf <i>vrf-name</i> ] [ via <i>mgmt-name</i> ]</b>
<b>Parameter Description</b>	<p><b>oob</b>: Remotely connects to a Telnet server through out-of-band communication (by using a management port). This option is available only when the device has a management port.</p>

	<p><i>host</i>: Indicates the IPv4 address, IPv6 address, or host name of the Telnet server.</p> <p><i>port</i>: Indicates the TCP port number of the Telnet server. The default value is 23.</p> <p><b>/source</b>: Indicates the source IP address or source port used by a Telnet client.</p> <p><b>ip</b> <i>A.B.C.D</i>: Indicates the source IPv4 address used by the Telnet client.</p> <p><b>ipv6</b> <i>X:X:X:X::X</i>: Indicates the source IPv6 address used by the Telnet client.</p> <p><b>interface</b> <i>interface-name</i>: Indicates the source port used by the Telnet client.</p> <p><b>/vrf</b> <i>vrf-name</i>: Indicates the name of the virtual routing and forwarding (VRF) table to be queried.</p> <p><b>via</b> <i>mgmt-name</i>: Indicates the management port used by the Telnet client when the <b>oob</b> option is specified.</p>
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	A user can telnet to a remote device identified by an IPv4 host name, IPv6 host name, IPv4 address, or IPv6 address.

### ↘ Restoring a Telnet Client Session

<b>Command</b>	<1-99>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	User EXEC mode
<b>Usage Guide</b>	Use this command to restore a Telnet client session. A user can press the shortcut key <b>Ctrl+Shift+6 X</b> to temporarily exit the Telnet client session that is established using the <b>telnet</b> command, run the <b>&lt;1-99&gt;</b> command to restore the session, and run the <b>show sessions</b> command to display the session information.

### ↘ Closing a Suspended Telnet Client Connection

<b>Command</b>	<b>disconnect</b> <i>session-id</i>
<b>Parameter Description</b>	<i>session-id</i> : Indicates the suspended Telnet client session ID.
<b>Command Mode</b>	User EXEC mode
<b>Usage Guide</b>	Use this command to close a specific Telnet client session by entering the session ID.

### ↘ Enabling the Telnet Server Service

<b>Command</b>	<b>enable service telnet-server</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to enable the Telnet Server service. The IPv4 and IPv6 services are also enabled after the command is executed.

### ▾ Configuring the Connection Timeout Time

<b>Command</b>	<b>exec-timeout</b> <i>minutes</i> [ <i>seconds</i> ]
<b>Parameter</b>	<i>minutes</i> : Indicates the connection timeout time in the unit of minutes.
<b>Description</b>	<i>seconds</i> : Indicates the connection timeout time in the unit of seconds.
<b>Command Mode</b>	Line configuration mode
<b>Usage Guide</b>	Use this command to configure the timeout time for the established connections on a line. A connection will be closed when no input is detected during the timeout time.  To remove the connection timeout configuration, run the <b>no exec-timeout</b> command in line configuration mode.

### ▾ Configuring the Session Timeout Time

<b>Command</b>	<b>session-timeout</b> <i>minutes</i> [ <b>output</b> ]
<b>Parameter</b>	<i>minutes</i> : Indicates the session timeout time in the unit of minutes.
<b>Description</b>	<b>output</b> : Indicates whether to add data output as a timeout criterion.
<b>Command Mode</b>	Line configuration mode
<b>Usage Guide</b>	Use this command to configure the timeout time for the remote host sessions on a line. A session will be disconnected when no input is detected during the timeout time.  To cancel the session timeout time, run the <b>no session-timeout</b> command in line configuration mode.

### ▾ Enabling Line-Based Terminal Lock

<b>Command</b>	<b>lockable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Line configuration mode
<b>Usage Guide</b>	N/A

### ▾ Locking a Terminal Connected to the Current Line

<b>Command</b>	<b>lock</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Line configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ▾ Establishing a Telnet Session to a Remote Network Device

<b>Configuration</b>	<ul style="list-style-type: none"> <li>Establish a Telnet session to a remote network device with the IP address 192.168.65.119.</li> </ul>
----------------------	---

<b>Steps</b>	<ul style="list-style-type: none"> <li>Establish a Telnet session to a remote network device with the IPv6 address 2AAA:BBBB::CCCC.</li> <li>Run the <b>telnet</b> command in privileged EXEC mode</li> </ul>
	<pre>Ruijie# telnet 192.168.65.119 Trying 192.168.65.119 ... Open User Access Verification Password:</pre>
	<pre>Ruijie# telnet 2AAA:BBBB::CCCC Trying 2AAA:BBBB::CCCC ... Open User Access Verification Password:</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the Telnet sessions are established to the remote network devices.</li> </ul>

#### 📌 Configuring the Connection Timeout Time

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Set the connection timeout time to 20 minutes.</li> </ul>
	<pre>Ruijie# configure terminal//Enter global configuration mode. Ruijie# line vty 0 //Enter line configuration mode. Ruijie(config-line)#exec-timeout 20 //Set the connection timeout time to 20 minutes.</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the connection between a terminal and the local device is closed when no input is detected during the timeout time.</li> </ul>

#### 📌 Configuring the Session Timeout Time

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Set the session timeout time to 20 minutes.</li> </ul>
	<pre>Ruijie# configure terminal//Enter global configuration mode. Ruijie(config)# line vty 0 //Enter line configuration mode. Ruijie(config-line)#session-timeout 20//Set the session timeout time to 20 minutes.</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the session between a terminal and the local device is disconnected when no input is detected during the timeout time.</li> </ul>

## 2.4.3 Configuring Basic System Parameters

### Configuration Effect

Configure basic system parameters.

### Configuration Steps

#### ↘ **Configuring the System Date and Clock**

Mandatory.

Configure the system time of a network device manually. The device clock starts from the configured time and keeps running even when the device is powered off.

---

The time configuration is applied only to the software clock if the network device does not provide a hardware clock. The configuration will be invalid when the device is powered off.

---

#### ↘ **Updating the Hardware Clock**

Optional.

Perform this configuration when you need to copy the date and time of the software clock to the hardware clock so that the hardware clock is synchronized with the software clock.

#### ↘ **Configuring a System Name**

(Optional) Perform this configuration to change the default system name.

#### ↘ **Configuring a Command Prompt**

(Optional) Perform this configuration to change the default command prompt.

#### ↘ **Configuring Daily Notification**

(Optional) Perform this configuration when you need to display important prompts or warnings to users.

You can configure notification in one or multiple lines, which will be displayed to users after login.

#### ↘ **Configuring a Login Banner**

(Optional) Perform this configuration when you need to display important messages to users upon login or logout.

#### ↘ **Configuring the Console Baud Rate**

(Optional) Perform this configuration to change the default Console baud rate.

### Verification

Run the **show clock** command to display the system time.

Check whether a login banner is displayed after login.

Run the **show version** command to display the system information and version.

## Related Commands

### ↘ Configuring the System Date and Clock

<b>Command</b>	<b>clock set</b> <i>hh:mm:ss month day year</i>
<b>Parameter Description</b>	<i>hh:mm:ss</i> : Indicates the current time, in the format of <i>hour</i> (24-hour format): <i>minute:second</i> . <i>day</i> : Indicates a day (1–31) of the month. <i>month</i> : Indicates a month (from January to December) of the year. <i>year</i> : Indicates a year, ranging from 1993 to 2035. Abbreviation is not supported.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Use this command to configure the system time.  If the device does not provide a hardware clock, the time configuration will be invalid when the device is powered off.

### ↘ Updating the Hardware Clock

<b>Command</b>	<b>clock update-calendar</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	After the configuration, the time of the software clock will overwrite that of the hardware clock.

### ↘ Configuring a System Name

<b>Command</b>	<b>hostname</b> <i>name</i>
<b>Parameter Description</b>	<i>name</i> : Indicates the system name, which must consist of printable characters and must not exceed 63 bytes.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To restore the system name to the default, run the <b>no hostname</b> command in global configuration mode.

### ↘ Configuring a Command Prompt

<b>Command</b>	<b>prompt</b> <i>string</i>
<b>Parameter Description</b>	<i>string</i> : Indicates the command prompt name. A name with more than 32 characters will be truncated to keep only the first 32 characters.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	To restore the command prompt to the default settings, run the <b>no prompt</b> command in global configuration mode.

### ↘ Configuring Daily Notification

<b>Command</b>	<b>banner motd</b> <i>c message c</i>
<b>Parameter Description</b>	<i>c</i> : Indicates a delimiter, which can be any character, such as "&".
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A message must start and end with delimiter+carriage return respectively. Any characters following the ending delimiter will be dropped. Any letter contained in the message must not be used as the delimiter. The message must not exceed 2047 bytes.

### ↘ Configuring a Login Banner

<b>Command</b>	<b>banner login</b> <i>c message c</i>
<b>Parameter Description</b>	<i>c</i> : Indicates a delimiter, which can be any character, such as "&".
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A message must start and end with delimiter+carriage return respectively. Any characters following the ending delimiter will be dropped. Any letter contained in the message must not be used as the delimiter. The message must not exceed 2047 bytes. To remove the login banner configuration, run the <b>no banner login</b> command in global configuration mode.

### ↘ Configuring the Console Baud Rate

<b>Command</b>	<b>speed</b> <i>speed</i>
<b>Parameter Description</b>	<i>speed</i> : Indicates the console baud rate, in the unit of bps. The serial port baud rate can be set to 9,600 bps, 19,200 bps, 38,400 bps, 57,600 bps, or 115,200 bps. The default is 9,600 bps.
<b>Command Mode</b>	Line configuration mode
<b>Usage Guide</b>	You can configure the asynchronous line baud rate based on requirements. The <b>speed</b> command is used to configure receive and transmit rates for the asynchronous line.

## Configuration Example

### ↘ Configuring the System Time

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Change the system time to 2003-6-20, 10:10:12.</li> </ul> <pre>Ruijie# clock set 10:10:12 6 20 2003 //Configure the system time and date.</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show clock</b> command in privileged EXEC mode to display the system time.</li> </ul> <pre>Ruijie# show clock //Confirm that the changed system time takes effect. clock: 2003-6-20 10:10:54</pre>

## ▾ Configuring Daily Notification

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the daily notification message "Notice: system will shutdown on July 6th." with the pound key (#) as the delimiter.</li> </ul>
	<pre>Ruijie(config)# banner motd #//Starting delimiter Enter TEXT message. End with the character '#'. Notice: system will shutdown on July 6th.# //Ending delimiter Ruijie(config)#</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show running-config</b> command to display the configuration.</li> <li>Connect to the local device through the Console, Telnet or SSH, and check whether daily notification is displayed before the CLI appears.</li> </ul>
	<pre>C:\&gt;telnet 192.168.65.236 Notice: system will shutdown on July 6th. Access for authorized users only. Please enter your password. User Access Verification Password:</pre>

## ▾ Configuring a Login Banner

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the login banner message "Access for authorized users only. Please enter your password." with the pound key (#) as the delimiter.</li> </ul>
	<pre>Ruijie(config)# banner login #//Starting delimiter Enter TEXT message. End with the character '#'. Access for authorized users only. Please enter your password. # //Ending delimiter Ruijie(config)#</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show running-config</b> command to display the configuration.</li> <li>Connect to the local device through the Console, Telnet or SSH, and check whether the login banner is displayed before the CLI appears.</li> </ul>
	<pre>C:\&gt;telnet 192.168.65.236 Notice: system will shutdown on July 6th. Access for authorized users only. Please enter your password. User Access Verification Password:</pre>

## ▾ Configuring the Serial Port Baud Rate

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Set the serial port baud rate to 57,600 bps.</li> </ul>
	<pre>Ruijie# configure terminal //Enter global configuration mode. Ruijie(config)# line console 0 //Enter console line configuration mode. Ruijie(config-line)# speed 57600 //Set the console baud rate to 57,600 bps. Ruijie(config-line)# end //Returns to privileged mode.</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show</b> command to display the configuration.</li> </ul>
	<pre>Ruijie# show line console 0 //Displays the console configuration. CON      Type      speed  Overruns * 0      CON      57600  0 Line 0, Location: "", Type: "vt100" Length: 25 lines, Width: 80 columns Special Chars: Escape Disconnect Activation               ^x      none      ^M Timeouts:      Idle EXEC      Idle Session               never      never History is enabled, history size is 10. Total input: 22 bytes Total output: 115 bytes Data overflow: 0 bytes stop rx interrupt: 0 times Modem: READY</pre>

## 2.4.4 Enabling and Disabling a Specific Service

### Configuration Effect

Dynamically adjust system services when the system is running, and enable and disable specific services (SNMP Agent, SSH Server, and Telnet Server).

### Configuration Steps

#### ▾ Enabling the SNMP Agent, SSH Server, and Telnet Server Services

(Optional) Perform this configuration when you need to use these services.

### Verification

Run the **show running-config** command to display the configuration.

Run the **show services** command to display the service Enabled/Disable state.

### Related Commands

#### ▾ Enabling the SSH Server, Telnet Server, and SNMP Agent Services

<b>Command</b>	<b>enable service { ssh-server   telnet-server   snmp-agent }</b>
<b>Parameter Description</b>	<p><b>ssh-server:</b> Enables or disables the SSH Server service. The IPv4 and IPv6 services are also enabled together with this service.</p> <p><b>telnet-server:</b> Enables or disables the Telnet Server service. The IPv4 and IPv6 services are also enabled together with this service.</p> <p><b>snmp-agent:</b> Enables or disables the SNMP Agent service. The IPv4 and IPv6 services are also enabled together with this service.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to enable and disable specific services.

### Configuration Example

#### ▾ Enabling the SSH Server Service

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable the SSH Server service.</li> </ul>
	<pre>Ruijie# configure terminal //Enter global configuration mode. Ruijie(config)#enable service ssh-server //Enable the SSH Server service.</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show running-config</b> command to display the configuration.</li> <li>● Run the <b>show ip ssh</b> command to display the configuration and running state of the SSH Server service.</li> </ul>

## 2.4.5 Configuring a Restart Policy

### Configuration Effect

Configure a restart policy to restart a device as scheduled.

### Configuration Steps

#### ▾ Configuring Direct Restart

Run the **reload** command in privileged EXEC mode to restart the system immediately.

## ↘ Configuring Timed Restart

```
reload at hh:mm:ss month day year [string]
```

If you configure a specific time, the system will restart at the time. The time must be a time in the future. The **month**, **day** and **year** parameters are optional. If they are not specified, the time of the system clock is used by default.

The clock feature must be supported by the system if you want to use the **at** option. It is recommended that you configure the system clock in advance. A new restart plan will overwrite the existing one. A restart plan will be invalid if the system is restarted before the plan takes effect.

The restart time must be later than the current system time. After you configure a restart plan, do not change the system clock; otherwise, the plan may fail (for example, the system time is changed to a time after the restart time.)

## Related Commands

### ↘ Restarting a Device

<b>Command</b>	<b>reload [ at { hh [ :mm [ :ss ] } [ month [ day [ year ] ] ] ]</b>
<b>Parameter</b>	<b>at</b> <i>hh:mm:ss</i> : Indicates the time when the system will restart.
<b>Description</b>	<i>month</i> : Indicates a month of the year, ranging from 1 to 12. <i>day</i> : Indicates a date, ranging from 1 to 31. <i>year</i> : Indicates a year, ranging from 1993 to 2035. Abbreviation is not supported.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Use this command to enable a device to restart at a specific time.

## 2.5 Monitoring

### Displaying

Description	Command
<b>show clock</b>	Displays the current system time.
<b>show line { console <i>line-num</i>   vty <i>line-num</i>   <i>line-num</i> }</b>	Displays line configurations.
<b>show reload</b>	Displays system restart settings.
<b>show running-config [ interface <i>interface</i> ]</b>	Displays the current running configurations of the device or the configurations on an interface.
<b>show startup-config</b>	Displays the device configurations stored in the NVRAM.
<b>show this</b>	Displays the current system configurations.
<b>show version [ devices   module   slots ]</b>	Displays system information.
<b>show sessions</b>	Displays the information of each established Telnet client instance.

## 3 Configuring Lines

### 3.1 Overview

There are various types of terminal lines on network devices. You can manage terminal lines in groups based on their types. Configurations on these terminal lines are called line configurations. On network devices, terminal lines are classified into multiple types such as CTY and VTY.

### 3.2 Applications

Application	Description
<a href="#">Accessing a Device Through Console</a>	Enter the command-line interface (CLI) of a network device through the Console.
<a href="#">Accessing a Device Through VTY</a>	Enter the CLI of a network device through Telnet or SSH.

#### 3.2.1 Accessing a Device Through Console

##### Scenario

Figure 3-1

<b>Remarks</b>	A is a network device to be managed. PC is a network management station.
----------------	---

##### Deployment

The network management station connects to the Console port of a network device through a serial cable. Using the Console software (Hyper Terminal or other terminal simulation software) on the network management station, you can access the Console of the network device and enter the CLI to configure and manage the network device.

#### 3.2.2 Accessing a Device Through VTY

##### Scenario

Figure 3-2

<b>Remarks</b>	A is a network device to be managed. PC is a network management station.
----------------	---

## Deployment

The network management station connects to a network device through the network. Using a VTY client (such as Putty) on the network management station, you can access the network device through Telnet or SSH and enter the CLI to configure and manage the network device.

## 3.3 Features

### Basic Concepts

#### ↳ CTY

The CTY line refers to the line connected to the Console port. Most network devices have a Console port. You can access the local system through the Console port.

#### ↳ VTY

The VTY line is a virtual terminal line that does not correspond to any hardware. It is used for Telnet or SSH connection.

### Overview

Feature	Description
<a href="#">Basic Features</a>	Configures a terminal, displays and clears terminal connection information.

### 3.3.1 Basic Features

#### Related Configuration

#### ↳ Configuring Terminal Lines

Run the **line** command in global configuration mode to enter the configuration mode of a specified line.

Configure the line attributes.

#### ↳ Clearing Terminal Connections

When a terminal connects to the network device, the corresponding terminal line is occupied. Run the **show user** command to display the connection status of these terminal lines. If you want to disconnect the terminal from the network device, run

the **clear line** command to clear the terminal line. After the terminal lines are cleared, the related connections (such as Telnet and SSH) are interrupted, the CLI exits, and the terminal lines restore to the unoccupied status. Users can re-establish connections.

### ↘ Specifying the Number of VTY Terminals

Run the **line vty** command to enter the VTY line configuration mode and specify the number of VTY terminals.

By default, there are 5 VTY terminals, numbered from 0 to 4. You can increase the number of VTY terminals to 36, with new ones numbered from 5 to 35. Only new terminals can be removed.

## 3.4 Configuration

Configuration	Description and Command
	(Mandatory) It is used to enter the line configuration mode.
<b>line [ console   vty ] first-line [ last-line ]</b>	Enters the specified line configuration mode.
<b>line vty line-number</b>	Increases or reduces the number of available VTY lines.

### 3.4.1 Entering Line Configuration Mode

#### Configuration Effect

Enter line configuration mode to configure other functions.

#### Configuration Steps

##### ↘ Entering Line Configuration Mode

Mandatory.

Unless otherwise specified, enter line configuration mode on each device to configure line attributes.

##### ↘ Increasing/Reducing the Number of VTY Lines

Optional.

Run the **(no) line vty line-number** command to increase or reduce the number of VTY lines.

#### Verification

Run the **show line** command to display line configuration.

#### Related Commands

##### ↘ Entering Line Configuration Mode

<b>Command</b>	<code>line [ aux   console   tty   vty ] first-line [ last-line ]</code>
<b>Parameter Description</b>	<p><b>console:</b> Indicates the Console port.</p> <p><b>vty:</b> Indicates a virtual terminal line, which supports Telnet or SSH.</p> <p><i>first-line:</i> Indicates the number of the first line.</p> <p><i>last-line:</i> Indicates the number of the last line.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Increasing/Reducing the Number of VTY Lines

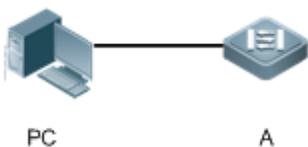

<b>Command</b>	<code>line vty line-number</code>
<b>Parameter Description</b>	<i>line-number:</i> Indicates the number of VTY lines. The value ranges from 0 to 35.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>no line vty line-number</b> command to reduce the number of available VTY lines.

### ↘ Displaying Line Configuration

<b>Command</b>	<code>show line { console line-num   vty line-num   line-num }</code>
<b>Parameter Description</b>	<p><b>console:</b> Indicates the Console port.</p> <p><b>vty:</b> Indicates a virtual terminal line, which supports Telnet or SSH.</p> <p><i>line-num:</i> Indicates the line to be displayed.</p>
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

## Configuration Example

<b>Scenario</b> Figure 3-3	 <p>The diagram shows a laptop icon labeled 'PC' on the left and a server icon labeled 'A' on the right. A horizontal line connects the two icons, representing a network connection.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Connect the PC to network device A through the Console line and enter the CLI on the PC.</li> <li>● Run the <b>show user</b> command to display the connection status of the terminal line.</li> <li>● Run the <b>show line console 0</b> command to display the status of the Console line.</li> </ul>

- Enter global configuration mode and run the **line vty** command to increase the number of VTY terminals to 36.

**A**

```

Ruijie#show user

Line          User          Host(s)          Idle          Location

## 3.5 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the line connection status.	<b>clear line</b> { <b>console</b> <i>line-num</i>   <b>vtty</b> <i>line-num</i>   <i>line-num</i> }

### Displaying

Description	Command
Displays the line configuration.	<b>show line</b> { <b>console</b> <i>line-num</i>   <b>vtty</b> <i>line-num</i>   <i>line-num</i> }
Displays historical records of a line.	<b>show history</b>
Displays the privilege level of a line.	<b>show privilege</b>
Displays users on a line.	<b>show user</b> [ <b>all</b> ]

## 4 Configuring Time Range

### 4.1 Overview

Time Range is a time-based control service that provides some applications with time control. For example, you can configure a time range and associate it with an access control list (ACL) so that the ACL takes effect within certain time periods of a week.

### 4.2 Typical Application

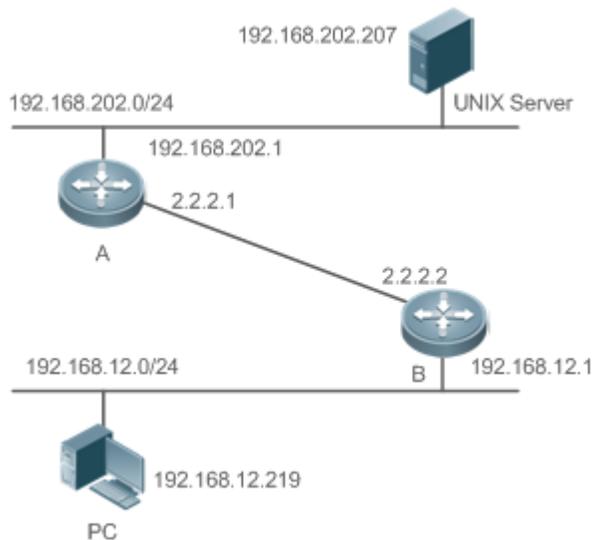

Typical Application	Scenario
<a href="#">Applying Time Range to an ACL</a> Applying Time Range to an ACL	Apply a time range to an ACL module so that the time-based ACL takes effect

#### 4.2.1 Applying Time Range to an ACL

##### Application Scenario

An organization allows users to access the Telnet service on a remote Unix host during working hours only, as shown in Figure 4-1.

Figure 4-1

<p>Note</p>	<p>Configure an ACL on device B to implement the following security function:</p>
-------------	---

	Hosts in network segment 192.168.12.0/24 can access the Telnet service on a remote Unix host during normal working hours only.
--	--

## Functional Deployment

On device B, apply an ACL to control Telnet service access of users in network segment 192.168.12.0/24. Associate the ACL with a time range, so that the users' access to the Unix host is allowed only during working hours.

## 4.3 Function Details

### Basic Concepts

#### ↘ Absolute Time Range

The absolute time range is a time period between a start time and an end time. For example, [12:00 January 1 2000, 12:00 January 1 2001] is a typical absolute time range. When an application based on a time range is associated with the time range, a certain function can be effective within this time range.

#### ↘ Periodic Time

Periodic time refers to a periodical interval in the time range. For example, “from 8:00 every Monday to 17:00 every Friday” is a typical periodic time interval. When a time-based application is associated with the time range, a certain function can be effective periodically from every Monday to Friday.

### Features

Feature	Function
<a href="#">Using Absolute Time Range</a>	Sets an absolute time range for a time-based application, so that a certain function takes effect within the absolute time range.
<a href="#">Using Periodic Time</a>	Sets periodic time or a time-based application, so that a certain function takes effect within the periodic time.

### 4.3.1 Using Absolute Time Range

#### Working Principle

When a time-based application enables a certain function, it determines whether current time is within the absolute time range. If yes, the function is effective or ineffective at the current time depending on specific configuration.

#### Related Configuration

#### ↘ Configuring Time Range

No time range is configured by default.

Use the **time-range** *time-range-name* command to configure a time range.

#### ↘ Configuring Absolute Time Range

The absolute time range is [00:00 January 1, 0, 23:59 December 31, 9999] by default.

Use the **absolute** { [start time date] | [end time date] } command to configure the absolute time range.

## 4.3.2 Using Periodic Time

### Working Principle

When a time-based application enables a certain function, it determines whether current time is within the period time. If yes, the function is effective or ineffective at the current time depending on specific configuration.

### Related Configuration

#### ↘ Configuring Time Range

No time range is configured by default.

Use the **time-range** *time-range-name* command to configure a time range.

#### ↘ Configure Periodic Time

No periodic time is configured by default.

Use the **periodic** *day-of-the-week time to* [day-of-the-week] *time* command to configure periodic time.

## 4.4 Configuration Details

Configuration Item	Suggestions and Related Commands
<a href="#">Configuring Time Range</a>	Mandatory configuration. Time range configuration is required so as to use the time range function.
	<b>time-range</b> <i>time-range-name</i>   Configures a time range.
	Optional configuration. You can configure various parameters as necessary.
	<b>absolute</b> { [start time date]   [end time date] }   Configures an absolute time range.
	<b>periodic</b> <i>day-of-the-week time to</i> [day-of-the-week] <i>time</i>   Configures periodic time.

### 4.4.1 Configuring Time Range

#### Configuration Effect

Configure a time range, which may be an absolute time range or a periodic time interval, so that a time-range-based application can enable a certain function within the time range.

#### Configuration Method

## ↘ Configuring Time Range

Mandatory configuration.

Perform the configuration on a device to which a time range applies.

## ↘ Configuring Absolute Time Range

Optional configuration.

## ↘ Configuring Periodic Time

Optional configuration.

## Verification

Use the **show time-range** [*time-range-name*] command to check time range configuration information.

## Related Commands

### ↘ Configuring Time Range

<b>Command</b>	<b>time-range</b> <i>time-range-name</i>
<b>Parameter Description</b>	<i>time-range-name</i> : name of the time range to be created.
<b>Default</b>	No time range is configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Some applications (such as ACL) may run based on time. For example, an ACL can be effective within certain time ranges of a week. To this end, first you must configure a time range, then you can configure relevant time control in time range configuration mode.

### ↘ Configuring Absolute Time Range

<b>Command</b>	<b>absolute</b> { [ <b>start</b> <i>time date</i> ]   [ <b>end</b> <i>time date</i> ] }
<b>Parameter Description</b>	<b>start</b> <i>time date</i> : start time of the range. <b>end</b> <i>time date</i> : end time of the range.
<b>Default</b>	No absolute time range is configured by default.
<b>Command Mode</b>	Time range configuration mode
<b>Usage Guide</b>	Use the <b>absolute</b> command to configure a time absolute time range between a start time and an end time to allow a certain function to take effect within the absolute time range.

### ↘ Configuring Periodic Time

<b>Command</b>	<b>periodic</b> <i>day-of-the-week time</i> to [ <i>day-of-the-week</i> ] <i>time</i>
<b>Parameter Description</b>	<i>day-of-the-week</i> : the week day when the periodic time starts or ends <i>time</i> : the exact time when the periodic time starts or ends

<b>Default</b>	No periodic time is configured by default.
<b>Command Mode</b>	Time range configuration mode
<b>Usage Guide</b>	Use the <b>periodic</b> command to configure a periodic time interval to allow a certain function to take effect within the periodic time.

## 4.5 Monitoring and Maintaining Time Range

### Displaying the Running Status

Function	Command
Displays time range configuration.	<b>show time-range</b> [ <i>time-range-name</i> ]

## 5 Configuring USB

### 5.1 Overview

Universal serial bus (USB) is an external bus standard. In this document, USB refers to a USB-compliant peripheral device, for example, a USB flash drive.

USB is a hot swappable device. You can use it to copy files (such as configuration and log files) from a communication device, or copy external data (such as system upgrade files) to the flash of the communication device.

Specific application scenarios of the USB are detailed in configuration guides of related functions. This document describes only how to identify, use, and remove the USB and view information about the USB.

### 5.2 Applications

Application	Description
<a href="#">Using a USB Flash Drive to Upgrade a Device</a>	Upgrade files are stored on a USB flash drive. After a device is powered on, the device detects the USB flash drive and runs the upgrade command to load the upgrade files. After loading is completed, the device is reset and runs the upgraded version.

#### 5.2.1 Using a USB Flash Drive to Upgrade a Device

##### Scenario

Upgrade files are stored on a USB flash drive. After a device is powered on, the device detects the USB flash drive and runs the upgrade command to load the upgrade files. After loading is completed, the device is reset and runs the upgraded version. An example of the upgrade command is as follows:

```
upgrade usb0:/s12k-ppc_11.0(1B2)_20131025_main_install.bin
```

If the file is valid and execution of this command succeeds, the device will be automatically reset and run the upgraded version.

##### Deployment

Use the prefix "usb0:/" to access USB 0. Run the **show usb** command to display information about the USB with the ID 0.

Run the **upgrade** command to perform upgrade.

### 5.3 Features

#### ↳ Using the USB

Insert a USB into the USB slot. The system automatically searches for the USB. After the USB is located, the driver module automatically initializes the driver of the USB. After initialization, the system automatically loads the file system on the USB. Later, the system can read or write this USB.

If the system finds a USB and successfully loads the driver, the following information will be displayed:

```
*Jan 1 00:09:42: %USB-5-USB_DISK_FOUND: USB Disk <Mass Storage> has been inserted to USB port 0!
*Jan 1 00:09:42: %USB-5-USB_DISK_PARTITION_MOUNT: Mount usb0(type:FAT32), size : 1050673152B(1002MB)
```

**i** "Mass Storage" indicates the name of the searched device, and "usb0:" indicates the first USB. "Size" indicates the size of the partition. For example, according to the preceding information displayed, the USB flash drive has a space of 1002 MB.

**i** "Size" indicates the size of the partition.

### 📄 Removing the USB

Use a command line interface (CLI) command to remove the USB first; otherwise, an error may occur if the system is currently using the USB.

If the USB is successfully removed, the following information will be displayed:

```
OK, now you can pull out the device 0.
```

You can remove the USB only after the preceding information is displayed.

## 5.4 Configuration

Configuration	Description and Command
<a href="#">Using a USB</a>	Mandatory.
	N/A
<a href="#">Removing a USB</a>	(Mandatory) It is used to remove a USB.
	<b>usb remove</b>

### 5.4.1 Using a USB

#### Configuration Effect

After a USB is loaded, you can run the file system commands (such as **dir**, **copy**, and **del**) to perform operations on the USB.

#### Notes

The Ruijie General Operating System (RGOS) is applicable only to devices (generally common USB flash drives) that support standard Small Computer System Interface (SCSI) commands. Other devices, such as the USB flash drive

embedded in the USB network interface card (NIC) and USB flash drive with the virtual CD-ROM drive, cannot be used in the RGOS. Some devices are configured with the function of converting a USB port to the serial port.

The USB supports only the FAT file system. Other file systems on the USB must be formatted to the FAT file system on a PC before the USB can be used on a device.

The RGOS supports the hub. When a USB flash drive is inserted to a port on a hub, the access path becomes different. If the USB flash drive is inserted to a USB port on a device, the access path is **usbX:/**, where **X** indicates the device ID. You can run the **show usb** command to display this path. If the USB flash drive is inserted to a USB port through a hub, the access path is **usbX-Y:/**, where **X** indicates the device ID, and **Y** indicates the hub port ID. For example, **usb0-3:/** indicates port 3 on the hub that is connected to USB port 0 on the device.

## Configuration Steps

### ▾ Identifying a USB

A USB can be directly inserted to the USB slot without a CLI operation.

### ▾ Using a USB

Perform the following operations to copy files from a USB to the flash:

Run the **cd** command to enter the partition of the USB.

Run the **copy** command to copy files on the USB to the flash on the device.

Run the **dir** command to check whether the files are copied to the device.

- i** If the USB has multiple partitions, you can access only the first FAT partition on the device.
- i** The path of the USB does not contain any upper-level directory. After running the **cd usbX:\** command to access a USB, you can run the **cd flash:\** command to return to the flash file system.

## Verification

Run the **show usb** command to display information about the USB inserted to the device.

## Configuration Example

### ▾ Using a USB Flash Drive

## 6 Configuring UFT

### 6.1 Overview

The unified forwarding table (UFT) enables the switch to dynamically allocate the hardware forwarding entries..

#### Protocols and Standards

N/A

### 6.2 Applications

Typical Application	Scenario
Dynamic Entry Allocation	When a device operates in common routing mode, the MPLS label is not required for forwarding and the corresponding entry capacity is not used. If the entry capacity of the MPLS label can be used by other entries, such as ARP/ND entries, the device can learn more ARP/ND entries.

#### 6.2.1 Dynamic Entry Allocation

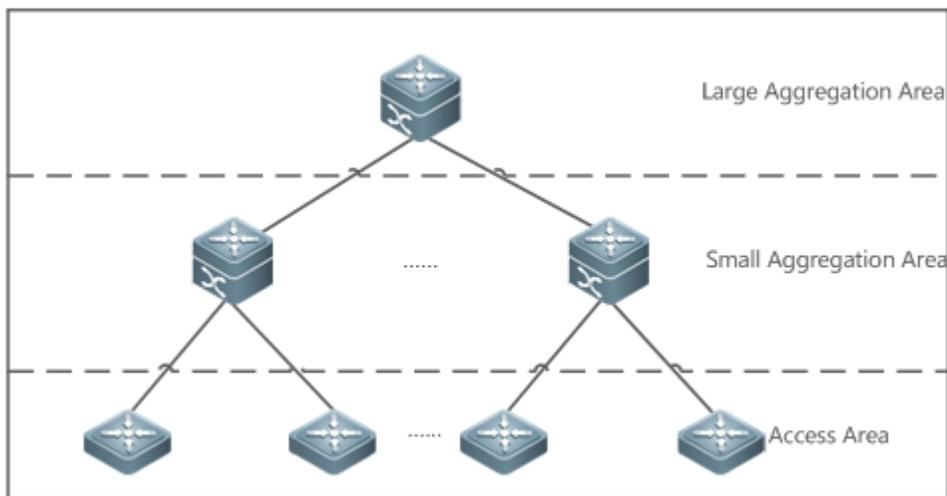

##### Scenario

The following figure shows the simple and common topology of the campus network. The core device may be deployed in the small convergence area as a small convergence device. Layer 2 functions of the core device are mainly enabled. The core device can also be deployed in the large convergence area as a large convergence device. In this case, the core device works as a gateway. When the core device acts as a small convergence device, it requires a large enough size of the MAC address table.

Another application scenario of the core device is acting as a large convergence device, namely, a large gateway. Its access capability depends on the ARP and ND capacity, namely, the number of IPv4 and IPv6 terminals that can be accessed. Take the device installed with Windows7 operating system as an example. Such a device supports IPv4 and IPv6 dual-stack.

When a terminal accesses the device, the terminal occupies one ARP entry and one ND entry. In this application scenario, a great number of ARP and ND entries are required.

Figure 6-1

### Deployment

Enable the switch to operate in Bridge mode of UFT to increase the MAC address table capacity.

Enable the switch to operate in Gateway mode of UFT to increase the ARP and ND entry capacity.

## 6.3 Features

### Basic Concepts

N/A

### Overview

Feature	Function
<a href="#">UFT operating mode</a>	The UFT provides a mechanism for users to select an operating mode to meet the application scenario needs.

### 6.3.1 UFT Operating Mode

#### Working Principle

The UFT provides a mechanism for users to select an operating mode to meet the application scenario needs.

The UFT supports up to eight operating modes. The selected operating mode can take effect after it is saved and the device is restarted.

#### Default

By default, the UFT mode of the switch is Default. In Default mode, each hardware entry of the switch is applied to most of application scenarios.

## ↘ Bridge

The Bridge mode is the Layer 2 forwarding mode. It is applied to the application scenarios in which pure Layer 2 services dominate. In Bridge mode, ARP, ND and MPLS capacity is greatly reduced and most of capacity is allocated to the MAC address table.

## ↘ Gateway

The Gateway mode is classified into three modes: gateway mode, gateway-max mode, and gateway-ndmax mode.

Gateway mode is applied to the application scenarios in which Layer 3 services dominate. Gateway-max mode is applied to the application scenarios in which a large number of terminals are deployed. Gateway-ndmax mode is applied to the application scenarios in which a large number of IPv6 terminals are deployed.

## ↘ Route

The Route mode is the network routing mode. It is applied to the application scenarios in which a great amount of routing and forwarding dominate.

The Route mode is classified into route-v4max and route-v6max modes. In these two modes, the IPv6 and IPv6 network routing table capacity are respectively allocated to maximum extent.

## ↘ Alpm

The alpm mode is applied to the routing scenarios.

## 6.4 Configuration

Configuration Item	Suggestions and Related Commands	
Configuring UFT Operating Mode	Optional configuration. Switch over the current UFT operating mode of the switch.	
	<b>switch-mode</b> <i>mode_type</i> <b>slot</b> <i>slot_num</i>	Switches the UFT operating mode in VSU mode.

### 6.4.1 Configuring UFT Operating Mode

#### Configuration Effect

Configure the Bridge mode to increase the Layer 2 entry size. The Bridge mode is applied to the application scenarios in which Layer 2 services dominate.

Configure the Gateway mode to increase the ARP and ND table size. The Gateway mode is applied to the application scenarios in which Layer3 services dominate.

Configure the Route mode to increase the routing table size. The Route mode is applied to the application scenarios that require a great amount of routing and forwarding.

## Notes

After configuration is complete, save it and restart the device to validate configuration.

Change the UFT mode and save the change. When the device is restarted for the first time after being upgraded, the UFT function may result in automatic restart of the line card once.

## Configuration Method

### Switching the UFT Operating Mode in Stand-Alone Mode

Mandatory configuration.

Use the **switch-mode** *mode\_type* **slot** *slot\_num* command to switch the UFT mode of the switch.

Command Syntax	<b>switch-mode</b> <i>mode_type</i> <b>slot</b> <i>slot_num</i>
Parameter Description	<i>mode_type</i> : UFT operating mode. <i>slot_num</i> : indicates the corresponding line card installed in the chassis.
Defaults	Default mode
Command Mode	Global configuration mode
Usage Guide	In stand-alone mode, the line card can operate in the following modes:  <b>default</b> : Default mode, which is applied to most of application scenarios.  <b>bridge</b> : Bridge mode, which is applied to the application scenarios where pure Layer 2 services dominate.  <b>gateway</b> : Gateway mode, which is applied to the application scenario in which Layer 3 services dominate.  <b>route-v4max</b> : IPv4 routing mode, which is applied to the application scenarios that require a great number of IPv4 routes.  <b>route-v6max</b> : IPv6 routing mode, which is applied to the application scenarios that require a great number of IPv6 routes.  <b>alpm</b> : Alpm mode, which is applied to the routing scenarios.

### Switching the UFT Operating Mode in VSU Mode

Mandatory configuration.

Use the **switch-mode** *mode\_type* **switch** *switch\_num* **slot** *slot\_num* command to switch the UFT mode of the switch.

Command Syntax	<b>switch-mode</b> <i>mode_type</i> <b>switch</b> <i>switch_num</i> <b>slot</b> <i>slot_num</i>
Parameter Description	<i>mode_type</i> : UFT operating mode. <i>switch_num</i> : In stand-alone mode, the <b>switch</b> keyword is invisible. In VSU mode, the <b>switch</b> keyword indicates the chassis or box device. <i>slot_num</i> : indicates the line card installed in the chassis device.
Defaults	Default mode

Command Mode	Global configuration mode
Usage Guide	<p> In VSU mode, the line card can operate in the following modes:</p> <p><b>default:</b> Default mode, which is applied to most of application scenarios.</p> <p><b>bridge:</b> Bridge mode, which is applied to the application scenarios where pure Layer 2 services dominate.</p> <p><b>gateway:</b> Gateway mode, which is applied to the application scenarios in which Layer 3 services dominate.</p> <p><b>route-v4max:</b> IPv4 routing mode, which is applied to the application scenarios that require a great number of IPv4 routes.</p> <p><b>route-v6max:</b> IPv6 routing mode, which is applied to the application scenarios that require a great number of IPv6 routes.</p> <p><b>alpm:</b> Alpm mode, which is applied to the routing scenarios.</p>

## Verification

After the device is restarted, use the **show run** command to display the current line card status and check whether the configuration takes effect.

Use the **show switch-mode status** command to display the UFT mode status.

Command Syntax	<b>show switch-mode status</b>
Parameter Description	N/A
Command Mode	Privileged EXEC mode, global configuration mode, interface configuration mode
Usage Guide	N/A
Configuration Example	<pre>Ruijie(config)#show switch-mode status Slot No          Switch-Mode switch 1 slot 3  bridge</pre>

## Configuration Examples

### Switching UFT Operating Mode in Stand-Alone Mode

Network Environment	N/A
Configuration Method	Switch the UFT operating mode of the line card in slot3 of the switch to Bridge mode.
	<pre>Ruijie(config)#switch-mode bridge slot 3 Please save current config and restart your device! Ruijie(config)#show run</pre>

	<pre> Building configuration... Current configuration : 1366 bytes version 11.0(1B2) ! cwmmp ! install 3 M8600E-24XS4QXS-DB ! sysmac 1414.4b34.5624 ! nfpp ! switch-mode bridge slot 3 </pre>
Check Method	Use the <b>show switch-mode status</b> command to display configuration information.
	<pre> Ruijie(config)#show switch-mode status Slot No          Switch-Mode 3                bridge </pre>

## Common Errors

---

N/A

## Displaying the Running Status

---

Function	Command
Displays UFT operating mode of the switch	<b>show switch-mode status</b>

## Displaying Debugging Information

---

-

-  The preceding monitoring and maintaining commands are also valid to the chassis devices and box devices, in stand-alone mode.
  -  In stand-alone mode, the **switch** keyword is invisible. For the chassis device, **slot** keyword indicates a specified line card.
-

## 7 Configuring ZAM

### 7.1 Overview

Manual deployment of all required devices for go-online on a network consumes a lot of labor and material resources, and has the following problems or defects:

Manual deployment of a massive number of devices for go-online on a network imposes a high technical requirement on deployment personnel. It requires a long period, resulting in high labor and material costs.

Manual deployment of a massive number of devices may cause fatigue, and consequently, may easily cause deployment inconsistency or errors, resulting in network malfunction.

Manual deployment does not support control and unified management, easily causing difference and inconsistency.

It is hard to track an event and network device deployment. The entire deployment process cannot be controlled and easily results in problems or missing.

It is hard to manage device go-online in a unified manner. Online statuses of devices cannot be tracked and thus administrators cannot learn about the online and running statuses of the devices on the network.

Device extensibility is poor. Automatic deployment of extensible devices and even the extensible network is not supported.

To address the preceding problems, Ruijie launches the ZAM solution to enable zero configuration of network devices, support plug-and-play, and realize unified and automatic deployment. The ZAM solution imposes few technical requirement on deployment personnel and helps reduce workload and costs. It avoids inconsistent deployment, supports unified deployment and management, tracks online statuses of devices, and simplifies operation, maintenance, and deployment of a massive number of devices.

#### Protocols and Standards

---

RFC1541: DHCP standard

### 7.2 Application

Application	Description
<a href="#">ZAM Automatic Deployment</a>	Implements unified management on device deployment for go-online.

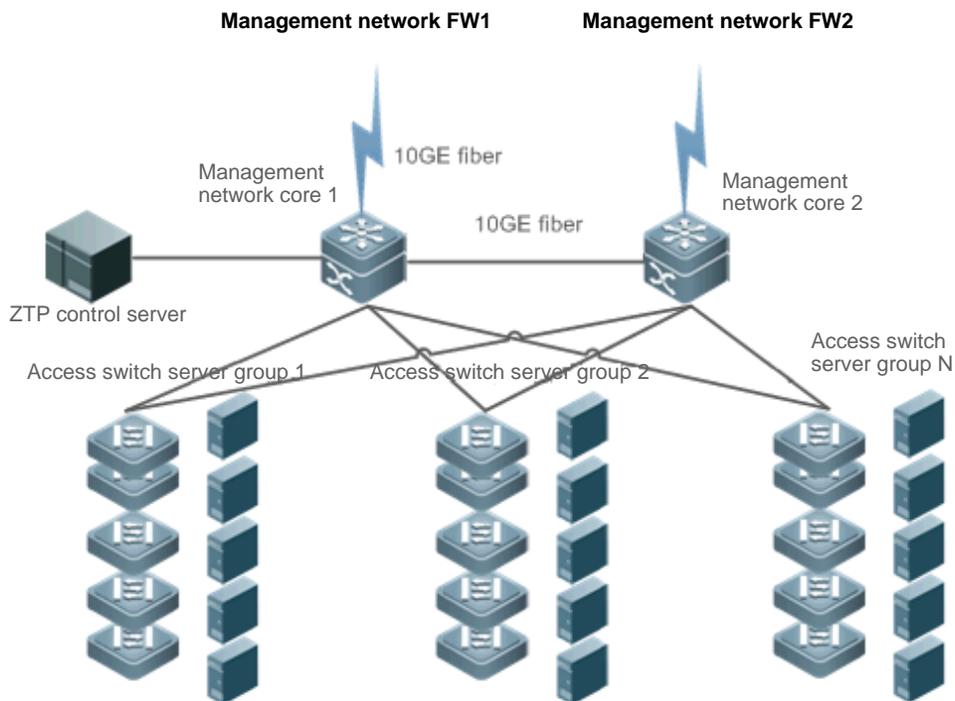

#### 7.2.1 ZAM Automatic Deployment

##### Scenario

---

Figure 7-1 shows the network topology for ZAM solution. On the basis of the original network, a ZAM control server is added. DHCP and TFTP services are deployed on the ZAM server for managing and controlling device deployment in a unified manner for go-online, thus realizing unified management of all the deployed devices.

Figure 7-1

## Deployment

Deploy DHCP and TFTP services on the ZAM control server.

Enable ZAM for access switch server groups 1, 2...N.

## 7.3 Features

### Basic Concepts

#### ↳ ZAM

Zero Automatic Manage

#### ↳ IDC

Internet Data Center

#### ↳ DHCP

Dynamic Host Configuration Protocol

#### ↳ TFTP

Trivial File Transfer Protocol

## Feature

---

Feature	Description
<a href="#">Device Go-online via ZAM</a>	Uses the ZAM solution to enable zero configuration of network devices.

### 7.3.1 Device Go-online via ZAM

The ZAM solution is implemented via three steps.

Step 1: A device without configurations accesses a network. The device applies for a fixed IP address from the ZAM control server via DHCP. The ZAM control server responds to the application by returning an IP address and the response also carries the TFTP server IP address and the configuration file name corresponding to the device. The device automatically applies the IP address, and resolves the TFTP server IP address and the configuration file name carried in the response.

Step 2: The device downloads the corresponding configuration file from the ZAM control server via TFTP (a TFTP server can be independently established).

Step 3: The device loads the configuration file.

The ZAM control server and device requiring go-online must meet the following requirements:

The ZAM control server must:

Be capable of identifying a device requiring go-online, IP address of a specific device, the TFTP server IP address, and configuration file name of this device saved on the TFTP server.

Be capable of allocating IP addresses to a device requiring go-online, that is, be capable of providing the DHCP service to pre-allocate an IP address, a TFTP server IP address, and a configuration file name, and enabling matching between the device and the preceding pre-allocated information.

Provide the TFTP function and support configuration file download and storage if the TFTP function is deployed on the ZAM control server (recommended).

The device requiring go-online must:

Be capable of automatically determining whether to go online via the ZAM solution after being powered on, that is, determining whether to go online without configuration via the ZAM solution.

Be capable of applying to the DHCP server for an IP address, and obtaining the TFTP server IP address and configures file name.

Be capable of downloading the specified configuration scripts from the TFTP server via TFTP.

Be capable of automatically loading the configuration script.

Provide a retry mechanism upon a ZAM deployment failure and provide a ZAM exit mechanism.

## Working Principle

---

Device go-online via ZAM is divided into four stages:

### ↳ Initialization

At this stage, a device without configurations is powered on and accesses a network. After loading is completed, the device automatically pre-deploys the ZAM environment. The pre-deployment requirement is as follows:

Use the MGMT port for ZTP management and retain all default configurations without extra operation.

### ↘ DHCP

After the pre-deployment, the device obtains the ZAM management IP address, TFTP server IP address, configuration file name of the device via DHCP. Requirements are as follows:

On the MGMT port, enable DHCP.

Trigger DHCP to obtain the ZAM management IP address. Add request identifiers of Option 67 (boot file name) and Option 150 (TFTP server IP address) to the requested parameter list.

Resolve and deploy ZAM management IP address. Resolve Option 67 and Option 150 in the response.

### ↘ TFTP

Download the corresponding configuration script according to the configuration file name and TFTP server IP address obtained at the DHCP stage.

After the configuration script is downloaded successfully, execute the configuration script to download the corresponding configuration file or bin file from the TFTP server.

### ↘ Configuration loading

Load the configuration file or bin file obtained at the TFTP stage and restart the device.

## Related Configuration

### ↘ Enabling ZAM

This function is enabled by default.

Run the ZAM command to enable or disable ZAM.

ZAM must be enabled on the device to implement automatic deployment via ZAM.

## 7.4 Configuration

Configuration	Description and Command
<a href="#">Configuring Device Go-online via ZAM</a>	 (Mandatory) It is used to enable ZAM.
	<code>zam</code> Enables ZAM.

### 7.4.1 Configuring Device Go-online via ZAM

#### Configuration Effect

Configure device go-online via ZAM, so that a device without configurations enters the go-online process and implements automatic deployment.

## Notes

Deploy a ZTP control server that supports device go-online via ZAM.

## Configuration Steps

### ↳ Enabling ZAM

Mandatory.

Enable ZAM on each switch, unless otherwise specified.

## Verification

Run the **show zam** command to check whether ZAM is enabled and to check configuration of the MGMT port.

## Related Commands

### ↳ Enabling ZAM

<b>Command</b>	<b>zam</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure ZAM.

## Configuration Example

 The following configuration example describes ZAM-related configuration only.

### ↳ Configuring Device Go-online via ZAM

<b>Scenario</b>	
<b>Configuration Steps</b>	Configure device go-online via ZAM as follows: <ul style="list-style-type: none"> <li>● Enable ZAM.</li> </ul>
<b>Online device via ZAM</b>	A# configure terminal A(config)# zam A(config)# exit
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show zam</b> command to display the current configuration and status of ZAM..</li> </ul>
<b>Ruijie</b>	Ruijie#show zam ZTP state : disable ZTP status : Now is idle

```
ZTP manage interface: Mgmt 0
Ruijie#
```

## Common Errors

The network connection between a device requiring go-online and the ZAM control server is abnormal.

The device requiring go-online is not in the zero-configuration state.

## 7.5 Monitoring

### Displaying

Description	Command
Displays the current configuration and status of ZAM.	<b>show zam</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable the debugging switch immediately after use.

Description	Command
Debugs the ZAM framework event.	<b>debug zam</b>

## 8 Configuring Module Hot Swapping

### 8.1 Overview

Module Hot Swapping is a common maintenance function provided by chassis-based devices.

Module Hot Swapping automates the installation, uninstallation, reset, and information check of hot-swappable modules (management cards, line cards, cross-connect and synchronous timing boards [XCSs], and multi-service cards) after they are inserted into chassis-based devices.

### 8.2 Applications

Application	Description
<a href="#">Resetting Online Modules</a>	During routine maintenance, you can reset an abnormally running module to troubleshoot the fault.
<a href="#">Clearing the Configuration of a Module</a>	During routine maintenance, you can replace the module in a slot with a different type of module.
<a href="#">Clearing the Configuration of a Virtual Switch Unit (VSU) Member Device</a>	During routine maintenance, you can clear the configuration of all modules on a VSU member device and then reconfigure the modules.
<a href="#">Deleting a MAC Address from the Configuration File</a>	During routine maintenance, you can delete the MAC addresses of VSU member devices to perform MAC address reelection.
<a href="#">Modifying a MAC Address in the Configuration File</a>	When you replace a switch with a new one in gateway mode, you can configure the MAC address of the new switch to be the same as that of the replaced switch to retain the MAC address of the bound gateway on downstream devices.

#### 8.2.1 Resetting Online Modules

##### Scenario

During routine maintenance, you can reset an abnormally running module in a slot to troubleshoot the fault.

##### Deployment

Run the **reset module** command on the console to reset a module.

#### 8.2.2 Clearing the Configuration of a Module

##### Scenario

During routine maintenance, you can replace the module in a slot on a chassis-based device with a different type of module without affecting other modules.

## Deployment

---

Perform the following operations in sequence:

1. Remove the module from the target slot.
2. Run the **remove configuration module** command on the device to remove the module configuration.
3. Insert a new module into the slot.

### 8.2.3 Clearing the Configuration of a VSU Member Device

#### Scenario

---

In VSU mode, to meet service change requirements, you need to clear all configurations on a member device and reconfigure the device. You can run the **remove configuration device** command to clear configurations all at once, rather than clear the configuration of individual modules one by one on the member device.

#### Deployment

---

Perform the following operations in sequence:

1. Run the **remove configuration device** command on the target device.
2. Save the configuration.
3. Restart the VSU and check whether the configuration of the device is cleared.

### 8.2.4 Deleting the MAC Address from the Configuration File

#### Scenario

---

In general, the MAC address used by a system is written in the management card or the flash memory of the chassis. In VSU mode, to avoid service interruption due to the change of the MAC address, the system automatically saves the MAC address to the configuration file. After the system restarts, the valid MAC address (if any) in the configuration file is used in preference. The **no sysmac** command can be used to delete the MAC address from the configuration file. Then the MAC address written in the flash memory is used by default.

#### Deployment

---

Perform the following operations in sequence:

1. Run the **no sysmac** command on the target device to delete its MAC address.
2. Save the configuration.
3. Restart the VSU and check whether the MAC address of the device is reelected.

### 8.2.5 Modifying a MAC Address in the Configuration File

#### Scenario

---

In gateway mode (the **auth-mode gateway** command is configured), some peripheral devices are configured with the MAC address of the bound gateway. If the gateway is replaced, you can use the **sysmac** command to configure the MAC address of the new gateway to be the same as that of the replaced gateway to retain the MAC address of the bound gateway on downstream devices. The **sysmac** command is valid only in gateway mode.

## Deployment

Perform the following operations in sequence:

1. Run the **sysmac** command in gateway mode on the target device.
2. Save the configuration.
3. Restart the device and check whether its MAC address is modified.

## 8.3 Features

### Feature

Feature	Description
<a href="#">Automatically Installing the Inserted Module</a>	After a new module is inserted into a chassis-based device, the device's management software will automatically install the module driver.
<a href="#">Resetting Online Modules</a>	Online modules can be reset.

### 8.3.1 Automatically Installing the Inserted Module

You can hot-swap (insert and remove) a module on a device in running state without impact on other modules. After the module is inserted into a slot, the device's management software will automatically install the module driver. The configuration of the removed module is retained for subsequent configuration. If the removed module is inserted again, the module will be automatically started with its configuration effective.

 The module mentioned here can be a management card, a line card, an XCS, or a multi-service card. A management card can only be inserted in a management card slot (M1 or M2). A line card or multi-service card can be inserted in a line card slot. An XCS can only be inserted in an XCS slot.

### Working Principle

After a module is inserted, the device's management software will automatically install the module driver and save the module information (such as the quantity of ports on the module and port type) to the device, which will be used for subsequent configuration. After the module is removed, its information is not cleared by the management software. You can continue to configure the module information. When the module is inserted again, the management software assigns the user's module configuration to the module and make it take effect.

## 8.3.2 Resetting Online Modules

The management software of a device provides the online module reset feature for module software troubleshooting.

 Resetting an online module may interrupt some services on the device.

### Working Principle

After you run the **reset module** command, the device's management software uses a hardware or software interface of the device to restart the software on the target module and restores the hardware chip to the post-power-on state. The software failure of the module will be rectified after the module is reset.

## 8.4 Configuration

 The module Hot Swapping feature is automatically implemented without manual configuration.

Configuration	Description and Command	
<a href="#">Clearing Module and Device Configuration</a>	 (Optional) It is used to clear configuration in global configuration mode. After you run the following commands, you need to save the command configuration so that it can take effect after system restart.	
	<b>remove configuration module</b> <i>[device-id]/slot-num</i>	Clears the configuration of a module.
	<b>remove configuration device</b> <i>device-id</i>	Clears the configuration of a VSU member device.
	<b>no sysmac</b>	Deletes a MAC address from the configuration file.
	<b>sysmac</b>	Modifies a MAC address in the configuration file.

### 8.4.1 Clearing Module and Device Configuration

#### Configuration Effect

Clear the configuration of a module.

Clear the configuration of a VSU member device.

Delete a MAC address from the configuration file.

#### Configuration Steps

##### Clearing the Configuration of a Module

(Optional) Perform this configuration when you need to remove a card from a slot on a device and delete related port configuration.

Command	<b>remove configuration module</b> <i>[device-id]/slot-num</i>

<b>Parameter Description</b>	<i>device-id</i> : Indicates the ID of a chassis (in VSU mode, you must input the ID of the chassis housing the module to be removed. In stand-alone, the input is not required). <i>slot-num</i> : Indicates the number of the slot for the module.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to clear the configuration of a module (or a board not in position).   This command is forbidden for online cards to prevent the anti-loop configuration on online cards from being cleared causing network loops.

### ↘ Clearing the Configuration of a VSU Member Device

(Optional) Perform this configuration when you need to clear the configuration of a VSU member device.

<b>Command</b>	<b>remove configuration device</b> <i>device-id</i>
<b>Parameter Description</b>	<i>device-id</i> : Indicates the ID of a chassis.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to clear the configuration of a VSU member device.

### ↘ Deleting a MAC Address from the Configuration File

(Optional) Perform this configuration when you need to change the MAC address of a system to the reelected MAC address.

In general, the MAC address used by a system is written in the management card or the flash memory of the chassis. In VSU mode, to avoid service interruption due to the change of the MAC address, the system automatically saves the MAC address to the configuration file. After the system restarts, the valid MAC address (if any) in the configuration file is used in preference.

<b>Command</b>	<b>no sysmac</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to delete a MAC address from the configuration file. Then the MAC address written in the flash memory is used by default.

### ↘ Modifying a MAC Address in the Configuration File

(Optional) Perform this configuration when you need to modify the MAC address of a device.

In gateway mode (the **auth-mode gateway** command is configured), some peripheral devices are configured with the MAC address of the bound gateway. If the gateway is replaced, you can use the **sysmac** command to configure the MAC address

of the new gateway to be the same as that of the replaced gateway to retain the MAC address of the bound gateway on downstream devices. The **sysmac** command is valid only in gateway mode.

<b>Command</b>	<b>sysmac</b> <i>mac-address</i>
<b>Parameter</b>	<i>mac-address</i> : Indicates the new MAC address.
<b>Description</b>	
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure the MAC address of a device. To make the MAC address take effect, save the configuration and restart the device.

## Verification

Run the **show version slot** command to display the installation information of a line card.

<b>Command</b>	<b>show version slots</b> [ <i>device-id</i> / <i>slot-num</i> ]
<b>Parameter</b>	<i>device-id</i> : (Optional) Indicates the ID of a chassis (in VSU mode, when you input a slot number, you also need to input the ID of the chassis where the module is located).
<b>Description</b>	<i>slot-num</i> : (Optional) Indicates the number of a slot.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Use this command to display the online state of a module. The <b>Configured Module</b> column shows the information of the installed module. After you run the <b>remove configuration module</b> command, the installation information of the removed module is deleted from this column.
	<pre>Show the module online status information Ruijie# show version slots  Dev  Slot  Port  Configured Module  Online Module  Software Status ----  ----  ----  - 1    1     0     none               none           none 1    2     24    M8606-24SFP/12GT  M8606-24SFP/12GT  none 1    3     2     M8606-2XFP        M8606-2XFP      cannot startup 1    4     24    M8606-24GT/12SFP  M8606-24GT/12SFP  ok 1    M1    0     N/A                M8606-CM        master 1    M2    0     N/A                none             none</pre>

## Configuration Example

### Clearing the Configuration of an Offline Module

<b>Scenario</b>	<ul style="list-style-type: none"> <li>To meet networking change requirements, the port configuration of the card in Slot 1 needs to be</li> </ul>
-----------------	--

	deleted to make the device's configuration file more concise.																																										
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>remove configuration module</b> command to delete the card configuration.</li> </ul>																																										
	<pre>Ruijie(config)# remove configuration module 1</pre>																																										
	<ul style="list-style-type: none"> <li>Run the <b>show version slots</b> command to verify that the card configuration in Slot 1 is cleared.</li> </ul> <pre>Ruijie# show version slots</pre> <table border="1"> <thead> <tr> <th>Dev</th> <th>Slot</th> <th>Port</th> <th>Configured Module</th> <th>Online Module</th> <th>Software Status</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>1</td> <td>0</td> <td>none</td> <td>none</td> <td>none</td> </tr> <tr> <td>1</td> <td>2</td> <td>24</td> <td>M8606-24SFP/12GT</td> <td>M8606-24SFP/12GT</td> <td>none</td> </tr> <tr> <td>1</td> <td>3</td> <td>2</td> <td>M8606-2XFP</td> <td>M8606-2XFP</td> <td>cannot startup</td> </tr> <tr> <td>1</td> <td>4</td> <td>24</td> <td>M8606-24GT/12SFP</td> <td>M8606-24GT/12SFP</td> <td>ok</td> </tr> <tr> <td>1</td> <td>M1</td> <td>0</td> <td>N/A</td> <td>M8606-CM</td> <td>master</td> </tr> <tr> <td>1</td> <td>M2</td> <td>0</td> <td>N/A</td> <td>none</td> <td>none</td> </tr> </tbody> </table>	Dev	Slot	Port	Configured Module	Online Module	Software Status	1	1	0	none	none	none	1	2	24	M8606-24SFP/12GT	M8606-24SFP/12GT	none	1	3	2	M8606-2XFP	M8606-2XFP	cannot startup	1	4	24	M8606-24GT/12SFP	M8606-24GT/12SFP	ok	1	M1	0	N/A	M8606-CM	master	1	M2	0	N/A	none	none

## 8.5 Monitoring

### Clearing

 Running the **reset module** command may interrupt services when the module is reset.

Description	Command
Resets a module	<b>reset module</b> <i>slot-num</i> <b>reset module</b> <i>device-id / slot-num</i> (in VSU mode)

### Displaying

Description	Command
Displays the details of a module.	<b>show version module detail</b> [ <i>slot-num</i> ] <b>show version module detail</b> [ <i>device-id/slot-num</i> ] (in VSU mode)
Displays the online state of a module.	<b>show version slots</b> [ <i>slot-num</i> ] <b>show version slots</b> [ <i>device-id/slot-num</i> ] (in VSU mode)
Displays the current MAC address of a device.	<b>show sysmac</b>
Displays system-level alarm information.	<b>show alarm</b>

## 9 Configuring Supervisor Module Redundancy

### 9.1 Overview

Supervisor module redundancy is a mechanism that adopts real-time backup (also called hot backup) of the service running status of supervisor modules to improve the device availability.

In a network device with the control plane separated from the forwarding plane, the control plane runs on a supervisor module and the forwarding plane runs on cards. The control plane information of the master supervisor module is backed up to the slave supervisor module in real time during device running. When the master supervisor module is shut down as expected (for example, due to software upgrade) or unexpectedly (for example, due to software or hardware exception), the device can automatically and rapidly switch to the slave supervisor module without losing user configuration, thereby ensuring the normal operation of the network. The forwarding plane continues with packet forwarding during switching. The forwarding is not stopped and no topology fluctuation occurs during the restart of the control plane.

The supervisor module redundancy technology provides the following conveniences for network services:

1. Improving the network availability

The supervisor module redundancy technology sustains data forwarding and the status information about user sessions during switching.

2. Preventing neighbors from detecting link flaps

The forwarding plane is not restarted during switching. Therefore, neighbors cannot detect the status change of a link from Down to Up.

3. Preventing route flaps

The forwarding plane sustains forwarding communication during switching, and the control plane rapidly constructs a new forwarding table. The process of replacing the old forwarding table with the new one is unobvious, preventing route flaps.

4. Preventing loss of user sessions

Thanks to real-time status synchronization, user sessions that are created prior to switching are not lost.

### 9.2 Applications

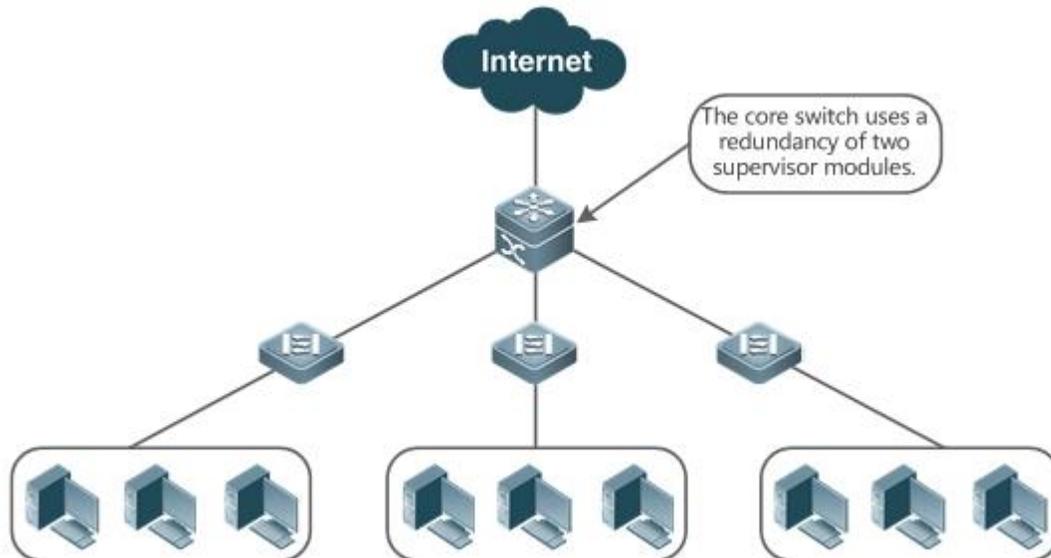

Application	Description
<a href="#">Redundancy of Supervisor Modules</a>	On a core switch where two supervisor modules are installed, the redundancy technology can improve the network stability and system availability.

#### 9.2.1 Redundancy of Supervisor Modules

##### Scenario

As shown in the following figure, in this network topology, if the core switch malfunctions, networks connected to the core switch break down. In order to improve the network stability, two supervisor modules need to be configured on the core switch to implement redundancy. The master supervisor module manages the entire system and the slave supervisor module backs up information about service running status of the master supervisor module in real time. When manual switching is performed or forcible switching is performed due to a failure occurring on the master supervisor module, the slave supervisor module immediately takes over functions of the master supervisor module. The forwarding plane can proceed with data forwarding and the system availability is enhanced.

Figure 9-1

## Deployment

For chassis-type devices, the system is equipped with the master/slave backup mechanism. The system supports plug-and-play as long as master and slave supervisor modules conform to redundancy conditions.

For case-type devices, each device is equivalent to one supervisor module and one line card.

## 9.3 Features

### Basic Concepts

#### Master Supervisor Module, Slave Supervisor Module

On a device where two supervisor modules are installed, the system elects one supervisor module as active, which is called the master supervisor module. The other supervisor module functions as a backup supervisor module. When the master supervisor module malfunctions or actively requests switching, the backup supervisor module takes over the functions of the master supervisor module and becomes the new master supervisor module, which is called the slave supervisor module. In general, the slave supervisor module does not participate in switch management but monitors the running status of the master supervisor module.

### ▾ Prerequisites for Redundancy of Supervisor Modules

In a device system, the hardware and software of all supervisor modules must be compatible so that the redundancy of supervisor modules functions properly.

Batch synchronization is required between the master and slave supervisor modules during startup so that the two supervisor modules are in the same state. The redundancy of supervisor modules is ineffective prior to synchronization.

### ▾ Redundancy Status of Supervisor Modules

The master supervisor module experiences the following status changes during master/slave backup:

alone state: In this state, only one supervisor module is running in the system, or the master/slave switching is not complete, and redundancy is not established between the new master supervisor module and the new slave supervisor module.

batch state: In this state, redundancy is established between the master and slave supervisor modules and batch backup is being performed.

realtime state: The master supervisor module enters this state after the batch backup between the master and slave supervisor modules is complete. Real-time backup is performed between the master and slave supervisor modules, and manual switching can be performed only in this state.

## Overview

Feature	Description
<a href="#">Election of Master and Slave Supervisor Modules</a>	The device can automatically select the master and slave supervisor modules based on the current status of the system. Manual selection is also supported.
<a href="#">Information Synchronization of Supervisor Modules</a>	In the redundancy environment of supervisor modules, the master supervisor module synchronizes status information and configuration files to the slave supervisor module in real time.

## 9.3.1 Election of Master and Slave Supervisor Modules

### Working Principle

#### ▾ Automatically Selecting Master and Slave Supervisor Modules for Chassis-type Devices

Users are allowed to insert or remove supervisor modules during device running. The device, based on the current condition of the system, automatically selects an engine for running, without affecting the normal data switching. The following cases may occur and the master supervisor module is selected accordingly:

If only one supervisor module is inserted during device startup, the device selects this supervisor module as the master supervisor module regardless of whether it is inserted into the M1 slot or M2 slot.

If two supervisor modules are inserted during device startup, by default, the supervisor module in the M1 slot is selected as the master supervisor module and the supervisor module in the M2 slot is selected as the slave supervisor module to serve as a backup, and relevant prompts are output.

If one supervisor module is inserted during device startup and another supervisor module is inserted during device running, the supervisor module that is inserted later is used as the slave supervisor module to serve as a backup regardless of whether it is inserted into the M1 slot or M2 slot, and relevant prompts are output.

Assume that two supervisor modules are inserted during device startup and one supervisor module is removed during device running (or one supervisor module malfunctions). If the removed supervisor module is the slave supervisor module prior to removal (or failure), only a prompt is displayed after removal (or malfunction), indicating that the slave supervisor module is removed (or fails to run). If the removed supervisor module is the master supervisor module prior to removal (or failure), the other supervisor module becomes the master supervisor module and relevant prompts are output.

### ↘ Manually Selecting the Master and Slave Supervisor Modules

Users can manually make configuration to select the master and slave supervisor modules, which are selected based on the environment as follows:

In standalone mode, users can manually perform master/slave switching. The supervisor modules take effect after reset.

## Related Configuration

### ↘ Manually Performing Master/Slave Switching

By default, the device can automatically select the master supervisor module.

In both the standalone mode, users can run the **redundancy forceswitch** command to perform manual switching.

## 9.3.2 Information Synchronization of Supervisor Modules

### Working Principle

#### Status synchronization

The master supervisor module synchronizes its running status to the slave supervisor module in real time so that the slave supervisor module can take over the functions of the master supervisor module at any time, without causing any perceivable changes.

#### Configuration synchronization

There are two system configuration files during device running: running-config and startup-config. running-config is a system configuration file dynamically generated during running and changes with the service configuration. startup-config is a system configuration file imported during device startup. You can run the **write** command to write running-config into startup-config or run the **copy** command to perform the copy operation.

For some functions that are not directly related to non-stop forwarding, the synchronization of system configuration files can ensure consistent user configuration during switching.

In the case of redundancy of dual supervisor modules, the master supervisor module periodically synchronizes the startup-config and running-config files to the slave supervisor module and all candidate supervisor modules. The configuration synchronization is also triggered in the following operations:

1. The running-config file is synchronized when the device switches from the global configuration mode to privileged EXEC mode.

2. The startup-config file is synchronized when the **write** or **copy** command is executed to save the configuration.
3. Information configured over the Simple Network Management Protocol (SNMP) is not automatically synchronized and the synchronization of the running-config file needs to be triggered by running commands on the CLI.

### Related Configuration

By default, the startup-config and running-config files are automatically synchronized once per hour.

Run the **auto-sync time-period** command to adjust the interval for the master supervisor module to synchronize configuration files.

## 9.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Manual Master/Slave Switching</a>	Optional.	
	<b>show redundancy states</b>	Displays the hot backup status.
	<b>redundancy forceswitch</b>	Manually performs master/slave switching.
<a href="#">Configuring the Automatic Synchronization Interval</a>	Optional.	
	<b>redundancy</b>	Enters the redundancy configuration mode.
	<b>auto-sync time-period</b>	Configures the automatic synchronization interval of configuration files in the case of redundancy of dual supervisor modules.
<a href="#">Resetting Supervisor Modules</a>	Optional.	
	<b>redundancy reload</b>	Resets the slave supervisor module or resets both the master and slave supervisor modules at the same time.

### 9.4.1 Configuring Manual Master/Slave Switching

#### Configuration Effect

The original master supervisor module is reset and the slave supervisor module becomes the new master supervisor module.

If there are more than two supervisor modules in the system, the original slave supervisor module becomes the master supervisor module, one supervisor module is elected out of candidate supervisor modules to serve as the new slave supervisor module, and the original master supervisor module becomes a candidate supervisor module after reset.

#### Notes

To ensure that data forwarding is not affected during switching, batch synchronization needs to be first performed between the master and slave supervisor modules so that the two supervisor modules are in the same state. That is, manual switching

can be performed only when the redundancy of supervisor modules is in the real-time backup state. In addition, to ensure synchronization completeness of configuration files, service modules temporarily forbid manual master/slave switching during synchronization. Therefore, the following conditions need to be met simultaneously for manual switching:

Manual master/slave switching is performed on the master supervisor module and a slave supervisor module is available.

All virtual switching devices (VSDs) in the system are in the real-time hot backup state.

The hot-backup switching of all VSDs in the system is not temporarily forbidden by service modules.

If devices are virtualized as multiple VSDs, manual switching can be successfully performed only when the supervisor modules of all the VSDs are in the real-time backup state.

## Configuration Steps

Optional.

Make the configuration on the master supervisor module.

## Verification

Run the **show redundancy states** command to check whether the master and slave supervisor modules are switched.

## Related Commands

### ▾ Checking the Hot Backup Status

<b>Command</b>	<b>show redundancy states</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged EXEC mode or global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Manually Performing Master/Slave Switching

<b>Command</b>	<b>redundancy forceswitch</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ▾ Manually Performing Master/Slave Switching

<b>Configuration Steps</b>	In the VSD environment where the name of one VSD is staff, perform master/slave switching.
----------------------------	--

	<pre>Ruijie&gt; enable  Ruijie# show redundancy states  Redundancy role: master  Redundancy state: realtime  Auto-sync time-period: 3600 s  VSD staff redundancy state: realtime  Ruijie# redundancy forceswitch  This operation will reload the master unit and force switchover to the slave unit. Are you sure to continue? [N/y] y</pre>
<b>Verification</b>	<p>On the original slave supervisor module, run the <b>show redundancy states</b> command to check the redundancy status.</p>
	<pre>Ruijie# show redundancy states  Redundancy role: master  Redundancy state: realtime  Auto-sync time-period: 3600 s  VSD staff redundancy state: realtime</pre>

## 9.4.2 Configuring the Automatic Synchronization Interval

### Configuration Effect

Change the automatic synchronization interval of the startup-config and running-config files. If the automatic synchronization interval is set to a smaller value, changed configuration is frequently synchronized to other supervisor modules, preventing the configuration loss incurred when services and data are forcibly switched to the slave supervisor module when the master supervisor module malfunctions.

### Configuration Steps

Optional. Make the configuration when the synchronization interval needs to be changed.

Make the configuration on the master supervisor module.

### Verification

View the output syslogs to check whether timed synchronization is performed.

### Related Commands

### ↘ Entering the Redundancy Configuration Mode

<b>Command</b>	<b>redundancy</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Automatic Synchronization Interval of Configuration Files

<b>Command</b>	<b>Auto-sync time-period</b> <i>value</i>
<b>Parameter Description</b>	<b>time-period value:</b> Indicates the automatic synchronization interval, with the unit of seconds. The value ranges from 1 second to 1 month (2,678,400 seconds).
<b>Command Mode</b>	Redundancy configuration mode
<b>Usage Guide</b>	Configure the automatic synchronization interval of the startup-config and running-config files in the case of redundancy of dual supervisor modules.

## Configuration Example

### ↘ Configuring the Automatic Synchronization Interval

<b>Configuration Steps</b>	In redundancy configuration mode of the master supervisor module, configure the automatic synchronization interval to 60 seconds.
	<pre>Ruijie(config)# redundancy Ruijie(config-red)# auto-sync time-period 60 Redundancy auto-sync time-period: enabled (60 seconds). Ruijie(config-red)# exit</pre>
<b>Verification</b>	Run the <b>show redundancy states</b> command to check the configuration.
	<pre>Ruijie# show redundancy states Redundancy role: master Redundancy state: realtime Auto-sync time-period: 3600 s</pre>

## 9.4.3 Resetting Supervisor Modules

### Configuration Effect

Resetting only the slave supervisor module does not affect data forwarding, and the forwarding is not interrupted or user session information is not lost during reset of the slave supervisor module.

In standalone mode, running the **redundancy reload shelf** command will cause simultaneous reset of all supervisor modules and line cards in the chassis.

## Notes

### N/A Configuration Steps

Optional. Perform the reset when the supervisor modules or device runs abnormally.

### Related Commands

<b>Command</b>	<b>redundancy reload {peer   shelf [switchid]}</b>
<b>Parameter Description</b>	<b>peer</b> : Only resets the slave supervisor module. <b>shelf [ switchid ]</b> : Indicates that the master and slave supervisor modules are set in standalone mode.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	In standalone mode, the device reset command is <b>redundancy reload shelf</b> , that is, the entire device is reset.

### Configuration Example

## 9.5 N/A Monitoring

### Displaying

Description	Command
Displays the current redundancy status of dual supervisor modules.	<b>show redundancy states</b>

# 10 Configuring Syslog

## 10.1 Overview

Status changes (such as link up and down) or abnormal events may occur anytime. Ruijie products provide the syslog mechanism to automatically generate messages (log packets) in fixed format upon status changes or occurrence of events. These messages are displayed on the related windows such as the Console or monitoring terminal, recorded on media such as the memory buffer or log files, or sent to a group of log servers on the network so that the administrator can analyze network performance and identify faults based on these log packets. Log packets can be added with the timestamps and sequence numbers and classified by severity level so that the administrator can conveniently read and manage log packets.

### Protocols and Standards

RFC3164: The BSD syslog Protocol

## 10.2 Applications

Application	Description
<a href="#">Sending Syslogs to the Console</a>	Monitor syslogs through the Console.
<a href="#">Sending Syslogs to the Log Server</a>	Monitor syslogs through the server.

### 10.2.1 Sending Syslogs to the Console

#### Scenario

Send syslogs to the Console to facilitate the administrator to monitor the performance of the system. The requirements are as follows:

1. Send logs of Level 6 or higher to the Console.
2. Send logs of only the ARP and IP modules to the Console.

Figure 10-1 shows the network topology.

Figure 10-1 Network topology

#### Deployment

Configure the device as follows:

1. Set the level of logs that can be sent to the Console to informational (Level 6).

2. Set the filtering direction of logs to terminal.
3. Set log filtering mode of logs to contains-only.
4. Set the filtering rule of logs to single-match. The module name contains only ARP or IP.

## 10.2.2 Sending Syslogs to the Log Server

### Scenario

Send syslogs to the log server to facilitate the administrator to monitor the logs of devices on the server. The requirements are as follows:

1. Send syslogs to the log server 10.1.1.1.
2. Send logs of Level 7 or higher to the log server.
3. Send syslogs from the source interface Loopback 0 to the log server.

Figure 10-2 shows the network topology.

Figure 10-2 Network topology

### Deployment

Configure the device as follows:

1. Set the IPv4 address of the server to 10.1.1.1.
2. Set the level of logs that can be sent to the log server to debugging (Level 7).
3. Set the source interface of logs sent to the log server to Loopback 0.

## 10.3 Features

### Basic Concepts

#### 📄 Classification of Syslogs

Syslogs can be classified into two types:

- Log type
- Debug type

#### 📄 Levels of Syslogs

Eight severity levels of syslogs are defined in descending order, including emergency, alert, critical, error, warning, notification, informational, and debugging. These levels correspond to eight numerical values from 0 to 7. A smaller value indicates a higher level.

Only logs with a level equaling to or higher than the specified level can be output. For example, if the level of logs is set to informational (Level 6), logs of Level 6 or higher will be output.

The following table describes the log levels.

Level	Numerical Value	Description
emergencies	0	Indicates that the system cannot run normally.
alerts	1	Indicates that the measures must be taken immediately.
critical	2	Indicates a critical condition.
errors	3	Indicates an error.
warnings	4	Indicates a warning.
notifications	5	Indicates a notification message that requires attention.
informational	6	Indicates an informational message.
debugging	7	Indicates a debugging message.

### ↘ Output Direction of Syslogs

Output directions of syslogs include Console, monitor, server, buffer, and file. The default level and type of logs vary with the output direction. You can customize filtering rules for different output directions.

The following table describes output directions of syslogs.

Output Direction	Description	Default Output Level	Description
Console	Console	Debugging (Level 7)	Logs and debugging information are output.
monitor	Monitoring terminal	Debugging (Level 7)	Logs and debugging information are output.
server	Log server	Informational (Level 6)	Logs and debugging information are output.
buffer	Log buffer	Debugging (Level 7)	Logs and debugging information are output. The log buffer is used to store syslogs.
file	Log file	Informational (Level 6)	Logs and debugging information are output. Logs in the log buffer are periodically written into files.

### ↘ RFC3164 Log Format

Formats of syslogs may vary with the syslog output direction.

If the output direction is the Console, monitor, buffer, or file, the syslog format is as follows:

```
seq no: *timestamp: sysname %module-level-mnemonic: content
```

For example, if you exit configuration mode, the following log is displayed on the Console:

```
001233: *May 22 09:44:36: Ruijie %SYS-5-CONFIG_I: Configured from console by console
```

If the output direction is the log server, the syslog format is as follows:

```
<priority>seq no: *timestamp: sysname %module-level-mnemonic: content
```

For example, if you exit configuration mode, the following log is displayed on the log server:

```
<189>001233: *May 22 09:44:36: Ruijie %SYS-5-CONFIG_I: Configured from console by console
```

The following describes each field in the log in details:

### 1. Priority

This field is valid only when logs are sent to the log server.

The priority is calculated using the following formula: Facility x 8 + Level. Level indicates the numerical code of the log level and Facility indicates the numerical code of the facility. The default facility value is local7 (23). The following table lists the value range of the facility.

Numerical Code	Facility Keyword	Facility Description
0	kern	kernel messages
1	user	user-level messages
2	mail	mail system
3	daemon	system daemons
4	auth1	security/authorization messages
5	syslog	messages generated internally by syslogs
6	lpr	line printer subsystem
7	news	network news subsystem
8	uucp	UUCP subsystem
9	clock1	clock daemon
10	auth2	security/authorization messages
11	ftp	FTP daemon
12	ntp	NTP subsystem
13	logaudit	log audit
14	logalert	log alert
15	clock2	clock daemon
16	local0	local use 0 (local0)
17	local1	local use 1 (local1)
18	local2	local use 2 (local2)
19	local3	local use 3 (local3)
20	local4	local use 4 (local4)
21	local5	local use 5 (local5)
22	local6	local use 6 (local6)
23	local7	local use 7 (local7)

### 2. Sequence Number

The sequence number of a syslog is a 6-digit integer, and increases sequentially. By default, the sequence number is not displayed. You can run a command to display or hide this field.

### 3. Timestamp

The timestamp records the time when a syslog is generated so that you can display and check the system event conveniently. Ruijie devices support two syslog timestamp formats: datetime and uptime.

- i** If the device does not have the real time clock (RTC), which is used to record the system absolute time, the device uses its startup time (uptime) as the syslog timestamp by default. If the device has the RTC, the device uses its absolute time (datetime) as the syslog timestamp by default.

The two timestamp formats are described as follows:

#### Datetime format

The datetime format is as follows:

```
Mmm dd yyyy hh:mm:ss.msec
```

The following table describes each parameter of the datetime.

Timestamp Parameter	Parameter Name	Description
Mmm	Month	Mmm refers to abbreviation of the current month. The 12 months in a year are written as Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, and Dec.
dd	Day	dd indicates the current date.
yyyy	Year	yyyy indicates the current year, and is not displayed by default.
hh	Hour	hh indicates the current hour.
mm	Minute	mm indicates the current minute.
ss	Second	ss indicates the current second.
msec	Millisecond	msec indicates the current millisecond.

By default, the datetime timestamp displayed in the syslog does not contain the year and millisecond. You can run a command to display or hide the year and millisecond of the datetime timestamp.

#### Uptime format

The uptime format is as follows:

```
dd:hh:mm:ss
```

The timestamp string indicates the accumulated days, hours, minutes, and seconds since the system is started.

#### 1. Sysname

This field indicates the name of the device that generates the log so that the log server can identify the host that sends the log. By default, this field is not displayed. You can run a command to display or hide this field.

#### 2. Module

This field indicates the name of the module that generates the log. The module name is an upper-case string of 2 to 20 characters, which contain upper-case letters, digits, or underscores. The module field is mandatory in the log-type information, and optional in the debug-type information.

#### 3. Level

Eight syslog levels from 0 to 7 are defined. The level of syslogs generated by each module is fixed and cannot be modified.

#### 4. Mnemonic

This field indicates the brief information about the log. The mnemonic is an upper-case string of 4 to 32 characters, which may include upper-case letters, digits, or underscore. The mnemonic field is mandatory in the log-type information, and optional in the debug-type information.

#### 5. Content

This field indicates the detailed content of the syslog.

## Overview

Feature	Description
<a href="#">Logging</a>	Enable or disable the system logging functions.
<a href="#">Syslog Format</a>	Configure the syslog format.
<a href="#">Logging Direction</a>	Configure the parameters to send syslogs in different directions.
<a href="#">Syslog Filtering</a>	Configure parameters of the syslog filtering function.
<a href="#">Featured Logging</a>	Configure parameters of the featured logging function.
<a href="#">Syslog Monitoring</a>	Configure parameters of the syslog monitoring function.

### 10.3.1 Logging

Enable or disable the logging, log redirection, and log statistics functions.

#### Related Configuration

##### ↘ Enable Logging

By default, logging is enabled.

Run the **logging on** command to enable logging in global configuration mode. After logging is enabled, logs generated by the system are sent in various directions for the administrator to monitor the performance of the system.

##### ↘ Enabling Log Redirection

By default, log redirection is enabled on the Virtual Switching Unit (VSU).

Run the **logging rd on** command to enable log redirection in global configuration mode. After log redirection is enabled, logs generated by the standby device or standby supervisor module are redirected to the active device or active supervisor module on the VSU to facilitate the administrator to manage logs.

##### ↘ Enabling Log Statistics

By default, log statistics is disabled.

Run the **logging count** command to enable log statistics in global configuration mode. After log statistics is enabled, the system records the number of times a log is generated and the last time when the log is generated.

## 10.3.2 Syslog Format

Configure the syslog format, including the timestamp format, sysname, and sequence number.

### [Related Configuration](#)

#### ↘ [Configuring the Timestamp Format](#)

By default, the syslog uses the datetime timestamp format, and the timestamp does not contain the year and millisecond.

Run the **service timestamps** command in global configuration mode to use the datetime timestamp format that contains the year and millisecond in the syslog, or change the datetime format to the uptime format.

#### ↘ [Adding Sysname to the Syslog](#)

By default, the syslog does not contain sysname.

Run the **service sysname** command in global configuration mode to add sysname to the syslog.

#### ↘ [Adding the Sequence Number to the Syslog](#)

By default, the syslog does not contain the sequence number.

Run the **service sequence-numbers** command in global configuration mode to add the sequence number to the syslog.

#### ↘ [Enabling the Standard Log Format](#)

By default, logs are displayed in the following format:

```
*timestamp: %module-level-mnemonic: content
```

Run the **service standard-syslog** command in global configuration mode to enable the standard log format and logs are displayed in the following format:

```
timestamp %module-level-mnemonic: content
```

Compared with the default log format, an asterisk (\*) is missing in front of the timestamp, and a colon (:) is missing at the end of the timestamp in the standard log format.

#### ↘ [Enabling the Private Log Format](#)

By default, logs are displayed in the following format:

```
*timestamp: %module-level-mnemonic: content
```

Run the **service private-syslog** command in global configuration mode to enable the private log format and logs are displayed in the following format:

```
timestamp module-level-mnemonic: content
```

Compared with the default log format, an asterisk (\*) is missing in front of the timestamp, a colon (:) is missing at the end of the timestamp, and a percent sign (%) is missing at the end of the module name in the private log format.

### 10.3.3 Logging Direction

Configure parameters for sending syslog messages in different directions, including the Console, monitor terminal, buffer, the log server, and log files.

#### Related Configuration

##### ↘ Synchronizing User Input with Log Output

By default, this function is disabled.

Run the **logging synchronous** command in line configuration mode to synchronize user input with log output. After this function is enabled, user input will not be interrupted.

##### ↘ Configuring the Log Rate Limit

By default, no log rate limit is configured.

Run the **logging rate-limit** { *number* | **all** *number* | **console** {*number* | **all** *number* } } [ **except** [ *severity* ] ] command in global configuration mode to configure the log rate limit.

##### ↘ Configuring the Log Redirection Rate Limit

By default, a maximum of 200 logs are redirected from the standby device to the active device of VSU per second.

Run the **logging rd rate-limit** *number* [ **except** *severity* ] command in global configuration mode to configure the log redirection rate limit, that is, the maximum number of logs that are redirected from the standby device to the active device or from the standby supervisor module to the active supervisor module per second.

##### ↘ Configuring the Level of Logs Sent to the Console

By default, the level of logs sent to the Console is debugging (Level 7).

Run the **logging console** [ *level* ] command in global configuration mode to configure the level of logs that can be sent to the Console.

##### ↘ Sending Logs to the Monitor Terminal

By default, it is not allowed to send logs to the monitor terminal.

Run the **terminal monitor** command in the privileged EXEC mode to send logs to the monitor terminal.

##### ↘ Configuring the Level of Logs Sent to the Monitor Terminal

By default, the level of logs sent to the monitor terminal is debugging (Level 7).

Run the **logging monitor** [ *level* ] command in global configuration mode to configure the level of logs that can be sent to the monitor terminal.

##### ↘ Writing Logs into the Memory Buffer

By default, logs are written into the memory buffer, and the default level of logs is debugging (Level 7).

Run the **logging buffered** [ *buffer-size* ] [ *level* ] command in global configuration mode to configure parameters for writing logs into the memory buffer, including the buffer size and log level.

### 📄 Sending Logs to the Log Server

By default, logs are not sent to the log server.

Run the **logging server** [ *oob* ] { *ip-address* | **ipv6** *ipv6-address* } [ **via** *mgmt-name* ] [ **udp-port** *port* ] [ **vrf** *vrf-name* ] command in global configuration mode to send logs to a server specified by an IP address.

Run the **logging server** [ *oob* ] *hostname* [ **via** *mgmt-name* ] [ **udp-port** *port* ] [ **vrf** *vrf-name* ] command in global configuration mode to send logs to a server specified by a hostname.

### 📄 Configuring the Level of Logs Sent to the Log Server

By default, the level of logs sent to the log server is informational (Level 6).

Run the **logging trap** [ *level* ] command in global configuration mode to configure the level of logs that can be sent to the log server.

### 📄 Configuring the Facility Value of Logs Sent to the Log Server

Run the **logging facility** *facility-type* command in global configuration mode to configure the facility value of logs sent to the log server.

### 📄 Configuring the Source Address of Logs Sent to the Log Server

By default, the source address of logs sent to the log server is the IP address of the interface sending logs.

Run the **logging source** [ **interface** ] *interface-type interface-number* command to configure the source interface of logs. If this source interface is not configured, or the IP address is not configured for this source interface, the source address of logs is the IP address of the interface sending logs.

Run the **logging source** { **ip** *ip-address* | **ipv6** *ipv6-address* } command to configure the source IP address of logs. If this IP address is not configured on the device, the source address of logs is the IP address of the interface sending logs.

### 📄 Writing Logs into Log Files

By default, logs are not written into log files. After the function of writing logs into log files is enabled, the level of logs written into log files is informational (Level 6) by default.

Run the **logging file** { **flash:filename** | **usb0:filename** | **usb1:filename** } [ *max-file-size* ] [ *level* ] command in global configuration mode to configure parameters for writing logs into log files, including the type of device where the file is stored, file name, file size, and log level.

### 📄 Configuring the Number of Log Files

By default, the number of log files is 16.

Run the **logging file numbers** *numbers* command in global configuration mode to configure the number of log files.

### ↘ Configuring the Interval at Which Logs Are Written into Log Files

By default, logs are written into log files at the interval of 3600s (one hour).

Run the **logging flash interval** *seconds* command in global configuration mode to configure the interval at which logs are written into log files.

### ↘ Configuring the Storage Time of Log Files

By default, the storage time is not configured.

Run the **logging life-time level** *level days* command in global configuration mode to configure the storage time of logs. The administrator can specify different storage days for logs of different levels.

### ↘ Immediately Writing Logs in the Buffer into Log Files

By default, syslog messages are stored in the syslog buffer and then written into log files periodically or when the buffer is full.

Run the **logging flash flush** command in global configuration mode to immediately write logs in the buffer into log files so that you can collect logs conveniently.

## 10.3.4 Syslog Filtering

By default, logs generated by the system are sent in all directions.

### Working Principle

#### ↘ Filtering Direction

Five log filtering directions are defined:

**buffer:** Filters out logs sent to the log buffer, that is, logs displayed by the **show logging** command.

**file:** Filters out logs written into log files.

**server:** Filters out logs sent to the log server.

**terminal:** Filters out logs sent to the Console and monitor terminal (including Telnet and SSH).

The four filtering directions can be used either in combinations to filter out logs sent in various directions, or separately to filter out logs sent in a single direction.

#### ↘ Filtering Mode

Two filtering modes are available:

**contains-only:** Indicates that only logs that contain keywords specified in the filtering rules are output. You may be interested in only a specified type of logs. In this case, you can apply the contains-only mode on the device to display only logs that match filtering rules on the terminal, helping you check whether any event occurs.

**filter-only:** Indicates that logs that contain keywords specified in the filtering rules are filtered out and will not be output. If a module generates too many logs, spamming may occur on the terminal interface. If you do not care about this type of logs, you can apply the filter-only mode and configure related filtering rules to filter out logs that may cause spamming.

The two filtering modes are mutually exclusive, that is, you can configure only one filtering mode at a time.

### Filter Rule

Two filtering rules are available:

**exact-match:** If exact-match is selected, you must select all the three filtering options (module, level, and mnemonic). If you want to filter out a specified log, use the exact-match filtering rule.

**single-match:** If exact-match is selected, you only need to select one of the three filtering options (module, level, and mnemonic). If you want to filter out a specified type of logs, use the single-match filtering rule.

If the same module, level, or mnemonic is configured in both the single-match and exact-match rules, the single-match rule prevails over the exact-match rule.

## Related Configuration

### Configuring the Log Filtering Direction

By default, the log filtering direction is all, that is, logs sent in all directions are filtered.

Run the **logging filter direction** { **all** | **buffer** | **file** | **server** | **terminal** } command in global configuration mode to configure the log filtering direction to filter out logs in the specified directions.

### Configuring the Log Filtering Mode

By default, the log filtering mode is filter-only.

Run the **logging filter type** { **contains-only** | **filter-only** } command in global configuration mode to configure the log filtering mode.

### Configuring the Log Filtering Rule

By default, no log filtering rule is configured on a device, that is, logs are not filtered out.

Run the **logging filter rule exact-match module** *module-name* **mnemonic** *mnemonic-name* **level** *level* command in global configuration mode to configure the exact-match rule.

Run the **logging filter rule single-match** { **level** *level* | **mnemonic** *mnemonic-name* | **module** *module-name* } command in global configuration mode to configure the single-match rule.

## 10.3.5 Syslog Monitoring

After syslog monitoring is enabled, the system monitors the access attempts of users and generates the related logs.

### Working Principle

After logging of login/exit attempts is enabled, the system records the access attempts of users. The log contains user name and source address.

After logging of operations is enabled, the system records changes in device configurations. The log contains user name, source address, and operation.

## Related Configuration

### ↘ Enabling Logging of Login or Exit Attempts

By default, a device does not generate logs when users access or exit the device.

Run the **logging userinfo** command in global configuration mode to enable logging of login/exit attempts. After this function is enabled, the device displays logs when users access the devices through Telnet, SSH, or HTTP so that the administrator can monitor the device connections.

### ↘ Enabling Logging of Operations

By default, a device does not generate logs when users modify device configurations.

Run the **logging userinfo command-log** command in global configuration mode to enable logging of operations. After this function is enabled, the system displays related logs to notify the administrator of configuration changes.

## 10.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Syslog Format</a>	(Optional) It is used to configure the syslog format.	
	<b>service timestamps</b> [ <i>message-type</i> [ <i>uptime</i>   <i>datetime</i> [ <i>msec</i> ] [ <i>year</i> ] ] ]	Configures the timestamp format of syslogs.
	<b>service sysname</b>	Adds the sysname to the syslog.
	<b>service sequence-numbers</b>	Adds the sequence number to the syslog.
	<b>service standard-syslog</b>	Enables the standard syslog format.
	<b>service private-syslog</b>	Enables the private syslog format.
<a href="#">Sending Syslogs to the Console</a>	(Optional) It is used to configure parameters for sending syslogs to the Console.	
	<b>logging on</b>	Enables logging.
	<b>logging count</b>	Enables log statistics.
	<b>logging console</b> [ <i>level</i> ]	Configures the level of logs displayed on the Console.
	<b>logging rate-limit</b> { <i>number</i>   <b>all number</b>   <b>console</b> { <i>number</i>   <b>all number</b> } } [ <b>except</b> [ <i>severity</i> ] ]	Configures the log rate limit.
<a href="#">Sending Syslogs to the Monitor Terminal</a>	(Optional) It is used to configure parameters for sending syslogs to the monitor terminal.	
	<b>terminal monitor</b>	Enables the monitor terminal to display logs.
	<b>logging monitor</b> [ <i>level</i> ]	Configures the level of logs displayed on the monitor terminal.
<a href="#">Writing Syslogs into the</a>	(Optional) It is used to configure parameters for writing syslogs into the memory buffer.	

Configuration	Description and Command	
<a href="#">Memory Buffer</a>	<b>logging buffered</b> [ <i>buffer-size</i> ] [ <i>level</i> ]	Configures parameters for writing syslogs into the memory buffer, including the buffer size and log level.
<a href="#">Sending Syslogs to the Log Server</a>	(Optional) It is used to configure parameters for sending syslogs to the log server.	
	<b>logging server</b> [ <i>oob</i> ] { <i>ip-address</i>   <b>ipv6</b> <i>ipv6-address</i> } [ <b>via</b> <i>mgmt-name</i> ] [ <b>udp-port</b> <i>port</i> ] [ <b>vrf</b> <i>vrf-name</i> ] <b>logging server</b> [ <i>oob</i> ] <i>hostname</i> [ <b>via</b> <i>mgmt-name</i> ] [ <b>udp-port</b> <i>port</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	Sends logs to a specified log server.
	<b>logging trap</b> [ <i>level</i> ]	Configures the level of logs sent to the log server.
	<b>logging facility</b> <i>facility-type</i>	Configures the facility value of logs sent to the log server.
	<b>logging source</b> [ <b>interface</b> ] <i>interface-type</i> <i>interface-number</i> <b>logging source</b> { <b>ip</b> <i>ip-address</i>   <b>ipv6</b> <i>ipv6-address</i> }	Configures the source address of logs sent to the log server.
<a href="#">Writing Syslogs into Log Files</a>	(Optional) It is used to configure parameters for writing syslogs into a file.	
	<b>logging file</b> { <b>flash</b> : <i>filename</i>   <b>usb0</b> : <i>filename</i>   <b>usb1</b> : <i>filename</i> } [ <i>max-file-size</i> ] [ <i>level</i> ]	Configures parameters for writing syslogs into a file, including the file storage type, file name, file size, and log level.
	<b>logging file numbers</b> <i>numbers</i>	Configures the number of files which logs are written into. The default value is 16.
	<b>logging flash interval</b> <i>seconds</i>	Configures the interval at which logs are written into log files. The default value is 3600.
	<b>logging life-time level</b> <i>level</i> <i>days</i>	Configures the storage time of log files.
<a href="#">Configuring Syslog Filtering</a>	(Optional) It is used to enable the syslog filtering function.	
	<b>logging filter direction</b> { <b>all</b>   <b>buffer</b>   <b>file</b>   <b>server</b>   <b>terminal</b> }	Configures the log filtering direction.
	<b>logging filter type</b> { <b>contains-only</b>   <b>filter-only</b> }	Configures the log filtering mode.
	<b>logging filter rule exact-match module</b> <i>module-name</i> <b>mnemonic</b> <i>mnemonic-name</i> <b>level</b> <i>level</i>	Configures the exact-match filtering rule.

Configuration	Description and Command	
	<b>logging filter rule single-match</b> { level <i>level</i>   mnemonic <i>mnemonic-name</i>   module <i>module-name</i> }	Configures the single-match filtering rule.
<a href="#">Configuring Syslog Redirection</a>	(Optional) It is used to enable the log redirection function.	
	<b>logging rd on</b>	Enables the log redirection function.
	<b>logging rd rate-limit</b> <i>number</i> [ <b>except</b> <i>severity</i> ]	Configures the log redirection rate limit.
<a href="#">Configuring Syslog Monitoring</a>	(Optional) It is used to configure parameters of the syslog monitoring function .	
	<b>logging userinfo</b>	Enables logging of login/exit attempts.
	<b>logging userinfo command-log</b>	Enables logging of operations.
<a href="#">Synchronizing User Input with Log Output</a>	(Optional) It is used to synchronize the user input with log output.	
	<b>logging synchronous</b>	Synchronizes user input with log output.

## 10.4.1 Configuring Syslog Format

### Configuration Effect

Configure the format of syslogs.

### Notes

#### ↘ RFC3164 Log Format

If the device does not have the real time clock (RTC), which is used to record the system absolute time, the device uses its startup time (uptime) as the syslog timestamp by default. If the device has the RTC, the device uses its absolute time (datetime) as the syslog timestamp by default.

The log sequence number is a 6-digit integer. Each time a log is generated, the sequence number increases by one. Each time the sequence number increases from 000000 to 1,000,000, or reaches  $2^{32}$ , the sequence number starts from 000000 again.

### Configuration Steps

#### ↘ Configuring the Timestamp Format of Syslogs

(Optional) By default, the datetime timestamp format is used.

Unless otherwise specified, perform this configuration on the device to configure the timestamp format.

#### ↘ Adding the Sysname to the Syslog

(Optional) By default, the syslog does not contain the sysname.

Unless otherwise specified, perform this configuration on the device to add the sysname to the syslog.

### ✚ Adding the Sequence Number to the Syslog

(Optional) By default, the syslog does not contain the sequence number.

Unless otherwise specified, perform this configuration on the device to add the sequence number to the syslog.

### ✚ Enabling the Standard Log Format

(Optional) By default, the default log format is used.

Unless otherwise specified, perform this configuration on the device to enable the standard log format.

### ✚ Enabling the Private Log Format

(Optional) By default, the default log format is used.

Unless otherwise specified, perform this configuration on the device to enable the private log format.

## Verification

Generate a syslog, and check the log format.

## Related Commands

### ✚ Configuring the Timestamp Format of Syslogs

<b>Command</b>	<b>service timestamps</b> [ <i>message-type</i> [ <b>uptime</b>   <b>datetime</b> [ <b>msec</b> ] [ <b>year</b> ] ] ]
<b>Parameter Description</b>	<p><i>message-type</i>: Indicates the log type. There are two log types: log and debug.</p> <p><b>uptime</b>: Indicates the device startup time in the format of dd:hh:mm:ss, for example, 07:00:10:41.</p> <p><b>datetime</b>: Indicates the current device time in the format of MM DD hh:mm:ss, for example, Jul 27 16:53:07.</p> <p><b>msec</b>: Indicates that the current device time contains millisecond.</p> <p><b>year</b>: Indicates that the current device time contains year.</p>
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	Two syslog timestamp formats are available, namely, uptime and datetime. You can select a timestamp format as required.

### ✚ Adding the Sysname to the Syslog

<b>Command</b>	<b>service sysname</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	This command is used to add the sysname to the log to enable you to learn about the device that sends syslogs to the server.

### ✚ Adding the Sequence Number to the Syslog

<b>Command</b>	<b>service sequence-numbers</b>
----------------	---------------------------------

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	This command is used to add the sequence number to the log. The sequence number starts from 1. After the sequence number is added, you can learn clearly whether any log is lost and the generation sequence of logs.

### ↘ Enabling the Standard Syslog Format

<b>Command</b>	<b>service standard-syslog</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>By default, logs are displayed in the following format (default format):</p> <pre>*timestamp: %module-level-mnemonic: content</pre> <p>If the standard syslog format is enabled, logs are displayed in the following format:</p> <pre>timestamp %module-level-mnemonic: content</pre> <p>Compared with the default format, an asterisk (*) is missing in front of the timestamp, and a colon (:) is missing at the end of the timestamp in the standard log format.</p>

### ↘ Enabling the Private Syslog Format

<b>Command</b>	<b>service private-syslog</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>By default, logs are displayed in the following format (default format):</p> <pre>*timestamp: %module-level-mnemonic: content</pre> <p>If the private syslog format is enabled, logs are displayed in the following format:</p> <pre>timestamp module-level-mnemonic: content</pre> <p>Compared with the default format, an asterisk (*) is missing in front of the timestamp, a colon (:) is missing at the end of the timestamp, and a percent sign (%) is missing in front of the module name in the private log format.</p>

## Configuration Example

### ↘ Enabling the RFC3164 Log Format

<b>Scenario</b>	It is required to configure the timestamp format as follows:
-----------------	--

	<ol style="list-style-type: none"> <li>1. Enable the RFC3164 format.</li> <li>2. Change the timestamp format to datetime and add the millisecond and year to the timestamp.</li> <li>3. Add the sysname to the log.</li> <li>4. Add the sequence number to the log.</li> </ol>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the syslog format.</li> </ul>
	<pre>Ruijie# configure terminal  Ruijie(config)# service timestamps log datetime year msec  Ruijie(config)# service timestamps debug datetime year msec  Ruijie(config)# service sysname  Ruijie(config)# service sequence-numbers</pre>
<b>Verification</b>	<p>After the timestamp format is configured, verify that new syslogs are displayed in the RFC3164 format.</p> <ul style="list-style-type: none"> <li>● Run the <b>show logging config</b> command to display the configuration.</li> <li>● Enter or exit global configuration mode to generate a new log, and check the format of the timestamp in the new log.</li> </ul>
	<pre>Ruijie(config)#exit  001302: *Jun 14 2013 19:01:40.293: Ruijie %SYS-5-CONFIG_I: Configured from console by admin on console  Ruijie#show logging config  Syslog logging: enabled    Console logging: level informational, 1306 messages logged    Monitor logging: level informational, 0 messages logged    Buffer logging: level informational, 1306 messages logged    File logging: level informational, 121 messages logged    File name:syslog_test.txt, size 128 Kbytes, have written 5 files    Standard format:false    Timestamp debug messages: datetime    Timestamp log messages: datetime    Sequence-number log messages: enable    Sysname log messages: enable    Count log messages: enable</pre>

```
Trap logging: level informational, 121 message lines logged, 0 fail
```

## 10.4.2 Sending Syslogs to the Console

### Configuration Effect

Send syslogs to the Console to facilitate the administrator to monitor the performance of the system.

### Notes

If too many syslogs are generated, you can limit the log rate to reduce the number of logs displayed on the Console.

### Configuration Steps

#### ↘ Enabling Logging

(Optional) By default, the logging function is enabled.

#### ↘ Enabling Log Statistics

(Optional) By default, log statistics is disabled.

Unless otherwise specified, perform this configuration on the device to enable log statistics.

#### ↘ Configuring the Level of Logs Displayed on the Console

(Optional) By default, the level of logs displayed on the Console is debugging (Level 7).

Unless otherwise specified, perform this configuration on the device to configure the level of logs displayed on the Console.

#### ↘ Configuring the Log Rate Limit

(Optional) By default, the no rate limit is configured.

Unless otherwise specified, perform this configuration on the device to limit the log rate.

### Verification

Run the **show logging config** command to display the level of logs displayed on the Console.

### Related Commands

#### ↘ Enabling Logging

<b>Command</b>	<b>logging on</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, logging is enabled. Do not disable logging in general cases. If too many syslogs are generated, you can configure log levels to reduce the number of logs.

### ▾ Enabling Log Statistics

<b>Command</b>	<b>logging count</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, log statistics is disabled. If log statistics is enabled, syslogs will be classified and counted. The system records the number of times a log is generated and the last time when the log is generated.

### ▾ Configuring the Level of Logs Displayed on the Console

<b>Command</b>	<b>logging console [ level ]</b>
<b>Parameter Description</b>	<i>level</i> : Indicates the log level.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, the level of logs displayed on the Console is debugging (Level 7). You can run the <b>show logging config</b> command in privileged EXEC mode to display the level of logs displayed on the Console.

### ▾ Configuring the Log Rate Limit

<b>Command</b>	<b>logging rate-limit { number   all number   console {number   all number } } [ except [ severity ] ]</b>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of logs processed per second. The value ranges from 1 to 10,000. <b>all</b> : Indicates that rate limit is applied to all logs ranging from Level 0 to Level 7. <b>console</b> : Indicates the number of logs displayed on the Console per second. <b>except severity</b> : Rate limit is not applied to logs with a level equaling to or lower than the specified severity level. By default, the severity level is error (Level 3), that is, rate limit is not applied to logs of Level 3 or lower.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, no rate limit is configured.

## Configuration Example

### ▾ Sending Syslogs to the Console

<b>Scenario</b>	It is required to configure the function of displaying syslogs on the Console as follows: <ol style="list-style-type: none"> <li>1. Enable log statistics.</li> <li>2. Set the level of logs that can be displayed on the Console to informational (Level 6).</li> <li>3. Set the log rate limit to 50.</li> </ol>

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure parameters for displaying syslogs on the Console.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# logging count Ruijie(config)# logging console informational Ruijie(config)# logging rate-limit console 50</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show logging config</b> command to display the configuration.</li> </ul>
	<pre>Ruijie(config)#show logging config Syslog logging: enabled   Console logging: level informational, 1303 messages logged   Monitor logging: level debugging, 0 messages logged   Buffer logging: level debugging, 1303 messages logged   File logging: level informational, 118 messages logged   File name:syslog_test.txt, size 128 Kbytes, have written 5 files   Standard format:false   Timestamp debug messages: datetime   Timestamp log messages: datetime   Sequence-number log messages: enable   Sysname log messages: enable   Count log messages: enable   Trap logging: level informational, 118 message lines logged,0 fail</pre>

### 10.4.3 Sending Syslogs to the Monitor Terminal

#### Configuration Effect

Send syslogs to a remote monitor terminal to facilitate the administrator to monitor the performance of the system.

#### Notes

If too many syslogs are generated, you can limit the log rate to reduce the number of logs displayed on the monitor terminal.

By default, the current monitor terminal is not allowed to display logs after you access the device remotely. You need to manually run the **terminal monitor** command to allow the current monitor terminal to display logs.

#### Configuration Steps

##### ↳ Allowing the Monitor Terminal to Display Logs

(Mandatory) By default, the monitor terminal is not allowed to display logs.

Unless otherwise specified, perform this operation on every monitor terminal connected to the device.

### ✚ Configuring the Level of Logs Displayed on the Monitor Terminal

(Optional) By default, the level of logs displayed on the monitor terminal is debugging (Level 7).

Unless otherwise specified, perform this configuration on the device to configure the level of logs displayed on the monitor terminal.

### Verification

Run the **show logging config** command to display the level of logs displayed on the monitor terminal.

### Related Commands

#### ✚ Allowing the Monitor Terminal to Display Logs

<b>Command</b>	<b>terminal monitor</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode
<b>Configuration Usage</b>	By default, the current monitor terminal is not allowed to display logs after you access the device remotely. You need to manually run the <b>terminal monitor</b> command to allow the current monitor terminal to display logs.

#### ✚ Configuring the Level of Logs Displayed on the Monitor Terminal

<b>Command</b>	<b>logging monitor [ level ]</b>
<b>Parameter Description</b>	<i>level</i> : Indicates the log level.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, the level of logs displayed on the monitor terminal is debugging (Level 7). You can run the <b>show logging config</b> command in privileged EXEC mode to display the level of logs displayed on the monitor terminal.

### Configuration Example

#### ✚ Sending Syslogs to the Monitor Terminal

<b>Scenario</b>	It is required to configure the function of displaying syslog on the monitor terminal as follows: <ol style="list-style-type: none"> <li>1. Display logs on the monitor terminal.</li> <li>2. Set the level of logs that can be displayed on the monitor terminal to informational (Level 6).</li> </ol>

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure parameters for displaying syslogs on the monitor terminal.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# logging monitor informational Ruijie(config)# line vty 0 4 Ruijie(config-line)# monitor</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show logging config</b> command to display the configuration.</li> </ul>
	<pre>Ruijie#show logging config Syslog logging: enabled   Console logging: level informational, 1304 messages logged   Monitor logging: level informational, 0 messages logged   Buffer logging: level debugging, 1304 messages logged   File logging: level informational, 119 messages logged   File name:syslog_test.txt, size 128 Kbytes, have written 5 files   Standard format:false   Timestamp debug messages: datetime   Timestamp log messages: datetime   Sequence-number log messages: enable   Sysname log messages: enable   Count log messages: enable   Trap logging: level informational, 119 message lines logged,0 fail</pre>

## Common Errors

To disable this function, run the **terminal no monitor** command, instead of the **no terminal monitor** command.

## 10.4.4 Writing Syslogs into the Memory Buffer

### Configuration Effect

Write syslogs into the memory buffer so that the administrator can view recent syslogs by running the **show logging** command.

### Notes

If the buffer is full, old logs will be overwritten by new logs that are written into the memory buffer.

## Configuration Steps

### Writing Logs into the Memory Buffer

(Optional) By default, the system writes logs into the memory buffer, and the default level of logs is debugging (Level 7).

Unless otherwise specified, perform this configuration on the device to write logs into the memory buffer.

## Verification

Run the **show logging config** command to display the level of logs written into the memory buffer.

Run the **show logging** command to display the level of logs written into the memory buffer.

## Related Commands

### Writing Logs into the Memory Buffer

<b>Command</b>	<b>logging buffered</b> [ <i>buffer-size</i> ] [ <i>level</i> ]
<b>Parameter</b>	<i>buffer-size</i> : Indicates the size of the memory buffer.
<b>Description</b>	<i>level</i> : Indicates the level of logs that can be written into the memory buffer.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, the level of logs written into the memory buffer is debugging (Level 7). Run the <b>show logging</b> command in privileged EXEC mode to display the level of logs written into the memory buffer and the buffer size.

## Configuration Example

### Writing Syslogs into the Memory Buffer

<b>Scenario</b>	It is required to configure the function of writing syslogs into the memory buffer as follows: <ol style="list-style-type: none"> <li>Set the log buffer size to 128 KB (131,072 bytes).</li> <li>Set the information level of logs that can be written into the memory buffer to informational (Level 6).</li> </ol>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure parameters for writing syslogs into the memory buffer.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# logging buffered 131072 informational</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show logging config</b> command to display the configuration and recent syslogs.</li> </ul> <pre>Ruijie#show logging Syslog logging: enabled Console logging: level informational, 1306 messages logged</pre>

<b>Scenario</b>	It is required to configure the function of writing syslogs into the memory buffer as follows: <ol style="list-style-type: none"> <li>Set the log buffer size to 128 KB (131,072 bytes).</li> <li>Set the information level of logs that can be written into the memory buffer to informational (Level 6).</li> </ol>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure parameters for writing syslogs into the memory buffer.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# logging buffered 131072 informational</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show logging config</b> command to display the configuration and recent syslogs.</li> </ul>
	<pre>Monitor logging: level informational, 0 messages logged Buffer logging: level informational, 1306 messages logged File logging: level informational, 121 messages logged File name:syslog_test.txt, size 128 Kbytes, have written 5 files Standard format:false Timestamp debug messages: datetime Timestamp log messages: datetime Sequence-number log messages: enable Sysname log messages: enable Count log messages: enable Trap logging: level informational, 121 message lines logged,0 fail Log Buffer (Total 131072 Bytes): have written 4200 001301: *Jun 14 2013 19:01:09.488: Ruijie %SYS-5-CONFIG_I: Configured from console by admin on console 001302: *Jun 14 2013 19:01:40.293: Ruijie %SYS-5-CONFIG_I: Configured from console by admin on console //Logs displayed are subject to the actual output of the <b>show logging</b> command.</pre>

## 10.4.5 Sending Syslogs to the Log Server

### Configuration Effect

Send syslogs to the log server to facilitate the administrator to monitor logs on the server.

### Notes

If the device has a MGMT interface and is connected to the log server through the MGMT interface, you must add the **oob** option (indicating that syslogs are sent to the log server through the MGMT interface) when configuring the **logging server** command.

To send logs to the log server, you must add the timestamp and sequence number to logs. Otherwise, the logs are not sent to the log server.

## Configuration Steps

### 📌 Sending Logs to a Specified Log Server

(Mandatory) By default, syslogs are not sent to any log server.

Unless otherwise specified, perform this configuration on every device.

### 📌 Configuring the Level of Logs Sent to the Log Server

(Optional) By default, the level of logs sent to the log server is informational (Level 6).

Unless otherwise specified, perform this configuration on the device to configure the level of logs sent to the log server.

### 📌 Configuring the Facility Value of Logs Sent to the Log Server

Unless otherwise specified, perform this configuration on the device to configure the facility value of logs sent to the log server.

### 📌 Configuring the Source Interface of Logs Sent to the Log Server

(Optional) By default, the source interface of logs sent to the log server is the interface sending the logs.

Unless otherwise specified, perform this configuration on the device to configure the source interface of logs sent to the log server.

### 📌 Configuring the Source Address of Logs Sent to the Log Server

(Optional) By default, the source address of logs sent to the log server is the IP address of the interface sending the logs.

Unless otherwise specified, perform this configuration on the device to configure the source address of logs sent to the log server.

## Verification

Run the **show logging config** command to display the configurations related to the log server.

## Related Commands

### 📌 Sending Logs to a Specified Log Server

<b>Command</b>	<b>logging server</b> [ <b>oob</b> ] { <i>ip-address</i>   <b>ipv6</b> <i>ipv6-address</i> } [ <b>via</b> <i>mgmt-name</i> ] [ <b>udp-port</b> <i>port</i> ] [ <b>vrf</b> <i>vrf-name</i> ] Or <b>logging</b> { <i>ip-address</i>   <b>ipv6</b> <i>ipv6-address</i> } [ <b>udp-prot</b> <i>port</i> ] [ <b>vrf</b> <i>vrf-name</i> ] <b>logging server</b> [ <b>oob</b> ] <i>hostname</i> [ <b>via</b> <i>mgmt-name</i> ] [ <b>udp-prot</b> <i>port</i> ] [ <b>vrf</b> <i>vrf-name</i> ]
<b>Parameter</b>	<b>oob</b> : Indicates that logs are sent to the log server through the MGMT interface.

<b>Description</b>	<p><i>hostname</i>: Specifies the hostname of the host that receives logs.</p> <p><i>ip-address</i>: Specifies the IP address of the host that receives logs.</p> <p><b>ipv6</b> <i>ipv6-address</i>: Specifies the IPv6 address of the host that receives logs.</p> <p><b>via</b> <i>mgmt-name</i>: Specifies the MGMT interface used by the log server when the <b>oob</b> option is included in the command.</p> <p><b>vrf</b> <i>vrf-name</i>: Specifies the VPN routing and forwarding (VRF) instance connected to the log server.</p> <p><b>udp-port</b> <i>port</i>: Specifies the port ID of the log server. The default port ID is 514.</p>
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>This command is used to specify the address of the log server that receives logs. You can specify multiple log servers, and logs will be sent simultaneously to all these log servers.</p> <p>You can specify <b>via</b> only when <b>oob</b> is included in the command. In this case, <b>vrf</b> cannot be used.</p> <p> When you configure the log server by specifying a hostname, the <b>logging hostname</b> command is not supported.</p> <p>You can configure up to five log servers on a Ruijie product.</p>

#### ▾ Configuring the Level of Logs Sent to the Log Server

<b>Command</b>	<b>logging trap</b> [ <i>level</i> ]
<b>Parameter Description</b>	<i>level</i> : Indicates the log level.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>By default, the level of logs sent to the log server is informational (Level 6).</p> <p>You can run the <b>show logging config</b> command in privileged EXEC mode to display the level of logs sent to the log server.</p>

#### ▾ Configuring the Facility Value of Logs Sent to the Log Server

<b>Command</b>	<b>logging facility</b> <i>facility-type</i>
<b>Parameter Description</b>	<i>facility-type</i> : Indicates the facility value of logs.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	N/A

#### ▾ Configuring the Source Interface of Logs Sent to the Log Server

<b>Command</b>	<b>logging source</b> [ <b>interface</b> ] <i>interface-type interface-number</i>
<b>Parameter Description</b>	<p><i>interface-type</i>: Indicates the interface type.</p> <p><i>interface-number</i>: Indicates the interface number.</p>

<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, the source interface of logs sent to the log server is the interface sending the logs. To facilitate management, you can use this command to set the source interface of all logs to an interface so that the administrator can identify the device that sends the logs based on the unique address.

### ▾ Configuring the Source Address of Logs Sent to the Log Server

<b>Command</b>	<b>logging source</b> { <b>ip</b> <i>ip-address</i>   <b>ipv6</b> <i>ipv6-address</i> }
<b>Parameter Description</b>	<b>ip</b> <i>ip-address</i> : Specifies the source IPv4 address of logs sent to the IPv4 log server. <b>ipv6</b> <i>ipv6-address</i> : Specifies the source IPv6 address of logs sent to the IPv6 log server.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, the source IP address of logs sent to the log server is the IP address of the interface sending the logs. To facilitate management, you can use this command to set the source IP address of all logs to the IP address of an interface so that the administrator can identify the device that sends the logs based on the unique address..

## Configuration Example

### ▾ Sending Syslogs to the Log Server

<b>Scenario</b>	It is required to configure the function of sending syslogs to the log server as follows: <ol style="list-style-type: none"> <li>1. Set the IPv4 address of the log server to 10.1.1.100.</li> <li>2. Set the level of logs that can be sent to the log server to debugging (Level 7).</li> <li>3. Set the source interface to Loopback 0.</li> </ol>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure parameters for sending syslogs to the log server.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# logging server 10.1.1.100 Ruijie(config)# logging trap debugging Ruijie(config)# logging source interface Loopback 0</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show logging config</b> command to display the configuration.</li> </ul> <pre>Ruijie#show logging config Syslog logging: enabled   Console logging: level informational, 1307 messages logged   Monitor logging: level informational, 0 messages logged</pre>

<b>Scenario</b>	<p>It is required to configure the function of sending syslogs to the log server as follows:</p> <ol style="list-style-type: none"> <li>1. Set the IPv4 address of the log server to 10.1.1.100.</li> <li>2. Set the level of logs that can be sent to the log server to debugging (Level 7).</li> <li>3. Set the source interface to Loopback 0.</li> </ol>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure parameters for sending syslogs to the log server.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# logging server 10.1.1.100 Ruijie(config)# logging trap debugging Ruijie(config)# logging source interface Loopback 0</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show logging config</b> command to display the configuration.</li> </ul>
	<pre>Buffer logging: level informational, 1307 messages logged File logging: level informational, 122 messages logged File name:syslog_test.txt, size 128 Kbytes, have written 5 files Standard format:false Timestamp debug messages: datetime Timestamp log messages: datetime Sequence-number log messages: enable Sysname log messages: enable Count log messages: enable Trap logging: level debugging, 122 message lines logged,0 fail logging to 10.1.1.100</pre>

## 10.4.6 Writing Syslogs into Log Files

### Configuration Effect

Write syslogs into log files at the specified interval so that the administrator can view history logs anytime on the local device.

### Notes

Syslogs are not immediately written into log files. They are first buffered in the memory buffer, and then written into log files either periodically (at the interval of one hour by default) or when the buffer is full.

### Configuration Steps

#### 📌 Writing Logs into Log Files

(Mandatory) By default, syslogs are not written to any log file.

Unless otherwise specified, perform this configuration on every device.

### ✚ Configuring the Number of Log Files

(Optional) By default, syslogs are written to 16 log files.

Unless otherwise specified, perform this configuration on the device to configure the number of files which logs are written into.

### ✚ Configuring the Interval at Which Logs Are Written into Log Files

(Optional) By default, syslogs are written to log files every hour.

Unless otherwise specified, perform this configuration on the device to configure the interval at which logs are written into log files.

### ✚ Configuring the Storage Time of Log Files

(Optional) By default, no storage time is configured.

Unless otherwise specified, perform this configuration on the device to configure the storage time of log files.

### ✚ Immediately Writing Logs in the Buffer into Log Files

(Optional) By default, syslogs are stored in the buffer and then written into log files periodically or when the buffer is full.

Unless otherwise specified, perform this configuration to write logs in the buffer into log files immediately. This command takes effect only once after it is configured.

## Verification

Run the **show logging config** command to display the configurations related to the log server.

## Related Commands

### ✚ Writing Logs into Log Files

<b>Command</b>	<b>logging file</b> { <b>flash:filename</b>   <b>usb0:filename</b>   <b>usb1:filename</b> } [ <i>max-file-size</i> ] [ <i>level</i> ]
<b>Parameter Description</b>	<p><b>flash:</b> Indicates that log files will be stored on the extended Flash.</p> <p><b>usb0:</b> Indicates that log files will be stored on USB 0. This option is supported only when the device has one USB port and a USB flash drive is inserted into the USB port.</p> <p><b>usb1:</b> Indicates that log files will be stored on USB 1. This option is supported only when the device has two USB ports and USB flash drives are inserted into the USB ports.</p> <p><i>filename:</i> Indicates the log file name, which does not contain a file name extension. The file name extension is always txt.</p> <p><i>max-file-size:</i> Indicates the maximum size of a log file. The value ranges from 128 KB to 6 MB. The default value is 128 KB.</p>

	<i>level</i> : Indicates the level of logs that can be written into a log file.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>This command is used to create a log file with the specified file name on the specified file storage device. The file size increases with the amount of logs, but cannot exceed the configured maximum size. If not specified, the maximum size of a log file is 128 KB by default.</p> <p>After this command is configured, the system saves logs to log files. A log file name does not contain any file name extension. The file name extension is always txt, which cannot be changed.</p> <p>After this command is configured, logs will be written into log files every hour. If you run the <b>logging file flash:syslog</b> command, a total of 16 log files will be created, namely, <b>syslog.txt</b>, <b>syslog_1.txt</b>, <b>syslog_2.txt</b>, ..., <b>syslog_14.txt</b>, and <b>syslog_15.txt</b>. Logs are written into the 16 log files in sequence. For example, the system writes logs into <b>syslog_1.txt</b> after <b>syslog.txt</b> is full. When <b>syslog_15.txt</b> is full, logs are written into <b>syslog.txt</b> again,</p>

### ▾ Configuring the Number of Log Files

<b>Command</b>	<b>logging file numbers</b> <i>numbers</i>
<b>Parameter Description</b>	<i>numbers</i> : Indicates the number of log files. The value ranges from 2 to 32.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>This command is used to configure the number of log files.</p> <p>If the number of log files is modified, the system will not delete the log files that have been generated. Therefore, you need to manually delete the existing log files to save the space of the extended flash. (Before deleting existing log files, you can transfer these log files to an external server through TFTP.) For example, after the function of writing logs into log files is enabled, 16 log files will be created by default. If the device has generated 16 log files and you change the number of log files to 2, new logs will be written into <b>syslog.txt</b> and <b>syslog_1.txt</b> by turns. The existing log files from <b>syslog_2.txt</b> to <b>syslog_15.txt</b> will be preserved. You can manually delete these log files.</p>

### ▾ Configuring the Interval at Which Logs Are Written into Log Files

<b>Command</b>	<b>logging flash interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the interval at which logs are written into log files. The value ranges from 1 s to 51,840s.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	This command is used to configure the interval at which logs are written into log files. The countdown starts after the command is configured.

### ▾ Configuring the Storage Time of Log Files

<b>Command</b>	<b>logging life-time level</b> <i>level days</i>
<b>Parameter</b>	<i>level</i> : Indicates the log level.

<b>Description</b>	<i>days</i> : Indicates the storage time of log files. The unit is day. The storage time is not less than seven days.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>After the log storage time is configured, the system writes logs of the same level that are generated in the same day into the same log file. The log file is named <b>yyyy-mm-dd_filename_level.txt</b>, where <b>yyyy-mm-dd</b> is the absolute time of the day when the logs are generated, <b>filename</b> is the log file named configured by the <b>logging file flash</b> command, and <b>level</b> is the log level.</p> <p>After you specify the storage time for logs of a certain level, the system deletes the logs after the storage time expires. Currently, the storage time ranges from 7days to 365 days.</p> <p>If the log storage time is not configured, logs are stored based on the file size to ensure compatibility with old configuration commands.</p>

### ↳ Immediately Writing Logs in the Buffer into Log Files

<b>Command</b>	<b>logging flash flush</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>After this command is configured, syslog are stored in the buffer and then written into log files periodically or when the buffer is full. You can run this command to immediately write logs into log files.</p> <hr/> <p>The <b>logging flash flush</b> command takes effect once after it is configured. That is, after this command is configured, logs in the buffer are immediately written to log files.</p>

## Configuration Example

### ↳ Writing Syslogs into Log Files

<b>Scenario</b>	<p>It is required to configure the function of writing syslogs into log files as follows:</p> <ol style="list-style-type: none"> <li>1. Set the log file name to syslog.</li> <li>2. Set the level of logs sent to the Console to debugging (Level 7).</li> <li>3. Set the interval at which device logs are written into files to 10 minutes (600s).</li> </ol>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure parameters for writing syslogs into log files.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# logging file flash:syslog debugging Ruijie(config)# logging flash interval 600</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show logging config</b> command to display the configuration.</li> </ul>

<b>Scenario</b>	It is required to configure the function of writing syslogs into log files as follows: <ol style="list-style-type: none"> <li>1. Set the log file name to syslog.</li> <li>2. Set the level of logs sent to the Console to debugging (Level 7).</li> <li>3. Set the interval at which device logs are written into files to 10 minutes (600s).</li> </ol>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure parameters for writing syslogs into log files.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# logging file flash:syslog debugging Ruijie(config)# logging flash interval 600</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show logging config</b> command to display the configuration.</li> </ul> <pre>Ruijie(config)#show logging config Syslog logging: enabled   Trap logging: level debugging, 122 message lines logged,0 fail   logging to 10.1.1.100</pre>

## 10.4.7 Configuring Syslog Filtering

### Configuration Effect

Filter out a specified type of syslogs if the administrator does not want to display these syslogs.

By default, logs generated by all modules are displayed on the Console or other terminals. You can configure log filtering rules to display only desired logs.

### Notes

Two filtering modes are available: contains-only and filter-only. You can configure only one filtering mode at a time.

If the same module, level, or mnemonic is configured in both the single-match and exact-match rules, the single-match rule prevails over the exact-match rule.

### Configuration Steps

#### 📌 Configuring the Log Filtering Direction

(Optional) By default, the filtering direction is all, that is, all logs are filtered out.

Unless otherwise specified, perform this configuration on the device to configure the log filtering direction.

#### 📌 Configuring the Log Filtering Mode

(Optional) By default, the log filtering mode is filter-only.

Unless otherwise specified, perform this configuration on the device to configure the log filtering mode.

### ↘ Configuring the Log Filtering Rule

(Mandatory) By default, no filtering rule is configured.

Unless otherwise specified, perform this configuration on the device to configure the log filtering rule.

### Verification

Run the **show running** command to display the configuration.

### Related Commands

#### ↘ Configuring the Log Filtering Direction

<b>Command</b>	<b>logging filter direction { all   buffer   file   server   terminal }</b>
<b>Parameter</b>	<b>all:</b> Filters out all logs.
<b>Description</b>	<b>buffer:</b> Filters out logs sent to the log buffer, that is, the logs displayed by the <b>show logging</b> command. <b>file:</b> Filters out logs written into log files. <b>server:</b> Filters out logs sent to the log server. <b>terminal:</b> Filters out logs sent to the Console and VTY terminal (including Telnet and SSH).
<b>Command</b> <b>Mode</b>	Global configuration mode
<b>Configuration</b> <b>Usage</b>	The default filtering direction is <b>all</b> , that is, all logs are filtered out. Run the <b>default logging filter direction</b> command to restore the default filtering direction.

#### ↘ Configuring the Log Filtering Mode

<b>Command</b>	<b>logging filter type { contains-only   filter-only }</b>
<b>Parameter</b> <b>Description</b>	<b>contains-only:</b> Indicates that only logs that contain keywords specified in the filtering rules are displayed. <b>filter-only:</b> Indicates that logs that contain keywords specified in the filtering rules are filtered out and will not be displayed.
<b>Command</b> <b>Mode</b>	Global configuration mode
<b>Configuration</b> <b>Usage</b>	Log filtering modes include contains-only and filter-only. The default filtering mode is filter-only.

#### ↘ Configuring the Log Filtering Rule

<b>Command</b>	<b>logging filter rule { exact-match module <i>module-name</i> mnemonic <i>mnemonic-name</i> level <i>level</i>   single-match { level <i>level</i>   mnemonic <i>mnemonic-name</i>   module <i>module-name</i> } }</b>
<b>Parameter</b> <b>Description</b>	<b>exact-match:</b> If exact-match is selected, you must specify all three filtering options. <b>single-match:</b> If single-match is selected, you may specify only one of the three filtering options. <b>module <i>module-name</i>:</b> Indicates the module name. Logs of this module will be filtered out. <b>mnemonic <i>mnemonic-name</i>:</b> Indicates the mnemonic. Logs with this mnemonic will be filtered out. <b>level <i>level</i>:</b> Indicates the log level. Logs of this level will be filtered out.

<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	<p>Log filtering rules include exact-match and single-match.</p> <p>The <b>no logging filter rule exact-match [ module <i>module-name</i> mnemonic <i>mnemonic-name</i> level <i>level</i> ]</b> command is used to delete the exact-match filtering rules. You can delete all exact-match filtering rules at a time or one by one.</p> <p>The <b>no logging filter rule single-match [ level <i>level</i>   mnemonic <i>mnemonic-name</i>   module <i>module-name</i> ]</b> command is used to delete the single-match filtering rules. You can delete all single-match filtering rules at a time or one by one.</p>

## Configuration Example

### Configuring Syslog Filtering

<b>Scenario</b>	<p>It is required to configure the syslog filtering function as follows:</p> <ol style="list-style-type: none"> <li>1. Set the filtering directions of logs to <b>terminal</b> and <b>server</b>.</li> <li>2. Set the log filtering mode to filter-only.</li> <li>3. Set the log filtering rule to single-match to filter out logs that contain the module name "SYS".</li> </ol>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the syslog filtering function.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# logging filter direction server Ruijie(config)# logging filter direction terminal Ruijie(config)# logging filter type filter-only Ruijie(config)# logging filter rule single-match module SYS</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show running-config   include logging</b> command to display the configuration.</li> <li>● Enter and exit global configuration mode, and verify that the system displays logs accordingly.</li> </ul> <pre>Ruijie#configure Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#exit Ruijie# Ruijie#show running-config   include logging logging filter direction server logging filter direction terminal logging filter rule single-match module SYS</pre>

## 10.4.8 Configuring Syslog Redirection

### Configuration Effect

On the VSU, logs on the secondary or standby device are displayed on its Console window, and redirected to the active device for display on the Console or VTY window, or stored in the memory buffer, extended flash, or syslog server.

On a box-type VSU, after the log redirection function is enabled, logs on the secondary or standby device will be redirected to the active device, and the role flag (\*device ID) will be added to each log to indicate that the log is redirected. Assume that four devices form a VSU. The ID of the active device is 1, the ID of the secondary device is 2, and the IDs of two standby devices are 3 and 4. The role flag is not added to logs generated by the active device. The role flag (\*2) is added to logs redirected from the secondary device to the active device. The role flags (\*3) and (\*4) are added respectively to logs redirected from the two standby devices to the active device.

On a card-type VSU, after the log redirection function is enabled, logs on the secondary or standby supervisor module will be redirected to the active supervisor module, and the role flag "(device ID/supervisor module name)" will be added to each log to indicate that the log is redirected. If four supervisor modules form a VSU, the role flags are listed as follows: (\*1/M1), (\*1/M2), (\*2/M1), and (\*2/M2).

### Notes

The syslog redirection function takes effect only on the VSU.

You can limit the rate of logs redirected to the active device to prevent generating a large amount of logs on the secondary or standby device.

### Configuration Steps

#### ▾ Enabling Log Redirection

(Optional) By default, log redirection is enabled on the VSU.

Unless otherwise specified, perform this configuration on the active device of VSU or active supervisor module.

#### ▾ Configuring the Rate Limit

(Optional) By default, a maximum of 200 logs can be redirected from the standby device to the active device of VSU per second.

Unless otherwise specified, perform this configuration on the active device of VSU or active supervisor module.

### Verification

Run the **show running** command to display the configuration.

### Related Commands

#### ▾ Enabling Log Redirection

Command	<b>logging rd on</b>
Parameter	N/A

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, log redirection is enabled on the VSU.

### ▾ Configuring the Rate Limit

<b>Command</b>	<b>logging rd rate-limit</b> <i>number</i> [ <b>except</b> <i>level</i> ]
<b>Parameter Description</b>	<b>rate-limit</b> <i>number</i> : Indicates the maximum number of logs redirected per second. The value ranges from 1 to 10,000. <b>except</b> <i>level</i> : Rate limit is not applied to logs with a level equaling to or lower than the specified severity level. By default, the severity level is error (Level 3), that is, rate limit is not applied to logs of Level 3 or lower.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, a maximum of 200 logs can be redirected from the standby device to the active device of VSU per second.

## Configuration Example

### ▾ Configuring Syslog Redirection

<b>Scenario</b>	It is required to configure the syslog redirection function on the VSU as follows: 1. Enable the log redirection function. 2. Set the maximum number of logs with a level higher than critical (Level 2) that can be redirected per second to 100.
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the syslog redirection function.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# logging rd on Ruijie(config)# logging rd rate-limit 100 except critical</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show running-config   include logging</b> command to display the configuration.</li> <li>Generate a log on the standby device, and verify that the log is redirected to and displayed on the active device.</li> </ul>
	<pre>Ruijie#show running-config   include logging logging rd rate-limit 100 except critical</pre>

## 10.4.9 Configuring Syslog Monitoring

### Configuration Effect

Record login/exit attempts. After logging of login/exit attempts is enabled, the related logs are displayed on the device when users access the device through Telnet or SSH. This helps the administrator monitor the device connections.

Record modification of device configurations. After logging of operations is enabled, the related logs are displayed on the device when users modify the device configurations. This helps the administrator monitor the changes in device configurations.

### Notes

If both the **logging userinfo** command and the **logging userinfo command-log** command are configured on the device, only the configuration result of the **logging userinfo command-log** command is displayed when you run the **show running-config** command.

### Configuration Steps

#### ▾ Enabling Logging of Login/Exit Attempts

(Optional) By default, logging of login/exit attempts is disabled.

Unless otherwise specified, perform this configuration on every line of the device to enable logging of login/exit attempts.

#### ▾ Enabling logging of Operations

(Optional) By default, logging of operations is disabled.

Unless otherwise specified, perform this configuration on every line of the device to enable logging of operations.

### Verification

Run the **show running** command to display the configuration.

### Related Commands

#### ▾ Enabling Logging of Login/Exit Attempts

<b>Command</b>	<b>logging userinfo</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	By default, a device does not generate related logs when users log into or exit the device.

#### ▾ Enabling Logging of Operations

<b>Command</b>	<b>logging userinfo command-log</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	The system generates related logs when users run configuration commands. By default, a device does not generate logs when users modify device configurations.

## Configuration Example

### ▾ Configuring Syslog Monitoring

<b>Scenario</b>	It is required to configure the syslog monitoring function as follows: <ol style="list-style-type: none"> <li>1. Enable logging of login/exit attempts.</li> <li>2. Enable logging of operations.</li> </ol>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the syslog monitoring function.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# logging userinfo Ruijie(config)# logging userinfo command-log</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show running-config   include logging</b> command to display the configuration.</li> <li>● Run a command in global configuration mode, and verify that the system generates a log.</li> </ul> <pre>Ruijie#configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#interface gigabitEthernet 0/0 *Jun 16 15:03:43: %CLI-5-EXEC_CMD: Configured from console by admin command: interface GigabitEthernet 0/0 Ruijie#show running-config   include logging logging userinfo command-log</pre>

## 10.4.10 Synchronizing User Input with Log Output

### Configuration Effect

By default, the user input is not synchronized with the log output. After this function is enabled, the content input during log output is displayed after log output is completed, ensuring integrity and continuity of the input.

### Notes

This command is executed in line configuration mode. You need to configure this command on every line as required.

## Configuration Steps

### ↘ Synchronizing User Input with Log Output

(Optional) By default, the synchronization function is disabled.

Unless otherwise specified, perform this configuration on every line to synchronize user input with log output.

## Verification

Run the **show running** command to display the configuration.

## Related Commands

### ↘ Synchronizing User Input with Log Output

<b>Command</b>	<b>logging synchronous</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Line configuration mode
<b>Configuration Usage</b>	This command is used to synchronize the user input with log output to prevent interrupting the user input.

## Configuration Example

### ↘ Synchronizing User Input with Log Output

<b>Scenario</b>	It is required to synchronize the user input with log output as follows: 1. Enable the synchronization function.
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the synchronization function.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# line console 0 Ruijie(config-line)# logging synchronous</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show running-config   begin line</b> command to display the configuration.</li> </ul> <pre>Ruijie#show running-config   begin line line con 0  logging synchronous  login local</pre> <p>As shown in the following output, when a user types in "vlan", the state of interface 0/1 changes and the</p>

related log is output. After log output is completed, the log module automatically displays the user input "vlan" so that the user can continue typing.

```
Ruijie(config)#vlan
```

```
*Aug 20 10:05:19: %LINK-5-CHANGED: Interface GigabitEthernet 0/1, changed state to up
```

```
*Aug 20 10:05:19: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet 0/1, changed state to up
```

```
Ruijie(config)#vlan
```

## 10.5 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears logs in the memory buffer.	<b>clear logging</b>

### Displaying

Description	Command
Displays log statistics and logs in the memory buffer based on the timestamp from oldest to latest.	<b>show logging</b>
Displays log statistics and logs in the memory buffer based on the timestamp from latest to oldest.	<b>show logging reverse</b>
Displays syslog configurations and statistics.	<b>show logging config</b>
Displays log statistics of each module in the system.	<b>show logging count</b>

# 11 Configuring MONITOR

## 11.1 Overview

Intelligent monitoring is the intelligent hardware management of Ruijie Network devices, including intelligent fan speed adjustment, and intelligent temperature monitoring. The intelligent monitoring performs the following tasks:

Automatic fan speed adjustment based on ambient temperature changes

Real-time temperature monitoring of boards to alert users

By default, the intelligent monitoring function is enabled after the device is powered on. It does not require any manual configuration.

### Protocol Specification

N/A

## 11.2 Features

### Basic Concepts

N/A

### Features

Feature	Function
<a href="#">Intelligent Speed Adjustment of Fans</a>	The rotating speed of fans is automatically adjusted as the temperature changes to address the heat dissipation needs of the system.
<a href="#">Intelligent Temperature Monitoring</a>	The system automatically monitors the temperature. When the temperature exceeds a certain threshold, the system automatically generates an alarm.
<a href="#">Power monitoring</a>	The system automatically monitors the power. When the power is insufficient or cannot be identified, the system automatically generates an alarm.

### 11.2.1 Intelligent Speed Adjustment of Fans

As the ambient temperature rises or drops, the fans automatically raise or reduce their rotating speed to dissipate heat and ensure that the noise is low.

## Working Principle

The system automatically specifies default start rotating speed for the fans according to the current operating mode of the fans. As the ambient temperature rises or drops, the fans automatically raise or reduce their rotating speed to dissipate heat and ensure that the noise is low.

## Verification

- Run the **show fan** command to display working status of all fans.
- Run the **show fan speed command** to display rotating speed.
- Run the **show fan attribute** command to display air flue type.

## 11.2.2 Intelligent Temperature Monitoring

The system automatically monitors the temperature. When the temperature changes, the system automatically notifies users.

## Working Principle

The system monitors the temperature once per minute. When the temperature exceeds a certain threshold, the system takes a certain action. The temperature and action vary with different devices.

## Verification

Run the **show temperature** command to display system temperature.

# 12 Configuring Package Management

## 12.1 Overview

Package management (pkg\_mgmt) is a package management and upgrade module. This module is responsible for installing, upgrading/degrading, querying and maintaining various components of the device, among which upgrade is the main function. Through upgrade, users can install new version of software that is more stable or powerful. Adopting a modular structure, the RGOS system not only supports overall upgrade and subsystem upgrade but also supports separate upgrade of a feature package.

✔ This document is for only version 11.0 and later, excluding those upgraded from earlier versions.

### Protocols and Standards

N/A

## 12.2 Applications

Application	Scenario
<a href="#">Upgrading/Degrading Subsystem</a>	Upgrade subsystem firmware like boot, kernel, and rootfs on the device.
<a href="#">Upgrading/Degrading a Single Feature Package</a>	Upgrade a single feature package on the device.
<a href="#">Installing a Hot Patch Package</a>	Install a hot patch, and repair a certain part of the feature component.
<a href="#">Auto-Sync for Upgrade</a>	Configure the auto sync policy, range and path.

### 12.2.1 Upgrading/Degrading Subsystem

#### Scenario

After the upgrade of a subsystem firmware is complete, all system software on the device is updated, and the overall software is enhanced. Generally, the subsystem firmware of the box-type device is called main package.

The main features of this upgrade mode are as follows: All software on the device is updated after the upgrade is completed; all known software bugs are fixed. It takes a long time to finish upgrade.

#### Deployment

You can store the main package in the root directory of the TFTP server, download the package to the device, and then run an upgrade command to upgrade the package locally. You can also store the main package in a USB flash drive or SD card, connect the USB flash drive to the device, and then run an upgrade command to upgrade the package.

You must store the rack package in a USB flash drive before performing the upgrade because the rack package is too large to be stored in the memory space of the device.

## 12.2.2 Upgrading Subsystem by One-click

### Scenario

---

Upgrade the firmware automatically without interrupting services on a dual-device VSU system. While either in VSU mode or in standalone mode, one single device will restart after this configuration, thus interrupting services.

### Deployment

---

Upgrade or downgrade the subsystem.

## 12.2.3 Upgrading/Degrading a Single Feature Package

### Scenario

---

Device software consists of several components, and each component is an independent feature module. After an independent feature package is upgraded, only the feature bug corresponding to this package is fixed. Besides, this feature is enhanced with the other features unchanged.

The features of this upgrade mode are as follows: Generally, a feature package is small and the upgrade speed is high. After the upgrade is completed, only the corresponding functional module is improved, and other functional modules remain unchanged.

### Deployment

---

You can store this package in the root directory of the TFTP server, download the package to the local device, and then complete the upgrade. You can also store the package in a USB flash drive, connect the USB flash drive to the device, and then complete the upgrade.

## 12.2.4 Installing a Hot Patch Package

### Scenario

---

To fix software bugs without restarting the device, you can install hot patch packages. Hot patch packages are only applicable to fixing a specific software version. Generally, hot patch packages are released to fix the software of a certain version only when the device cannot be started in the user's environment.

The most significant feature of hot patch upgrade is that all bugs can be fixed without device restart after the upgrade is completed.

### Deployment

---

You can store this package in the root directory of the TFTP server, download the package to the local device, and then complete the upgrade. You can also store the package in a USB flash drive or SD card, connect the USB flash drive or SD card to the device, and then complete the upgrade.

---

## 12.2.5 Auto-Sync for Upgrade

### Scenario

Auto-sync upgrade aims to ensure the coordination of multiple modules (line cards and chassis) within a system on a rack-type device or VSU. Specifically, the upgrade firmware is pushed to all target members automatically and the software version of new members is upgraded automatically based on the auto-sync policy.

### Deployment

- Configure the policy for auto-sync upgrade.
- Configure the path of firmware for auto-sync upgrade.

## 12.3 Features

### Basic Concepts

#### ↳ Subsystem

A subsystem exists on a device in the form of images. The subsystems of the RGOS include:

**boot:** After being powered on, the device loads and runs the boot subsystem first. This subsystem is responsible for initializing the device, and loading and running system images.

**kernel:** kernel is the OS core part of the system. This subsystem shields hardware composition of the system and provides applications with abstract running environment.

**rootfs:** rootfs is the collection of applications in the system.

#### ↳ Main Package

Main package is often used to upgrade/degrade a subsystem of the box-type device. The main package is a combination package of the boot, kernel, and rootfs subsystems. The main package can be used for overall system upgrade/degradation.

#### ↳ Feature Package of RGOS

The feature package of RGOS refers to a collection which enables a certain feature. When the device is delivered, all supported functions are contained in the rootfs subsystem. You can upgrade only a specific feature by upgrading a single feature package.

#### ↳ Hot Patch Package

A hot patch package contains the hot patches of several features. You can upgrade a hot patch package to install patches for various features. New features are provided immediately without device restart after the upgrade.

**i** "Firmware" in this document refers to an installation file that contains a subsystem or feature module.

### Overview

Feature	Description
---------	-------------

<a href="#">Upgrading/Degrading and Managing Subsystem Components</a>	Upgrades/degrades a subsystem.
Upgrading/Degrading and Managing Functional Components	Upgrades/degrades a functional component.
Upgrading/Degrading and Managing Hot Patch Packages	Installs a hot patch package.
Auto-Sync for Upgrade	Ensures uniform upgrade upon member change.

### 12.3.1 Upgrading/Degrading and Managing Subsystem Components

Subsystem upgrade/degradation aims to upgrade the software by replacing the subsystem components of the device with the subsystem components in the firmware. The subsystem component contains redundancy design. Subsystems of the device are not directly replaced with the subsystems in the package during upgrade/degradation in most cases. Instead, subsystems are added to the device and then activated during upgrade/degradation.

#### Working Principle

##### ↘ Upgrade/Degradation

Various subsystems exist on the device in different forms. Therefore, upgrade/degradation varies with different subsystems.

boot: Generally, this subsystem exists on the norflash device in the form of images. Therefore, upgrading/degrading this subsystem is to write the image into the norflash device.

kernel: This subsystem exists in a specific partition in the form of files. Therefore, upgrading/degrading this subsystem is to write the file.

rootfs: Generally, this subsystem exists on the nandflash device in the form of images. Therefore, upgrading/degrading this subsystem is to write the image into the nandflash device.

##### ↘ Management

Query the subsystem components that are available currently and then load subsystem components as required.

Each subsystem component contains redundancy design. During the upgrade/degradation:

boot: The boot subsystem always contains a master boot subsystem and a slave boot subsystem. Only the master boot subsystem is involved in the upgrade, and the slave boot subsystem serves as the redundancy backup all along.

kernel: as the kernel subsystem contains at least one redundancy backup. More redundancy backups are allowed if there is enough space.

rootfs: The rootfs subsystem always contains a redundancy backup.

The boot component is not included in the scope of subsystem management due to its particularity. During upgrade of the kernel or rootfs subsystem component, the upgrade/degradation module always records the subsystem component in use, the redundant subsystem component, and management information about various versions.

### Relevant Configuration

#### ↳ Upgrade

Store the upgrade file on the local device, and then run the **upgrade** command for upgrade.

## 12.3.2 Upgrading/Degrading and Managing Functional Components

### Working Principle

In fact, upgrading a feature is replacing feature files on the device with the feature files in the package.

Managing feature components and hot patches is aimed at recording the information of feature components and hot patches by using a database. In fact, installing, displaying and uninstalling a component is the result of performing the Add, Query and Delete operation on the database.

After package upgrade, component upgrade cannot be performed.

### Relevant Configuration

#### ↳ Upgrade

Store the upgrade file on the local device, and then run the **upgrade** command for upgrade.

## 12.3.3 Upgrading/Degrading and Managing Hot Patch Packages

### Working Principle

In fact, upgrading a feature component is replacing feature files on the device with the feature files in the package.

Upgrading hot patch packages is similar to upgrading features. The difference is that only files to be revised are replaced during hot patch package upgrade. In addition, after the files are replaced, the new files take effect automatically.

After package upgrade, component upgrade cannot be performed.

#### ↳ Management

Similar to feature component management, hot patch management also includes the query, installation, and uninstallation operation, which is the result of adding, querying and deleting data respectively.

Hot patches and feature components are managed based on the same technology. The difference is that the hot patches involve three different states, that is, Not installed, Installed, and Activated. These states are described as follows:

The hot patch in Installed state only indicates that this hot patch exists on the device, but it has not taken effect yet.

Only the hot patch in Activated state is valid.

## Relevant Configuration

---

### ↘ Upgrade

Store the upgrade file in the local file system, and then run the **upgrade** command for upgrade.

### ↘ Activating a Hot Patch

You can run the **patch active** command to activate a patch temporarily. The patch becomes invalid after device restart. To use this patch after device restart, you need to activate it again.

You can also run the **patch running** command to activate a patch already permanently. The patch is still valid after device start.

The patch not activated will never become valid.

### ↘ Deactivating a Hot Patch

To deactivate an activated patch, run the **patch deactivate** command.

### ↘ Uninstalling a Hot Patch

You can run the **patch delete** command to uninstall a hot patch.

## 12.3.4 Auto-Sync for Upgrade

### Working Principle

---

Auto-sync upgrade aims to ensure the coordination of multiple modules (line cards and chassis) within a system. Specifically, the upgrade firmware is pushed to all target members automatically and the software version of new members is upgraded automatically based on the auto-sync policy.

There are three policies available.

None: No auto-sync upgrade.

Compatible: Performs auto-synchronization based on the sequential order of versions.

Coordinate: Synchronizes with the version based on the firmware stored on the supervisor module.

Auto-sync is performed in the following scenarios:

If no upgrade target is specified, the firmware is pushed to all matching members (including line cards and chassis) for auto-sync.

Every member is checked when the device is restarted and auto-sync is performed accordingly.

Every new member is checked when added into the system and auto-sync is performed accordingly.

### ↘ Management

Auto-upgrade policy, range and path should be configured in advance.

## Relevant Configuration

---

### ↘ Configuring Auto-Sync Policy

To perform upgrade as expected, check the configuration in advance, such as the path.

If some line cards are not checked for upgrade because the system is not configured with auto-sync policy . You can upgrade them manually.

## 12.4 Configuration

Configuration	Description and Command	
<a href="#">Upgrading/Degrading a Firmware</a>	 The basic function of the configuration is installing and upgrading/degrading a subsystem firmware, feature package, and hot patch package. This command is valid on both the box-type device and rack-type device.	
	<b>upgrade</b> <i>url</i> [ <b>patch-active</b>   <b>patch-running</b> ] [ <i>force</i> ]	<i>url</i> is a local path where the firmware is stored. This command is used to upgrade the firmware stored on the device.
	<b>upgrade download tftp://</b> <i>path</i> [ <b>patch-active</b>   <b>patch-running</b> ] [ <i>force</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	<i>path</i> is the path of the firmware on the server. This command is used to download a firmware from the server and upgrade the package automatically.
	<b>upgrade download oob_tftp://</b> <i>path</i> [ <b>patch-active</b>   <b>patch-running</b> ] [ <i>force</i> ]	<i>path</i> is the path of the firmware on the server.  <b>via mgmt number:</b> If the transfer mode is <i>oob_tftp</i> and there are multiple MGMT ports, you can select a specific port. This command is used to download a firmware from the server and upgrade the package automatically.
	<b>patch active</b> <b>patch running</b>	Activates a patch temporarily. Activates a patch permanently,
<a href="#">Deactivating and Uninstalling a Hot Patch</a>	 (Optional) Deactivates or uninstalls a hot patch.	
	<b>upgrade deactivate</b>	Deactivates an activated patch.
	<b>patch delete</b>	Uninstalls a hot patch.
<a href="#">Auto-Sync for Upgrade</a>	 (Optional) Configures auto-sync policy.	
	<b>upgrade auto-sync policy</b> [ <b>compatible</b>   <b>coordinate</b> ]	Configures the auto-sync policy.
	<b>upgrade auto-sync range</b> [ <b>chassis</b> ]	Configures the auto-sync range.
	<b>upgrade auto-sync package</b> <i>url</i> <b>upgrade auto-sync patch</b> <i>url</i>	Configures the auto-sync package path. Configures the auto-sync patch path.

## 12.4.1 Upgrading/Degrading a Firmware

### Configuration Effect

Available firmwares include the main package.

After the upgrade of the main package is complete, all system software on the line card is updated, and the overall software is enhanced.

After an independent feature package is upgraded, only the feature bug corresponding to this package is fixed. Besides, this feature is enhanced, with other features remain unchanged.

Upgrading hot patch packages is aimed at fixing software bugs without restarting the device. Hot patch packages are only applicable to fixing bugs for a specific version of software.

- 
- ✔ Generally a main package is released to upgrade a box-type device.
- 

### Notes

N/A

### Configuration Steps

#### ↳ **Upgrading the Main Package for a Single Device**

Optional configuration. This configuration is required when all system software on the device needs to be upgraded.

Download the firmware to the local device and run the **upgrade** command.

- 
- ✔ Generally a main package is pushed to upgrade a box-type device.
- 

#### ↳ **Upgrading a Main Package on a VSU**

- Optional configuration. This configuration is required when all system software on a VSU needs to be upgraded without service interruption.
- Download the firmware to the local device and run the **upgrade auto** command.
- If one-click upgrade times out, please reset the device manually.

- 
- ✔ Generally a rack package is pushed to upgrade a rack-type device.
- 

#### ↳ **Upgrading Each Feature Package**

- Optional configuration. The configuration is used to fix bugs of a certain feature and enhance the function of this feature.

Download the firmware to the local device and run the **upgrade** command.

#### ↳ **Upgrading a Hot Patch Package**

- Optional configuration. The configuration is used to fix software bugs without restarting the device.
-

- Download the firmware to the local device and run the **upgrade** command.

After being upgraded, the hot patch can be used after it is activated. The configuration in this step is mandatory. Two activation modes are available: Run the **patch active** command to activate a patch temporarily, or run the **patch running** command to activate a patch permanently.

 Generally, the **patch running** command must be used to activate a patch permanently in the user scenario. The **patch active** command can be used to activate a patch only when a user intends to verify the patch.

## Verification

After upgrading a subsystem component, you can run the **show upgrade history** command to check whether the upgrade is successful.

After upgrading a feature component, you can run the **show component** command to check whether the upgrade is successful.

After upgrading a hot patch package, you can run the **show patch** command to check whether the upgrade is successful.

## Commands

### Upgrade

<b>Command</b>	<b>upgrade</b> <i>url</i> [ <b>patch-active</b>   <b>patch-running</b> ] [ <b>force</b> ]
<b>Parameter Description</b>	<b>force</b> : Indicates forced upgrade. <b>patch-active</b> : Activates a patch temporarily. <b>patch-running</b> : Activates a patch permanently.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

<b>Command</b>	<b>upgrade download</b> <i>tftp:/path</i> [ <b>patch-active</b>   <b>patch-running</b> ] [ <b>force</b> ] <b>upgrade download oob_tftp:/path</b> [ <b>patch-active</b>   <b>patch-running</b> ] [ <b>force</b> ]
<b>Parameter Description</b>	<i>url</i> indicates the path of the firmware in the device file system. <b>force</b> : Indicates forced upgrade. <b>patch-active</b> : Activates a patch temporarily. <b>patch-running</b> : Activates a patch permanently.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

### Displaying the Firmware Stored on the Device

<b>Command</b>	<b>show upgrade file</b> <i>url</i>
<b>Parameter Description</b>	<i>url</i> indicates the path of the firmware in the device file system.

<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

### ↘ Displaying the Device Upgrade Process

<b>Command</b>	<b>show upgrade status</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

### ↘ Displaying Upgrade History

<b>Command</b>	<b>show upgrade history</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

### ↘ Displaying the Feature Components Already Installed

<b>Command</b>	<b>show component [ slot { num   M1   M2   all } ]</b>
<b>Parameter Description</b>	<b>slot</b> indicates that this command is executed on the device in the specified slot; <i>num</i> indicates the slot number of the specified line card; <b>M1</b> and <b>M2</b> indicate the supervisor modules; <b>all</b> indicates all devices.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

### ↘ Displaying the Patch Packages Already Installed

<b>Command</b>	<b>show patch [ package_name ]</b>
<b>Parameter Description</b>	<b>slot</b> indicates that this command is executed on the device in the specified slot; <i>num</i> indicates the slot number of the specified line card; <b>M1</b> and <b>M2</b> indicate the supervisor modules; <b>all</b> indicates all devices.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	All parameters are applicable to only the rack-type device.

### ↘ Activating the Patches Temporarily

<b>Command</b>	<b>patch active</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	This operation can be performed only on the device already installed with a patch. This command can be used to activate a patch temporarily, and the activated patch becomes invalid after device restart.

### ↘ Activating the Patches Permanently

<b>Command</b>	<b>patch running</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	This operation can be performed only on the device already installed with a patch. This command can be used to activate a patch permanently.

## Configuration Example

### ↘ Example of Upgrading a Subsystem Firmware on the Box-Type Device

<b>Network Environment</b>	<p>Before the upgrade, you must copy the firmware to the device. The upgrade module provides the following solutions.</p> <ul style="list-style-type: none"> <li>● Run some file system commands like <b>copy tftp</b> and <b>copy xmodem</b> to copy the firmware on the server to the device file system, and then run the <b>upgrade url</b> command to upgrade the firmware in the local file system.</li> <li>● Run the <b>upgrade download tftp://path</b> command directly to upgrade the firmware file stored on the tftp server.</li> <li>● Copy the firmware to a USB flash drive, insert the USB flash drive to the device, and then run the <b>upgrade url</b> command to upgrade the firmware in the USB flash drive or SD card.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Run the upgrade command.</li> <li>● After upgrading the subsystem, restart the device.</li> </ul>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the system version on the current device. If the version information changes, the upgrade is successful.</li> </ul>

### ↘ Example of Upgrading a Feature Package on the Box-Type Device

<b>Network Environment</b>	<p>Before the upgrade, you must copy the firmware to the device. The upgrade module provides the following solutions.</p> <p>Run some file system commands like <b>copy tftp</b> and <b>copy xmodem</b> to copy the firmware on the server to the device file system, and then run the <b>upgrade url</b> command to upgrade the firmware in the local file system.</p> <p>Run the <b>upgrade download tftp://path</b> command directly to upgrade the firmware file stored on the tftp server.</p> <p>Copy the firmware to a USB flash drive or SD card, connect the USB flash drive or SD card to the device, and then run the <b>upgrade url</b> command to upgrade the firmware in the USB flash drive or SD card.</p>
<b>Configuration Steps</b>	<p>Run the <b>upgrade</b> command.</p> <p>Check whether the device needs to be restarted based on the prompt displayed after the upgrade.</p>
	<pre>Ruijie#upgrade sata0://bridge_eg1000m_2.3.1.1252ea-1.mips.rpm Upgrade processing is 10% Upgrade processing is 60% Upgrade processing is 90%  Upgrade info [OK]       bridge version[2.0.1.37cd5cda -&gt;2.3.1.1252ea] [OK] Upgrade processing is 100% Reload system to take effect! Reload system?(Y/N)y Restarting system.</pre>
<b>Verification</b>	<p>Check the version of the feature component on the current device. If the version information changes, the upgrade is successful.</p>
	<pre>Ruijie# show component Package  :sysmonit   Version:1.0.1.23cd34aa      Build time: Wed Dec 7 00:58:56 2011   Size:12877   Install time :Wed Mar 5 14:23:12 2012   Description:this is a system monit package   Required packages: None  ----- package:bridge   Version: 2.3.1.1252ea      Build time: Wed Dec 7 00:54:56 2011   Size:26945   Install time : Wed Mar 19:23:15 2012   Description:this is a bridge package   Required packages: None</pre>

### ↘ Example of Upgrading a Main Package for a VSU

<b>Network Environment</b>	<p>Before the upgrade, you must copy the firmware to the device. The upgrade module provides the following solutions.</p> <p>Run some file system commands like <b>copy tftp</b> and <b>copy xmodem</b> to copy the firmware on the server to the device file system, and then run the <b>upgrade auto url</b> command to upgrade the firmware in the local file system.</p> <p>Copy the firmware to a USB flash drive or SD card, Insert the USB flash drive or SD card to the device, and then run the <b>upgrade auto url</b> command to upgrade the firmware in the USB flash drive or SD card.</p>
<b>Configuration Steps</b>	<p>Run the <b>upgrade auto</b> command.</p> <p>The VSU active and standby devices are restarted in sequence.</p>

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the hot patches installed on the current device.</li> </ul>
	<pre> :patch package patch_install installed in the system, version:pal Package : patch_bridge Status : running Version: pal      Build time: Mon May 13 09:03:07 2013   Size: 277      Install time: Tue May 21 03:07:17 2013 Description: a patch for bridge Required packages: None                     </pre>

### Common Errors

If an error occurs during the upgrade, the upgrade module displays an error message. The following provides an example:

```

Upgrade info [ERR]
  Reason:creat config file err(217)
                    
```

The following describes several types of common error messages:

**Invalid firmware:** The cause is that the firmware may be damaged or incorrect. It is recommended to obtain the firmware again and perform the upgrade operation.

**Firmware not supported by the device:** The cause is that you may use the firmware of other devices by mistake. It is recommended to obtain the firmware again, verify the package, and perform the upgrade operation.

**Insufficient device space:** It is recommended to check whether the device is supplied with a USB flash drive or SD card. Generally, this device has a USB flash drive.

## 12.4.2 Deactivating and Uninstalling a Hot Patch

### Configuration Effect

An activated hot patch is deactivated or uninstalled.

### Notes

A hot patch that is not activated does not take effect; therefore, you cannot deactivate it.

### Configuration Steps

#### ↘ Deactivating an Activated Patch

Optional configuration. To deactivate an activated patch, run the **patch deactivate** command.

#### ↘ Uninstalling a Hot Patch

- Optional configuration. To uninstall a hot patch already installed, run the **patch delete** command.

### Verification

You can run the **show patch** command to check whether a patch is activated or uninstalled.

### Commands

#### ↘ Deactivating an Activated Patch

<b>Command</b>	<b>patch deactivate</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	You can perform this operation on only an activated patch.

#### ↘ Deleting a Hot Patch

<b>Command</b>	<b>patch delete</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	This command is used to remove the hot patch package from the device.

### Configuration Example

---

### ▾ Deactivating and Uninstalling a Patch on the Box Device

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Run the patch deactivation command.</li> <li>● Run the patch deletion command.</li> </ul>
	<pre>Ruijie#patch deactivate Deactivate the patch package success Ruijie# patch delete Clear the patch patch_bridge success Clear the patch success</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Display patch status.</li> </ul>
	<pre>Ruijie#show patch No patch package installed in the system</pre>

### Common Errors

Run the **patch deactivate** command when the patch is not activated. It is recommended to check the patch status. You can run the **patch deactivate** command only when the patch is in the **status:running** state.

## 12.4.3 Auto-Sync for Upgrade

### Configuration Effect

Auto-sync policy, range and path is configured.

### Notes

N/A

### Configuration Steps

#### ▾ Configuring Auto-Sync Policy

Run the **upgrade auto-sync policy command** to configure the auto-sync policy. There are three modes available:

Compatible: Performs auto-synchronization based on the sequential order of versions.

Coordinate: Synchronizes with the version based on the firmware stored on the supervisor module.

#### ▾ Configuring Auto-Sync Range

Run the **upgrade auto-sync range** command to configure the auto-sync range. There are two ranges available:

chassis: Performs auto-sync on a chassis.

vsd: Performs auto-sync in the VSU system.

### ↘ Configuring Auto-Sync Package Path

- ↘ Every time the system is upgraded, the package path is recorded automatically for later auto-sync upgrade. Alternatively, use the `upgrade auto-sync package` command to set a path. [Configuring Auto-Sync Patch Path](#)

Every time the system is upgraded, the patch path is recorded automatically for later auto-sync upgrade. Alternatively, use the `upgrade auto-sync patch` command to set a path.

### Verification

Run the `upgrade auto-sync` command to check the configuration.

### Commands

#### ↘ Configuring Auto-Sync Policy

<b>command</b>	<code>upgrade auto-sync policy [ compatible   coordinate ]</code>
<b>Parameter Description</b>	<b>compatible:</b> Performs auto-synchronization based on the sequential order of versions. <b>coordinate:</b> Synchronizes with the version based on the firmware stored on the supervisor module.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	It is recommended to set <b>coordinate</b> .

#### ↘ Configuring Auto-Sync Range

<b>command</b>	<code>upgrade auto-sync range [ chassis ]</code>
<b>Parameter Description</b>	<b>chassis:</b> Performs auto-sync on a chassis.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring Auto-Sync Package Path

<b>command</b>	<code>upgrade auto-sync package <i>url</i></code>
<b>Parameter Description</b>	<i>url</i> indicates the path of the upgrade package in the device file system.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	The path is not set generally.

#### ↘ Configuring Auto-Sync Patch Path

<b>command</b>	<code>upgrade auto-sync patch <i>url</i></code>
----------------	---

<b>Parameter Description</b>	<i>url</i> indicates the path of the patch in the device file system.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	The path is not set generally.   All parameters are applicable to only the rack-type device and VSU.

## Configuration Example

### Configuring Auto-Sync Policy

<b>Configuration Steps</b>	Configure the auto-sync policy.
	Ruijie# upgrade auto-sync policy coordinate Upgrade auto-sync policy is set as coordinate
<b>Verification</b>	Check the auto-sync policy.
	Ruijie#show upgrade auto-sync auto-sync policy: coordinate auto-sync range: vsu auto-sync package: flash:/eg1000m_main_1.0.0.0f328e91.bin auto-sync patch : flash:sp1.bin

### Configuring Auto-Sync Range

<b>Configuration Steps</b>	Configure the auto-sync range.
	Ruijie# upgrade auto-sync range vsu Upgrade auto-sync range is set as vsu.
<b>Verification</b>	Check the auto-sync range.
	Ruijie#show upgrade auto-sync auto-sync policy: coordinate auto-sync range: vsu auto-sync package: flash:/eg1000m_main_1.0.0.0f328e91.bin auto-sync patch : flash:sp1.bin

## Common Errors

*url* is not valid.

## 12.5 Monitoring

### Clearing

---

Function	Command
Deletes a hot patch package already installed.	<b>patch delete</b>

### Displaying

---

Function	Command
Displays all components already installed on the current device and their information.	<b>show component</b> [ slot { <i>num</i>   <b>M1</b>   <b>M2</b>   <b>all</b> } ]
Displays the information about the hot patch packages already installed on the device.	<b>show patch</b> [ <i>patch_name</i> ]
Displays the upgrade status of various line cards.	<b>show upgrade status</b>
Displays the upgrade history.	<b>show upgrade history</b>

---

# 13 Configuring Python Shell

## 13.1 Overview

Python is an object-oriented interpreted computer programming language. It is totally free software and its source code and interpreter named CPython comply with the GNU General Public License (GPL) protocol. The Python shell component can implement simple debugging and Python script execution via CLI commands. It mainly provides the following functions:

- In privileged EXEC mode, you can run a Python CLI command to access the Python console to conduct debugging.
- In privileged EXEC mode, you can add a file name to a Python CLI command and run the command to run the script in the **flash:** and **tmp:** directories of the device.
- The Python commands and scripts can be executed only on files in the **flash:** and **tmp:** directories due to permission control.
- Highly risky functions such as popen and system functions cannot be executed in Python scripts due to permission control.

## 13.2 Applications

Application	Scenario
<a href="#">Debugging and Running a Python Script</a>	Run the <b>copy</b> command to copy a local Python script to the device and then run a Python CLI command to run the Python script on the device.

### 13.2.1 Python Script Execution Application Scenario

#### Scenario

To debug and run a Python script, do as follows:

- Compile a Python script (such as **test.py**) on the local PC and set up a Trivial File Transfer Protocol (TFTP) server.
- Run the **copy tftp://xxx.xxx.xxx.xxx/test.py flash:** command to copy the script to the device.
- In privileged EXEC mode, run the **python flash:test.py** command to run the Python script on the device.

#### Deployment

- The PC can be pinged from the device and the TFTP server is installed on the PC.

## 13.3 Features

### 13.3.1 Python Script Debugging

Python script debugging is to test or execute a script that is to be uploaded to the device. The debugging can be performed by accessing the Python console or copying the script to the device.

#### Working Principle

Open-source Python commands are actually executed regardless of which debugging method is used, and all debugging methods are consistent with those for open-source Python commands on other platforms. The Python shell component only redirects the input and output of open-source Python processes to the current STA.

Run the **python** *file\_name args* command to debug and run the Python script.

### 13.3.2 Permission Control

Permission control means that Python CLI commands can be executed only on files in the **flash:** and **tmp:** directories, and the execution of popen, system, and other highly risky functions is prohibited inside scripts.

#### Working Principle

Permission control is to conduct control at the Python ingress. Permissions are controlled for Python scripts executed on the device, to control risks brought by Python script execution.

14. Configuring Single Fiber

# 1 Configuring Interfaces

## 1.1 Overview

Interfaces are important in implementing data switching on network devices. Ruijie devices support two types of interfaces: physical ports and logical interfaces. A physical port is a hardware port on a device, such as the 100M Ethernet interface and gigabit Ethernet interface. A logical interface is not a hardware port on the device. A logical interface, such as the loopback interface and tunnel interface, can be associated with a physical port or independent of any physical port. For network protocols, physical ports and logical interfaces serve the same function.

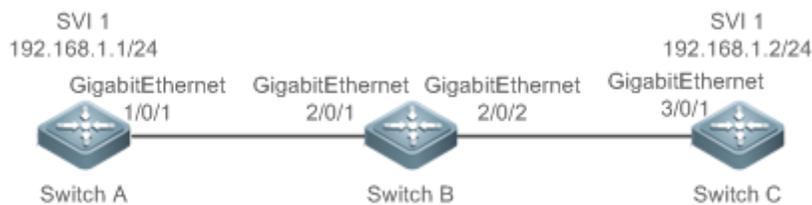

## 1.2 Applications

Application	Description
<a href="#">L2 Data Switching Through the Physical Ethernet Interface</a>	Implement Layer-2 (L2) data communication of network devices through the physical L2 Ethernet interface.
<a href="#">L3 Routing Through the Physical Ethernet Interface</a>	Implement Layer-3 (L3) data communication of network devices through the physical L3 Ethernet interface.

### 1.2.1 L2 Data Switching Through the Physical Ethernet Interface

#### Scenario

Figure 1-1

As shown in Figure 1-1, Switch A, Switch B, and Switch C form a simple L2 data switching network.

#### Deployment

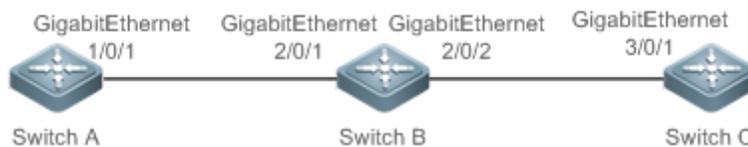

- Connect Switch A to Switch B through physical ports GigabitEthernet 1/0/1 and GigabitEthernet 2/0/1.
- Connect Switch B to Switch C through physical ports GigabitEthernet 2/0/2 and GigabitEthernet 3/0/1.
- Configure GigabitEthernet 1/0/1, GigabitEthernet 2/0/1, GigabitEthernet 2/0/2, and GigabitEthernet 3/0/1 as Trunk ports.

- Create a switch virtual interface (SVI), SVI 1, on Switch A and Switch C respectively, and configure IP addresses from a network segment for the two SVIs. The IP address of SVI 1 on Switch A is 192.168.1.1/24, and the IP address of SVI 1 on Switch C is 192.168.1.2/24.
- Run the **ping 192.168.1.2** command on Switch A and the **ping 192.168.1.1** command on Switch C to implement data switching through Switch B.

## 1.2.2 L3 Routing Through the Physical Ethernet Interface

### Scenario

Figure 1-2

As shown in Figure 1-2, Switch A, Switch B, and Switch C form a simple L3 data communication network.

### Deployment

- Connect Switch A to Switch B through physical ports GigabitEthernet 1/0/1 and GigabitEthernet 2/0/1.
- Connect Switch B to Switch C through physical ports GigabitEthernet 2/0/2 and GigabitEthernet 3/0/1.
- Configure GigabitEthernet 1/0/1, GigabitEthernet 2/0/1, GigabitEthernet 2/0/2, and GigabitEthernet 3/0/1 as L3 routed ports.
- Configure IP addresses from a network segment for GigabitEthernet 1/0/1 and GigabitEthernet 2/0/1. The IP address of GigabitEthernet 1/0/1 is 192.168.1.1/24, and the IP address of GigabitEthernet 2/0/1 is 192.168.1.2/24.
- Configure IP addresses from a network segment for GigabitEthernet 2/0/2 and GigabitEthernet 3/0/1. The IP address of GigabitEthernet 2/0/2 is 192.168.2.1/24, and the IP address of GigabitEthernet 3/0/1 is 192.168.2.2/24.
- Configure a static route entry on Switch C so that Switch C can directly access the network segment 192.168.1.0/24. Configure a static route entry on Switch A so that Switch C can directly access the network segment 192.168.1.0/24.
- Run the **ping 192.168.2.2** command on Switch A and the **ping 192.168.1.1** command on Switch C to implement L3 routing through Switch B.

## 1.3 Features

### Basic Concepts

#### 📌 Interface Classification

1. Interfaces on Ruijie devices fall into three categories:
  - L2 interface (Switches or gateway bridge)

- L3 interface (supported by L3 devices)
2. Common L2 interfaces are classified into the following types:
    - Switch port
    - L2 aggregate port (AP)
  3. Common L3 interfaces are classified into the following types:
    - Routed port
    - L3 AP port
    - SVI
    - Loopback interface
    - Tunnel interface

#### ↘ Switch Port

A switch port is an individual physical port on the device, and implements only the L2 switching function. The switch port is used to manage physical ports and L2 protocols related to physical ports.

#### ↘ L2 AP Port

An AP port is formed by aggregating multiple physical ports. Multiple physical links can be bound together to form a simple logical link. This logical link is called an AP port.

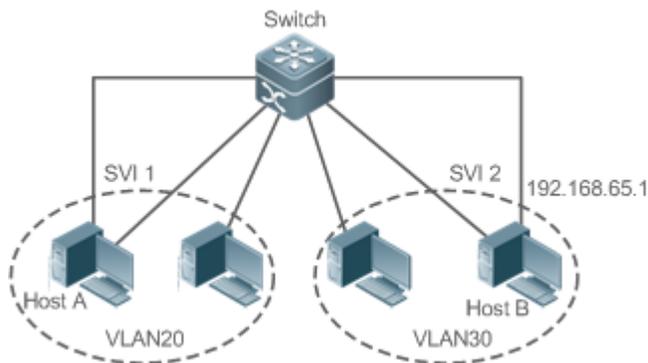

For L2 switching, an AP port is equivalent to a switch port that combines bandwidths of multiple ports, thus expanding the link bandwidth. Frames sent over the L2 AP port are balanced among the L2 AP member ports. If one member link fails, the L2 AP port automatically transfers the traffic on the faulty link to other member links, improving reliability of connections.

#### ↘ SVI

The SVI can be used as the management interface of the local device, through which the administrator can manage the device. You can also create an SVI as a gateway interface, which is mapped to the virtual interface of each VLAN to implement routing across VLANs among L3 devices. You can run the **interface vlan** command to create an SVI and assign an IP address to this interface to set up a route between VLANs.

As shown in Figure 1-3, hosts in VLAN 20 can directly communicate with each other without participation of L3 devices. If Host A in VLAN 20 wants to communicate with Host B in VLAN 30, SVI 1 of VLAN 20 and SVI 2 of VLAN 30 must be used.

Figure 1-3

### ↳ Routed Port

A physical port on a L3 device can be configured as a routed port, which functions as the gateway interface for L3 switching. A routed port is not related with a specific VLAN. Instead, it is just an access port. The routed port cannot be used for L2 switching. You can run the **no switchport** command to change a switch port to a routed port and assign an IP address to this port to set up a route. Note that you must delete all L2 features of a switch port before running the **no switchport** command.

- i** If a port is a L2 AP member port or a DOT1X port that is not authenticated, you cannot run the **switchport** or **no switchport** command to configure the switch port or routed port.

### ↳ L3 AP Port

Like the L2 AP port, a L3 AP port is a logical port that aggregates multiple physical member ports. The aggregated ports must be the L3 ports of the same type. The AP port functions as a gateway interface for L3 switching. Multiple physical links are combined into one logical link, expanding the bandwidth of a link. Frames sent over the L3 AP port are balanced among the L3 AP member ports. If one member link fails, the L3 AP port automatically transfers the traffic on the faulty link to other member links, improving reliability of connections.

A L3 AP port cannot be used for L2 switching. You can run the **no switchport** command to change a L2 AP port that does not contain any member port into a L3 AP port, add multiple routed ports to this L3 AP port, and then assign an IP address to this L3 AP port to set up a route.

### ↳ Loopback Interface

The loopback interface is a local L3 logical interface simulated by the software that is always UP. Packets sent to the loopback interface are processed on the device locally, including the route information. The IP address of the loopback interface can be used as the device ID of the Open Shortest Path First (OSPF) routing protocol, or as the source address used by Border Gateway Protocol (BGP) to set up a TCP connection. The procedure for configuring a loopback interface is similar to that for configuring an Ethernet interface, and you can treat the loopback interface as a virtual Ethernet interface.

### ↳ Tunnel Interface

The Tunnel interface implements the tunnel function. Over the Tunnel interface, transmission protocols (e.g., IP) can be used to transmit packets of any protocol. Like other logical interfaces, the tunnel interface is also a virtual interface of the system.

Instead of specifying any transmission protocol or load protocol, the tunnel interface provides a standard point-to-point (P2P) transmission mode. Therefore, a tunnel interface must be configured for every individual link.

## Overview

Feature	Description
<a href="#">Interface Configuration Commands</a>	You can configure interface-related attributes in interface configuration mode. If you enter interface configuration mode of a non-existing logical interface, the interface will be created.
<a href="#">Interface Description and Administrative Status</a>	You can configure a name for an interface to identify the interface and help you remember the functions of the interface. You can also configure the administrative status of the interface.
<a href="#">MTU</a>	You can configure the maximum transmission unit (MTU) of a port to limit the length of a frame that can be received or sent over this port.
<a href="#">Bandwidth</a>	You can configure the bandwidth of an interface.
<a href="#">Load Interval</a>	You can specify the interval for load calculation of an interface.
<a href="#">Carrier Delay</a>	You can configure the carrier delay of an interface to adjust the delay after which the status of an interface changes from Down to Up or from Up to Down.
<a href="#">Link Trap Policy</a>	You can enable or disable the link trap function on an interface.
<a href="#">Interface Index Persistence</a>	You can enable the interface index persistence function so that the interface index remains unchanged after the device is restarted.
<a href="#">Routed Port</a>	You can configure a physical port on a L3 device as a routed port, which functions as the gateway interface for L3 switching.
<a href="#">L3 AP Port</a>	You can configure an AP port on a L3 device as a L3 AP port, which functions as the gateway interface for L3 switching.
<a href="#">Interface Speed, Duplex Mode, Flow Control Mode, and Auto Negotiation Mode</a>	You can configure the speed, duplex mode, flow control mode, and auto negotiation mode of an interface.
<a href="#">Automatic Module Detection</a>	If the interface speed is set to auto, the interface speed can be automatically adjusted based on the type of the inserted module.
<a href="#">Protected Port</a>	You can configure some ports as protected ports to disable communication between these ports. You can also disable routing between protected ports.
<a href="#">Port Errdisable Recovery</a>	After a port is shut down due to a violation, you can run the <b>errdisable recovery</b> command in global configuration mode to recover all the ports in errdisable state and enable these ports.
<a href="#">Port Flapping Protection</a>	You can configure the port flapping protection function so that the system can automatically turn the port into the violation mode when flapping occurs on the port.

### 1.3.1 Interface Configuration Commands

Run the **interface** command in global configuration mode to enter interface configuration mode. You can configure interface-related attributes in interface configuration mode.

#### Working Principle

Run the **interface** command in global configuration mode to enter interface configuration mode. If you enter interface configuration mode of a non-existing logical interface, the interface will be created. You can also run the **interface range** or **interface range macro** command in global configuration mode to configure the range (IDs) of interfaces. Interfaces defined in the same range must be of the same type and have the same features.

You can run the **no interface** command in global configuration mode to delete a specified logical interface.

#### ▾ Interface Numbering Rules

In stand-alone mode, the ID of a physical port consists of two parts: slot ID and port ID on the slot. For example, if the slot ID of the port is 2, and port ID on the slot is 3, the interface ID is 2/3.

The slot number rules are as follows: The static slot ID is 0, whereas the ID of a dynamic slot (pluggable module or line card) ranges from 1 to the number of slots. Assume that you are facing the device panel. Dynamic slot are numbered from 1 sequentially from front to rear, from left to right, and from top to bottom.

The ID of a port on the slot ranges from 1 to the number of ports on the slot, and is numbered sequentially from left to right.

The ID of an AP port ranges from 1 to the number of AP ports supported by the device.

The ID of an SVI is the VID of the VLAN corresponding to this SVI.

#### ▾ Configuring Interfaces Within a Range

You can run the **interface range** command in global configuration mode to configure multiple interfaces at a time. Attributes configured in interface configuration mode apply to all these interfaces.

The **interface range** command can be used to specify several interface ranges.

The **macro** parameter is used to configure the macro corresponding to a range. For details, see "Configuring Macros of Interface Ranges."

Ranges can be separated by commas (,).

The types of interfaces within all ranges **specified** in a command must be the same.

Pay attention to the format of the **range** parameter when you run the **interface range** command.

The following interface range formats are valid:

- **FastEthernet** device/slot/{first port} - {last port};
- **GigabitEthernet** device/slot/{first port} - {last port};
- **TenGigabitEthernet** device/slot/{first port} - {last port};
- **FortyGigabitEthernet** device/slot/{first port} - {last port};
- **AggregatePort** *Aggregate-port ID* (The AP ID ranges from 1 to the maximum number of AP ports supported by the device.)

- **vlan** vlan-ID-vlan-ID (The VLAN ID ranges from 1 to 4,094.)
- **Loopback** loopback-ID (The loopback ID ranges from 1 to 2,147,483,647.)
- **Tunnel** tunnel-ID (The tunnel ID ranges from 0 to the maximum number of tunnel interfaces supported by the device minus 1.)

Interfaces in an interface range must be of the same type, namely, FastEthernet or GigabitEthernet.

#### ↘ Configuring Macros of Interface Ranges

You can define some macros to replace the interface ranges. Before using the **macro** parameter in the **interface range** command, you must first run the **define interface-range** command in global configuration mode to define these macros.

Run the **no define interface-range macro\_name** command in global configuration mode to delete the configured macros.

### 1.3.2 Interface Description and Administrative Status

You can configure a name for an interface to identify the interface and help you remember the functions of the interface.

You can enter interface configuration mode to enable or disable an interface.

#### Working Principle

##### ↘ Interface Description

You can configure the name of an interface based on the purpose of the interface. For example, if you want to assign GigabitEthernet 1/1 for exclusive use by user A, you can describe the interface as "Port for User A."

##### ↘ Interface Administrative Status

You can configure the administrative status of an interface to disable the interface as required. If the interface is disabled, no frame will be received or sent on this interface, and the interface will lose all its functions. You can enable a disabled interface by configuring the administrative status of the interface. Two types of interface administrative status are defined: Up and Down. The administrative status of an interface is Down when the interface is disabled, and Up when the interface is enabled.

### 1.3.3 MTU

You can configure the MTU of a port to limit the length of a frame that can be received or sent over this port.

#### Working Principle

When a large amount of data is exchanged over a port, frames greater than the standard Ethernet frame may exist. This type of frame is called jumbo frame. The MTU is the length of the valid data segment in a frame. It does not include the Ethernet encapsulation overhead.

If a port receives or sends a frame with a length greater than the MTU, this frame will be discarded.

The MTU ranges from 64 bytes to 9,216 bytes, at a step of four bytes. The default MTU is 1500 bytes.

---

 The **mtu** command takes effect only on a physical or AP port.

### 1.3.4 Bandwidth

#### Working Principle

The **bandwidth** command can be configured so that some routing protocols (for example, OSPF) can calculate the route metric and the Resource Reservation Protocol (RSVP) can calculate the reserved bandwidth. Modifying the interface bandwidth will not affect the data transmission rate of the physical port.

---

**i** The **bandwidth** command is a routing parameter, and does not affect the bandwidth of a physical link.

---

### 1.3.5 Load Interval

#### Working Principle

You can run the **load-interval** command to specify the interval for load calculation of an interface. Generally, the interval is 10s.

### 1.3.6 Carrier Delay

#### Working Principle

The carrier delay refers to the delay after which the data carrier detect (DCD) signal changes from Down to Up or from Up to Down. If the DCD **status** changes during the delay, the system will ignore this change to avoid negotiation at the upper data link layer. If this parameter is set to a great value, nearly every DCD change is not detected. On the contrary, if the parameter is set to 0, every DCD signal change will be detected, resulting in poor stability.

---

**i** If the DCD carrier is interrupted for a long time, the carrier delay should be set to a smaller value to accelerate convergence of the topology or route. On the contrary, if the DCD carrier interruption time is shorter than the topology or route convergence time, the carrier delay should be set to a greater value to avoid topology or route flapping.

---

### 1.3.7 Link Trap Policy

You can enable or disable the link trap function on an interface.

#### Working Principle

When the link trap function on an interface is enabled, the Simple Network Management Protocol (SNMP) sends link traps when the link status changes on the interface.

### 1.3.8 Interface Index Persistence

Like the interface name, the interface index also identifies an interface. When an interface is created, the system automatically assigns a unique index to the interface. The index of an interface may change after the device is restarted. You can enable the interface index persistence function so that the interface index remains unchanged after the device is restarted.

#### Working Principle

After interface index persistence is enabled, the interface index remains unchanged after the device is restarted.

### 1.3.9 Routed Port

#### Working Principle

A physical port on a L3 device can be configured as a routed port, which functions as the gateway interface for L3 switching. The routed port cannot be used for L2 switching. You can run the **no switchport** command to change a switch port to a routed port and assign an IP address to this port to set up a route. Note that you must delete all L2 features of a switch port before running the **no switchport** command.

### 1.3.10 L3 AP Port

#### Working Principle

Like a L3 routed port, you can run the **no switchport** command to change a L2 AP port into a L3 AP port on a L3 device, and then assign an IP address to this AP port to set up a route. Note that you must delete all L2 features of the AP port before running the **no switchport** command.

- 
- i** A L2 AP port with one or more member ports cannot be configured as a L3 AP port. Similarly, a L3 AP port with one or more member ports cannot be changed to a L2 AP port.
- 

### 1.3.11 Interface Speed, Duplex Mode, Flow Control Mode, and Auto Negotiation Mode

You can configure the interface speed, duplex mode, flow control mode, and auto negotiation mode of an Ethernet physical port or AP port.

#### Working Principle

##### ↘ Speed

Generally, the speed of an Ethernet physical port is determined through negotiation with the peer device. The negotiated speed can be any speed within the interface capability. You can also configure any speed within the interface capability for the Ethernet physical port.

When you configure the speed of an AP port, the configuration takes effect on all of its member ports. (All these member ports are Ethernet physical ports.)

##### ↘ Duplex Mode

- The duplex mode of an Ethernet physical port or AP port can be configured as follows:
- Set the duplex mode of the interface to full-duplex so that the interface can receive packets while sending packets.
- Set the duplex mode of the interface to half-duplex so that the interface can receive or send packets at a time.
- Set the duplex mode of the interface to auto-negotiation so that the duplex mode of the interface is determined through auto negotiation between the local interface and peer interface.

- When you configure the duplex mode of an AP port, the configuration takes effect on all of its member ports. (All these member ports are Ethernet physical ports.)

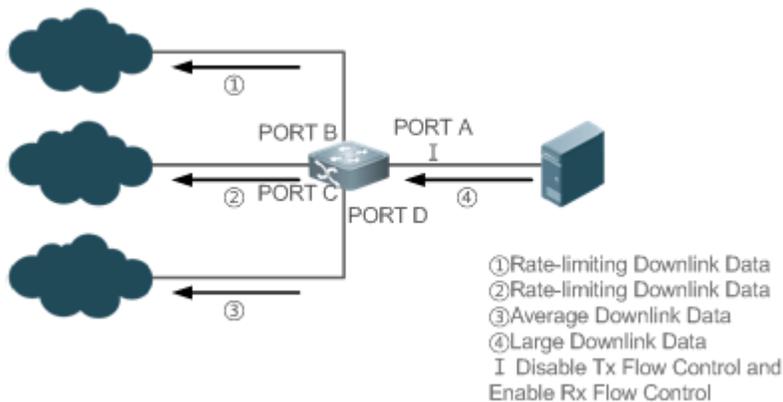

### ▾ Flow Control

Two flow control modes are defined for an interface:

- Symmetric flow control mode: Generally, after flow control is enabled on an interface, the interface processes the received flow control frames, and sends the flow control frames when congestion occurs on the interface. The received and sent flow control frames are processed in the same way. This is called symmetric flow control mode.
- Asymmetric flow control mode: In some cases, an interface on a device is expected to process the received flow control frames to ensure that no packet is discarded due to congestion, and not to send the flow control frames to avoid decreasing the network speed. In this case, you need to configure asymmetric flow control mode to separate the procedure for receiving flow control frames from the procedure for sending flow control frames.
- When you configure the flow control mode of an AP port, the configuration takes effect on all of its member ports. (All these member ports are Ethernet physical ports.)

As shown in Figure 1-4, Port A of the device is an uplink port, and Ports B, C and D are downlink ports. Assume that Port A is enabled with the functions of sending and receiving flow control frames. Port B and Port C are connected to different slow networks. If a large amount of data is sent on Port B and Port C, Port B and Port C will be congested, and consequently congestion occurs in the inbound direction of Port A. Therefore, Port A sends flow control frames. When the uplink device responds to the flow control frames, it reduces the data flow sent to Port A, which indirectly slows down the network speed on Port D. At this time, you can disable the function of sending flow control frames on Port A to ensure the bandwidth usage of the entire network.

Figure 1-4

### ▾ Auto Negotiation Mode

- The auto negotiation mode of an interface can be On or Off. The auto negotiation state of an interface is not completely equivalent to the auto negotiation mode. The auto negotiation state of an interface is jointly determined by the interface speed, duplex mode, flow control mode, and auto negotiation mode.
- When you configure the auto negotiation mode of an AP port, the configuration takes effect on all of its member ports. (All these member ports are Ethernet physical ports.)

- 
- ❗ Generally, if one of the interface speed, duplex mode, and flow control mode is set to auto, or the auto negotiation mode of an interface is On, the auto negotiation state of the interface is On, that is, the auto negotiation function of the interface is enabled. If none of the interface speed, duplex mode, and flow control mode is set to auto, and the auto negotiation mode of an interface is Off, the auto negotiation state of the interface is Off, that is, the auto negotiation function of the interface is disabled.
  - ❗ For a 100M fiber port, the auto negotiation function is always disabled, that is, the auto negotiation state of a 100M fiber port is always Off. For a Gigabit copper port, the auto negotiation function is always enabled, that is, the auto negotiation state of a Gigabit copper port is always On.
- 

### 1.3.12 Automatic Module Detection

If the interface speed is set to auto, the interface speed can be automatically adjusted based on the type of the inserted module.

#### Working Principle

Currently, the automatic module detection function can be used to detect only the SFP and SFP+ modules. The SFP is a Gigabit module, whereas SFP+ is a 10 Gigabit module. If the inserted module is SFP, the interface works in Gigabit mode. If the inserted module is SFP+, the interface works in 10 Gigabit mode.

- 
- ❗ The automatic module detection function takes effect only when the interface speed is set to auto.
- 

### 1.3.13 Protected Port

In some application environments, it is required that communication be disabled between some ports. For this purpose, you can configure some ports as protected ports. You can also disable routing between protected ports.

#### Working Principle

##### ↘ Protected Port

After ports are configured as protected ports, protected ports cannot communicate with each other, but can communicate with non-protected ports.

Protected ports work in either of the two modes. In the first mode, L2 switching is blocked but routing is allowed between protected ports. In the second mode, both L2 switching and routing are blocked between protected ports. If a protected port supports both modes, the first mode is used by default.

When two protected port are configured as a pair of mirroring ports, frames sent or received by the source port can be mirrored to the destination port.

Currently, only an Ethernet physical port or AP port can be configured as a protected port. When an AP port is configured as a protected port, all of its member ports are configured as protected ports.

##### ↘ Blocking L3 Routing Between Protected Ports

By default, L3 routing between protected ports is not blocked. In this case, you can run the **protected-ports route-deny** command to block routing between protected ports.

### 1.3.14 Port Errdisable Recovery

Some protocols support the port errdisable recovery function to ensure security and stability of the network. For example, in the port security protocol, when you enable port security and configure the maximum number of security addresses on the port, a port violation event is generated if the number of addresses learned on this port exceeds the maximum number of security addresses. Other protocols, such as the Spanning Tree Protocol (STP), DOT1X, REUP, and frequent port flapping support the similar functions, and a violating port will be automatically shut down to ensure security.

#### Working Principle

After a port is shut down due to a violation, you can run the **errdisable recovery** command in global configuration mode to recovery all the ports in errdisable state and enable these ports. You can manually recover a port, or automatically recover a port at a scheduled time.

### 1.3.15 Split and Combination of the 100G Port

#### Working Principle

The 100G Ethernet port is a high-bandwidth port. It is mainly used on devices at the convergence layer or core layer to increase the port bandwidth. 100G port split means that a 100G port is split into four 25G ports. At this time, the 100G port becomes unavailable, and the four 25G ports forward data independently. 100G port combination means that four 25G ports are combined into a 100G port. At this time, the four 25G ports become unavailable, and only the 100G port forwards data. You can flexibly adjust the bandwidth by combining or splitting ports.

### 1.3.16 SVI or Sub-Interface Sampling

By default, the SVI or sub-interface does not support packet statistics. Information, such as the number of packets received or sent on the SVI or sub-interface and the packet sending/receiving rate, cannot be displayed. You can enable SVI or sub-interface sampling to display these statistics.

### 1.3.17 Port Flapping Protection

When flapping occurs on a port, a lot of hardware interruptions occur, consuming a lot of CPU resources. On the other hand, frequent port flapping damages the port. You can configure the flapping protection function to protect ports.

#### Working Principle

By default, the port flapping protection function is enabled. You can disable this function as required. When flapping occurs on a port, the port detects flapping every 2s or 10s. If flapping occurs six times within 2s on a port, the device displays a prompt. If 10 prompts are displayed continuously, that is, port flapping is detected continuously within 20s, the port is turned into the violation mode(the violation cause shows Link Dither). If flapping occurs 10 times within 10s on a port, the device displays a prompt without turning the port into the violation mode.

### 1.3.18 Syslog

You can enable or disable the syslog function to determine whether to display information about the interface changes or exceptions.

#### Working Principle

You can enable or disable the syslog function as required. By default, this function is enabled. When an interface becomes abnormal, for example, the interface status changes, or the interface receives error frames, or flapping occurs, the system displays prompts to notify users.

### 1.3.19 Global MTU

Users can set the global MTU to control the maximum length of frames that can be sent and received over all ports.

#### Working Principle

When large-throughput data exchange is performed over a port, frames whose length is longer than that of a standard Ethernet frame may exist, and these frames are called jumbo frames. The MTU indicates the length of valid data fields in a frame, excluding the Ethernet encapsulation overhead.

If the length of a frame received or forwarded by a port exceeds the MTU value, the frame will be discarded.

The MTU value ranges from 64 to 9216 bytes. The granularity is four bytes. The default value is 1500 bytes.

-  The IP MTU automatically changes to the value of the link MTU of an interface when the globally set link MTU changes.
-  The MTU of an interface takes precedence over the global MTU. After the global MTU is configured, the MTU of an interface cannot be set to the default value.

### 1.3.20 Interface MAC Address

#### Working Principle

By default, each Ethernet interface has a globally unique MAC address. The MAC addresses of Ethernet interfaces can be modified if required. However, MAC addresses in the same LAN must be unique.

To configure the MAC address of an Ethernet interface, run the **mac-address** command in interface configuration mode:

-  Configuration of MAC addresses may affect internal communication in a LAN. Therefore, it is recommended that users do not configure MAC addresses by themselves if unnecessary.

#### Related Configuration

##### [Configuring MAC Addresses for Interfaces](#)

By default, each interface has a globally unique MAC address.

You can run the **mac-address mac-address** command in interface configuration mode to modify the MAC address of an interface.

### 1.3.21 VLAN Encapsulation Flag on Interfaces

#### Working Principle

Virtual local area network (VLAN) is a logical network divided on a physical network and corresponds to the layer-2 network in the ISO model. In 1999, IEEE released the 802.1Q protocol draft for standardizing the VLAN implementation solution.

The VLAN technology enables the network administrator to divide a physical LAN into multiple broadcast domains (or VLANs). Each VLAN contains a group of workstations with the same requirements and each VLAN has the same attributes as the physical LAN. As VLANs are logically divided, workstations in the same VLAN do not need to be placed in the same physical space, that is, these workstations may belong to different physical LAN network segments. Multicast and unicast traffic in a VLAN will not be forwarded to other VLANs. This helps control traffic, reduce device investment, simplify network management, and improve the network security.

VLAN is a protocol used to solve Ethernet broadcast and security problems. During packet transmission, a VLAN header is added to Ethernet frames. In addition, VLAN IDs are used to classify users to different work groups to restrict layer-2 exchange between users in different work groups. Each work group is a VLAN. VLANs can be used to restrict the broadcast scope and form virtual work groups to manage networks dynamically.

To ensure communication with hosts in a VLAN, users can configure the 802.1Q (VLAN protocol) VLAN encapsulation flag on the Ethernet interface or sub-interface. In this case, when packets are sent over the Ethernet interface, the corresponding VLAN header will be encapsulated. When packets are received, the VLAN header will be deleted from the packet.

#### Related Configuration

##### ▾ Configuring the VLAN Encapsulation Flag for Interfaces

By default, the 802.1Q encapsulation protocol is disabled for interfaces.

You can run the **encapsulation dot1Q VlanID** command in interface mode for 802.1Q encapsulation for an interface. **VlanID** indicates the encapsulated VLAN ID.

### 1.3.22 Interface FEC Mode

#### Working Principle

Forward Error Correction (FEC) is an error code correction method employing the following working principle: The sender adds a redundancy error-correcting code to the data for sending. The receiver performs error detection on the data based on the error-correcting code. If an error is found, the receiver corrects the error. FEC improves signal quality but also causes signal delay. Users can enable or disable this function according to the actual situation.

Different types of ports support different FEC modes. A 25 Gbps port supports the BASE-R mode, while a 100 Gbps port supports the RS mode.

#### Related Configuration

##### ▾ Configuring Interface FEC Mode

By default, FEC mode is disabled on a 25 Gbps port, and whether the FEC mode is enabled or disabled on a 100 Gbps port is determined by the inserted optical module.

Run the **fec mode {rs | base-r | none | auto}** command in interface mode to configure the FEC mode on an interface.

### 1.3.23 Statistics Sampling Cycle on Ethernet Ports

#### Working Principle

The default statistics sampling cycle of Ethernet ports is 5 seconds, which means that the interface statistics are updated every 5 seconds. In scenarios with high requirements for real-time statistics, you can prolong the sampling cycle.

-  A shorter sampling cycle indicates higher system performance consumption. Therefore, the sampling cycle must be adjusted as required. If the number of physical port exceeds 500, it is recommended to set the sampling cycle to over 10s.

#### Related Configuration

##### ▾ [Configuring Statistics Sampling Cycle on Ethernet Ports](#)

The default statistics sampling cycle of Ethernet ports is 5 seconds.

Run the **ethernet-port counter sample-period [ seconds ]** command in global configuration mode to adjust the sampling cycle on Ethernet ports.

## 1.4 Limitations

- Optical ports of the S6500 series products do not support the speed of 100 Mbps.

- 10G optical port: When a 10G optical transceiver is inserted into a 10G optical port, the auto-negotiation mode is disabled. When a 1000M optical transceiver is inserted into a 10G optical port, the auto-negotiation mode is enabled by default.
- 40G optical port: When an optical transceiver is inserted into a 40G optical port, the auto-negotiation mode is disabled. When a copper cable is connected to a 40G optical port, the auto-negotiation mode is enabled.

- For S6500 series products, the MTU is converted into a packet length for calculation in chips. The converted packet length used for calculation is 26 bytes (including a 14-byte Ethernet header, a 4-byte FCS, and two tags) greater than the configured MTU.

- When mode switching is configured on 25G ports of the S6510 (**port speed-mode 10G/25G**), the modes of four consecutive ports of the configured port are changed at the same time, and no speed can be configured for the 25G ports.

- Ensure that the IP MTU, IPv6 MTU, and link MTU of layer-3 interfaces are set properly and the IP/IPv6 MTU is not greater than the interface MTU. Layer-3 interfaces include routing ports, layer-3 APs, and SVIs.

## 1.5 Configuration

Configuration	Description and Command	
<a href="#">Performing Basic Configurations</a>	(Optional) It is used to manage interface configurations, for example, creating/deleting an interface, or configuring the interface description.	
	<b>interface</b>	Creates an interface and enters configuration mode of the created interface or a specified interface.
	<b>interface range</b>	Enters an interface range, creates these interfaces (if not created), and enters interface configuration mode.
	<b>define interface-range</b>	Creates a macro to specify an interface range.
	<b>snmp-server if-index persist</b>	Enables the interface index persistence function so that the interface index remains unchanged after the device is restarted.
	<b>description</b>	Configures the interface description of up to 80 characters in interface configuration mode.
	<b>snmp trap link-status</b>	Configures whether to send the link traps of the interface.
	<b>shutdown</b>	Shuts down an interface in interface configuration mode.
	<b>split interface</b>	Splits a 40G port in global configuration mode.
	<b>physical-port dither protect</b>	Configures interface flapping protection in global configuration mode.
	<b>logging [link-updown   error-frame   link-dither   res-lack-frame]</b>	Enables logging of status information on an interface in global configuration mode.
<a href="#">Configuring Interface Attributes</a>	(Optional) It is used to configure interface attributes.	
	<b>bandwidth</b>	Configures the bandwidth of an interface in interface configuration mode.
	<b>carrier-delay</b>	Configures the carrier delay of an interface in interface configuration mode.
	<b>load-interval</b>	Configures the interval for load calculation of an interface.
	<b>duplex</b>	Configures the duplex mode of an interface.

Configuration	Description and Command
	<b>flowcontrol</b> Enables or disables flow control of an interface.
	<b>mtu</b> Configures the MTU of an interface.
	<b>negotiation mode</b> Configures the auto negotiation mode of an interface.
	<b>speed</b> Configures the speed of an interface.
	<b>port speed-mode</b> Configures the speed mode for a 25G port.
	<b>switchport</b> Configures an interface as a L2 interface in interface configuration mode. (Run the <b>no switchport</b> command to configure an interface as a L3 interface.)
	<b>switchport protected</b> Configures a port as a protected port.
	<b>protected-ports route-deny</b> Blocks L3 routing between protected ports in global configuration mode.
	<b>errdisable recovery [cause link-state]</b> Recovers a port in errdisable state in global configuration mode.
	<b>route-sample enable</b> Enables the sampling function of a SVI/subinterface in interface configuration mode.
	<b>mtu forwarding</b> Sets the global MTU and IP MTU.
	<b>mac-address</b> Sets the MAC address of an interface.
	<b>encapsulation dot1Q</b> Sets the VLAN tag for an interface.
	<b>fec mode</b> Configures the FEC mode for an interface.
	<b>ethernet-port counter sample-period</b> Configures the statistics sampling period for an Ethernet port.

## 1.5.1 Performing Basic Configurations

### Configuration Effect

- Create a specified logical interface and enter configuration mode of this interface, or enter configuration mode of an existing physical or logical interface.
- Create multiple specified logical interfaces and enter interface configuration mode, or enter configuration mode of multiple existing physical or logical interfaces.
- The interface indexes remain unchanged after the device is restarted.
- Configure the interface description so that users can directly learn information about the interface.
- Enable or disable the link trap function of an interface.
- Enable or disable an interface.
- Split a 100G port or combine four 25G ports into a 100G port.

### Notes

- The **no** form of the command can be used to delete a specified logical interface or logical interfaces in a specified range, but cannot be used to delete a physical port or physical ports in a specified range.

- The **default** form of the command can be used in interface configuration mode to restore default settings of a specified physical or logical interface, or interfaces in a specified range.

## Configuration Steps

### ▾ Configuring a Specified Interface

- Optional.
- Run this command to create a logical interface or enter configuration mode of a physical port or an existing logical interface.

<b>Command</b>	<b>interface</b> <i>interface-type interface-number</i>
<b>Parameter</b>	<i>interface-type interface-number</i> : Indicates the type and number of the interface. The interface can be an Ethernet physical port, AP port, SVI, or loopback interface.
<b>Description</b>	Ethernet physical port, AP port, SVI, or loopback interface.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<ul style="list-style-type: none"> <li>● If a logical interface is not created yet, run this command to create this interface and enter configuration mode of this interface.</li> <li>● For a physical port or an existing logical interface, run this command to enter configuration mode of this interface.</li> <li>● Use the <b>no</b> form of the command to delete a specified logical interface.</li> <li>● Use the <b>default</b> form of the command to restore default settings of the interface in interface configuration mode.</li> </ul>

### ▾ Configuring Interfaces Within a Range

- Optional.
- Run this command to create multiple logical interfaces or enter configuration mode of multiple physical port or existing logical interfaces.

<b>Command</b>	<b>interface range</b> { <i>port-range</i>   <b>macro</b> <i>macro_name</i> }
<b>Parameter</b>	<i>port-range</i> : Indicates the type and ID range of interfaces. These interfaces can be Ethernet physical ports, AP ports, SVIs, or loopback interfaces.
<b>Description</b>	<i>macro_name</i> : Indicates the name of the interface range macro.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<ul style="list-style-type: none"> <li>● If logical interfaces are not created yet, run this command to create these interfaces and enter interface configuration mode.</li> <li>● For multiple physical ports or existing logical interfaces, run this command to enter interface configuration mode.</li> <li>● Use the <b>default</b> form of the command to restore default settings of these interfaces in interface configuration mode.</li> </ul>

	<ul style="list-style-type: none"> <li>● Before using a macro, run the <b>define interface-range</b> command to define the interface range as a macro name in global configuration mode, and then run the <b>interface range macro</b> <i>macro_name</i> command to apply the macro.</li> </ul>
--	---

▾ **Configuring Interface Index Persistence**

- Optional.
- Run this command when the interface indexes must remain unchanged after the device is restarted.

<b>Command</b>	<b>snmp-server if-index persist</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, interface index persistence is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is executed, current indexes of all interfaces will be saved, and the indexes remain unchanged after the device is restarted. You can use the <b>no</b> or <b>default</b> form of the command to disable the interface index persistence function.

▾ **Configuring the Description of an Interface**

- Optional.
- Run this command to configure the description of an interface.

<b>Command</b>	<b>description</b> <i>string</i>
<b>Parameter</b>	<i>string</i> : Indicates a string of up to 80 characters.
<b>Description</b>	
<b>Defaults</b>	By default, no description is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to configure the description of an interface. You can use the <b>no</b> or <b>default</b> form of the command to delete the description of an interface.-

▾ **Configuring the Link Trap Function of an Interface**

- Optional.
- Run this command to obtain the link traps through SNMP.

<b>Command</b>	<b>snmp trap link-status</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, the link trap function is enabled.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to configure the link trap function on an interface. When this function is enabled, the

	SNMP sends link traps when the link status changes on the interface. You can use the <b>no</b> or <b>default</b> form of the command to disable the link trap function.
--	---

▾ **Configuring the Administrative Status of an Interface**

- Optional.
- Run this command to enable or disable an interface.
- An interface cannot send or receive packets after it is disabled.

<b>Command</b>	<b>Shutdown</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, the administrative status of an interface is Up.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	You can run the <b>shutdown</b> command to disable an interface, or the <b>no shutdown</b> command to enable an interface. In some cases, for example, when an interface is in errdisable state, you cannot run the <b>no shutdown</b> command on an interface. You can use the <b>no</b> or <b>default</b> form of the command to enable the interface.

▾ **Splitting a 100G Port or Combining Four 25G Ports into a 100G Port**

- Optional.
- Run this command to split a 100G port or combine four 25G ports into a 100G port.

<b>Command</b>	<b>[no] split interface</b> <i>interface-type interface-number</i>
<b>Parameter Description</b>	<i>interface-type interface-number</i> . Indicates the type and number of a port. The port must be a 100G port.
<b>Defaults</b>	By default, the ports are combined.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	You can run the <b>split</b> command to split a 100G port, or the <b>no split</b> command to combine the split 100G port. After this command is configured, you generally need to restart the line card or the entire device so that the configuration can take effect.

▾ **Configuring the SVI or Sub-Interface Sampling Function**

- Optional.
- Run this command to enable the SVI or sub-interface sampling function.

<b>Command</b>	<b>[no] route-sample enable</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, the SVI or sub-interface does not support sampling.

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring Port Flapping Protection

- Optional.
- Run this command to protect the port against flapping.

<b>Command</b>	<b>physical-port dither protect</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, port flapping protection is enabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Syslog Function

- Optional.
- Run this command to enable or disable the syslog function on an interface.

<b>Command</b>	<b>[no] logging [link-updown   error-frame   link-dither   res-lack-frame ]</b>
<b>Parameter Description</b>	<b>link-updown:</b> prints the status change information. <b>error-frame:</b> prints the error frame information. <b>link-dither:</b> prints the port flapping information. <b>res-lack-frame:</b> prints the error frame information received by an interface due to lack of resource.
<b>Defaults</b>	By default, the syslog function is enabled on an interface.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

## Verification

### ▾ Configuring a Specified Interface

- Run the **interface** command. If you can enter interface configuration mode, the configuration is successful.
- For a logical interface, after the **no interface** command is executed, run the **show running** or **show interfaces** command to check whether the logical interface exists. If not, the logical interface is deleted.
- After the **default interface** command is executed, run the **show running** command to check whether the default settings of the corresponding interface are restored. If yes, the operation is successful.

### ↘ Configuring Interfaces Within a Range

- Run the **interface range** command. If you can enter interface configuration mode, the configuration is successful.
- After the **default interface range** command is executed, run the **show running** command to check whether the default settings of the corresponding interfaces are restored. If yes, the operation is successful.

### ↘ Configuring Interface Index Persistence

- After the **snmp-server if-index persist** command is executed, run the **write** command to save the configuration, restart the device, and run the **show interface** command to check the interface index. If the index of an interface remains the same after the restart, interface index persistence is enabled.

### ↘ Configuring the Link Trap Function of an Interface

- Remove and then insert the network cable on a physical port, and enable the SNMP server. If the SNMP server receives link traps, the link trap function is enabled.
- Run the **no** form of the **snmp trap link-status** command. Remove and then insert the network cable on a physical port. If the SNMP server does not receive link traps, the link trap function is disabled.

### ↘ Configuring the Administrative Status of an Interface

- Insert the network cable on a physical port, enable the port, and run the **shutdown** command on this port. If the syslog is displayed on the Console indicating that the state of the port changes to Down, and the indicator on the port is off, the port is disabled. Run the **show interfaces** command, and verify that the interface state changes to Administratively Down. Then, run the **no shutdown** command to enable the port. If the syslog is displayed on the Console indicating that the state of the port changes to Up, and the indicator on the port is on, the port is enabled.

### ↘ Splitting or Combining a 100G Port

- Run the **split** command on a 100G port in global configuration mode. Verify that the related syslog is displayed on the Console. Run the **write** command to save the configuration, and restart the device or line card according to the method described in the syslog. The four 25G ports can be configured as L2 or L3 ports, but the split 100G port cannot be configured as a L2 or L3 port.
- Run the **no split** command on a split 100G port. Verify that the related syslog is displayed on the Console. Run the **write** command to save the configuration, and restart the device or line card according to the method described in the syslog. The four 25G ports cannot be configured as L2 or L3 ports, but the combined 100G port can be configured as a L2 or L3 port.

### ↘ Configuring the SVI or Sub-Interface Sampling Function

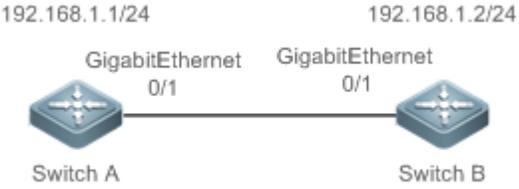

- Run the **route-sample enable** command in SVI or sub-interface configuration mode. Then, run the **show interface** command and verify that the number of sent or received packets and the packet sending/receiving rate are displayed. Run the **no route-sample enable** command. Then, run the **show interface** command and verify that the number of sent or received packets and the packet sending/receiving rate are not displayed.

### ↘ Configuring Port Flapping Protection

- Run the **physical-port dither protect** command in global configuration mode. Frequently remove and insert the network cable on a physical port to simulate port flapping. Verify that a syslog indicating port flapping is displayed on the Console. After such a syslog is displayed for several times, the system prompts that the port will be turned into the violation mode.

### Configuration Example

#### Configuring Basic Attributes of Interfaces

<p><b>Scenario</b> Figure 1-5</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Connect two devices through the switch ports.</li> <li>● Configure an SVI respectively on two devices, and assign IP addresses from a network segment to the two SVIs.</li> <li>● Enable interface index persistence on the two devices.</li> <li>● Enable the link trap function on the two devices.</li> <li>● Configure the interface administrative status on the two devices.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# snmp-server if-index persist A(config)# interface vlan 1 A(config-if-VLAN 1)# ip address 192.168.1.1 255.255.255.0 A(config-if-VLAN 1)# exit A(config)# interface gigabitethernet 0/1 A(config-if-GigabitEthernet 0/1)# snmp trap link-status A(config-if-GigabitEthernet 0/1)# shutdown A(config-if-GigabitEthernet 0/1)# end A# write</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# snmp-server if-index persist B(config)# interface vlan 1 B(config-if-VLAN 1)# ip address 192.168.1.2 255.255.255.0 B(config-if-VLAN 1)# exit</pre>

	<pre>B(config)# interface gigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# snmp trap link-status B(config-if-GigabitEthernet 0/1)# shutdown B(config-if-GigabitEthernet 0/1)# end B# write</pre>																																													
<p><b>Verification</b></p>	<p>Perform verification on Switch A and Switch B as follows:</p> <ul style="list-style-type: none"> <li>● Run the <b>shutdown</b> command on port GigabitEthernet 0/1, and check whether GigabitEthernet 0/1 and SVI 1 are Down.</li> <li>● Run the <b>shutdown</b> command on port GigabitEthernet 0/1, and check whether a trap indicating that this interface is Down is sent.</li> <li>● Restart the device, and check whether the index of GigabitEthernet 0/1 is the same as that before the restart.</li> </ul>																																													
<p><b>A</b></p>	<pre>A# show interfaces gigabitEthernet 0/1 Index(dec):1 (hex):1 GigabitEthernet 0/1 is administratively down , line protocol is DOWN Hardware is GigabitEthernet, address is 00d0.f865.de9b (bia 00d0.f865.de9b) Interface address is: no ip address MTU 1500 bytes, BW 1000000 Kbit Encapsulation protocol is Bridge, loopback not set Keepalive interval is 10 sec , set Carrier delay is 2 sec Rxload is 1/255, Txload is 1/255</pre> <table border="1"> <thead> <tr> <th>Queue</th> <th>Transmitted packets</th> <th>Transmitted bytes</th> <th>Dropped packets</th> <th>Dropped bytes</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>2</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>3</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>4</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>5</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>6</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>7</td> <td>4</td> <td>440</td> <td>0</td> <td>0</td> </tr> </tbody> </table>	Queue	Transmitted packets	Transmitted bytes	Dropped packets	Dropped bytes	0	0	0	0	0	1	0	0	0	0	2	0	0	0	0	3	0	0	0	0	4	0	0	0	0	5	0	0	0	0	6	0	0	0	0	7	4	440	0	0

Index(dec):4097 (hex):1001

VLAN 1 is UP , line protocol is DOWN

Hardware is VLAN, address is 00d0.f822.33af (bia 00d0.f822.33af)

Interface address is: 192.168.1.2/24

ARP type: ARPA, ARP Timeout: 3600 seconds

MTU 1500 bytes, BW 1000000 Kbit

Encapsulation protocol is Ethernet-II, loopback not set

Keepalive interval is 10 sec , set

Carrier delay is 2 sec

Rxload is 0/255, Txload is 0/255
    
```

## 1.5.2 Configuring Interface Attributes

### Configuration Effect

- Enable the device to connect and communicate with other devices through the switch port or routed port.
- Adjust various interface attributes on the device.

### Configuration Steps

#### ▾ Configuring a Routed Port

- Optional.
- Run this command to configure a port as a L3 routed port.
- After a port is configured as a L3 routed port, L2 protocols running on the port do not take effect.
- This command is applicable to a L2 switch port.

<b>Command</b>	<b>no switchport</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, an Ethernet physical port is a L2 switch port.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	On a L3 device, you can run this command to configure a L2 switch port as a L3 routed port. You can run the

**switchport** command to change a L3 routed port into a L2 switch port.

↘ **Configuring a L3 AP Port**

- Optional.
- Run the **no switchport** command in interface configuration mode to configure a L2 AP port as a L3 AP port. Run the **switchport** command to configure a L3 AP port as a L2 AP port.
- After a port is configured as a L3 routed port, L2 protocols running on the port do not take effect.
- This command is applicable to a L2 AP port.

<b>Command</b>	<b>no switchport</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, an AP port is a L2 AP port.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After entering configuration mode of a L2 AP port on a L3 device, you can run this command to configure a L2 AP port as a L3 AP port. After entering configuration mode of a L3 AP port, you can run the <b>switchport</b> command to change a L3 AP port into a L2 AP port.

↘ **Configuring the Speed of an Interface**

- Optional.
- Port flapping may occur if the configured speed of a port changes.
- This command is applicable to an Ethernet physical port or AP port.
- A same speed mode must be configured on four consecutive 25 Gbps ports.

<b>Command</b>	<b>speed [ 10   100   1000   10G   40G   100G   auto ]</b>
<b>Parameter Description</b>	<p><b>10</b>: Indicates that the speed of the interface is 10 Mbps.</p> <p><b>100</b>: Indicates that the speed of the interface is 100 Mbps.</p> <p><b>1000</b>: Indicates that the speed of the interface is 1000 Mbps.</p> <p><b>10G</b>: Indicates that the speed of the interface is 10 Gbps.</p> <p><b>40G</b>: Indicates that the speed of the interface is 40 Gbps.</p> <p><b>100G</b>: Indicates that the speed of the interface is 100 Gbps.</p>
<b>Defaults</b>	By default, the speed of an interface is auto.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>If an interface is an AP member port, the speed of this interface is determined by the speed of the AP port. When the interface exits the AP port, it uses its own speed configuration. You can run <b>show interfaces</b> to display the speed configurations. The speed options available to an interface vary with the type of the interface. For example, you cannot set the speed of an SFP interface to 10 Mbps.</p> <hr/> <p> The speed of a 40G physical port can only be set to 40 Gbps or auto.</p>
<b>Command</b>	<b>port speed-mode [ 10G   25G ]</b>
<b>Parameter</b>	<b>10G</b> : Indicates that the speed of the interface is 10 Gbps.

<b>Description</b>	<b>25G</b> : Indicates that the speed of the interface is 25 Gbps.
<b>Defaults</b>	The speed of the interface is <b>25G</b> by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Only 25 Gbps ports support this speed mode. A same speed mode must be configured on four consecutive 25 Gbps ports.</p> <hr/> <ul style="list-style-type: none"> <li> Only 25 Gbps ports with the same speed mode are allowed to join the same aggregation group.</li> <li> Running the <b>default interface</b> command does not clear the speed mode configuration on 25 Gbps ports.</li> </ul>

↘ **Configuring the Duplex Mode of an Interface**

- Optional.
- Port flapping may occur if the configured duplex mode of a port changes.
- This command is applicable to an Ethernet physical port or AP port.

<b>Command</b>	<b>duplex { auto   full   half }</b>
<b>Parameter Description</b>	<p><b>auto</b>: Indicates automatic switching between full duplex and half duplex.</p> <p><b>full</b>: Indicates full duplex.</p> <p><b>half</b>: Indicates half duplex.</p>
<b>Defaults</b>	By default, the duplex mode of an interface is auto.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The duplex mode of an interface is related to the interface type. You can run <b>show interfaces</b> to display the configurations of the duplex mode.

↘ **Configuring the Flow Control Mode of an Interface**

- Optional.
- Generally, the flow control mode of an interface is off by default. For some products, the flow control mode is on by default.
- After flow control is enabled on an interface, the flow control frames will be sent or received to adjust the data volume when congestion occurs on the interface.
- Port flapping may occur if the configured flow control mode of a port changes.
- This command is applicable to an Ethernet physical port or AP port.

<b>Command</b>	<b>flowcontrol { auto   off   on }</b>
<b>Parameter Description</b>	<p><b>auto</b>: Indicates automatic flow control.</p> <p><b>off</b>: Indicates that flow control is disabled.</p> <p><b>on</b>: Indicates that flow control is enabled.</p>
<b>Defaults</b>	By default, flow control is disabled on an interface.
<b>Command</b>	Interface configuration mode

<b>Mode</b>	
-------------	--

↘ **Configuring the Auto Negotiation Mode of an Interface**

- Optional.
- Port flapping may occur if the configured auto negotiation mode of a port changes.
- This command is applicable to an Ethernet physical port or AP port.

<b>Command</b>	<b>negotiation mode { on   off }</b>
<b>Parameter</b>	<b>on:</b> Indicates that the auto negotiation mode is on.
<b>Description</b>	<b>off:</b> Indicates that the auto negotiation mode is off.
<b>Defaults</b>	By default, the auto negotiation mode is off.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

↘ **Configuring the MTU of an Interface**

- Optional.
- You can configure the MTU of a port to limit the length of a frame that can be received or sent over this port.
- This command is applicable to an Ethernet physical port or SVI.

<b>Command</b>	<b>mtu num</b>
<b>Parameter</b>	<i>num: 64–9216</i>
<b>Description</b>	
<b>Defaults</b>	By default, the MTU of an interface is 1500 bytes.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to configure the interface MTU, that is, the maximum length of a data frame at the link layer. Currently, you can configure MTU for only a physical port or an AP port that contains one or more member ports.

↘ **Configuring Global MTU**

- Optional.
- Users can set the global MTU and IP MTU to control the maximum length of frames that can be sent and received over all ports.
- Support physical Ethernet port.

<b>Command</b>	<b>mtu forwarding num</b>
<b>Parameter</b>	<i>num: 64–9216</i>
<b>Description</b>	
<b>Defaults</b>	By default, the MTU of an interface is 1500 bytes.
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	The IP MTU automatically changes to the value of the link MTU of an interface when the globally set link MTU changes.

↘ **Configuring the Bandwidth of an Interface**

- Optional.
- Generally, the bandwidth of an interface is the same as the speed of the interface.

<b>Command</b>	<b>bandwidth</b> <i>kilobits</i>
<b>Parameter Description</b>	<i>kilobits</i> : The value ranges from 1 to 2,147,483,647. The unit is kilo bits.
<b>Defaults</b>	Generally, the bandwidth of an interface matches the type of the interface. For example, the default bandwidth of a gigabit Ethernet physical port is 1,000,000, and that of a 10G Ethernet physical port is 10,000,000.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

↘ **Configuring the Carrier Delay of an Interface**

- Optional.
- If the configured carrier delay is long, it takes a long time to change the protocol status when the physical status of an interface changes. If the carrier delay is set to 0, the protocol status changes immediately after the physical status of an interface changes.

<b>Command</b>	<b>carrier-delay</b> {[ <i>milliseconds</i> ] <i>num</i>   up [ <i>milliseconds</i> ] <i>num</i> down [ <i>milliseconds</i> ] <i>num</i> }
<b>Parameter Description</b>	<i>num</i> : The value ranges from 0 to 60. The unit is second. <b>milliseconds</b> : Indicates the carrier delay. The value ranges from 0 to 60,000. The unit is millisecond. <b>Up</b> : Indicates the delay after which the state of the DCD changes from Down to Up. <b>Down</b> : Indicates the delay after which the state of the DCD changes from Up to Down.
<b>Defaults</b>	By default, the carrier delay of an interface is 2s.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If millisecond is used as the unit, the configured carrier delay must be an integer multiple of 100 milliseconds.

↘ **Configuring the Load Interval of an Interface**

- Optional.
- The configured load interval affects computation of the average packet rate on an interface. If the configured load interval is short, the average packet rate can accurately reflect the changes of the real-time traffic.

<b>Command</b>	<b>load-interval</b> <i>seconds</i>
<b>Parameter</b>	<i>seconds</i> : The value ranges from 5 to 600. The unit is second.

<b>Description</b>	
<b>Defaults</b>	By default, the load interval of an interface is 10s.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring a Protected Port

- Optional.
- L2 packets cannot be forwarded between protected ports.
- This command is applicable to an Ethernet physical port or AP port.

<b>Command</b>	<b>switchport protected</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, no protected port is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ↘ Blocking L3 Routing Between Protected Ports

- Optional.
- After this command is configured, L3 routing between protected ports are blocked.

<b>Command</b>	<b>protected-ports route-deny</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, the function of blocking L3 routing between protected ports is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, L3 routing between protected ports is not blocked. In this case, you can run this command to block routing between protected ports.

### ↘ Configuring Port Errdisable Recovery

- Optional.
- By default, a port will be disabled and will not be recovered after a violation occurs. After port errdisable recovery is configured, a port in errdisable state will be recovered and enabled.

<b>Command</b>	<b>errdisable recovery [interval time   cause link-state]</b>
<b>Parameter Description</b>	<i>time</i> : Indicates the automatic recovery time. The value ranges from 30 to 86,400. The unit is second. <i>link-state</i> : Restores the port that is set to the errdisable state by the REUP link state tracking function.
<b>Defaults</b>	By default, port errdisable recovery is disabled.
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	By default, a port in errdisable state is not recovered. You can recover the port manually or run this command to automatically recover the port.

↘ **Configuring MAC Addresses for Interfaces**

- Optional. If this function is required, run the **mac-address** command in interface configuration mode.
- By default, MAC addresses of interfaces have fixed values.

<b>Command</b>	<b>mac-address</b> <i>mac-address</i>
<b>Parameter Description</b>	<b>Mac-address:</b> Indicates a valid MAC address.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

↘ **Configuring the VLAN Encapsulation Flag for Interfaces**

- Optional. If this function is required, run the **encapsulation dot1Q** command in interface configuration mode.
- By default, the VLAN encapsulation protocol is disabled for interfaces.

<b>Command</b>	<b>encapsulation dot1Q</b> <i>VlanID</i>
<b>Parameter Description</b>	<b>VlanID:</b> Indicates the VLAN ID. The value range is from <b>1</b> to <b>4094</b> .
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

↘ **Configuring Interface FEC Mode**

- Optional.
- By default, FEC mode is disabled on a 25 Gbps port, and whether the FEC mode is enabled or disabled on a 100 Gbps port is determined by the inserted optical module.

<b>Command</b>	<b>fec mode {rs   base-r   none   auto}</b>
<b>Parameter Description</b>	rs: Enable FEC mode by rs. Supported by 100 Gbps port. base-r: Enable FEC mode by base-r. Supported by 25 Gbps port. none: Enable FEC function. auto: Whether the FEC mode is enabled or disabled is determined by the inserted optical module. Supported by 100 Gbps port.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

↘ **Configuring Statistics Sampling Cycle on Ethernet Port**

- Optional.

- The default statistics sampling cycle of Ethernet ports is 5 seconds.

<b>Command</b>	<b>ethernet-port counter sample-period [ seconds ]</b>
<b>Parameter Description</b>	seconds: Unit of the sampling cycle.
<b>Defaults</b>	rs: Enable FEC mode by rs. Supported by 100 Gbps port. base-r: Enable FEC mode by base-r. Supported by 25 Gbps port. none: Enable FEC function. auto: Whether the FEC mode is enabled or disabled is determined by the inserted optical module. Supported by 100 Gbps port.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A shorter sampling cycle indicates higher system performance consumption. Therefore, the sampling cycle must be adjusted as required.

### Verification

- Run the **show interfaces** command to display the attribute configurations of interfaces.

<b>Command</b>	<b>show interfaces [ interface-type interface-number ] [ description   switchport   trunk ]</b>
<b>Parameter Description</b>	<i>interface-type interface-number</i> : Indicates the type and number of the interface. <b>description</b> : Indicates the interface description, including the link status. <b>switchport</b> : Indicates the L2 interface information. This parameter is effective only for a L2 interface. <b>trunk</b> : Indicates the Trunk port information. This parameter is effective for a physical port or an AP port.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Use this command without any parameter to display the basic interface information.
	<pre>SwitchA#show interfaces GigabitEthernet 0/1 Index(dec):1 (hex):1 GigabitEthernet 0/1 is DOWN, line protocol is DOWN   Hardware is Broadcom 5464 GigabitEthernet, address is 00d0.f865.de9b (bia 00d0.f865.de9b)   Interface address is: no ip address   Interface IPv6 address is:     No IPv6 address   MTU 1500 bytes, BW 1000000 Kbit   Encapsulation protocol is Ethernet-II, loopback not set   Keepalive interval is 10 sec, set   Carrier delay is 2 sec</pre>

```

Ethernet attributes:

  Last link state change time: 2012-12-22 14:00:48
  Time duration since last link state change: 3 days, 2 hours, 50 minutes, 50 seconds
  Priority is 0
  Medium-type is Copper
  Admin duplex mode is AUTO, oper duplex is Unknown
  Admin speed is AUTO, oper speed is Unknown
  Flow receive control admin status is OFF,flow send control admin status is OFF
  Flow receive control oper status is Unknown,flow send control oper status is
Unknown

  Storm Control: Broadcast is OFF, Multicast is OFF, Unicast is OFF

Bridge attributes:

  Port-type: trunk
  Native vlan:1
  Allowed vlan lists:1-4094 //Allowed VLAN list of the Trunk port
  Active vlan lists:1, 3-4 //Active VLAN list (indicating that only VLAN 1, VLAN
3, and VLAN 4 are created on the device)

  Rxload is 1/255,Txload is 1/255

  5 minutes input rate 0 bits/sec, 0 packets/sec
  5 minutes output rate 0 bits/sec, 0 packets/sec

  0 packets input, 0 bytes, 0 no buffer, 0 dropped
  Received 0 broadcasts, 0 runts, 0 giants
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 abort
  0 packets output, 0 bytes, 0 underruns, 0 dropped
  0 output errors, 0 collisions, 0 interface resets
    
```

- Run the **show eee interfaces status** command to display the EEE status of an interface.

<b>Command</b>	<b>show eee interfaces</b> { <i>interface-type interface-number</i>   <i>status</i> }
<b>Parameter</b>	<i>interface-type interface-number</i> . Indicates the type and number of an interface.
<b>Description</b>	<b>status</b> : Indicates the EEE status of all interfaces.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	If the interface is specified, the EEE status of the specified interface is displayed; otherwise, the EEE status of all interfaces is displayed.

1. Display the EEE status of GigabitEthernet 0/1.

```
Ruijie#show eee interface gigabitEthernet 0/1
Interface           : Gi0/1
EEE Support         : Yes
Admin Status       : Enable
Oper Status        : Disable
Remote Status      : Disable
Trouble Cause      : Remote Disable
```

Interface	Indicates the interface information.
EEE Support	Indicates whether EEE is supported.
Admin Status	Indicates the administrative status.
Oper Status	Indicates the operational status.
Trouble Cause	Indicates the reason why the EEE status of an interface is abnormal.

2. Display the EEE status of all interfaces.

```
Ruijie#show eee interface status
Interface EEE      Admin   Oper    Remote  Trouble
           Support Status  Status  Status  Cause
-----
Gi0/1   Yes   Enable  Disable  Disable  Remote Disable
Gi0/2   Yes   Enable  Disable  Unknown  None
Gi0/3   Yes   Enable  Enable   Enable   None
Gi0/4   Yes   Enable  Enable   Enable   None
Gi0/5   Yes   Enable  Enable   Enable   None
Gi0/6   Yes   Enable  Enable   Enable   None
Gi0/7   Yes   Enable  Enable   Enable   None
Gi0/8   Yes   Enable  Enable   Enable   None
Gi0/9   Yes   Enable  Enable   Enable   None
Gi0/10  Yes   Enable  Enable   Enable   None
```

Interface	Indicates the interface information.
EEE Support	Indicates whether EEE is supported.
Admin Status	Indicates the administrative status.
Oper Status	Indicates the operational status.
Trouble Cause	Indicates the reason why the EEE status of an

		interface is abnormal.
--	--	------------------------

## Configuration Example

### Configuring Interface Attributes

<p><b>Scenario</b> Figure 1-1</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>On Switch A, configure GigabitEthernet 0/1 as an access mode, and the default VLAN ID is 1. Configure SVI 1, assign an IP address to SVI 1, and set up a route to Switch D.</li> <li>On Switch B, configure GigabitEthernet 0/1 and GigabitEthernet 0/2 as Trunk ports, and the default VLAN ID is 1. Configure SVI 1, and assign an IP address to SVI 1. Configure GigabitEthernet 0/3 as a routed port, and assign an IP address from another network segment to this port.</li> <li>On Switch C, configure GigabitEthernet 0/1 as an Access port, and the default VLAN ID is 1. Configure SVI 1, and assign an IP address to SVI 1.</li> <li>On Switch D, configure GigabitEthernet 0/1 as a routed port, assign an IP address to this port, and set up a route to Switch A.</li> </ul>

D

```
D# show interfaces gigabitEthernet 0/1

Index(dec):1 (hex):1

GigabitEthernet 0/1 is UP, line protocol is UP

Hardware is GigabitEthernet, address is 00d0.f865.de93 (bia 00d0.f865.de93)

Interface address is: 192.168.2.1/24

MTU 1500 bytes, BW 100000 Kbit

Encapsulation protocol is Ethernet-II, loopback not set

Keepalive interval is 10 sec, set

Carrier delay is 2 sec

Ethernet attributes:

  Last link state change time: 2012-12-22 14:00:48

  Time duration since last link state change: 3 days, 2 hours, 50 minutes, 50 seconds

  Priority is 0

  Admin medium-type is Copper, oper medium-type is Copper

  Admin duplex mode is AUTO, oper duplex is Full

  Admin speed is AUTO, oper speed is 100M

  Flow control admin status is OFF, flow control oper status is OFF

  Admin negotiation mode is OFF, oper negotiation state is ON

  Storm Control: Broadcast is OFF, Multicast is OFF, Unicast is OFF

Rxload is 1/255, Txload is 1/255

10 seconds input rate 0 bits/sec, 0 packets/sec

10 seconds output rate 67 bits/sec, 0 packets/sec

  362 packets input, 87760 bytes, 0 no buffer, 0 dropped

  Received 0 broadcasts, 0 runts, 0 giants

  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 abort

  363 packets output, 82260 bytes, 0 underruns, 0 dropped

  0 output errors, 0 collisions, 0 interface resets
```

## 1.6 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the counters of a specified interface.	<b>clear counters</b> [ <i>interface-type interface-number</i> ]
Resets the interface hardware.	<b>clear interface</b> <i>interface-type interface-number</i>
Clears the statistics of link status change.	<b>clear link-state-change statistics</b> [ <i>interface-type interface-number</i> ]

## Displaying

### ▾ Displaying Interface Configurations and Status

Description	Command
Displays all the status and configuration information of a specified interface.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ]
Displays the interface status.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>status</b>
Displays the interface errdisable status.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>status err-disable</b>
Displays the link status change time and count of a specified port.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>link-state-change statistics</b>
Displays the administrative and operational states of switch ports (non-routed ports).	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>switchport</b>
Displays the description and status of a specified interface.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>description</b>
Displays the counters of a specified port, among which the displayed speed may have an error of ±0.5%.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>counters</b>
Displays the number of packets increased in a load interval.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>counters increment</b>
Displays statistics about error packets.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>counters error</b>
Displays the packet sending/receiving rate of an interface.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>counters rate</b>
Displays the packet sending/receiving rate of an interface at the physical layer. The packet sending/receiving rate at the physical layer refers to the sending/receiving rate of packets that contain interframe spacing.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>counters rate physical-layer</b>
Displays a summary of interface information.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>counters summary</b>
Displays the bandwidth usage of an interface.	<b>show interfaces</b> [ <i>interface-type interface-number</i> ] <b>usage</b>
Displays the global MTU information.	<b>show interface</b> [ <i>interface-type interface-number</i> ] <b>mtu forwarding</b>
Displays the sub VLAN interface information.	<b>show vlans</b>

### ▾ Displaying Optical Module Information

Description	Command
-------------	---------

Displays basic information about the optical module of a specified interface.	<b>show interfaces [ <i>interface-type interface-number</i> ] transceiver</b>
Displays the fault alarms of the optical module on a specified interface. If no fault occurs, "None" is displayed.	<b>show interfaces [ <i>interface-type interface-number</i> ] transceiver alarm</b>
Displays the optical module diagnosis values of a specified interface.	<b>show interfaces [ <i>interface-type interface-number</i> ] transceiver diagnosis</b>

## 2 Configuring MAC Address

### 2.1 Overview

A MAC address table contains the MAC addresses, interface numbers and VLAN IDs of the devices connected to the local device.

When a device forwards a packet, it finds an output port from its MAC address table according to the destination MAC address and the VLAN ID of the packet.

After that, the packet is unicast, multicast or broadcast.

**i** This document covers dynamic MAC addresses, static MAC addresses and filtered MAC addresses. For the management of multicast MAC addresses, please see *Configuring IGMP Snooping Configuration*.

#### Protocols and Standards

- IEEE 802.3: Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications
- IEEE 802.1Q: Virtual Bridged Local Area Networks

### 2.2 Applications

Application	Description
<a href="#">MAC Address Learning</a>	Forward unicast packets through MAC addresses learning.
<a href="#">MAC Address Change Notification</a>	Monitor change of the devices connected to a network device through MAC address change notification.

#### 2.2.1 MAC Address Learning

##### Scenario

Usually a device maintains a MAC address table by learning MAC addresses dynamically. The operating principle is described as follows:

As shown in the following figure, the MAC address table of the switch is empty. When User A communicates with User B, it sends a packet to the port GigabitEthernet 0/2 of the switch, and the switch learns the MAC address of User A and stores it in the table.

As the table does not contain the MAC address of User B, the switch broadcasts the packet to the ports of all connected devices except User A, including User B and User C.

Figure 2-1 Step 1 of MAC Address Learning

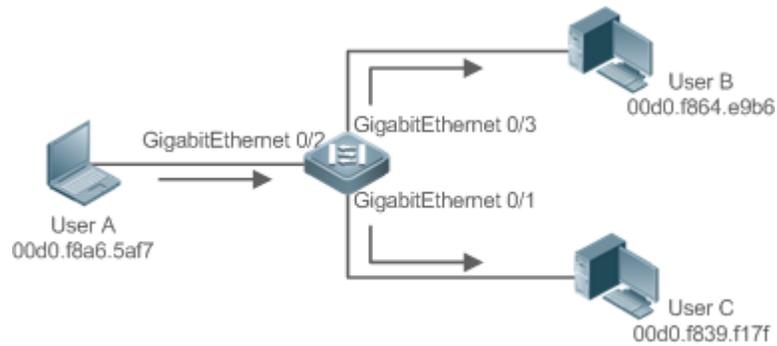

Figure 2-2 MAC Address Table 1

Status	VLAN	MAC address	Interface
Dynamic	1	00d0.f8a6.5af7	GigabitEthernet 0/2

When User B receives the packet, it sends a reply packet to User A through port GigabitEthernet 0/3 on the switch. As the MAC address of User A is already in the MAC address table, the switch send the reply unicast packet to port GigabitEthernet 0/2 port and learns the MAC address of User B. User C does not receive the reply packet from User B to User A.

Figure 2-3 Step 2 of MAC Address Learning

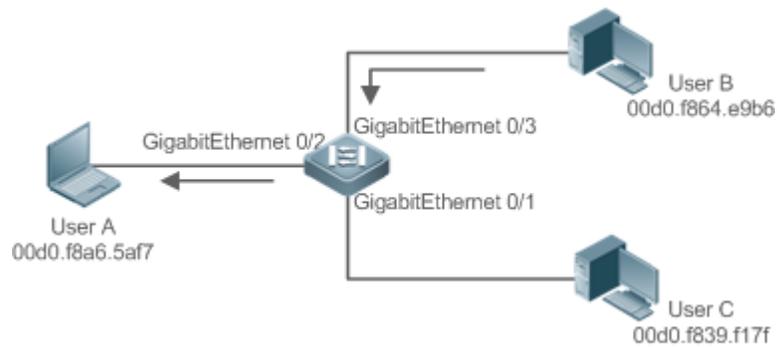

Figure 2-4 MAC Address Table 2

Status	VLAN	MAC address	Interface
Dynamic	1	00d0.f8a6.5af7	GigabitEthernet 0/2
Dynamic	1	00d0.f8a4.e9b6	GigabitEthernet 0/3

Through the interaction between User A and User B, the switch learns the MAC addresses of User A and User B. After that, packets between User A and User B will be exchanged via unicast without being received by User C.

## Deployment

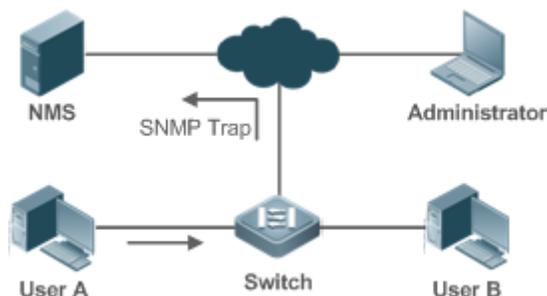

- With MAC address learning, a layer-2 switch forwards packets through unicast, reducing broadcast packets and network load.

## 2.2.2 MAC Address Change Notification

MAC address change notification provides a mechanism for the network management system (NMS) to monitor the change of devices connected to a network device.

### Scenario

Figure 2-5 MAC Address Change Notification

After MAC address change notification is enabled on a device, the device generates a notification message when the device learns a new MAC address or finishes aging a learned MAC address, and sends the message in an SNMP Trap message to a specified NMS.

A notification of adding a MAC address indicates that a new user accesses the network, and that of deleting a MAC address indicates that a user sends no packets within an aging time and usually the user exits the network.

When a network device is connected to a number of devices, a lot of MAC address changes may occur in a short time, resulting in an increase in traffic. To reduce traffic, you may configure an interval for sending MAC address change notifications. When the interval expires, all notifications generated during the interval are encapsulated into a message.

When a notification is generated, it is stored in the table of historical MAC address change notifications. The administrator may know recent MAC address changes by checking the table of notification history even without NMS.

**i** A MAC address change notification is generated only for a dynamic MAC address.

### Deployment

- Enable MAC address change notification on a layer-2 switch to monitor the change of devices connected to a network device.

## 2.3 Features

### Basic Concepts

#### Dynamic MAC Address

A dynamic MAC address is a MAC address entry generated through the process of MAC address learning by a device.

#### Address Aging

A device only learns a limited number of MAC addresses, and inactive entries are deleted through address aging.

A device starts aging a MAC address when it learns it. If the device receives no packet containing the source MAC address, it will delete the MAC address from the MAC address table when the time expires.

#### ↳ Forwarding via Unicast

If a device finds in its MAC address table an entry containing the MAC address and the VLAN ID of a packet and the output port is unique, it will send the packet through the port directly.

#### ↳ Forwarding via Broadcast

If a device receives a packet containing the destination address ffff.ffff.ffff or an unidentified destination address, it will send the packet through all the ports in the VLAN where the packet is from, except the input port.

### Overview

Feature	Description
<a href="#">Dynamic Address Limit for VLAN</a>	Limit the number of dynamic MAC addresses in a VLAN.
<a href="#">Dynamic Address Limit for Interface</a>	Limit the number of dynamic MAC addresses on an interface.

## 2.3.1 Dynamic Address Limit for VLAN

### Working Principle

The MAC address table with a limited capacity is shared by all VLANs. Configure the maximum number of dynamic MAC addresses for each VLAN to prevent one single VLAN from exhausting the MAC address table space.

A VLAN can only learn a limited number of dynamic MAC addresses after the limit is configured. The packets exceeding the limit are broadcast.

- i** If the number of learned MAC addresses is greater than the limit, a device will stop learning the MAC addresses from the VLAN and will not start learning again until the number drops below the limit after address aging.
- i** The MAC addresses copied to a specific VLAN are not subject to the limit.

## 2.3.2 Dynamic Address Limit for Interface

### Working Principle

An interface can only learn a limited number of dynamic MAC addresses after the limit is configured. The packets exceeding the limit are broadcast

- i** If the number of learned MAC addresses is greater than the limit, a device will stop learning the MAC addresses from the interface and will not start learning again until the number drops below the limit after address aging.

## 2.4 Limitations

S6500 series products do not learn or forward packets whose source MAC address and destination MAC address is all 0.

## 2.5 Configuration

Configuration	Description and Command	
<a href="#">Configuring Dynamic MAC Address</a>	(Optional) It is used to enable MAC address learning.	
	<b>mac-address-learning</b>	Configures MAC address learning globally or on an interface.
	<b>mac-address-table aging-time</b>	Configures an aging time for a dynamic MAC address.
<a href="#">Configuring a Static MAC Address</a>	(Optional) It is used to bind the MAC address of a device with a port of a switch.	
	<b>mac-address-table static</b>	Configures a static MAC address.
<a href="#">Configuring a MAC Address for Packet Filtering</a>	(Optional) It is used to filter packets.	
	<b>mac-address-table filtering</b>	Configures a MAC address for packet filtering.
<a href="#">Configuring MAC Address Change Notification</a>	(Optional) It is used to monitor change of devices connected to a network device.	
	<b>mac-address-table notification</b>	Configures MAC address change notification globally.
	<b>snmp trap mac-notification</b>	Configures MAC address change notification on an interface.
<a href="#">Configuring a Management VLAN for an AP Port</a>	(Optional) It is used to configure a management VLAN for an AP port.	
	<b>aggregateport-admin vlan</b>	Configures a management VLAN for an AP port.
<a href="#">Configuring the Alarm Logging Function for MAC Address Drift</a>	(Optional) It is used to configure the alarm logging function for detected MAC address drift.	
	<b>mac-address-table flapping-logging</b>	
<a href="#">Configuring the Maximum Number of Learned MAC Addresses</a>	(Optional) It is used to configure the maximum number of learned MAC addresses.	
	<b>max-dynamic-mac-count</b> <i>count</i>	
<a href="#">Configuring Packet Discarding When the</a>	(Optional) It is used to configure the packet processing method when the number of learned MAC addresses exceeds the address limit.	

Configuration	Description and Command
<a href="#">Number of Learned MAC Addresses Exceeds the Address Limit</a>	<b>max-dynamic-mac-count exceed-action</b> <i>forward   discard</i>

## 2.5.1 Configuring Dynamic MAC Address

### Configuration Effect

Learn MAC addresses dynamically and forward packets via unicast.

### Configuration Steps

#### ▾ **Configuring Global MAC Address Learning**

- Optional.
- You can perform this configuration to disable global MAC address learning.
- Configuration:

<b>Command</b>	<b>mac-address-learning { enable   disable }</b>
<b>Parameter</b>	<b>enable:</b> Enables global MAC address learning.
<b>Description</b>	<b>disable:</b> Disable global MAC address learning.
<b>Defaults</b>	Global MAC address learning is enabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

- i** By default, global MAC address learning is enabled. When global MAC address learning is enabled, the MAC address learning configuration on an interface takes effect; when the function is disabled, MAC addresses cannot be learned globally.

#### ▾ **Configuring MAC Address Learning on Interface**

- Optional.
- You can perform this configuration to disable MAC address learning on an interface.
- Configuration:

<b>Command</b>	<b>mac-address-learning</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	MAC address learning is enabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Perform this configuration on a layer-2 interface, for example, a switch port or an AP port.

**i** By default, MAC address learning is enabled. If DOT1X, IP SOURCE GUARD, or a port security function is configured on a port, MAC address learning cannot be enabled. Access control cannot be enabled on a port with MAC address learning disabled.

**▾ Configuring an Aging Time for a Dynamic MAC Address**

- Optional.
- Configure an aging time for dynamic MAC addresses.
- Configuration:

<b>Command</b>	<b>mac-address-table aging-time</b> <i>value</i>
<b>Parameter Description</b>	<i>value</i> : Indicates the aging time. The value is either 0 or in the range from 10 to 1000,000.
<b>Defaults</b>	The default is 300s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the value is set to 0, MAC address aging is disabled and learned MAC addresses will not be aged.

**i** The actual aging time may be different from the configured value, but it is not more than two times of the configured value.

**Verification**

- Check whether a device learns dynamic MAC addresses.
- Run the **show mac-address-table dynamic** command to display dynamic MAC addresses.
- Run the **show mac-address-table aging-time** command to display the aging time for dynamic MAC addresses.

<b>Command</b>	<b>show mac-address-table dynamic</b> [ <b>address</b> <i>mac-address</i> ] [ <b>interface</b> <i>interface-id</i> ] [ <b>vlan</b> <i>vlan-id</i> ]
<b>Parameter Description</b>	<b>address</b> <i>mac-address</i> : Displays the information of a specific dynamic MAC address. <b>interface</b> <i>interface-id</i> : Specifies a physical interface or an AP port. <b>vlan</b> <i>vlan-id</i> : Displays the dynamic MAC addresses in a specific VLAN.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

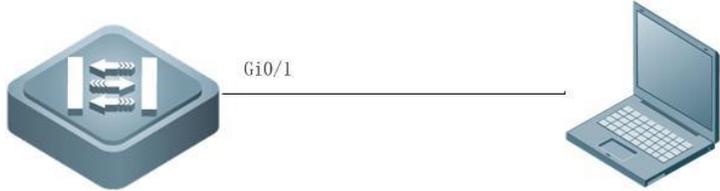

```
Ruijie# show mac-address-table dynamic
Vlan      MAC Address      Type      Interface
-----  -
1         0000.0000.0001   DYNAMIC   GigabitEthernet 1/1
1         0001.960c.a740   DYNAMIC   GigabitEthernet 1/1
1         0007.95c7.dff9   DYNAMIC   GigabitEthernet 1/1
1         0007.95cf.eee0   DYNAMIC   GigabitEthernet 1/1
```

1	0007.95cf.f41f	DYNAMIC	GigabitEthernet 1/1
1	0009.b715.d400	DYNAMIC	GigabitEthernet 1/1
1	0050.bade.63c4	DYNAMIC	GigabitEthernet 1/1
Field	Description		
Vlan	Indicates the VLAN where the MAC address resides.		
MAC Address	Indicates a MAC Address.		
Type	Indicates a MAC address type.		
Interface	Indicates the interface where the MAC address resides.		

<b>Command</b>	<b>show mac-address-table aging-time</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A
	<pre>Ruijie# show mac-address-table aging-time Aging time      : 300</pre>

## Configuration Example

### Configuring Dynamic MAC Address

<b>Scenario</b> Figure 2-6	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable MAC address learning on an interface.</li> <li>● Configure the aging time for dynamic MAC addresses to 180s.</li> <li>● Delete all dynamic MAC addresses in VLAN 1 on port GigabitEthernet 0/1.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config-if-GigabitEthernet 0/1)# mac-address-learning Ruijie(config-if-GigabitEthernet 0/1)# exit Ruijie(config)# mac aging-time 180 Ruijie# clear mac-address-table dynamic interface GigabitEthernet 0/1 vlan 1</pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check MAC address learning on an interface.</li> <li>● Display the aging time for dynamic MAC addresses.</li> <li>● Display all dynamic MAC addresses in VLAN 1 on port GigabitEthernet 0/1.</li> </ul>
	<pre> Ruijie# show mac-address-learning  GigabitEthernet 0/1      learning ability: enable  Ruijie# show mac aging-time  Aging time      : 180 seconds  Ruijie# show mac-address-table dynamic interface GigabitEthernet 0/1 vlan 1  Vlan          MAC Address          Type          Interface ----- 1             00d0.f800.1001        STATIC       GigabitEthernet 1/1                     </pre>

### Common Errors

Configure MAC address learning on an interface before configuring the interface as a layer-2 interface, for example, a switch port or an AP port.

## 2.5.2 Configuring a Static MAC Address

### Configuration Effect

- Bind the MAC address of a network device with a port of a switch.

### Configuration Steps

#### ▾ Configuring a Static MAC address

- Optional.
- Bind the MAC address of a network device with a port of a switch.
- Configuration:

<b>Command</b>	<b>mac-address-table static</b> <i>mac-address</i> <b>vlan</b> <i>vlan-id</i> <b>interface</b> <i>interface-id</i>
<b>Parameter</b>	<b>address</b> <i>mac-address</i> : Specifies a MAC address.
<b>Description</b>	<b>vlan</b> <i>vlan-id</i> : Specifies a VLAN where the MAC address resides. <b>interface</b> <i>interface-id</i> : Specifies a physical interface or an AP port.
<b>Defaults</b>	By default, no static MAC address is configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When the switch receives a packet containing the specified MAC address on the specified VLAN, the packet is forwarded to the bound interface.

## Verification

- Run the **show mac-address-table static** command to check whether the configuration takes effect.

<b>Command</b>	<b>show mac-address-table static</b> [ <b>address</b> <i>mac-address</i> ] [ <b>interface</b> <i>interface-id</i> ] [ <b>vlan</b> <i>vlan-id</i> ]																
<b>Parameter Description</b>	<b>address</b> <i>mac-address</i> : Specifies a MAC address. <b>interface</b> <i>interface-id</i> : Specifies a physical interface or an AP port. <b>vlan</b> <i>vlan-id</i> : Specifies a VLAN where the MAC address resides.																
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode /Interface configuration mode																
<b>Usage Guide</b>	N/A																
	<pre>Ruijie# show mac-address-table static</pre> <table border="1"> <thead> <tr> <th>Vlan</th> <th>MAC Address</th> <th>Type</th> <th>Interface</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>00d0.f800.1001</td> <td>STATIC</td> <td>GigabitEthernet 1/1</td> </tr> <tr> <td>1</td> <td>00d0.f800.1002</td> <td>STATIC</td> <td>GigabitEthernet 1/1</td> </tr> <tr> <td>1</td> <td>00d0.f800.1003</td> <td>STATIC</td> <td>GigabitEthernet 1/1</td> </tr> </tbody> </table>	Vlan	MAC Address	Type	Interface	1	00d0.f800.1001	STATIC	GigabitEthernet 1/1	1	00d0.f800.1002	STATIC	GigabitEthernet 1/1	1	00d0.f800.1003	STATIC	GigabitEthernet 1/1
Vlan	MAC Address	Type	Interface														
1	00d0.f800.1001	STATIC	GigabitEthernet 1/1														
1	00d0.f800.1002	STATIC	GigabitEthernet 1/1														
1	00d0.f800.1003	STATIC	GigabitEthernet 1/1														

## Configuration Example

### Configuring a Static MAC address

In the above example, the relationship of MAC addresses, VLAN and interfaces is shown in the following table.

Role	MAC Address	VLAN ID	Interface ID
Web Server	00d0.3232.0001	VLAN2	Gi0/10
Database Server	00d0.3232.0002	VLAN2	Gi0/11
Administrator	00d0.3232.1000	VLAN2	Gi0/12

<p><b>Scenario</b> Figure 2-7</p>
<p><b>Configuration Steps</b></p> <ul style="list-style-type: none"> <li>● Specify destination MAC addresses (<i>mac-address</i>).</li> <li>● Specify the VLAN (<i>vlan-id</i>) where the MAC addresses reside.</li> </ul>

	<ul style="list-style-type: none"> <li>Specify interface IDs (<i>interface-id</i>).</li> </ul>																
<b>A</b>	<pre>A# configure terminal A(config)# mac-address-table static 00d0.f800.3232.0001 vlan 2 interface gigabitEthernet 0/10 A(config)# mac-address-table static 00d0.f800.3232.0002 vlan 2 interface gigabitEthernet 0/11 A(config)# mac-address-table static 00d0.f800.3232.1000 vlan 2 interface gigabitEthernet 0/12</pre>																
<b>Verification</b>	Display the static MAC address configuration on a switch.																
<b>A</b>	<pre>A# show mac-address-table static</pre> <table border="1"> <thead> <tr> <th>Vlan</th> <th>MAC Address</th> <th>Type</th> <th>Interface</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>00d0.f800.3232.0001</td> <td>STATIC</td> <td>GigabitEthernet 0/10</td> </tr> <tr> <td>2</td> <td>00d0.f800.3232.0002</td> <td>STATIC</td> <td>GigabitEthernet 0/11</td> </tr> <tr> <td>2</td> <td>00d0.f800.3232.1000</td> <td>STATIC</td> <td>GigabitEthernet 0/12</td> </tr> </tbody> </table>	Vlan	MAC Address	Type	Interface	2	00d0.f800.3232.0001	STATIC	GigabitEthernet 0/10	2	00d0.f800.3232.0002	STATIC	GigabitEthernet 0/11	2	00d0.f800.3232.1000	STATIC	GigabitEthernet 0/12
Vlan	MAC Address	Type	Interface														
2	00d0.f800.3232.0001	STATIC	GigabitEthernet 0/10														
2	00d0.f800.3232.0002	STATIC	GigabitEthernet 0/11														
2	00d0.f800.3232.1000	STATIC	GigabitEthernet 0/12														

### Common Errors

- Configure a static MAC address before configuring the specific port as a layer-2 interface, for example, a switch port or an AP port.

## 2.5.3 Configuring a MAC Address for Packet Filtering

### Configuration Effect

- If a device receives packets containing a source MAC address or destination MAC address specified as the filtered MAC address, the packets are discarded.

### Configuration Steps

#### Configuring a MAC Address for Packet Filtering

- Optional.
- Perform this configuration to filter packets.
- Configuration:

<b>Command</b>	<b>mac-address-table filtering</b> <i>mac-address</i> <b>vlan</b> <i>vlan-id</i>
<b>Parameter</b>	<b>address</b> <i>mac-address</i> : Specifies a MAC address.
<b>Description</b>	<b>vlan</b> <i>vlan-id</i> : Specifies a VLAN where the MAC address resides.
<b>Defaults</b>	By default, no filtered MAC address is configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If a device receives packets containing a source MAC address or destination MAC address specified as the

	filtered MAC address, the packets are discarded.
--	--

### Verification

- Run the **show mac-address-table filter** command to display the filtered MAC address.

<b>Command</b>	<b>show mac-address-table filter [ address <i>mac-address</i> ] [ vlan <i>vlan-id</i> ]</b>
<b>Parameter Description</b>	<b>address <i>mac-address</i></b> : Specifies a MAC address. <b>vlan <i>vlan-id</i></b> : Specifies a VLAN where the MAC address resides.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode /Interface configuration mode
<b>Usage Guide</b>	N/A
	<pre>Ruijie# show mac-address-table filtering Vlan      MAC Address      Type      Interface ----- 1         0000.2222.2222   FILTER</pre>

### Configuration Example

#### Configuring a MAC Address for Packet Filtering

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Specify a destination MAC address (<i>mac-address</i>) for filtering.</li> <li>● Specify a VLAN where the MAC addresses resides.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# mac-address-table static 00d0.f800.3232.0001 vlan 1</pre>
<b>Verification</b>	Display the filtered MAC address configuration.
	<pre>Ruijie# show mac-address-table filter Vlan      MAC Address      Type      Interface ----- 1         00d0.f800.3232.0001 FILTER</pre>

## 2.5.4 Configuring MAC Address Change Notification

### Configuration Effect

- Monitor change of devices connected to a network device.

### Configuration Steps

#### Configuring NMS

- Optional.
- Perform this configuration to enable an NMS to receive MAC address change notifications.
- Configuration:

<b>Command</b>	<b>snmp-server host</b> <i>host-addr</i> <b>traps</b> [ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> [ <b>auth</b>   <b>noauth</b>   <b>priv</b> ] } ] <i>community-string</i>
<b>Parameter</b>	<b>host</b> <i>host-addr</i> : Specifies the IP address of a receiver.
<b>Description</b>	<ul style="list-style-type: none"> <li>● <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> [ <b>auth</b>   <b>noauth</b>   <b>priv</b> ] }: Specifies the version of SNMP TRAP messages. You can also specify authentication and a security level for packets of Version 3.</li> </ul> <i>community-string</i> : Indicates an authentication name.
<b>Defaults</b>	By default, the function is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling SNMP Trap

- Optional.
- Perform this configuration to send SNMP Trap messages.
- Configuration:

<b>Command</b>	<b>snmp-server enable traps</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, the function is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring Global MAC Address Change Notification

- Optional.
- If MAC address change notification is disabled globally, it is disabled on all interfaces.
- Configuration:

<b>Command</b>	<b>mac-address-table notification</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, MAC address change notification is disabled globally.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring MAC Address Change Notification On Interface

- Optional.
- Perform this configuration to enable MAC address change notification on an interface.
- Configuration:

<b>Command</b>	<b>snmp trap mac-notification { added   removed }</b>
<b>Parameter Description</b>	<b>added:</b> Generates a notification when an MAC address is added. <b>removed:</b> Generates a notification when an MAC address is deleted.
<b>Defaults</b>	By default, MAC address change notification is disabled on an interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

↘ **Configuring Interval for Generating MAC Address Change Notifications and Volume of Notification History**

- Optional.
- Perform this configuration to modify the interval for generating MAC address change notifications and the volume of notification history.
- Configuration:

<b>Command</b>	<b>mac-address-table notification { interval <i>value</i>   history-size <i>value</i> }</b>
<b>Parameter Description</b>	<b>interval <i>value</i>:</b> (Optional) Indicates the interval for generating MAC address change notifications. The value ranges from 1 to 3600 seconds., <b>history-size <i>value</i>:</b> Indicates the maximum number of entries in the table of notification history. The value ranges from 1 to 200.
<b>Defaults</b>	The default interval is 1 second. The default maximum amount of notifications is 50.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

**Verification**

- Run the **show mac-address-table notification** command to check whether the NMS receives MAC address change notifications.

<b>Command</b>	<b>show mac-address-table notification [ interface [ <i>interface-id</i> ]   history ]</b>
<b>Parameter Description</b>	<b>Interface:</b> Displays the configuration of MAC address change notification on all interfaces. <b><i>interface-id</i>:</b> Displays the configuration of MAC address change notification on a specified interface. <b>history:</b> Displays the history of MAC address change notifications.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode /Interface configuration mode
<b>Usage Guide</b>	N/A
<b>Usage Guide</b>	Display the configuration of global MAC address change notification.

```
Ruijie#show mac-address-table notification
```

MAC Notification Feature : **Enabled**

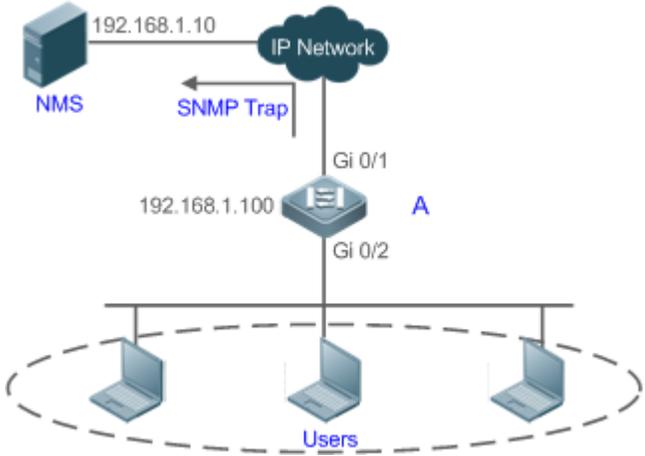

Interval(Sec): **300**

Maximum History Size : **50**

Current History Size : **0**

Field	Description
Interval(Sec)	Indicates the interval for generating MAC address change notifications.
Maximum History Size	Indicates the maximum number of entries in the table of notification history.
Current History Size	Indicates the current notification entry number.

### Configuration Example

<p><b>Scenario</b> Figure 2-8</p>	 <p>The figure shows an intranet of an enterprise. Users are connected to A via port Gi0/2.</p> <p>The Perform the configuration to achieve the following effects:</p> <ul style="list-style-type: none"> <li>● When port Gi0/2 learns a new MAC address or finishes aging a learned MAC address, a MAC address change notification is generated.</li> <li>● Meanwhile, A sends the MAC address change notification in an SNMP Trap message to a specified NMS.</li> <li>● In a scenario where A is connected to a number of Users, the configuration can prevent MAC address change notification burst in a short time so as to reduce the network flow.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable global MAC address change notification on A, and configure MAC address change notification on port Gi0/2.</li> <li>● Configure the IP address of the NMS host, and enable A with SNMP Trap. A communicates with the NMS via routing.</li> </ul>

## 2.5.5 Configuring a Management VLAN for an AP Port

### Configuration Effect

- Enable an AP port to process the packets from a management VLAN as management packets, and those from a non-management VLAN as data packets.

### Configuration Steps

#### ▾ Configuring a Management VLAN for an AP Port

- Optional.
- Perform this configuration to enable an AP port to distinguish management packets from data packets.
- Configuration:

<b>Command</b>	<code>aggregateport-admin vlan <i>vlan-list</i></code>
<b>Parameter Description</b>	<i>vlan-list</i> : Indicates a VLAN or a range of VLANs separated by "-".
<b>Defaults</b>	By default, no management VLAN is configured for an AP port.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	An AP port processes the packets received on the management VLAN as management packets.

### Verification

- An AP port processes the packets from a management VLAN as management packets, and those from a non-management VLAN as data packets.

### Configuration Example

#### ▾ Configuring a Management VLAN for an AP Port

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Specify management VLANs for an AP port.</li> </ul>
----------------------------	--

	<pre>Ruijie# configure terminal Ruijie(config)# aggregateport-admin vlan 1-20</pre>
<b>Verification</b>	Run the <b>show running</b> command to display the configuration.

## 2.5.6 Configuring MAC Address Flapping Check

### Configuration Effect

- Print a syslog alarm when MAC address flapping occurs, that is, a MAC address is learned by more than one port in a short time in a VLAN.

### Configuration Steps

#### 📌 Configuring MAC Address Flapping Check

- Optional.
- Configure this configuration to print a syslog alarm upon MAC address flapping.
- Configuration:

<b>Command</b>	<b>mac-address-table flapping-logging</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, the function is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Verification

- Run the **show run** command to display the configuration.
- Print syslog to check the MAC address flapping.

### Configuration Example

#### 📌 Configuring Syslog Printing upon MAC Address Flapping

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable syslog printing upon MAC address flapping.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# mac-address-table flapping-logging</pre>
<b>Verification</b>	Run the show running command to display the configuration.

## 2.5.7 Configuring the MAC Address Flapping Protection Policy

### Configuration Effect

- When MAC address flapping is detected on a port with the MAC address flapping protection policy configured, the port will be shut down.

### Notes

- The MAC address flapping detection function must be enabled.

### Configuration Steps

#### ▾ Configuring the MAC Address Flapping Protection Policy

- Optional
- Perform this operation to prevent MAC address flapping between different ports.
- Perform this operation on the switch.

<b>Command</b>	<b>mac-address-table flapping action [error-down   priority <i>priority-num</i>]</b>
<b>Parameter Description</b>	<b>error-down:</b> Specifies the policy that a port is shut down if MAC address flapping is detected on the port. <b>priority <i>priority-num</i>:</b> Indicates the priority of the port shutdown policy. The default value is <b>0</b> (the lowest priority). The value ranges from 0 to 5. A larger value indicates a higher priority.
<b>Defaults</b>	By default, the MAC address flapping protection function is disabled.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The MAC address flapping check function must be enabled first. Otherwise, the configuration does not take effect.

### Verification

- Run **show run** to query the configuration result.

### Configuration Example

#### ▾ Configuring the MAC Address Flapping Protection Policy

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable the MAC address flapping detection function.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# mac-address-table flapping-logging</pre>
	<ul style="list-style-type: none"> <li>● Configure the MAC address flapping protection policy.</li> </ul> <pre>Ruijie(config)# interface GigabitEthernet 1/1 Ruijie(config-if-GigabitEthernet 1/1)# mac-address-table flapping action error-down</pre>

	<pre>Ruijie(config-if-GigabitEthernet 1/1)# mac-address-table flapping action priority 2</pre>
<b>Verification</b>	Run <b>show running</b> on the switch to query the configuration.

**Common Errors**

None

**2.5.8 Configuring the Maximum Number of MAC Addresses Learned by a Port**

**Configuration Effect**

- Only a limited number of dynamic MAC addresses can be learned by a port.

**Notes**

None

**Configuration Steps**

📌 **Configuring the Maximum Number of MAC Addresses Learned by a Port**

- Optional
- Perform this operation on the switch.

<b>Command</b>	<b>max-dynamic-mac-count</b> <i>count</i>
<b>Parameter Description</b>	<b>count:</b> Indicates the maximum number of MAC addresses learned by a port.
<b>Defaults</b>	By default, the number of MAC addresses learned by a port is not limited. After the number of MAC addresses learned by a port is limited and after the maximum number of MAC addresses exceeds the limit, packets from source MAC addresses are forwarded by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	

**Verification**

- Run **show run** to query the configuration result.

**Configuration Example**

📌 **Configuring the Maximum Number of MAC Addresses Learned by a Port**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the maximum number of MAC addresses learned by a port.</li> </ul>
	<ul style="list-style-type: none"> <li>● Configure the maximum number of MAC addresses learned by a port and the countermeasure for the</li> </ul>

	<p>case that the number of MAC addresses exceeds the limit.</p> <pre>Ruijie(config)# interface GigabitEthernet 1/1 Ruijie(config-if-GigabitEthernet 1/1)# max-dynamic-mac-count 100 Ruijie(config-if-GigabitEthernet 1/1)# max-dynamic-mac-count exceed-action discard</pre>
<b>Verification</b>	Run <b>show running</b> on the switch to query the configuration.

### Common Errors

None

## 2.5.9 Configuring the Maximum Number of MAC Addresses Learned by a VLAN

### Configuration Effect

- Only a limited number of dynamic MAC addresses can be learned by a VLAN.

### Notes

None

### Configuration Steps

#### ▾ Configuring the Maximum Number of MAC Addresses Learned by a VLAN

- Optional
- Perform this operation on the switch.

<b>Command</b>	<b>max-dynamic-mac-count exceed-action</b> <i>forward   discard</i>
<b>Parameter Description</b>	<b>Forward/discard:</b> Indicates that packets are forwarded or discarded when the number of MAC addresses learned by a VLAN exceeds the limit.
<b>Defaults</b>	By default, the number of MAC addresses learned by a VLAN is not limited. After the number of MAC addresses learned by a VLAN is limited and after the maximum number of MAC addresses exceeds the limit, packets from source MAC addresses are forwarded by default.
<b>Command Mode</b>	VLAN configuration mode
<b>Usage Guide</b>	N/A

### Verification

- Run **show run** to query the configuration result.

### Configuration Example

#### ▾ Configuring the Maximum Number of MAC Addresses Learned by a VLAN

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the maximum number of MAC addresses learned by a VLAN.</li> </ul>
	<ul style="list-style-type: none"> <li>Configure the maximum number of MAC addresses learned by a VLAN and the countermeasure for the case that the number of MAC addresses exceeds the limit.</li> </ul> <pre>Ruijie(config)# vlan 2 Ruijie(config-vlan)#max-dynamic-mac-count 100 Ruijie(config-vlan)# max-dynamic-mac-count exceed-action discard</pre>
<b>Verification</b>	Run <b>show running</b> on the switch to query the configuration.

## Common Errors

None

## 2.6 Monitoring

### Clearing

 Running the clear commands may lose vital information and interrupt services.

Description	Command
Clears dynamic MAC addresses.	<b>clear mac-address-table dynamic</b> [ <b>address</b> <i>mac-address</i> ] [ <b>interface</b> <i>interface-id</i> ] [ <b>vlan</b> <i>vlan-id</i> ]

### Displaying

Description	Command
Displays the MAC address table.	<b>show mac-address-table</b> { <b>dynamic</b>   <b>static</b>   <b>filter</b> } [ <b>address</b> <i>mac-address</i> ] [ <b>interface</b> <i>interface-id</i> ] [ <b>vlan</b> <i>vlan-id</i> ]
Displays the aging time for dynamic MAC addresses.	<b>show mac-address-table aging-time</b>
Displays the maximum number of dynamic MAC addresses.	<b>show mac-address-table max-dynamic-mac-count</b>
Displays the configuration and history of MAC address change notifications.	<b>show mac-address-table notification</b> [ <b>interface</b> [ <i>interface-id</i> ]   <b>history</b> ]

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs MAC address operation.	<b>debug bridge mac</b>

## 3 Configuring Aggregate Port

### 3.1 Overview

An aggregate port (AP) is used to bundle multiple physical links into one logical link to increase the link bandwidth and improve connection reliability.

An AP port supports load balancing, namely, distributes load evenly among member links. Besides, an AP port realizes link backup. When a member link of the AP port is disconnected, the load carried by the link is automatically allocated to other functional member links. A member link does not forward broadcast or multicast packets to other member links.

For example, the link between two devices supports a maximum bandwidth of 1,000 Mbps. When the service traffic carried by the link exceeds 1,000 Mbps, the traffic in excess will be discarded. Port aggregation can be used to solve the problem. For example, you can connect the two devices with network cables and combine multiple links to form a logical link capable of multiples of 1,000 Mbps.

For example, there are two devices connected by a network cable. When the link between the two ports of the devices is disconnected, the services carried by the link will be interrupted. After the connected ports are aggregated, the services will not be affected as long as one link remains connected.

#### Protocols and Standards

- IEEE 802.3ad

### 3.2 Applications

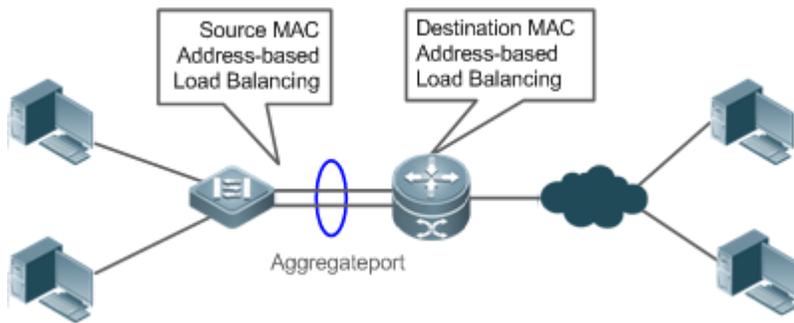

Applications	Description
<a href="#">AP Link Aggregation and Load Balancing</a>	A large number of packets are transmitted between an aggregation device and a core device, which requires a greater bandwidth. To meet this requirement, you can bundle the physical links between the devices into one logical link to increase the link bandwidth, and configure a proper load balancing algorithm to distribute the work load evenly to each physical link, thus improving bandwidth utilization.

#### 3.2.1 AP Link Aggregation and Load Balancing

##### Scenario

In Figure 31, the switch communicates with the router through an AP port. All the devices on the intranet (such as the two PCs on the left) use the router as a gateway. All the devices on the extranet (such as the two PCs on the right) send packets to the internet devices through the router, with the gateway's MAC address as its source MAC address. To distribute the load between the router and other hosts to other links, configure destination MAC address-based load balancing. On the switch, configure source MAC address-based load balancing.

Figure 3-1 AP Link Aggregation and Load Balancing

### Deployment

- Configure the directly connected ports between the switch and router as a static AP port or a Link Aggregation Control Protocol (LACP) AP port.
- On the switch, configure a source MAC address-based load balancing algorithm.
- On the router, configure a destination MAC address-based load balancing algorithm.
- Features

## 3.3 Features

### Basic Concepts

#### Static AP

The static AP mode is an aggregation mode in which physical ports are directly added to an AP aggregation group through manual configuration to allow the physical ports to forward packets when the ports are proper in link state and protocol state. An AP port in static AP mode is called a static AP, and its member ports are called static AP member ports.

#### LACP

LACP is a protocol about dynamic link aggregation. It exchanges information with the connected device through LACP data units (LACPDUs).

An AP port in LACP mode is called an LACP AP port, and its member ports are called LACP AP member ports.

#### AP Member Port Mode

There are three aggregation modes available, namely, active, passive, and static.

AP member ports in active mode initiate LACP negotiation. AP member ports in passive mode only respond to received LACPDUs. AP member ports in static mode do not send LACPDUs for negotiation. The following table lists the requirements for peer port mode.

Port Mode	Peer Port Mode
Active mode	Active or passive mode

Port Mode	Peer Port Mode
Passive mode	Active mode
Static Mode	Static Mode

### AP Member Port State

There are two kinds of AP member port state available:

- When a member port is Down, the port cannot forward packets. The Down state is displayed.
- When a member port is Up and the link protocol is ready, the port can forward packets. The Up state is displayed.

There are three kinds of LACP member port state:

- When the link of a port is Down, the port cannot forward packets. The Down state is displayed.
- When the link of a port is Up and the port is added to an aggregation group, the bndl state is displayed.
- When the link of a port is Up but the port is suspended because the peer end is not enabled with LACP or the attributes of the ports are inconsistent with those of the master port, the susp state is displayed. (The port in susp state does not forward packets.)

- 
- i** Only full-duplex ports are capable of LACP aggregation.
  - i** LACP aggregation can be implemented only when the rates, flow control approaches, medium types, and Layer-2/3 attributes of member ports are consistent.
  - i** If you modify the preceding attributes of a member port in the aggregation group, LACP aggregation will fail.
  - !** The ports which are prohibited from joining or exiting an AP port cannot be added to or removed from a static AP port or an LACP AP port.
- 

### AP Capacity Mode

The maximum number of member ports is fixed, which is equal to the maximum number of AP ports multiplied by the maximum number of member ports supported by a single AP port. If you want to increase the maximum number of AP ports, the maximum number of member ports supported by a single AP port must be reduced, and vice versa. This concerns the AP capacity mode concept. Some devices support the configuration of the AP capacity mode. For example, if the system supports 16,384 member ports, you can select the 1024 x 16, 512 x 32, and other AP capacity modes (Maximum number of AP ports multiplied by the maximum number of member ports supported by a single AP port).

### LACP System ID

By default, all the LACP ports on a device belong to the same LACP aggregation system.

One device can be configured with only one LACP aggregation system. The system is identified by a system ID and each system has a priority, which is a configurable value. The system ID consists of the LACP system priority and MAC address of the device. A lower system priority indicates a higher priority of the system ID. If the system priorities are the same, a smaller MAC address of the device indicates a higher priority of the system ID. The system with an ID of a higher priority determines the port state. The port state of a system with an ID of a lower priority keeps consistent with that of a higher priority.

The LACP system ID can be configured when LACP ports of multiple (a maximum of four) independent devices need to negotiate with the LACP port of a specific device (for example, LACP ports of two independent ASWs need to negotiate with the LACP port of the NC). You can set the system IDs of the LACP ports of independent devices to the same MAC address and configure different device IDs to implement normal negotiation.

#### ↳ LACP Device ID

The LACP device ID can be configured when LACP ports of multiple independent devices need to negotiate with the LACP port of a specific device. It must be configured together with the system ID.

#### ↳ LACP Port ID

Each port has an independent LACP port priority, which is a configurable value. The port ID consists of the LACP port priority and port number. A smaller port priority indicates a higher priority of the port ID. If the port priorities are the same, a smaller port number indicates a higher priority of the port ID.

#### ↳ LACP Master Port

When dynamic member ports are Up, LACP selects one of those ports to be the master port based on the rates and duplex modes, ID priorities of the ports in the aggregation group, and the bundling state of the member ports in the Up state. Only the ports that have the same attributes as the master port are in Bundle state and participate in data forwarding. When the attributes of ports are changed, LACP reselects a master port. When the new master port is not in Bundle state, LACP disaggregates the member ports and performs aggregation again.

#### ↳ Minimum Number of AP Member Ports

An AP can be configured with a minimum number of AP member ports. When a member port exits the AP aggregation group, causing the number of member ports to be smaller than the minimum number, the other member ports in the group are unbundled (Down Status). When the member port rejoins the group, causing the number of member ports to be greater than the minimum number, the member ports in the group are automatically bundled (Up Status).

#### ↳ LACP Independent Ports

In normal cases, LACP independent ports are used for interworking between access switches and servers with two NICs. If the OS is not pre-installed when a server with two NICs starts, the OS needs to be installed via the remote PXE OS installation device. Before the OS is installed, the server with two NICs cannot perform LACP negotiation with the access device, and only one NIC can work. In this case, the port on the access device must be able to change to a common Ethernet physical port automatically to ensure normal communication between the server and the remote PXE OS installation device. After the OS is installed and both NICs can run the LACP, the port on the access device must be able to enable the LACP again for negotiation.

---

 LACP independent ports can work only at layer 2. After an LACP independent port is enabled, if the LACP independent port does not receive LACP packets, it automatically changes to a common Ethernet port, which automatically copies the rate, duplex mode, flow control, and VLAN configuration from the AP port to ensure port forwarding capabilities.

 An LACP independent port automatically changes to a common Ethernet port only if it does not receive LACP packets within the set time-out period. After the port receives LACP packets, it changes to an LACP member port again.

---

## Overview

Overview	Description
<a href="#">Link Aggregation</a>	Aggregates physical links statically or dynamically to realize bandwidth extension and link backup.
<a href="#">Load Balancing</a>	Balances the load within an aggregation group flexibly by using different load balancing methods.

### 3.3.1 Link Aggregation

#### Working Principle

There are two kinds of AP link aggregation. One is static AP, and the other is dynamic aggregation through LACP.

- Static AP

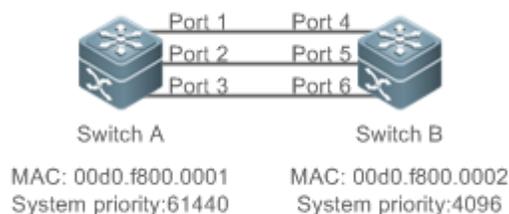

The static AP configuration is simple. Run a command to add the specified physical port to the AP port. After joining the aggregation group, a member port can receive and transmit data and participate in load balancing within the group.

- Dynamic AP (LACP)

An LACP-enabled port sends LACPDUs to advertise its system priority, system MAC address, port priority, port number, and operation key. When receiving the LACPDU from the peer end, the device compares the system priorities of both ends based on the system ID in the packet. The end with a higher system ID priority sets the ports in the aggregation group to Bundle state based on the port ID priorities in a descending order, and sends an updated LACPDU. When receiving the LACPDU, the peer end sets corresponding ports to Bundle state so that both ends maintain consistency when a port exits or joins the aggregation group. The physical link can forward packets only after the ports at both ends are bundled dynamically.

After link aggregation, the LACP member ports periodically exchange LACPDUs. When a port does not receive an LACPDU in the specified time, a timeout occurs and the links are unbundled. In this case, the member ports cannot forward packets. There are two timeout modes: long timeout and short timeout. In long timeout mode, a port sends a packet every 30s. If it does not receive a packet from the peer end in 90s, a timeout occurs. In short timeout mode, a port sends a packet every 1s. If it does not receive a packet from the peer end in 3s, a timeout occurs. (The default timeout time in LACP short timeout mode is 3 seconds. The value is changeable.)

Figure 3-2 LACP Negotiation

In Figure 1-2, Switch A is connected to Switch B through three ports. Set the system priorities of Switch A and Switch B to 61440 and 4096 respectively. Enable LACP on the Ports 1–6, set the aggregation mode to the active mode, and set the port priority to the default value 32768.

When receiving an LACPDU from Switch A, Switch B finds that it has a higher system ID priority than Switch A (the system priority of Switch B is higher than that of Switch A). Switch B sets Port 4, Port 5, and Port 6 to Bundle state based on the

order of port ID priorities (or in an ascending order of port numbers if the port priorities are the same). When receiving an updated LACPDU from Switch B, Switch A finds that Switch B has a higher system ID priority and has set Port 4, Port 5, and Port 6 to Bundle state. Then Switch A also sets Port 1, Port 2, and Port 3 to Bundle state.

### 3.3.2 Load Balancing

#### Working Principle

AP ports segregate packet flows by using load balancing algorithms based on packet features, such as the source and destination MAC addresses, source and destination IP addresses, and Layer-4 source and destination port numbers. The packet flow with the consistent feature is transmitted by one member link, and different packet flows are evenly distributed to member links. For example, in source MAC address-based load balancing, packets are distributed to the member links based on the source MAC addresses of the packets. Packets with different source MAC addresses are evenly distributed to member links. Packets with the identical source MAC address are forwarded by one member link.

Currently, there are several AP load balancing modes as follows:

- Source MAC address or destination MAC address
- Source MAC address + destination MAC address
- Source IP address or destination IP address
- Source IP address + destination IP address
- Layer-4 source port number or Layer-4 destination port number
- Layer-4 source port number + Layer-4 destination port number
- Source IP address + Layer-4 source port number
- Source IP address + Layer-4 destination port number
- Destination IP address + Layer-4 source port number
- Destination IP address + Layer-4 destination port number
- Source IP address + Layer-4 source port number + Layer-4 destination port number
- Destination IP address + Layer-4 source port number + Layer-4 destination port number
- Source IP address + destination IP address + Layer-4 source port number
- Source IP address + destination IP address + Layer-4 destination port number
- Source IP address + destination IP address + Layer-4 source port number + Layer-4 destination port number
- Panel port for incoming packets
- Labels of Multiprotocol Label Switching (MPLS) packets
- Aggregation member port polling
- Enhanced mode

-  Load balancing based on IP addresses or port numbers is applicable only to Layer-3 packets. When a device enabled with this load balancing method receives Layer-2 packets, it automatically switches to the default load balancing method.
-  All the load balancing methods use a load algorithm (hash algorithm) to calculate the member links based on the input parameters of the methods. The input parameters include the source MAC address, destination MAC address, source MAC address + destination MAC address, source IP address, destination IP address, source IP address + destination IP addresses, source IP address + destination IP address + Layer-4 port number and so on. The algorithm ensures that packets with different input parameters are evenly distributed to member links. It does not indicate that these packets are always distributed to different member links. For example, in IP address-based load balancing, two packets with different source and destination IP addresses may be distributed to the same member link through calculation.
-  Different products may support different load balancing algorithms.

### Enhanced Load Balancing

Enhanced load balancing allows the combination of multiple fields in different types of packets. These fields include **src-mac**, **dst-mac**, **I2-protocol**, and **src-port** in Layer-2 packets, **src-ip**, **dst-ip**, **protocol**, **I4-src-port**, **I4-dst-port**, and **src-port** in IPv4 packets, **src-ip**, **dst-ip**, **protocol**, **I4-src-port**, **I4-dst-port**, and **src-port** in IPv6 packets; **top-label**, **2nd-label**, **3rd-label**, **src-ip**, **dst-ip**, **vlan**, **src-port**, **src-mac**, **dst-mac**, **protocol**, **I4-src-port**, **I4-dst-port**, and **I2-etype** in MPLS packets; and **vlan**, **src-port**, **src-id**, **rx-id**, **ox-id**, **fabric-id**, and **dst-id** in FCoE packets.

A device enabled with enhanced load balancing first determines the type of packets to be transmitted and performs load balancing based on the specified fields in the packets. For example, the AP port performs source IP-based load balancing on the packets containing an ever-changing source IPv4 address.

-  All the load balancing methods are applicable to Layer-2 and Layer-3 AP ports. You need to configure proper load distribution methods based on different network environments to fully utilize network bandwidth.
-  Perform enhanced load balancing based on the **src-mac**, **dst-mac**, and **vlan** fields in Layer-2 packets, and the **src-ip** field in IPv4 packets. If the incoming packet is an IPv4 packet with an ever-changing source MAC address, the enhanced balancing algorithm does not take effect, because the device will perform load balancing only based on the **src-ip** field in the IPv4 packet after finding that it is an IPv4 packet.
-  In enhanced load balancing, the MPLS balancing algorithm takes effect only for MPLS Layer-3 VPN packets, but does not take effect for MPLS Layer-2 VPN packets.

### Hash Load Balancing Control

Hash load balancing enables users to control load balancing flexibly in different scenarios. Currently, Ruijie adopts the following hash load balancing control functions:

- Hash disturbance factor: Traffic over AP ports is hashed for balancing. For two devices of the same type, the same path will be calculated for load balancing for the same stream. When the ECMP is deployed, the same stream of the two devices may be balanced to the same destination device, resulting in hash polarization. The hash disturbance factor is used to affect the load balancing algorithm. Different disturbance factors are configured for different devices to ensure that different paths are provided for the same stream.

- Hash synchronization: To ensure network security, a firewall cluster is deployed between the internal and external networks for traffic cleaning. This requires that both the uplink and downlink traffic of a session is transmitted to the same device in the firewall cluster for processing. The source and destination IP addresses contained in the uplink and downlink streams of a session are reversed. The uplink and downlink streams will be directed to different firewalls in the firewall cluster based on the traditional hash algorithm. The hash synchronization function ensures that uplink and downlink streams of a session be transmitted over the same path.
- Hash algorithm mode: Apply the most appropriate hash algorithm mode to different traffic, so that when traffic changes, balance can still be kept. For example, if the source and destination MAC addresses of a stream increase 1 at the same time, configure the algorithm based on the source and destination MAC addresses cannot keep stream balance. At the moment, a suitable hash algorithm mode needs to be applied.
- Hash factor acquisition mode: There are an inner layer and an outer layer in the header in each of VXLAN packets, GRE packets, and other tunnel packets. It can be specified to obtain the hash factor from the inner layer or outer layer, to achieve a better balancing effect. For example, in some scenarios, tunnel packets share the same outer IP address but have different inner IP addresses. In this case, the inner IP address can be specified as the hash factor to optimize traffic balancing.

### 3.3.3 Member Port BFD Detection

#### Working Principle

Bidirectional Forwarding Detection (BFD) is a protocol that delivers fast detection of path failures. According to RFC7130, LACP takes 3s to detect link failures even in short timeout mode. The packets distributed to the faulty link during the 3-second period will be lost. BFD delivers faster failure detection. You can configure BFD on member ports to detect link failure and switch load to other member links in case of a link failure.

Because BFD is a Layer-3 protocol, you need to configure BFD on Layer-3 AP ports. BFD is classified into IPv4 detection and IPv6 detection, which detect IPv4 and IPv6 paths respectively. When BFD detects that the path on a member port fails, the packets will not be distributed to the member port.

After BFD is enabled on an AP port, BFD sessions are set up on its member ports in forwarding state independently.

## 3.4 Limitations

- Each AP of the S6500 series products contains up to eight member ports, and each device supports up to 256 APs by default.
- For S6500 series products, the capacity mode of APs can be set to any one of the following: 255\*16, 127\*32, 63\*64, and 31\*128. In these modes, the maximum number of member ports supported by each AP is 16, 32, 64, and 128 respectively, and the maximum number of supported APs is 255, 127, 63, and 31 respectively. The default configuration is 255\*16.

- When the S6500 series products adopt load balancing that is based on the source MAC address, destination MAC address, or source MAC address + destination MAC address, the devices also use the Ethernet type

field and VLAN field of unicast packets as balancing factors by default.

- The S6500 series products adopt the non-enhanced load balancing mode. With the Internet Group Management Protocol snooping (IGMP snooping) or multicast routing enabled, the keywords for load balancing of multicast packets are src-ip, dst-ip, or src-ip+dst-ip. The keywords for load balancing of other multicast packets, unknown unicast packets, and broadcast packets are src-mac, dst-mac, or src-mac+dst-mac. For example, when layer-3 packets (unknown unicast, multicast, and broadcast packets) are forwarded at layer 2, load balancing cannot be performed based on src-ip or dst-ip. In this case, the enhanced mode can be adopted because load balancing is performed based on the packet type in this mode.
- In load balancing mode based on src-dst-ip-l4port, L4port changes on the S6500 series products are valid only to unicast packets.
- The S6500 series products support AP-based load balancing algorithms. AP-based load balancing algorithms support load balancing based only on SMAC, DMAC, SMAC+DMAC, SIP, DIP, and SIP+DIP.
- The S6500 series products do not support the Round Robin (RR) load balancing algorithm.
- Enhanced load balancing templates of the S6500 series products support the following fields:  
 L2 template: src-mac dst-mac vlan l2-protocol src-port  
 IPv4 template: src-ip dst-ip protocol vlan l4-src-port l4-dst-port src-port  
 IPv6 template: src-ip dst-ip protocol vlan l4-src-port l4-dst-port src-port

### 3.5 Configuration

Configuration	Description and Command	
<a href="#">Configuring Static AP Ports</a>	 (Mandatory) It is used to configure link aggregation manually.	
	<b>interface aggregateport</b>	Creates an Ethernet AP port.
	<b>interface san-port-channel</b>	Creates an FC AP port.
	<b>port-group</b>	Configures static AP member ports.
<a href="#">Configuring LACP AP Ports</a>	 (Mandatory) It is used to configure link aggregation dynamically.	
	<b>port-group mode</b>	Configures LACP member ports.
	<b>lACP system-priority</b>	Configures the LACP system priority.
	<a href="#"><b>lACP short-timeout period</b></a>	Configures the timeout time of the LACP system in short timeout mode.
	<b>lACP port-priority</b>	Configures the port priority.
	<b>lACP short-timeout</b>	Configures the short timeout mode on a port.
<a href="#">Enabling LinkTrap</a>	 (Optional) It is used to enable LinkTrap.	
	<b>snmp trap link-status</b>	Enables LinkTrap advertisement for an AP port.
	<b>aggregateport member linktrap</b>	Enables LinkTrap t for AP member ports.

Configuration	Description and Command	
<a href="#">Configuring a Load Balancing Mode</a>	 (Optional) It is used to configure a load balancing mode for an aggregated link.	
	<b>aggregateport load-balance</b>	Configures a load balancing algorithm for an AP port or AP member ports.
	 (Optional) It is used to configure the profile of enhanced load balancing.	
	<b>load-balance-profile</b>	Renames the profile of enhanced load balancing.
	<b>l2 field</b>	Configures a load balancing mode for Layer-2 packets.
	<b>ipv4 field</b>	Configures a load balancing mode for IPv4 packets.
	<b>ipv6 field</b>	Configures a load balancing mode for IPv6 packets.
	<b>mpls field</b>	Configures a load balancing mode for MPLS packets.
	<b>trill field</b>	Configures a load balancing mode for TRILL packets.
	<b>fcoe field</b>	Configures a load balancing mode for FCoE packets.
	 (Optional) It is used to control load balancing policy.	
	<b>aggregateport hash-elasticity enable</b>	Configures flexible hash.
	<b>hash-disturb <i>string</i></b>	Configures hash disturbance factor.
	<b>hash-symmetrical [ipv4   ipv6   fcoe] on]</b>	Configures hash synchronization.
<b>aggregateport hash-header {inner   outer   inner-outer}</b>	Configures the balancing factor acquisition mode for tunnel packet.	
<a href="#">Configuring an AP Capacity Mode</a>	 (Optional) It is used to configure the AP capacity mode.	
	<b>aggregateport capacity mode</b>	Configures an AP capacity mode in global configuration mode.
<a href="#">Enabling BFD for AP Member Ports</a>	 (Optional) It is used to enable BFD for AP member ports.	
	<b>aggregate bfd-detect ipv4</b>	Enables IPv4 BFD for AP member ports.
<a href="#">Configuring a Preferred AP Member Port</a>	 (Optional) It is used to configure an AP member port as the preferred port.	
	<b>aggregateport primary-port</b>	Configures an AP member port as the preferred port.
<a href="#">Configuring the Minimum Number of AP Member Ports</a>	<b>Aggregateport member minimum</b>	Configures the minimum number of AP member ports.

Configuration	Description and Command	
<a href="#">Configuring the Minimum Number of AP Member Ports (Action)</a>	<b>Aggregateport member minimum action</b>	Triggers action when the number of AP member ports in the Up state is less than the minimum number of the AP member ports.
<a href="#">Enabling the LACP Independent Port Function</a>	<b>lACP individual enable</b>	Enables the LACP independent port function.

### 3.5.1 Configuring Static AP Ports

#### Configuration Effect

- Configure multiple physical ports as AP member ports to realize link aggregation.
- The bandwidth of the aggregation link is equal to the sum of the member link bandwidths.
- When a member link of the AP port is disconnected, the load carried by the link is automatically allocated to other functional member links.

#### Notes

- Only physical ports can be added to an AP port.
  - The ports of different media types or port modes cannot be added to the same AP port.
  - Layer-2 ports can be added to only a Layer-2 AP port, and Layer-3 ports can be added to only a Layer-3 AP port. The Layer-2/3 attributes of an AP port that contains member ports cannot be modified.
  - After a port is added to an AP port, the attributes of the port are replaced by those of the AP port.
  - After a port is removed from an AP port, the attributes of the port are restored.
- !** After a port is added to an AP port, the attributes of the port are consistent with those of the AP port. Therefore, do not perform configuration on the AP member ports or apply configuration to a specific AP member port. However, some configurations (the **shutdown** and **no shutdown** commands) can be configured on AP member ports. When you use AP member ports, check whether the function that you want to configure can take effect on a specific AP member port, and perform this configuration properly.

#### Configuration Steps

##### ↳ Creating an Ethernet AP Port

- Mandatory.
- Perform this configuration on an AP-enabled device.

<b>Command</b>	<b>interface aggregateport</b> <i>ap-number</i>
<b>Parameter</b>	<i>ap-number</i> : Indicates the number of an AP port.
<b>Description</b>	
<b>Defaults</b>	By default, no AP port is created.
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	To create an Ethernet AP port, run <b>interfaces aggregateport</b> in global configuration mode. To delete the specified Ethernet AP port, run <b>no interfaces aggregateport ap-number</b> in global configuration mode.
--------------------	---

- i** Run **port-group** to add a physical port to a static AP port in interface configuration mode. If the AP port does not exist, it will be created automatically.
- i** Run **port-group mode** to add a physical port to an LACP AP port in interface configuration mode. If the AP port does not exist, it will be created automatically.
- i** The AP feature must be configured on the devices at both ends of a link and the AP mode must be the same (static AP or LACP AP).

**▾ Configuring Static AP Member Ports**

- Mandatory.
- Perform this configuration on AP-enabled devices.

<b>Command</b>	<b>port-group ap-number</b>
<b>Parameter Description</b>	<b>port-group ap-number</b> . Indicates the number of an AP port.
<b>Defaults</b>	By default, no ports are added to any static AP port.
<b>Command Mode</b>	Interface configuration mode of the specified Ethernet port
<b>Usage Guide</b>	To add member ports to an AP port, run <b>port-group</b> in interface configuration mode. To remove member ports from an AP port, run <b>no port-group</b> in interface configuration mode.

- i** The static AP member ports configured on the devices at both ends of a link must be consistent.
- i** After a member port exits the AP port, the default settings of the member port are restored. Different functions deal with the default settings of the member ports differently. It is recommended that you check and confirm the port settings after a member port exits an AP port.
- i** After a member port exits an AP port, the port is disabled by using the **shutdown** command to avoid loops. After you confirm that the topology is normal, run **no shutdown** in interface configuration mode to enable the port again.

**▾ Converting Layer-2 APs to Layer-3 APs**

- Optional.
- When you need to enable Layer-3 routing on an AP port, for example, to configure IP addresses or static route entries, convert the Layer-2 AP port to a Layer-3 AP port and enable routing on the Layer-3 AP port.
- Perform this configuration on AP-enabled devices that support Layer-2 and Layer-3 features, such as Layer-3 switches or wireless access controllers (ACs).

<b>Command</b>	<b>no switchport</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Defaults</b>	By default, the AP ports are Layer-2 AP ports.
<b>Command Mode</b>	Interface configuration mode of the specified AP port
<b>Usage Guide</b>	The Layer-3 AP feature is supported by only Layer-3 devices.

**i** The AP port created on a Layer-3 device that does not support Layer-2 feature is a Layer-3 AP port. Otherwise, the AP port is a Layer-2 AP port.

### 📌 Creating an Ethernet AP Subinterface

- Optional.
- On a device that supports subinterface configuration, run **interface aggregateport sub-ap-number** to create a subinterface.
- Perform this configuration on AP-enabled devices that support Layer-2 and Layer-3 features, such as Layer-3 switches.

<b>Command</b>	<b>interface aggregateport sub-ap-number</b>
<b>Parameter Description</b>	<i>sub-ap-number</i> : Indicates the number of an AP subinterface.
<b>Defaults</b>	By default, no subinterfaces are created.
<b>Command Mode</b>	Interface configuration mode of the specified AP port
<b>Usage Guide</b>	You need to convert the master port of the AP port to a Layer-3 port before creating a subinterface.

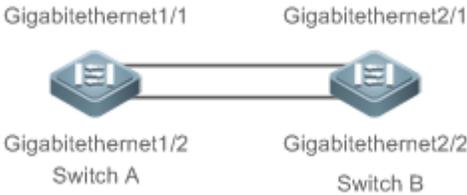

### Verification

- Run **show running** to display the configuration.
- Run **show aggregateport summary** to display the AP configuration.

<b>Command</b>	<b>show aggregateport aggregate-port-number [ load-balance   summary ]</b>
<b>Parameter Description</b>	<i>aggregate-port-number</i> : Indicates the number of an AP port. <b>load-balance</b> : Displays the load balancing algorithm. <b>summary</b> : Displays the summary of each link.
<b>Command Mode</b>	Any mode
<b>Usage Guide</b>	The information on all AP ports is displayed if you do not specify the AP port number.
	<pre> Ruijie# show aggregateport 1 summary AggregatePort  MaxPorts      SwitchPort Mode    Load balance      Ports ----- Ag1             8             Enabled  ACCESS  dst-mac            Gi0/2                     </pre>

### Configuration Example

➤ **Configuring an Ethernet Static AP Port**

<p><b>Scenario</b></p> <p><b>Figure 3-2</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Add the GigabitEthernet 1/1 and GigabitEthernet 1/2 ports on Switch A to static AP port 3.</li> <li>● Add the GigabitEthernet 2/1 and GigabitEthernet 2/2 ports on Switch B to static AP port 3.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# configure terminal SwitchA(config)# interface range GigabitEthernet 1/1-2 SwitchA(config-if-range)# port-group 3</pre>
<p><b>Switch B</b></p>	<pre>SwitchB# configure terminal SwitchB(config)# interface range GigabitEthernet 2/1-2 SwitchB(config-if-range)# port-group 3</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run <b>show aggregateport summary</b> to check whether AP port 3 contains member ports GigabitEthernet 1/1 and GigabitEthernet 1/2.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# show aggregateport summary AggregatePort MaxPorts SwitchPort Mode Ports ----- Ag3           8      Enabled  ACCESS Gi1/1, Gi1/2</pre>
<p><b>Switch B</b></p>	<pre>SwitchB# show aggregateport summary AggregatePort MaxPorts SwitchPort Mode Ports ----- Ag3           8      Enabled  ACCESS Gi2/1, Gi2/2</pre>

### 3.5.2 Configuring LACP AP Ports

#### Configuration Effect

- Connected devices perform autonegotiation through LACP to realize dynamic link aggregation.
- The bandwidth of the aggregation link is equal to the sum of the member link bandwidths.

- When a member link of the AP port is disconnected, the load carried by the link is automatically allocated to other functional member links.
- It takes LACP 90s to detect a link failure in long timeout mode and 3s in short timeout mode.

## Notes

- After a port exits an LACP AP port, the default settings of the port may be restored. Different functions deal with the default settings of the member ports differently. It is recommended that you check and confirm the port settings after a member port exits an LACP AP port.
- Changing the LACP system priority may cause LACP member ports to be disaggregated and aggregated again.
- Changing the priority of an LACP member port may cause the other member ports to be disaggregated and aggregated again.

## Configuration Steps

### ▾ Configuring LACP Member Ports

- Mandatory.
- Perform this configuration on LACP-enabled devices.

<b>Command</b>	<b>port-group</b> <i>key-number</i> <b>mode</b> { <b>active</b>   <b>passive</b> }
<b>Parameter Description</b>	<i>Key-number</i> : Indicates the management key of an AP port. In other words, it is the LACP AP port number. The maximum value is subject to the number of AP ports supported by the device. <b>active</b> : Indicates that ports are added to a dynamic AP port actively. <b>passive</b> : Indicates that ports are added to a dynamic AP port passively.
<b>Defaults</b>	By default, no physical ports are added to any LACP AP port.
<b>Command Mode</b>	Interface configuration mode of the specified physical port
<b>Usage Guide</b>	Use this command in interface configuration mode to add member ports to an LACP AP port.

 The LACP member port configuration at both ends of a link must be consistent.

### ▾ Configuring the LACP System ID

- Optional.
- Configure the LACP system ID when LACP ports of multiple (a maximum of four) independent devices need to negotiate with the LACP port of a specific device. Configure the LACP system ID together with the LACP device ID.

<b>Command</b>	<b>lACP system-id</b> <i>system-id</i>
<b>Parameter Description</b>	<i>system-id</i> : Indicates the system ID of an aggregation group. It must be a valid unicast MAC address.
<b>Defaults</b>	The LACP system ID is the MAC address of device by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command in interface configuration mode to configure the LACP system ID.

### ▾ Configuring the LACP Device ID

- Optional.
- Configure the LACP device ID when LACP ports of multiple (a maximum of four) independent devices need to negotiate with the LACP port of a specific device. Configure the LACP device ID together with the LACP system ID.

<b>Command</b>	<b>lACP device</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the device ID of an aggregation group. The value ranges from <b>0</b> to <b>3</b> .
<b>Defaults</b>	The LACP device ID is 0 by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command in interface configuration mode to configure the LACP device ID.

### ▾ Configuring the LACP System Priority

- Optional.
- Perform this configuration when you need to adjust the system ID priority. A smaller value indicates a higher system ID priority. The device with a higher system ID priority selects an AP port.
- Perform this configuration on LACP-enabled devices.

<b>Command</b>	<b>lACP system-priority</b> <i>system-priority</i>
<b>Parameter Description</b>	<i>system-priority</i> : Indicates the LACP system priority. The value ranges from 0 to 65535.
<b>Defaults</b>	By default, the LACP system priority is 32768.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command in global configuration mode to configure the LACP system priority. All the dynamic member links share one LACP system priority. Changing the LACP system priority will affect all member links. To restore the default settings, run <b>no lACP system-priority</b> in interface configuration mode.

### ▾ Configuring the Priority of an LACP Member Port

- Optional.
- Perform this configuration when you need to specify the port ID priority. A smaller value indicates a higher port ID priority. The port with the highest port ID priority will be selected as the master port.
- Perform this configuration on LACP-enabled devices.

<b>Command</b>	<b>lACP port-priority</b> <i>port-priority</i>
<b>Parameter Description</b>	<i>port-priority</i> : Indicates the priority of an LACP member port. The value ranges from 0 to 65535.
<b>Defaults</b>	By default, the priority of an LACP member port is 32768.
<b>Command Mode</b>	Interface configuration mode of the specified physical port

<b>Usage Guide</b>	Use this command in global configuration mode to configure the priority of an LACP member port. To restore the settings, run <b>no lacp port-priority</b> in interface configuration mode.
--------------------	--

↘ **Configuring the Timeout Mode of LACP Member Ports**

- Optional.
- When you need to implement real-time link failure detection, configure the short timeout mode. It takes LACP 90s to detect a link failure in long timeout mode and 3s in short timeout mode. (The default timeout time in LACP short timeout mode is 3 seconds. The value is changeable.)
- Perform this configuration on LACP-enabled devices, such as switches.

<b>Command</b>	<b>lacp short-timeout</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, the timeout mode of LACP member ports is long timeout.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The timeout mode is supported only by physical ports. To restore the default settings, run <b>no lacp short-timeout</b> in interface configuration mode.

↘ **Configuring the Timeout Time of the LACP System in Short Timeout Mode**

- Optional.
- Configure this function when the timeout time of a device in LACP short timeout mode needs to be adjusted.
- Configure this function on devices that support the LACP function.

<b>Command</b>	<b>lacp short-timeout period <i>value</i></b>
<b>Parameter Description</b>	<i>value</i> : Indicates the timeout time in short timeout mode. The value ranges from 3 seconds to 90 seconds.
<b>Defaults</b>	The default timeout time in LACP short timeout mode is 3 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In global configuration mode, run the command to configure the timeout time in LACP short timeout mode. All dynamic link groups configured on a device share the same timeout time in LACP short timeout mode. Changing the value will affect all aggregate groups on the switch. In interface configuration mode, run the <b>no lacp short-timeout period</b> command to restore the timeout time in LACP short timeout mode to the default value.

**Verification**

- Run **show running** to display the configuration.
- Run **show lacp summary** to display LACP link state.

<b>Command</b>	<b>show lacp summary [ <i>key-number</i> ]</b>
----------------	--

<b>Parameter Description</b>	<i>key-name</i> : Indicates the number of an LACP AP port.
<b>Command Mode</b>	Any mode
<b>Usage Guide</b>	The information on all LACP AP ports is displayed if you do not specify <i>key-name</i> . The system ID and device ID are displayed if configured.
	<pre> Ruijie#show lacp summary  System Id:32768, 0000.1236.54aa  Flags: S - Device is requesting Slow LACPDUs  F - Device is requesting Fast LACPDUs. A - Device is in active mode.          P - Device is in passive mode. ### 3.5.3 Enabling LinkTrap

#### Configuration Effect

Enable the system with LinkTrap to send LinkTrap messages when aggregation links are changed.

#### Configuration Steps

##### 📌 Enabling LinkTrap for an AP Port

- Optional.
- Enable LinkTrap in interface configuration mode. By default, LinkTrap is enabled. LinkTrap messages are sent when the link state or protocol state of the AP port is changed.

- Perform this configuration on AP-enabled devices.

<b>Command</b>	<b>snmp trap link-status</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, LinkTrap is enabled.
<b>Command Mode</b>	Interface configuration mode of the specified AP port
<b>Usage Guide</b>	Use this command in interface configuration mode to enable LinkTrap for the specified AP port. After LinkTrap is enabled, LinkTrap messages are sent when the link state of the AP port is changed. Otherwise, LinkTrap messages are not sent. By default, LinkTrap is enabled. To disable LinkTrap for an AP port, run <b>no snmp trap link-status</b> in interface configuration mode.  LinkTrap cannot be enabled for a specific AP member port. To enable LinkTrap for all AP member ports, run <b>aggregateport member linktrap</b> in global configuration mode.

↘ **Enabling LinkTrap for AP Member Ports**

- Optional.
- By default, LinkTrap is disabled for AP member ports.
- Perform this configuration on AP-enabled devices.

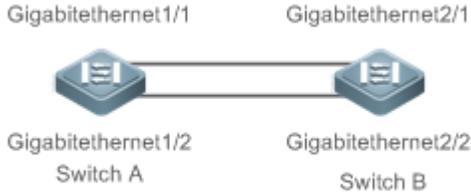

<b>Command</b>	<b>aggregateport member linktrap</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, LinkTrap is disabled for AP member ports.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command in global configuration mode to enable LinkTrap for all AP member ports. By default, LinkTrap messages are not sent when the link state of AP member ports is changed. To disable LinkTrap for all AP member ports, run <b>no aggregateport member linktrap</b> in global configuration mode.

Verification

- Run **show running** to display the configuration.
- After LinkTrap is enabled, you can monitor this feature on AP ports or their member ports by using the MIB software.

Configuration Example

↘ **Enabling LinkTrap for AP Member Ports**

<p><b>Scenario</b></p> <p><b>Figure 3-4</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Add the GigabitEthernet 1/1 and GigabitEthernet 1/2 ports on Switch A to static AP port 3.</li> <li>● Add the GigabitEthernet 2/1 and GigabitEthernet 2/2 ports on Switch B to static AP port 3.</li> <li>● On Switch A, disable LinkTrap for AP port 3 and enable LinkTrap for its member ports.</li> <li>● On Switch B, disable LinkTrap for AP port 3 and enable LinkTrap its AP member ports.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# configure terminal SwitchA(config)# interface range GigabitEthernet 1/1-2 SwitchA(config-if-range)# port-group 3 SwitchA(config-if-range)# exit SwitchA(config)# aggregateport member linktrap SwitchA(config)# interface Aggregateport 3 SwitchA(config-if-AggregatePort 3)# no snmp trap link-status</pre>
<p><b>Switch B</b></p>	<pre>SwitchB# configure terminal SwitchB(config)# interface range GigabitEthernet 2/1-2 SwitchB(config-if-range)# port-group 3 SwitchB(config-if-range)# exit SwitchB(config)# aggregateport member linktrap SwitchB(config)# interface Aggregateport 3 SwitchB(config-if-AggregatePort 3)# no snmp trap link-status</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run <b>show running</b> to check whether LinkTrap is enabled for AP port 3 and its member ports.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# show run   include AggregatePort 3 Building configuration... Current configuration: 54 bytes interface AggregatePort 3   no snmp trap link-status SwitchA# show run   include AggregatePort aggregateport member linktrap</pre>

```

Switch B

interface AggregatePort 3
    no snmp trap link-status

SwitchB# show run | include AggregatePort

aggregateport member linktrap
    
```

### 3.5.4 Configuring a Load Balancing Mode

#### Configuration Effect

- The system distributes incoming packets among member links by using the specified load balancing algorithm. The packet flow with the consistent feature is transmitted by one member link, whereas different packet flows are evenly distributed to various links. A device enabled with enhanced load balancing first determines the type of packets to be transmitted and performs load balancing based on the specified fields in the packets. For example, the AP port performs source IP-based load balancing on the packets containing an ever-changing source IPv4 address.
- In enhanced load balancing mode, configure the hash disturbance factor to ensure that same packets from two devices of the same type will be balanced to different links.
- In enhanced load balancing mode, enable hash synchronization to ensure that uplink and downlink packets of the same type will be transmitted over the same link. For example, in load balancing based on the source and destination IP addresses, enable hash synchronization for IPv4 packets to ensure that the uplink and downlink IPv4 packets will be transmitted over the same path.

#### Notes

- Different disturbance factors may lead to the same disturbance effect.
- Enable or disable hash synchronization for IPv4, IPv6, FCoE and On as required.

#### Configuration Steps

##### 📌 Configuring the Global Load Balancing Algorithm of an AP port

- (Optional) Perform this configuration when you need to optimize load balancing.
- Perform this configuration on AP-enabled devices.

<b>Command</b>	<b>aggregateport load-balance { dst-mac   src-mac   src-dst-mac   dst-ip   src-ip   src-dst-ip   src-dst-ip-l4port   enhanced profile <i>profile-name</i> }</b>
<b>Parameter Description</b>	<b>dst-mac:</b> Indicates that load is distributed based on the destination MAC addresses of incoming packets. <b>src-mac:</b> Indicates that load is distributed based on the source MAC addresses of incoming packets. <b>src-dst-ip:</b> Indicates that load is distributed based on source and destination IP addresses of incoming

	<p>packets.</p> <p><b>dst-ip:</b> Indicates that load is distributed based on the destination IP addresses of incoming packets.</p> <p><b>src-ip:</b> Indicates that load is distributed based on the source IP addresses of incoming packets.</p> <p><b>src-dst-mac:</b> Indicates that load is distributed based on source and destination MAC addresses of incoming packets.</p> <p><b>src-dst-ip-l4port:</b> Indicates that load is distributed based on source IP and destination IP addresses as well as Layer-4 source and destination port numbers.</p> <p><b>enhanced profile <i>profile-name</i>:</b> Indicates the name of the enhanced load balancing profile.</p>
<b>Defaults</b>	Load balancing can be based on source and destination MAC addresses (applicable to switches), source and destination IP addresses (applicable to gateways), or the profile of enhanced load balancing (applicable to switches with CB line cards).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>To restore the default settings, run <b>no aggregateport load-balance</b> in global configuration mode. You can run <b>aggregateport load-balance</b> in interface configuration mode of an AP port on devices that support load balancing configuration on a specific AP port. The configuration in interface configuration mode prevails. To disable the load balancing algorithm, run <b>no aggregateport load-balance</b> in interface configuration mode of the AP port. After that, the load balancing algorithm configured in global configuration mode takes effect.</p> <hr/> <p> You can run <b>aggregateport load-balance</b> in interface configuration mode of an AP port on devices that support load balancing configuration on a specific AP port.</p>

↘ **Renaming the Profile of Enhanced Load Balancing**

- By default, if a device supports enhanced load balancing, the system creates a profile named **default** for enhanced load balancing. Perform this configuration when you need to rename the profile or restore the default settings. In other cases, the configuration is optional.
- Perform this configuration on devices that support enhanced load balancing, such as aggregation switches and core switches.

<b>Command</b>	<b>load-balance-profile <i>profile-name</i></b>
<b>Parameter Description</b>	<i>profile-name</i> : Indicates the profile name, which contains up to 31 characters.
<b>Defaults</b>	The default profile name is <b>default</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>To enter default profile mode, run <b>load-balance-profile default</b>. To rename the enhanced load balancing profile, run <b>load-balance-profile <i>profile-nam</i></b>. To restore the default profile name, run <b>default load-balance-profile</b> in global configuration mode. To restore the default load balancing settings, run <b>default load-balance-profile <i>profile-name</i></b> in global configuration mode.</p> <p>Only one profile is supported globally. Please do not delete the profile. To display the enhanced load</p>

	balancing profile, run <b>show load-balance-profile</b> .
--	---

➤ **Configuring the Layer-2 Packet Load Balancing Mode**

- (Optional) Perform this configuration to specify the Layer-2 packet load balancing mode.
- Perform this configuration on devices that support enhanced load balancing, such as aggregation switches and core switches.

<b>Command</b>	<b>l2 field</b> { [ <b>src-mac</b> ] [ <b>dst-mac</b> ] [ <b>l2-protocol</b> ] [ <b>src-port</b> ] [ <b>dst-port</b> ] }
<b>Parameter Description</b>	<p><b>src-mac</b>: Indicates that load is distributed based on the source MAC addresses of incoming Layer-2 packets.</p> <p><b>dst-mac</b>: Indicates that load is distributed based on the destination MAC addresses of incoming Layer-2 packets.</p> <p><b>l2-protocol</b>: Indicates that load is distributed based on the Layer-2 protocol types of incoming Layer-2 packets.</p> <p><b>src-port</b>: Indicates that load is distributed based on the panel port for incoming Layer-2 packets.</p>
<b>Defaults</b>	By default, the load balancing mode of Layer-2 packets is <b>src-mac</b> and <b>dst-mac</b> .
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	To restore the default settings, run <b>no l2 field</b> in profile configuration mode.

➤ **Configuring the IPv4 Packet Load Balancing Mode**

- Optional.
- Perform this configuration to specify the IPv4 packet load balancing mode.
- Perform this configuration on devices that support enhanced load balancing, such as aggregation switches and core switches.

<b>Command</b>	<b>ipv4 field</b> { [ <b>src-ip</b> ] [ <b>dst-ip</b> ] [ <b>protocol</b> ] [ <b>l4-src-port</b> ] [ <b>l4-dst-port</b> ] [ <b>src-port</b> ] }
<b>Parameter Description</b>	<p><b>src-ip</b>: Indicates that load is distributed based on the source IP addresses of incoming IPv4 packets.</p> <p><b>dst-ip</b>: Indicates that load is distributed based on the destination IP addresses of incoming IPv4 packets.</p> <p><b>protocol</b>: Indicates that load is distributed based on the protocol types of incoming IPv4 packets.</p> <p><b>l4-src-port</b>: Indicates that load is distributed based on the Layer-4 source port numbers of incoming IPv4 packets.</p> <p><b>l4-dst-port</b>: Indicates that load is distributed based on the Layer-4 destination port numbers of incoming IPv4 packets.</p> <p><b>src-port</b>: Indicates that load is distributed based on the panel port for incoming IPv4 packets.</p>
<b>Defaults</b>	By default, the load balancing mode of IPv4 packets is <b>src-ip</b> and <b>dst-ip</b> .
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	To restore the default settings, run <b>no ipv4 field</b> in profile configuration mode.

➤ **Configuring the IPv6 Packet Load Balancing Mode**

- Optional.
- Perform this configuration to specify the IPv6 packet load balancing mode.
- Perform this configuration on devices that support IPv6 packet load balancing, such as aggregation switches and core switches.

<b>Command</b>	<code>ipv6 field { [ src-ip ] [ dst-ip ] [ protocol ] [ I4-src-port ][ I4-dst-port ] [ src-port ] }</code>
<b>Parameter Description</b>	<p><b>src-ip:</b> Indicates that load is distributed based on the source IP addresses of incoming IPv6 packets.</p> <p><b>dst-ip:</b> Indicates that load is distributed based on the destination IP addresses of incoming IPv6 packets.</p> <p><b>protocol:</b> Indicates that load is distributed based on the protocol types of incoming IPv6 packets.</p> <p><b>I4-src-port:</b> Indicates that load is distributed based on the Layer-4 source port numbers of incoming IPv6 packets.</p> <p><b>I4-dst-port:</b> Indicates that load is distributed based on the Layer-4 destination port numbers of incoming IPv6 packets.</p> <p><b>src-port:</b> Indicates that load is distributed according to the source port numbers of incoming IPv6 packets.</p>
<b>Defaults</b>	By default, the load balancing mode of IPv6 packets is <b>src-ip</b> and <b>dst-ip</b> .
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	To restore the default settings, run <b>no ipv6 field</b> in profile configuration mode.

📌 **Configuring the MPLS Packet Load Balancing Mode**

- Optional.
- Perform this configuration to specify the MPLS packet load balancing mode.
- Perform this configuration on devices that support MPLS packet load balancing, such as aggregation switches and core switches.

<b>Command</b>	<code>mpls field { [ top-label ] [ 2nd-label ] [3rd-label] [ src-ip ] [ dst-ip ] [ vlan ] [ src-port ] [dst-port] [src-mac] [dst-mac] [protocol] [I4-src-port] [I4-dst-port] [I2-etype] }</code>
<b>Parameter Description</b>	<p><b>src-ip:</b> Indicates that load is distributed based on the source IP addresses of incoming MPLS packets.</p> <p><b>dst-ip:</b> Indicates that load is distributed based on the destination IP addresses of incoming MPLS packets.</p> <p><b>top-label:</b> Indicates that load is distributed based on the top labels of incoming MPLS packets.</p> <p><b>2nd-label:</b> Indicates that load is distributed based on the second labels of incoming MPLS packets.</p> <p><b>3rd-label:</b> Indicates that load is distributed based on the third labels of incoming MPLS packets.</p> <p><b>vlan:</b> Indicates that load is distributed based on the VLAN IDs of incoming MPLS packets.</p> <p><b>src-port:</b> Indicates that load is distributed based on the source port numbers of incoming MPLS packets.</p> <p><b>dst-port:</b> Indicates that load is distributed based on the panel port for outgoing MPLS packets.</p> <p><b>src-mac:</b> Indicates that load is distributed based on the source MAC addresses of incoming MPLS packets.</p> <p><b>dst-mac:</b> Indicates that load is distributed based on the destination MAC addresses of incoming MPLS packets.</p> <p><b>protocol:</b> Indicates that load is distributed based on the protocol types of incoming MPLS packets.</p> <p><b>I4-src-port:</b> Indicates that load is distributed based on the Layer-4 source port numbers of incoming MPLS packets.</p>

	<p><b>I4-dst-port:</b> Indicates that load is distributed based on the Layer-4 destination port numbers of incoming MPLS packets.</p> <p><b>I2-etype:</b> Indicates that load is distributed based on the Ethernet types of MPLS packets.</p>
<b>Defaults</b>	By default, the load balancing mode of MPLS packets is <b>top-label</b> and <b>2nd-label</b> .
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	To restore the default settings, run <b>no mpls field</b> in profile configuration mode.

 The MPLS load balancing algorithm takes effect only for MPLS Layer-3 VPN packets.

 **Configuring the TRILL Packet Load Balancing Mode**

- Optional.
- Perform this configuration to specify the TRILL packet load balancing mode.
- Perform this configuration on devices that support TRILL packet load balancing, such as aggregation switches and core switches.

<b>Command</b>	<b>trill field { [vlan] [src-ip] [dst-ip ] [src-port] [dst-port] [src-mac] [dst-mac] [I4-src-port] [I4-dst-port] [I2-etype] [protocol] [ing-nick] [egr-nick] }</b>
<b>Parameter Description</b>	<p><b>vlan:</b> Indicates that load is distributed based on the VLAN IDs of incoming TRILL packets.</p> <p><b>src-ip:</b> Indicates that load is distributed based on the source IP addresses of incoming TRILL packets.</p> <p><b>dst-ip:</b> Indicates that load is distributed based on the destination IP addresses of incoming TRILL packets.</p> <p><b>src-port:</b> Traffic is distributed according to the source port numbers of the incoming TRILL packets.</p> <p><b>src-mac:</b> Indicates that load is distributed based on the source MAC addresses of incoming TRILL packets.</p> <p><b>dst-mac:</b> Indicates that load is distributed based on the destination MAC addresses of incoming TRILL packets.</p> <p><b>I4-src-port:</b> Indicates that load is distributed based on the Layer-4 source port numbers of incoming TRILL packets.</p> <p><b>I4-dst-port:</b> Indicates that load is distributed based on the Layer-4 destination port numbers of incoming TRILL packets.</p> <p><b>I2-etype:</b> Indicates that load is distributed based on the Ethernet types of TRILL packets.</p> <p><b>protocol:</b> Indicates that load is distributed based on the protocol types of incoming TRILL packets.</p> <p><b>ing-nick:</b> Indicates that load is distributed based on the Ingress Rbridge Nicknames of incoming TRILL packets.</p> <p><b>egr-nick:</b> Indicates that load is distributed based on the Egress Rbridge Nicknames of incoming TRILL packets.</p>
<b>Defaults</b>	By default, the load balancing mode of TRILL packets is <b>src-mac</b> , <b>dst-mac</b> , and <b>vlan</b> .
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	<p>To restore the default settings, run <b>no trill field</b> in profile configuration mode.</p> <p> TRILL Transit RBridge packet flows are balanced based on the following fields: <b>ing-nick</b>, <b>egr-nick</b>, <b>src-mac</b>, <b>dst-mac</b>, <b>vlan</b>, and <b>I2-etype</b>.</p>

	<p><b>i</b> TRILL Egress RBridge packet flows are balanced based on the following fields:</p> <p>Layer-2 packets: <b>src-mac</b>, <b>dst-mac</b>, <b>vlan</b>, and <b>I2- protocol</b>.</p> <p>Layer-3 packets: <b>src-ip</b>, <b>dst-ip</b>, <b>I4-src-port</b>, <b>I4-dst-port</b>, <b>protocol</b>, and <b>vlan</b>.</p> <p><b>i</b> The <b>src-port</b> and <b>dst-port</b> fields can be used to balance all TRILL Transit RBridge and TRILL Egress RBridge packet flows.</p>
--	--

▾ **Configuring the FCoE Packet Load Balancing Mode**

- Optional.
- Perform this configuration to specify the FCoE packet load balancing mode.
- Perform this configuration on devices that support FCoE packet load balancing, such as aggregation switches and core switches.

<b>Command</b>	<b>foe field</b> {[vlan] [src-port] [dst-port] [src-id] [dst-id] [rx-id] [ox-id] [fabric-id]}
<b>Parameter Description</b>	<p><b>vlan</b>: Indicates that load is distributed based on the VLAN IDs of incoming FCoE packets.</p> <p><b>src-port</b>: Indicates that load is distributed based on the source port numbers of incoming FCoE packets.</p> <p><b>src-id</b>: Indicates that load is distributed based on the source IDs of FCoE packets.</p> <p><b>dst-id</b>: Indicates that load is distributed based on the destination IDs of FCoE packets.</p> <p><b>rx-id</b>: Indicates that load is distributed based on the Responder Exchange IDs of FCoE packets.</p> <p><b>ox-id</b>: Indicates that load is distributed based on the Originator Exchange IDs of FCoE packets.</p> <p><b>fabric-id</b>: Indicates that load is distributed based on the FC network fabric IDs of FCoE packets.</p>
<b>Defaults</b>	By default, the load balancing mode of FCoE packets is <b>src-id</b> , <b>dst-id</b> , and <b>ox-id</b> .
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	To restore the default settings, run <b>no foe field</b> in profile configuration mode.

▾ **Configuring the Hash Disturbance Factor**

- Optional
- Perform this operation to balance packets of the same type over the AP port for devices of the same type.

<b>Command</b>	<b>hash-disturb</b> <i>string</i>
<b>Parameter Description</b>	<b>String</b> : Indicates the character string used to calculate the hash disturbance factor.
<b>Defaults</b>	By default, no hash disturbance factor is set.
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	To restore the default settings, run <b>no hash-disturb</b> in profile configuration mode.

▾ **Enabling or Disabling Hash Synchronization**

- Optional

- Perform this operation to ensure that uplink and downlink streams of the same packet type are transmitted over the same path.

<b>Command</b>	<b>hash-disturb {ipv4   ipv6   fcoe  on }</b>
<b>Parameter Description</b>	<b>ipv4:</b> Indicates that hash synchronization is enabled for IPv4 packets. <b>ipv6:</b> Indicates that hash synchronization is enabled for IPv6 packets. <b>fcoe:</b> Indicates that hash synchronization is enabled for FCoE packets. <b>on:</b> Indicates that hash synchronization is enabled for packets on a module. Different modules support different packets type.
<b>Defaults</b>	Set it as required.
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	When hash synchronization is enabled for IPv4, IPv6, and FCoE packets as required, if uplink and downlink streams of the same packet type do not need to be transmitted over the same path, run the <b>no</b> form of this command in profile configuration mode.

#### 📌 Configuring Global Traffic Balance Algorithm Mode on AP

- Optional
- Perform this operation when traffic changes to keep traffic balance.

<b>Command</b>	<b>aggregateport algorithm mode <i>number</i></b>
<b>Parameter Description</b>	<i>Number.</i> Indicates algorithm mode.
<b>Defaults</b>	The default mode varies from product. Run command <b>show aggregateport load-balance</b> to check the default setting.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run command <b>no aggregateport algorithm mode</b> in global configuration mode to restore the default setting. Run command <b>show running</b> and <b>show aggregateport load-balance</b> to check whether it takes effect.

#### 📌 Configuring the Balancing Factor Acquisition Mode for Tunnel Packets

- Optional. When performing load balancing, use this command to specify the balancing factor acquisition mode for specific tunnel packets, to optimize traffic balancing.

<b>Command</b>	<b>aggregateport hash-header {inner   outer   inner-outer}</b>
<b>Parameter Description</b>	<b>inner:</b> Specifies the inner layer in the header of tunnel packets as the source for acquiring the balancing factor. <b>outer:</b> Specifies the outer layer in the header of tunnel packets as the source for acquiring the balancing factor. <b>Inner-outer:</b> Specifies both the inner and outer layers in the header of tunnel packets as the source for acquiring the balancing factor.

<b>Defaults</b>	The default configuration varies with products.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Use the <b>default</b> form of this command to restore the default acquisition mode.</p> <p>After configuration, if the <b>show running</b> command does not display the configuration, the configured mode is the same as the default value.</p> <hr/> <p> The supported configuration options and types of tunnel packets vary with products.</p>

### Verification

- Run **show running** to display the configuration.
- Run **show aggregateport load-balance** to display the load balancing configuration. If a device supports load balancing configuration on a specific AP port, run **show aggregateport summary** to display the configuration.
- Run **show load-balance-profile** to display the enhanced load balancing profile.

<b>Command</b>	<b>show aggregateport</b> <i>aggregate-port-number</i> [ <b>load-balance</b>   <b>summary</b> ]
<b>Parameter Description</b>	<i>aggregate-port-number</i> : Indicates the number of an AP port. <b>load-balance</b> : Displays the load balancing algorithm. <b>summary</b> : Displays the summary of each link.
<b>Command Mode</b>	Any mode
<b>Usage Guide</b>	The information on All AP ports is displayed if you do not specify the AP port number.
	<pre>Ruijie# show aggregateport 1 summary AggregatePort  MaxPorts      SwitchPort Mode   Load balance      Ports ----- ----- Ag1             8             Enabled  ACCESS  dst-mac             Gi0/2</pre>

<b>Command</b>	<b>show load-balance-profile</b> [ <i>profile-name</i> ]
<b>Parameter Description</b>	<i>profile-name</i> : Indicates the profile name.
<b>Command Mode</b>	Any mode
<b>Usage Guide</b>	All enhanced profiles are displayed if you do not specify the profile number.
	<pre>Ruijie# show load-balance-profile module0 Load-balance-profile: module0 Packet   Hash Field:</pre>

<p>IPv4: <a href="#">src-ip dst-ip</a></p> <p>IPv6: <a href="#">src-ip dst-ip</a></p> <p>L2 : <a href="#">src-mac dst-mac vlan</a></p> <p>MPLS: <a href="#">top-labe l2nd-label</a></p>
---

### Configuration Example

#### Configuring a Load Balancing Mode

<p><b>Scenario</b></p> <p>Figure 3-4</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Add the GigabitEthernet 1/1 and GigabitEthernet 1/2 ports on Switch A to static AP port 3.</li> <li>● Add the GigabitEthernet 2/1 and GigabitEthernet 2/2 ports on Switch B to static AP port 3.</li> <li>● On Switch A, configure source MAC address-based load balancing for AP port 3 in global configuration mode.</li> <li>● On Switch B, configure destination MAC address-based load balancing for AP port 3 in global configuration mode.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# configure terminal SwitchA(config)# interface range GigabitEthernet 1/1-2 SwitchA(config-if-range)# port-group 3 SwitchA(config-if-range)# exit SwitchA(config)# aggregateport load-balance src-mac</pre>
<p><b>Switch B</b></p>	<pre>SwitchB# configure terminal SwitchB(config)# interface range GigabitEthernet 2/1-2 SwitchB(config-if-range)# port-group 3 SwitchB(config-if-range)# exit SwitchB(config)# aggregateport load-balance dst-mac</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run <b>show aggregateport load-balance</b> to check the load balancing algorithm configuration.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# show aggregatePort load-balance Load-balance : <b>Source MAC</b></pre>

<b>Switch B</b>	<pre>SwitchB# show aggregatePort load-balance</pre> <p>Load-balance : <b>Destination MAC</b></p>
-----------------	--

➤ **Configuring Hash Load Balancing Control**

<b>Scenario</b>	<p style="text-align: center;">             GigabitEthernet1/1      GigabitEthernet2/1   —————               GigabitEthernet1/2      GigabitEthernet2/2              Switch A                      Switch B         </p>
<b>Figure 1-7</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Add the GigabitEthernet 1/1 and GigabitEthernet 1/2 ports on Switch A to static AP port 3.</li> <li>● Add the GigabitEthernet 2/1 and GigabitEthernet 2/2 ports on Switch B to static AP port 3.</li> <li>● On Switch A, disable hash synchronization for FCoE packets.</li> <li>● On Switch B, disable hash synchronization for FCoE packets.</li> <li>● On Switch A, configure the hash disturbance factor A.</li> <li>● On Switch B, configure the hash disturbance factor B.</li> <li>● On Switch A, enable flexible hash.</li> <li>● On Switch B, enable flexible hash.</li> </ul>
<b>Switch A</b>	<pre>SwitchA# configure terminal SwitchA(config)# interface range GigabitEthernet 1/1-2 SwitchA(config-if-range)# port-group 3 SwitchA(config-if-range)# exit SwitchA(config)#load-balance-profile SwitchA(config-load-balance-profile)#no hash-symmetrical fcoe SwitchA(config-load-balance-profile)#hash-disturb A SwitchA(config-load-balance-profile)#exit SwitchA(config)#aggregateport hash-elasticity enable</pre>
<b>Switch B</b>	<pre>SwitchB# configure terminal SwitchB(config)# interface range GigabitEthernet 2/1-2 SwitchB(config-if-range)# port-group 3 SwitchB(config-if-range)# exit SwitchB(config)#load-balance-profile SwitchB(config-load-balance-profile)# no hash-symmetrical fcoe</pre>

	<pre>SwitchA(config-load-balance-profile)#hash-disturb B SwitchB(config-load-balance-profile)#exit SwitchB(config)#aggregateport hash-elasticity enable</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run <b>show running</b> to check whether the configuration is correct.</li> </ul>

## Common Errors

A user enables hash synchronization for IPv4, IPv6, FCoE and On packets. However, no configuration is displayed when the user runs **show running**. This is because hash synchronization for IPv4, IPv6, and FCoE packets is enabled by default. After the user disables the function, the configuration is displayed.

## 3.5.5 Configuring an AP Capacity Mode

### Configuration Effect

- Change the maximum number of configurable AP ports and the maximum number of member ports in each AP port.

### Notes

- The system has a default AP capacity mode. You can run **show aggregateport capacity** to display the current capacity mode.
- If the current configuration (maximum number of AP ports or the number of member ports in each AP port) exceeds the capacity to be configured, the capacity mode configuration will fail.

### Configuration Steps

#### ▾ Configuring an AP Capacity Mode

- (Optional) Perform this configuration to change the AP capacity.
- Perform this configuration on devices that support AP capacity change, such as core switches.

<b>Command</b>	<b>aggregateport capacity mode</b> <i>capacity-mode</i>
<b>Parameter Description</b>	<i>capacity-mode</i> : Indicates a capacity mode.
<b>Defaults</b>	By default, AP capacity modes vary with devices. For example, 256 x 16 indicates that the device has a maximum of 256 AP ports and 16 member ports in each AP port.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The system provides several capacity modes for devices that support capacity mode configuration. To restore the default settings, run <b>no aggregateport capacity mode</b> in global configuration mode.

### Verification

- Run **show running** to display the configuration.
- Run **show aggregateport capacity** to display the current AP capacity mode and AP capacity usage.

<b>Command</b>	<b>show aggregateport capacity</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Any mode
<b>Usage Guide</b>	N/A
	<pre> Ruijie# show aggregateport capacity AggregatePort Capacity Information: Configuration Capacity Mode: 128*16. Effective Capacity Mode      : 256*8. Available Capacity          : 128*8.  Total Number: 128, Used: 1, Available: 127.                     </pre>

### Configuration Example

#### Configuring an AP Capacity Mode

<p><b>Scenario</b></p> <p><b>Figure 3-6</b></p>	<pre> graph LR     S1[Switch A] --- S2[Switch B]     S1 --- G1_1[GigabitEthernet1/1]     S1 --- G1_2[GigabitEthernet1/2]     S2 --- G2_1[GigabitEthernet2/1]     S2 --- G2_2[GigabitEthernet2/2]                     </pre>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Add the GigabitEthernet 1/1 and GigabitEthernet 1/2 ports on Switch A to static AP port 3.</li> <li>● Add the GigabitEthernet 2/1 and GigabitEthernet 2/2 ports on Switch B to static AP port 3.</li> <li>● On Switch A, configure the 128 x128 AP capacity mode.</li> <li>● On Switch B, configure the 256 x 64 AP capacity mode.</li> </ul>
<p><b>Switch A</b></p>	<pre> SwitchA# configure terminal SwitchA(config)# interface range GigabitEthernet 1/1-2 SwitchA(config-if-range)# port-group 3 SwitchA(config-if-range)# exit SwitchA(config)# aggregateport capacity mode 128*128                     </pre>
<p><b>Switch B</b></p>	<pre> SwitchB# configure terminal SwitchB(config)# interface range GigabitEthernet 2/1-2                     </pre>

	<pre>SwitchB(config-if-range)# port-group 3 SwitchB(config-if-range)# exit SwitchB(config)# aggregateport capacity mode 256*64</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run <b>show aggregateport capacity</b> to check the AP capacity mode configuration.</li> </ul>
<b>Switch A</b>	<pre>SwitchA# show aggregatePort capacity AggregatePort Capacity Information: Configuration Capacity Mode: 128*128. Effective Capacity Mode      : 128*128. Available Capacity Mode     : 128*128. Total Number : 128, Used: 1, Available: 127.</pre>

### 3.5.6 Enabling BFD for AP Member Ports

#### Configuration Effect

- Enable BFD for all the member ports of a specified AP port.
- After BFD is enabled for an AP port, each member port performs BFD to determine whether the packets should be distributed to the member port to realize load balancing. When BFD detects a member port Down, the packets are not distributed to the port. When BFD detects that the member port is restored to Up, the packets are distributed to the port again.

#### Notes

- After BFD is enabled for an AP port, BFD sessions are set up. To make the sessions take effect, you need to configure BFD parameters. For details, see *Configuring BFD*.
- Enabling or disabling BFD for a single AP member port is not supported. You must enable or disable BFD for the entire AP group.
- Only member ports in the forwarding state are enabled with BFD. If a member port is not in the forwarding state because the link or LACP is down, the BFD session on the member port is automatically deleted.

- If only one member port is available (in the forwarding state), all packets are distributed to this port. In this case, BFD fails. When there are more than one available member port, BFD takes effect again.

## Configuration Steps

### ▾ Enabling BFD for AP Member Ports

- (Optional) Enable BFD when you need to detect path failure on member ports in milliseconds. Traffic on the faulty link will be switched to other member links in case of a link failure.
- Perform this configuration on devices that support AP-BFD correlation.

<b>Command</b>	<b>aggregate bfd-detect {ipv4   ipv6} src_ip dst_ip</b>
<b>Parameter Description</b>	<b>ipv4:</b> Enables IPv4 BFD if the AP port is configured with an IPv4 address. <b>ipv6:</b> Enables IPv6 BFD if the AP port is configured with an IPv6 address. <i>src_ip:</i> Indicates the source IP address, that is, the IP address configured on the AP port. <i>dst_ip:</i> Indicates the destination IP address, that is, the IP address configured on the peer AP port.
<b>Defaults</b>	By default, BFD is disabled.
<b>Command Mode</b>	Interface configuration mode of the specified AP port
<b>Usage Guide</b>	<ol style="list-style-type: none"> <li>1. To make BFD sessions take effect, you need to configure BFD parameters. For details, see <i>Configuring BFD</i>.</li> <li>2. Different products may support different IPv4/IPv6 BFD.</li> <li>3. Both IPv4 BFD and IPv6 BFD can be enabled for an AP port if both are supported.</li> <li>4. After BFD is enabled for an AP port, BFD sessions are automatically set up on its member ports in the forwarding state.</li> </ol>

## Verification

- Run **show running** to display the configuration.
- Run **show interface aggregateport** to display the BFD state of the AP member ports.

<b>Command</b>	<b>show interface aggregateport ap-num</b>
<b>Parameter Description</b>	<i>ap-num:</i> Indicates the number of an AP port.
<b>Command Mode</b>	Any mode
<b>Usage Guide</b>	N/A
	<pre>Ruijie# show interface aggregateport 11 ... Aggregate Port Informations:     Aggregate Number: 11     Name: "AggregatePort 11"</pre>

	<pre> Members: (count=2)  GigabitEthernet 0/1      Link Status: Up    LACP Status: bndl   BFD Status: UP  GigabitEthernet 0/2      Link Status: Up    LACP Status: susp   BFD Status: Invalid  ...                 </pre>
--	---

### Configuration Example

#### ▾ Enabling IPv4 BFD for AP Member Ports

<p><b>Scenario</b></p> <p><b>Figure 3-9</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable LACP for the GigabitEthernet 1/1 and GigabitEthernet 1/2 ports on Switch A and add the ports to LACP AP port 3.</li> <li>● Enable LACP for the GigabitEthernet 2/1 and GigabitEthernet 2/2 ports on Switch B and add the ports to LACP AP port 3.</li> <li>● Configure IP address 1.0.0.1 for AP port 3 on Switch A and enable IPv4 BFD.</li> <li>● Configure IP address 1.0.0.2 for AP port 3 on Switch B and enable IPv4 BFD.</li> </ul>
<p><b>Switch A</b></p>	<pre> SwitchA# configure terminal SwitchA(config)# interface range GigabitEthernet 1/1-2 SwitchA(config-if-range)# no switchport SwitchA(config-if-range)# port-group 3 mode active SwitchA(config-if-range)# exit SwitchA(config)# interface aggregateport 3 SwitchA(config-if-Aggregateport 3)# ip address 1.0.0.1 SwitchA(config-if-Aggregateport 3)# aggregate bfd-detect ipv4 1.0.0.1 1.0.0.2 SwitchA(config-if-Aggregateport 3)# bfd interval 50 min_rx 50 multiplier 3                 </pre>
<p><b>Switch B</b></p>	<pre> SwitchB# configure terminal SwitchB(config)# interface range GigabitEthernet 1/1-2 SwitchB(config-if-range)# no switchport                 </pre>

	<pre>SwitchB(config-if-range)# port-group 3 mode active  SwitchB(config-if-range)# exit  SwitchB(config)# interface aggregateport 3  SwitchB(config-if-Aggregateport 3)# ip address 1.0.0.2  SwitchB(config-if-Aggregateport 3)# aggregate bfd-detect ipv4 1.0.0.2 1.0.0.1  SwitchB(config-if-Aggregateport 3)# bfd interval 50 min_rx 50 multiplier 3</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run <b>show run</b> to check whether the configuration takes effect.</li> <li>● Run <b>show interface aggregateport</b> to display the BFD state of the AP member ports.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# show run   include AggregatePort 3  Building configuration...  Current configuration: 54 bytes  interface AggregatePort 3  no switchport  ip address 1.0.0.1  aggregate bfd-detect ipv4 1.0.0.1 1.0.0.2  bfd interval 50 min_rx 50 multiplier 3  SwitchA# show interface aggregateport 3  ...  Aggregate Port Informations:  Aggregate Number: 3  Name: "AggregatePort 3"  Members: (count=2)  GigabitEthernet 1/1      Link Status: Up   LACP Status: bndl   BFD Status: UP  GigabitEthernet 1/2      Link Status: Up   LACP Status: bndl   BFD Status: UP  ...</pre>
<p><b>Switch B</b></p>	<pre>SwitchB# show run   include AggregatePort 3  Building configuration...  Current configuration: 54 bytes  interface AggregatePort 3</pre>

```
no switchport
ip address 1.0.0.2
aggregate bfd-detect ipv4 1.0.0.2 1.0.0.1
bfd interval 50 min_rx 50 multiplier 3
SwitchB# show interface aggregateport 3
...
Aggregate Port Informations:
    Aggregate Number: 3
    Name: "AggregatePort 3"
    Members: (count=2)
        GigabitEthernet 1/1      Link Status: Up    LACP Status: bndl  BFD Status:
UP
        GigabitEthernet 1/2      Link Status: Up    LACP Status: bndl  BFD Status:
UP
    ...
```

## Common Errors

1. If BFD is enabled for an AP port without BFD parameters, BFD does not take effect.
2. After BFD is enabled for an AP port, the BFD neighbor must be a directly connected AP port enabled with BFD.

## 3.5.7 Configuring a Preferred AP Member Port

### Configuration Effect

- Configure a member port as the preferred AP member port.
- After the preferred member port is configured, the management VLAN packets on the AP port are forwarded by this port.

### Notes

- For details about management VLAN configuration, see *Configuring MAC*.
- Only one preferred member port can be configured for one AP port.
- After an LACP AP member port is configured as the preferred AP member port, if the LACP negotiation on all AP member ports fails, the preferred port is automatically downgraded to a static AP member port.

### Configuration Steps

- **Configuring a Preferred AP Member Port**

- (Optional) Perform this configuration to specify an AP member port dedicated to forwarding management VLAN packets.
- The configuration is applicable to dual-system servers. Configure the port connected to the management NIC of the server as the preferred AP member port.

<b>Command</b>	<b>aggregateport primary-port</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, No AP member port is a preferred port.
<b>Command Mode</b>	Interface configuration mode of an AP member port
<b>Usage Guide</b>	N/A

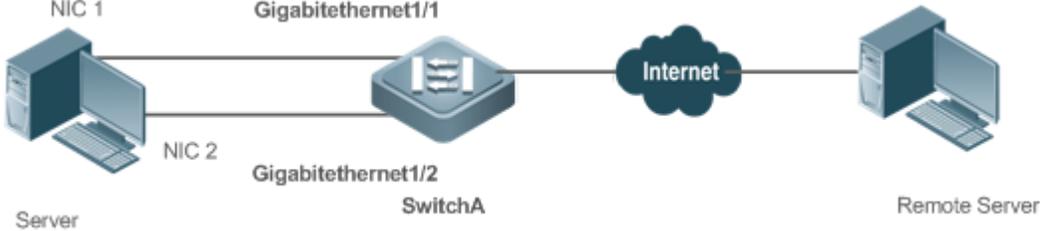

### Verification

- Run **show running** to display the configuration.
- Run **show interface aggregateport** to display the preferred AP member port.

<b>Command</b>	<b>show interface aggregateport <i>ap-num</i></b>
<b>Parameter Description</b>	<i>ap-num</i> : Indicates the number of an AP port.
<b>Command Mode</b>	Any mode
<b>Usage Guide</b>	N/A
	<pre> Ruijie# show interface aggregateport 11 ... --	---

### 3.5.8 Configuring the Minimum Number of LACP AP Member Ports

#### Configuration Effect

- After the minimum number of AP member ports is configured, the aggregation group takes effect only when the number of member ports is greater than the minimum number.

#### Notes

- If the number of LACP AP member ports for an LACP aggregation group is less than the minimum number of AP member ports configured, all AP member ports are in the unbinding state.
- After the minimum number of static AP member ports is configured, if the number of static AP member ports in the Up state is less than the minimum number, the static AP member ports in the Up state cannot forward data and the corresponding AP is down. However, the state of the peer is not affected. Therefore, corresponding functions must be configured on the peer.

#### Configuration Steps

##### ▾ Configuring the Minimum Number of AP Member Ports

- (Optional) Perform this configuration to specify the minimum number of AP member ports.

<b>Command</b>	<code>aggregateport member minimum <i>number</i></code>
<b>Parameter</b>	<i>number</i> : Indicates the minimum number of member ports.
<b>Description</b>	
<b>Defaults</b>	By default, the minimum number of member ports is 1.
<b>Command Mode</b>	Interface configuration mode of the specified AP port
<b>Usage Guide</b>	N/A

##### ▾ Configuring the Minimum Number of AP Member Ports (Action)

- (Optional) Perform this configuration when the number of AP member ports in the Up state is less than the minimum number of the AP member ports.

<b>Command</b>	<code>aggregateport member minimum action [shutdown]</code>
----------------	---

<b>Parameter Description</b>	<i>Shutdown</i> : shuts down the aggregated port when the number of AP member ports in the Up state is less than the minimum number of the AP member ports.
<b>Defaults</b>	By default, no action is triggered.
<b>Command Mode</b>	Interface configuration mode of the specified AP port
<b>Usage Guide</b>	N/A

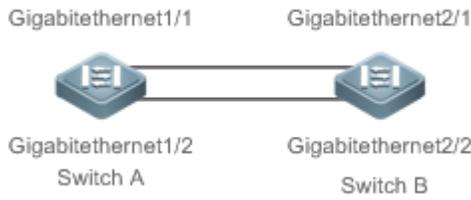

### Verification

- Run **show running** to display the configuration.
- Run **show interface aggregateport** to display the state of the AP member ports.

<b>Command</b>	<b>show interface aggregateport</b> <i>ap-num</i>
<b>Parameter Description</b>	<i>ap-num</i> : Indicates the number of an AP port.
<b>Command Mode</b>	Any mode
<b>Usage Guide</b>	N/A
	<pre> Ruijie# show interface aggregateport 3 ... Aggregate Port Informations:     Aggregate Number: 3     Name: "AggregatePort 3"     Members: (count=2)     GigabitEthernet 0/1      Link Status: Up    LACP Status: bndl     GigabitEthernet 0/2      Link Status: Up    LACP Status: bndl ...                 </pre>

### Configuration Example

- **Configuring the Minimum Number of LACP AP Member Ports, with the Number of LACP AP Member Ports Less Than the Minimum Number of LACP AP Member Ports**

<p><b>Scenario</b></p> <p><b>Figure 3-12</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable LACP for the GigabitEthernet 1/1 and GigabitEthernet 1/2 ports on Switch A and add the ports to LACP AP port 3.</li> <li>● Enable LACP for the GigabitEthernet 2/1 and GigabitEthernet 2/2 ports on Switch B and add the ports to LACP AP port 3.</li> <li>● On Switch A, set the minimum number of the member ports of AP port 3 to 3.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# configure terminal SwitchA(config)# interface range GigabitEthernet 1/1-2 SwitchA(config-if-range)# no switchport SwitchA(config-if-range)# port-group 3 mode active SwitchA(config-if-range)# exit SwitchA(config)# interface aggregateport 3 SwitchA(config-if-Aggregateport 3)# aggregateport minimum member 3</pre>

## Common Errors

The number of LACP AP member ports of an LACP aggregation group is less than the minimum number of AP member ports configured, the LACP aggregation group is not in the binding state.

## 3.5.9 Enabling the LACP Independent Port Function

### Configuration Effect

- After the independent LACP port function is enabled, an LACP member port automatically changes to a common physical port if the LACP member port does not receive LACP packets within the set time-out period. The LACP member port state is changed to **individual** and the LACP member port can forward packets properly.
- After the LACP member port receives LACP packets, it changes to an LACP independent port again to perform LACP packet negotiation.
- The time-out period of an independent port can be adjusted by configuration.

### Notes

- After the LACP independent port function is enabled, an LACP member port will not change to a common physical port immediately. An LACP member port changes to an independent port (a common physical port) only if it does not receive LACP packets within the set time-out period,
- The time-out period configuration of LACP independent port only affects LACP member ports that have not turned into independent ports. After the time-out period is configured, the period calculation will restart.
- In the long time-out mode, the LACP packet is sent every 30s. The time-out period should be longer than 30s so as not to affect the normal LACP negotiation. It is recommended to configure the time-out period at least twice the period of LACP packet sending. In the short time-out period, there is no limit.

### Configuration Steps

#### ▾ Enabling the LACP Independent Port Function

- Optional
- Perform this operation so that an member port of LACP aggregate group can forward packets normally when the LACP member port cannot perform LACP negotiation.

<b>Command</b>	<b>lACP individual-port enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, the LACP independent port function is disabled.

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

📌 **Configuring the Time-out Period of LACP Independent Port**

- Optional
- Perform this operation when an LACP independent port needs to adjust the time-out period.

**Command** `lacp individual-timeout period time`

**Parameter** *Time*: Time-out period. The range is 10-90, and the unit is second.

**Description**

**Defaults** The time-out period of LACP independent port is 90s by default.

**Command Mode** Global configuration mode

**Mode**

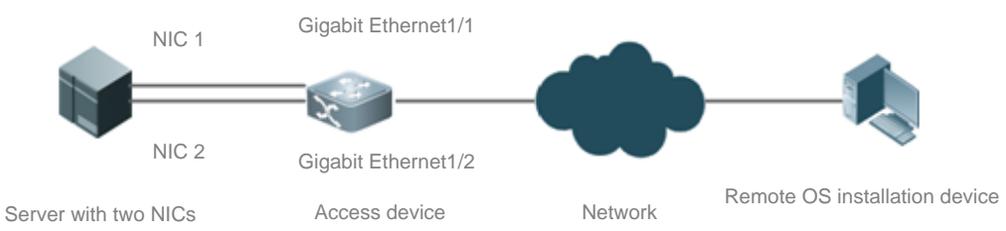

**Verification**

- Run `show running` to query the corresponding configuration.
- Run `show interface aggregateport` to query the AP member port status.

<b>Command</b>	<code>show interface aggregateport ap-num</code>
<b>Parameter</b>	<b>ap-num</b> : Indicates the AP number.
<b>Description</b>	
<b>Command Mode</b>	All modes
<b>Usage Guide</b>	N/A
<b>Command Presentation</b>	<pre> Ruijie# show interface aggregateport 3 ... Aggregate Port Informations:   Aggregate Number: 3   Name: "AggregatePort 3"   Members: (count=2)   GigabitEthernet 0/1      Link Status: Up   LACP Status: individual   GigabitEthernet 0/2      Link Status: Up   LACP Status: individual ...                     </pre>

**Configuration Example**

📌 **Enabling the LACP Independent Port Function**

<p><b>Scenario</b></p> <p><b>Figure 1-14</b></p>	 <p>The diagram illustrates a network topology. On the left, a server is shown with two Network Interface Cards (NICs), labeled NIC 1 and NIC 2. These are connected to an access device (a switch) with two ports, Gigabit Ethernet1/1 and Gigabit Ethernet1/2. The access device is connected to a central network cloud, which is then connected to a remote OS installation device on the right.</p>
<p><b>Description</b></p>	<p>As shown in Figure 1-14, the server uses NIC 1 and NIC 2 as the communication ports to access to the GigabitEthernet1/1 and GigabitEthernet1/2 ports of the access device. The GigabitEthernet1/1 and GigabitEthernet1/2 ports are added to the LACP aggregation group, for example, AP port 3. A specific VLAN, for example, VLAN 10 is allocated. The LACP independent port function is enabled for the GigabitEthernet1/1 and GigabitEthernet1/2 ports. When the OS is not installed on the server, LACP negotiation between the server and the access device fails. In this case, the GigabitEthernet1/1 and GigabitEthernet1/2 ports of the access device change to common physical ports and are allocated to VLAN 10 automatically. The server uses NIC 1 or NIC 2 to communicate with the remote OS installation device. After the OS is installed, the server connects to the access device in LACP mode.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable LACP for the GigabitEthernet 1/1 and GigabitEthernet 1/2 ports on the access device and add the ports to LACP AP port 3.</li> <li>● Enable the LACP independent port function for the GigabitEthernet 1/1 and GigabitEthernet 1/2 ports on the access device.</li> <li>● Allocate AP port 3 on the access device to VLAN 10.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# configure terminal SwitchA(config)# interface range GigabitEthernet 1/1-2 SwitchA(config-if-range)# port-group 3 mode active SwitchA(config-if-range)# lACP individual-port enable SwitchA(config-if-range)# exit SwitchA(config)# interface aggregateport 3 SwitchA(config-if-Aggregateport 3)#switch access vlan 10 SwitchA(config-if-Aggregateport 3)#</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run <b>show run</b> to check whether the configuration is correct.</li> <li>● Run <b>show lACP summary</b> to query the status of each member port of the AP port.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA# show LACP summary 3 System Id:32768, 00d0.f8fb.0001 Flags: S - Device is requesting Slow LACPDUs</pre>

```

F - Device is requesting Fast LACPDUs.
A - Device is in active mode.          P - Device is in passive mode.

### 3.6 Monitoring

#### Clearing

Description	Command
Clears the statistics of LACP packets on a LACP member port.	<b>clear lacp counters</b> [ <i>key-number</i>   <i>interface-type interface-number</i> ]

#### Displaying

Description	Command
Displays the configuration of an enhanced load balancing profile.	<b>show load-balance-profile</b> [ <i>profile-name</i> ]
Displays the LACP aggregation state. You can display the information on a specified LACP AP port by specifying <i>key-number</i> .	<b>show lacp summary</b> [ <i>key-numebr</i> ]

Description	Command
Displays the statistics of LACP packets on LACP member ports. You can display the information on a specified LACP AP port by specifying <i>key-number</i> .	<b>show lacp counters</b> [ <i>key-numebr</i> ]
Displays the summary or load balancing algorithm of an AP port.	<b>show aggregateport</b> [ <i>ap-number</i> ] { <b>load-balance</b>   <b>summary</b> }
Displays the capacity mode and usage of an AP port.	<b>show aggregateport capacity</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs an AP port.	<b>debug lsm ap</b>
Debugs LACP.	<b>debug lacp</b> { <b>packet</b>   <b>event</b>   <b>database</b>   <b>ha</b>   <b>realtime</b>   <b>stm</b>   <b>timer</b>   <b>all</b> }

## 4 Configuring VLAN

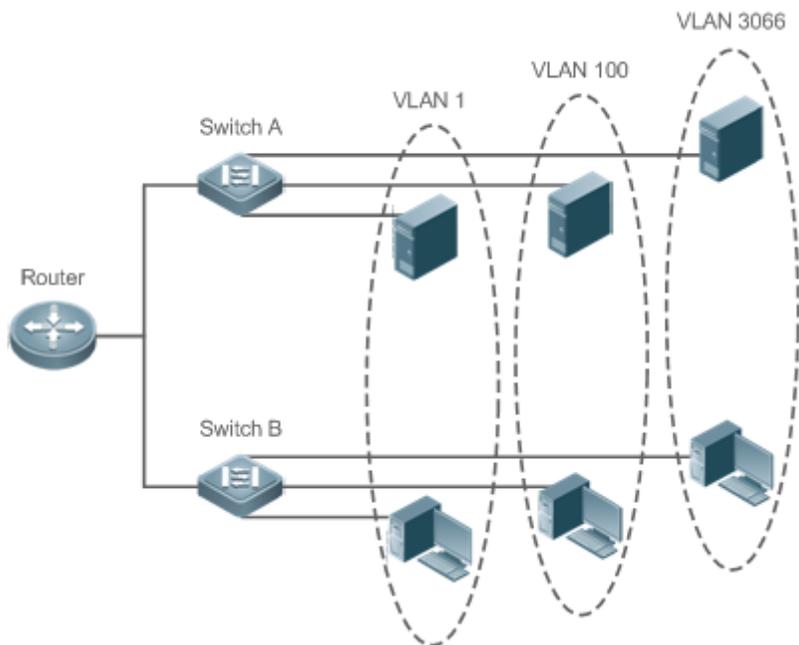

### 4.1 Overview

A Virtual Local Area Network (VLAN) is a logical network created based on a physical network. A VLAN can be categorized into Layer-2 networks of the OSI model.

A VLAN has the same properties as a common LAN, except for physical location limitation. Unicast, broadcast and multicast frames of Layer 2 are forwarded and transmitted within a VLAN, keeping traffic segregated.

We may define a port as a member of a VLAN, and all terminals connected to this port are parts of a virtual network that supports multiple VLANs. You do not need to adjust the network physically when adding, removing and modifying users. Communication among VLANs is realized through Layer-3 devices, as shown in the following figure.

Figure 5-1

#### Protocols and Standards

- IEEE 802.1Q

### 4.2 Applications

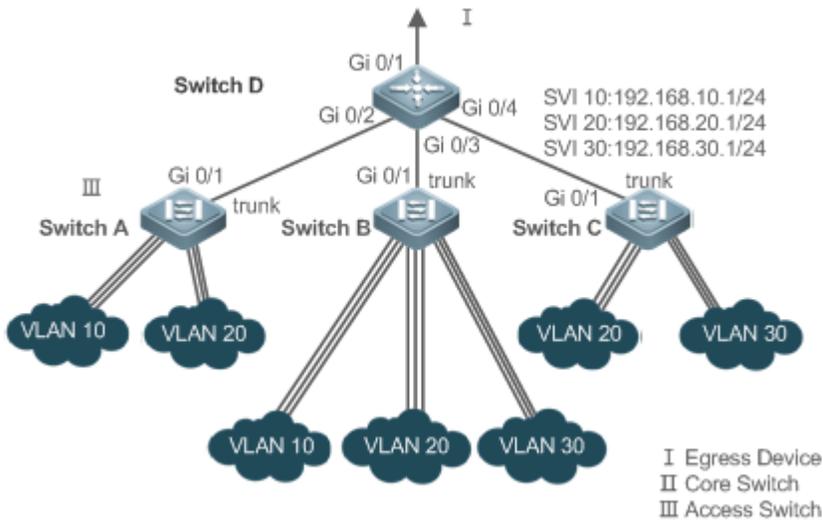

Application	Description
<a href="#">Isolating VLANs at Layer 2 and Interconnecting VLANs at Layer 3</a>	An intranet is divided into multiple VLANs, realizing Layer-2 isolation and Layer-3 interconnection with each other through IP forwarding by core switches.

### 4.2.1 Isolating VLANs at Layer 2 and Interconnecting VLANs at Layer 3

#### Scenario

An intranet is divided into VLAN 10, VLAN 20 and VLAN 30, realizing Layer-2 isolation from each other. The three VLANs correspond respectively to the IP sub-networks 192.168.10.0/24, 192.168.20.0/24, and 192.168.30.0/24, realizing interconnection with each other through IP forwarding by Layer-3 core switches.

Figure 5-2

<b>Remarks:</b>	<p>Switch A, Switch B and Switch C are access switches.</p> <p>Configure three VLANs on a core switch and the port connected to the access switches as a Trunk port, and specify a list of allowed-VLANs to realize Layer-2 isolation;</p> <p>Configure three SVIs on the core switch, which are the gateway interfaces of the IP sub-networks corresponding to the three VLANs, and configure the IP addresses for these interfaces.</p> <p>Create VLANs respectively on the three access switches, assign Access ports for the VLANs, and specify Trunk ports of the core switch.</p>
-----------------	---

#### Deployment

- Divide an intranet into multiple VLANs to realize Layer-2 isolation among them.
- Configure SVIs on a Layer-3 switch to realize Layer-3 communication among VLANs.

## 4.3 Features

### Basic Concepts

#### ↘ VLAN

A VLAN is a logical network created based on a physical network. A VLAN has the same properties as a common LAN, except for physical location limitation. Unicast, broadcast and multicast frames of Layer 2 are forwarded and transmitted within a VLAN, keeping traffic segregated.

-  The VLANs supported by Ruijie products comply with the IEEE802.1Q standard. A maximum of 4094 VLANs (VLAN ID 1-4094) are supported, among which VLAN 1 cannot be deleted.
-  The configurable VLAN IDs are from 1 to 4094.
-  In case of insufficient hardware resources, the system returns information on VLAN creation failure.

## Port Mode

You can determine the frames allowed to pass a port and the VLANs which the port belongs to by configuring the port mode. See the following table for details.

Port Mode	Description
Access port	An Access port belongs to only one VLAN, which is specified manually.
Trunk port (802.1Q)	A Trunk port belongs to all the VLANs of an access switch by default, and it can forward the frames of all the VLANs or the frames of allowed-VLANs.
Uplink port	An Uplink port belongs to all the VLANs of an access switch by default, and it can forward the frames of all the VLANs and tag the native VLAN egress traffic.
Hybrid port	A Hybrid port belongs to all the VLANs of an access switch by default, and it can forward the frames of all the VLANs and send frames of VLANs untagged. It can also transmit frames of allowed-VLANs.
Servicechain Port	A service chain port does not learn MAC addresses and can forward packets from any VLAN by default. In addition, no other configuration is allowed.

## Overview

Feature	Description
<a href="#">VLAN</a>	VLAN helps realize Layer-2 isolation.

### 4.3.1 VLAN

Every VLAN has an independent broadcast domain, and different VLANs are isolated on Layer 2.

#### Working Principle

Every VLAN has an independent broadcast domain, and different VLANs are isolated on Layer 2.

Layer-2 isolation: If no SVIs are configured for VLANs, VLANs are isolated on Layer 2. This means users in these VLANs cannot communicate with each other.

Layer-3 interconnection: If SVIs are configured on a Layer-3 switch for VLANs, these VLANs can communicate with each other on Layer 3.

## 4.4 Configuration

Configuration	Description and Command
<a href="#">Configuring Basic VLAN</a>	 (Mandatory) It is used to create a VLAN.
	<b>vlan</b> Enters a VLAN ID.
	 (Optional) It is used to configure an Access port to transmit the flows from a single VLAN.
	<b>switchport mode access</b> Defines a port as a Layer-2 Access port.
	<b>switchport access vlan</b> Assigns a port to a VLAN.
	<b>add interface</b> Adds one Access port or a group of such ports to the current VLAN.
	 (Optional) It is used to rename a VLAN.
<a href="#">Configuring a Trunk Port</a>	 (Mandatory) It is used to configure the port as a Trunk port.
	<b>switchport mode trunk</b> Defines a port as a Layer-2 Trunk port.
	 (Optional) It is used to configure Trunk ports to transmit flows from multiple VLANs.
	<b>switchport trunk allowed vlan</b> Configures allowed-VLANs for a Trunk port.
<a href="#">Configuring an Uplink Port</a>	<b>switchport trunk native vlan</b> Specifies a native VLAN for a Trunk port.
	 (Mandatory) It is used to configure the port as an Uplink port.
	<b>switchport mode uplink</b> Configures a port as an Uplink port.
<a href="#">Configuring a Hybrid Port</a>	 (Optional) It is used to restore the port mode.
	<b>no switchport mode</b> Restores the port mode.
	 (Mandatory) It is used to configure a port as a Hybrid port.
	<b>switchport mode hybrid</b> Configures a port as a Hybrid port.
	 (Optional) It is used to transmit the frames of multiple VLANs untagged.
<a href="#">Configuring a Service Chain Port</a>	<b>no switchport mode</b> Restores the port mode.
	<b>switchport hybrid allowed vlan</b> Configures allowed-VLANs for a Hybrid port.
	<b>switchport hybrid native vlan</b> Configures a default VLAN for a Hybrid port.
	 (Mandatory) It is used to configure a port as a service chain port.
Configuring an Inherited VLAN for an Independent Port	<b>switchport mode servicechain</b> Configures a port as a service chain port.
	 (Mandatory) After a port is configured as an AP, if its member port is changed to independent port, then the independent port uses the inherited VLAN configured on the AP as its allowed VLAN list. If AP does not configure the inherited VLAN for the independent port, the member port inherits the allowed VLAN list of AP as its allowed VLAN list.
	<b>switchport mode servicechain</b> Configures a port as a service chain port.

## 4.4.1 Configuring Basic VLAN

### Configuration Effect

- A VLAN is identified by a VLAN ID. You may add, delete, modify VLANs 2 to 4094, but VLAN 1 is created automatically and cannot be deleted. You may configure the port mode, and add or remove a VLAN.

### Notes

- N/A

### Configuration Steps

#### 📄 Creating and Modifying a VLAN

- Mandatory.
- In case of insufficient hardware resources, the system returns information on VLAN creation failure.
- Use the **vlan** *vlan-id* command to create a VLAN or enter VLAN mode.
- Configuration:

<b>Command</b>	<b>vlan</b> <i>vlan-id</i>
<b>Parameter Description</b>	<i>vlan-id</i> : indicates VLAN ID ranging from 1 to 4094.
<b>Defaults</b>	VLAN 1 is created automatically and is not deletable.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If you enter a new VLAN ID, the corresponding VLAN will be created. If you enter an existing VLAN ID, the corresponding VLAN will be modified. You may use the <b>no vlan</b> <i>vlan-id</i> command to delete a VLAN. The undeletable VLANs include VLAN1, the VLANs configured with SVIs, and SubVLANs.

#### 📄 Renaming a VLAN

- Optional.
- You cannot rename a VLAN the same as the default name of another VLAN.
- Configuration:

<b>Command</b>	<b>name</b> <i>vlan-name</i>
<b>Parameter Description</b>	<i>vlan-name</i> : indicates a VLAN name.
<b>Defaults</b>	By default, the name of a VLAN is its VLAN ID. For example, the default name of the VLAN 4 is VLAN 0004.
<b>Command Mode</b>	VLAN configuration mode
<b>Usage Guide</b>	To restore the VLAN name to defaults, use the <b>no name</b> command.

➤ **Assigning Current Access port to a Specified VLAN**

- Optional.
- Use the **switchport mode access** command to specify Layer-2 ports (switch ports) as Access ports.
- Use the **switchport access vlan** *vlan-id* command to add an Access port to a specific VLAN so that the flows from the VLAN can be transmitted through the port.

<b>Command</b>	<b>switchport mode access</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	A switch port is an Access port by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

<b>Command</b>	<b>switchport access vlan</b> <i>vlan-id</i>
<b>Parameter</b>	<i>vlan-id</i> : indicates a VLAN ID.
<b>Description</b>	
<b>Defaults</b>	An Access port is added to VLAN 1 by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If a port is assigned to a non-existent VLAN, the VLAN will be created automatically.

➤ **Adding an Access Port to Current VLAN**

- Optional.
- This command takes effect only on an Access port. After an Access port is added to a VLAN, the flows of the VLAN can be transmitted through the port.
- Configuration:

<b>Command</b>	<b>add interface</b> { <i>interface-id</i>   <b>range</b> <i>interface-range</i> }
<b>Parameter</b>	<i>interface-id</i> : indicates a single port.
<b>Description</b>	<i>interface-id</i> : indicates multiple ports.
<b>Defaults</b>	By default, all Layer-2 Ethernet ports belong to VLAN 1.
<b>Command Mode</b>	VLAN configuration mode
<b>Usage Guide</b>	In VLAN configuration mode, add a specific Access port to a VLAN. This command takes the same effect as command <b>switchport access vlan</b> <i>vlan-id</i> .

**i** For the two commands of adding a port to a VLAN, the command configured later will overwrite the other one.

**Verification**

- Send untagged packets to an Access port, and they are broadcast within the VLAN.

- Use commands **show vlan** and **show interface switchport** to check whether the configuration takes effect.

<b>Command</b>	<b>show vlan [ id <i>vlan-id</i> ]</b>									
<b>Parameter Description</b>	<i>vlan-id</i> : indicates a VLAN ID.									
<b>Command Mode</b>	Any mode									
<b>Usage Guide</b>	N/A									
<b>Command Display</b>	<pre>Ruijie(config-vlan)#show vlan id 20</pre> <table border="1"> <thead> <tr> <th>VLAN Name</th> <th>Status</th> <th>Ports</th> </tr> </thead> <tbody> <tr> <td colspan="3">-----</td> </tr> <tr> <td>20 VLAN0020</td> <td>STATIC</td> <td>Gi0/1</td> </tr> </tbody> </table>	VLAN Name	Status	Ports	-----			20 VLAN0020	STATIC	Gi0/1
VLAN Name	Status	Ports								
-----										
20 VLAN0020	STATIC	Gi0/1								

## Configuration Example

### Configuring Basic VLAN and Access Port

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Create a VLAN and rename it.</li> <li>● Add an Access port to the VLAN. There are two approaches. One is:</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# vlan 888 Ruijie(config-vlan)# name test888 Ruijie# (config-vlan)# exit Ruijie(config)# interface GigabitEthernet 0/3 Ruijie(config-if-GigabitEthernet 0/3)# switchport mode access Ruijie(config-if-GigabitEthernet 0/3)# switchport access vlan 20</pre> <p>The other approach is adding an Access port (GigabitEthernet 0/3) to VLAN20:</p> <pre>Ruijie# configure terminal SwitchA(config)#vlan 20 SwitchA(config-vlan)#add interface GigabitEthernet 0/3</pre>												
<b>Verification</b>	<p>Check whether the configuration is correct.</p> <pre>Ruijie(config-vlan)#show vlan</pre> <table border="1"> <thead> <tr> <th>VLAN Name</th> <th>Status</th> <th>Ports</th> </tr> </thead> <tbody> <tr> <td colspan="3">-----</td> </tr> <tr> <td>1 VLAN0001</td> <td>STATIC</td> <td></td> </tr> <tr> <td>20 VLAN0020</td> <td>STATIC</td> <td>Gi0/3</td> </tr> </tbody> </table>	VLAN Name	Status	Ports	-----			1 VLAN0001	STATIC		20 VLAN0020	STATIC	Gi0/3
VLAN Name	Status	Ports											
-----													
1 VLAN0001	STATIC												
20 VLAN0020	STATIC	Gi0/3											

```

888 test888                               STATIC

Ruijie(config-vlan)#

Ruijie# show interface GigabitEthernet 0/3 switchport

Interface                               Switchport Mode      Access Native Protected VLAN lists
-----
GigabitEthernet 0/3                    enabled    ACCESS    20    1    Disabled ALL

Ruijie# show run

!
    
```

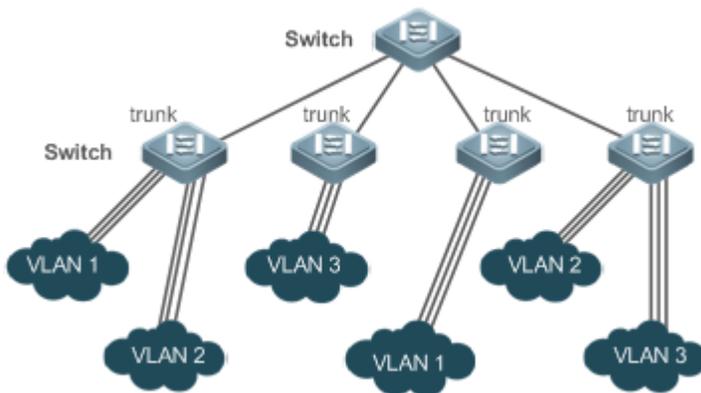

### 4.4.2 Configuring a Trunk Port

#### Configuration Effect

A Trunk is a point-to-point link connecting one Ethernet interface or multiple ones to other network devices (for example, a router or switch) and it may transmit the flows from multiple VLANs.

The Trunk of Ruijie devices adopts the 802.1Q encapsulation standard. The following figure displays a network adopting a Trunk connection.

Figure 5-3

You may configure an Ethernet port or Aggregate Port (See *Configuring Aggregate Port* for details) as a Trunk port.

You should specify a native VLAN for a Trunk port. The untagged packets received by and sent from the Trunk port are considered to belong to the native VLAN. The default VLAN ID (PVID in the IEEE 802.1Q) of this Trunk port is the native VLAN ID. Meanwhile, frames of the native VLAN sent via the Trunk are untagged. The default native VLAN of a Trunk port is VLAN 1.

When configuring a Trunk link, make sure the Trunk ports at the two ends of the link adopt the same native VLAN.

#### Configuration Steps

##### ➤ Configuring a Trunk Port

- Mandatory.
- Configure a Trunk port to transmit the flows from multiple VLANs.
- Configuration:

<b>Command</b>	<b>switchport mode trunk</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The default mode is Access, which can be modified to Trunk.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To restore all properties of a Trunk port to defaults, use the <b>no switchport mode</b> command.

↘ **Defining Allowed-VLANs for a Trunk Port**

- Optional.
- By default, a trunk port transmits the flows from all the VLANs (1 to 4094). You may configure a list of allowed-VLANs to prohibit flows of some VLANs from passing through a Trunk port.
- Configuration:

<b>Command</b>	<b>switchport trunk allowed vlan {all   [add   remove   except   only ] } vlan-list</b>
<b>Parameter Description</b>	The parameter vlan-list can be a VLAN or some VLANs, and the VLAN IDs are connected by "-" in order. For example: 10–20. <b>all</b> indicates allowed-VLANs include all VLANs; <b>add</b> indicates adding a specific VLAN to the list of allowed-VLANs; <b>remove</b> indicates removing a specific VLAN from the list of allowed-VLANs; <b>except</b> indicates adding all VLANs except those in the listed VLAN to the list of allowed-VLANs. <b>only</b> indicates adding the listed VLANs to the list of allowed-VLANs, and removing the other VLANs from the list.
<b>Defaults</b>	The Trunk port and the Uplink port belong to all VLANs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To restore the configuration on a Trunk port to defaults ( <b>all</b> ), use the <b>no switchport trunk allowed vlan</b> command.

↘ **Configuring a Native VLAN**

- Optional.
- A Trunk port receives and sends tagged or untagged 802.1Q frames. Untagged frames transmit the flows from the native VLAN. The default native VLAN is VLAN 1.
- If a frame carries the VLAN ID of a native VLAN, its tag will be stripped automatically when it passes a Trunk port.
- Configuration:

<b>Command</b>	<b>switchport trunk native vlan</b> <i>vlan-id</i>
<b>Parameter</b>	<i>vlan-id</i> : indicates a VLAN ID.
<b>Description</b>	
<b>Defaults</b>	The default VALN for a Trunk/Uplink port is VLAN 1.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To restore the native VLAN of a Trunk port back to defaults, use the <b>no switchport trunk native vlan</b> command.

**i** When you set the native VLAN of a port to a non-existent VLAN, this VLAN will not be created automatically. Besides, the native VLAN can be out of the list of allowed-VLANs for this port. In this case, the flows from the native VLAN cannot pass through the port.

### Verification

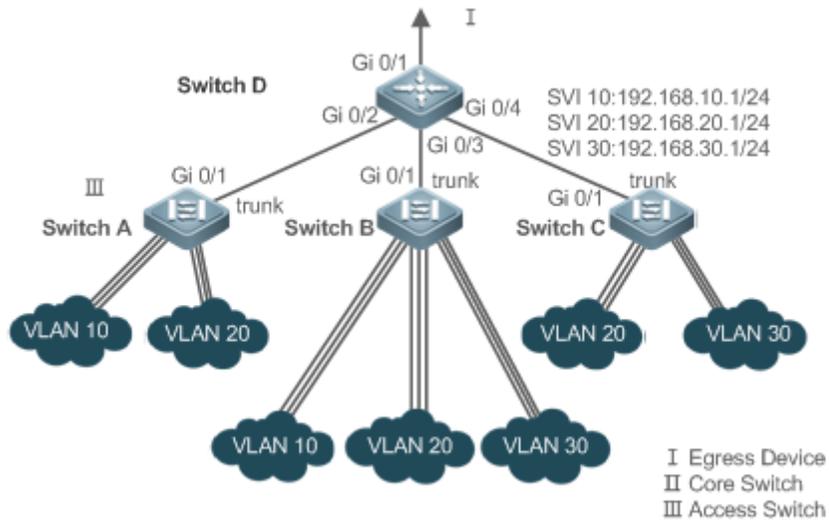

- Send tag packets to a Trunk port, and they are broadcast within the specified VLANs.
- Use commands **show vlan** and **show interface switchport** to check whether the configuration takes effect.

<b>Command</b>	<b>show vlan</b> [ id <i>vlan-id</i> ]						
<b>Parameter</b>	<i>vlan-id</i> : indicates a VLAN ID.						
<b>Description</b>							
<b>Command Mode</b>	Any mode						
<b>Usage Guide</b>	N/A						
<b>Command Display</b>	<pre>Ruijie(config-vlan)#show vlan id 20</pre> <table border="1"> <thead> <tr> <th>VLAN Name</th> <th>Status</th> <th>Ports</th> </tr> </thead> <tbody> <tr> <td>20 VLAN0020</td> <td>STATIC</td> <td>Gi0/1</td> </tr> </tbody> </table>	VLAN Name	Status	Ports	20 VLAN0020	STATIC	Gi0/1
VLAN Name	Status	Ports					
20 VLAN0020	STATIC	Gi0/1					

### Configuration Example

#### Configuring Basic VLAN to Realize Layer-2 Isolation and Layer-3 Interconnection

**Scenario**  
**Figure 5-4**

**Configuration Steps**

**Networking Requirements:**

As shown in the figure above, an intranet is divided into VLAN 10, VLAN 20 and VLAN 30, realizing Layer-2 isolation from each other. The three VLANs correspond respectively to the IP sub-networks 192.168.10.0/24, 192.168.20.0/24, and 192.168.30.0/24, realizing interconnection with each other through IP forwarding by Layer-3 core switches.

**Key Points:**

The following example describes the configuration steps on a core switch and an access switch.

- Configure three VLANs on a core switch and the port connected to the access switches as a Trunk port, and specify a list of allowed-VLANs to realize Layer-2 isolation.
- Configure three SVIs on the core switch, which are the gateway interfaces of the IP sub-networks corresponding to the three VLANs, and configure the IP addresses for these interfaces.
- Create VLANs respectively on the three access switches, assign Access ports for the VLANs, and specify Trunk ports of the core switch. The following example describes the configuration steps on Switch A.

**D**

```

D#configure terminal
D(config)#vlan 10
D(config-vlan)#vlan 20
D(config-vlan)#vlan 30
D(config-vlan)#exit
D(config)#interface range GigabitEthernet 0/2-4
D(config-if-range)#switchport mode trunk
D(config-if-range)#exit
D(config)#interface GigabitEthernet 0/2
D(config-if-GigabitEthernet 0/2)#switchport trunk allowed vlan remove 1-4094
    
```

	<pre> D(config-if-GigabitEthernet 0/2)#switchport trunk allowed vlan add 10,20 D(config-if-GigabitEthernet 0/2)#interface GigabitEthernet 0/3 D(config-if-GigabitEthernet 0/3)#switchport trunk allowed vlan remove 1-4094 D(config-if-GigabitEthernet 0/3)#switchport trunk allowed vlan add 10,20,30 D(config-if-GigabitEthernet 0/3)#interface GigabitEthernet 0/4 D(config-if-GigabitEthernet 0/4)#switchport trunk allowed vlan remove 1-4094 D(config-if-GigabitEthernet 0/4)#switchport trunk allowed vlan add 20,30 D#configure terminal D(config)#interface vlan 10 D(config-if-VLAN 10)#ip address 192.168.10.1 255.255.255.0 D(config-if-VLAN 10)#interface vlan 20 D(config-if-VLAN 20)#ip address 192.168.20.1 255.255.255.0 D(config-if-VLAN 20)#interface vlan 30 D(config-if-VLAN 30)#ip address 192.168.30.1 255.255.255.0 D(config-if-VLAN 30)#exit         </pre>
<p><b>A</b></p>	<pre> A#configure terminal A(config)#vlan 10 A(config-vlan)#vlan 20 A(config-vlan)#exit A(config)#interface range GigabitEthernet 0/2-12 A(config-if-range)#switchport mode access A(config-if-range)#switchport access vlan 10 A(config-if-range)#interface range GigabitEthernet 0/13-24 A(config-if-range)#switchport mode access A(config-if-range)#switchport access vlan 20 A(config-if-range)#exit A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#switchport mode trunk         </pre>
<p><b>Verification</b></p>	<p>Display the VLAN configuration on the core switch.</p> <ul style="list-style-type: none"> <li>● Display VLAN information including VLAN IDs, VLAN names, status and involved ports.</li> <li>● Display the status of ports Gi 0/2, Gi 0/3 and Gi 0/4.</li> </ul>

```

```

**Common Errors**

- N/A

**4.4.3 Configuring an Uplink Port**

**Configuration Effect**

- An Uplink port is usually used in QinQ (the IEEE 802.1ad standard) environment, and is similar to a Trunk port. Their difference is that an Uplink port only transmits tagged frames while a Trunk port sends untagged frames of the native VLAN.

## Configuration Steps

### ↘ Configuring an Uplink Port

- Mandatory.
- Configure an Uplink port to transmit the flows from multiple VLANs, but only tagged frames can be transmitted.
- Configuration:

<b>Command</b>	<b>switchport mode uplink</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The default mode is Access, which can be modified to Uplink.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To restore all properties of an Uplink port to defaults, use the <b>no switchport mode</b> command.

### ↘ Defining Allowed-VLANs for a Trunk Port

- Optional.
- You may configure a list of allowed-VLANs to prohibit flows of some VLANs from passing through an Uplink port.
- Configuration:

<b>Command</b>	<b>switchport trunk allowed vlan { all   [ add   remove   except   only ] } <i>vlan-list</i></b>
<b>Parameter Description</b>	The parameter <i>vlan-list</i> can be a VLAN or some VLANs, and the VLAN IDs are connected by "-" in order. For example: 10-20. <b>all</b> indicates allowed-VLANs include all VLANs; <b>add</b> indicates adding a specific VLAN to the list of allowed-VLANs; <b>remove</b> indicates removing a specific VLAN from the list of allowed-VLANs; <b>except</b> indicates adding all VLANs except those in the listed VLAN to the list of allowed-VLANs; and <b>only</b> indicates adding the listed VLANs to the list of allowed-VLANs, and removing the other VLANs from the list.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To restore the allowed-VLANs to defaults ( <b>all</b> ), use the <b>no switchport trunk allowed vlan</b> command.

### ↘ Configuring a Native VLAN

- Optional.
- If a frame carries the VLAN ID of a native VLAN, its tag will not be stripped when it passes an Uplink port. This is contrary to a Trunk port.
- Configuration:

<b>Command</b>	<b>switchport trunk native vlan <i>vlan-id</i></b>
----------------	--

<b>Parameter Description</b>	<i>vlan-id</i> : indicates a VLAN ID.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To restore the native VLAN of an Uplink to defaults, use the <b>no switchport trunk native vlan</b> command.

### Verification

- Send tag packets to an Uplink port, and they are broadcast within the specified VLANs.
- Use commands **show vlan** and **show interface switchport** to check whether the configuration takes effect.

<b>Command</b>	<b>show vlan [ id <i>vlan-id</i> ]</b>									
<b>Parameter Description</b>	<i>vlan-id</i> : indicates a VLAN ID.									
<b>Command Mode</b>	Any mode									
<b>Usage Guide</b>	N/A									
<b>Command Display</b>	<pre>Ruijie(config-vlan)#show vlan id 20</pre> <table border="1"> <thead> <tr> <th>VLAN Name</th> <th>Status</th> <th>Ports</th> </tr> </thead> <tbody> <tr> <td>-----</td> <td></td> <td></td> </tr> <tr> <td>20 VLAN0020</td> <td>STATIC</td> <td>Gi0/1</td> </tr> </tbody> </table>	VLAN Name	Status	Ports	-----			20 VLAN0020	STATIC	Gi0/1
VLAN Name	Status	Ports								
-----										
20 VLAN0020	STATIC	Gi0/1								

### Configuration Example

#### Configuring an Uplink Port

<b>Configuration Steps</b>	<p>The following is an example of configuring Gi0/1 as an Uplink port.</p> <pre>Ruijie# configure terminal Ruijie(config)# interface gi 0/1 Ruijie(config-if-GigabitEthernet 0/1)# switchport mode uplink Ruijie(config-if-GigabitEthernet 0/1)# end</pre>															
<b>Verification</b>	<p>Check whether the configuration is correct.</p> <pre>Ruijie# show interfaces GigabitEthernet 0/1 switchport</pre> <table border="1"> <thead> <tr> <th>Interface</th> <th>Switchport Mode</th> <th>Access Native</th> <th>Protected</th> <th>VLAN lists</th> </tr> </thead> <tbody> <tr> <td>-----</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>GigabitEthernet 0/1</td> <td>enabled UPLINK</td> <td>1</td> <td>1</td> <td>disabled ALL</td> </tr> </tbody> </table>	Interface	Switchport Mode	Access Native	Protected	VLAN lists	-----					GigabitEthernet 0/1	enabled UPLINK	1	1	disabled ALL
Interface	Switchport Mode	Access Native	Protected	VLAN lists												
-----																
GigabitEthernet 0/1	enabled UPLINK	1	1	disabled ALL												

## 4.4.4 Configuring a Hybrid Port

### Configuration Effect

- A Hybrid port is usually used in SHARE VLAN environment. By default, a Hybrid port is the same as a Trunk port. Their difference is that a Hybrid port can send the frames from the VLANs except the default VLAN in the untagged format.

### Configuration Steps

#### ▾ Configuring a Hybrid Port

- Mandatory.
- Configure a Hybrid port to transmit the flows from multiple VLANs.
- Configuration:

<b>Command</b>	<b>switchport mode hybrid</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The default mode is Access, which can be modified to Hybrid.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To restore all properties of a Hybrid port to defaults, use the <b>no switchport mode</b> command.

#### ▾ Defining Allowed-VLANs for a Hybrid Port

- Optional.
- By default, a Hybrid port transmits the flows from all the VLANs (1 to 4094). You may configure a list of allowed-VLANs to prohibit flows of some VLANs from passing through a Hybrid port.
- Configuration:

<b>Command</b>	<b>switchport hybrid allowed vlan [ [add   only ] tagged   [ add ] untagged   remove ] <i>vlan_list</i></b>
<b>Parameter Description</b>	<i>vlan-id</i> : indicates a VLAN ID.
<b>Defaults</b>	By default a Hybrid port belongs to all VLANs. The port is added to the default VLAN in untagged form and to the other VLANs in the tagged form.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring a Native VLAN

- Optional.
- If a frame carries the VLAN ID of a native VLAN, its tag will be stripped automatically when it passes a Hybrid port.
- Configuration:

<b>Command</b>	<b>switchport hybrid native vlan</b> <i>vlan_id</i>
<b>Parameter</b>	<i>vlan-id</i> : indicates a VLAN ID.
<b>Description</b>	
<b>Defaults</b>	The default native VLAN is VLAN 1.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To restore the native VLAN of a Hybrid port to defaults, use the <b>no switchport hybrid native vlan</b> command.

### Verification

- Send tagged packets to an Hybrid port, and they are broadcast within the specified VLANs.
- Use commands **show vlan** and **show interface switchport** to check whether the configuration takes effect.

<b>Command</b>	<b>show vlan</b> [ id <i>vlan-id</i> ]									
<b>Parameter</b>	<i>vlan-id</i> : indicates a VLAN ID.									
<b>Description</b>										
<b>Command Mode</b>	Any mode									
<b>Usage Guide</b>	N/A									
<b>Command Display</b>	<pre>Ruijie(config-vlan)#show vlan id 20</pre> <table border="1"> <thead> <tr> <th>VLAN Name</th> <th>Status</th> <th>Ports</th> </tr> </thead> <tbody> <tr> <td>-----</td> <td></td> <td></td> </tr> <tr> <td>20 VLAN0020</td> <td>STATIC</td> <td>Gi0/1</td> </tr> </tbody> </table>	VLAN Name	Status	Ports	-----			20 VLAN0020	STATIC	Gi0/1
VLAN Name	Status	Ports								
-----										
20 VLAN0020	STATIC	Gi0/1								

### Configuration Example

#### Configuring a Hybrid Port

<b>Configuration Steps</b>	The following is an example of configuring Gi0/1 as a Hybrid port.
	<pre>Ruijie# configure terminal Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# switchport mode hybrid Ruijie(config-if-GigabitEthernet 0/1)# switchport hybrid native vlan 3 Ruijie(config-if-GigabitEthernet 0/1)# switchport hybrid allowed vlan untagged 20-30 Ruijie(config-if-GigabitEthernet 0/1)# end</pre>
<b>Verification</b>	Check whether the configuration is correct.

```
Ruijie(config-if-GigabitEthernet 0/1)#show run interface gigabitEthernet 0/1

Building configuration...

Current configuration : 166 bytes

interface GigabitEthernet 0/1
    switchport
    switchport mode hybrid
    switchport hybrid native vlan 3
    switchport hybrid allowed vlan add untagged 20-30
```

### 4.4.5 Configuring a Service Chain Port

#### Configuration Effect

- In normal cases, the service chain port is used at layer 2 diversion environment. By default, the service chain port does not learn MAC addresses and can forward packets from any VLAN. In addition, it is deployed in transparent mode to divert layer-2 and layer-3 packets.

#### Configuration Steps

##### ▾ Configuring a Service Chain Port

- Mandatory.
- Perform this operation to configure a port as a service chain port.
- Perform this operation on the switch.

<b>Command</b>	<b>switchport mode servicechain</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	The default mode is <b>ACCESS</b> .
<b>Command Mode</b>	Interface configuration model
<b>Usage Guide</b>	Before changing a port from an access, trunk, hybrid, uplink, or 802.1Q tunnel port to a service chain port, clear other configurations on the port and changes the port to an access port first. To restore the default settings, run <b>no switchport mode</b> in interface configuration mode.

#### Verification

- The service chain port does not learn the MAC address when packets with tags are sent over the service chain port. In addition, packets are transmitted regardless of the carried tag and whether the VLAN is created.

## Configuration Example

### Configuring a Service Chain Port

 Only configuration related to the service chain port is described.

<b>Configuration Steps</b>	Configure the Gi0/1 port as a service chain port.
	<pre>Ruijie# configure terminal Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# switchport mode servicechain Ruijie(config-if-GigabitEthernet 0/1)# end</pre>
<b>Verification</b>	Run <b>show run</b> to check whether the configuration is correct.
	<pre>Ruijie(config-if-GigabitEthernet 0/1)#show run interface gigabitEthernet 0/1  Building configuration... Current configuration : 166 bytes  interface GigabitEthernet 0/1   switchport   switchport mode <b>servicechain</b></pre>

## 4.4.6 Configuring an Inherited VLAN for an Independent Port

### Configuration Effect

- Only trunk, uplink, and hybrid ports support this configuration. After the extend VLAN list of a trunk or uplink port is specified, when this port is an AP and a member port of the AP is changed to an independent port, the member port uses the extend VLAN list configured on the AP as the allowed VLAN list. Likewise, after the extend VLAN list of a hybrid port is specified, the extend VLAN list is used as the allowed VLAN list of a member hybrid port, and a member hybrid port that is changed to an independent port will also inherit the tag VLAN list of the AP.

### Configuration Steps

#### Configuring an Inherited VLAN for an Independent Port

- Mandatory.
- Perform this operation on the switch. In PXE OS installation scenarios, perform this operation on an AP.

<b>Command</b>	<b>switchport individual-port extend-vlan <i>vlan-list</i></b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	No inherited VLAN is configured by default.
<b>Command</b>	Interface configuration mode of a switch port

<b>Mode</b>	
<b>Usage Guide</b>	To disable this function, use the <b>no switchport individual-port extend-vlan</b> or <b>default switchport individual-port extend-vlan</b> command. Only trunk, uplink, and hybrid ports support this configuration.

### Verification

- Run the **show run** command to check whether the **switchport individual-port extend-vlan** command exists on the interface.

### Configuration Example

#### Configuring an Inherited VLAN for an Independent Port

 Only the configuration related to inherited VLANs of independent ports is described.

<b>Configuration Steps</b>	The following is an example of this command:
	<pre>Ruijie# configure terminal Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1) switchport mode trunk Ruijie(config-if-GigabitEthernet 0/1) switchport individual-port extend-vlan 10</pre>
<b>Verification</b>	Run the <b>show run</b> command to check whether the configuration is correct.
	<pre>Ruijie(config-if-GigabitEthernet 0/1)#show run  Building configuration... Current configuration : 166 bytes  interface GigabitEthernet 0/1 switchport individual-port extend-vlan 10</pre>

## 4.5 Monitoring

### Displaying

Description	Command
Displays VLAN configuration.	<b>show vlan</b>
Displays configuration of switch ports.	<b>show interface switchport</b>

### Debugging

 System resources are occupied when debugging information is output. Disable the debugging switch immediately after use.

Description	Command
Debugs	<b>debug bridge vlan</b>

VLANs.	
--------	--

## 5 Configuring MAC VLAN

### 5.1 Overview

The MAC VLAN function refers to assigning VLANs based on MAC addresses, which is a new method of VLAN assignment. This function is often used with 802.1Xdynamic VLAN assignment to implement secure and flexible access of 802.1Xterminals. After an 802.1Xuser passes authentication, the access switch automatically generates a MAC VLAN entry based on the VLAN and user MAC address pushed by the authentication server. A network administrator can also configure the association between a MAC address and a VLAN on the switch in advance.

#### Protocols

---

- IEEE 802.1Q: Virtual Bridged Local Area Networks and Standards

## 5.2 Applications

Application	Description
<a href="#">Configuring MAC VLAN</a>	Configures the MAC VLAN function to assign VLANs based on users' MAC addresses. When the physical location of a user changes, i.e. switching from one switch to another, it is unnecessary to re-configure the VLAN of the port used by the user.

### 5.2.1 Configuring MAC VLAN

#### Scenario

With popularization of mobile office, terminal devices usually do not use fixed ports for network access. A terminal device may use port A to access the network this time, but use port B to access the network next time. If the VLAN configurations of ports A and B are different, the terminal device will be assigned to a different VLAN in the second access, and fail to use the resources of the previous VLAN. If the VLAN configurations of ports A and B are the same, security issues may be introduced when port B is assigned to other terminal devices. How to allow hosts of different VLANs to access the network on the same port? The MAC VLAN function is hereby introduced.

The biggest advantage of MAC VLAN lies in that when the physical location of a user changes, i.e. switching from one switch to another, it is unnecessary to re-configure the VLAN of the port used by the user. Therefore, MAC address-based VLAN assignment can be regarded as user-based.

#### Deployment

- Configure or push MAC VLAN entries on a layer-2 switch or wireless device to assign VLANs based on users' MAC addresses.

## 5.3 Overview

#### Feature

Feature	Description
<a href="#">Configuring MAC VLAN</a>	Configures the MAC VLAN function to assign VLANs based on users' MAC addresses.

### 5.3.1 Configuring MAC VLAN

#### Working Principle

When a switch receives a packet, the switch compare the source MAC address of the packet with the MAC address specified in a MAC VLAN entry. If they match, the switch forwards the packet to the VLAN specified in the MAC VLAN entry. If they don't match, the VLAN to which the data stream belongs is still determined by the VLAN assignment rule of the port.

To ensure that a PC is assigned to a specified VLAN no matter which switch it is connected to, you can perform configuration by using the following approaches:

- Static configuration by using commands. You can configure the association between a MAC address and a VLAN on a local switch by using commands.
- Automatic configuration by using an authentication server (802.1Xdynamic VLAN assignment). After a user passes authentication, a switch dynamically creates an association between the MAC address and a VLAN based on the information provided by the authentication server. When the user goes offline, the switch automatically deletes the association. This approach requires that the MAC-VLAN association be configured on the authentication server. For details about 802.1Xdynamic VLAN assignment, refer to the Configuring 802.1X.

MAC VLAN entries support both of the two approaches, that is, the entries can be configured on both a local switch and an authentication server. The configurations can take effect only if they are consistent. If the configurations are different, the configuration performed earlier takes effect.

-  The MAC VLAN function can be configured on hybrid ports only.
-  MAC VLAN entries are effective only for untagged packets, but not effective for tagged packets.
-  For MAC VLAN entries statically configured or dynamically generated, the specified VLANs must exist.
-  VLANs specified in MAC VLAN entries cannot be Super VLANs (but can be Sub VLANs), Remote VLANs, or Primary VLANs (but can be Secondary VLANs).
-  MAC addresses specified in MAC VLAN entries must be unicast addresses.
-  MAC VLANs are effective for all hybrid ports that are enabled with the MAC VLAN function.

## 5.4 Configuration

Configuration	Description and Command
<a href="#">Enabling MAC VLAN on a Port</a>	 (Mandatory) It is used to enable the MAC VLAN function on a port.
	<b>mac-vlan enable</b> Enables MAC VLAN on a port.
<a href="#">Adding a Static MAC VLAN Entry Globally</a>	 (Optional) It is used to bind MAC addresses with VLANs.
	<b>mac-vlan mac-address</b> Configures a static MAC VLAN entry.

### 5.4.1 Enabling MAC VLAN on a Port

#### Configuration Effect

Enable the MAC VLAN function on a port so that MAC VLAN entries can take effect on the port.

#### Notes

N/A

## Configuration Steps

### ▾ Enabling MAC VLAN on a Port

- Mandatory.
- By default, the MAC VLAN function is disabled on ports and all MAC VLAN entries are ineffective on the ports.
- Enable MAC VLAN on a switch.

<b>Command</b>	<b>mac-vlan enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	The MAC VLAN function is disabled on a port.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## Verification

- Run the **show mac-vlan interface** command to display information about the ports enabled with the MAC VLAN function.

<b>Command</b>	<b>show mac-vlan interface</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged configuration mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A
<b>Command Display</b>	<pre>Ruijie# show mac-vlan interface MAC VLAN is enabled on following interface: ----- FastEthernet 0/1</pre>

## Configuration Example

### ▾ Enabling MAC VLAN on a Port

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable the MAC VLAN function on the Fast Ethernet 0/10 port.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# interface FastEthernet0/10 Ruijie(config-if-FastEthernet 0/10)# mac-vlan enable</pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>Check the information about the port enabled with the MAC VLAN function.</li> </ul>
	<pre>Ruijie# show mac-vlan interface MAC VLAN is enabled on following interface: ----- FastEthernet 0/10</pre>

### Common Errors

When the MAC VLAN function is enabled on a port, the port is not configured as a layer-2 port (such as switch port or AP port) in advance.

## 5.4.2 Adding a Static MAC VLAN Entry Globally

### Configuration Effect

- Configure a static MAC VLAN entry to bind a MAC addresses with a VLAN. The 802.1p priority can be configured, which is 0 by default.

### Notes

N/A

### Configuration Steps

#### ▾ Adding a Static MAC VLAN Entry

- Optional.
- To bind a MAC addresses with a VLAN, you should perform this configuration. The 802.1p priority can be configured, which is 0 by default.
- Add a static MAC VLAN entry on a switch.

<b>Command</b>	<b>mac-vlan mac-address</b> <i>mac-address</i> [ <b>mask</b> <i>mac-mask</i> ] <b>vlan</b> <i>vlan-id</i> [ <b>priority</b> <i>pri_val</i> ]
<b>Parameter</b>	<b>mac-address</b> <i>mac-address</i> : Indicates a MAC address.
<b>Description</b>	<b>mask</b> <i>mac-mask</i> : Indicates a mask. <b>vlan</b> <i>vlan-id</i> : Indicates the associated VLAN. <b>priority</b> <i>pri_val</i> : Indicates the priority.
<b>Defaults</b>	No static MAC VLAN entry is configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

**i** If an untagged packet is matched with a MAC VLAN entry, the packet is modified to the VLAN specified by the MAC VLAN entry once arriving at the switch since the MAC VLAN entry has the highest priority. Subsequent functions and protocols are implemented based on the modified VLAN. Possible influences are as follows:

- i** If an 802.1X user fails to be authenticated, the hybrid port jumps to VLAN 100 specified by the FAIL VLAN function; however, the MAC VLAN entry statically configured redirects all packets of this user to VLAN 200. Consequently, the user cannot implement normal communication in FAIL VLAN 100.
- i** After an untagged packet is matched with a MAC VLAN entry, the VLAN that triggers MAC address learning is the VLAN redirected based on the MAC VLAN entry.
- i** For a port that is enabled with the MAC VLAN function, if received packets are matched with both MAC VLAN entries with full F masks and those without full F masks, the packets are processed based on the MAC VLAN entries without full F masks.
- i** If an untagged packet is matched with both a MAC VLAN entry and a VOICE VLAN entry, the packet priority is modified simultaneously. The priority of the VOICE VLAN entry is used as that of the packet.
- i** If an untagged packet is matched with both a MAC VLAN entry and a PROTOCOL VLAN entry, the VLAN carried in the packet should be the MAC VLAN.
- i** The MAC VLAN function is applied only to untagged packets, but not applied to PRIORITY packets (packets whose VLAN tag is 0 and carrying COS PRIORITY information) and the processing actions are uncertain.
- i** The QoS packet trust model on a switch is disabled by default, which will change PRIORITY of all packets to 0 and overwrite the modification on packet priorities by the MAC VLAN function. Run the **mls qos trust cos** command in the interface configuration mode to enable the QoS trust model and trust packet priorities.

📄 **Deleting All Static MAC VLAN Entries**

- Optional.
- To delete all static MAC VLAN entries, you should perform this configuration.
- Perform this configuration on a switch.

<b>Command</b>	<b>no mac-vlan all</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

📄 **Deleting the Static MAC VLAN Entry of a Specified MAC Address**

- Optional.
- To delete the MAC VLAN entry of a specified MAC address, you should perform this configuration.
- Perform this configuration on a switch.

<b>Command</b>	<b>no mac-vlan mac-address</b> <i>mac-address</i> [ <b>mask</b> <i>mac-mask</i> ]
<b>Parameter</b>	<b>mac-address</b> <i>mac-address</i> : Indicates a MAC address.
<b>Description</b>	<b>mask</b> <i>mac-mask</i> : Indicates a mask.
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	N/A

📌 **Deleting the Static MAC VLAN Entry of a Specified VLAN**

- Optional.
- To delete the MAC VLAN entry of a specified VLAN, you should perform this configuration.
- Perform this configuration on a switch.

<b>Command</b>	<b>no mac-vlan vlan</b> <i>vlan-id</i>
<b>Parameter</b>	<b>vlan</b> <i>vlan-id</i> : Indicates a VLAN.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

**Verification**

- Run the **show mac-vlan static** command to check whether all static MAC VLAN entries are correct.
- Run the **show mac-vlan vlan** *vlan-id* command to check whether the MAC VLAN entry of a specified VLAN is correct.
- Run the **show mac-vlan mac-address** *mac-address* [ **mask** *mac-mask* ] command to display the MAC VLAN entry of a specified MAC address.

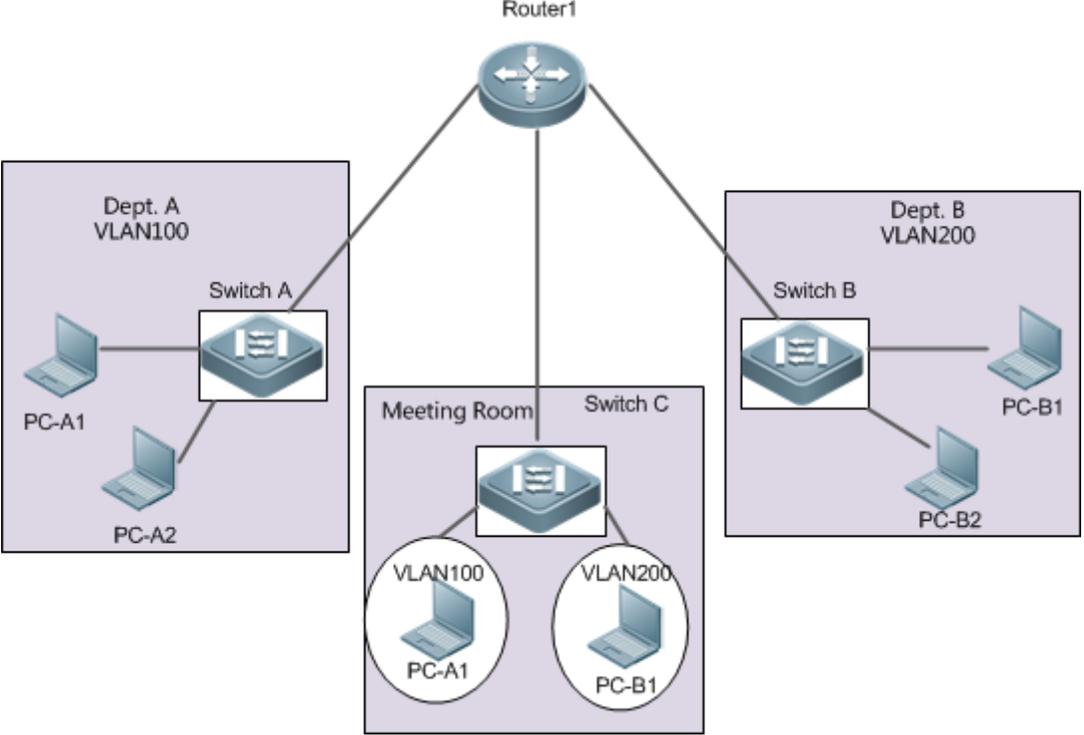

<b>Command</b>	<b>show mac-vlan static</b> <b>show mac-vlan vlan</b> <i>vlan-id</i> <b>show mac-vlan mac-address</b> <i>mac-address</i> [ <b>mask</b> <i>mac-mask</i> ]
<b>Parameter</b>	<b>vlan</b> <i>vlan-id</i> : Indicates a specified VLAN.
<b>Description</b>	<b>mac-address</b> <i>mac-address</i> : Indicates a specified MAC address. <b>mask</b> <i>mac-mask</i> : Indicates a specified mask.
<b>Command Mode</b>	Privileged configuration mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A
<b>Command Display</b>	<pre> Ruijie# show mac-vlan all The following MAC VLAN address exist: S: Static   D: Dynamic MAC ADDR      MASK           VLAN ID  PRIO  STATE ----- 0000.0000.0001  ffff.ffff.ffff  2        0     D 0000.0000.0002  ffff.ffff.ffff  3        3     S 0000.0000.0003  ffff.ffff.ffff  3        3     S&amp;D Total MAC VLAN address count: 3                     </pre>

## Configuration Example

### Adding a Static MAC VLAN Entry Globally

As shown in Figure 6-1, PC-A1 and PC-A2 belong to department A and are assigned to VLAN 100. PC-B1 and PC-B2 belong to department B and are assigned to VLAN 200. Due to employee mobility, the company provides a temporary office at the meeting room but requires that accessed employees be assigned to the VLANs of their own departments. For example, PC-A1 must be assigned to VLAN 100 and PC-B1 must be assigned to VLAN 200 after access.

Since the access ports for PCs at the meeting room are not fixed, the MAC VLAN function can be used to associate the PC MAC addresses with the VLANs of their departments. No matter which ports the employees use for access, the MAC VLAN function automatically assigns the VLANs of their departments.

<p><b>Scenario</b> <b>Figure 6-1</b></p>	 <p>The diagram illustrates a network topology. At the top is Router1. Below it are three switches: Switch A, Switch B, and Switch C. Switch A is connected to Router1 and is labeled 'Dept. A VLAN100'. It has two PCs connected to it: PC-A1 and PC-A2. Switch B is also connected to Router1 and is labeled 'Dept. B VLAN200'. It has two PCs connected to it: PC-B1 and PC-B2. Switch C is connected to Router1 and is labeled 'Meeting Room'. It has two VLANs: VLAN100 with PC-A1 and VLAN200 with PC-B1. This represents the mobility scenario where employees from different departments access the meeting room.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the port connecting Switch C and Router 1 as a Trunk port.</li> <li>● Configure all ports connecting PCs on Switch C as hybrid ports, enable the MAC VLAN function and modify the default untagged VLAN list.</li> <li>● Configure MAC VLAN entries on Switch C.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# interface interface_name A(config-if)# switchport mode trunk A(config-if)# exit A(config)# interface interface_name</pre>

	<pre>A(config-if)# switchport mode hybrid A(config-if)# switchport hybrid allowed vlan add untagged 100,200 A(config-if)# mac-vlan enable A(config-if)# exit A(config)# mac-vlan mac-address PC-A1-mac vlan 100 A(config)# mac-vlan mac-address PC-B1-mac vlan 200</pre>
<b>Verification</b>	Check the configured static MAC VLAN entries on Switch C.
<b>A</b>	<pre>A# Ruijie# show mac-vlan static The following MAC VLAN address exist: S: Static   D: Dynamic MAC ADDR      MASK           VLAN ID  PRIO  STATE ----- PC-A1-macffff.ffff.ffff  100      0      S PC-B1-macffff.ffff.ffff  200      3      S Total MAC VLAN address count: 2</pre>

## 5.5 Monitoring

### Displaying

Description	Command
Displays all the MAC VLAN entries, including static and dynamic.	<b>show mac-vlan all</b>
Displays the dynamic MAC VLAN entries.	<b>show mac-vlan dynamic</b>
Displays the static MAC VLAN entries.	<b>show mac-vlan static</b>
Displays the MAC VLAN entries of a specified VLAN.	<b>show mac-vlan vlan <i>vlan-id</i></b>
Displays the MAC VLAN entries of a specified MAC address.	<b>show mac-vlan mac-address <i>mac-address</i> [<i>mask mac-mask</i>]</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
-------------	---------

Debugs the MAC VLAN function.	<code>debug bridge mvlan</code>
-------------------------------	---------------------------------

## 6 Configuring Super VLAN

### 6.1 Overview

Super virtual local area network (VLAN) is an approach to dividing VLANs. Super VLAN is also called VLAN aggregation, and is a management technology tailored for IP address optimization.

Using super VLAN can greatly save IP addresses. Only one IP address needs to be assigned to the super VLAN that consists of multiple sub VLANs, which greatly saves IP addresses and facilitates network management.

### 6.2 Application

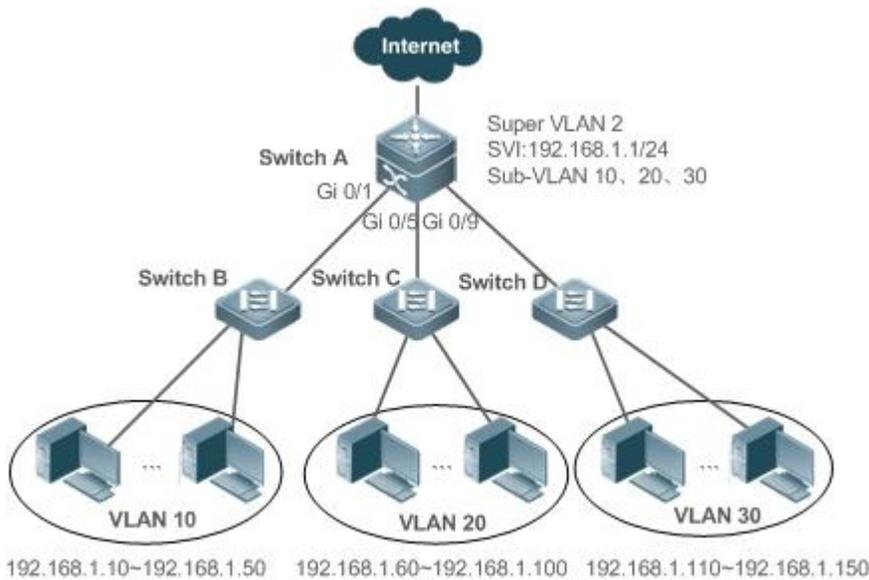

Application	Description
<a href="#">Sharing One IP Gateway Among Multiple VLANs</a>	VLANs are divided to implement layer-2 (L2) isolation of access users. All VLAN users share one IP gateway to implement layer-3 (L3) communication and communication with external networks.

#### 6.2.1 Sharing One IP Gateway Among Multiple VLANs

##### Scenario

Multiple VLANs are isolated at L2 on a L3 device, but users of these VLANs can perform L3 communication with each other in the same network segment.

Figure7-1

<b>Remarks</b>	<p>Switch A is a gateway or core switch.</p> <p>Switch B, Switch C, and Switch D are access switches.</p> <p>On Switch A, a super VLAN and multiple sub VLANs are configured, and a L3 interface and the IP address of the L3 interface are configured for the super VLAN.</p> <p>VLAN 10 is configured on Switch B, VLAN 20 is configured on Switch C, and VLAN 30 is configured on Switch D. Different departments of the company reside in different VLANs.</p>
----------------	--

## Deployment

On the intranet, use the super VLAN so that multiple sub VLANs can share one IP gateway and meanwhile VLANs are mutually isolated at L2.

Users in sub VLANs can perform L3 communication through the gateway of the super VLAN.

## 6.3 Features

### Basic Concepts

#### Super VLAN

Super VLAN is also called VLAN aggregation, and is a management technology tailored for IP address optimization. It aggregates multiple VLANs to one IP network segment. No physical port can be added to a super VLAN. The switch virtual interface (SVI) is used to manage the cross-VLAN communication of sub VLANs. The super VLAN cannot be used as a common 802.1Q VLAN, but can be treated as the primary VLAN of sub VLANs.

#### Sub VLAN

A sub VLAN is an independent broadcast domain. Sub VLANs are mutually isolated at L2. Users of sub VLANs of the same or different super VLANs communicate with each other through the L3 SVIs of their own super VLANs.

➤ **ARP Proxy**

A L3 SVI can be created only for a super VLAN. Users in a sub VLAN communicates with users in other sub VLANs of the same super VLAN or users in other network segments through the ARP proxy and the L3 SVI of the super VLAN. When a user of a sub VLAN sends an ARP request to a user of another sub VLAN, the gateway of the super VLAN uses its own MAC address to send or respond to the ARP requests. The process is called ARP proxy.

➤ **IP Address Range of the Sub VLAN**

Based on the gateway IP address configured for the super VLAN, an IP address range can be configured for each sub VLAN.

**Overview**

Feature	Description
<a href="#">Super VLAN</a>	Create a L3 interface as an SVI to allow all sub VLANs to share the same IP network segment through the ARP proxy.

**6.3.1 Super VLAN**

Users of all sub VLANs of a super VLAN can be allocated IP addresses in the same IP address range, and share the same IP gateway. Users can implement cross-VLAN communication through this gateway. It is unnecessary to allocate a gateway for every VLAN, which saves the IP addresses.

**Working Principle**

IP addresses in a network segment are allocated to different sub VLANs that belong to the same super VLAN. Each sub VLAN has an independent broadcast domain of the VLAN, and different sub VLANs are isolated from each other at L2. When users in sub VLANs need to perform L3 communication, the IP address of the SVI of the super VLAN is used as the gateway address. In this way, multiple VLANs share the same IP gateway, and it is unnecessary to configure a gateway for every VLAN. In addition, to implement L3 communication between sub VLANs and between sub VLANs and other network segments, the ARP proxy function is used to forward and process the ARP requests and responses.

L2 communication of sub VLANs: If the SVI is not configured for the super VLAN, sub VLANs of super VLAN are mutually isolated at L2, that is, users in different sub VLANs cannot communicate with each other. If the SVI is configured for the super VLAN, and the gateway of the super VLAN can function as the ARP proxy, users in different sub VLANs of the same super VLAN can communicate with each other. This is because IP addresses of users in different sub VLANs belong to the same network segment, and communication between these users is still treated as L2 communication.

L3 communication of sub VLANs: If users in sub VLANs of a super VLAN need to perform L3 communication across network segments, the gateway of this super VLAN functions as the ARP proxy to respond to the ARP requests in place of sub VLANs.

**6.4 Configuration**

Configuration Item	Description and Command
--------------------	-------------------------

Configuration Item	Description and Command	
<a href="#">Configuring Basic Functions of the Super VLAN</a>	 Mandatory.	
	<b>supervlan</b>	Configures a super VLAN.
	<b>subvlan</b> <i>vlan-id-list</i>	Configures a sub VLAN.
	<b>proxy-arp</b>	Enables the ARP proxy function.
	<b>interface vlan</b> <i>vlan-id</i>	Creates a virtual interface for a super VLAN.
	<b>ip address</b> <i>ip mask</i>	Configures the IP address of the virtual interface of a super VLAN.
	 Optional.	
<b>subvlan-address-range</b> <i>start-ip end-ip</i>	Specifies the IP address range in a sub VLAN.	

## 6.4.1 Configuring Basic Functions of the Super VLAN

### Configuration Effect

Enable the super VLAN function and configure an SVI for the super VLAN to implement L2/L3 communication between sub VLANs across VLANs.

Users in all sub VLANs of a super VLAN share the same IP gateway. It is unnecessary to specify a network segment for every VLAN, which saves the IP addresses.

### Notes

-  A super VLAN does not belong to any physical port. Therefore, the device configured with the super VLAN cannot process packets that contain the super VLAN tag.
-  Both the super VLAN function and the ARP proxy function of each sub VLAN must be enabled.
-  An SVI and an IP address must be configured for a super VLAN. The SVI is a virtual interface used for communication of users in all sub VLANs.

### Configuration Steps

#### Configuring a Super VLAN

- Mandatory.
- No physical port exists in a super VLAN.
- The ARP proxy function must be enabled. This function is enabled by default.
- You can run the **supervlan** command to change a common VLAN into a super VLAN.
- After a common VLAN becomes a super VLAN, ports added to this VLAN will be deleted from this VLAN because no physical port exists in a super VLAN.

 A super VLAN is valid only after you configure sub VLANs for this super VLAN.

-  VLAN 1 cannot be configured as a super VLAN.
-  A super VLAN cannot be configured as a sub VLAN of another super VLAN. A sub VLAN of a super VLAN cannot be configured as a super VLAN.

<b>Command</b>	<b>supervlan</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, a VLAN is a common VLAN.
<b>Command Mode</b>	VLAN configuration mode
<b>Usage Guide</b>	By default, the super VLAN function is disabled. No physical port can be added to a super VLAN. Once a VLAN is not a super VLAN, all its sub VLANs become common static VLANs.

#### ▾ Configuring a Virtual Interface for a Super VLAN

- Mandatory.
- No physical port can be added to a super VLAN. You can configure the L3 SVI for a VLAN.

-  When a super VLAN is configured with an SVI, it allocates a L3 interface to each sub VLAN. If a sub VLAN is not allocated a L3 interface due to resource deficiency, the sub VLAN becomes a common VLAN again.

<b>Command</b>	<b>interface vlan</b> <i>vlan-id</i>
<b>Parameter Description</b>	<i>vlan-id</i> : Indicates the ID of the super VLAN.
<b>Defaults</b>	By default, no super VLAN is configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A L3 interface must be configured as the virtual interface of a super VLAN.

#### ▾ Configuring the Gateway of a Super VLAN

- Mandatory.
- The IP gateway on the L3 SVI is configured as the proxy for all users in sub VLANs to respond to ARP requests.

<b>Command</b>	<b>ip address</b> <i>ip mask</i>
<b>Parameter Description</b>	<i>ip</i> : Indicates the IP address of the gateway on the virtual interface of a super VLAN. <i>Mask</i> : Indicates the mask.
<b>Defaults</b>	By default, no gateway is configured for a super VLAN.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Run this command to configure the gateway for a super VLAN. Users of all sub VLANs of the super VLAN

	share this gateway.
--	---------------------

**Configuring a Sub VLAN**

- Mandatory.
- Physical ports can be added to sub VLANs. Sub VLANs of a super VLAN share the gateway address of the super VLAN and reside in the same network segment.
- The ARP proxy function must be enabled. This function is enabled by default.
- You can run the **subvlan** *vlan-id-list* command to change a common VLAN into a sub VLAN of a super VLAN. Physical ports can be added to sub VLANs.
- Communication of users in a sub VLAN is managed by the super VLAN.

 You must change a sub VLAN into a common VLAN before you can delete this sub VLAN by running the **no vlan** command.

 One sub VLAN belongs to only one super VLAN.

<b>Command</b>	<b>subvlan</b> <i>vlan-id-list</i>
<b>Parameter Description</b>	<i>vlan-id-list</i> : Specifies multiple VLANs as sub VLANs of a super VLAN.
<b>Defaults</b>	By default, a VLAN is a common VLAN.
<b>Command Mode</b>	VLAN configuration mode
<b>Usage Guide</b>	<p>Connection interfaces can be added to a sub VLAN.</p> <p>You must change a sub VLAN into a common VLAN before you can delete this sub VLAN by running the <b>no vlan [ id]</b> command.</p> <p>You cannot configure a L3 SVI of the VLAN for a sub VLAN.</p> <hr/> <p> If you have configured a L3 SVI for a super VLAN, the attempt of adding more sub VLANs may fail due to resource deficiency.</p> <p> If you configure sub VLANs to a super VLAN, and then configure a L3 SVI of the VLAN for a super VLAN, some sub VLANs may become common VLANs again due to resource deficiency.</p>

**Configuring the ARP Proxy**

- (Mandatory) The ARP proxy function is enabled by default.
- Users in sub VLANs can implement L2/L3 communication across VLANs through the gateway proxy only after the ARP proxy function is enabled on both the super VLAN and sub VLANs.
- Users in sub VLANs can communicate with users of other VLANs only after the ARP proxy function is enabled on both the super VLAN and sub VLANs.

 The ARP proxy function must be enabled on both the super VLAN and sub VLANs. Otherwise, this function does not take effect.

<b>Command</b>	<b>proxy-arp</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, the ARP proxy function is enabled.
<b>Command Mode</b>	VLAN configuration mode
<b>Usage Guide</b>	By default, the ARP proxy function is enabled. Run this command to enable the ARP proxy function on both the super VLAN and sub VLANs. Users in sub VLANs can implement L2/L3 communication across VLANs only after the ARP proxy function is enabled on both the super VLAN and sub VLANs.

▾ **Configuring the IP Address Range of the Sub VLAN**

- You can allocate an IP address range to each sub VLAN. Users in a sub VLAN can communicate with users of other VLANs only when their IP addresses are in the specified range.
- Unless otherwise specified, you do not need to configure the IP address range.

- ⚠ IP addresses dynamically allocated to users through DHCP may not be in the allocated IP address range. If the IP addresses allocated through DHCP are not in the specified range, users in a sub VLAN cannot communicate with users of other VLANs. Therefore, be cautious in using the **subvlan-address-range start-ip end-ip** command.
- ⚠ The IP address range of a sub VLAN must be within the IP address range of the super VLAN to which the sub VLAN belongs. Otherwise, users in sub VLANs cannot communicate with each other.
- ⚠ IP addresses of users in a sub VLAN must be within the IP address range of the sub VLAN. Otherwise, users in the sub VLAN cannot communicate with each other.

<b>Command</b>	<b>subvlan-address-range start-ip end-ip</b>
<b>Parameter Description</b>	<i>start-ip</i> : Indicates the start IP address of a sub VLAN. <i>end-ip</i> : Indicates the end IP address of a sub VLAN.
<b>Defaults</b>	By default, no IP address range is configured.
<b>Command Mode</b>	VLAN configuration mode
<b>Usage Guide</b>	Optional. Run this command to configure the IP address range of users in a sub VLAN. IP address ranges of different sub VLANs of a super VLAN cannot overlap with each other.  <ul style="list-style-type: none"> <li>⚠ The IP address range of a sub VLAN must be within the IP address range of the super VLAN to which the sub VLAN belongs. Otherwise, users in sub VLANs cannot communicate with each other.</li> <li>⚠ Users in a sub VLAN can communicate with users of other VLANs only when their IP addresses (either dynamically allocated through DHCP or statically configured) are in the configured IP address range.</li> <li>⚠ IP addresses allocated through DHCP may not be in the configured IP address range. In this case, users in a sub VLAN cannot communicate with users of other VLANs. Therefore, be cautious when</li> </ul>

using this command.

**Verification**

After each sub VLAN is correlated with the gateway of the super VLAN, users in sub VLANs can ping each other.

**Configuration Example**

**Configuring a Super VLAN on the Network so That Users in its Sub VLANs Use the Same Network Segment and Share the Same IP Gateway to Save IP Addresses**

<p><b>Scenario</b> Figure 7-2</p>	
<p><b>Configuration Steps</b></p>	<p>Perform the related super VLAN configuration on the core switch.</p> <p>On the access switches, configure the common VLANs corresponding to the sub VLANs on the core switch.</p>
<p><b>A</b></p>	<pre>SwitchA#configure terminal Enter configuration commands, one per line. End with CNTL/Z. SwitchA(config)#vlan 2 SwitchA(config-vlan)#exit SwitchA(config)#vlan 10 SwitchA(config-vlan)#exit SwitchA(config)#vlan 20 SwitchA(config-vlan)#exit SwitchA(config)#vlan 30</pre>

	<pre>SwitchA(config-vlan)#exit SwitchA(config)#vlan 2 SwitchA(config-vlan)#supervlan SwitchA(config-vlan)#subvlan 10, 20, 30 SwitchA(config-vlan)#exit SwitchA(config)#interface vlan 2 SwitchA(config-if-VLAN 2)#ip address 192.168.1.1 255.255.255.0 SwitchA(config)#vlan 10 SwitchA(config-vlan)#subvlan-address-range 192.168.1.10 192.168.1.50 SwitchA(config-vlan)#exit SwitchA(config)#vlan 20 SwitchA(config-vlan)#subvlan-address-range 192.168.1.60 192.168.1.100 SwitchA(config-vlan)#exit SwitchA(config)#vlan 30 SwitchA(config-vlan)#subvlan-address-range 192.168.1.110 192.168.1.150 SwitchA(config)#interface range gigabitEthernet 0/1,0/5,0/9 SwitchA(config-if-range)#switchport mode trunk</pre>
<b>Verification</b>	Verify that the source host (192.168.1.10) and the destination host (192.168.1.60) can ping each other.
<b>A</b>	<pre>SwitchA(config-if-range)#show supervlan supervlan id  supervlan arp-proxy  subvlan id  subvlan arp-proxy  subvlan ip range -----                 2          ON          10          ON192.168.1.10 - 192.168.1.50 20              ON 192.168.1.60 - 192.168.1.100 30              ON 192.168.1.110 - 192.168.1.150</pre>

**Common Errors**

The SVI and IP gateway are not configured for the super VLAN. Consequently, communication fails between sub VLANs and between sub VLANs and other VLANs.

The ARP proxy function is disabled on the super VLAN or sub VLANs. Consequently, users in sub VLANs cannot communicate with users of other VLANs.

The IP address range of the sub VLAN is configured, but IP addresses allocated to users are not in this range.

## 6.5 Monitoring

### Displaying

Description	Command
Displays the super VLAN configuration.	<b>show supervlan</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the super VLAN.	<b>debug bridge svlan</b>

## 7 Configuring Protocol VLAN

### 7.1 Overview

The protocol VLAN technology is a VLAN distribution technology based on the packet protocol type. It can distribute packets of a certain protocol type with a null VLAN ID to the same VLAN. That is, the switch, based on the protocol type and encapsulation format of packets received by ports, matches the received untagged packets with protocol profiles. If the matching is successful, the switch automatically distributes the packets to a relevant VLAN for transmission. There are two types of protocol VLANs: IP address-based protocol VLAN and protocol VLAN based on the packet type and Ethernet type on ports. The protocol VLAN based on the packet type and Ethernet type on ports is called protocol VLAN for short and the IP address-based protocol VLAN is called subnet VLAN for short.

**i** The protocol VLAN is applicable only to Trunk ports and Hybrid ports.

#### Protocols and Standards

IEEE standard 802.1Q

### 7.2 Applications

Application	Description
<a href="#">Configuration and Application of Protocol VLAN</a>	Implements Layer-2 communication isolation of user hosts that use different protocol packets for communication to reduce the network traffic.
<a href="#">Configuration and Application of Subnet VLAN</a>	Specifies the VLAN range based on the IP network segment to which user packets belong.

#### 7.2.1 Configuration and Application of Protocol VLAN

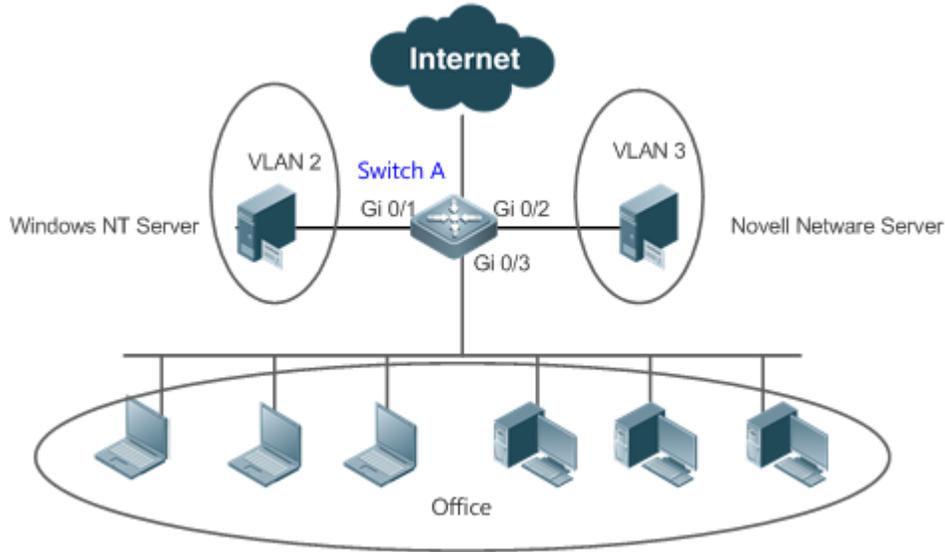

##### Scenario

As shown in the following figure, the network architecture is composed of the interconnected Windows NT server and Novell Netware server and the office area is connected to the Layer-3 device Switch A through a hub. There are different PCs in the office area. Some PCs use the Windows NT operating system (OS) and support the IP protocol, and some PCs use the Novell Netware OS and support the IPX protocol. PCs in the office area communicate with the external network and servers through the uplink port Gi 0/3.

The main requirements are as follows:

- The Layer-2 communication of PCs using the Windows NT OS is isolated from that of PCs using the Novell Netware OS, so as to reduce the network traffic.

Figure 8-1

<b>Remarks</b>	Switch A is a switch and Port Gi 0/3 is a Hybrid port. Port Gi 0/1 is an Access port and belongs to VLAN 2. Port Gi 0/2 is also an Access port and belongs to VLAN 3.
----------------	---

**Deployment**

- Configure profiles of the packet type and Ethernet type (in this example, configure Profile 1 for IP protocol packets and configure Profile 2 for IPX protocol packets).
- Apply the profiles to the uplink port (Port Gi 0/3 in this example) and associate them with VLANs (in this example, associate Profile 1 with VLAN 2 and associate Profile 2 with VLAN 3).

**⚠** The configured protocol VLANs take effect only on the Trunk ports and Hybrid ports.

**7.2.2 Configuration and Application of Subnet VLAN**

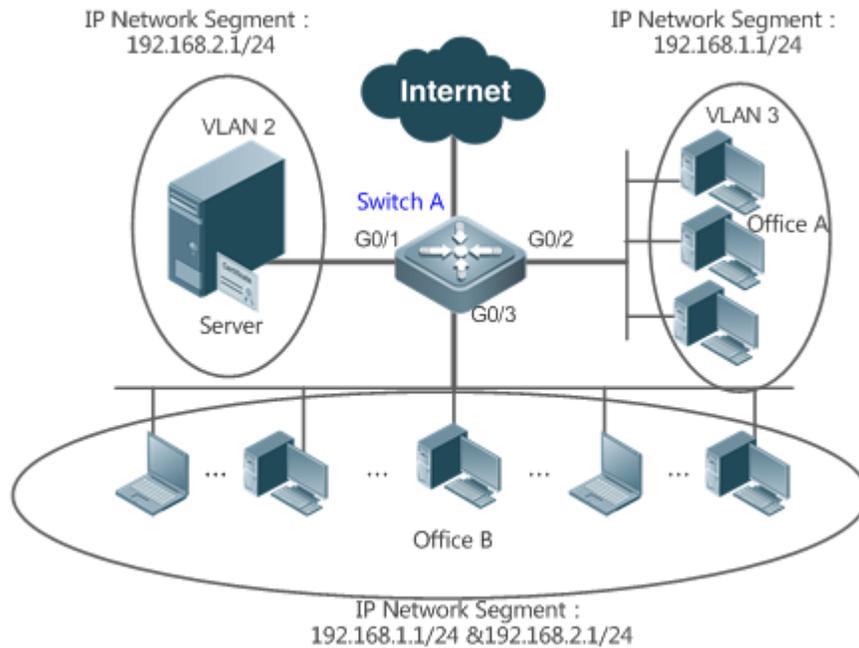

**Scenario**

As shown in the following figure, PCs in Office A and Office B are connected to the Layer-3 device Switch A through hubs. In Office A, the PCs belong to a fixed network segment and they are distributed to the same VLAN by port. In Office B, the PCs belong to two network segments, but they cannot be distributed to VLANs by fixed port.

The main requirements are as follows:

For PCs in Office B, Switch A can determine the VLAN range of the PCs based on the IP network segment to which their packets belong.

Figure 8-2

<b>Remarks</b>	Switch A is a switch. Port G0/1 is an Access port and belongs to VLAN 2. Port G0/2 is also an Access port and belongs to VLAN 3. Port G0/3 is a Hybrid port.
----------------	--

### Deployment

- Globally configure subnet VLANs (in this example, allocate the IP network segment 192.168.1.1/24 to VLAN 3 and the IP network segment 192.168.2.1/24 to VLAN 2) and enable the subnet VLAN function on the uplink port (Port Gi 0/3 in this example).

**!** The configured subnet VLANs take effect only on the Trunk ports and Hybrid ports.

## 7.3 Features

### Basic Concepts

#### Protocol VLAN

The protocol VLAN technology is a VLAN distribution technology based on the packet protocol type. It can distribute packets of a certain protocol type with a null VLAN ID to the same VLAN.

VLANs need to be specified for packets received by device ports so that a packet belongs to a unique VLAN. There are three possible cases:

- If a packet contains a null VLAN ID (untagged or priority packet) and the device supports only port-based VLAN distribution, the VLAN ID in the tag added to the packet is the PVID of the input port.

- If a packet contains a null VLAN ID (untagged or priority packet) and the device supports VLAN distribution based on the packet protocol type, the VLAN ID in the tag added to the packet is selected from the VLAN IDs mapped to the protocol suite configuration of the input port. If the protocol type of the packet does not match all protocol suite configuration of the input port, a VLAN ID is allocated according to the port-based VLAN distribution.
- If a packet is a tagged packet, the VLAN to which the packet belongs is determined by the VLAN ID in the tag.

Subnet VLANs can be configured only globally that is, only the protocol VLAN function can be enabled or disabled on ports. The matching configuration is globally performed for the protocol VLAN, the matching configuration is selected on ports and the VLAN IDs are specified for packets that are matched successfully.

- If an input packet contains a null VLAN ID and the IP address of the input packet matches an IP address, the packet is distributed to the subnet VLAN.
- If an input packet contains a null VLAN ID and the packet type and Ethernet type of the input packet match the packet type and Ethernet type of an input port, the packet is allocated to the protocol VLAN.

▾ Protocol VLAN Priority

The priority of a subnet VLAN is higher than that of a protocol VLAN. That is, if a subnet VLAN and protocol VLAN are configured at the same time and an input packet conforms to both the subnet VLAN and protocol VLAN, the subnet VLAN prevails.

Overview

Feature	Description
<a href="#">Automatic VLAN Distribution Based on Packet Type</a>	The service types supported on a network are bound with VLANs or packets from a specified IP network segment are transmitted in a specified VLAN to facilitate management and maintenance.

7.3.1 Automatic VLAN Distribution Based on Packet Type

Working Principle

Set rules on the hardware and enable the rules on ports. The rules take effect only after they are enabled on ports. The rules include the packet type and IP address of packets. When a port receives untagged data packets that meet the rules, the port automatically distributes them to the VLAN specified in the rules for transmission. When the rules are disabled on ports, untagged data packets are distributed to the Native VLAN according to the port configuration.

Related Configuration

7.4 Configuration

Configuration	Description and Command
<a href="#">Configuring the Protocol VLAN Function</a>	 (Mandatory) It is used to enable the VLAN distribution function based on the packet type and Ethernet type of the protocol VLAN.

Configuration	Description and Command	
	<b>protocol-vlan profile</b> <i>num</i> <b>frame-type</b> [ <i>type</i> ] <b>ether-type</b> [ <i>type</i> ]	Configures the profile of the packet type and Ethernet type.
	<b>protocol-vlan profile</b> <i>num</i> <b>ether-type</b> [ <i>type</i> ]	Configures the profile of the Ethernet type (some models do not support frame identification).
	<b>protocol-vlan profile</b> <i>num</i> <b>vlan</b> <i>vid</i>	(Interface configuration mode) Applies the protocol VLAN on a port.
<a href="#">Configuring the Subnet VLAN Function</a>	 (Mandatory) It is used to enable IP address-based VLAN distribution function of the protocol VLAN.	
	<b>protocol-vlan ipv4</b> <i>address mask</i> <i>address</i> <b>vlan</b> <i>vid</i>	Configures an IP address, subnet mask, and VLAN distribution.
	<b>protocol-vlan ipv4</b>	(Interface configuration mode) Enables the subnet VLAN on a port.

### 7.4.1 Configuring the Protocol VLAN Function

#### Configuration Effect

Bind service types supported in a network with VLANs to facilitate management and maintenance.

#### Notes

- It is recommended that the protocol VLAN be configured after VLANs, and the Trunk, Hybrid, Access, and AP attributes of ports are configured.
- If protocol VLAN is configured on a Trunk port or Hybrid port, all VLANs relevant to the protocol VLAN need to be contained in the permitted VLAN list of the Trunk port or Hybrid port.

#### Configuration Steps

##### 📌 Configuring the Protocol VLAN Globally

- Mandatory.
- The protocol VLAN can be applied on an interface only in global configuration mode.

<b>Command</b>	<b>protocol-vlan profile</b> <i>num</i> <b>frame-type</b> [ <i>type</i> ] <b>ether-type</b> [ <i>type</i> ]
<b>Parameter</b>	<i>num</i> : Indicates the profile index.
<b>Description</b>	<i>type</i> : Indicates the packet type and Ethernet type.
<b>Defaults</b>	The protocol VLAN is disabled by default.
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	The protocol VLAN can be configured on an interface only when the protocol VLAN is globally configured. When the global configuration of a protocol VLAN profile is deleted, the protocol VLAN configuration is deleted from all interfaces corresponding to the profile of the protocol VLAN.
--------------------	--

↘ **Switching the Port Mode to Trunk/Hybrid Mode**

- Mandatory. The protocol VLAN function takes effect only on ports that are in Trunk/Hybrid mode.

↘ **Enabling the Protocol VLAN on a Port**

- Mandatory. The protocol VLAN is disabled by default.
- The protocol VLAN is truly enabled only when it is applied on interfaces.

<b>Command</b>	<b>protocol-vlan profile</b> <i>num</i> <b>vlan</b> <i>vid</i>
<b>Parameter</b>	<i>num</i> : Indicates the profile index.
<b>Description</b>	<i>vid</i> : Indicates the VLAN ID. The value 1 indicates the maximum VLAN ID supported by the product.
<b>Defaults</b>	The protocol VLAN is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	An interface must work in Trunk/Hybrid mode.

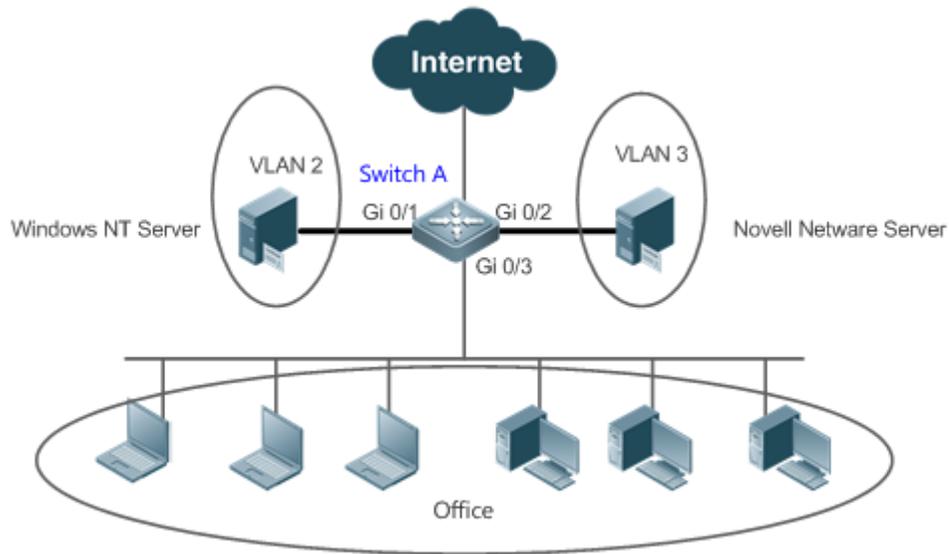

Verification

Run the **show protocol-vlan profile** command to check the configuration.

Configuration Example

↘ **Enabling the Protocol VLAN Function in the Topological Environment**

<b>Scenario</b>	
<b>Figure 8-3</b>	

**Configuration Steps**

- Configure VLAN 2 and VLAN 3 for user communication on Switch A.
- Configure the protocol VLAN globally on Switch A (in this example, configure Profile 1 for IP protocol packets and configure Profile 2 for IPX protocol packets), enable the protocol VLAN function on the uplink port (Port Gi 0/3 in this example), and complete the protocol-VLAN association (in this example, associate Profile 1 with VLAN 2 and associate Profile 2 with VLAN 3).
- Port Gi 0/1 is an Access port and belongs to VLAN 2. Port Gi 0/2 is also an Access port and belongs to VLAN 3. Port Gi 0/3 is a Hybrid port. Ensure that the user communication VLANs are contained in the permitted untagged VLAN list of the Hybrid port.

**A**

```

1. Create VLAN 2 and VLAN 3 for user network communication.

# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
A(config)# vlan range 2-3

2. Configure the port mode.

A(config)#interface gigabitEthernet 0/1
A(config-if-GigabitEthernet 0/1)#switchport
A(config-if-GigabitEthernet 0/1)#switchport access vlan 2
A(config-if-GigabitEthernet 0/1)#exit
    
```

```

A(config)#interface gigabitEthernet 0/2
A(config-if-GigabitEthernet 0/2)#switchport
A(config-if-GigabitEthernet 0/2)#switchport access vlan 3
A(config-if-GigabitEthernet 0/2)#exit
A(config)# interface gigabitEthernet 0/3
A(config-if-GigabitEthernet 0/3)#switchport
A(config-if-GigabitEthernet 0/3)# switchport mode hybrid
A(config-if-GigabitEthernet 0/3)# switchport hybrid allowed vlan untagged 2-3

3. Configure the protocol VLAN globally.

Configure Profile 1 for IP protocol packets and Profile 2 for IPX protocol packets (in this example,
assume that packets are encapsulated using Ethernet II and the Ethernet types of IP protocol packets
and IPX protocol packets are 0X0800 and 0X8137 respectively).

A(config)#protocol-vlan profile 1 frame-type ETHERII ether-type 0x0800
A(config)#protocol-vlan profile 2 frame-type ETHERII ether-type 0x8137

4. Apply Profile 1 and Profile 2 to Port Gi 0/3 and allocate Profile 1 to VLAN 2 and Profile 2 to
VLAN 3.

A(config)# interface gigabitEthernet 0/3
A(config-if-GigabitEthernet 0/3) #protocol-vlan profile 1 vlan 2
A(config-if-GigabitEthernet 0/3) #protocol-vlan profile 2 vlan 3
    
```

**Verification** Check whether the protocol VLAN configuration on the device is correct.

```

A
A(config)#show protocol-vlan profile

profile frame-type      ether-type/DSAP+SSAP  interface      vlan
-----
1      ETHERII              0x0800
                                     Gi0/3         2

2      ETHERII              0x8137
    
```

	Gi0/3	3
--	-------	---

### Common Errors

- A port connected to the device is not in Trunk/Hybrid mode.
- The permitted VLAN list of the port connected to the device does not contain the user communication VLANs.
- The protocol VLAN function is disabled on a port.

## 7.4.2 Configuring the Subnet VLAN Function

### Configuration Effect

Distribute packets from a specified network segment or IP address to a specified VLAN for transmission.

### Notes

- It is recommended that the protocol VLAN be configured after VLANs, and the Trunk, Hybrid, Access, and AP attributes of ports are configured.
- If protocol VLAN is configured on a Trunk port or Hybrid port, all VLANs relevant to the protocol VLAN need to be contained in the permitted VLAN list of the Trunk port or Hybrid port.

### Configuration Steps

#### ↘ Configuring the Subnet VLAN Globally

- Mandatory.
- The subnet VLAN can be applied on an interface only in global configuration mode.

<b>Command</b>	<code>protocol-vlan ipv4 address mask address vlan vid</code>
<b>Parameter</b>	<i>address</i> : Indicates the IP address.
<b>Description</b>	<i>vid</i> : Indicates the VLAN ID. The value 1 indicates the maximum VLAN ID supported by the product.
<b>Defaults</b>	The subnet VLAN is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The subnet VLAN can be enabled on an interface even if the protocol VLAN is not enabled globally. Nevertheless, the subnet VLAN takes effect only when the protocol VLAN is configured globally.

#### ↘ Switching the Port Mode to Trunk/Hybrid Mode

- Mandatory. The subnet VLAN function takes effect only on ports that are in Trunk/Hybrid mode.

#### ↘ Enabling the Subnet VLAN on a Port

- Mandatory. The subnet VLAN is disabled by default.
- The subnet VLAN is truly enabled only when it is applied on interfaces.

<b>Command</b>	<code>protocol-vlan ipv4</code>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The subnet VLAN is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	An interface must work in Trunk/Hybrid mode.

**Verification**

Run the `show protocol-vlan ipv4` command to check the configuration.

**Configuration Example**

↳ **Enabling the Subnet VLAN Function in the Topological Environment**

<p><b>Scenario</b> Figure 8-4</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure VLAN 2 and VLAN 3 for user communication on Switch A.</li> <li>● Globally configure subnet VLANs on Switch A (in this example, allocate the IP network segment 192.168.1.1/24 to VLAN 3 and the IP network segment 192.168.2.1/24 to VLAN 2) and enable the subnet VLAN function on the uplink port (Port Gi 0/3 in this example).</li> <li>● Port Gi 0/1 is an Access port and belongs to VLAN 2. Port Gi 0/2 is also an Access port and belongs to VLAN 3. Port Gi 0/3 is a Hybrid port. Ensure that the user communication VLANs are contained in the permitted untagged VLAN list of the Hybrid port.</li> </ul>

<p><b>A</b></p>	<p>1. Create VLAN 2 and VLAN 3 for user network communication.</p> <pre>A# configure terminal</pre> <p>Enter configuration commands, one per line. End with CNTL/Z.</p> <pre>A(config)# vlan range 2-3</pre> <p>2. Configure the port mode.</p> <pre>A(config)#interface gigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#switchport A(config-if-GigabitEthernet 0/1)#switchport access vlan 2 A(config-if-GigabitEthernet 0/1)#exit A(config)#interface gigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)#switchport A(config-if-GigabitEthernet 0/2)#switchport access vlan 3 A(config-if-GigabitEthernet 0/2)#exit A(config)# interface gigabitEthernet 0/3 A(config-if-GigabitEthernet 0/3)#switchport A(config-if-GigabitEthernet 0/3)# switchport mode hybrid A(config-if-GigabitEthernet 0/3)# switchport hybrid allowed vlan untagged 2-3</pre> <p>3. Configure the subnet VLAN globally.</p> <pre>A(config)# protocol-vlan ipv4 192.168.1.0 mask 255.255.255.0 vlan 3 A(config)# protocol-vlan ipv4 192.168.2.0 mask 255.255.255.0 vlan 2</pre> <p>4. Enable the subnet VLAN on interfaces. The subnet VLAN is disabled by default.</p> <pre>(config-if-GigabitEthernet 0/3)# protocol-vlan ipv4</pre>						
<p><b>Verification</b></p>	<p>Check whether the subnet VLAN configuration on the device is correct.</p>						
<p><b>A</b></p>	<pre>A# show protocol-vlan ipv4</pre> <table border="1"> <thead> <tr> <th>ip</th> <th>mask</th> <th>vlan</th> </tr> </thead> <tbody> <tr> <td>-----</td> <td>-----</td> <td>----</td> </tr> </tbody> </table>	ip	mask	vlan	-----	-----	----
ip	mask	vlan					
-----	-----	----

192.168.2.0	255.255.255.0	2
interface	ipv4 status	
-----		
Gi0/3	enable	

### Common Errors

- A port connected to the device is not in Trunk/Hybrid mode.
- The permitted VLAN list of the port connected to the device does not contain the user communication VLANs.
- The subnet VLAN is disabled on a port.

## 7.5 Monitoring

### Displaying

Description	Command
Displays the protocol VLAN content.	<b>show protocol-vlan</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the protocol VLAN.	<b>debug bridge protvlan</b>

## 8 Configuring Private VLAN

### 8.1 Overview

Private VLAN divides the Layer-2 broadcast domain of a VLAN into multiple subdomains. Each subdomain is composed of one private VLAN pair: primary VLAN and secondary VLAN.

One private VLAN domain may consist of multiple private VLAN pairs and each private VLAN pair represents one subdomain. In a private VLAN domain, all private VLAN pairs share the same primary VLAN. The secondary VLAN IDs of subdomains are different.

If a service provider allocates one VLAN to each user, the number of users that can be supported by the service provider is restricted because one device supports a maximum of 4,096 VLANs. On a Layer-3 device, one subnet address or a series of addresses are allocated to each VLAN, which results in the waste of IP addresses. The private VLAN technology properly solves the preceding two problems. Private VLAN is hereinafter called PVLAN for short.

### 8.2 Applications

Application	Description
<a href="#">Cross-Device Layer-2 Application of PVLAN</a>	Users of an enterprise can communicate with each other but the user communication between enterprises is isolated.
<a href="#">Layer-3 Application of PVLAN on a Single Device</a>	All enterprise users share the same gateway address and can communicate with the external network.

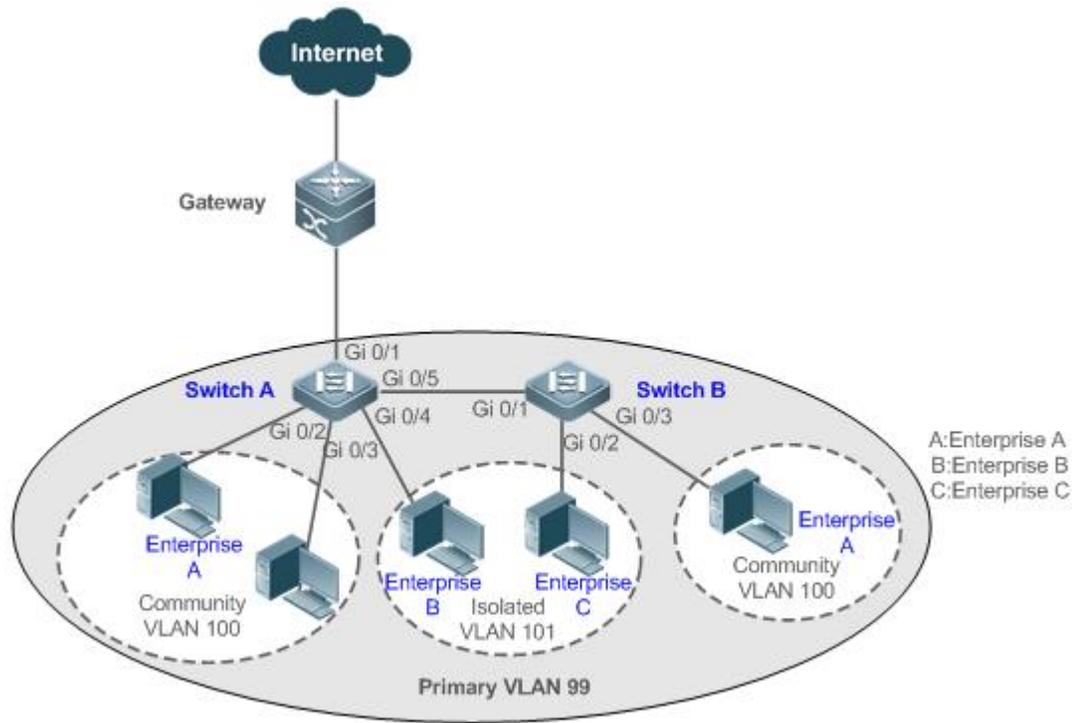

#### 8.2.1 Cross-Device Layer-2 Application of PVLAN

##### Scenario

As shown in the following figure, in the hosting service operation network, enterprise user hosts are connected to the network through Switch A or Switch B. The main requirements are as follows:

- Users of an enterprise can communicate with each other but the user communication between enterprises is isolated.
- All enterprise users share the same gateway address and can communicate with the external network.

Figure 9-1

<b>Remarks</b>	<p>Switch A and Switch B are access switches.</p> <p>PVLAN runs across devices. The ports for connecting the devices need to be configured as Trunk ports, that is, Port Gi 0/5 of Switch A and Port Gi 0/1 of Switch B are configured as Trunk ports.</p> <p>Port Gi 0/1 for connecting Switch A to the gateway needs to be configured as a promiscuous port.</p> <p>Port Gi 0/1 of the gateway can be configured as a Trunk port or Hybrid port and the Native VLAN is the primary VLAN of PVLAN.</p>
----------------	---

### Deployment

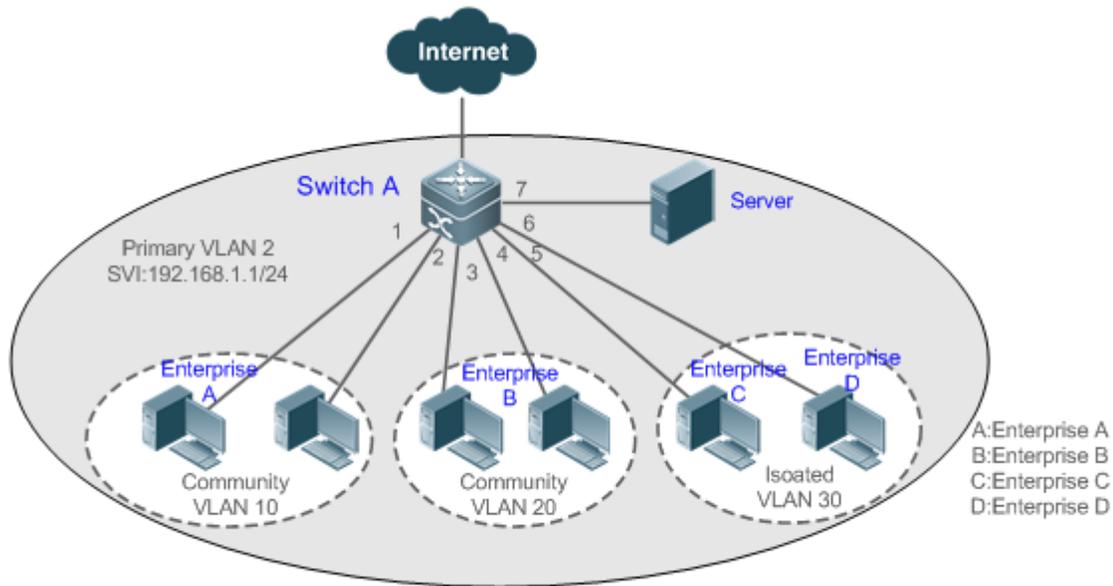

- Configure all enterprises to be in the same PVLAN (primary VLAN 99 in this example). All enterprise users share the same Layer-3 interface through this VLAN to communicate with the external network.
- If an enterprise has multiple user hosts, allocate the user hosts of different enterprises to different community VLANs. That is, configure the ports connected to the enterprise user hosts as the host ports of a community VLAN, so as to implement user communication inside an enterprise but isolate the user communication between enterprises.
- If an enterprise has only one user host, configure the ports connected to the user hosts of such enterprises as the host ports of an isolated VLAN so as to implement isolation of user communication between the enterprises.

### 8.2.2 Layer-3 Application of PVLAN on a Single Device

As shown in the following figure, in the hosting service operation network, enterprise user hosts are connected to the network through the Layer-3 device Switch A. The main requirements are as follows:

- Users of an enterprise can communicate with each other but the user communication between enterprises is isolated.
- All enterprise users can access the server.
- All enterprise users share the same gateway address and can communicate with the external network.

Figure 9-2

<b>Remarks</b>	<p>Switch A is a gateway switch.</p> <p>When user hosts are connected to a single device, Port Gi 0/7 for connecting to the server is configured as a promiscuous port so that enterprise users can communicate with the server.</p> <p>Layer-3 mapping needs to be performed on the primary VLAN and secondary VLANs so that the users can communicate with the external network.</p>
----------------	--

### Deployment

- Configure the port that is directly connected to the server as a promiscuous port. Then, all enterprise users can communicate with the server through the promiscuous port.
- Configure the gateway address of PVLAN on the Layer-3 device (Switch A in this example) (in this example, set the SVI address of VLAN 2 to 192.168.1.1/24) and configure the mapping between the primary VLAN and secondary VLANs on the Layer-3 interface. Then, all enterprise users can communicate with the external network through the gateway address.

## 8.3 Features

### Basic Concepts

## ↘ PVLAN

PVLAN supports three types of VLANs: primary VLANs, isolated VLANs, and community VLANs.

A PVLAN domain has only one primary VLAN. Secondary VLANs implement Layer-2 isolation in the same PVLAN domain. There are two types of secondary VLANs.

### ↘ Isolated VLAN

Ports in the same isolated VLAN cannot mutually make Layer-2 communication. A PVLAN domain has only one isolated VLAN.

### ↘ Community VLAN

Ports in the same community VLAN can make Layer-2 communication with each other but cannot make Layer-2 communication with ports in other community VLANs. A PVLAN domain can have multiple community VLANs.

### ↘ Layer-2 Association of PVLAN

PVLAN pairs exist only after Layer-2 association is performed among the three types of VLANs of PVLAN. Then, a primary VLAN has a specified secondary VLAN and a secondary VLAN has a specified primary VLAN. A primary VLAN and secondary VLANs are in the one-to-many relationship.

### ↘ Layer-3 Association of PVLAN

In PVLAN, Layer-3 interfaces, that is, switched virtual interfaces (SVIs) can be created only in a primary VLAN. Users in a secondary VLAN can make Layer-3 communication only after Layer-3 association is performed between the secondary VLAN and the primary VLAN. Otherwise, the users can make only Layer-2 communication.

### ↘ Community Port

Community ports are ports in a community VLAN. Community ports in the same community VLAN can communicate with each other and can communicate with promiscuous ports. They cannot communicate with community ports in other community VLANs or isolated ports in an isolated VLAN.

### ↘ Promiscuous Port

Promiscuous ports are ports in a primary VLAN. They can communicate with any ports, including isolated ports and community ports in secondary VLANs of the same PVLAN domain.

 In PVLAN, SVIs can be created only in a primary VLAN and SVIs cannot be created in secondary VLANs.

 Ports in PVLAN can be used as mirroring source ports but cannot be used as mirroring destination ports.

## Overview

Feature	Description
<a href="#">PVLAN Layer-2 Isolation and IP</a>	Ports of different PVLAN types can be configured to implement interworking and isolation of VLAN intermediate user hosts.

<a href="#">Address Saving</a>	After Layer-2 mapping is performed between a primary VLAN and secondary VLANs, only Layer-2 communication is supported. If Layer-3 communication is required, users in a secondary VLAN need to use SVIs of the primary VLAN to make Layer-3 communication.
--------------------------------	---

### 8.3.1 PVLAN Layer-2 Isolation and IP Address Saving

Add users to subdomains of PVLAN to isolate communication between enterprises and between enterprise users.

#### Working Principle

Configure PVLAN, configure Layer-2 association and Layer-3 association between a primary VLAN and SubVLANs of PVLAN, and configure ports connected to user hosts, external network devices, and servers as different types of PVLAN ports. In this way, subdomain division and communication of users in subdomains with the external network and servers can be implemented.

#### Packet Forwarding Relationship Between Ports of Different Types

Output Port \ Input Port	Promiscuous Port	Isolated Port	Community Port	Isolated Trunk Port (in the Same VLAN)	Promiscuous Trunk Port (in the Same VLAN)	Trunk Port (in the Same VLAN)
Promiscuous Port	Supported	Supported	Supported	Supported	Supported	Supported
Isolated Port	Supported	Unsupported	Unsupported	Unsupported	Supported	Supported
Community Port	Supported	Unsupported	Supported	Supported	Supported	Supported

#### VLAN Tag Changes After Packet Forwarding Between Ports of Different Types

Output Port \ Input Port	Promiscuous Port	Isolated Port	Community Port	Isolated Trunk Port (in the Same VLAN)	Promiscuous Trunk Port (in the Same VLAN)	Trunk Port (in the Same VLAN)
Promiscuous Port	Unchanged	Unchanged	Unchanged	A secondary VLAN ID is added.	A primary VLAN ID tag is added and the VLAN tag keeps unchanged in the non-PVLAN.	A primary VLAN ID tag is added.
Isolated Port	Unchanged	NA	NA	NA	A primary VLAN ID tag is added and the VLAN tag keeps unchanged in the non-PVLAN.	An isolated VLAN ID tag is added.
Community Port	Unchanged	NA	Unchanged	A community VLAN ID tag is added.	A primary VLAN ID tag is added and	A community

Output Port Input Port	Promiscuous Port	Isolated Port	Community Port	Isolated Trunk Port (in the Same VLAN)	Promiscuous Trunk Port (in the Same VLAN)	Trunk Port (in the Same VLAN)
					the VLAN tag keeps unchanged in the non-PVLAN.	VLAN ID tag is added.
Switch CPU	Untag	Untag	Untag	A secondary VLAN ID tag is added.	A primary VLAN ID tag is added and the VLAN tag keeps unchanged in the non-PVLAN.	A primary VLAN ID tag is added.

## 8.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic Functions of PVLAN</a>	 (Mandatory) It is used to configure a primary VLAN and secondary VLANs.	
	<b>private-vlan {community   isolated   primary}</b>	Configures the PVLAN type.
	 (Mandatory) It is used to configure Layer-2 association between a primary VLAN and secondary VLANs of PVLAN to form PVLAN pairs.	
	<b>private-vlan association {svlist   add svlist   remove svlist}</b>	Configures Layer-2 association between a primary VLAN and secondary VLANs to form PVLAN pairs.
	 (Optional) It is used to allocate users to an isolated VLAN or community VLAN.	
	<b>switchport mode private-vlan host</b>	Configures a PVLAN host port.
	<b>switchport private-vlan host-association p_vid s_vid</b>	Associates Layer-2 ports with PVLAN and allocates ports to subdomains.
	 (Optional) It is used to configure a port as a promiscuous port.	
	<b>Switchport mode private-vlan promiscuous</b>	Configures a PVLAN promiscuous port.
	<b>switchport private-vlan mapping p_vid { svlist   add svlist   remove svlist }</b>	Configures the primary VLAN to which a PVLAN promiscuous port belongs and a list of secondary VLANs. PVLAN packets can be transmitted or received through this port only after the configuration is performed.
 (Optional) It is used to configure Layer-3 communication for users in a secondary VLAN.		

Configuration	Description and Command
	<p><b>private-vlan mapping</b> { <i>svlist</i>   <b>add</b> <i>svlist</i>   <b>remove</b> <i>svlist</i> }</p> <p>Configures the SVI of the primary VLAN and configures Layer-3 association between the primary VLAN and secondary VLANs after PVLAN is created and Layer-2 association is performed. Users in a SubVLAN can make Layer-3 communication through the SVI of the primary VLAN.</p>

### 8.4.1 Configuring Basic Functions of PVLAN

#### Configuration Effect

- Enable PVLAN subdomains to form to implement isolation between enterprises and between enterprise users.
- Implement Layer-3 mapping between multiple secondary VLANs and the primary VLAN so that and multiple VLANs uses the same IP gateway, thereby helping save IP addresses.

#### Notes

- After a primary VLAN and a secondary VLAN are configured, a PVLAN subdomain exist only after Layer-2 association is performed between them.
- A port connected to a use host must be configured as a specific PVLAN port so that the user host joins a subdomain to implement the real user isolation.
- The port connected to the external network and the port connected to a server must be configured as promiscuous ports so that upstream and downstream packets are forwarded normally.
- Users in a secondary VLAN can make Layer-3 communication through the SVI of the primary VLAN only after Layer-3 mapping is performed between the secondary VLAN and the primary VLAN.

#### Configuration Steps

##### Configuring PVLAN

- Mandatory.
- A primary VLAN and a secondary VLAN must be configured. The two types of VLANs cannot exist independently.
- Run the **private-vlan { community | isolated | primary }** command to configure a VLAN as the primary VLAN of PVLAN and other VLANs as secondary VLANs.

<b>Command</b>	<b>private-vlan { community   isolated   primary }</b>
<b>Parameter Description</b>	<p><b>community:</b> Specifies that the VLAN type is community VLAN.</p> <p><b>isolated:</b> Specifies that the VLAN type is isolated VLAN.</p> <p><b>primary:</b> Specifies that the VLAN type is the primary VLAN of a PVLAN pair.</p>
<b>Defaults</b>	VLANs are common VLANs and do not have the attributes of PVLAN.
<b>Command</b>	VLAN mode

<b>Mode</b>	
<b>Usage Guide</b>	This command is used to specify the primary VLAN and secondary VLANs of PVLAN.

↘ **Configuring Layer-2 Association of PVLAN**

- Mandatory.
- PVLAN subdomains form, and isolated ports, community ports, and Layer-3 association can be configured only after Layer-2 association is performed between the primary VLAN and secondary VLANs of PVLAN.
- By default, after various PVLANS are configured, the primary VLANs and secondary VLANs are independent of each other. A primary VLAN has a secondary VLAN and a secondary VLAN has a primary VLAN only after Layer-2 association is performed.
- Run the **private-vlan association** { *svlist* | **add** *svlist* | **remove** *svlist* } command to configure or cancel the Layer-2 association between the primary VLAN and secondary VLANs of PVLAN. A PVLAN subdomain forms only after Layer-2 association is configured,. The PVLAN subdomain does not exist after Layer-2 association is cancelled. If Layer-2 association is not performed, when isolated ports and promiscuous ports are used to configure associated PVLAN pairs, the configuration will fail or the association between ports and VLANs will be cancelled.

<b>Command</b>	<b>private-vlan association</b> { <i>svlist</i>   <b>add</b> <i>svlist</i>   <b>remove</b> <i>svlist</i> }
<b>Parameter Description</b>	<i>svlist</i> : Specifies the list of secondary VLANs to be associated or disassociated. <b>add</b> <i>svlist</i> : Adds the secondary VLANs to be associated. <b>remove</b> <i>svlist</i> : Cancels the association between <i>svlist</i> and the primary VLAN.
<b>Defaults</b>	By default, the primary VLAN and secondary VLANs are not associated.
<b>Command Mode</b>	Primary VLAN mode of PVLAN
<b>Usage Guide</b>	This command is used to configure Layer-2 association between a primary VLAN and secondary VLANs to form PVLAN pairs. Each primary VLAN can be associated with only one isolated VLAN but can be associated with multiple community VLANs.

↘ **Configuring Layer-3 Association of PVLAN**

- If users in a secondary VLAN domain needs to make Layer-3 communication, configure a Layer-3 interface SVI for the primary VLAN and then configure Layer-3 association between the primary VLAN and secondary VLANs on the SVI.
- By default, SVIs can be configured only in a primary VLAN. Secondary VLANs do not support Layer-3 communication.
- If users in a secondary VLAN of PVLAN need to make Layer-3 communication, the SVI of the primary VLAN needs to be used to transmit and receive packets.
- Run the **private-vlan mapping** { *svlist* | **add** *svlist* | **remove** *svlist* } command to configure or cancel the Layer-3 association between the primary VLAN and secondary VLANs of PVLAN. Users in a secondary VLAN can make Layer-3 communication with the external network only after Layer-3 association is configured. After Layer-3 association is cancelled, users in a secondary VLAN cannot make Layer-3 communication.

<b>Command</b>	<b>private-vlan mapping</b> { <i>svlist</i>   <b>add</b> <i>svlist</i>   <b>remove</b> <i>svlist</i> }
<b>Parameter Description</b>	<i>svlist</i> : Indicates the list of secondary VLANs, for which Layer-3 mapping needs to be configured. <b>add</b> <i>svlist</i> : Adds the secondary VLANs to be associated with a Layer-3 interface. <b>remove</b> <i>svlist</i> : Cancels the secondary VLANs associated with a Layer-3 interface.
<b>Defaults</b>	By default, the primary VLAN and secondary VLANs are not associated.
<b>Command Mode</b>	Interface configuration mode of the primary VLAN
<b>Usage Guide</b>	A Layer-3 SVI must be configured for the primary VLAN first. Layer-3 interfaces can be configured only in a primary VLAN. Layer-2 association must be performed between associated secondary VLANs and the primary VLAN.

↘ **Configuring Isolated Ports and Community Ports**

- After the primary VLAN and secondary VLANs of PVLAN as well as Layer-2 association are configured, allocate the device ports connected to user hosts so as to specify the subdomains to which the user hosts belong.
- If an enterprise has only one user host, set the port connected to the user host as an isolated port.
- If an enterprise has multiple user hosts, set the ports connected to the user hosts as community ports.

<b>Command</b>	<b>switchport mode private-vlan host</b> <b>switchport private-vlan host-association</b> <i>p_vid</i> <i>s_vid</i>
<b>Parameter Description</b>	<i>p_vid</i> : Indicates the primary VLAN ID in a PVLAN pair. <i>s_vid</i> : Indicates the secondary VLAN ID in a PVLAN pair. The port is an associated port if the VLAN is an isolated VLAN and the port is a community port if the VLAN is a community VLAN.
<b>Defaults</b>	By default, the interface works in Access mode; no private VLAN pairs are associated.
<b>Command Mode</b>	Both commands run in interface configuration mode.
<b>Usage Guide</b>	Both the preceding commands need to be configured. Before a port is configured as an isolated port or promiscuous port, and the port mode must be configured as the host port mode. Whether a port is configured as an isolated port or community port depends on the <i>s_vid</i> parameter. <i>p_vid</i> and <i>s_vid</i> must be respectively the IDs of the primary VLAN and secondary VLAN in a PVLAN pair, on which Layer-2 association is performed. One host port can be associated with only one PVLAN pair.

↘ **Configuring a Promiscuous Port**

- According to the table listing port packet transmission and receiving rules in section "Features", the single port type of PVLAN cannot ensure symmetric forwarding of upstream and downstream packets. Ports for connecting to the external network or server need to be configured as promiscuous ports to ensure that users can successfully access the external network or server.

<b>Command</b>	<b>switchport mode private-vlan promiscuous</b>
----------------	---

	<b>switchport private-vlan mapping</b> <i>p_vid</i> { <i>svlist</i>   <b>add</b> <i>svlist</i>   <b>remove</b> <i>svlist</i> }
<b>Parameter Description</b>	<p><i>p_vid</i>: Indicates the primary VLAN ID in a PVLAN pair.</p> <p><i>svlist</i>: Indicates the secondary VLAN associated with a promiscuous port. Layer-2 association must be performed between it and <i>p_vid</i>.</p> <p><b>add</b> <i>svlist</i>: Adds a secondary VLAN to be associated with a port.</p> <p><b>remove</b> <i>svlist</i>: Cancels the secondary VLAN associated with a port.</p>
<b>Defaults</b>	By default, an interface works in Access mode; a promiscuous port is not associated with a secondary VLAN.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>The port mode must be configured as the promiscuous mode.</p> <p>If a port is configured as a promiscuous port, it must be associated with PVLN pairs. Otherwise, the port cannot bear or forward services.</p> <p>One promiscuous port can be associated with multiple PVLAN pairs within one primary VLAN but cannot be associated with multiple primary VLANs.</p>

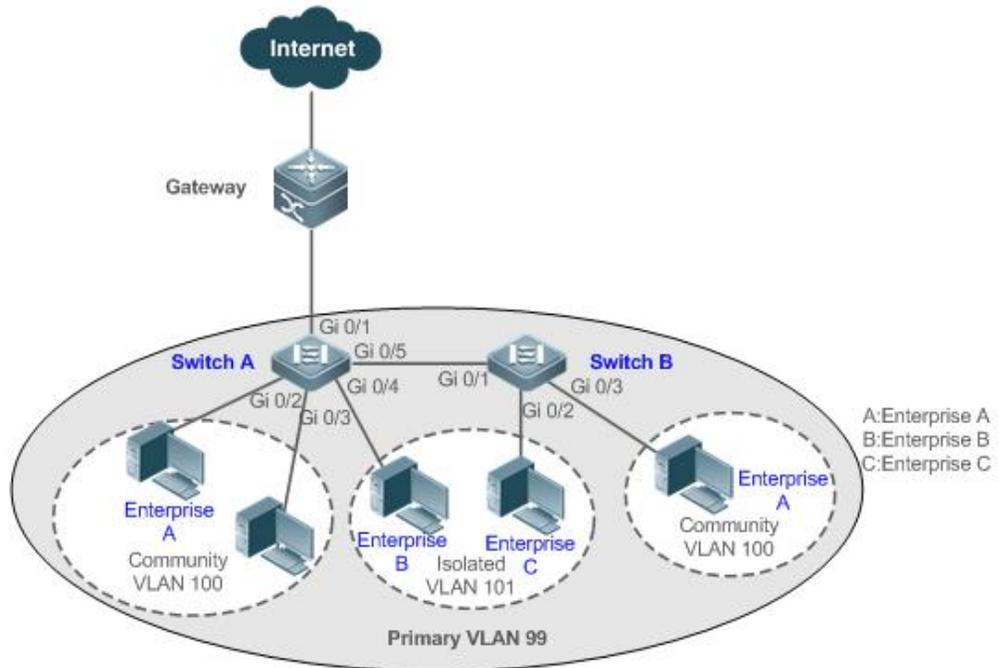

## Verification

Make user hosts connected to PVLAN ports transmit and receive packets as per PVLAN port forwarding rules to implement isolation. Configure Layer-3 association to make users in the primary VLAN and secondary VLANs of the same PVLAN to share the same gateway IP address and make Layer-3 communication.

## Configuration Example

### ↘ Cross-Device Layer-2 Application of PVLAN

Figure 9-3

**Configuration Steps**

- Configure all enterprises to be in the same PVLAN (primary VLAN 99 in this example). All enterprise users share the same Layer-3 interface through this VLAN to communicate with the external network.
- If an enterprise has multiple user hosts, allocate each enterprise to a different community VLAN (in this example, allocate Enterprise A to Community VLAN 100) to implement user communication inside an enterprise and isolate user communication between enterprises.
- If an enterprise has only one user host, allocate such enterprises to the same isolated VLAN (in this example, allocate Enterprise B and Enterprise C to Isolated VLAN 101) to isolate user communication between enterprises.

**A**

```
SwitchA#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchA(config)#vlan 99
SwitchA(config-vlan)#private-vlan primary
SwitchA(config-vlan)#exit
SwitchA(config)#vlan 100
SwitchA(config-vlan)#private-vlan community
SwitchA(config-vlan)#exit
SwitchA(config)#vlan 101
SwitchA(config-vlan)#private-vlan isolated
SwitchA(config-vlan)#exit
```

	<pre>SwitchA(config)#vlan 99  SwitchA(config-vlan)#private-vlan association 100-101  SwitchA(config-vlan)#exit  SwitchA(config)#interface range gigabitEthernet 0/2-3  SwitchA(config-if-range)#switchport mode private-vlan host  SwitchA(config-if-range)#switchport private-vlan host-association 99 100  SwitchA(config-if-range)#exit  SwitchA(config)#interface gigabitEthernet 0/4  SwitchA(config-if-GigabitEthernet 0/4)#switchport mode private-vlan host  SwitchA(config-if-GigabitEthernet 0/4)#switchport private-vlan host-association 99 101</pre>
<b>B</b>	<pre>SwitchB#configure terminal  Enter configuration commands, one per line.  End with CNTL/Z.  SwitchB(config)#vlan 99  SwitchB(config-vlan)#private-vlan primary  SwitchB(config-vlan)#exit  SwitchB(config)#vlan 100  SwitchB(config-vlan)#private-vlan community  SwitchB(config-vlan)#exit  SwitchB(config)#vlan 101  SwitchB(config-vlan)#private-vlan isolated  SwitchB(config-vlan)#exit  SwitchB(config)#vlan 99  SwitchB(config-vlan)#private-vlan association 100-101  SwitchB(config-vlan)#exit  SwitchB(config)#interface gigabitEthernet 0/2  SwitchB(config-if-GigabitEthernet 0/2)#switchport mode private-vlan host  SwitchB(config-if-GigabitEthernet 0/2)# switchport private-vlan host-association 99 101  SwitchB(config-if-GigabitEthernet 0/2)#exit  SwitchB(config)#interface gigabitEthernet 0/3  SwitchB(config-if-GigabitEthernet 0/3)#switchport mode private-vlan host  SwitchB(config-if-GigabitEthernet 0/3)# switchport private-vlan host-association 99 100</pre>

	SwitchB(config-if-GigabitEthernet 0/3)#exit
<b>Verification</b>	Check whether VLANs and ports are correctly configured, and check whether packet forwarding is correct according to packet forwarding rules in section "Features".
<b>A</b>	<pre>SwitchA#show running-config ! vlan 99   private-vlan primary   private-vlan association add 100-101 ! vlan 100   private-vlan community ! vlan 101   private-vlan isolated ! interface GigabitEthernet 0/1   switchport mode private-vlan promiscuous   switchport private-vlan mapping 99 add 100-101 ! interface GigabitEthernet 0/2   switchport mode private-vlan host   switchport private-vlan host-association 99 100 ! interface GigabitEthernet 0/3   switchport mode private-vlan host   switchport private-vlan host-association 99 100 ! interface GigabitEthernet 0/4   switchport mode private-vlan host   switchport private-vlan host-association 99 101 !</pre>

```

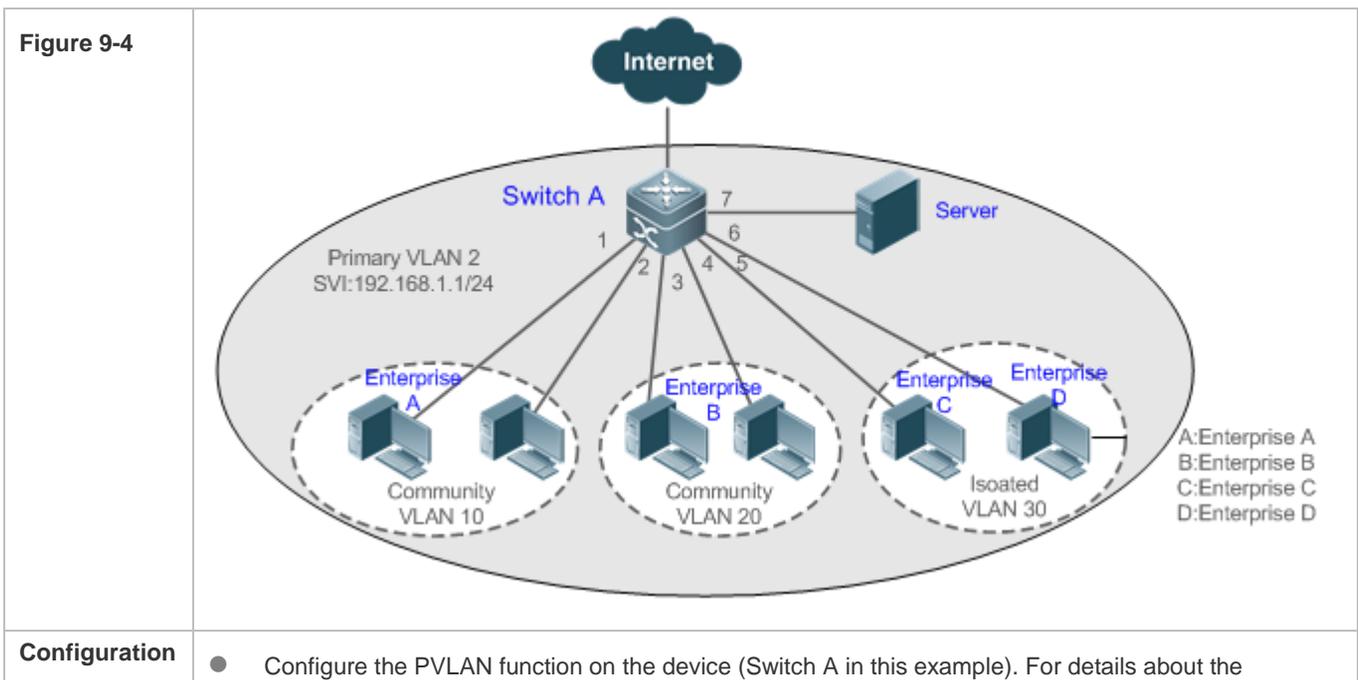

B
SwitchB#show running-config
!
vlan 99
  private-vlan primary
  private-vlan association add 100-101
!
vlan 100
  private-vlan community
!
vlan 101
  private-vlan isolated
!
    
```

**Common Errors**

- Layer-2 association is not performed between the primary VLAN and secondary VLANs of PVLAN, and a port VLAN list fails to be added when isolated ports, promiscuous ports, and community ports are configured.
- One host port fails to be associated with multiple PVLAN pairs.

**Configuration Example**

📌 **Layer-3 Application of PVLAN on a Single Device**

<b>Steps</b>	<p>configuration, see configuration tips in "Cross-Device Layer-2 Application of PVLAN."</p> <ul style="list-style-type: none"> <li>● Set the port that is directly connected to the server (Port Gi 0/7 in this example) as a promiscuous port. Then, all enterprise users can communicate with the server through the promiscuous port.</li> <li>● Configure the gateway address of PVLAN on the Layer-3 device (Switch A in this example) (in this example, set the SVI address of VLAN 2 to 192.168.1.1/24) and configure the Layer-3 interface mapping between the primary VLAN (VLAN 2 in this example) and secondary VLANs (VLAN 10, VLAN 20, and VLAN 30 in this example). Then, all enterprise users can communicate with the external network through the gateway address.</li> </ul>

-----
2     primary active  Enabled Gi0/7   10, 20, 30
10    community active  Enabled Gi0/1, Gi0/2  2
20    community active  Enabled Gi0/3, Gi0/4  2
30    isolated active  Enabled Gi0/5, Gi0/6  2
    
```

↘ **Common Errors**

- No Layer-2 association is performed on the primary VLAN and secondary VLANs of PVLAN and the Layer-3 association fails to be configured.
- The device is connected to the external network before Layer-3 association is configured. As a result, the device cannot communicate with the external network.
- The interfaces for connecting to the server and the external network are not configured as promiscuous interfaces, which results in asymmetric forwarding of upstream and downstream packets.

## 8.5 Monitoring

### Displaying

Description	Command
Displays PVLAN configuration.	<b>show vlan private-vlan</b>

### Debugging

- i** System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs PVLAN.	<b>debug bridge pvlan</b>

## 9 Configuring MSTP

### 9.1 Overview

Spanning Tree Protocol (STP) is a Layer-2 management protocol. It cannot only selectively block redundant links to eliminate Layer-2 loops but also can back up links.

Similar to many protocols, STP is continuously updated from Rapid Spanning Tree Protocol (RSTP) to Multiple Spanning Tree Protocol (MSTP) as the network develops.

For the Layer-2 Ethernet, only one active link can exist between two local area networks (LANs). Otherwise, a broadcast storm will occur. To enhance the reliability of a LAN, it is necessary to establish a redundant link and keep some paths in backup state. If the network is faulty and a link fails, you must switch the redundant link to the active state. STP can automatically activate the redundant link without any manual operations. STP enables devices on a LAN to:

- Discover and start the best tree topology on the LAN.
- Troubleshoot a fault and automatically update the network topology so that the possible best tree topology is always selected.

The LAN topology is automatically calculated based on a set of bridge parameters configured by the administrator. The best topology tree can be obtained by properly configuring these parameters.

RSTP is completely compatible with 802.1D STP. Similar to traditional STP, RSTP provides loop-free and redundancy services. It is characterized by rapid speed. If all bridges in a LAN support RSTP and are properly configured by the administrator, it takes less than 1 second (about 50 seconds if traditional STP is used) to re-generate a topology tree after the network topology changes.

STP and RSTP have the following defects:

- STP migration is slow. Even on point-to-point links or edge ports, it still takes two times of the forward delay for ports to switch to the forwarding state.
- RSTP can rapidly converge but has the same defect with STP: Since all VLANs in a LAN share the same spanning tree, packets of all VLANs are forwarded along this spanning tree. Therefore, redundant links cannot be blocked according to specific VLANs and data traffic cannot be balanced among VLANs.

MSTP, defined by the IEEE in 802.1s, resolves defects of STP and RSTP. It cannot only rapidly converge but also can enable traffic of different VLANs to be forwarded along respective paths, thereby providing a better load balancing mechanism for redundant links.

In general, STP/RSTP works based on ports while MSTP works based on instances. An instance is a set of multiple VLANs. Binding multiple VLANs to one instance can reduce the communication overhead and resource utilization.

Ruijie devices support STP, RSTP, and MSTP, and comply with IEEE 802.1D, IEEE 802.1w, and IEEE 802.1s.

### Protocols and Standards

- IEEE 802.1D: Media Access Control (MAC) Bridges
- IEEE 802.1w: Part 3: Media Access Control (MAC) Bridges—Amendment 2: Rapid Reconfiguration
- IEEE 802.1s: Virtual Bridged Local Area Networks—Amendment 3: Multiple Spanning Trees

## 9.2 Applications

Application	Description
<a href="#">MSTP+VRRP Dual-Core Topology</a>	With a hierarchical network architecture model, the MSTP+VRRP mode is used to implement redundancy and load balancing to improve system availability of the network.
<a href="#">BPDU Tunnel</a>	In QinQ network environment, Bridge Protocol Data Unit (BPDU) Tunnel is used to implement tunnel-based transparent transmission of STP packets.

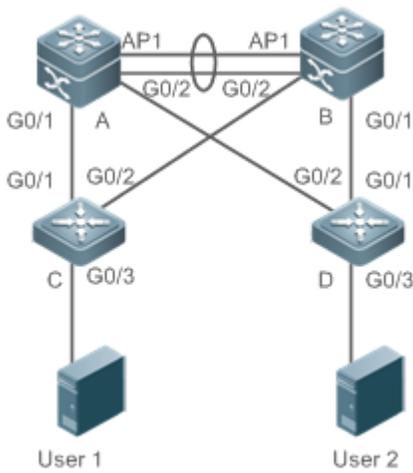

### 9.2.1 MSTP+VRRP Dual-Core Topology

#### Scenario

The typical application of MSTP is the MSTP+VRRP dual-core solution. This solution is an excellent solution to improve system availability of the network. Using a hierarchical network architecture model, it is generally divided into three layers (core layer, convergence layer, and access layer) or two layers (core layer and access layer). They form the core network system to provide data exchange service.

The main advantage of this architecture is its hierarchical structure. In the hierarchical network architecture, all capacity indicators, characteristics, and functions of network devices at each layer are optimized based on their network locations and roles, enhancing their stability and availability.

Figure 10-1 MSTP+VRRP Dual-Core Topology

**Remarks** The topology is divided into two layers: core layer (Devices A and B) and access layer (Devices C and D).

### Deployment

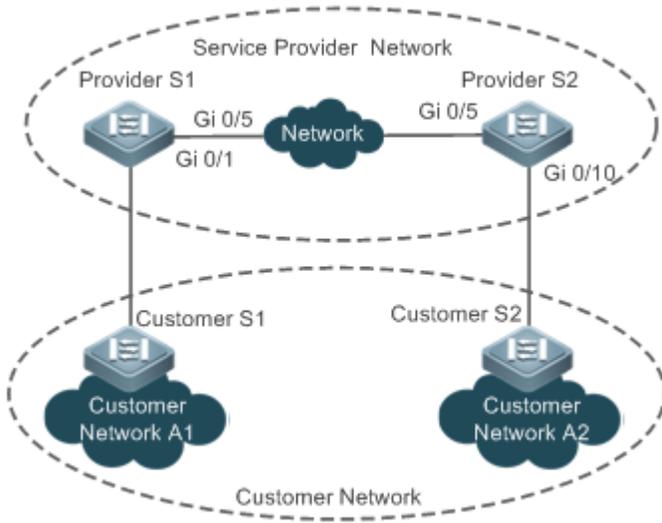

- Core layer: Multiple MSTP instances are configured to realize load balancing. For example, two instances are created: Instance 1 and Instance 2. Instance 1 maps VLAN 10 while Instance 2 maps VLAN 20. Device A is the root bridge of Instances 0 and 1 (Instance 0 is CIST, which exists by default). Device B is the root bridge of Instance 2.
- Core layer: Devices A and B are the active VRRP devices respectively on VLAN 10 and VLAN 20.
- Access layer: Configure the port directly connected to the terminal (PC or server) as a PortFast port, and enable BPDU guard to prevent unauthorized users from accessing illegal devices.

## 9.2.2 BPDU Tunnel

### Scenario

The QinQ network is generally divided into two parts: customer network and service provider (SP) network. You can enable BPDU Tunnel to calculate STP packets of the customer network independently of the SP network, thereby preventing STP packets between the customer network from affecting the SP network.

Figure 10-2 BPDU Tunnel Topology

<b>Remarks</b>	<p>As shown in the above figure, the upper part is the SP network and the lower part is the customer network. The SP network consists of two provider edges (PEs): Provider S1 and Provider S2. Customer Network A1 and Customer Network A2 are a user's two sites in different regions. Customer S1 and Customer S2, access devices from the customer network to the SP network, access the SP network respectively through Provider S1 and Provider S2.</p> <p>Using BPDU Tunnel, Customer Network A1 and Customer Network A2 in different regions can perform unified spanning tree calculation across the SP network, not affecting the spanning tree calculation of the SP network.</p>
----------------	--

### Deployment

- Enable basic QinQ on the PEs (Provider S1/Provider S2 in this example) so that data packets of the customer network are transmitted within the specified VLAN on the SP network.
- Enable STP transparent transmission on the PEs (Provider S1/Provider S2 in this example) so that the SP network can transmit STP packets of the customer network through BPDU Tunnel.

## 9.3 Features

### Basic Concepts

#### ↳ BPDU

To generate a stable tree topology network, the following conditions must be met:

- Each bridge has a unique ID consisting of the bridge priority and MAC address.
- The overhead of the path from the bridge to the root bridge is called root path cost.
- A port ID consists of the port priority and port number.

Bridges exchange BPDU packets to obtain information required for establishing the best tree topology. These packets use the multicast address 01-80-C2-00-00-00 (hexadecimal) as the destination address.

A BPDU consists of the following elements:

- Root bridge ID assumed by the local bridge
- Root path cost of the local bridge
- Bridge ID (ID of the local bridge)
- Message age (age of a packet)
- Port ID (ID of the port sending this packet)
- **Forward-Delay Time, Hello Time, Max-Age Time** are time parameters specified in the MSTP.
- Other flags, such as flags indicating network topology changes and local port status.

If a bridge receives a BPDU with a higher priority (smaller bridge ID and lower root path cost) at a port, it saves the BPDU information at this port and transmits the information to all other ports. If the bridge receives a BPDU with a lower priority, it discards the information.

Such a mechanism allows information with higher priorities to be transmitted across the entire network. BPDU exchange results are as follows:

- A bridge is selected as the root bridge.
- Except the root bridge, each bridge has a root port, that is, a port providing the shortest path to the root bridge.
- Each bridge calculates the shortest path to the root bridge.
- Each LAN has a designated bridge located in the shortest path between the LAN and the root bridge. A port designated to connect the bridge and the LAN is called designated port.
- The root port and designated port enter the forwarding status.

### ↘ Bridge ID

According to IEEE 802.1W, each bridge has a unique ID. The spanning tree algorithm selects the root bridge based on the bridge ID. The bridge ID consists of eight bytes, of which the last six bytes are the MAC address of the bridge. In its first two bytes (as listed in the following table), the first four bits indicate the priority; the last eight bits indicate the system ID for use in extended protocol. In RSTP, the system ID is 0. Therefore, the bridge priority should be an integral multiple of 4,096.

	Bit	Value
Priority value	16	32,768
	15	16,384
	14	8,192
	13	4,096
System ID	12	2,048
	11	1,024
	10	512
	9	256
	8	128
	7	64

	6	32
	5	16
	4	8
	3	4
	2	2
	1	1

↘ **Spanning-Tree Timers**

The following three timers affect the performance of the entire spanning tree:

- Hello timer: Interval for periodically sending a BPDU packet.
- Forward-Delay timer: Interval for changing the port status, that is, interval for a port to change from the listening state to the learning state or from the learning state to the forwarding state when RSTP runs in STP-compatible mode.
- Max-Age timer: The longest time-to-live (TTL) of a BPDU packet. When this timer elapses, the packet is discarded.

↘ **Port Roles and Port States**

Each port plays a role on a network to reflect different functions in the network topology.

- Root port: Port providing the shortest path to the root bridge.
- Designated port: Port used by each LAN to connect the root bridge.
- Alternate port: Alternative port of the root port. Once the root port loses effect, the alternate port immediately changes to the root port.
- Backup port: Backup port of the designated port. When a bridge has two ports connected to a LAN, the port with the higher priority is the designated port while the port with the lower priority is the backup port.
- Disabled port: Inactive port. All ports with the operation state being down play this role.

The following figures show the roles of different ports:

R = Root port    D = Designated port    A = Alternate port    B = Backup port

Unless otherwise specified, port priorities decrease from left to right.

Figure 10-3

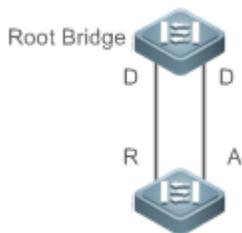

Figure 10-4

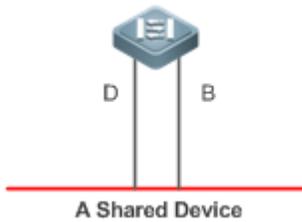

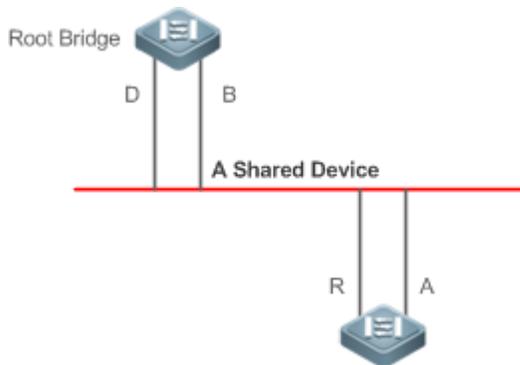

Figure 10-5

Each port has three states indicating whether to forward data packets so as to control the entire spanning tree topology.

- Discarding: Neither forwards received packets nor learns the source MAC address.
- Learning: Does not forward received packets but learns the source MAC address, which is a transitive state.
- Forwarding: Forwards received packets and learns the source MAC address.

For a stable network topology, only the root port and designated port can enter the forwarding state while other ports are always in discarding state.

### ↘ Hop Count

Internal spanning trees (ISTs) and multiple spanning tree instances (MSTIs) calculate whether the BPDU packet time expires based on an IP TTL-alike mechanism Hop Count, instead of Message Age and Max Age.

It is recommended to run the **spanning-tree max-hops** command in global configuration mode to configure the hop count. In a region, every time a BPDU packet passes through a device from the root bridge, the hop count decreases by 1. When the hop count becomes 0, the BPDU packet time expires and the device discards the packet.

To be compatible with STP and RSTP outside the region, MSTP also retains the Message Age and Max Age mechanisms.

### Overview

Feature	Description
<a href="#">STP</a>	STP, defined by the IEEE in 802.1D, is used to eliminate physical loops at the data link layer in a LAN.
<a href="#">RSTP</a>	RSTP, defined by the IEEE in 802.1w, is optimized based on STP to rapidly converge the network topology.

<a href="#">MSTP</a>	MSTP, defined by the IEEE in 802.1s, resolves defects of STP, RSTP, and Per-VLAN Spanning Tree (PVST). It cannot only rapidly converge but also can forward traffic of different VLANs along respective paths, thereby providing a better load balancing mechanism for redundant links.
<a href="#">MSTP Optical Features</a>	MSTP includes the following features: PortFast, BPDU guard, BPDU filter, TC protection, TC guard, TC filter, BPDU check based on the source MAC address, BPDU filter based on the illegal length, Auto Edge, root guard, and loop guard.

### 9.3.1 STP

STP is used to prevent broadcast storms incurred by loops and provide link redundancy.

#### Working Principle

For the Layer-2 Ethernet, only one active link can exist between two LANs. Otherwise, a broadcast storm will occur. To enhance the reliability of a LAN, it is necessary to establish a redundant link and keep some paths in backup state. If the network is faulty and a link fails, you must switch the redundant link to the active state. STP can automatically activate the redundant link without any manual operations. STP enables devices on a LAN to:

- Discover and start the best tree topology on the LAN.
- Troubleshoot a fault and automatically update the network topology so that the possible best tree topology is always selected.

The LAN topology is automatically calculated based on a set of bridge parameters configured by the administrator. The best topology tree can be obtained by properly configuring these parameters.

#### Related Configuration

##### ↘ [Enabling spanning-tree](#)

- By default, the spanning-tree function is disabled.
- Run the **spanning-tree** [ **forward-time** *seconds* | **hello-time** *seconds* | **max-age** *seconds* ] command to enable STP and configure basic attributes.
- The forward-time ranges from 4 to 30. The hello-time ranges from 1 to 10. The max-age ranges from 6 to 40.

 Running the **clear** commands may lose vital information and thus interrupt services. The value ranges of forward-time, hello-time, and max-age are related. If one of them is modified, the other two ranges are affected. The three values must meet the following condition:  $2 \times (\text{Hello Time} + 1 \text{ second}) \leq \text{Max-Age Time} \leq 2 \times (\text{Forward-Delay Time} - 1 \text{ second})$ . Otherwise, the configuration will fail.

### 9.3.2 RSTP

RSTP is completely compatible with 802.1D STP. Similar to traditional STP, RSTP provides loop-free and redundancy services. It is characterized by rapid speed. If all bridges in a LAN support RSTP and are properly configured by the

administrator, it takes less than 1 second (about 50 seconds if traditional STP is used) to re-generate a topology tree after the network topology changes.

### Working Principle

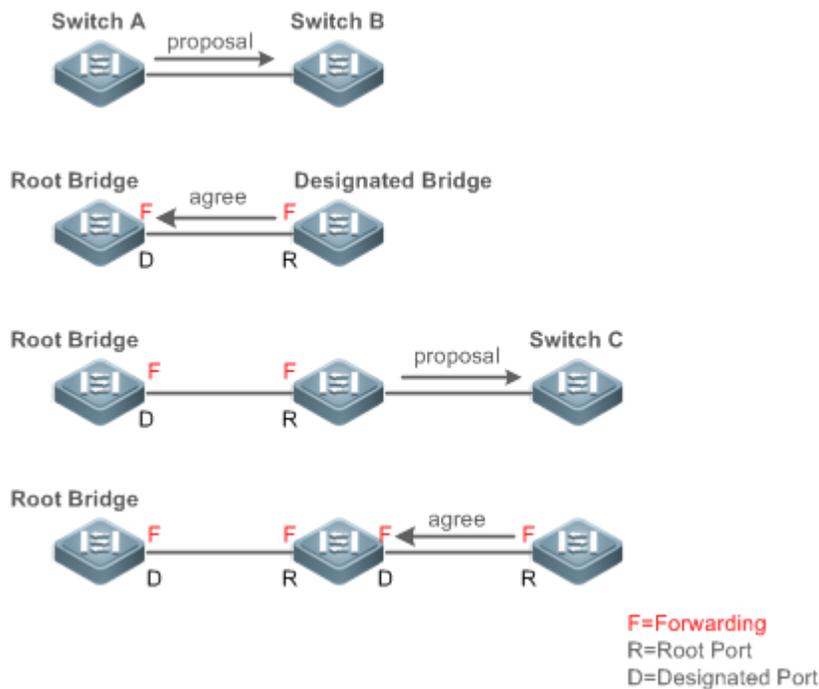

#### Fast RSTP Convergence

RSTP has a special feature, that is, to make ports quickly enter the forwarding state.

STP enables a port to enter the forwarding state 30 seconds (two times of the Forward-Delay Time; the Forward-Delay Time can be configured, with a default value of 15 seconds) after selecting a port role. Every time the topology changes, the root port and designated port reselected by each bridge enter the forwarding state 30 seconds later. Therefore, it takes about 50 seconds for the entire network topology to become a tree.

RSTP differs greatly from STP in the forwarding process. As shown in Figure 10-6, Switch A sends an RSTP Proposal packet to Switch B. If Switch B finds the priority of Switch A higher, it selects Switch A as the root bridge and the port receiving the packet as the root port, enters the forwarding state, and then sends an Agree packet from the root port to Switch A. If the designated port of Switch A is agreed, the port enters the forwarding state. Switch B's designated port resends a Proposal packet to extend the spanning tree by sequence. Theoretically, RSTP can recover the network tree topology to rapidly converge once the network topology changes.

Figure 10-6

**i** The above handshake process is implemented only when the connection between ports is in point-to-point mode. To give the devices their full play, it is recommended not to enable point-to-point connection between devices.

Figure 10-7 and Figure 10-8 show the examples of non point-to-point connection.

Example of non point-to-point connection:

Figure 10-7

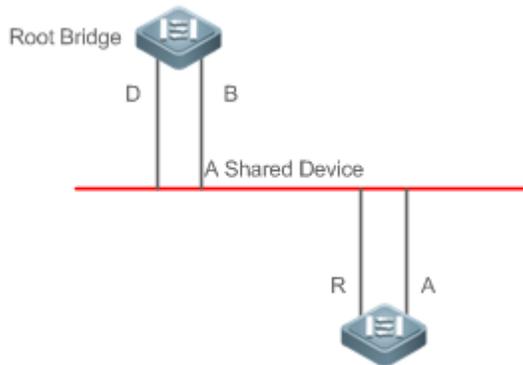

Figure 10-8

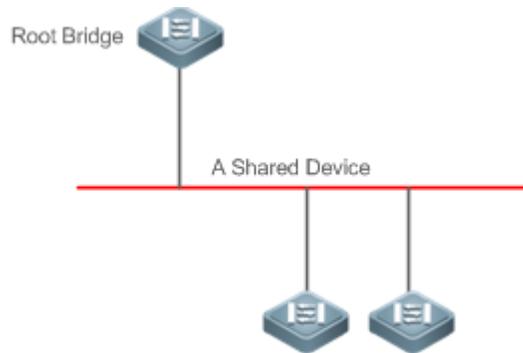

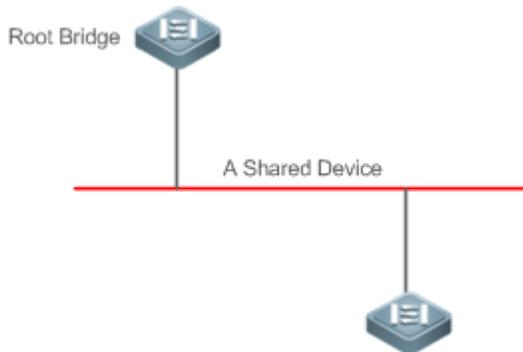

Figure 10-9 shows an example of point-to-point connection.

Figure 10-9

### Compatibility Between RSTP and STP

RSTP is completely compatible with STP. RSTP automatically checks whether the connected bridge supports STP or RSTP based on the received BPDU version number. If the port connects to an STP bridge, the port enters the forwarding state 30 seconds later, which cannot give RSTP its full play.

Another problem may occur when RSTP and STP are used together. As shown in the following figures, Switch A (RSTP) connects to Switch B (STP). If Switch A finds itself connected to an STP bridge, it sends an STP BPDU packet. However, if Switch B is replaced with Switch C (RSTP) but Switch A still sends STP BPDU packets, Switch C will assume itself connected to the STP bridge. As a result, two RSTP devices work under STP, greatly reducing the efficiency.

RSTP provides the protocol migration feature to forcibly send RSTP BPDU packets (the peer bridge must support RSTP). In this case, Switch A is enforced to send an RSTP BPDU and Switch C then finds itself connected to the RSTP bridge. As a result, two RSTP devices work under RSTP, as shown in Figure 10-11.

Figure 10-10

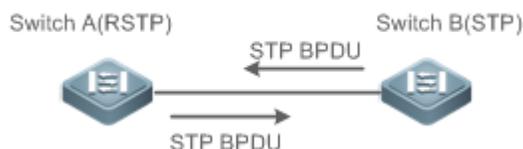

Figure 10-11

### Related Configuration

#### Configuring Protocol Migration

- Run the **clear spanning-tree detected-protocols [ interface interface-id ]** command to enforce version check on a port. For details, see "Compatibility Between RSTP and STP".

### 9.3.3 MSTP

MSTP resolves defects of STP and RSTP. It cannot only rapidly converge but also can forward traffic of different VLANs along respective paths, thereby providing a better load balancing mechanism for redundant links.

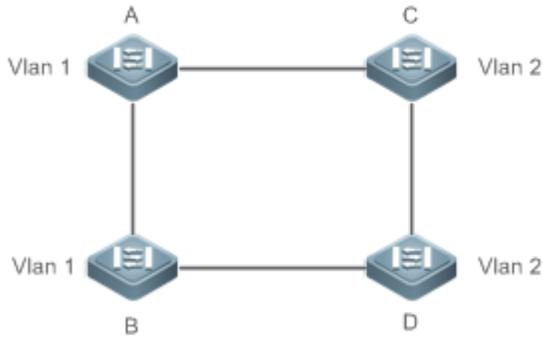

#### Working Principle

Ruijie devices support MSTP. MSTP is a new spanning tree protocol developed from traditional STP and RSTP and includes the fast RSTP forwarding mechanism.

Since traditional spanning tree protocols are irrelevant to VLANs, problems may occur in specific network topologies:

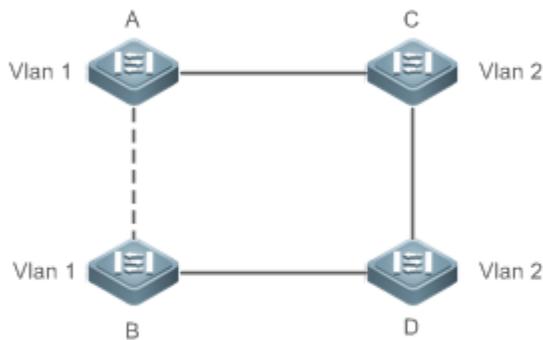

As shown in Figure 10-12, Devices A and B are in VLAN 1 while Devices C and D are in VLAN 2, forming a loop.

Figure 10-12

If the link from Device A to Device B through Devices C and D costs less than the link from Device A direct to Device B, the link between Device A and Device B enters the discarding state (as shown in Figure 10-13). Since Devices C and D do not include VLAN 1 and cannot forward data packets of VLAN 1, VLAN 1 of Device A fails to communicate with VLAN 1 of Device B.

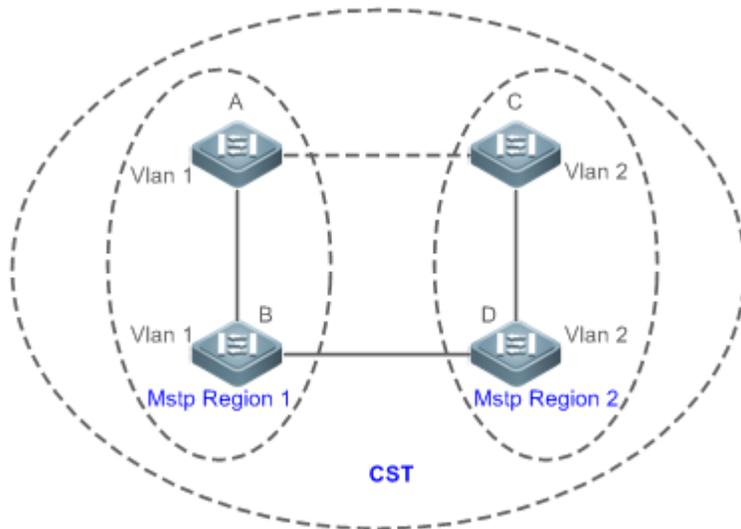

Figure 10-13

MSTP is developed to resolve this problem. It divides one or multiple VLANs of a device into an instance. Devices configured with the same instance form an MST region to run an independent spanning tree (called IST). This MST region, like a big device, implements the spanning tree algorithm with other MST regions to generate a complete spanning tree called common spanning tree (CST).

Based on this algorithm, the above network can form the topology shown in Figure 10-14 under the MSTP algorithm: Devices A and B are in MSTP region 1 in which no loop occurs, and therefore no link enters the discarding state. This also applies to MSTP Region 2. Region 1 and Region 2, like two big devices having loops, select a link to enter the discarding state based on related configuration.

Figure 10-14

This prevents loops to ensure proper communication between devices in the same VLAN.

### ↘ MSTP Region Division

To give MSTP its due play, properly divide MSTP regions and configure the same MST configuration information for devices in the same MSTP region.

MST configuration information include:

- MST configuration name: Consists of at most 32 bytes to identify an MSTP region.
- MST Revision Number: Consists of 16 bits to identify an MSTP region.
- MST instance-VLAN mapping table: A maximum number of 64 instances (with their IDs ranging from 1 to 64) are created for each device and Instance 0 exists mandatorily. Therefore, the system supports a maximum number of 65 instances. Users can assign 1 to 4,994 VLANs belonging to different instances (ranging from 0 to 64) as required. Unassigned VLANs belong to Instance 0 by default. In this case, each MSTI is a VLAN group and implements the spanning tree algorithm of the MSTI specified in the BPDU packet, not affected by CIST and other MSTIs.

Run the **spanning-tree mst configuration** command in global configuration mode to enter the MST configuration mode to configure the above information.

MSTP BPDUs carry the above information. If the BPDU received by a device carries the same MST configuration information with the information on the device, it regards that the connected device belongs to the same MST region with itself.

Otherwise, it regards the connected device originated from another MST region.

**i** It is recommended to configure the instance-VLAN mapping table after disabling MSTP. After the configuration, re-enable MSTP to ensure stability and convergence of the network topology.

### ↘ IST (Spanning Tree in an MSTP Region)

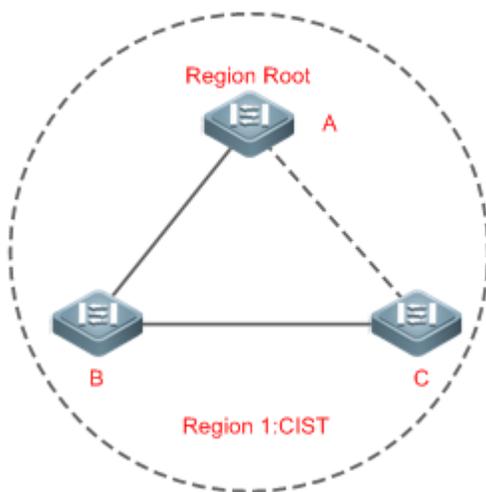

After MSTP regions are divided, each region selects an independent root bridge for each instance based on the corresponding parameters such as bridge priority and port priority, assigns roles to each port on each device, and specifies whether the port is in forwarding or discarding state in the instance based on the port role.

Through MSTP BPDU exchange, an IST is generated and each instance has their own spanning trees (MSTIs), in which the spanning tree corresponding to Instance 0 and CST are uniformly called Common Instance Spanning Tree (CIST). That is, each instance provides a single and loop-free network topology for their own VLAN groups.

As shown in Figure 90-15, Devices A, B, and C form a loop in Region 1.

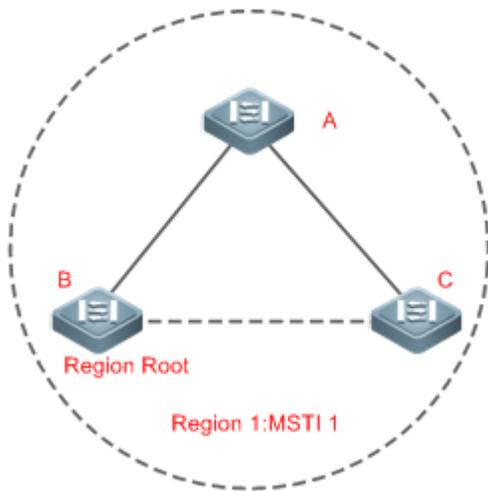

As shown in Figure 90-15, Device A has the highest priority in the CIST (Instance 0) and thereby is selected as the region root. Then MSTP enables the link between A and C to enter the discarding state based on other parameters. Therefore, for the VLAN group of Instance 0, only links from A to B and from B to C are available, interrupting the loop of this VLAN group.

Figure 90-15

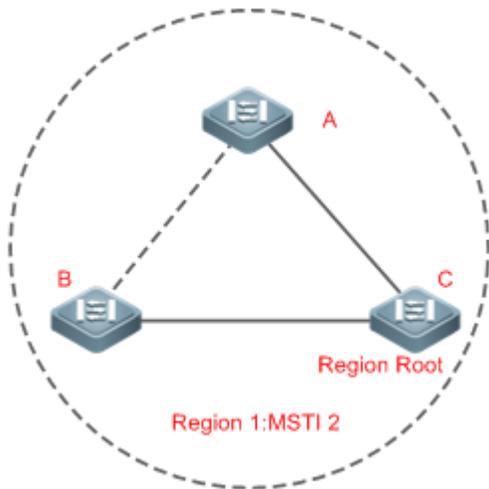

As shown in Figure 10-16, Device B has the highest priority in the MSTI 1 (Instance 1) and thereby is selected as the region root. Then MSTP enables the link between B and C to enter the discarding state based on other parameters. Therefore, for the VLAN group of Instance 1, only links from A to B and from A to C are available, interrupting the loop of this VLAN group.

Figure 10-16

As shown in Figure 10-17, Device C has the highest priority in the MSTI 2 (Instance 2) and thereby is selected as the region root. Then MSTP enables the link between B and C to enter the discarding state based on other parameters. Therefore, for the VLAN group of Instance 2, only links from B to C and from A to C are available, interrupting the loop of this VLAN group.

Figure 10-17

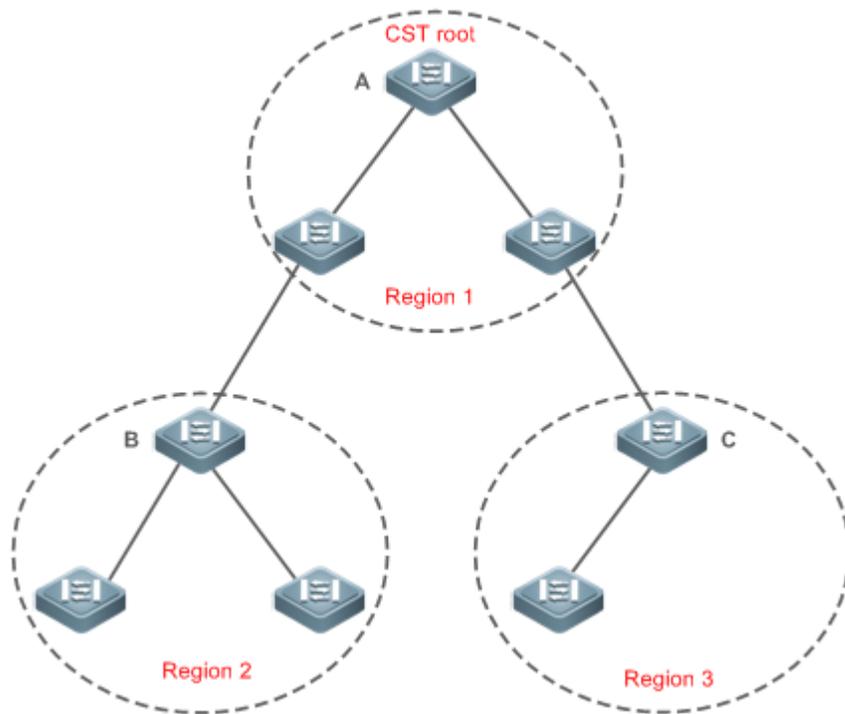

Note that MSTP does not care which VLAN a port belongs to. Therefore, users should configure the path cost and priority of a related port based on the actual VLAN configuration to prevent MSTP from interrupting wrong loops.

📌 **CST (Spanning Tree Between MSTP Regions)**

Each MSTP region is like a big device for the CST. Different MSTP regions form a bit network topology tree called CST. As shown in Figure 10-18, Device A, of which the bridge ID is the smallest, is selected as the root in the entire CST and the CIST regional root in this region. In Region 2, since the root path cost from Device B to the CST root is lowest, Device B is selected as the CIST regional root in this region. For the same reason, Device C is selected as the CIST regional root.

Figure 10-18

The CIST regional root may not be the device of which the bridge ID is the smallest in the region but indicates the device of which the root path cost from this region to the CST root is the smallest.

For the MSTI, the root port of the CIST regional root has a new role "master port". The master port acts as the outbound port of all instances and is in forwarding state for all instances. To make the topology more stable, we suggest that the master port of each region to the CST root be on the same device of the region if possible.

#### Compatibility Among MSTP, RSTP, and STP

Similar to RSTP, MSTP sends STP BPDUs to be compatible with STP. For details, see "Compatibility Between RSTP and STP".

Since RSTP processes MSTP BPDUs of the CIST, MSTP does not need to send RSTP BPDUs to be compatible with it.

Each STP or RSTP device is a single region and does not form the same region with any devices.

### Related Configuration

#### Configuring STP

- By default, the STP mode is MSTP mode.
- Run **spanning-tree mode [stp | rstp | mstp]** to modify the STP mode.

### 9.3.4 MSTP Optional Features

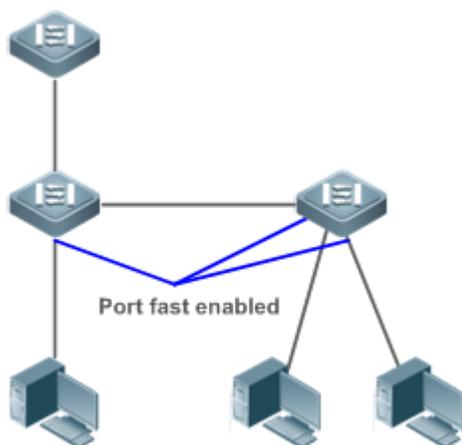

MSTP optional features mainly include PortFast port, BPDU guard, BPDU filter, TC guard, and guard. The optional features are mainly used to deploy MSTP configurations based on the network topology and application characteristics in the MSTP network. This enhances the stability, robustness, and anti-attack capability of MSTP, meeting application requirements of MSTP in different customer scenarios.

#### Working Principle

##### PortFast

If a port of a device connects directly to the network terminal, this port is configured as a PortFast port to directly enter the forwarding state. If the PortFast port is not configured, the port needs to wait for 30 seconds to enter the forwarding state. Figure 10-19 shows which ports of a device can be configured as PortFast ports.

Figure 10-19

If a PortFast port still receives BPDUs, its Port Fast Operational State is Disabled and the port enters the forwarding state according to the normal STP algorithm.

##### BPDU Guard

BPDU guard can be enabled globally or enabled on an interface.

It is recommended to run the **spanning-tree portfast bpduguard default** command in global configuration mode to enable global BPDU guard. If PortFast is enabled on a port or this port is automatically identified as an edge port, this port enters the error-disabled state to indicate the configuration error immediately after receiving a BPDU. At the same time, the port is disabled, indicating that a network device may be added by an unauthorized user to change the network topology.

It is also recommended to run the **spanning-tree bpduguard enable** command in interface configuration mode to enable BPDU guard on a port (whether PortFast is enabled or not on the port). In this case, the port enters the error-disabled state immediately after receiving a BPDU.

##### BPDU Filter

BPDU filter can be enabled globally or enabled on an interface.

It is recommended to run the **spanning-tree portfast bpdudfilter default** command in global configuration mode to enable global BPDU filter. In this case, the PortFast port neither receives nor sends BPDUs and therefore the host connecting directly to the PortFast port receives no BPDUs. If the port changes its Port Fast Operational State to Disabled after receiving a BPDU, BPDU filter automatically loses effect.

It is also recommended to run the **spanning-tree bpdudfilter enable** command in interface configuration mode to enable BPDU filter on a port (whether PortFast is enabled or not on the port). In this case, the port neither receives nor sends BPDUs but directly enters the forwarding state.

### TC Protection

TC BPDUs are BPDU packets carrying the TC. If a switch receives such packets, it indicates the network topology changes and the switch will delete the MAC address table. For Layer-3 switches in this case, the forwarding module is re-enabled and the port status in the ARP entry changes. When a switch is attacked by forged TC BPDUs, it will frequently perform the above operations, causing heavy load and affecting network stability. To prevent this problem, you can enable TC protection.

TC protection can only be globally enabled or disabled. This function is disabled by default.

When TC protection is enabled, the switch deletes TC BPDUs within a specified period (generally 4 seconds) after receiving them and monitors whether any TC BPDU packet is received during the period. If a device receives TC BPDU packets during this period, it deletes them when the period expires. This can prevent the device from frequently deleting MAC address entries and ARP entries.

### TC Guard

TC protection ensures less dynamic MAC addresses and ARP entries removed when a large number of TC packets are generated on the network. However, a device receiving TC attack packets still performs many removal operations and TC packets can be spread, affecting the entire network. Users can enable TC guard to prevent TC packets from spreading globally or on a port. If TC guard is enabled globally or on a port, a port receiving TC packets filters these TC packets or TC packets generated by itself so that TC packets will not be spread to other ports. This can effectively control possible TC attacks in the network to ensure network stability. Particularly on Layer-3 devices, this function can effectively prevent the access-layer device from flapping and interrupting the core route.

- 
-  If TC guard is used incorrectly, the communication between networks is interrupted.
  -  It is recommended to enable this function only when illegal TC attack packets are received in the network.
  -  If TC guard is enabled globally, no port spreads TC packets to others. This function can be enabled only on laptop access devices.
  -  If TC guard is enabled on a port, the topology changes incurred and TC packets received on the port will not be spread to other ports. This function can be enabled only on uplink ports, particularly on ports of the convergence core.
- 

### TC Filter

If TC guard is enabled on a port, the port does not forward TC packets received and generated by the port to other ports performing spanning tree calculation on the device. When the status of a port changes (for example, from blocking to forwarding), the port generates TC packets, indicating that the topology may have changed.

In this case, since TC guard prevents TC packets from spreading, the device may not clear the MAC addresses of the port when the network topology changes, causing a data forwarding error.

To resolve this problem, TC filter is introduced. TC filter does not process TC packets received by ports but processes TC packets in case of normal topology changes. If TC filter is enabled, the address removal problem will be avoided and the core route will not be interrupted when ports not enabled with PortFast frequently go up or down, and the core routing entries can be updated in a timely manner when the topology changes.

---

 TC filter is disabled by default.

---

### **BPDU Source MAC Address Check**

BPDU source MAC address check prevents BPDU packets from maliciously attacking switches and causing MSTP abnormal. When the switch connected to a port on a point-to-point link is determined, you can enable BPDU source MAC address check to receive BPDU packets sent only by the peer switch and discard all other BPDU packets, thereby preventing malicious attacks. You can enable the BPDU source MAC address check in interface configuration mode for a specific port. One port can only filter one MAC address. If you run the **no bpdu src-mac-check** command to disable BPDU source MAC address check on a port, the port receives all BPDU packets.

### **BPDU Filter**

If the Ethernet length of a BPDU exceeds 1,500, this BPDU will be discarded, preventing receipt of illegal BPDU packets.

### **Auto Edge**

If the designated port of a device does not receive a BPDU from the downlink port within a specific period (3 seconds), the device regards a network device connected to the designated port, configures the port as an edge port, and switches the port directly into the forwarding state. The edge port will be automatically identified as a non-edge port after receiving a BPDU.

You can run the **spanning-tree autoedge disabled** command to disable Auto Edge.

This function is enabled by default.

---

 If Auto Edge conflicts with the manually configured PortFast, the manual configuration prevails.

 Since this function is used for rapid negotiation and forwarding between the designated port and the downlink port, STP does not support this function. If the designated port is in forwarding state, the Auto Edge configuration does not take effect on this port. It takes only when rapid negotiation is re-performed, for example, when the network cable is removed and plugged.

 If BPDU filter has been enabled on a port, the port directly enters the forwarding state and is not automatically identified as an edge port.

 This function applies only to the designated port.

---

### **Root Guard**

In the network design, the root bridge and backup root bridge are usually divided into the same region. Due to incorrect configuration of maintenance personnel or malicious attacks in the network, the root bridge may receive configuration information with a higher priority and thereby switches to the backup root bridge, causing incorrect changes in the network topology. Root guard is to resolve this problem.

If root guard is enabled on a port, its roles on all instances are enforced as the designated port. Once the port receives configuration information with a higher priority, it enters the root-inconsistent (blocking) state. If the port does not receive configuration information with a higher priority within a period, it returns to its original state.

If a port enters the blocking state due to root guard, you can manually restore the port to the normal state by disabling root guard on this port or disabling spanning tree guard (running **spanning-tree guard none** in interface configuration mode).

-  If root guard is used incorrectly, the network link will be interrupted.
-  If root guard is enabled on a non-designated port, this port will be enforced as a designated port and enter the BKN state. This indicates that the port enters the blocking state due to root inconsistency.
-  If a port enters the BKN state due to receipt of configuration information with a higher priority in MST0, this port will be enforced in the BKN state in all other instances.
-  Root guard and loop guard cannot take effect on a port at the same time.

### ↳ Loop Guard

Due to the unidirectional link failure, the root port or backup port becomes the designated port and enters the forwarding state if it does not receive BPDUs, causing a network loop. Loop guard is to prevent this problem.

If a port enabled with loop guard does not receive BPDUs, the port switches its role but stays in discarding state till it receives BPDUs and recalculates the spanning tree.

-  You can enable loop guard globally or on a port.
-  Root guard and loop guard cannot take effect on a port at the same time.
-  Before MSTP is restarted on a port, the port enters the blocking state in loop guard. If the port still receives no BPDU after MSTP is restarted, the port will become a designated port and enter the forwarding state. Therefore, it is recommended to identify the cause why a port enters the blocking state in loop protection and rectify the fault as soon as possible before restarting MSTP. Otherwise, the spanning tree topology will still become abnormal after MSTP is restarted.

### ↳ BPDU Transparent Transmission

In IEEE 802.1Q, the destination MAC address 01-80-C2-00-00-00 of the BPDU is used as a reserved address. That is, devices compliant with IEEE 802.1Q do not forward the BPDU packets received. However, devices may need to transparently transmit BPDU packets in actual network deployment. For example, if STP is disabled on a device, the device needs to transparently transmit BPDU packets so that the spanning tree between devices is properly calculated.

-  BPDU transparent transmission is disabled by default.
-  BPDU transparent transmission takes effect only when STP is disabled. If STP is enabled on a device, the device does not transparently transmit BPDU packets.

### ↳ BPDU Tunnel

The QinQ network is generally divided into two parts: customer network and SP network. Before a user packet enters the SP network, it is encapsulated with the VLAN tag of an SP network and also retains the original VLAN tag as data. As a result,

the packet carries two VLAN tags to pass through the SP network. In the SP network, packets are transmitted only based on the outer-layer VLAN tag. When packets leave the SP network, the outer-layer VLAN tag is removed.

The STP packet transparent transmission feature, namely BPDU Tunnel, can be used to realize the transmission of STP packets between the customer network without any impact on the SP network. If an STP packet sent from the customer network enters a PE, the PE changes the destination MAC address of the packet to a private address before the packet is forwarded by the SP network. When the packet reaches the PE at the peer end, the PE changes the destination MAC address to a public address and returns the packet to the customer network at the peer end, realizing transparent transmission across the SP network. In this case, STP on the customer network is calculated independently of that on the SP network.

## Related Configuration

### ▾ Configuring PortFast

- PortFast is disabled by default.
- In global configuration mode, run the **spanning-tree portfast default** command to enable PortFast on all ports and the **no spanning-tree portfast default** command to disable PortFast on all ports.
- In interface configuration mode, run the **spanning-tree portfast** command to enable PortFast on a port and the **spanning-tree portfast disabled** command to disable PortFast on a port.

### ▾ Configuring BPDU Guard

- BPDU guard is disabled by default.
- In global configuration mode, run the **spanning-tree portfast bpduguard default** command to enable BPDU guard on all ports and the **no spanning-tree portfast bpduguard default** command to disable BPDU guard on all ports.
- In interface configuration mode, run the **spanning-tree bpduguard enabled** command to enable BPDU guard on a port and the **spanning-tree bpduguard disabled** command to disable BPDU guard on a port.

### ▾ Configuring BPDU Filter

- BPDU Filter is disabled by default.
- In global configuration mode, run the **spanning-tree portfast bpdufilter default** command to enable BPDU filter on all ports and the **no spanning-tree portfast bpdufilter default** command to disable BPDU filter on all ports.
- In interface configuration mode, run the **spanning-tree bpdufilter enabled** command to enable BPDU filter on a port and the **spanning-tree bpdufilter disabled** command to disable BPDU filter on a port.

### ▾ Configuring TC Protection

- TC protection is disabled by default.
- In global configuration mode, run the **spanning-tree tc-protection** command to enable TC protection on all ports and the **no spanning-tree tc-protection** command to disable TC protection on all ports.
- TC protection can only be enabled or disabled globally.

### ↘ Enabling TC Guard

- TC guard is disabled by default.
- In global configuration mode, run the **spanning-tree tc-protection tc-guard** command to enable TC guard on all ports and the **no spanning-tree tc-protection tc-guard** command to disable TC guard on all ports.
- In interface configuration mode, run the **spanning-tree tc-guard** command to enable TC guard on a port and the **no spanning-tree tc-guard** command to disable TC guard on a port.

### ↘ Configuring TC Filter

- TC filter is disabled by default.
- In interface configuration mode, run the **spanning-tree ignore tc** command to enable TC filter on a port and the **no spanning-tree ignore tc** command to disable it on a port.

### ↘ Enabling BPDU Source MAC Address Check

- BPDU Source MAC Address Check is disabled by default.
- In interface configuration mode, run the **bpdu src-mac-check H.H.H** command to enable BPDU source MAC address check on a port and the **no bpdu src-mac-check** command to disable it on a port.

### ↘ Configuring Auto Edge

- Auto Edge is disabled by default.
- In interface configuration mode, run the **spanning-tree autoedge** command to enable Auto Edge on a port and the **spanning-tree autoedge disabled** command to disable it on a port.

### ↘ Configuring Root Guard

- Root Guard is disabled by default.
- In interface configuration mode, run the **spanning-tree guard root** command to enable root guard on a port and the **no spanning-tree guard root** command to disable it on a port.

### ↘ Configuring Loop Guard

- Loop Guard is disabled by default.
- In global configuration mode, run the **spanning-tree loopguard default** command to enable loop guard on all ports and the **no spanning-tree loopguard default** command to disable it on all ports.
- In interface configuration mode, run the **spanning-tree guard loop** command to enable loop guard on a port and the **no spanning-tree guard loop** command to disable it on a port.

### ↘ Configuring BPDU Transparent Transmission

- BPDU Transparent Transmission is disabled by default.
- In global configuration mode, run the **bridge-frame forwarding protocol bpdu** command to enable BPDU transparent transmission and the **no bridge-frame forwarding protocol bpdu** command to disable it.

- BPDU transparent transmission takes effect only when STP is disabled. If STP is enabled on a device, the device does not transparently transmit BPDU packets.

↘ **Configuring BPDU Tunnel**

- BPDU Tunnel is disabled by default.
- In global configuration mode, run the **I2protocol-tunnel stp** command to globally enable BPDU Tunnel and the **no I2protocol-tunnel stp** command to globally disable it.
- In interface configuration mode, run the **I2protocol-tunnel stp enable** command to enable BPDU Tunnel on a port and the **no I2protocol-tunnel stp enable** command to disable it on a port.
- BPDU Tunnel takes effect only when it is enabled in both global configuration mode and interface configuration mode.

## 9.4 Configuration

Configuration	Description and Command	
<a href="#">Enabling STP</a>	⚠ (Mandatory) It is used to enable STP.	
	<b>spanning-tree</b>	Enables STP and configures basic attributes.
	<b>spanning-tree mode</b>	Configures the STP mode.
<a href="#">Configuring STP Compatibility</a>	⚠ (Optional) It is used to be compatible with competitor devices.	
	<b>spanning-tree compatible enable</b>	Enables the compatibility mode of a port.
	<b>clear spanning-tree detected-protocols</b>	Performs mandatory version check for BPDUs.
<a href="#">Configuring an MSTP Region</a>	⚠ (Optional) It is used to configure an MSTP region.	
	<b>spanning-tree mst configuration</b>	Enters the MST configuration mode.
<a href="#">Enabling Fast RSTP Convergence</a>	⚠ (Optional) It is used to configure whether the link type of a port is point-to-point connection.	
	<b>spanning-tree link-type</b>	Configures the link type.
<a href="#">Configuring Priorities</a>	⚠ (Optional) It is used to configure the switch priority or port priority.	
	<b>spanning-tree priority</b>	Configures the switch priority.
	<b>spanning-tree port-priority</b>	Configures the port priority.
<a href="#">Configuring the Port Path Cost</a>	⚠ (Optional) It is used to configure the path cost of a port or the default path cost calculation method.	
	<b>spanning-tree cost</b>	Configures the port path cost.
	<b>spanning-tree pathcost method</b>	Configures the default path cost calculation method.

Configuration	Description and Command	
<a href="#">Configuring the Maximum Hop Count of a BPDU Packet</a>	 (Optional) It is used to configure the maximum hop count of a BPDU packet.	
	<b>spanning-tree max-hops</b>	Configures the maximum hop count of a BPDU packet.
<a href="#">Enabling PortFast-related Features</a>	 (Optional) It is used to enable PortFast-related features.	
	<b>spanning-tree portfast</b>	Enables PortFast.
	<b>spanning-tree portfast bpduguard default</b>	Enables BPDU guard on all ports.
	<b>spanning-tree bpduguard enabled</b>	Enables BPDU guard on a port.
	<b>spanning-tree portfast bpdufilter default</b>	Enables BPDU filter on all ports.
<b>spanning-tree bpdufilter enabled</b>	Enables BPDU filter on a port.	
<a href="#">Enabling TC-related Features</a>	 (Optional) It is used to enable TC-related features.	
	<b>spanning-tree tc-protection</b>	Enables TC protection.
	<b>spanning-tree tc-protection tc-guard</b>	Enables TC guard on all ports.
	<b>spanning-tree tc-guard</b>	Enables TC guard on a port.
<b>spanning-tree ignore tc</b>	Enables TC filter on a port.	
<a href="#">Enabling BPDU Source MAC Address Check</a>	 (Optional) It is used to enable BPDU source MAC address check.	
	<b>bpdu src-mac-check</b>	Enables BPDU source MAC address check on a port.
<a href="#">Configuring Auto Edge</a>	 (Optional) It is used to configure Auto Edge.	
	<b>spanning-tree autoedge</b>	Enables Auto Edge on a port. This function is enabled by default.
<a href="#">Enabling Guard-related Features</a>	 (Optional) It is used to enable port guard features.	
	<b>spanning-tree guard root</b>	Enables root guard on a port.
	<b>spanning-tree loopguard default</b>	Enables loop guard on all ports.
	<b>spanning-tree guard loop</b>	Enables loop guard on a port.
<b>spanning-tree guard none</b>	Disables the guard feature on a port.	
<a href="#">Enabling BPDU Transparent Transmission</a>	 (Optional) It is used to enable BPDU transparent transmission	
	<b>bridge-frame forwarding protocol bpdu</b>	Enables BPDU transparent transmission.
<a href="#">Enabling BPDU Tunnel</a>	 (Optional) It is used to enable BPDU Tunnel.	
	<b>l2protocol-tunnel stp</b>	Enables BPDU Tunnel globally.
	<b>l2protocol-tunnel stp enable</b>	Enables BPDU Tunnel on a port.
<b>l2protocol-tunnel stp tunnel-dmac</b>	Configures the transparent transmission address of BPDU Tunnel.	

## 9.4.1 Enabling STP

### Configuration Effect

- Enable STP globally and configure the basic attributes.
- Configure the STP mode.

### Notes

- STP is disabled by default. Once STP is enabled, the device starts to run STP. The device runs MSTP by default.
- The default STP mode is MSTP mode.
- STP and Transparent Interconnection of Lots of Links (TRILL) of the data center cannot be enabled at the same time.
- STP timer parameters take effect only when the device is selected as the root bridge of the spanning tree. That is, the timer parameters of a non-root bridge should use the timer values of the root bridge.

### Configuration Steps

#### ▾ Enabling STP

- Mandatory.
- Unless otherwise specified, enable STP on each device.
- Run the **spanning-tree [ forward-time seconds | hello-time seconds | max-age seconds ]** command to enable STP and configure basic attributes.

 Running the **clear** commands may lose vital information and thus interrupt services. The value ranges of forward-time, hello-time, and max-age are related. If one of them is modified, the other two ranges are affected. The three values must meet the following condition:  $2 \times (\text{Hello Time} + 1 \text{ second}) \leq \text{Max-Age Time} \leq 2 \times (\text{Forward-Delay Time} - 1 \text{ second})$ . Otherwise, the topology may become unstable.

<b>Command</b>	<b>spanning-tree [ forward-time seconds   hello-time seconds   max-age seconds   tx-hold-count numbers]</b>
<b>Parameter Description</b>	<p><b>forward-time seconds:</b> Indicates the interval when the port status changes. The value ranges from 4 to 30 seconds. The default value is 15 seconds.</p> <p><b>hello-time seconds:</b> Indicates the interval when a device sends a BPDU packet. The value ranges from 1 to 10 seconds. The default value is 2 seconds.</p> <p><b>max-age second:</b> Indicates the longest TTL of a BPDU packet. The value ranges from 6 to 40 seconds. The default value is 20 seconds.</p> <p><b>tx-hold-count numbers:</b> Indicates the maximum number of BPDUs sent per second. The value ranges from 1 to 10. The default value is 3.</p>
<b>Defaults</b>	STP is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The value ranges of forward-time, hello-time, and max-age are related. If one of them is modified, the other two ranges are affected. The three values must meet the following condition: $2 \times (\text{Hello Time} + 1 \text{ second}) \leq \text{Max-Age Time} \leq 2 \times (\text{Forward-Delay Time} - 1 \text{ second})$

	Otherwise, the topology may become unstable.
--	--

↘ **Configuring the STP Mode**

- Optional.
- According to related 802.1 protocol standards, STP, RSTP, and MSTP are mutually compatible, without any configuration by the administrator. However, some vendors' devices do not work according to 802.1 protocol standards, possibly causing incompatibility. Therefore, Ruijie provides a command for the administrator to switch the STP mode to a lower version if other vendors' devices are incompatible with Ruijie devices.
- Run the **spanning-tree mode [ stp | rstp | mstp ]** command to modify the STP mode.

<b>Command</b>	<b>spanning-tree mode [ stp   rstp   mstp ]</b>
<b>Parameter</b>	<b>stp</b> : Spanning Tree Protocol (IEEE 802.1d)
<b>Description</b>	<b>rstp</b> : Rapid Spanning Tree Protocol (IEEE 802.1w) <b>mstp</b> : Multiple Spanning Tree Protocol (IEEE 802.1s)
<b>Defaults</b>	The default value is <b>mstp</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	However, some vendors' devices do not work according to 802.1 protocol standards, possibly causing incompatibility. If other vendors' devices are incompatible with Ruijie devices, run this command to switch the STP mode to a lower version.

**Verification**

- Display the configuration.

**Related Commands**

↘ **Configuring STP**

<b>Command</b>	<b>spanning-tree [ forward-time seconds   hello-time seconds   max-age seconds   tx-hold-count numbers]</b>
<b>Parameter Description</b>	<b>forward-time seconds</b> : Indicates the interval when the port status changes. The value ranges from 4 to 30 seconds. The default value is 15 seconds. <b>hello-time seconds</b> : Indicates the interval when a device sends a BPDU packet. The value ranges from 1 to 10 seconds. The default value is 2 seconds. <b>max-age second</b> : Indicates the longest TTL of a BPDU packet. The value ranges from 6 to 40 seconds. The default value is 20 seconds. <b>tx-hold-count numbers</b> : Indicates the maximum number of BPDUs sent per second. The value ranges from 1 to 10. The default value is 3.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The value ranges of forward-time, hello-time, and max-age are related. If one of them is modified, the other two ranges are affected. The three values must meet the following condition: $2 \times (\text{Hello Time} + 1 \text{ second}) \leq \text{Max-Age Time} \leq 2 \times (\text{Forward-Delay Time} - 1 \text{ second})$

Otherwise, the topology may become unstable and the configuration will fail.

▾ **Configuring the STP Mode**

<b>Command</b>	<b>spanning-tree mode [ stp   rstp   mstp ]</b>
<b>Parameter</b>	<b>stp:</b> Spanning Tree Protocol (IEEE 802.1d)
<b>Description</b>	<b>rstp:</b> Rapid Spanning Tree Protocol (IEEE 802.1w) <b>mstp:</b> Multiple Spanning Tree Protocol (IEEE 802.1s)
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	However, some vendors' devices do not work according to 802.1 protocol standards, possibly causing incompatibility. If other vendors' devices are incompatible with Ruijie devices, run this command to switch the STP mode to a lower version.

**Configuration Example**

▾ **Enabling STP and Configuring Timer Parameters**

<b>Scenario</b> Figure 10-20	<p>The diagram shows two network devices, DEV A and DEV B, connected in a mesh topology. DEV A is at the top and DEV B is at the bottom. They are connected by two parallel links: one between G 0/1 on DEV A and G 0/1 on DEV B, and another between G 0/2 on DEV A and G 0/2 on DEV B.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable STP and set the STP mode to STP on the devices.</li> <li>● Configure the timer parameters of root bridge DEV A as follows: Hello Time=4s, Max Age=25s, Forward Delay=18s.</li> </ul>
<b>DEV A</b>	<p>Step 1: Enable STP and set the STP mode to STP.</p> <pre>Ruijie#configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#spanning-tree Ruijie(config)#spanning-tree mode stp</pre> <p>Step 2: Configure the timer parameters of root bridge DEV A.</p> <pre>Ruijie(config)#spanning-tree hello-time 4 Ruijie(config)#spanning-tree max-age 25 Ruijie(config)#spanning-tree forward-time 18</pre>

<p><b>DEV B</b></p>	<p>Enable STP and set the STP mode to STP.</p> <pre>Ruijie#configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#spanning-tree Ruijie(config)#spanning-tree mode stp</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run the <b>show spanning-tree summary</b> command to display the spanning tree topology and protocol configuration parameters.</li> </ul>
<p><b>DEV A</b></p>	<pre>Ruijie#show spanning-tree summary  Spanning tree enabled protocol stp    Root ID    Priority    0             Address    00d0.f822.3344             this bridge is root             Hello Time 4 sec Forward Delay 18 sec Max Age 25 sec    Bridge ID  Priority    0             Address    00d0.f822.3344             Hello Time 4 sec Forward Delay 18 sec Max Age 25 sec  Interface      Role Sts Cost      Prio OperEdge Type ----- Gi0/2          Desg FWD 20000    128   False P2p Gi0/1          Desg FWD 20000    128   False P2p</pre>

-----					
Gi0/2	Altn	BLK	20000	128	False P2p Bound(STP)
Gi0/1	Root	FWD	20000	128	False P2p Bound(STP)

### Common Errors

N/A

## 9.4.2 Configuring STP Compatibility

### Configuration Effect

- Enable the compatibility mode of a port to realize interconnection between Ruijie devices and other SPs' devices.
- Enable protocol migration to perform forcible version check to affect the compatibility between RSTP and STP.

### Notes

- If the compatibility mode is enabled on a port, this port will add different MSTI information into the to-be-sent BPDU based on the current port to realize interconnection between Ruijie devices and other SPs' devices.
- When enabling compatibility on a port, ensure correct VLAN trimming information of the port. It is recommended to configure consistent VLAN lists for ports at both ends of the link.

### Configuration Steps

#### ▾ Enabling the Compatibility Mode on a Port

- Optional.

#### ▾ Configuring Protocol Migration

- ▾ Optional.

- ▾ If the peer device supports RSTP, you can enforce version check on the local device to force the two devices to run RSTP.

### Verification

- Display the configuration.

## Related Commands

### ↳ Enabling the Compatibility Mode on a Port

<b>Command</b>	<b>spanning-tree compatible enable</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The compatibility mode is disabled on a port by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If the compatibility mode is enabled on a port, this port will add different MSTI information into the to-be-sent BPDU based on the current port to realize interconnection between Ruijie devices and other SPs' devices.

### ↳ Enabling Protocol Migration

<b>Command</b>	<b>clear spanning-tree detected-protocols [ interface <i>interface-id</i> ]</b>
<b>Parameter Description</b>	<b>interface <i>interface-id</i></b> : Indicates a port.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	This command is used to enforce a port to send RSTP BPDU packets and perform forcible check on them.

## Configuration Example

### ↳ Enabling STP Compatibility

<b>Scenario</b> Figure 10-21	<p>The diagram shows two network devices, DEV A and DEV B, connected in a point-to-point configuration. DEV A is at the top and DEV B is at the bottom. A vertical line represents the connection between them. On the left side of the connection, the interface G 0/1 is labeled for both devices. On the right side, the interface G 0/2 is labeled for both devices.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure Instances 1 and 2 on Devices A and B, and map Instance 1 with VLAN 10 and Instance 2 with VLAN 20.</li> <li>● Configure Gi0/1 and Gi0/2 to respectively belong to VLAN 10 and VLAN 20, and enable STP compatibility.</li> </ul>
<b>DEV A</b>	Step 1: Configure Instances 1 and 2, and map Instances 1 and 2 respectively with VLANs 10 and 20.

	<pre>Ruijie#configure terminal  Enter configuration commands, one per line. End with CNTL/Z.  Ruijie(config)#spanning-tree mst configuration  Ruijie(config-mst)#instance 1 vlan 10  Ruijie(config-mst)#instance 2 vlan 20</pre> <p><b>Step 2: Configure the VLAN the port belongs to, and enable STP compatibility on the port.</b></p> <pre>Ruijie(config)#int gi 0/1  Ruijie(config-if-GigabitEthernet 0/1)#switchport access vlan 10  Ruijie(config-if-GigabitEthernet 0/1)#spanning-tree compatible enable  Ruijie(config-if-GigabitEthernet 0/1)#int gi 0/2  Ruijie(config-if-GigabitEthernet 0/2)#switchport access vlan 20  Ruijie(config-if-GigabitEthernet 0/2)#spanning-tree compatible enable</pre>
<b>DEV B</b>	Perform the same steps as DEV A.

## Common Errors

N/A

## 9.4.3 Configuring an MSTP Region

### Configuration Effect

- Configure an MSTP region to adjust which devices belong to the same MSTP region and thereby affect the network topology.

### Notes

- To make multiple devices belong to the same MSTP region, configure the same name, revision number, and instance-VLAN mapping table for them.
- You can configure VLANs for Instances 0 to 64, and then the remaining VLANs are automatically allocated to Instance 0. One VLAN belongs to only one instance.
- It is recommended to configure the instance-VLAN mapping table after disabling STP. After the configuration, re-enable MSTP to ensure stability and convergence of the network topology.

### Configuration Steps

#### ↘ Configuring an MSTP Region

- Optional.
- Configure an MSTP region when multiple devices need to belong to the same MSTP region.

### Verification

- Display the configuration.

### Related Commands

#### ↘ Entering MSTP Region Configuration Mode

- Optional.
- Configure an MSTP region when multiple devices need to belong to the same MSTP region.
- Run the **spanning-tree mst configuration** command to enter the MST configuration mode.
- Run the **instance** *instance-id* **vlan** *vlan-range* command to configure the MSTI-VLAN mapping.
- Run the **name** *name* command to configure the MST name.

- Run the **revision** *version* command to configure the MST version number.

<b>Command</b>	<b>spanning-tree mst configuration</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to enter the MST configuration mode.

### ↘ Configuring Instance-VLAN Mapping

<b>Command</b>	<b>instance</b> <i>instance-id</i> <b>vlan</b> <i>vlan-range</i>
<b>Parameter Description</b>	<i>instance-id</i> : Indicates the MSTI ID, ranging from 0 to 64. <i>vlan-range</i> : Indicates the VLAN ID, ranging from 1 to 4,094.
<b>Defaults</b>	The default instance-VLAN mapping is that all VLANs are in Instance 0.
<b>Command Mode</b>	MST configuration mode
<b>Usage Guide</b>	To add a VLAN group to an MSTI, run this command. For example, instance 1 vlan 2-200: Adds VLANs 2 to 200 to Instance 1. instance 1 vlan 2,20,200: Adds VLANs 2, 20, and 200 to Instance 1. You can use the <b>no</b> form of this command to remove VLANs from an instance. Removed VLANs are automatically forwarded to Instance 0.

### ↘ Configuring MST Version Name

<b>Command</b>	<b>name</b> <i>name</i>
<b>Parameter Description</b>	<i>name</i> : Indicates the MST name. It consists of a maximum of 32 bytes.
<b>Defaults</b>	The default name is an empty character string.
<b>Command Mode</b>	MST configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring MST Version Number

<b>Command</b>	<b>revision</b> <i>version</i>
<b>Parameter Description</b>	<i>version</i> : Indicates the MST revision number, ranging from 0 to 65,535.
<b>Defaults</b>	The default revision number is 0.
<b>Command Mode</b>	MST configuration mode
<b>Usage Guide</b>	N/A

## Verification

- Display the configuration.
- Run the **show spanning-tree mst configuration** command to display the MSTP region configuration.

### Configuration Example

#### Enabling MSTP to Achieve VLAN Load Balancing in the MSTP+VRRP Topology

<p><b>Scenario</b> Figure 10-22</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable MSTP and create Instances 1 and 2 on Switches A, B, C, and D.</li> <li>● Configure Switch A as the root bridge of Instances 0 and 1 and Switch B as the root bridge of Instance 2.</li> <li>● Configure Switch A as the VRRP master device of VLANs 1 and 10 and Switch B as the VRRP master device of VLAN 20.</li> </ul>
<p><b>A</b></p>	<p>Step 1: Configure VLANs 10 and 20, and configure ports as Trunk ports.</p> <pre>A(config)#vlan 10 A(config-vlan)#vlan 20 A(config-vlan)#exit A(config)#int range gi 0/1-2 A(config-if-range)#switchport mode trunk A(config-if-range)#int ag 1 A(config-if-AggregatePort 1)# switchport mode trunk</pre> <p>Step 2: Enable MSTP and create Instances 1 and 2.</p> <pre>A(config)#spanning-tree A(config)# spanning-tree mst configuration</pre>

```
A(config-mst)#instance 1 vlan 10
A(config-mst)#instance 2 vlan 20
A(config-mst)#exit
```

**Step 3: Configure Switch A as the root bridge of Instances 0 and 1.**

```
A(config)#spanning-tree mst 0 priority 4096
A(config)#spanning-tree mst 1 priority 4096
A(config)#spanning-tree mst 2 priority 8192
```

**Step 4: Configure VRRP priorities to enable Switch A to act as the VRRP master device of VLAN 10, and configure the virtual gateway IP address of VRRP.**

```
A(config)#interface vlan 10
A(config-if-VLAN 10) ip address 192.168.10.2 255.255.255.0
A(config-if-VLAN 10) vrrp 1 priority 120
A(config-if-VLAN 10) vrrp 1 ip 192.168.10.1
```

**Step 5 Set the VRRP priority to the default value 100 to enable Switch A to act as the VRRP backup device of VLAN 20.**

```
A(config)#interface vlan 20
A(config-if-VLAN 20) ip address 192.168.20.2 255.255.255.0
A(config-if-VLAN 20) vrrp 1 ip 192.168.20.1
```

**B**

**Step 1: Configure VLANs 10 and 20, and configure ports as Trunk ports.**

```
B(config)#vlan 10
B(config-vlan)#vlan 20
B(config-vlan)#exit
B(config)#int range gi 0/1-2
B(config-if-range)#switchport mode trunk
B(config-if-range)#int ag 1
B(config-if-AggregatePort 1)# switchport mode trunk
```

**Step 2: Enable MSTP and create Instances 1 and 2.**

```
B(config)#spanning-tree
```

```
B(config)# spanning-tree mst configuration
B(config-mst)#instance 1 vlan 10
B(config-mst)#instance 2 vlan 20
B(config-mst)#exit
```

**Step 3: Configure Switch A as the root bridge of Instance 2.**

```
B(config)#spanning-tree mst 0 priority 8192
B(config)#spanning-tree mst 1 priority 8192
B(config)#spanning-tree mst 2 priority 4096
```

**Step 4: Configure the virtual gateway IP address of VRRP.**

```
B(config)#interface vlan 10
B(config-if-VLAN 10) ip address 192.168.10.3 255.255.255.0
B(config-if-VLAN 10) vrrp 1 ip 192.168.10.1
```

**Step 5 Set the VRRP priority to 120 to enable Switch B to act as the VRRP backup device of VLAN 20.**

```
B(config)#interface vlan 20
B(config-if-VLAN 20)vrrp 1 priority 120
B(config-if-VLAN 20) ip address 192.168.20.3 255.255.255.0
B(config-if-VLAN 20) vrrp 1 ip 192.168.20.1
```

**C**

**Step 1: Configure VLANs 10 and 20, and configure ports as Trunk ports.**

```
C(config)#vlan 10
C(config-vlan)#vlan 20
C(config-vlan)#exit
C(config)#int range gi 0/1-2
C(config-if-range)#switchport mode trunk
```

**Step 2: Enable MSTP and create Instances 1 and 2.**

```
C(config)#spanning-tree
C(config)# spanning-tree mst configuration
C(config-mst)#instance 1 vlan 10
C(config-mst)#instance 2 vlan 20
```

	<pre>C(config-mst)#exit</pre> <p><b>Step 3: Configure the port connecting Device C directly to users as a PortFast port and enable BPDU guard.</b></p> <pre>C(config)#int gi 0/3 C(config-if-GigabitEthernet 0/3)#spanning-tree portfast C(config-if-GigabitEthernet 0/3)#spanning-tree bpduguard enable</pre>																												
<b>D</b>	<p>Perform the same steps as Device C.</p>																												
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show spanning-tree summary</b> command to check whether the spanning tree topology is correctly calculated.</li> <li>● Run the <b>show vrrp brief</b> command to check whether the VRRP master/backup devices are successfully created.</li> </ul>

<b>D</b>	Omitted.					

**Common Errors**

- MST region configurations are inconsistent in the MSTP topology.
- VLANs are not created before you configure the mapping between the instance and VLAN.
- A device runs STP or RSTP in the MSTP+VRRP topology, but calculates the spanning tree according to the algorithms of different MST regions.

**9.4.4 Enabling Fast RSTP Convergence**

**Configuration Effect**

- Configure the link type to make RSTP rapidly converge.

## Notes

- If the link type of a port is point-to-point connection, RSTP can rapidly converge. For details, see "Fast RSTP Convergence". If the link type is not configured, the device automatically sets the link type based on the duplex mode of the port. If a port is in full duplex mode, the device sets the link type to point-to-point. If a port is in half duplex mode, the device sets the link type to shared. You can also forcibly configure the link type to determine whether the port connection is point-to-point connection.
- The link type of a port is related to the rate and duplex mode. If the port is in half duplex mode, the link type is shared.

## Configuration Steps

### ▾ Configuring the Link Type

- Optional.

## Verification

- Display the configuration.
- Run the **show spanning-tree [mst instance-id] interface interface-id** command to display the spanning tree configuration of the port.

## Related Commands

### ▾ Configuring the Link Type

<b>Command</b>	<b>spanning-tree link-type [ point-to-point   shared ]</b>
<b>Parameter</b>	<b>point-to-point:</b> Forcibly configures the link type of a port to be point-to-point.
<b>Description</b>	<b>shared:</b> Forcibly configures the link type of a port to be shared.
<b>Defaults</b>	If a port is in full duplex mode, the link type of the port is point-to-point. If a port is in half duplex mode, the link type of the port is shared.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If the link type of a port is point-to-point connection, RSTP can rapidly converge. If the link type is not configured, the device automatically sets the link type based on the duplex mode of the port.

## Configuration Example

### ▾ Enabling Fast RSTP Convergence

### Common Errors

N/A

## 9.4.5 Configuring Priorities

### Configuration Effect

- Configure the switch priority to determine a device as the root of the entire network and to determine the topology of the entire network.
- Configure the port priority to determine which port enters the forwarding state.

### Notes

- It is recommended to set the priority of the core device higher (to a smaller value) to ensure stability of the entire network. You can assign different switch priorities to different instances so that each instance runs an independent STP based on the assigned priorities. Devices in different regions use the priority only of the CIST (Instance 0). As described in bridge ID, the switch priority has 16 optional values: 0, 4,096, 8,192, 12,288, 16,384, 20,480, 24,576, 28,672, 32,768, 36,864, 40,960, 45,056, 49,152, 53,248, 57,344, 61,440. They are integral multiples of 4,096. The default value is 32,768.

- If two ports are connected to a shared device, the device selects a port with a higher priority (smaller value) to enter the forwarding state and a port with a lower priority (larger value) to enter the discarding state. If the two ports have the same priority, the device selects the port with a smaller port ID to enter the forwarding state. You can assign different port priorities to different instances on a port so that each instance runs an independent STP based on the assigned priorities.
- Similar to the switch priority, the port priority also has 16 optional values: 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, 240. They are integral multiples of 16. The default value is 128.
- The modified port priority takes effect only on the designated port.

## Configuration Steps

### ▾ Configuring the Switch Priority

- Optional.
- To change the root or topology of a network, configure the switch priority.

### ▾ Configuring the Port Priority

- Optional.
- To change the preferred port entering the forwarding state, configure the port priority.

## Verification

- Display the configuration.
- Run the **show spanning-tree [mst *instance-id*] interface *interface-id*** command to display the spanning tree configuration of the port.

## Related Commands

### ▾ Configuring the Switch Priority

<b>Command</b>	<b>spanning-tree [ mst <i>instance-id</i> ] priority <i>priority</i></b>
<b>Parameter</b>	<b>mst <i>instance-id</i></b> : Indicates the instance ID, ranging from 0 to 64.
<b>Description</b>	<b>priority <i>priority</i></b> : Indicates the switch priority. There are 16 optional values: 0, 4,096, 8,192, 12,288, 16,384, 20,480, 24,576, 28,672, 32,768, 36,864, 40,960, 45,056, 49,152, 53,248, 57,344, 61,440. They are integral multiples of 4,096.
<b>Defaults</b>	The default value of <i>instance-id</i> is 0 while that of <i>priority</i> is 32,768.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure the switch priority to determine a device as the root of the entire network and to determine the topology of the entire network.

### ▾ Configuring the Port Priority

<b>Command</b>	<b>spanning-tree [ mst <i>instance-id</i> ] port-priority <i>priority</i></b>
----------------	---

<b>Parameter</b>	<b>mst</b> <i>instance-id</i> : Indicates the instance ID, ranging from 0 to 64.
<b>Description</b>	<b>port-priority</b> <i>priority</i> : Indicates the port priority. There are 16 optional values: 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, 240. They are integral multiples of 4,096.
<b>Defaults</b>	The default value of <i>instance-id</i> is 0. The default value of <i>priority</i> is 128.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If a loop occurs in a region, the port with a higher priority is preferred to enter the forwarding state. If two ports have the same priority, the port with a smaller port ID is selected to enter the forwarding state. Run this command to determine which port in the loop of a region enters the forwarding state.

## 9.4.6 Configuring the Port Path Cost

### Configuration Effect

- Configure the path cost of a port to determine the forwarding state of the port and the topology of the entire network.
- If the path cost of a port uses its default value, configure the path cost calculation method to affect the calculation result.

### Notes

- A device selects a port as the root port if the path cost from this port to the root bridge is the lowest. Therefore, the port path cost determines the root port of the local device. The default port path cost is automatically calculated based on the port rate (Media Speed). A port with a higher rate will have a low path cost. Since this method can calculate the most scientific path cost, do not change the path cost unless required. You can assign different path costs to different instances on a port so that each instance runs an independent STP based on the assigned path costs.
- If the port path cost uses the default value, the device automatically calculates the port path cost based on the port rate. However, IEEE 802.1d-1998 and IEEE 802.1t define different path costs for the same link rate. The value is a short integer ranging from 1 to 65,535 in 802.1d-1998 while is a long integer ranging from 1 to 200,000,000 in IEEE 802.1t. The path cost of an aggregate port (AP) has two solutions: 1. Ruijie solution: Port Path Cost x 95%; 2. Solution recommended in standards: 20,000,000,000/Actual link bandwidth of the AP, in which Actual link bandwidth of the AP = Bandwidth of a member port x Number of active member ports. The administrator must unify the path cost calculation method in the entire network. The default standard is the private long integer standard.
- The following table lists path costs automatically configured for different link rate in two solutions.

Port Rate	Port	IEEE 802.1d (short)	IEEE 802.1t (long)	IEEE 802.1t (long standard)
10M	Common port	100	2000000	2000000
	AP	95	1900000	2000000÷linkupcnt
100M	Common port	19	200000	200000
	AP	18	190000	200000÷linkupcnt
1000M	Common port	4	20000	20000
	AP	3	19000	20000÷linkupcnt
10000M	Common port	2	2000	2000
	AP	1	1900	20000÷linkupcnt

- Ruijie's long integer standard is used by default. After the solution is changed to the path cost solution recommended by the standards, the path cost of an AP changes with the number of member ports in UP state. If the port path cost changes, the network topology also will change.
- If an AP is static, linkupcnt in the table is the number of active member ports. If an AP is an LACP AP, linkupcnt in the table is the number of member ports forwarding AP data. If no member port in the AP goes up, linkupcnt is 1. For details about AP and LACP, see the *Configuring AP*.
- The modified port path cost takes effect only on the Rx port.

## Configuration Steps

### ▾ Configuring the Port Path Cost

- Optional.
- To determine which port or path data packets prefer to pass through, configure the port path cost.

### ▾ Configuring the Default Path Cost Calculation Method

- Optional.
- To change the path cost calculation method, configure the default path cost calculation method.

## Verification

- Display the configuration.
- Run the **show spanning-tree [mst instance-id] interface interface-id** command to display the spanning tree configuration of the port.

## Related Commands

### ▾ Configuring the Port Path Cost

<b>Command</b>	<b>spanning-tree [ mst instance-id ] cost cost</b>
<b>Parameter Description</b>	<b>mst instance-id:</b> Indicates the instance ID, ranging from 0 to 64. <b>cost cost:</b> Indicates the path cost, ranging from 1 to 200,000,000.
<b>Defaults</b>	The default value of <i>instance-id</i> is 0. The default value is automatically calculated based on the port rate. 1000 Mbps—20000 100 Mbps—200000 10 Mbps—2000000
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A larger value of <i>cost</i> indicates a higher path cost.

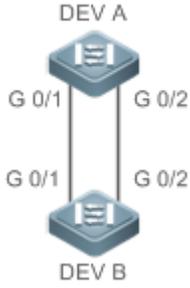

### ▾ Configuring the Default Path Cost Calculation Method

<b>Command</b>	<b>spanning-tree pathcost method { long [ standard ]   short }</b>
----------------	--

<b>Parameter Description</b>	<i>long</i> : Uses the path cost specified in 802.1t. <i>standard</i> : Uses the cost calculated according to the standard. <i>short</i> : Uses the path cost specified in 802.1d.
<b>Defaults</b>	The path cost specified in 802.1t is used by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the port path cost uses the default value, the device automatically calculates the port path cost based on the port rate.

## 9.4.7 Configuring the Maximum Hop Count of a BPDU Packet

### Configuration Effect

- Configure the maximum hop count of a BPDU packet to change the BPDU TTL and thereby affect the network topology.

### Notes

- The default maximum hop count of a BPDU packet is 20. Generally, it is not recommended to change the default value.

### Configuration Steps

#### ▾ Configuring the Maximum Hop Count

- (Optional) If the network topology is so large that a BPDU packet exceeds the default 20 hops, it is recommended to change the maximum hop count.

### Verification

- Display the configuration.

### Related Commands

#### ▾ Configuring the Maximum Hop Count

<b>Command</b>	<b>spanning-tree max-hops</b> <i>hop-count</i>
<b>Parameter Description</b>	<i>hop-count</i> : Indicates the number of devices a BPDU passes through before being discarded. It ranges from 1 to 40.
<b>Defaults</b>	The default value of <i>hop-count</i> is 20.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In a region, the BPDU sent by the root bridge includes a hop count. Every time a BPDU passes through a device from the root bridge, the hop count decreases by 1. When the hop count becomes 0, the BPDU times out and the device discards the packet.  This command specifies the number of devices a BPDU passes through in a region before being discarded. Changing the maximum hop count will affect all instances.

### Configuration Example

#### ▾ Configuring the Maximum Hop Count of a BPDU Packet

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Set the maximum hop count of a BPDU packet to 25.</li> </ul>
	<pre>Ruijie(config)# spanning-tree max-hops 25</pre>

## 9.4.8 Enabling PortFast-related Features

### Configuration Effect

- After PortFast is enabled on a port, the port directly enters the forwarding state. However, since the Port Fast Operational State becomes disabled due to receipt of BPDUs, the port can properly run the STP algorithm and enter the forwarding state.
- If BPDU guard is enabled on a port, the port enters the error-disabled state after receiving a BPDU.

- If BPDU filter is enabled on a port, the port neither sends nor receives BPDUs.

## Notes

- The global BPDU guard takes effect only when PortFast is enabled on a port.
- If BPDU filter is enabled globally, a PortFast-enabled port neither sends nor receives BPDUs. In this case, the host connecting directly to the PortFast-enabled port does not receive any BPDUs. If the port changes its Port Fast Operational State to Disabled after receiving a BPDU, BPDU filter automatically fails.
- The global BPDU filter takes effect only when PortFast is enabled on a port.

## Configuration Steps

### ↳ Enabling PortFast

- Optional.
- If a port connects directly to the network terminal, configure this port as a PortFast port.

### ↳ Enabling BPDU Guard

- Optional.
- If device ports connect directly to network terminals, you can enable BPDU guard on these ports to prevent BPDU attacks from causing abnormality in the spanning tree topology. A port enabled with BPDU guard enters the error-disabled state after receiving a BPDU.
- If device ports connect directly to network terminals, you can enable BPDU guard to prevent loops on the ports. The prerequisite is that the downlink device (such as the hub) can forward BPDU packets.

### ↳ Enabling BPDU Filter

- Optional.
- To prevent abnormal BPDU packets from affecting the spanning tree topology, you can enable BPDU filter on a port to filter abnormal BPDU packets.

## Verification

- Display the configuration.
- Run the **show spanning-tree [mst instance-id] interface interface-id** command to display the spanning tree configuration of the port.

## Related Commands

### ↳ Configuring PortFast

<b>Command</b>	<b>spanning-tree portfast</b>
<b>Parameter</b>	N/A
<b>Description</b>	

<b>Defaults</b>	PortFast is disabled on a port by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After PortFast is enabled on a port, the port directly enters the forwarding state. However, since the Port Fast Operational State becomes disabled due to receipt of BPDUs, the port can properly run the STP algorithm and enter the forwarding state.

### ↘ Configuring BPDU Guard for all Ports

<b>Command</b>	<b>spanning-tree portfast bpduguard default</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	BPDU guard is globally disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If BPDU guard is enabled on a port, the port enters the error-disabled state after receiving a BPDU. Run the <b>show spanning-tree</b> command to display the configuration.

### ↘ Configuring BPDU Guard for a Port

<b>Command</b>	<b>spanning-tree bpduguard enabled</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	BPDU guard is disabled on a port by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If BPDU guard is enabled on a port, the port enters the error-disabled state after receiving a BPDU.

### ↘ Configuring BPDU Filter for all Ports

<b>Command</b>	<b>spanning-tree portfast bpdufilter default</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	BPDU filter is globally disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If BPDU filter is enabled, corresponding ports neither send nor receive BPDUs.

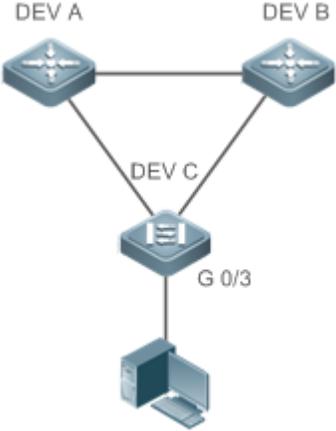

### ↘ Configuring BPDU Filter for a Port

<b>Command</b>	<b>spanning-tree bpdufilter enabled</b>
<b>Parameter Description</b>	N/A

<b>Defaults</b>	BPDU filter is disabled on a port by default.
<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	If BPDU filter is enabled on a port, the port neither sends nor receives BPDUs.

### Configuration Example

#### Enabling PortFast on a Port

<p><b>Scenario</b> Figure 10-25</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Configure Gi 0/3 of DEV C as a PortFast port and enable BPDU guard.</li> </ul>

```

## 9.4.9 Enabling TC-related Features

### Configuration Effect

- If TC protection is enabled on a port, the port deletes TC BPDU packets within a specified time (generally 4 seconds) after receiving them, preventing MAC and ARP entry from being removed.
- If TC guard is enabled, a port receiving TC packets filters TC packets received or generated by itself so that TC packets are not spread to other ports. In this way, possible TC attacks are efficiently prevented to keep the network stable.
- TC filter does not process TC packets received by ports but processes TC packets in case of normal topology changes.

### Notes

- It is recommended to enable TC guard only when illegal TC attack packets are received in the network.

### Configuration Steps

#### 📌 Enabling TC Protection

- Optional.
- TC protection is disabled by default.

#### ↳ Enabling TC Guard

- Optional.
- TC guard is disabled by default.
- To filter TC packets received or generated due to topology changes, you can enable TC guard.

#### ↳ Enabling TC Filter

- Optional.
- TC filter is disabled by default.
- To filter TC packets received on a port, you can enable TC filter on the port.

### Verification

- Display the configuration.

### Related Commands

#### ↳ Enabling TC Protection

<b>Command</b>	<b>spanning-tree tc-protection</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	TC protection is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ↳ Configuring TC Guard for all Ports

<b>Command</b>	<b>spanning-tree tc-protection tc-guard</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	TC guard is globally disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Enable TC guard to prevent TC packets from spreading.

#### ↳ Configuring TC Guard for a Port

<b>Command</b>	<b>spanning-tree tc-guard</b>
<b>Parameter</b>	N/A
<b>Description</b>	

<b>Defaults</b>	TC guard is disabled on a port by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Enable TC guard to prevent TC packets from spreading.

↘ **Configuring TC Filter for a Port**

<b>Command</b>	<b>spanning-tree ignore tc</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	TC filter is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If TC filter is enabled on a port, the port does not process received TC packets.

**Configuration Example**

↘ **Enabling TC Guard on a Port**

<b>Configuration Steps</b>	Enable TC guard on a port.
	<pre>Ruijie(config)#int gi 0/1 Ruijie(config-if-GigabitEthernet 0/1)#spanning-tree tc-guard</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show run interface</b> command to display the TC guard configuration of the port.</li> </ul>
	<pre>Ruijie#show run int gi 0/1  Building configuration...  Current configuration : 134 bytes  interface GigabitEthernet 0/1   switchport mode trunk   spanning-tree tc-guard</pre>

**Common Errors**

- If TC guard or TC filter is incorrectly configured, an error may occur during packet forwarding of the network device. For example, when the topology changes, the device fails to clear MAC address in a timely manner, causing packet forwarding errors.

## 9.4.10 Enabling BPDU Source MAC Address Check

### Configuration Effect

- Enable BPDU source MAC address check. After this, a device receives only BPDU packets with the source MAC address being the specified MAC address and discards other BPDU packets.

### Notes

- When the switch connected to a port on a point-to-point link is determined, you can enable BPDU source MAC address check so that the switch receives the BPDU packets sent only by the peer switch.

### Configuration Steps

#### ↳ Enabling BPDU Source MAC Address Check

- Optional.
- BPDU source MAC address check is disabled by default.
- To prevent malicious BPDU attacks, you can enable BPDU source MAC address check.

### Verification

- Display the configuration.

### Related Commands

#### ↳ Enabling BPDU Source MAC Address Check

<b>Command</b>	<b>bpdu src-mac-check <i>H.H.H</i></b>
<b>Parameter Description</b>	<i>H.H.H</i> : Indicates an MAC address. The device receives only BPDU packets with this address being the source MAC address.
<b>Defaults</b>	BPDU source MAC address check is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	BPDU source MAC address check prevents BPDU packets from maliciously attacking switches and causing MSTP abnormal. When the switch connected to a port on a point-to-point link is determined, you can enable BPDU source MAC address check to receive BPDU packets sent only by the peer switch and discard all other BPDU packets, thereby preventing malicious attacks. You can enable BPDU source MAC address check in interface configuration mode for a specific port. One port can only filter one MAC address.

### Configuration Example

#### ↳ Enabling BPDU Source MAC Address Check on a Port

<b>Configuration Steps</b>	Enable BPDU source MAC address check on a port.
	<pre>Ruijie(config)#int gi 0/1 Ruijie(config-if-GigabitEthernet 0/1)#bpdu src-mac-check 00d0.f800.1234</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show run interface</b> command to display the spanning tree configuration of the port.</li> </ul>
	<pre>Ruijie#show run int gi 0/1  Building configuration...  Current configuration : 170 bytes  interface GigabitEthernet 0/1   switchport mode trunk   bpdu src-mac-check 00d0.f800.1234   spanning-tree link-type point-to-point</pre>

### Common Errors

- If BPDU source MAC address check is enabled on a port, the port receives only BPDU packets with the configured MAC address being the source MAC address and discards all other BPDU packets.

## 9.4.11 Configuring Auto Edge

### Configuration Effect

- Enable Auto Edge. If a designated port does not receive any BPDUs within a specified time (3 seconds), it is automatically identified as an edge port. However, if the port receives BPDUs, its Port Fast Operational State will become Disabled.

### Notes

- Unless otherwise specified, do not disable Auto Edge.
- By default, the port is automatically identified as an edge port and enters the forwarding state if a designated port does not receive any BPDUs within 3 seconds. If packet loss or packet Tx/Rx delay occurs in the network, it is recommended to disable Auto Edge.

### Configuration Steps

#### ↳ Configuring Auto Edge

- Optional.

- Auto Edge is enabled by default.

### Verification

- Display the configuration.

### Related Commands

#### ▾ Configuring Auto Edge

<b>Command</b>	<b>spanning-tree autoedge</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	Auto Edge is enabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>If the designated port of a device does not receive a BPDU from the downlink port within a specific period (3 seconds), the device regards a network device connected to the designated port, configures the port as an edge port, and switches the port directly into the forwarding state. The edge port will be automatically identified as a non-edge port after receiving a BPDU.</p> <p>You can run the <b>spanning-tree autoedge disabled</b> command to disable Auto Edge.</p>

### Configuration Example

#### ▾ Disabling Auto Edge on a Port

<b>Configuration Steps</b>	<p>Disable Auto Edge on a port.</p> <pre>Ruijie(config)#int gi 0/1 Ruijie(config-if-GigabitEthernet 0/1)#spanning-tree autoedge disabled</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show spanning-tree interface</b> command to display the spanning tree configuration of the port.</li> </ul> <pre>Ruijie#show spanning-tree interface gi 0/1  PortAdminPortFast : Disabled PortOperPortFast : Disabled PortAdminAutoEdge : Disabled PortOperAutoEdge : Disabled</pre>

## Common Errors

---

### 9.4.12 Enabling Guard-related Features

#### Configuration Effect

---

- If root guard is enabled on a port, its roles on all instances are enforced as the designated port. Once the port receives configuration information with a higher priority, it enters the root-inconsistent (blocking) state. If the port does not receive configuration information with a higher priority within a period, it returns to its original state.
- Due to the unidirectional link failure, the root port or backup port becomes the designated port and enters the forwarding state if it does not receive BPDUs, causing a network loop. Loop guard is to prevent this problem.

#### Notes

---

- Root guard and loop guard cannot take effect on a port at the same time.

## Configuration Steps

### ↳ Enabling Root Guard

- Optional.
- The root bridge may receive configuration with a higher priority due to incorrect configuration by maintenance personnel or malicious attacks in the network. As a result, the current root bridge may lose its role, causing incorrect topology changes. To prevent this problem, you can enable root guard on a designated port of a device.

### ↳ Enabling Loop Guard

- Optional.
- You can enable loop guard on a port (root port, master port, or AP) to prevent it from failing to receive BPDUs sent by the designated bridge, increasing device stability. Otherwise, the network topology will change, possibly causing a loop.

### ↳ Disabling Guard

- Optional.
- Guard is disabled by default.

## Verification

- Display the configuration.

## Related Commands

### ↳ Enabling Root Guard

## Common Errors

- If root guard is enabled on the root port, master port, or AP, the port may be incorrectly blocked.

## 9.4.13 Enabling BPDU Transparent Transmission

### Configuration Effect

- If STP is disabled on a device, the device needs to transparently transmit BPDU packets so that the spanning tree between devices is properly calculated.

### Notes

- BPDU transparent transmission takes effect only when STP is disabled. If STP is enabled on a device, the device does not transparently transmit BPDU packets.

### Configuration Steps

#### ▾ Enabling BPDU Transparent Transmission

- Optional.
- If STP is disabled on a device that needs to transparently transmit BPDU packets, enable BPDU transparent transmission.

### Verification

- Display the configuration.

### Related Commands

#### ▾ Enabling BPDU Transparent Transmission

<b>Command</b>	<b>bridge-frame forwarding protocol bpdu</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	BPDU transparent transmission is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In IEEE 802.1Q, the destination MAC address 01-80-C2-00-00-00 of the BPDU is used as a reserved address. That is, devices compliant with IEEE 802.1Q do not forward the BPDU packets received. However, devices may need to transparently transmit BPDU packets in actual network deployment. For example, if STP is disabled on a device, the device needs to transparently transmit BPDU packets so that the spanning tree between devices is properly calculated.  BPDU transparent transmission takes effect only when STP is disabled. If STP is enabled on a device, the device does not transparently transmit BPDU packets.

### Configuration Example

#### ▾ Enabling BPDU Transparent Transmission

<p><b>Scenario</b> Figure 10-27</p>	
	<p>STP is enabled on DEV A and DEV C while is disabled on DEV B.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BPDU transparent transmission on DEV B so that STP between DEV A and DEV C can be correctly calculated.</li> </ul>
<p><b>DEV B</b></p>	<pre>Ruijie(config)#bridge-frame forwarding protocol bpdu</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run the <b>show run</b> command to check whether BPDU transparent transmission is enabled.</li> </ul>
<p><b>DEV B</b></p>	<pre>Ruijie#show run  Building configuration...  Current configuration : 694 bytes  bridge-frame forwarding protocol bpdu</pre>

### 9.4.14 Enabling BPDU Tunnel

#### Configuration Effect

- Enable BPDU Tunnel so that STP packets from the customer network can be transparently transmitted across the SP network. STP packet transmission between the customer network does not affect the SP network, causing STP on the customer network to be calculated independently of that on the SP network.

#### Notes

- BPDU Tunnel takes effect only when it is enabled in both global configuration mode and interface configuration mode.

#### Configuration Steps

##### ▾ Enabling BPDU Tunnel

- (Optional) In a QinQ network, you can enable BPDU Tunnel if STP needs to be calculated separately between customer networks and SP networks.

#### Verification

- Run the **show l2protocol-tunnel stp** command to display the BPDU Tunnel configuration.

#### Related Commands

##### ▾ Configuring BPDU Tunnel in Global Configuration Mode

<p><b>Command</b></p>	<p><b>l2protocol-tunnel stp</b></p>
-----------------------	-------------------------------------

<b>Parameter Description</b>	N/A
<b>Defaults</b>	BPDU Tunnel is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	BPDU Tunnel takes effect only when it is enabled in both global configuration mode and interface configuration mode.

↘ **Configuring BPDU Tunnel in Interface Configuration Mode**

<b>Command</b>	<b>I2protocol-tunnel stp enable</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	BPDU Tunnel is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	BPDU Tunnel takes effect only when it is enabled in both global configuration mode and interface configuration mode.

↘ **Configuring BPDU Tunnel Transparent Transmission Address**

<b>Command</b>	<b>I2protocol-tunnel stp tunnel-dmac <i>mac-address</i></b>
<b>Parameter Description</b>	<i>mac-address</i> : Indicates the STP address for transparent transmission.
<b>Defaults</b>	The default MAC address is 01d0.f800.0005.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If an STP packet sent from a customer network enters a PE, the PE changes the destination MAC address of the packet to a private address before the packet is forwarded by the SP network. When the packet reaches the PE at the peer end, the PE changes the destination MAC address to a public address and returns the packet to the customer network at the peer end, realizing transparent transmission across the SP network. This private address is the transparent transmission address of BPDU Tunnel.</p> <p> Optional transparent transmission addresses of STP packets include 01d0.f800.0005, 011a.a900.0005, 010f.e200.0003, 0100.0ccd.cdd0, 0100.0ccd.cdd1, and 0100.0ccd.cdd2.</p> <p> If no transparent transmission address is configured, BPDU Tunnel uses the default address 01d0.f800.0005.</p>

**Configuration Example**

↘ **Enabling BPDU Tunnel**

<p><b>Scenario</b> Figure 10-28</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable basic QinQ on the PEs (Provider S1/Provider S2 in this example) so that data packets of the customer network are transmitted within VLAN 200 on the SP network.</li> <li>● Enable STP transparent transmission on the PEs (Provider S1/Provider S2 in this example) so that the SP network can transmit STP packets of the customer network through BPDU Tunnel.</li> </ul>
<p><b>Provider S1</b></p>	<p>Step 1: Create VLAN 200 on the SP network.</p> <pre>Ruijie#configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#vlan 200 Ruijie(config-vlan)#exit</pre> <p>Step 2: Enable basic QinQ on the port connected to the customer network and use VLAN 20 for tunneling.</p> <pre>Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#switchport mode dot1q-tunnel Ruijie(config-if-GigabitEthernet 0/1)#switchport dot1q-tunnel native vlan 200 Ruijie(config-if-GigabitEthernet 0/1)#switchport dot1q-tunnel allowed vlan add untagged 200</pre> <p>Step 3: Enable STP transparent transmission on the port connected to the customer network.</p> <pre>Ruijie(config-if-GigabitEthernet 0/1)#l2protocol-tunnel stp enable Ruijie(config-if-GigabitEthernet 0/1)#exit</pre> <p>Step 4: Enable STP transparent transmission in global configuration mode.</p> <pre>Ruijie(config)#l2protocol-tunnel stp</pre> <p>Step 5: Configure an Uplink port.</p> <pre>Ruijie(config)# interface gigabitEthernet 0/5</pre>

	<pre>Ruijie(config-if-GigabitEthernet 0/5)#switchport mode uplink</pre>
<b>Provider S2</b>	Configure Provider S2 by performing the same steps.
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the BPDU Tunnel configuration is correct.</li> <li>● Verify the Tunnel port configuration by checking whether: 1. The port type is dot1q-tunnel; 2. The outer tag VLAN is consistent with the native VLAN and added to the VLAN list of the Tunnel port; 3. The port that accesses the SP network is configured as an Uplink port.</li> </ul>
<b>Provider S1</b>	<p>Step 1: Check whether the BPDU Tunnel configuration is correct.</p> <pre>Ruijie#show l2protocol-tunnel stp</pre> <pre>L2protocol-tunnel: stp Enable</pre> <pre>L2protocol-tunnel destination mac address: 01d0.f800.0005</pre> <pre>GigabitEthernet 0/1 l2protocol-tunnel stp enable</pre> <p>Step 2: Check whether the QinQ configuration is correct.</p> <pre>Ruijie#show running-config</pre> <pre>interface GigabitEthernet 0/1</pre> <pre>  switchport mode dot1q-tunnel</pre> <pre>  switchport dot1q-tunnel allowed vlan add untagged 200</pre> <pre>  switchport dot1q-tunnel native vlan 200</pre> <pre>  l2protocol-tunnel stp enable</pre> <pre>  spanning-tree bpdufilter enable</pre> <pre>!</pre> <pre>interface GigabitEthernet 0/5</pre> <pre>  switchport mode uplink</pre>
<b>Provider S2</b>	Verify Provider S2 configuration by performing the same steps.

### Common Errors

- In the SP network, BPDU packets can be correctly transparently transmitted only when the transparent transmission addresses of BPDU Tunnel are consistent.

## 9.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the statistics of packets sent and received on a port.	<b>clear spanning-tree counters</b> [ <b>interface</b> <i>interface-id</i> ]
Clears the STP topology change information.	<b>clear spanning-tree mst</b> <i>instance-id</i> <b>topochange record</b>

## Displaying

Description	Command

Debugs the port role transition state machine.	<b>debug mstp roletran</b>
Debugs the port state transition state machine.	<b>debug mstp statetran</b>
Debugs the MSTP sending state machine.	<b>debug mstp transmit</b>

# 10 Configuring GVRP

## 10.1 Overview

The GARP VLAN Registration Protocol (GVRP) is an application of the Generic Attribute Registration Protocol (GARP) used to dynamically configure and proliferate VLAN memberships.

GVRP simplifies VLAN configuration and management. It reduces the workload of manually configuring VLANs and adding ports to VLANs, and reduces the possibility of network disconnection due to inconsistent configuration. With GVRP, you can dynamically maintain VLANs and add/remove ports to/from VLANs to ensure VLAN connectivity in a topology.

### Protocols and Standards

IEEE standard 802.1D

IEEE standard 802.1Q

## 10.2 Applications

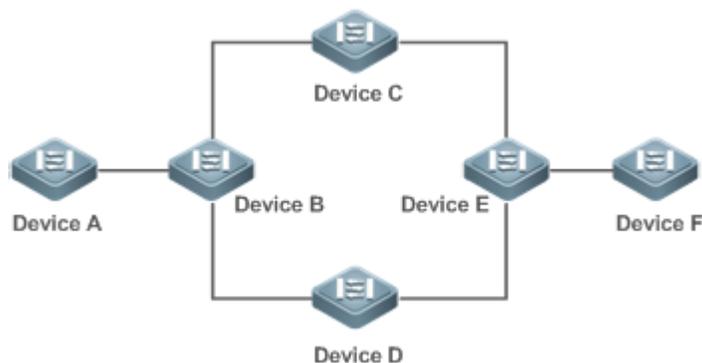

Application	Description
<a href="#">GVRP Configuration in a LAN</a>	Connect two switches in a local area network (LAN) and realize VLAN synchronization.
<a href="#">GVRP PDUs Tunnel Application</a>	Use the GVRP Protocol Data Units (PDUs) Tunnel feature to transparently transmit GVRP packets through a tunnel in a QinQ network environment.

### 10.2.1 GVRP Configuration in a LAN

#### Scenario

Enable GVRP and set the GVRP registration mode to Normal to register and deregister all dynamic and static VLANs between Device A and Device F.

Figure 11-1

<b>Remarks</b>	<p>Device A, Device B, Device C, Device D, Device E, and Device F are switches. The ports connected between two devices are Trunk ports.</p> <p>On Device A and Device F, configure static VLANs used for communication.</p> <p>Enable GVRP on all switches.</p>
----------------	--

### Deployment

- On each device, enable the GVRP and dynamic VLAN creation features, and ensure that dynamic VLANs can be created on intermediate devices.
- On Device A and Device F, configure static VLANs used for communication. Device B, Device C, Device D, and Device E will dynamically learn the VLANs through GVRP.

 It is recommended that the Spanning Tree Protocol (STP) be enabled to avoid loops in the customer network topology.

## 10.2.2 GVRP PDUs Tunnel Application

### Scenario

A QinQ network environment is generally divided into a customer network and a service provider (SP) network. The GVRP PDUs Tunnel feature allows GVRP packets to be transmitted between customer networks without impact on SP networks. The GVRP calculation in customer networks is separated from that in SP networks without interference.

Figure 11-2 GVRP PDUs Tunnel Application Topology

<b>Remarks</b>	<p>Figure 11-2 shows an SP network and a customer network. The SP network contains the provider edge (PE) devices Provider S1 and Provider S2. Customer Network A1 and Customer Network A2 are the same customer's two sites in different locations. Customer S1 and Customer S2 are the access devices in the customer network, which are connected to the SP network through Provider S1 and Provider S2 respectively.</p> <p>The GVRP PDUs Tunnel feature allows Customer Network A1 and Customer Network A2 to perform unified GVRP calculation across the SP network, without impact on the SP network's GVRP calculation.</p>
----------------	---

## Deployment

- Enable basic QinQ on the PEs (Provider S1 and Provider S2) in the SP network to transmit data packets from the customer network through a specified VLAN in the SP network.
- Enable GVRP transparent transmission on the PEs (Provider S1 and Provider S2) in the SP network to allow the SP network to tunnel GVRP packets from the customer network via the GVRP PDUs Tunnel feature.

## 10.3 Features

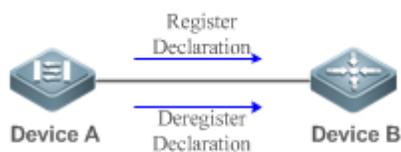

### Basic Concepts

#### ↳ GVRP

GVRP is an application of GARP used to register and deregister VLAN attributes in the following modes:

- When a port receives a VLAN attribute declaration, the port will register the VLAN attributes contained in the declaration (that is, the port will join the VLAN).
- When a port receives a VLAN attribute revocation declaration, the port will deregister the VLAN attributes contained in the declaration (that is, the port will exit the VLAN).

Figure 11-3

#### ↳ Dynamic VLAN

A VLAN that can be dynamically created and deleted without the need for manual configuration is called a dynamic VLAN.

You can manually convert a dynamic VLAN to a static VLAN, but not the way around.

A protocol state machine controls the joining of ports to dynamic VLANs created through GVRP. Only the Trunk ports that receive GVRP VLAN attribute declaration can join these VLANs. You cannot manually add ports to dynamic VLANs.

#### ↳ Message Types

(1) Join message

When a GARP application entity hopes other GARP entities to register its attributes, it will send a Join message. When a GARP entity receives a Join message from another entity or requires other entities to register its static attributes, it will send a Join message. There are two types of Join message: JoinEmpty and JoinIn.

- JoinEmpty message: Used to declare an unregistered attribute
- JoinIn message: Used to declare a registered attribute

## (2) Leave message

When a GARP application entity hopes other GARP entities to deregister its attributes, it will send a Leave message. When a GARP entity receives a Leave message from another entity or requires other entities to deregister its statically deregistered attributes, it will send a Leave message. There are two types of Leave message: LeaveEmpty and LeaveIn.

- LeaveEmpty message: Used to deregister an unregistered attribute
- LeaveIn message: Used to deregister a registered attribute

## (3) LeaveAll message

Each GARP application entity starts its LeaveAll timer during startup. When the timer times out, the entity sends a LeaveAll message to deregister all attributes to enable other GARP entities to reregister attributes. When the GARP application entity receives a LeaveAll message from another entity, it also sends a LeaveAll message. The LeaveAll timer is restarted when a LeaveAll message is sent again to initiate a new cycle.

## ↘ Timer Types

GARP defines four timers used to control GARP message sending.

### (1) Hold timer

The Hold timer controls the sending of GARP messages (including Join and Leave messages). When a GARP application entity has its attributes changed or receives a GARP message from another entity, it starts the Hold timer. During the timeout period, the GARP application entity encapsulates all GARP messages to be sent into packets as few as possible, and sends the packets when the timer times out. This reduces the quantity of sent packets and saves bandwidth resources.

### (2) Join timer

The Join timer controls the sending of Join messages. After a GARP application entity sends a Join message, it waits for one timeout interval of the Join timer to ensure that the Join message is reliably transmitted to another entity. If the GARP application entity receives a JoinIn message from another entity before the timer times out, it will not resend the Join message; otherwise, it will resend the Join message. Not each attribute has its own Join timer, but each GARP application entity has one Join timer.

### (3) Leave timer

The Leave timer controls attribute deregistration. When a GARP application entity hopes other entities to deregister one of its attributes, it sends a Leave message. Other entities which receive the Leave message start the Leave timer. The attribute will be deregistered only if these entities receive no Join message mapped to the attribute during the timeout period.

### (4) LeaveAll timer

Each GARP application entity starts its own LeaveAll timer upon startup. When the timer times out, the entity sends a LeaveAll message to enable other entities to reregister attributes. Then the LeaveAll timer is restarted to initiate a new cycle.

## ↘ GVRP Advertising Modes

GVRP allows a switch to inform other interconnected devices of its VLANs and instruct the peer device to create specific VLANs and add the ports that transmit GVRP packets to corresponding VLANs.

Two GVRP advertising modes are available:

- Normal mode: A device externally advertises its VLAN information, including dynamic and static VLANs.
- Non-applicant mode: A device does not externally advertise its VLAN information.

### ↘ GVRP Registration Modes

A GVRP registration mode specifies whether the switch that receives a GVRP packet processes the VLAN information in the packet, such as dynamically creating a new VLAN and adding the port that receives the packet to the VLAN.

Two GVRP registration modes are available:

- Normal mode: Process the VLAN information in the received GVRP packet.
- Disabled mode: No to process the VLAN information in the received GVRP packet.

## Overview

Feature	Description
<a href="#">Intra-Topology VLAN Information Synchronization</a>	Dynamically creates VLANs and adds/removes ports to/from VLANs, which reduces the manual configuration workload and the probability of VLAN disconnection due to missing configuration.

### 10.3.1 Intra-Topology VLAN Information Synchronization

#### Working Principle

GVRP is an application of GARP based on the GARP working mechanism. GVRP maintains the dynamic registration information of VLANs on a device and propagates the information to other devices. A GVRP-enabled device receives VLAN registration information from other devices and dynamically updates the local VLAN registration information. The device also propagates the local VLAN registration information to other devices so that all devices in a LAN maintain consistent VLAN information. The VLAN registration information propagated by GVRP includes the manually-configured static registration information on the local device and the dynamic registration information from other devices.

#### ↘ External VLAN Information Advertising

The Trunk port on a GVRP-enabled device periodically collects VLAN information within the port, including the VLANs that the Trunk port joins or exits. The collected VLAN information is encapsulated in a GVRP packet to be sent to the peer device. After the Trunk port on the peer device receives the packet, it resolves the VLAN information. Then corresponding VLANs will be dynamically created, and the Trunk port will join the created VLANs or exit other VLANs. For details about the VLAN information, see the above description of GVRP message types.

#### Related Configurations

- GVRP is disabled by default.
- Run `[no] gvrp enable` to enable or disable GVRP.
- After GVRP is enabled on a device, the device sends GVRP packets carrying VLAN information. If GVRP is disabled on the device, the device does not send GVRP packets carrying VLAN information or process received GVRP packets.

➤ **VLAN Registration and Deregistration**

Upon receiving a GVRP packet, the switch determines whether to process the VLAN information in the packet according to the registration mode of the corresponding port. For details, see the above description of GVRP registration modes.

Related Configurations

- If GVRP is enabled, the port in Trunk mode is enabled with dynamic VLAN registration by default.
- To enable dynamic VLAN registration on a port, run the **gvrp registration mode normal** command. To disable dynamic VLAN registration on a port, run the **gvrp register mode disable** command.
- If dynamic VLAN registration is enabled, dynamic VLANs will be created on the local device when the port receives a GVRP packet carrying VLAN information from the peer end.
- If dynamic VLAN registration is disabled, no dynamic VLAN will be created on the local device when the port receives a GVRP packet from the peer end.

Configuration	Description and Command	
<a href="#">Configuring Basic GVRP Features and VLAN Information Synchronization</a>	 (Mandatory) It is used to enable GVRP and dynamic VLAN creation.	
	<b>gvrp enable</b>	Enables GVRP.
	<b>gvrp dynamic-vlan-creation enable</b>	Enables dynamic VLAN creation.
	<b>switchport mode trunk</b>	Switches to Trunk port mode. GVRP take effects only in Trunk mode.
	<b>switchport trunk allowed vlan all</b>	Allows the traffic from all VLANs to pass through.
	<b>gvrp applicant state</b>	Configures the advertising mode of a port. The Normal mode indicates to advertise VLAN information externally by sending a GVRP packet. The Non-applicant mode indicates not to advertise VLAN information externally.
	<b>gvrp registration mode</b>	Configures the registration mode of a port. The Normal mode indicates to process the VLAN information in the received GVRP packet, such as dynamically creating VLANs and adding ports to VLANs. The Disabled mode indicates not to process the VLAN information in the received GVRP packet.
	 (Optional) It is used to configure timers and the registration mode and advertising mode of a port.	
<b>gvrp timer</b>	Configures timers.	

Configuration	Description and Command	
<a href="#">Configuring GVRP PDUs Transparent Transmission</a>	 (Optional) It is used to configure GVRP PDUs transparent transmission.	
	<b>bridge-frame forwarding protocol gvrp</b>	Enables GVRP PDUs transparent transmission.
<a href="#">Configuring the GVRP PDUs Tunnel Feature</a>	 (Optional) It is used to configure the GVRP PDUs Tunnel feature.	
	<b>I2protocol-tunnel gvrp</b>	Enables the GVRP PDUs Tunnel feature in global configuration mode.
	<b>I2protocol-tunnel gvrp enable</b>	Enables the GVRP PDUs Tunnel feature in interface configuration mode.
	<b>I2protocol-tunnel gvrp tunnel-dmac</b>	Configures the transparent transmission address used by the GVRP PDUs Tunnel feature.

## 10.4 Configuration

### 10.4.1 Configuring Basic GVRP Features and VLAN Information Synchronization

#### Configuration Effect

- Dynamically create/delete VLANs and add/remove ports to/from VLANs.
- Synchronize VLAN information between devices to ensure normal intra-topology communication.
- Reduce the manual configuration workload and simplify VLAN management.

#### Notes

- GVRP must be enabled on both connected devices. GVRP information is transmitted only by Trunk Links. The transmitted information contains the information of all VLANs on the current device, including dynamically learned VLANs and manually configured VLANs.
- If STP is enabled, only ports in Forwarding state participate in GVRP (such as receiving and sending GVRP PDUs) and have their VLAN information propagated by GVRP.
- All VLAN ports added by GVRP are tagged ports.
- The system does not save the VLAN information that is dynamically learned by GVRP. The information will be lost when the device is reset and cannot be saved manually.
- All devices that need to exchange GVRP information must maintain consistent GVRP timers (Join timer, Leave timer, and Leaveall timer).
- If STP is not enabled, all available ports can participate in GVRP. If Single Spanning Tree (SST) is enabled, only ports in Forwarding state in the SST Context participate in GVRP. If Multi Spanning Tree (MST) is enabled, GVRP can run in the Spanning Tree Context to which VLAN1 belongs. You cannot specify other Spanning Tree Context for GVRP.

## Configuration Steps

---

### ↳ Enabling GVRP

- Mandatory.
- Only GVRP-enabled devices can process GVRP packets.

### ↳ Enabling Dynamic VLAN Creation

- Mandatory.
- After dynamic VLAN creation is enabled on a device, the device will dynamically create VLANs upon receiving GVRP Join messages.

### ↳ Configuring Timers

- Optional.
- There are three GVRP timers: Join timer, Leave timer, and Leaveall timer, which are used to control message sending intervals.
- The timer interval relationships are as follows: The interval of the Leave timer must be three times or more greater than that of the Join timer; the interval of the Leaveall timer must be greater than that of the Leave timer.
- The three timers are controlled by the GVRP state machine and can be triggered by each other.

### ↳ Configuring the Advertising Mode of a Port

- Optional.
- Two GVRP advertising modes are available: Normal (default) and Non-applicant.
- Normal mode: Indicates that a device externally advertises its VLAN information.
- Non-applicant mode: Indicates that a device does not externally advertise its VLAN information.

### ↳ Configuring the Registration Mode of a Port

- Optional.
- Two GVRP registration modes are available: Normal and Disabled.

### ↳ Switching to Trunk Port Mode

- Mandatory.
- GVRP takes effect only on ports in Trunk mode.

## Verification

---

- Run the **show gvrp configuration** command to check the configuration.
- Check whether a dynamic VLAN is configured and the corresponding port joins the VLAN.

## Related Commands

### ↳ Enabling GVRP

<b>Command</b>	<b>gvrp enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, GVRP is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	GVRP can be enabled only in global configuration mode. If GVRP is not enabled globally, you can still set other GVRP parameters, but the parameter settings take effect only when GVRP starts running.

### ↳ Enabling Dynamic VLAN Creation

<b>Command</b>	<b>gvrp dynamic-vlan-creation enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, dynamic VLAN creation is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When a port receives a JoinIn or JoinEmpty message that indicates a non-existent VLAN on the local device, GVRP may create this VLAN, depending on the configuration of this command.

 The parameters of a dynamic VLAN created through GVRP cannot be modified manually.

### ↳ Configuring Timers

<b>Command</b>	<b>gvrp timer { join timer-value   leave timer-value   leaveall timer-value }</b>
<b>Parameter</b>	<i>timer-value</i> : 1–2,147,483,647 ms
<b>Description</b>	
<b>Defaults</b>	Join timer: 200ms, leave timer: 600ms, leaveall timer: 10,000ms
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The interval of the Leave timer must be three times or greater than that of the Join timer.</p> <p>The interval of the Leaveall timer must be greater than that of the Leave timer.</p> <p>The time unit is milliseconds.</p> <p>The following timer intervals are recommended in actual networking:</p> <p>Join timer: 6,000 ms (6s)</p> <p>Leave timer: 30,000 ms (30s)</p> <p>Leaveall timer: 120,000 ms (2 minutes)</p>
	<p> Ensure that the GVRP timer settings on all interconnected GVRP devices are consistent; otherwise, GVRP may work abnormally.</p>

↘ **Configuring the Advertising Mode of a Port**

<b>Command</b>	<b>gvrp applicant state { normal   non-applicant }</b>
<b>Parameter</b>	<b>normal:</b> Indicates that a port externally advertises VLAN information.
<b>Description</b>	<b>non-applicant:</b> Indicates that a port does not externally advertise VLAN information.
<b>Defaults</b>	By default, ports are allowed to send GVRP notification.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to configure the GVRP advertising mode of a port.

↘ **Configuring the Registration Mode of a Port**

<b>Command</b>	<b>gvrp registration mode { normal   disabled }</b>
<b>Parameter</b>	<b>normal:</b> Indicates that the port is allowed to join a dynamic VLAN.
<b>Description</b>	<b>disabled:</b> Indicates that the port is not allowed to join a dynamic VLAN.
<b>Defaults</b>	If GVRP is enabled, the port in Trunk mode is enabled with dynamic VLAN registration by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is used to configure the GVRP registration mode of a port.

**Configuration Example**

↘ **Enabling GVRP in a Topology and Dynamically Maintaining VLANs and the VLAN-Port Relationship**

<b>Scenario</b> Figure 11-4	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>On Switch A and Switch C, configure VLANs used for communication in the customer network.</li> <li>Enable the GVRP and dynamic VLAN creation features on Switch A, Switch B, and Switch C.</li> <li>Configure the ports connected between switches as Trunk ports, and ensure that the VLAN lists of Trunk ports include the communication VLANs. By default, a Trunk port allows the traffic from all VLANs to pass through.</li> <li>It is recommended that STP be enabled to avoid loops.</li> </ul>
<b>A</b>	<p>1. Create VLAN 1–200 used for communication in the customer network.</p> <pre>A# configure terminal Enter configuration commands, one per line. End with CNTL/Z. **Common Errors**

- The ports connected between devices are not in Trunk mode.
- The VLAN lists of the ports connected between devices do not include the VLANs used for communication in the customer network.
- The GVRP advertising modes and registration modes of Trunk ports are not set to Normal.

## 10.4.2 Enabling GVRP PDUs Transparent Transmission

### Configuration Effect

Enable devices to transparently transmit GVRP PDU frames to realize normal inter-device GVRP calculation when GVRP is not enabled.

### Notes

GVRP PDUs transparent transmission takes effect only when GVRP is disabled. After GVRP is enabled, devices will not transparently transmit GVRP PDU frames.

### Configuration Steps

#### ▾ Configuring GVRP PDUs Transparent Transmission

- Optional.
- Perform this configuration when you need to enable devices to transparently transmit GVRP PDU frames when GVRP is disabled.

### Verification

Run the **show run** command to check whether GVRP PDUs transparent transmission is enabled.

### Related Commands

#### ▾ Configuring GVRP PDUs Transparent Transmission

<b>Command</b>	<b>bridge-frame forwarding protocol gvrp</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Defaults</b>	The function is disabled by default.
<b>Usage Guide</b>	In the IEEE 802.1Q standard, the destination MAC address 01-80-C2-00-00-06 for GVRP PDUs is reserved. Devices compliant with IEEE 802.1Q do not forward received GVRP PDU frames. However, in actual network deployment, devices may need to transparently transmit GVRP PDU frames to realize normal inter-device GVRP calculation when GVRP is not enabled. GVRP PDUs transparent transmission takes effect only when GVRP is disabled. After GVRP is enabled, devices will not transparently transmit GVRP PDU frames.

### Configuration Example

#### ▾ Configuring GVRP PDUs Transparent Transmission

<p><b>Scenario</b> Figure 11-5</p>	
	<p>Enable GVRP on DEV A and DEV C. (DEV B is not enabled with GVRP.)</p>
<p><b>Configuration Steps</b></p>	<p>Configure GVRP PDUs transparent transmission on DEV B to realize normal GVRP calculation between DEV A and DEV C.</p>
<p><b>DEV B</b></p>	<pre>Ruijie(config)#bridge-frame forwarding protocol gvrp</pre>
<p><b>Verification</b></p>	<p>Run the <b>show run</b> command to check whether GVRP PDUs transparent transmission is enabled.</p>
<p><b>DEV B</b></p>	<pre>Ruijie#show run  Building configuration...  Current configuration : 694 bytes  bridge-frame forwarding protocol gvrp</pre>

### 10.4.3 Configuring the GVRP PDUs Tunnel Feature

#### Configuration Effect

Transparently transmit GVRP packets between customer networks through tunnels in SP networks without impact on the SP networks, and thereby separate the GVRP calculation in customer networks from that in SP networks.

#### Notes

The GVRP PDUs Tunnel feature takes effect after it is enabled in global configuration mode and interface configuration mode.

#### Configuration Steps

##### Configuring the GVRP PDUs Tunnel Feature

- (Optional) Perform this configuration when you need to separate GVRP calculation between customer networks and SP networks in a QinQ environment.

#### Verification

Run the **show l2protocol-tunnel gvrp** command to check the GVRP PDUs Tunnel configuration.

## Related Commands

### ▾ Configuring the GVRP PDUs Tunnel Feature in Global Configuration Mode

<b>Provider S2</b>	The verification on Provider S2 is the same as that on Provider S1.

## Common Errors

In an SP network, transparent transmission addresses are not configured consistently, which affects the transmission of GVRP PDU frames.

## 10.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears port counters.	<b>clear gvrp statistics</b> { <i>interface-id</i>   <b>all</b> }

### Displaying

Description	Command
Displays port counters.	<b>show gvrp statistics</b> { <i>interface-id</i>   <b>all</b> }
Displays the current GVRP status.	<b>show gvrp status</b>
Displays the current GVRP configuration.	<b>show gvrp configuration</b>
Displays the information of the GVRP PDUs Tunnel feature.	<b>show l2protocol-tunnel gvrp</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Enables GVRP event debugging.	<b>debug gvrp event</b>
Enables GVRP timer debugging.	<b>debug gvrp timer</b>

# 11 Configuring LLDP

## 11.1 Overview

The Link Layer Discovery Protocol (LLDP), defined in the IEEE 802.1AB standard, is used to discover the topology and identify topological changes. LLDP encapsulates local information of a device into LLDP data units (LLDPDUs) in the type/length/value (TLV) format and then sends the LLDPDUs to neighbors. It also stores LLDPDUs from neighbors in the management information base (MIB) to be accessed by the network management system (NMS).

With LLDP, the NMS can learn about topology, for example, which ports of a device are connected to other devices and whether the rates and duplex modes at both ends of a link are consistent. Administrators can quickly locate and rectify a fault based on the information.

A Ruijie LLDP-compliant device is capable of discovering neighbors when the peer is either of the following:

- Ruijie LLDP-compliant device
- Endpoint device that complies with the Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED)

### Protocols and Standards

- IEEE 802.1AB 2005: Station and Media Access Control Connectivity Discovery
- ANSI/TIA-1057: Link Layer Discovery Protocol for Media Endpoint Devices

## 11.2 Applications

Application	Description
<a href="#">Displaying Topology</a>	Multiple switches, a MED device, and an NMS are deployed in the network topology.
<a href="#">Conducting Error Detection</a>	Two switches are directly connected and incorrect configuration will be displayed.

### 11.2.1 Displaying Topology

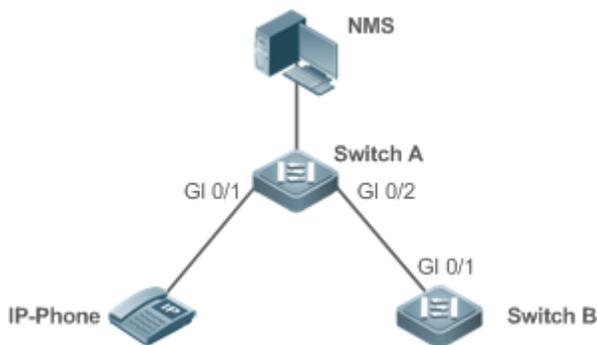

#### Scenario

Multiple switches, a MED device, and an NMS are deployed in the network topology.

As shown in the following figure, the LLDP function is enabled by default and no additional configuration is required.

- Switch A and Switch B discover that they are neighbors.
- Switch A discovers its neighbor MED device, that is, IP-Phone, through port GigabitEthernet 0/1.
- The NMS accesses MIB of switch A.

Figure 12-1

<b>Remarks</b>	Ruijie Switch A, Switch B, and IP-Phone support LLDP and LLDP-MED. LLDP on switch ports works in TxRx mode. The LLDP transmission interval is 30 seconds and transmission delay is 2 seconds by default.
----------------	--

### Deployment

- Run LLDP on a switch to implement neighbor discovery.
- Run the Simple Network Management Protocol (SNMP) on the switch so that the NMS acquires and sets LLDP-relevant information on the switch.

## 11.2.2 Conducting Error Detection

### Scenario

Two switches are directly connected and incorrect configuration will be displayed.

As shown in the following figure, the LLDP function and LLDP error detection function are enabled by default, and no additional configuration is required.

- After you configure a virtual local area network (VLAN), port rate and duplex mode, link aggregation, and maximum transmission unit (MTU) of a port on Switch A, an error will be prompted if the configuration does not match that on Switch B, and vice versa.

Figure 12-2

<b>Remarks</b>	Ruijie Switch A and Switch B support LLDP. LLDP on switch ports works in TxRx mode. The LLDP transmission interval is 30 seconds and transmission delay is 2 seconds by default.
----------------	--

### Deployment

- Run LLDP on a switch to implement neighbor discovery and detect link fault.

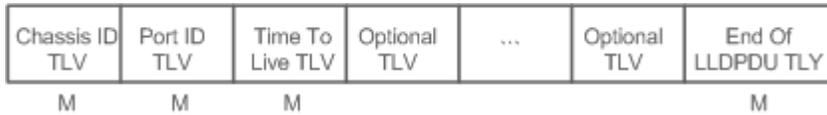

## 11.3 Features

### Basic Concepts

#### LLDPDU

LLDPDU is a protocol data unit encapsulated into an LLDP packet. Each LLDPDU is a sequence of TLV structures. The TLV collection consists of three mandatory TLVs, a series of optional TLVs, and one End Of TLV. The following figure shows the format of an LLDPDU.

Figure 12-3 LLDPDU Format

In the preceding figure:

- M indicates a mandatory TLV.
- In an LLDPDU, Chassis ID TLV, Port ID TLV, Time To Live TLV, and End Of LLDPDU TLV are mandatory and TLVs of other TLVs are optional.

#### LLDP Encapsulation Format

LLDP packets can be encapsulated in two formats: Ethernet II and Subnetwork Access Protocols (SNAP).

The following figure shows the format of LLDP packets encapsulated in the Ethernet II format.

Figure 12-4 Ethernet II Format

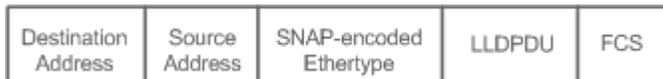

In the preceding figure:

- Destination Address: Indicates the destination MAC address, which is the LLDP multicast address 01-80-C2-00-00-0E.
- Source Address: Indicates the source MAC address, which is the port MAC address.
- Ethertype: Indicates the Ethernet type, which is 0x88CC.
- LLDPDU: Indicates the LLDP protocol data unit.
- FCS: Indicates the frame check sequence.

Figure 12-5 shows the format of LLDP packets encapsulated in the SNAP format.

Figure 12-5 SNAP Format

In the preceding figure:

- Destination Address: Indicates the destination MAC address, which is the LLDP multicast address 01-80-C2-00-00-0E.

- Source Address: Indicates the source MAC address, which is the port MAC address.
- SNAP-encoded Ethertype: Indicates the Ethernet type of the SNMP encapsulation, which is AA-AA-03-00-00-00-88-CC.
- LLDPDU: Indicates the LLDP protocol data unit.
- FCS: Indicates the frame check sequence.

## ↘ TLV

TLVs encapsulated into an LLDPDU can be classified into two types:

- Basic management TLVs
- Organizationally specific TLVs

Basic management TLVs are a collection of basic TLVs used for network management. Organizationally specific TLVs are defined by standard organizations and other institutions, for example, the IEEE 802.1 organization and IEEE 802.3 organization define their own TLV collections.

### 4. Basic management TLVs

The basic management TLV collection consists of two types of TLVs: mandatory TLVs and optional TLVs. A mandatory TLV must be contained in an LLDPDU for advertisement and an optional TLV is contained selectively.

The following table describes basic management TLVs.

TLV Type	Description	Mandatory/Optional
End Of LLDPDU TLV	Indicates the end of an LLDPDU, occupying two bytes.	Mandatory
Chassis ID TLV	Identifies a device with a MAC address.	Mandatory
Port ID TLV	Identifies a port sending LLDPDUs.	Fixed
Time To Live TLV	Indicates the time to live (TTL) of local information on a neighbor. When a device receives a TLV containing TTL 0, it deletes the neighbor information.	Mandatory
Port Description TLV	Indicates the descriptor of the port sending LLDPDUs.	Optional
System Name TLV	Describes the device name.	Optional
System Description TLV	Indicates the device description, including the hardware version, software version, and operating system information.	Optional
System Capabilities TLV	Describes main functions of the device, such as the bridge, routing, and relay functions.	Optional
Management Address TLV	Indicates the management address, which contains the interface ID and object identifier (OID).	Optional

- ✔ Ruijie LLDP-compliant switches support advertisement of basic management TLVs.

### 5. Organizationally specific TLVs

Different organizations, such as the IEEE 802.1, IEEE 802.3, IETF and device suppliers, define specific TLVs to advertise specific information about devices. The organizationally unique identifier (OUI) field in a TLV is used to distinguish different organizations.

- Organizationally specific TLVs are optional and are advertised in an LLDPDU selectively. Currently, there are three types of common organizationally specific TLVs: IEEE 802.1 organizationally specific TLVs, IEEE 802.3 organizationally specific TLVs, and LLDP-MED TLVs.

The following table describes IEEE 802.1 organizationally specific TLVs.

TLV Type	Description
Port VLAN ID TLV	Indicates the VLAN identifier of a port.
Port And Protocol VLAN ID TLV	Indicates the protocol VLAN identifier of a port.
VLAN Name TLV	Indicates the VLAN name of a port.
Protocol Identity TLV	Indicates the protocol type supported by a port.

- ✔ Ruijie LLDP-compliant switches do not send the Protocol Identity TLV but receive this TLV.

- IEEE 802.3 organizationally specific TLVs

The following table describes IEEE 802.3 organizationally specific TLVs.

TLV Type	Description
MAC/PHY Configuration//Status TLV	Indicates the rate and duplex mode of a port, and whether to support and enable auto-negotiation.
Power Via MDI TLV	Indicates the power supply capacity of a port.
Link Aggregation TLV	Indicates the link aggregation capacity of a port and the current aggregation state.
Maximum Frame Size TLV	Indicates the maximum size of the frame transmitted by a port.

- ✔ Ruijie LLDP-compliant devices support advertisement of IEEE 802.3 organizationally specific TLVs.

- LLDP-MED TLV

LLDP-MED is an extension to LLDP based on IEEE 802.1AB LLDP. It enables users to conveniently deploy the Voice Over IP (VoIP) network and detect faults. It provides applications including the network configuration policies, device discovery, PoE management, and inventory management, meeting requirements for low cost, effective management, and easy deployment.

The following table describes LLDP-MED TLVs.

TLV Type	Description
LLDP-MED Capabilities TLV	Indicates the type of the LLDP-MED TLV encapsulated into an LLDPDU and device type (network connectivity device or endpoint device), and whether to support LLDP-MED,.
Network Policy TLV	Advertises the port VLAN configuration, supported application type (such as voice or video services), and Layer-2 priority information.
Location Identification TLV	Locates and identifies an endpoint device.
Extended Power-via-MDI TLV	Provides more advanced power supply management.
Inventory – Hardware Revision TLV	Indicates hardware version of a MED device.
Inventory – Firmware Revision TLV	Indicates the firmware version of the MED device.

TLV Type	Description
Inventory – Software Revision TLV	Indicates the software version of the MED device.
Inventory – Serial Number TLV	Indicates the serial number of the MED device.
Inventory – Manufacturer Name TLV	Indicates the name of the manufacturer of the MED device.
Inventory – Model Name TLV	Indicates the module name of the MED device.
Inventory – Asset ID TLV	Indicates the asset identifier of the MED device, used for inventory management and asset tracking.

- ✔ Ruijie LLDP-compliant Ruijie devices support advertisement of LLDP-MED TLVs.

## Overview

Feature	Description
<a href="#">LLDP Work Mode</a>	Configures the mode of transmitting and receiving LLDP packets.
<a href="#">LLDP Transmission Mechanism</a>	Enables directly connected LLDP-compliant devices to send LLDP packets to the peer.
<a href="#">LLDP Reception Mechanism</a>	Enables directly connected LLDP-compliant devices to receive LLDP packets from the peer.

### 11.3.1 LLDP Work Mode

Configure the LLDP work mode so as to specify the LLDP packet transmission and reception mode.

#### Working Principle

LLDP provides three work modes:

- TxRx: Transmits and receives LLDPDUs.
- Rx Only: Only receives LLDPDUs.
- Tx Only: Only transmits LLDPDUs.

When the LLDP work mode is changed, the port initializes the protocol state machine. You can set a port initialization delay to prevent repeated initialization of a port due to frequent changes of the LLDP work mode.

#### Related Configuration

##### ↘ [Configuring the LLDP Work Mode](#)

The default LLDP work mode is TxRx.

You can run the **lldp mode** command to configure the LLDP work mode.

If the work mode is set to TxRx, the device can both transmit and receive LLDP packets. If the work mode is set to Rx Only, the device can only receive LLDP packets. If the work mode is set to Tx Only, the device can only transmit LLDP packets. If the work mode is disabled, the device cannot transmit or receive LLDP packets.

## 11.3.2 LLDP Transmission Mechanism

LLDP packets inform peers of their neighbors. When the LLDP transmission mode is cancelled or disabled, LLDP packets cannot be transmitted to neighbors.

### Working Principle

LLDP periodically transmits LLDP packets when working in TxRx or Tx Only mode. When information about the local device changes, LLDP immediately transmits LLDP packets. You can configure a delay time to avoid frequent transmission of LLDP packets caused by frequent changes of local information.

LLDP provides two types of packets:

- Standard LLDP packet, which contains management and configuration information about the local device.
- Shutdown packet: When the LLDP work mode is disabled or the port is shut down, LLDP Shutdown packets will be transmitted. A Shutdown packet consists of the Chassis ID TLV, Port ID TLV, Time To Live TLV, and End OF LLDP TLV. TTL in the Time to Live TLV is 0. When a device receives an LLDP Shutdown packet, it considers that the neighbor information is invalid and immediately deletes it.

When the LLDP work mode is changed from disabled or Rx to TxRx or Tx, or when LLDP discovers a new neighbor (that is, a device receives a new LLDP packet and the neighbor information is not stored locally), the fast transmission mechanism is started so that the neighbor quickly learns the device information. The fast transmission mechanism enables a device to transmit multiple LLDP packets at an interval of 1 second.

### Related Configuration

#### ↘ [Configuring the LLDP Work Mode](#)

The default work mode is TxRx.

Run the **lldp mode txrx** or **lldp mode tx** command to enable the LLDP packet transmission function. Run the **lldp mode rx** or **no lldp mode** command to disable the LLDP packet transmission function.

In order to enable LLDP packet reception, set the work mode to TxRx or Rx Only. If the work mode is set to Rx Only, the device can only receive LLDP packets.

#### ↘ [Configuring the LLDP Transmission Delay](#)

The default LLDP transmission delay is 2 seconds.

Run the **lldp timer tx-delay** command to change the LLDP transmission delay.

If the delay is set to a very small value, the frequent change of local information will cause frequent transmission of LLDP packets. If the delay is set to a very large value, no LLDP packet may be transmitted even if local information is changed.

#### ↘ [Configuring the LLDP Transmission Interval](#)

The default LLDP transmission interval is 30 seconds.

Run the **lldp timer tx-interval** command to change the LLDP transmission interval.

If the interval is set to a very small value, LLDP packets may be transmitted frequently. If the interval is set to a very large value, the peer may not discover the local device in time.

#### ↘ [Configuring the TLVs to Be Advertised](#)

By default, an interface is allowed to advertise TLVs of all types except Location Identification TLV.

Run the **lldp tlv-enable** command to change the TLVs to be advertised.

#### ↘ [Configuring the LLDP Fast Transmission Count](#)

By default, three LLDP packets are fast transmitted.

Run the **lldp fast-count** command to change the number of LLDP packets that are fast transmitted.

### 11.3.3 LLDP Reception Mechanism

A device can discover the neighbor and determine whether to age the neighbor information according to received LLDP packets.

#### [Working Principle](#)

A device can receive LLDP packets when working in TxRx or Rx Only mode. After receiving an LLDP packet, a device conducts validity check. After the packet passes the check, the device checks whether the packet contains information about a new neighbor or about an existing neighbor and stores the neighbor information locally. The device sets the TTL of neighbor information according to the value of TTL TLV in the packet. If the value of TTL TLV is 0, the neighbor information is aged immediately.

#### [Related Configuration](#)

#### ↘ [Configuring the LLDP Work Mode](#)

The default LLDP work mode is TxRx.

Run the **lldp mode txrx** or **lldp mode rx** command to enable the LLDP packet reception function. Run the **lldp mode tx** or **no lldp mode** command to disable the LLDP packet reception function.

In order to enable LLDP packet reception, set the work mode to TxRx or Rx Only. If the work mode is set to Tx Only, the device can only transmit LLDP packets.

## 11.4 Configuration

Configuration	Description and Command
<a href="#">Configuring the LLDP Function</a>	 (Optional) It is used to enable or disable the LLDP function in global or interface configuration mode.
	<b>lldp enable</b> Enables the LLDP function.
	<b>no lldp enable</b> Disables the LLDP function.

Configuration	Description and Command	
<a href="#">Configuring the LLDP Work Mode</a>	 (Optional) It is used to configure the LLDP work mode.	
	<b>lldp mode {rx   tx   txrx }</b>	Configures the LLDP work mode.
	<b>no lldp mode</b>	Shuts down the LLDP work mode.
<a href="#">Configuring the TLVs to Be Advertised</a>	 (Optional) It is used to configure the TLVs to be advertised.	
	<b>lldp tlv-enable</b>	Configures the TLVs to be advertised.
	<b>no lldp tlv-enable</b>	Cancels TLVs.
<a href="#">Configures the Management Address to Be Advertised</a>	 (Optional) It is used to configure the management address to be advertised in LLDP packets.	
	<b>lldp management-address-tlv [ip-address]</b>	Configures the management address to be advertised in LLDP packets.
	<b>no lldp management-address-tlv</b>	Cancels the management address.
<a href="#">Configuring the LLDP Fast Transmission Count</a>	 (Optional) It is used to configure the number of LLDP packets that are fast transmitted.	
	<b>lldp fast-count value</b>	Configures the <u>LLDP fast transmission</u> count.
	<b>no lldp fast-count</b>	Restores the default <u>LLDP fast transmission</u> count.
<a href="#">Configuring the TTL Multiplier and Transmission Interval</a>	 (Optional) It is used to configure the TTL multiplier and transmission interval.	
	<b>lldp hold-multiplier value</b>	Configures the TTL multiplier.
	<b>no lldp hold-multiplier</b>	Restores the default TTL multiplier.
	<b>lldp timer tx-interval seconds</b>	Configures the transmission interval.
	<b>no lldp timer tx-interval</b>	Restores the default transmission interval.
<a href="#">Configuring the Transmission Delay</a>	 (Optional) It is used to configure the delay time for LLDP packet transmission.	
	<b>lldp timer tx-delay seconds</b>	Configures the transmission delay.
	<b>no lldp timer tx-delay</b>	Restores the default transmission delay.
<a href="#">Configuring the Initialization Delay</a>	 (Optional) It is used to configure the delay time for LLDP to initialize on any interface.	
	<b>lldp timer reinit-delay seconds</b>	Configures the initialization delay.
	<b>no lldp timer reinit-delay</b>	Restores the default initialization delay.
<a href="#">Configuring the LLDP Trap Function</a>	 (Optional) It is used to configure the LLDP Trap function.	
	<b>lldp notification remote-change enable</b>	Enables the LLDP Trap function.
	<b>no lldp notification remote-change enable</b>	Disables the LLDP Trap function.
	<b>lldp timer notification-interval</b>	Configures the LLDP Trap transmission interval.

Configuration	Description and Command	
	<b>no lldp timer notification-interval</b>	Restores the default LLDP Trap transmission interval.
<a href="#">Configuring the LLDP Error Detection Function</a>	 (Optional) It is used to configure the LLDP error detection function.	
	<b>lldp error-detect</b>	Enables the LLDP error detection function.
	<b>no lldp error-detect</b>	Disables the LLDP error detection function.
<a href="#">Configuring the LLDP Encapsulation Format</a>	 (Optional) It is used to configure the LLDP encapsulation format.	
	<b>lldp encapsulation snap</b>	Sets the LLDP encapsulation format to SNAP.
	<b>no lldp encapsulation snap</b>	Sets the LLDP encapsulation format to Ethernet II.
<a href="#">Configuring the LLDP Network Policy</a>	 (Optional) It is used to configure the LLDP Network Policy.	
	<b>lldp network-policy profile <i>profile-num</i></b>	Configures an LLDP Network Policy.
	<b>no lldp network-policy profile <i>profile-num</i></b>	Deletes an LLDP Network Policy.
<a href="#">Configuring the Civic Address</a>	 (Optional) It is used to configure the civic address of a device.	
	<b>{ country   state   county   city   division   neighborhood   street-group   leading-street-dir   trailing-street-suffix   street-suffix   number   street-number-suffix   landmark   additional-location-information   name   postal-code   building   unit   floor   room   type-of-place   postal-community-name   post-office-box   additional-code } <i>ca-word</i></b>	Configures the civic address of a device.
	<b>no { country   state   county   city   division   neighborhood   street-group   leading-street-dir   trailing-street-suffix   street-suffix   number   street-number-suffix   landmark   additional-location-information   name   postal-code   building   unit   floor   room   type-of-place   postal-community-name   post-office-box   additional-code } <i>ca-word</i></b>	Deletes civic address of a device.
<a href="#">Configuring the Emergency Telephone Number</a>	 (Optional) It is used to configure the emergency telephone number of a device.	
	<b>lldp location elin identifier <i>id</i> elin-location <i>tel-number</i></b>	Configures the emergency telephone number of a device.

Configuration	Description and Command	
	<b>no lldp location elin identifier <i>id</i></b>	Deletes the emergency telephone number of a device.
<a href="#">Configuring the Function of Ignoring PVID Detection</a>	 (Optional) It is used to ignore PVID detection.	
	<b>lldp ignore pvid-error-detect</b>	Enables the function of ignoring PVID detection.
	<b>no lldp ignore pvid-error-detect</b>	Disables the function of ignoring PVID detection.

## 11.4.1 Configuring the LLDP Function

### Configuration Effect

- Enable or disable the LLDP function.

### Notes

- To make the LLDP function take effect on an interface, you need to enable the LLDP function globally and on the interface.

### Configuration Steps

- Optional.
- Configure the LLDP function in global or interface configuration mode.

### Verification

Display LLDP status

- Check whether the LLDP function is enabled in global configuration mode.
- Check whether the LLDP function is enabled in interface configuration mode.

### Related Commands

#### ↳ Enabling the LLDP Function

<b>Command</b>	<b>lldp enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	The LLDP function takes effect on an interface only after it is enabled in global configuration mode and interface configuration mode.

#### ↳ Disabling the LLDP Function

<b>Command</b>	<b>no lldp enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### Disabling the LLDP Function

<b>Configuration Steps</b>	Disable the LLDP function in global configuration mode.
	<pre>Ruijie(config)#no lldp enable</pre>
<b>Verification</b>	Display global LLDP status.
	<pre>Ruijie(config)#show lldp status Global status of LLDP: Disable</pre>

## Common Errors

- If the LLDP function is enabled on an interface but disabled in global configuration mode, the LLDP function does not take effect on the interface.
- A port can learn a maximum of five neighbors.
- If a neighbor does not support LLDP but it is connected to an LLDP-supported device, a port may learn information about the device that is not directly connected to the port because the neighbor may forward LLDP packets.

## 11.4.2 Configuring the LLDP Work Mode

### Configuration Effect

- If you set the LLDP work mode to TxRx, the interface can transmit and receive packets.
- If you set the LLDP work mode to Tx, the interface can only transmit packets but cannot receive packets.
- If you set the LLDP work mode to Rx, the interface can only receive packets but cannot transmit packets.
- If you disable the LLDP work mode, the interface can neither receive nor transmit packets.

### Notes

- LLDP runs on physical ports (AP member ports for AP ports). Stacked ports and VSL ports do not support LLDP.

### Configuration Steps

- Optional.

- Set the LLDP work mode to Tx or Rx as required.

### Verification

Display LLDP status information on an interface

- Check whether the configuration takes effect.

### Related Commands

#### ▾ Configuring the LLDP Work Mode

<b>Command</b>	<b>lldp mode { rx   tx   txrx }</b>
<b>Parameter</b>	<b>rx:</b> Only receives LLDPDUs.
<b>Description</b>	<b>tx:</b> Only transmits LLDPDUs. <b>txrx:</b> Transmits and receives LLDPDUs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To make LLDP take effect on an interface, make sure to enable LLDP globally and set the LLDP work mode on the interface to Tx, Rx or TxRx.

#### ▾ Disabling the LLDP Work Mode

<b>Command</b>	<b>no lldp mode</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After the LLDP work mode on an interface is disabled, the interface does not transmit or receive LLDP packets.

### Configuration Example

#### ▾ Configuring the LLDP Work Mode

<b>Configuration Steps</b>	Set the LLDP work mode to Tx in interface configuration mode.
	<pre>Ruijie(config)#interface gigabitethernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#lldp mode tx</pre>
<b>Verification</b>	Display LLDP status information on the interface.
	<pre>Ruijie(config-if-GigabitEthernet 0/1)#show lldp status interface gigabitethernet 0/1 Port [GigabitEthernet 0/1] Port status of LLDP           : Enable</pre>

Port state	: UP
Port encapsulation	: Ethernet II
Operational mode	: TxOnly
Notification enable	: NO
Error detect enable	: YES
Number of neighbors	: 0
Number of MED neighbors	: 0

### 11.4.3 Configuring the TLVs to Be Advertised

#### Configuration Effect

- Configure the type of TLVs to be advertised to specify the LLDPDUs in LLDP packets.

#### Notes

- If you configure the **all** parameter for the basic management TLVs, IEEE 802.1 organizationally specific TLVs, and IEEE 802.3 organizationally specific TLVs, all optional TLVs of these types are advertised.
- If you configure the **all** parameter for the LLDP-MED TLVs, all LLDP-MED TLVs except Location Identification TLV are advertised.
- If you want to configure the LLDP-MED Capability TLV, configure the LLDP 802.3 MAC/PHY TLV first; if you want to cancel the LLDP 802.3 MAC/PHY TLV, cancel the LLDP-MED Capability TLV first.
- If you want to configure LLDP-MED TLVs, configure the LLDP-MED Capability TLV before configuring other types of LLDP-MED TLVs. If you want to cancel LLDP-MED TLVs, cancel the LLDP-MED Capability TLV before canceling other types of LLDP-MED TLVs. If a device is connected to an IP-Phone that supports LLDP-MED, you can configure the Network Policy TLV to push policy configuration to the IP-Phone.
- If a device supports the DCBX function by default, ports of the device are not allowed to advertise IEEE 802.3 organizationally specific TLVs and LLDP-MED TLVs by default.

#### Configuration Steps

- Optional.
- Configure the type of TLVs to be advertised on an interface.

#### Verification

Display the configuration of TLVs to be advertised on an interface

- Check whether the configuration takes effect.

Network Policy TLV       YES     YES
Location Identification TLV NO     NO
Extended Power via MDI TLV YES     YES
Inventory TLV             YES     YES
    
```

### 11.4.4 Configures the Management Address to Be Advertised

#### Configuration Effect

- Configure the management address to be advertised in LLDP packets in interface configuration mode.

- After the management address to be advertised is cancelled, the management address in LLDP packets is subject to the default settings.

## Notes

- LLDP runs on physical ports (AP member ports for AP ports). Stacked ports and VSL ports do not support LLDP.

## Configuration Steps

- Optional.
- Configure the management address to be advertised in LLDP packets in interface configuration mode.

## Verification

Display LLDP information on a local interface

- Check whether the configuration takes effect.

## Related Commands

### ↘ Configuring the Management Address to Be Advertised

<b>Command</b>	<b>lldp management-address-tlv [ ip-address ]</b>
<b>Parameter Description</b>	<i>ip-address</i> : Indicates the management address to be advertised in an LLDP packet.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A management address is advertised through LLDP packets by default. The management address is the IPv4 address of the minimum VLAN supported by the port. If no IPv4 address is configured for the VLAN, LLDP keeps searching for the qualified IP address. If no IPv4 address is found, LLDP searches for the IPv6 address of the minimum VLAN supported by the port. If no IPv6 address is found, the loopback address 127.0.0.1 is used as the management address.

### ↘ Canceling the Management Address

<b>Command</b>	<b>no lldp management-address-tlv</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A management address is advertised through LLDP packets by default. The management address is the IPv4 address of the minimum VLAN supported by the port. If no IPv4 address is configured for the VLAN, LLDP keeps searching for the qualified IP address. If no IPv4 address is found, LLDP searches for the IPv6 address of the minimum VLAN supported by the port.

	If no IPv6 address is found, the loopback address 127.0.0.1 is used as the management address.

## 11.4.5 Configuring the LLDP Fast Transmission Count

### Configuration Effect

- Configure the number of LLDP packets that are fast transmitted.

### Configuration Steps

- Optional.
- Configure the number of LLDP packets that are fast transmitted in global configuration mode.

### Verification

Displaying the global LLDP status information

- Check whether the configuration takes effect.

### Related Commands

#### ▾ Configuring the LLDP Fast Transmission Count

<b>Command</b>	<b>lldp fast-count</b> <i>value</i>
<b>Parameter</b>	<i>value</i> : Indicates the number of LLDP packets that are fast transmitted. The value ranges from 1 to 10. The
<b>Description</b>	default value is 3.

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Restoring the Default LLDP Fast Transmission Count

<b>Command</b>	<b>no lldp fast-count</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### ↘ Configuring the LLDP Fast Transmission Count

<b>Configuration Steps</b>	Set the LLDP fast transmission count to 5 in global configuration mode.
	<pre>Ruijie(config)#lldp fast-count 5</pre>
<b>Verification</b>	Display the global LLDP status information.
	<pre>Ruijie(config)#show lldp status Global status of LLDP           : Enable Neighbor information last changed time : Transmit interval               : 30s Hold multiplier                 : 4 Reinit delay                   : 2s Transmit delay                  : 2s Notification interval          : 5s Fast start counts               : 5</pre>

## 11.4.6 Configuring the TTL Multiplier and Transmission Interval

### Configuration Effect

- Configure the TTL multiplier.
- Configure the LLDP packet transmission interval.

### Configuration Steps

- Optional.
- Perform the configuration in global configuration mode.

## Verification

Display LLDP status information on an interface

- Check whether the configuration takes effect.

## Related Commands

### ↘ Configuring the TTL Multiplier

<b>Command</b>	<b>lldp hold-multiplier</b> <i>value</i>
<b>Parameter Description</b>	<i>value</i> : Indicates the TTL multiplier. The value ranges from 2 to 10. The default value is 4.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In an LLDP packet, the value of Time To Live TLV is calculated based on the following formula: Time to Live TLV = TTL multiplier x Packet transmission interval + 1. Therefore, you can modify the Time to Live TLV in LLDP packets by configuring the TTL multiplier.

### ↘ Restoring the Default TTL Multiplier

<b>Command</b>	<b>no lldp hold-multiplier</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In an LLDP packet, the value of Time To Live TLV is calculated based on the following formula: Time to Live TLV = TTL multiplier x Packet transmission interval + 1. Therefore, you can modify the Time to Live TLV in LLDP packets by configuring the TTL multiplier.

### ↘ Configuring the Transmission Interval

<b>Command</b>	<b>lldp timer tx-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LLDP packet transmission interval. The value ranges from 5 to 32,768.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Restoring the Default Transmission Interval

<b>Command</b>	<b>no lldp timer tx-interval</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### ▾ Configuring the TTL Multiplier and Transmission Interval

<b>Configuration Steps</b>	Set the TTL multiplier to 3 and the transmission interval to 20 seconds. The TTL of local device information on neighbors is 61 seconds.
	<pre>Ruijie(config)#lldp hold-multiplier 3 Ruijie(config)#lldp timer tx-interval 20</pre>
<b>Verification</b>	Display the global LLDP status information.
	<pre>Ruijie(config)#lldp hold-multiplier 3 Ruijie(config)#lldp timer tx-interval 20 Ruijie(config)#show lldp status  Global status of LLDP                : Enable Neighbor information last changed time : Transmit interval                     : 20s Hold multiplier                       : 3 Reinit delay                          : 2s Transmit delay                        : 2s Notification interval                 : 5s Fast start counts                     : 3</pre>

## 11.4.7 Configuring the Transmission Delay

### Configuration Effect

- Configure the delay time for LLDP packet transmission.

### Configuration Steps

- Optional.
- Perform the configuration in global configuration mode.

### Verification

Displaying the global LLDP status information

- Check whether the configuration takes effect.

## Related Commands

### Configuring the Transmission Delay

<b>Command</b>	<b>lldp timer tx-delay</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the transmission delay. The value ranges from 1 to 8,192.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When local information of a device changes, the device immediately transmits LLDP packets to its neighbors. Configure the transmission delay to prevent frequent transmission of LLDP packets caused by frequent changes of local information.

### Restoring the Default Transmission Delay

<b>Command</b>	<b>no lldp timer tx-delay</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When local information of a device changes, the device immediately transmits LLDP packets to its neighbors. Configure the transmission delay to prevent frequent transmission of LLDP packets caused by frequent changes of local information.

## Configuration Example

### Configuring the Transmission Delay

<b>Configuration Steps</b>	Set the transmission delay to 3 seconds.
	<pre>Ruijie(config)#lldp timer tx-delay 3</pre>
<b>Verification</b>	Display the global LLDP status information.
	<pre>Ruijie(config)#show lldp status Global status of LLDP           : Enable Neighbor information last changed time : Transmit interval               : 30s Hold multiplier                  : 4 Reinit delay                     : 2s</pre>

Transmit delay	: 3s
Notification interval	: 5s
Fast start counts	: 3

## 11.4.8 Configuring the Initialization Delay

### Configuration Effect

- Configure the delay time for LLDP to initialize on any interface.

### Configuration Steps

- Optional.
- Configure the delay time for LLDP to initialize on any interface.

### Verification

Display the global LLDP status information

- Check whether the configuration takes effect.

### Related Commands

#### ▾ Configuring the Initialization Delay

<b>Command</b>	<b>lldp timer reinit-delay</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the initialization delay . The value ranges from 1 to 10 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure the initialization delay to prevent frequent initialization of the state machine caused by frequent changes of the port work mode.

#### ▾ Restoring the Default Initialization Delay

<b>Command</b>	<b>no lldp timer reinit-delay</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure the initialization delay to prevent frequent initialization of the state machine caused by frequent changes of the port work mode.

### Configuration Example

#### ▾ Configuring the Initialization Delay

<b>Configuration Steps</b>	Set the initialization delay to 3 seconds.
	<pre>Ruijie(config)#lldp timer reinit-delay 3</pre>
<b>Verification</b>	Display the global LLDP status information.
	<pre>Ruijie(config)#show lldp status Global status of LLDP           : Enable Neighbor information last changed time : Transmit interval                : 30s Hold multiplier                  : 4 Reinit delay                     : 3s Transmit delay                   : 2s Notification interval           : 5s Fast start counts                : 3</pre>

## 11.4.9 Configuring the LLDP Trap Function

### Configuration Effect

- Configure the interval for transmitting LLDP Trap messages.

### Configuration Steps

#### ▾ Enabling the LLDP Trap Function

- Optional.
- Perform the configuration in interface configuration mode.

#### ▾ Configuring the LLDP Trap Transmission Interval

- Optional.
- Perform the configuration in global configuration mode.

### Verification

Display LLDP status information

- Check whether the LLDP Trap function is enabled.
- Check whether the interval configuration takes effect.

### Related Commands

### ▾ Enabling the LLDP Trap Function

<b>Command</b>	<b>lldp notification remote-change enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The LLDP Trap function enables a device to send its local LLDP information (such as neighbor discovery and communication link fault) to the NMS server so that administrators learn about the network performance

### ▾ Disabling the LLDP Trap Function

<b>Command</b>	<b>no lldp notification remote-change enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The LLDP Trap function enables a device to send its local LLDP information (such as neighbor discovery and communication link fault) to the NMS server so that administrators learn about the network performance.

### ▾ Configuring the LLDP Trap Transmission Interval

<b>Command</b>	<b>lldp timer notification-interval <i>seconds</i></b>
<b>Parameter</b>	<i>seconds</i> : Indicates the interval for transmitting LLDP Trap messages. The value ranges from 5 to 3,600
<b>Description</b>	<i>seconds</i> . The default value is 5 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure the LLDP Trap transmission interval to prevent frequent transmission of LLDP Trap messages. LLDP changes detected within this interval will be transmitted to the NMS server.

### ▾ Restoring the LLDP Trap Transmission Interval

<b>Command</b>	<b>no lldp timer notification-interval</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure the LLDP Trap transmission interval to prevent frequent transmission of LLDP Trap messages. LLDP changes detected within this interval will be transmitted to the NMS server.

## Configuration Example

### ▾ Enabling the LLDP Trap Function and Configuring the LLDP Trap Transmission Interval

<b>Configuration Steps</b>	Enable the LLDP Trap function and set the LLDP Trap transmission interval to 10 seconds.
	<pre>Ruijie(config)#lldp timer notification-interval 10 Ruijie(config)#interface gigabitethernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#lldp notification remote-change enable</pre>
<b>Verification</b>	Display LLDP status information.
	<pre>Ruijie(config-if-GigabitEthernet 0/1)#show lldp status Global status of LLDP           : Enable Neighbor information last changed time : Transmit interval               : 30s Hold multiplier                 : 4 Reinit delay                    : 2s Transmit delay                  : 2s Notification interval           : 10s Fast start counts               : 3 ----- Port [GigabitEthernet 0/1] ----- Port status of LLDP            : Enable Port state                     : UP Port encapsulation             : Ethernet II Operational mode               : RxAndTx Notification enable            : YES Error detect enable            : YES Number of neighbors            : 0 Number of MED neighbors        : 0</pre>

## 11.4.10 Configuring the LLDP Error Detection Function

### Configuration Effect

- Enable the LLDP error detection function. When LLDP detects an error, the error is logged.

- Configure the LLDP error detection function to detect VLAN configuration at both ends of a link, port status, aggregate port configuration, MTU configuration, and loops.

## Notes

N/A

## Configuration Steps

- Optional.
- Enable or disable the LLDP error detection function in interface configuration mode.

## Verification

Display LLDP status information on an interface

- Check whether the configuration takes effect.

## Related Commands

### ↳ Enabling the LLDP Error Detection Function

<b>Command</b>	<b>lldp error-detect</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The LLDP error detection function relies on specific TLVs in LLDP packets exchanged between devices at both ends of a link. Therefore, a device needs to advertise correct TLVs to ensure the LLDP error detection function.

### ↳ Disabling the LLDP Error Detection Function

<b>Command</b>	<b>no lldp error-detect</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The LLDP error detection function relies on specific TLVs in LLDP packets exchanged between devices at both ends of a link. Therefore, a device needs to advertise correct TLVs to ensure the LLDP error detection function.

## Configuration Example

### ↳ Enabling the LLDP Error Detection Function

<b>Configuration Steps</b>	Enable the LLDP error detection function on interface GigabitEthernet 0/1.
----------------------------	--

	<pre>Ruijie(config)#interface gigabitethernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#lldp error-detect</pre>
<b>Verification</b>	Display LLDP status information on the interface.
	<pre>Ruijie(config-if-GigabitEthernet 0/1)#show lldp status interface gigabitethernet 0/1 Port [GigabitEthernet 0/1] Port status of LLDP          : Enable Port state                   : UP Port encapsulation          : Ethernet II Operational mode             : RxAndTx Notification enable         : NO Error detect enable         : YES Number of neighbors         : 0 Number of MED neighbors     : 0</pre>

### 11.4.11 Configuring the LLDP Encapsulation Format

#### Configuration Effect

- Configure the LLDP encapsulation format.

#### Configuration Steps

- Optional.
- Configure the LLDP encapsulation format on an interface.

#### Verification

Display LLDP status information of an interface

- Check whether the configuration takes effect.

#### Related Commands

##### ▾ Setting the LLDP Encapsulation Format to SNAP

<b>Command</b>	<b>lldp encapsulation snap</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode

<b>Usage Guide</b>	 The LLDP encapsulation format configuration on a device and its neighbors must be consistent.
--------------------	---

↘ Restoring the Default LLDP Encapsulation Format (Ethernet II)

<b>Command</b>	No lldp encapsulation snap
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	 The LLDP encapsulation format configuration on a device and its neighbors must be consistent.

Configuration Example

↘ Setting the LLDP Encapsulation Format to SNAP

<b>Configuration Steps</b>	Set the LLDP encapsulation format to SNAP.
	<pre>Ruijie(config)#interface gigabitethernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#lldp encapsulation snap</pre>
<b>Verification</b>	Display LLDP status information on the interface.
	<pre>Ruijie(config-if-GigabitEthernet 0/1)#show lldp status interface gigabitethernet 0/1 Port [GigabitEthernet 0/1] Port status of LLDP           : Enable Port state                    : UP Port encapsulation           : Snap Operational mode              : RxAndTx Notification enable           : NO Error detect enable           : YES Number of neighbors           : 0 Number of MED neighbors       : 0</pre>

11.4.12 Configuring the LLDP Network Policy

Configuration Effect

- Configure the LLDP Network Policy.

- If a device is connected to an IP-Phone that supports LLDP-MED, you can configure the Network Policy TLV to push policy configuration to the IP-Phone, which enables the IP-Phone to change the tag and QoS of voice streams. In addition to the LLDP Network Policy, perform the following steps on the device: 1. Enable the Voice VLAN function and add the port connected to the IP-Phone to the Voice VLAN. 2. Configure the port connected to the IP-Phone as a QoS trusted port (the trusted DSCP mode is recommended). 3. If 802.1X authentication is also enabled on the port, configure a secure channel for the packets from the Voice VLAN. If the IP-Phone does not support LLDP-MED, enable the voice VLAN function and add the MAC address of the IP-Phone to the Voice VLAN OUI list manually.
- For the configuration of the QoS trust mode, see *Configuring IP QoS*; for the configuration of the Voice VLAN, see *Configuring Voice VLAN*; for the configuration of the secure channel, see *Configuring ACL*.

## Configuration Steps

- Optional.
- Configure the LLDP Network Policy.

## Verification

Displaying the LLDP network policy configuration.

- Check whether the configuration takes effect.

## Related Commands

### ▾ Configuring the LLDP Network Policy

<b>Command</b>	<b>lldp network-policy profile</b> <i>profile-num</i>
<b>Parameter Description</b>	<i>profile-num</i> : Indicates the ID of an LLDP Network Policy. The value ranges from 1 to 1,024.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to enter the LLDP network policy mode after specifying a policy ID. After entering the LLDP network policy mode, run the <b>{ voice   voice-signaling } vlan</b> command to configure a specific network policy.

### ▾ Deleting the LLDP Network Policy

<b>Command</b>	<b>no lldp network-policy profile</b> <i>profile-num</i>
<b>Parameter Description</b>	<i>profile-num</i> : Indicates the LLDP Network Policy ID. The value ranges from 1 to 1,024.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Run this command to enter the LLDP network policy mode after specifying a policy ID. After entering the LLDP network policy mode, run the <b>{ voice   voice-signaling } vlan</b> command to configure a specific network policy.

## Configuration Example

➤ **Configuring the LLDP Network Policy**

<b>Configuration Steps</b>	Set the Network Policy TLV to 1 for LLDP packets to be advertised by port GigabitEthernet 0/1 and set the VLAN ID of the Voice application to 3, COS to 4, and DSCP to 6.
	<pre>Ruijie#config Ruijie(config)#lldp network-policy profile 1 Ruijie(config-lldp-network-policy)# voice vlan 3 cos 4 Ruijie(config-lldp-network-policy)# voice vlan 3 dscp 6 Ruijie(config-lldp-network-policy)#exit Ruijie(config)# interface gigabitethernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# lldp tlv-enable med-tlv network-policy profile 1</pre>
<b>Verification</b>	Display the LLDP network policy configuration on the local device.
	<pre>network-policy information: ----- network policy profile :1 voice vlan 3 cos 4 voice vlan 3 dscp 6</pre>

### 11.4.13 Configuring the Civic Address

#### Configuration Effect

- Configure the civic address of a device.

#### Configuration Steps

- Optional.
- Perform this configuration in LLDP Civic Address configuration mode.

#### Verification

Display the LLDP civic address of the local device

- Check whether the configuration takes effect.

#### Related Commands

➤ **Configuring the Civic Address of a Device**

<b>Command</b>	Configure the LLDP civic address. Use the <b>no</b> option to delete the address. { <b>country</b>   <b>state</b>   <b>county</b>   <b>city</b>   <b>division</b>   <b>neighborhood</b>   <b>street-group</b>   <b>leading-street-dir</b>

**📌 Deleting the Civic Address of a Device**

<p><b>Command</b></p>	<p><b>no { country   state   county   city   division   neighborhood   street-group   leading-street-dir   trailing-street-suffix   street-suffix   number   street-number-suffix   landmark   additional-location-information   name   postal-code   building   unit   floor   room   type-of-place   postal-community-name   post-office-box   additional-code }</b></p>
<p><b>Parameter Description</b></p>	<p>N/A</p>
<p><b>Command Mode</b></p>	<p>LLDP Civic Address configuration mode</p>

<b>Usage Guide</b>	After entering the LLDP Civic Address configuration mode, configure the LLDP civic address.
--------------------	---

▾ **Configuring the Device Type**

<b>Command</b>	<b>device-type</b> <i>device-type</i>
<b>Parameter</b>	<i>device-type</i> : Indicates the device type. The value ranges from 0 to 2. The default value is 1.
<b>Description</b>	0 indicates that the device type is DHCP server. 1 indicates that the device type is switch. 2 indicates that the device type is LLDP MED .
<b>Command Mode</b>	LLDP Civic Address configuration mode
<b>Usage Guide</b>	After entering the LLDP Civic Address configuration mode, configure the device type.

▾ **Restoring the Device Type**

<b>Command</b>	<b>no device-type</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	LLDP Civic Address configuration mode
<b>Usage Guide</b>	After entering the LLDP Civic Address configuration mode, restore the default settings.

**Configuration Example**

▾ **Configuring the Civic Address of a Device**

<b>Configuration Steps</b>	Set the address of port GigabitEthernet 0/1 as follows: set country to CH, city to Fuzhou, and postal code to 350000.
	<pre>Ruijie#config Ruijie(config)#lldp location civic-location identifier 1 Ruijie(config-lldp-civic)# country CH Ruijie(config-lldp-civic)# city Fuzhou Ruijie(config-lldp-civic)# postal-code 350000</pre>
<b>Verification</b>	Display the LLDP civic address of port GigabitEthernet 0/1 1.
	<pre>civic location information: ----- Identifier           :1 country              :CH device type         :1</pre>

city	:Fuzhou
postal-code	:350000

## 11.4.14 Configuring the Emergency Telephone Number

### Configuration Effect

- Configure the emergency telephone number of a device.

### Configuration Steps

- Optional.
- Perform this configuration in global configuration mode.

### Verification

Display the emergency telephone number of the local device

- Check whether the configuration takes effect.

### Related Commands

#### ▾ Configuring the Emergency Telephone Number of a Device

<b>Command</b>	<b>lldp location elin identifier</b> <i>id</i> <b>elin-location</b> <i>tel-number</i>
<b>Parameter</b>	<i>id</i> : Indicates the identifier of an emergency telephone number. The value ranges from 1 to 1,024.
<b>Description</b>	<i>tel-number</i> : Indicates emergency telephone number, containing 10-25 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure the emergency telephone number.

#### ▾ Deleting the Emergency Telephone Number of a Device

<b>Command</b>	<b>no lldp location elin identifier</b> <i>id</i>
<b>Parameter</b>	<i>id</i> : Indicates the identifier of an emergency telephone number. The value ranges from 1 to 1,024.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### ▾ Configuring the Emergency Telephone Number of a Device

<b>Configuration Steps</b>	Set the emergency telephone number of port GigabitEthernet 0/1 to 08528555556.
----------------------------	--

	<pre>Ruijie#config Ruijie(config)#lldp location elin identifier 1 elin-location 085283671111</pre>
<b>Verification</b>	Display the emergency telephone number of port GigabitEthernet 0/1.
	<pre>elin location information: ----- Identifier          :1 elin number         :085283671111</pre>

### 11.4.15 Configuring the Function of Ignoring PVID Detection

#### Configuration Effect

- Ignores the PVID detection.

#### Configuration Steps

- Optional.
- According to the real condition, select whether to enable the function..

#### Verification

Display the LLDP information.

- Check whether the status of PVID detection in global LLDP is the same as your configuration.

#### Related Commands

##### ↳ Ignoring PVID Detection

<b>Command</b>	<b>lldp ignore pvid-error-detect</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use the command to ignore PVID detection.

#### Configuration Example

##### ↳ Configuring the Function of Ignoring PVID Detection

<b>Configuration Steps</b>	Ignores PVID detection in global configuration mode.
----------------------------	--

	<pre>Ruijie#config Ruijie(config)#lldp ignore pvid-error-detect</pre>
<b>Verification</b>	Display the global LLDP information.
	<pre>uijie(config)#show lldp status  Global status of LLDP           : Enable Neighbor information last changed time : Transmit interval               : 30s Hold multiplier                  : 4 Reinit delay                     : 2s Transmit delay                   : 2s Notification interval           : 5s Fast start counts                : 5 Ignore PVID error detect        : YES</pre>

## 11.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears LLDP statistics.	<b>clear lldp statistics</b> [ <b>interface</b> <i>interface-name</i> ]
Clears LLDP neighbor information.	<b>clear lldp table</b> [ <b>interface</b> <i>interface-name</i> ]

### Displaying

Description	Command
Displays LLDP information on the local device, which will be organized as TLVs and sent to neighbors.	<b>show lldp local-information</b> [ <b>global</b>   <b>interface</b> <i>interface-name</i> ]
Displays the LLDP civic address or emergency telephone number of a local device.	<b>show lldp location</b> { <b>civic-location</b>   <b>elin-location</b> } { <b>identifier</b> <i>id</i>   <b>interface</b> <i>interface-name</i>   <b>static</b> }
Displays LLDP information on a neighbor.	<b>show lldp neighbors</b> [ <b>interface</b> <i>interface-name</i> ] [ <b>detail</b> ]
Displays the LLDP network policy configuration of the local device.	<b>show lldp network-policy</b> { <b>profile</b> [ <i>profile-num</i> ]   <b>interface</b> <i>interface-name</i> }

Description	Command
Displays LLDP statistics.	<b>show lldp statistics</b> [ <b>global</b>   <b>interface</b> <i>interface-name</i> ]
Displays LLDP status information.	<b>show lldp status</b> [ <b>interface</b> <i>interface-name</i> ]
Displays the configuration of TLVs to be advertised by a port.	<b>show lldp tlv-config</b> [ <b>interface</b> <i>interface-name</i> ]

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs LLDP error processing.	<b>debug lldp error</b>
Debugs LLDP event processing.	<b>debug lldp event</b>
Debugs LLDP hot backup processing.	<b>debug lldp ha</b>
Debugs the LLDP packet reception.	<b>debug lldp packet</b>
Debugs the LLDP state machine.	<b>debug lldp stm</b>

# 12 Configuring QinQ

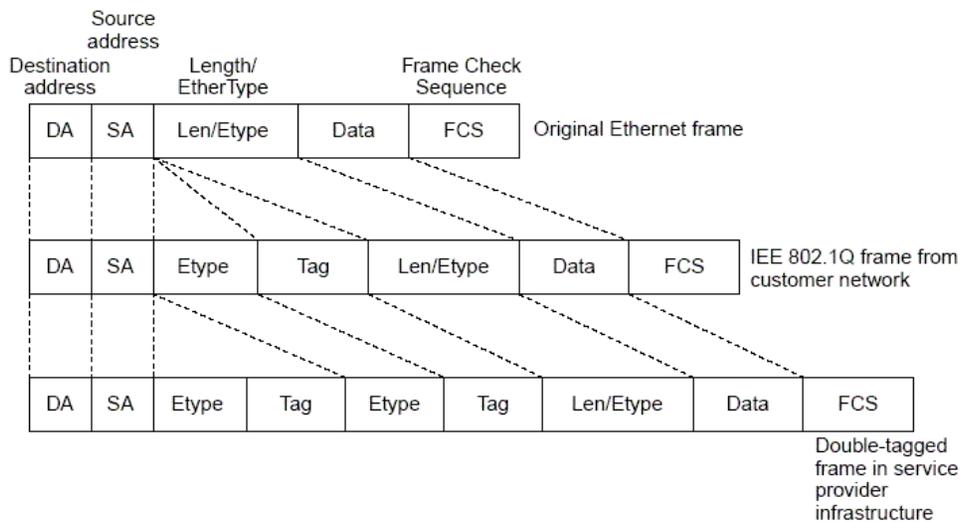

## 12.1 Overview

QinQ is used to insert a public virtual local area network (VLAN) tag into a packet with a private VLAN tag to allow the double-tagged packet to be transmitted over a service provider (SP) network.

Users on a metropolitan area network (MAN) must be separated by VLANs. IEEE 802.1Q supports only 4,094 VLANs, far from enough. Through the double-tag encapsulation provided by QinQ, a packet is transmitted over the SP network based on the unique outer VLAN tag assigned by the public network. In this way, private VLANs can be reused, which increases the number of available VLAN tags and provides a simple Layer-2 virtual private network (VPN) feature.

Figure 13-1 shows the double-tag insertion process. The entrance to an SP network is called a dot1q-tunnel port, or Tunnel port for short. All frames entering provider edges (PEs) are considered untagged. All tags, whether untagged frames or frames with customer VLAN tags, are encapsulated with the tags of the SP network. The VLAN ID of the SP network is the ID of the default VLAN for the Tunnel port.

Figure 13-1 Outer Tag Encapsulation

### Protocols and Standards

- IEEE 802.1ad

## 12.2 Applications

Application	Description
<a href="#">Implementing Layer-2 VPN Through Port-Based Basic QinQ</a>	Data is transmitted from Customer A and Customer B to the peer end without conflict on the SP network even if the data comes from the same VLAN.

Application	Description
<a href="#">Implementing Layer-2 VPN and Service Flow Management Through C-TAG-Based Selective QinQ</a>	Outer tags are inserted into frames flexibly based on different customer VLANs to achieve Layer-2 VPN, segregate service flows (e.g., broadband Internet access and IPTV), and implement various QoS policies. Customer tag (C-TAG)-based QinQ is more flexible than port-based QinQ.
<a href="#">Implementing Layer-2 VPN and Service Flow Management Through ACL-Based Selective QinQ</a>	The different service flows, such as broadband Internet access and IPTV, are segregated based on access control lists (ACLs). Different QoS policies are applied to service flows through selective QinQ.
<a href="#">Implementing VLAN Aggregation for Different Services Through VLAN Mapping</a>	Different service flows (PC, IPTV, and VoIP) are transmitted through different VLANs. The VLANs are aggregated on a campus network so that only one VLAN is used to carry the same service flows, thus saving VLAN resources.
<a href="#">Implementing QinQ-Based Layer-2 Transparent Transmission</a>	Customer Network A and Customer Network B in different areas can perform unified Multiple Spanning Tree Protocol (MSTP) calculation or VLAN deployment across the SP network without affecting the SP network.

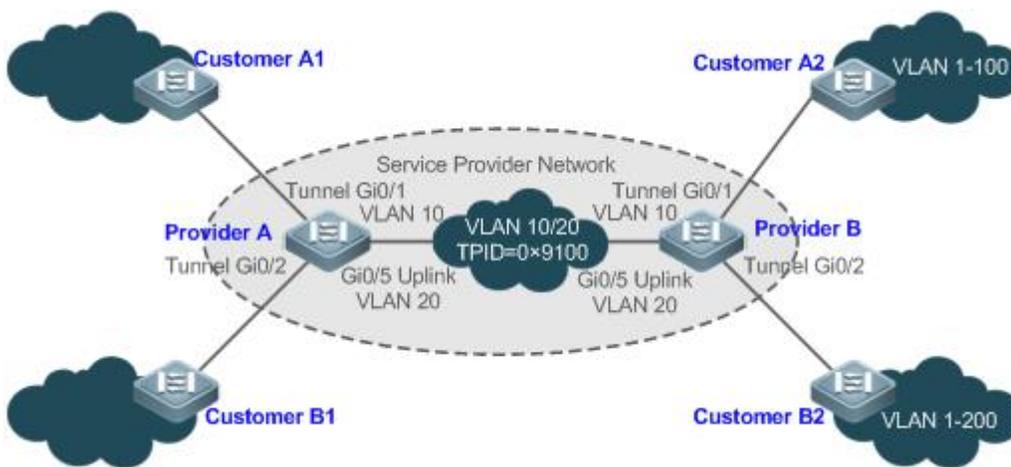

### 12.2.1 Implementing Layer-2 VPN Through Port-Based Basic QinQ

#### Scenario

An SP provides the VPN service to Customer A and Customer B.

- Customer A and Customer B belong to different VLANs on the SP network and achieve communication through respective SP VLANs.
- The VLANs of Customer A and Customer B are transparent to the SP network. The VLANs can be reused without conflicts.
- The Tunnel port encapsulates a native VLAN tag in each packet. Packets are transmitted through the native VLAN over the SP network without impact on the VLANs of Customer A and Customer B, thus implementing simple Layer-2 VPN.

Figure 13-2

<b>Remarks</b>	Customer A1 and Customer A2 are the customer edges (CEs) for Customer A network. Customer B1 and Customer B2 are the CEs for Customer B network.
----------------	--

Provider A and Provider B are the PEs on the SP network. Customer A and Customer B access the SP network through Provider A and Provider B. The VLAN of Customer A ranges from 1 to 100. The VLAN of Customer B ranges from 1 to 200.
---

## Deployment

- Enable basic QinQ on PEs to implement Layer-2 VPN.
- The tag protocol identifiers (TPIDs) used by many switches (including Ruijie switches) are set to 0x8100, but the switches of some vendors do not use 0x8100. In the latter case, you need to change the TPID value on the Uplink ports of PEs to the values of the TPIDs used by third-party switches.
- Configure priority replication and priority mapping for class of service (CoS) on the Tunnel ports of PEs, and configure different QoS policies for different service flows (for details, see *Configuring QoS*).

## 12.2.2 Implementing Layer-2 VPN and Service Flow Management Through C-TAG-Based Selective QinQ

### Scenario

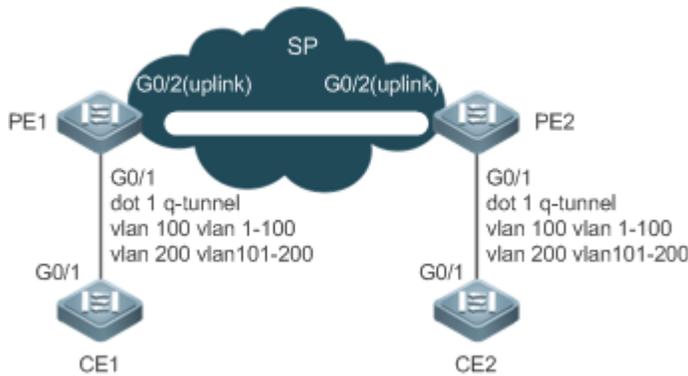

Basic QinQ encapsulates an outer tag of the native VLAN in a packet. That is, the encapsulation of outer tags depends on the native VLAN on Tunnel ports. Selective QinQ encapsulates an outer tag in a packet based on its inner tag to implement VPN transparent transmission and apply QoS policies flexibly.

- Broadband Internet access and IPTV are important services carried by MANs. The SPs manage different service flows through different VLANs and provides QoS policies for the VLANs or CoS. You can enable C-TAG-based QinQ on PEs to encapsulate outer VLAN tags in the service flows to achieve transparent transmission based on the QoS policies of the SP network.
- Important services and regular services are separated within different VLAN ranges. The customer can transmit service flows transparently over an SP network through C-TAG-based selective QinQ and ensure preferential transmission of important service flows by using the QoS policies of the SP network.

In Figure 13-3, the CEs are aggregated by the floor switches inside residential buildings. The broadband Internet access and IPTV services are segregated by VLANs with different QoS policies.

- The service flows of broadband Internet access and IPTV are transmitted transparently by different VLANs over the SP network.
- The SP network provides QoS policies based on VLANs or CoS. On the PEs, you can encapsulate an outer tag in the service flow based on its inner VLAN tag or set a CoS to ensure preferential transmission of service flows over the SP network.
- The CoS values of service packets can be changed through priority mapping or replication so that the QoS policies of the SP network are applied flexibly.

Figure 13-3

<b>Remarks</b>	<p>CE 1 and CE 2 access the SP network through PE1 and PE2.</p> <p>On CE 1 and CE 2, the broadband Internet access flows are transmitted through VLAN 1–100, and IPTV flows are transmitted through VLAN 101–200.</p> <p>PE 1 and PE 2 are configured with Tunnel ports and VLAN mappings to segregate service flows.</p>
----------------	---

### Deployment

- Configure C-TAG-based selective QinQ on the ports (G0/1) of PE 1 and PE 2 connected to CE 1 and CE 2 respectively to realize the segregation and transparent transmission of service flows.
- If the SP network provides QoS policies based on VLANs or CoS, you can encapsulate an outer tag in the service flow based on its inner tag or set a CoS through priority replication or mapping on PE 1 and PE 2 to ensure preferential transmission of service flows over the SP network.

## 12.2.3 Implementing Layer-2 VPN and Service Flow Management Through ACL-Based Selective QinQ

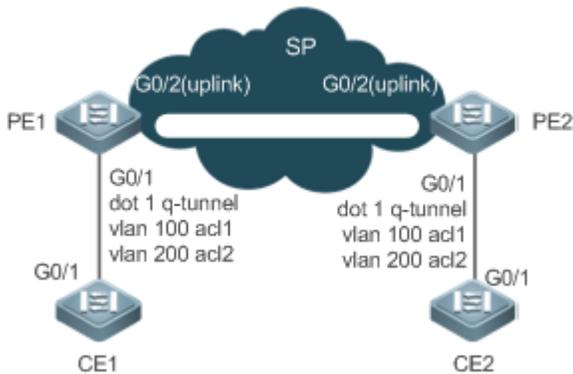

### Scenario

The service flows from the customer network may be classified by MAC address, IP address, or protocol type, instead of by VLAN. The customer network may contain many low-end access devices unable to segregate service flows by VLAN IDs. In the preceding two situations, the packets from the customer network cannot be encapsulated with outer tags based on their inner tags to realize transparent transmission and implement QoS policies. Service flows may be classified by MAC address, IP address, or protocol type through ACLs. Selective QinQ uses ACLs to segregate service flows and add or modify outer tags in order to implement Layer-2 VPN and QoS policies based on different service flows.

In Figure 13-4, different VLANs are configured on PE 1 and PE 2 to transmit different service flows classified through ACLs. If the SP network provides QoS policies based on different services, certain services can be transmitted preferentially.

- Outer VLAN tags are encapsulated based on different service flows. The service flows of a customer network can be transmitted transparently, and its branch offices can access each other.
- The SP network provides QoS policies based on the VLAN tags or CoS values to ensure preferential transmission of certain service flows.

Figure 13-4

<b>Remarks</b>	<p>CE 1 and CE 2 access the SP network through PE 1 and PE 2.</p> <p>PE 1 and PE 2 classify flows based on ACLs: ACL 1 matches the Point-to-Point Protocol over Ethernet (PPPoE) flows, and ACL 2 matches the IPTV flows.</p> <p>PE 1 and PE 2 are configured with Tunnel ports, as well as outer tag encapsulation policies applicable to service flows recognized by different ACLs.</p>
----------------	--

## Deployment

- Configure ACLs on PE 1 and PE 2 to segregate service flows.
- Configure ACL-based selective QinQ on the ports (G0/1) of PE 1 and PE 2 connected to CE 1 and CE 2 respectively to realize the segregation and transparent transmission of service flows.
- If the SP network provides QoS policies based on VLANs or CoS, you can encapsulate an outer tag in the service flow based on its inner tag or set a CoS through priority replication or mapping on PE 1 and PE 2 to ensure preferential transmission of service flows over the SP network.

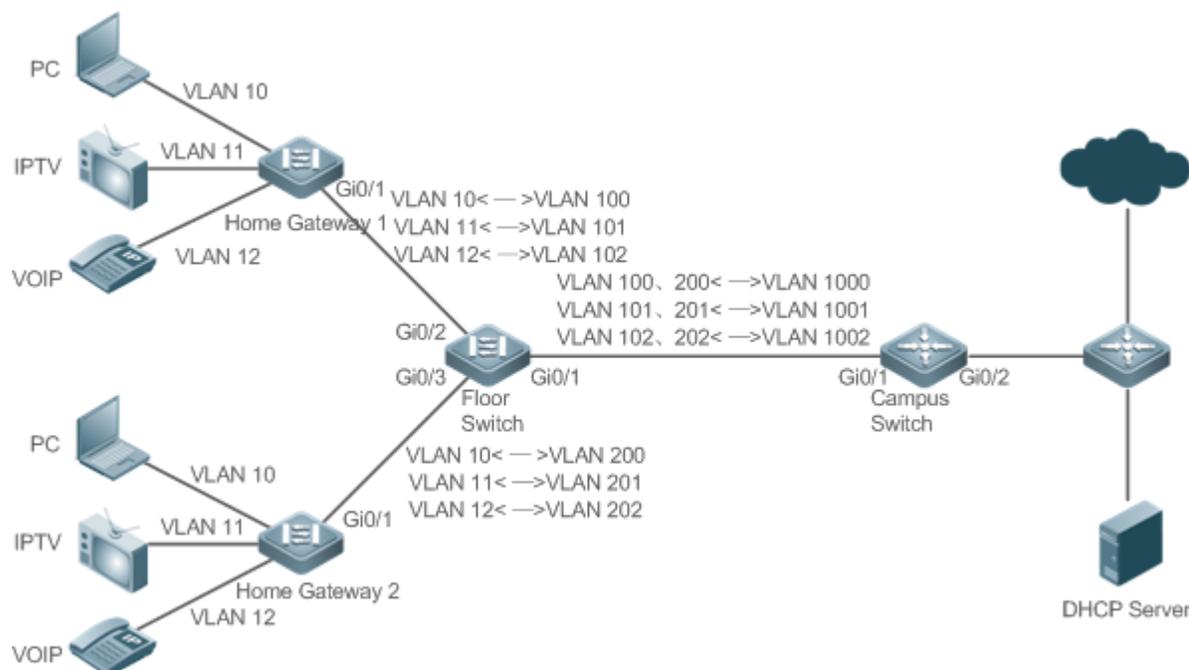

## 12.2.4 Implementing VLAN Aggregation for Different Services Through VLAN Mapping

### Scenario

The different service flows of different users are segregated on a campus network.

- The different service flows are transmitted through different VLANs on the home gateway.
- The same service flows from different users are segregated on the floor switch.
- The same service flows from different users are sent by a campus switch through one single VLAN.

Figure 13-5

**Remarks**

PC, IPTV, and VoIP are different user services.  
 Switch A and Switch B are the gateway devices of different users.  
 Switch C is a floor switch.  
 Switch D is a campus switch.

**Deployment**

- On the home gateway devices, configure VLANs for different services to segregate service flows. For example, configure VLAN 10 for the PC service, VLAN 11 for IPTV, and VLAN 12 for VoIP.
- On the ports of the floor switch (Switch D) connected to the home gateway devices, configure VLAN mapping to segregate the service flows of different users.
- On the campus switch, configure VLAN mapping to segregate the service flows.
- Through the preceding deployment, the different service flows of different users are segregated.

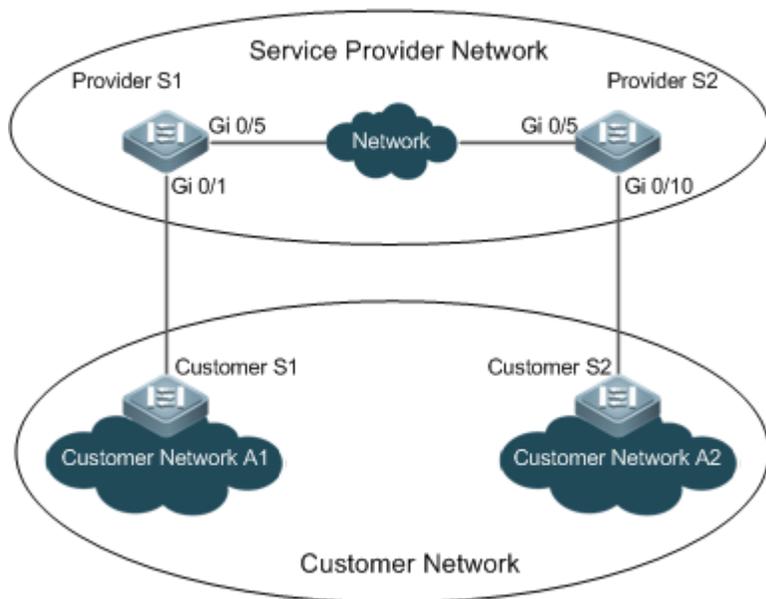

**12.2.5 Implementing QinQ-Based Layer-2 Transparent Transmission**

**Scenario**

The Layer-2 transparent transmission between customer networks has no impact on the SP network.

- The Layer-2 packets on customer networks are transparent to SP networks and can be transmitted between the customer networks without impact on the SP networks.

Figure 13-6

<b>Remarks</b>	Customer S1 and Customer S2 access the SP network through Provider S1 and Provider S2. Provider S1 and Provider S2 are enabled with Layer-2 transparent transmission globally, and the Gi 0/1 and Gi 0/10 ports are enabled with Layer-2 transparent transmission.
----------------	--

**Deployment**

- On the ports of the PEs (Provider S1 and Provider S2) connected to Customer S1 and Customer S2 respectively, configure Layer-2 transparent transmission between Customer Network A1 and Customer Network A2 without impact on the SP network.
- Configure STP transparent transmission based on user requirements to realize transparent transmission of bridge protocol data unit (BPDU) packets between Customer Network A1 and Customer Network A2 and to perform unified MSTP calculation across the SP network.
- Configure GARP VLAN Registration Protocol (GVRP) transparent transmission based on user requirements to realize transparent transmission of GVRP packets between Customer Network A1 and Customer Network A2 and dynamic VLAN configuration on the customer networks across the SP network.

## 12.3 Features

### Basic Concepts

➤ **Basic QinQ**

Configure basic QinQ on a Tunnel port and configure a native VLAN for the port. Packets entering the port are encapsulated with outer tags containing the native VLAN ID. Basic QinQ does not segregate service flows and cannot encapsulate packets flexibly based on VLANs.

➤ **Selective QinQ**

Selective QinQ is classified into two types: selective QinQ based on C-TAGs and selective QinQ based on ACLs.

In C-TAG-based selective QinQ, outer tags are encapsulated in packets based on the inner tags to segregate service flows and realize transparent transmission.

In ACL-based selective QinQ, outer tags are encapsulated in packets based on the ACLs to segregate service flows.

### ▾ TPID

An Ethernet frame tag consists of four fields: TPID, User Priority, Canonical Format Indicator (CFI), and VLAN ID.

By default, the TPID is 0x8100 according to IEEE802.1Q. On the switches of some vendors, the TPID is set to 0x9100 or other values. The TPID configuration aims to ensure that the TPIDs of packets to be forwarded are compatible with the TPIDs supported by third-party switches.

### ▾ Priority Mapping and Priority Replication

The default value of User Priority in Ethernet frame tags is 0, indicating regular flows. You can set this field to ensure preferential transmission of certain packets. You can specify User Priority by setting the value of CoS in a QoS policy.

Priority replication: If the SP network provides a QoS policy corresponding to a specified CoS in the inner tag, you can replicate the CoS of the inner tag to the outer tag to enable transparent transmission based on the QoS policy provided by the SP network.

Priority mapping: If the SP network provides various QoS policies corresponding to specified CoS values for different service flows, you can map the CoS value of the inner tag to the CoS value of the outer tag to ensure preferential transmission of service flows based on the QoS policies provided by the SP network.

### ▾ Layer-2 Transparent Transmission

STP and GVRP packets may affect the topology of the SP network. If you want to unify the topology of two customer networks separated by the SP network without affecting the SP network topology, transmit the STP and GVRP packets from the customer networks over the SP network transparently.

## Overview

Feature	Description
<a href="#">Basic QinQ</a>	Configures the Tunnel port and specifies whether packets sent from the port are tagged.
<a href="#">Selective QinQ</a>	Encapsulates different outer tags in data flows based on ACLs.
<a href="#">VLAN Mapping</a>	Replaces the inner tags of packets with outer tags, and then restores the outer tags to inner tags based on the same rules.
<a href="#">TPID Configuration</a>	By default, the TPID is 0x8100 according to IEEE802.1Q. On the switches of some vendors, the TPIDs of outer tags are set to 0x9100 or other values. The TPID configuration aims to ensure that the TPIDs of packets to be forwarded are compatible with the TPIDs supported by third-party switches.
<a href="#">MAC Address Replication</a>	In ACL-based selective QinQ, the VLAN IDs for the MAC addresses that switches learn belong to the native VLAN. If VLAN conversion is implemented based on ACLs, upon receiving packets from the peer end, the local end may fail to query MAC addresses, causing a flood. To address this problem, MAC address replication is provided to replicate the MAC addresses of the native VLAN to the VLAN where the outer tag is located.

Feature	Description
<a href="#">Layer-2 Transparent Transmission</a>	Transmits Layer-2 packets between customer networks without impact on SP networks.
<a href="#">Priority Replication</a>	If the SP network provides a QoS policy corresponding to a specified CoS value in the inner tag, you can replicate the CoS of the inner tag to the outer tag to enable transparent transmission based on the QoS policy provided by the SP network.
<a href="#">Priority Mapping</a>	If the SP network provides various QoS policies corresponding to specified CoS values for different service flows, you can map the CoS value of the inner tag to the CoS value of the outer tag to ensure preferential transmission of service flows based on the QoS policies provided by the SP network.

### 12.3.1 Basic QinQ

Basic QinQ can be used to implement simple Layer-2 VPN, but it lacks flexibility in encapsulating outer tags.

#### [Working Principle](#)

After a Tunnel port receives a packet, the switch adds the outer tag containing the default VLAN ID to the packet. If the received packet already carries a VLAN tag, it is encapsulated as a double-tagged packet. If it does not have a VLAN tag, it is added with the VLAN tag containing the default VLAN ID.

### 12.3.2 Selective QinQ

Selective QinQ adds different outer tags to data flows flexibly.

#### [Working Principle](#)

Selective QinQ can be used to encapsulate different outer tags based on inner tags, MAC addresses, protocol numbers, source addresses, destination addresses, priorities, or the port numbers of applications. In this way, packets of different users, services, and priorities are encapsulated with different outer VLAN tags.

You can configure the following selective QinQ policies:

- Add an outer VLAN tag based on the inner VLAN tag.
- Modify an outer VLAN tag based on the outer VLAN tag.
- Modify an outer VLAN tag based on the inner VLAN tag.
- Modify an outer VLAN tag based on the inner and outer VLAN tags.
- Add an outer VLAN tag based on the ACL.
- Modify an outer VLAN tag based on the ACL.
- Modify an inner VLAN tag based on the ACL.

### 12.3.3 VLAN Mapping

#### [Working Principle](#)

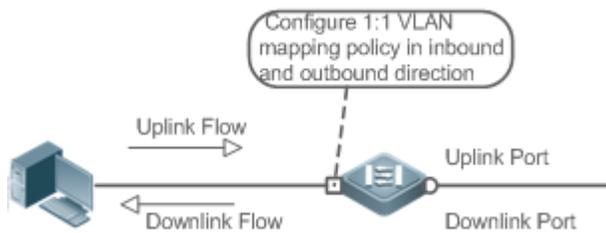

The inner tag of a packet is replaced by an outer tag to allow the packet to be transmitted based on the public network topology. When the packet is transmitted to the customer network, the outer tag is restored to the original inner tag based on the same rule. VLAN mapping supports the following mapping rule:

- 1:1 VLAN mapping: Changes a VLAN ID to the specified VLAN ID.

#### 1:1 VLAN Mapping Mode 1

1:1 VLAN mapping is mainly applied on floor switches to use different VLANs to carry the same services from different users, as shown in Figure 13-7.

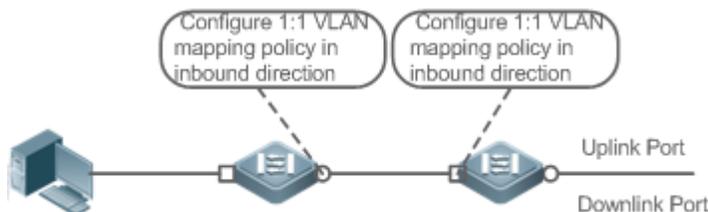

Figure 13-7

- Configure the Downlink port with a VLAN mapping policy in the inbound direction to map the inner tag of the uplink flow to an outer tag.
- Configure the Uplink port with a VLAN mapping policy in the outbound direction to map the outer tag of the downlink flow to the original inner tag.

#### 1:1 VLAN Mapping Mode 2

Figure 13-8

- Configure the Downlink port with a VLAN mapping policy in the inbound direction to map the inner tag of the uplink flow to an outer tag.
- For downstream data flows, Configure the Uplink port with a VLAN mapping policy in the inbound direction to the outer tag of the downlink flow to the original inner tag.

## 12.3.4 TPID Configuration

### Working Principle

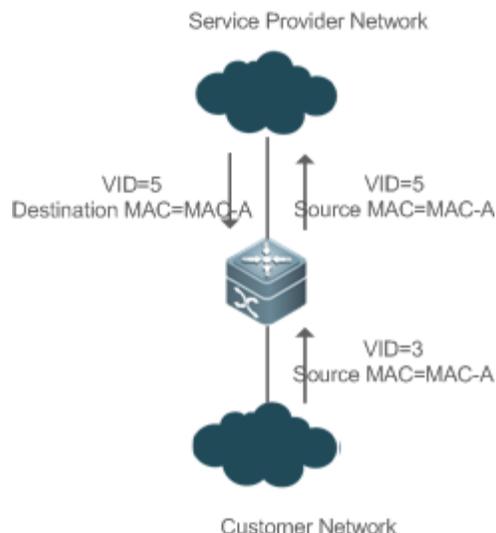

An Ethernet frame tag consists of four fields, namely, TPID, User Priority, CFI, and VLAN ID. By default, the TPID is 0x8100 according to IEEE802.1Q. On the switches of some vendors, the TPIDs of outer tags are set to 0x9100 or other values. The TPID configuration feature allows you to configure TPIDs on ports, which will replace the TPIDs of the outer VLAN tags in packets with the configured TPIDs to realize TPID compatibility.

### 12.3.5 MAC Address Replication

#### Working Principle

In ACL-based selective QinQ, the MAC address learned by a switch belongs to the native VLAN. The Tunnel port tags the packet with the specified outer VLAN ID based on the selective QinQ policy. Upon receiving a reply packet containing the same outer VLAN tag, the Tunnel port fails to find the MAC address in the outer VLAN as it is in the native VLAN, causing a flood.

Figure 13-9

As in Figure 13-9, the customer network is connected to the Tunnel port of the switch. Configured with native VLAN 4, the Tunnel port tags the packet whose source MAC address is A with outer VLAN 5. Upon receiving a packet with inner tag VLAN 3 and source MAC address A, the switch tags the packet with outer VLAN 5. Because the port is configured with native VLAN 4, MAC address A is learned by VLAN 4. Upon receiving the reply packet, the switch looks for MAC address A on VLAN 5 because the outer tag of the packet contains VLAN ID 5. However, MAC address A is not learned by VLAN 5, causing floods.

You can configure the Tunnel port to replicate the MAC address of the native VLAN to the outer VLAN to avoid continuous flooding of the packets from the SP network. You can also configure the Tunnel port to replicate the MAC address of the outer VLAN for the outer tag to the native VLAN to avoid continuous flooding of the packets from the customer network.

### 12.3.6 Layer-2 Transparent Transmission

#### Working Principle

The Layer-2 transparent transmission feature is designed to realize the transmission of Layer-2 packets between customer networks without impact on SP networks. When a Layer-2 packet from a customer network enters a PE, the PE changes the destination MAC address of the packet to a private address before forwarding the packet. The peer PE changes the destination MAC address to a public address to send the packet to the customer network at the other end, realizing transparent transmission on the SP network.

### 12.3.7 Priority Replication

#### Working Principle

If the SP network provides a QoS policy corresponding to a specified User Priority (CoS) in the inner tag, you can replicate the CoS of the inner tag to the outer tag to enable transparent transmission based on the QoS policy provided by the SP network.

### 12.3.8 Priority Mapping

#### Working Principle

If the SP network provides various QoS policies corresponding to specified CoS values for different service flows, you can map the CoS value of the inner tag to the CoS value of the outer tag to ensure preferential transmission of service flows based on the QoS policies provided by the SP network.

## 12.4 Limitations

- The S6500 series products support four global Tag Protocol Identifier (TPID) values. One of the TPID values must be 0x8100, and the other three are random.

## 12.5 Configuration

Configuration	Description and Command	
<a href="#">Configuring QinQ</a>	Mandatory.	
	<b>switchport mode dot1q-tunnel</b>	Configures a Tunnel port.
	<b>switchport dot1q-tunnel allowed vlan { [ add ] tagged vlist   [ add ] untagged vlist   remove vlist }</b>	Adds the VLANs to the Tunnel port in tagged or untagged mode.
	<b>switchport dot1q-tunnel native vlan VID</b>	Configures the default VLAN for the Tunnel port.
<a href="#">Configuring C-TAG-Based Selective QinQ</a>	(Mandatory) It is used to configure C-TAG-based selective QinQ based on basic QinQ. Selective QinQ prevails over basic QinQ.	
	<b>dot1q outer-vid VID register inner-vid v_list</b>	Configures the policy to add the VLAN IDs of outer tags based on inner tags.
<a href="#">Configuring ACL-Based Selective QinQ</a>	(Mandatory) It is used to configure ACL-based selective QinQ based on basic QinQ. Selective QinQ prevails over basic QinQ.	
	<b>traffic-redirect access-group acl nested-vlan VID in</b>	Configures the policy to add the VLAN IDs of outer tags based on ACLs.
<a href="#">Configuring VLAN Mapping</a>	(Mandatory) It is used to enable VLAN mapping.	

Configuration	Description and Command	
	<b>vlan-mapping-in</b> <i>vlan cvlan remark svlan</i>	Configures 1:1 VLAN mapping in the inbound direction. This feature changes the inner VLAN ID of the packet entering a port to a specified outer VLAN ID.
	<b>vlan-mapping-out</b> <i>vlan svlan remark cvlan</i>	Configures 1:1 VLAN mapping in the outbound direction. This feature changes the outer VLAN ID of the packet exiting a port to a specified inner VLAN ID.
	<b>vlan-mapping-in</b> <i>vlan cvlan-list remark svlan</i>	Configures N:1 VLAN mapping in the inbound direction. This feature changes the inner VLAN ID of the packet entering a port to a specified outer VLAN ID.
<a href="#">Configuring TPIDs</a>	 (Optional) It is used to realize TPID compatibility.	
	<b>frame-tag</b> <i>tpid tpid</i>	Configures the TPID of a frame tag. If you want to set it to 0x9100, configure the <b>frame-tag tpid 9100</b> command. By default, the TPID is in hexadecimal format. You need to configure this feature on an egress port.
<a href="#">Configuring MAC Address Replication</a>	 (Optional) It is used to configure MAC address replication to prevent floods.	
	<b>mac-address-mapping</b> <i>x source-vlan src-vlan-list destination-vlan dst-vlan-id</i>	Replicates the dynamic MAC address of the source VLAN to the destination VLAN.
<a href="#">Configuring an Inner/Outer VLAN Tag Modification Policy</a>	 (Optional) It is used to adjust the outer and inner VLAN tags of the packets transmitted over SP networks based on network topologies.	
	<b>dot1q relay-vid</b> <i>VID translate local-vid v_list</i>	Configures the policy to change the VLAN IDs of outer tags based on the outer tags.
	<b>dot1q relay-vid</b> <i>VID translate inner-vid v_list</i>	Configures the policy to change the VLAN IDs of outer tags based on inner tags.
	<b>dot1q new-outer-vlan</b> <i>VID translate old-outer-vlan vid inner-vlan v_list</i>	Configures the policy to change the VLAN IDs of outer tags based on outer and inner tags.
	<b>traffic-redirect access-group</b> <i>acl outer-vlan VID in</i>	Configures the policy to change the VLAN IDs of outer tags based on an ACL.
	<b>traffic-redirect access-group</b> <i>acl inner-vlan VID out</i>	Configures the policy to change the VLAN IDs of inner tags based on an ACL.
<a href="#">Configuring Priority Mapping and Priority</a>	 (Optional) It is used to apply the QoS policy provided by the SP network by priority replication.	

Configuration	Description and Command	
<a href="#">Replication</a>	<b>inner-priority-trust enable</b>	Replicates the value of the User Priority field in the inner tag (C-TAG) to the User Priority field of the outer tag (S-TAG).
	 (Optional) It is used to apply the QoS policy provided by the SP network by priority mapping.	
	<b>dot1q-tunnel cos <i>inner-cos-value</i> remark-cos <i>outer-cos-value</i></b>	Sets the value of the User Priority field in the outer tag (S-TAG) based on the User Priority field of the inner tag (C-TAG).
<a href="#">Configuring Layer-2 Transparent Transmission</a>	 (Optional) It is used to transmit MSTP and GVRP packets transparently based on the customer network topology without affecting the SP network topology.	
	<b>I2protocol-tunnel stp</b>	Enables STP transparent transmission in global configuration mode.
	<b>I2protocol-tunnel stp enable</b>	Enables STP transparent transmission in interface configuration mode.
	<b>I2protocol-tunnel gvrp</b>	Enables GVRP transparent transmission in global configuration mode.
	<b>I2protocol-tunnel gvrp enable</b>	Enables GVRP transparent transmission in interface configuration mode.
	<b>I2protocol-tunnel{STP GVRP}tunnel-dmac <i>mac-address</i></b>	Configures a transparent transmission address.

-  Pay attention to the following limitations when you configure QinQ:
-  Do not configure a routed port as the Tunnel port.
-  Do not enable 802.1X on the Tunnel port.
-  Do not enable the port security function on the Tunnel port.
-  When the Tunnel port is configured as the source port of the remote switched port analyzer (RSPAN), the packets whose outer tags contain VLAN IDs consistent with the RSPAN VLAN IDs are monitored.
-  If you want to match the ACL applied to the Tunnel port with the VLAN IDs of inner tags, use the **inner** keyword.
-  Configure the egress port of the customer network connected to the SP network as an Uplink port. If you configure the TPID of the outer tag on a QinQ-enabled port, set the TPID of the outer tag on the Uplink port to the same value.
-  By default, the maximum transmission unit (MTU) on a port is 1,500 bytes. After added with an outer VLAN tag, a packet is four bytes longer. It is recommended to increase the port MTU on the SP networks to at least 1,504 bytes.
-  After a switch port is enabled with QinQ, you must enable SVGL sharing before enabling IGMP snooping. Otherwise, IGMP snooping will not work on the QinQ-enabled port.
-  If a packet matches two or more ACL-based selective QinQ policies without priority, only one policy is executed. It is recommended to specify the priority.

## 12.5.1 Configuring QinQ

### Configuration Effect

- Implement Layer-2 VPN based on a port-based QinQ policy.

## Notes

- It is not recommended to configure the native VLAN of the Trunk port on the PE as its default VLAN, because the Trunk port strips off the tags containing the native VLAN IDs when sending packets.

## Configuration Steps

### ▾ Configuring the Tunnel port

- (Mandatory) Configure the Tunnel port in interface configuration mode.
- Run the **switchport mode dot1q-tunnel** command in interface configuration mode to configure the Tunnel port.

<b>Command</b>	<b>switchport mode dot1q-tunnel</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, no Tunnel port is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Native VLAN

- Mandatory.
- Configure the native VLAN for the Tunnel port.
- After you configure the native VLAN, add it to the VLAN list of the Tunnel port in untagged mode.
- Run the **switchport dot1q-tunnel native vlan VID** command in interface configuration mode to configure the default VLAN for the Tunnel port.
- If the native VLAN is added to the VLAN list in untagged mode, the outgoing packets on the Tunnel port are not tagged. If the native VLAN is added to the VLAN list in tagged mode, the outgoing packets on the Tunnel port are tagged with the native VLAN ID. To ensure the uplink and downlink transmission, add the native VLAN to the VLAN list in untagged mode.

<b>Command</b>	<b>switchport dot1q-tunnel native vlan VID</b>
<b>Parameter Description</b>	<i>VID</i> : Indicates the ID of the native VLAN. The value ranges from 1 to 4,094. The default value is 1.
<b>Defaults</b>	By default, the native VLAN is VLAN 1.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure the VLAN of the SP network.

### ▾ Adding the VLANs on the Tunnel port

- Mandatory.
- After you configure the native VLAN, add it to the VLAN list of the Tunnel port in untagged mode.

- If port-based QinQ is enabled, you do not need to add the VLANs of the customer network to the VLAN list of the Tunnel port.
- If selective QinQ is enabled, add the VLANs of the customer network to the VLAN list of the Tunnel port in tagged or untagged mode based on requirements.
- Run the **switchport dot1q-tunnel allowed vlan { [ add ] tagged vlist | [ add ] untagged vlist | remove vlist }** command in interface configuration mode to add VLANs to the VLAN list of the Tunnel port. Upon receiving packets from corresponding VLANs, the Tunnel port adds or removes tags based on the settings.

<b>Command</b>	<b>switchport dot1q-tunnel allowed vlan { [ add ] tagged vlist   [ add ] untagged vlist   remove vlist }</b>
<b>Parameter Description</b>	<i>v_list</i> : Indicates the list of the VLANs on the Tunnel port.
<b>Defaults</b>	By default, VLAN 1 is added to the VLAN list of the Tunnel port in untagged mode. Other VLANs are not added.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to add or remove VLANs on the Tunnel port and specify whether the outgoing packets are tagged or untagged. If basic QinQ is enabled, add the native VLAN to the VLAN list of the Tunnel port in untagged mode.

**Verification**

Check the Tunnel port configuration.

- Check whether the Tunnel port is configured properly on a switch.

**Configuration Example**

📌 **Configuring Basic QinQ to Implement Layer-2 VPN**

<p><b>Scenario</b> Figure 13-10</p>	<p style="text-align: right;">① Service Provider Network</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure Tunnel ports on the PEs and connect the CEs to the Tunnel ports.</li> <li>● Configure the native VLANs for the Tunnel ports and add the native VLANs to the VLAN lists of the Tunnel ports respectively in untagged mode.</li> </ul>

	<ul style="list-style-type: none"> <li>● Configure VLANs on the customer networks based on requirements.</li> <li>❗ QinQ-enabled switches encapsulate outer tags in packets for transmission over the SP network. Therefore, you do not need to configure customer VLANs on the PEs.</li> <li>❗ The TPID is 0x8100 by default according to IEEE802.1Q. On some third-party switches, the TPID is set to a different value. If such switches are deployed, set the TPIDs on the ports connected to the third-party switches to realize TPID compatibility.</li> <li>⚠ If the PEs are connected through Trunk ports or Hybrid ports, do not configure the native VLANs for the Trunk ports or Hybrid ports as the default VLANs for the Tunnel ports. The Trunk ports or Hybrid ports strip off the VLAN tags containing the Native VLAN IDs when sending packets.</li> </ul>
<b>Provider A</b>	<p>Step 1: Create VLAN 10 and VLAN 20 on the SP network to segregate the data of Customer A and Customer B.</p> <pre>ProviderA#configure terminal Enter configuration commands, one per line. End with CNTL/Z. ProviderA(config)#vlan 10 ProviderA(config-vlan)#exit ProviderA(config)#vlan 20 ProviderA(config-vlan)#exit</pre> <p>Step 2: Enable basic QinQ on the port connected to the network of Customer A to use VLAN 10 for tunneling.</p> <pre>ProviderA(config)#interface gigabitEthernet 0/1 ProviderA(config-if-GigabitEthernet 0/1)#switchport mode dot1q-tunnel ProviderA(config-if-GigabitEthernet 0/1)#switchport dot1q-tunnel native vlan 10 ProviderA(config-if-GigabitEthernet 0/1)#switchport dot1q-tunnel allowed vlan add untagged 10</pre> <p>Step 3: Enable basic QinQ on the port connected to the network of Customer B to use VLAN 20 for tunneling.</p> <pre>ProviderA(config)#interface gigabitEthernet 0/2 ProviderA(config-if-GigabitEthernet 0/2)#switchport mode dot1q-tunnel ProviderA(config-if-GigabitEthernet 0/2)#switchport dot1q-tunnel native vlan 20 ProviderA(config-if-GigabitEthernet 0/2)#switchport dot1q-tunnel allowed vlan add untagged 20</pre> <p>Step 4: Configure an Uplink port.</p> <pre>ProviderA(config)# interface gigabitEthernet 0/5 ProviderA(config-if-GigabitEthernet 0/5)#switchport mode uplink</pre> <p>Step 5: Change the TPID of the outgoing packets on the Uplink port to a value (for example, 0x9100) recognizable by third-party switches.</p>

	<pre>ProviderA(config-if-GigabitEthernet 0/5)#frame-tag tpid 9100</pre> <p>Step 6: Configure Provider B by performing the same steps.</p>
<b>Verification</b>	<p>Customer A1 sends a packet containing VLAN ID 100 destined to Customer A2. The packet through Provider A is tagged with the outer tag specified by the Tunnel port. The packet that reaches Customer A2 carries the original VLAN ID 100.</p> <p>Check whether the Tunnel port is configured correctly.</p> <p>Check whether the TPID is configured correctly.</p>
<b>Provider A</b>	<pre>ProviderA#show running-config interface GigabitEthernet 0/1   switchport mode dot1q-tunnel   switchport dot1q-tunnel allowed vlan add untagged 10   switchport dot1q-tunnel native vlan 10   spanning-tree bpdupfilter enable ! interface GigabitEthernet 0/2   switchport mode dot1q-tunnel   switchport dot1q-tunnel allowed vlan add untagged 20   switchport dot1q-tunnel native vlan 20   spanning-tree bpdupfilter enable ! interface GigabitEthernet 0/5   switchport mode uplink   frame-tag tpid 0x9100 ProviderA#show interfaces dot1q-tunnel  =====Interface Gi0/1===== Native vlan: 10 Allowed vlan list:1,10, Tagged vlan list:  =====Interface Gi0/2===== Native vlan: 20</pre>

	<pre> Allowed vlan list:1,20, Tagged vlan list: ProviderA#show frame-tag tpid Ports          Tpid ----- Gi0/5          0x9100 </pre>
<b>Provider B</b>	Check Provider B by performing the same steps.

### Common Errors

- The native VLAN is not added to the VLAN list of the Tunnel port in untagged mode.
- No TPID is configured on the port connected to the third-party switch on which TPID is not 0x8100. As a result, packets cannot be recognized by the third-party switch.

## 12.5.2 Configuring C-TAG-Based Selective QinQ

### Configuration Effect

- Encapsulate outer VLAN tags (S-TAGs) in packets based on inner tags to ensure preferential transmission and management of Layer-2 VPN and service flows.

### Notes

- C-TAG-based selective QinQ must be configured based on basic QinQ.
- Some selective QinQ policies are not supported on some products due to limitations of chips.
- If you need to continue to adopt the VLAN tag priority specified by the customer network, you can configure priority replication to configure an outer tag the same as the inner tag.
- If the SP network requires the transmission of packets based on the priority of the outer tag, you need to configure priority replication to set the CoS of the outer tag to the specified value.

### Configuration Steps

#### 📌 Configuring a Policy to Add the VLAN IDs of Outer Tags Based on Inner Tags

- Mandatory.
- Upon receiving a packet, the Tunnel port adds the VLAN ID of the outer tag based on the VLAN ID of the inner tag. This function enables the Tunnel port to add the VLAN ID of the inner tag to the outer tag and adds the port to the VLAN in untagged mode. In this way, the outgoing packets carry the original inner tags.

- 📘 The ACL-based QinQ policy prevails over the port-based and C-TAG-based QinQ policy.
- 📘 When a member port is added to or removed from an aggregate port (AP), the QinQ policy configured on the AP port will be deleted. You need to configure the policy again. It is recommended that you configure a selective QinQ policy on the AP port after you configure its member ports.

**!** You must configure the Tunnel port and the port connected to the public network to permit packets with specified VLAN IDs (including the native VLAN ID) in the outer tag to pass through.

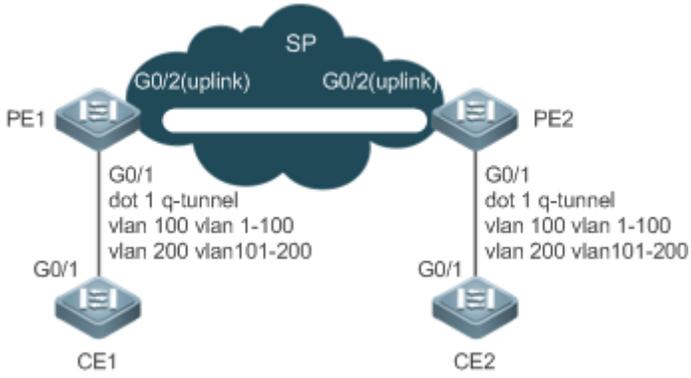

<b>Command</b>	<code>dot1q outer-vid VID register inner-vid v_list</code>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, no policy is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### Verification

- Check whether the users within the VLANs can communicate with each other.
- Check whether Layer-2 VPN is implemented.
- Check whether different service traffic is transmitted based on the selective QinQ policy, such as outer tag insertion, priority replication, and priority mapping.

### Configuration Example

#### Implementing Layer-2 VPN and Service Flow Management Through C-TAG-Based Selective QinQ

<p><b>Scenario</b> Figure 13-11</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the ports on PE 1 and PE 2 connected to CE 1 and CE 2 as Tunnel ports.</li> <li>● Configure a selective QinQ policy to add an outer tag to the packet based on its inner tag.</li> <li>● If the SP network provides a VLAN-based QoS policy, the policy enables the port to add the outer tags with the corresponding VLAN ID to the specified service flow packets.</li> <li>● If the SP network provides a CoS-based QoS policy and the CoS value is the same as that of the inner tag, you can configure priority mapping to replicate the CoS value of the inner tag to the outer VLAN tag so that the packet is transmitted based on the priority policy for the inner tag.</li> <li>● If the SP network provides a CoS-based QoS policy, you can configure priority mapping to set the CoS value of the outer VLAN tag to a specified value so that the packet is transmitted based on the priority policy.</li> </ul>
<p><b>PE1</b></p>	<p>Step 1: Configure the VLAN for transparent transmission.</p>

	<pre>PE1#configure terminal  Enter configuration commands, one per line. End with CNTL/Z.  PE1(config)#vlan 100  PE1(config-vlan)#exit  PE1(config)#vlan 200  PE1(config-vlan)#exit</pre> <p>Step 2: On the Downlink port of the access switch, configure a selective QinQ policy to add outer tags based on inner tags.</p> <p>Configure port Gi 0/1 as a Tunnel port.</p> <pre>PE1(config)#interface gigabitEthernet 0/1  PE1(config-if)# switchport mode dot1q-tunnel</pre> <p>Add VLAN 101 and VLAN 201 of the SP to the VLAN list of the Tunnel port and configure the Tunnel port to strip off the outer tag from incoming packets.</p> <pre>PE1(config-if)# switchport dot1q-tunnel allowed vlan add untagged 100,200</pre> <p>Configure the Tunnel port to add outer tag VLAN 100 to incoming data frames containing inner tag VLAN 1-100.</p> <pre>PE1(config-if)# dot1q outer-vid 100 register inner-vid 1-100</pre> <p>Configure the Tunnel port to add outer tag VLAN 200 to incoming data frames containing inner tag VLAN 101-200.</p> <pre>PE1(config-if)# dot1q outer-vid 200 register inner-vid 101-200</pre> <p>Step 3: Configure the port that accesses the SP network as an Uplink port.</p> <pre>PE1(config)# interface gigabitEthernet 0/2  PE1(config-if-GigabitEthernet 0/2)#switchport mode uplink</pre>
<p><b>PE2</b></p>	<ul style="list-style-type: none"> <li>● Perform the same configuration on PE 2.</li> </ul>
<p><b>Verification</b></p>	<p>Verify the configuration by checking whether:</p> <ul style="list-style-type: none"> <li>● The Downlink port is configured as a Tunnel port.</li> <li>● The VLAN specified by the outer tag is added to the VLAN list of the Tunnel port.</li> <li>● The selective QinQ policy on the Tunnel port is correct.</li> <li>● The Uplink port is configured correctly.</li> </ul> <p>Step 1: Check whether the VLAN mapping policy is correct.</p>
<p><b>PE1</b></p>	<pre>PE1#show running-config interface gigabitEthernet 0/1  interface GigabitEthernet 0/1  switchport mode dot1q-tunnel</pre>

```

switchport dot1q-tunnel allowed vlan add untagged 100,200

dot1q outer-vid 100 register inner-vid 1-200

dot1q outer-vid 200 register inner-vid 101-200

spanning-tree bpdufilter enable

!

```

Step 2: Check the C-TAG-based selective QinQ policy. Check whether the mapping relationship between the inner and outer VLAN tags is correct.

```
PE1#show registration-table
```

Ports	Type	Outer-VID	Inner-VID-list
<i>Gi0/1</i>	<i>Add-outer</i>	<i>100</i>	<i>1-200</i>
<i>Gi0/1</i>	<i>Add-outer</i>	<i>200</i>	<i>101-200</i>

### 12.5.3 Configuring ACL-Based Selective QinQ

#### Configuration Effect

- Encapsulate outer VLAN tags (S-TAGs) in packets based on the ACL-based flow classification to allow the SP network to manage different services.

#### Notes

- ACL-based selective QinQ must be configured based on basic QinQ.
- Some selective QinQ policies are not supported on some products due to limitations of chips.
- If you need to continue to adopt the VLAN tag priority specified by the customer network, you can configure priority replication to configure an outer tag the same as the inner tag.
- If the SP network requires the transmission of packets based on the priority of the outer tag, you need to configure priority replication to set the CoS of the outer tag to the specified value.

- i** The ACL-based QinQ policy prevails over the port-based and C-TAG-based QinQ policy.
- i** When an ACL is deleted, the related policy will be automatically deleted.
- i** Upon receiving a packet with two or more tags, the Tunnel port cannot add an outer tag to the packet based on the ACL-based selective QinQ policy.
- i** If a packet matches two or more ACL-based selective QinQ policies without priority, only one policy is executed. It is recommended to specify the priority.
- !** You must configure the Tunnel port and the port connected to the public network to permit packets with specified VLAN IDs (including the native VLAN ID) in the outer tag to pass through.

## Configuration Steps

### Configuring a Policy to Add the VLAN IDs of Outer Tags Based on ACLs

- Mandatory.
- The Tunnel port adds outer tags with different VLAN IDs to incoming packets based on the packet content.

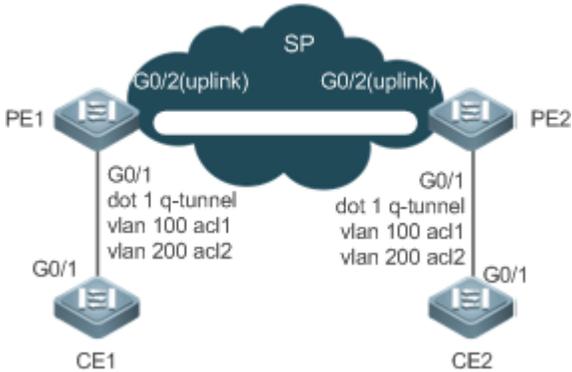

<b>Command</b>	<b>traffic-redirect access-group <i>acl</i> nested-vlan <i>VID</i> in</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, no policy is added.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### Verification

- Check whether the users of the same service in different branch offices can communicate with each other and whether specified service data is transmitted preferentially through virtual private LAN segment (VPLS) configuration.
- Check whether Layer-2 VPN is implemented.
- Check whether different service traffic is transmitted based on the selective QinQ policy, such as outer tag insertion, priority replication, and priority mapping.

## Configuration Example

### Implementing Layer-2 VPN and Service Flow Management Through ACL-Based Selective QinQ

<p><b>Scenario</b></p> <p><b>Figure 13-12</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the ports on PE 1 and PE 2 connected to CE 1 and CE 2 as Tunnel ports.</li> <li>● Configure ACL policies on PE 1 and PE 2 to segregate the service flows from the customer network.</li> <li>● On the Tunnel ports, configure a selective QinQ policy to add an outer tag to the packet based on ACL policies.</li> <li>● If the SP network provides a VLAN-based QoS policy, the policy enables the port to add the corresponding VLAN ID to the outer tags of the specified service flow.</li> <li>● If the SP network provides a CoS-based QoS policy, you can configure priority mapping to set the CoS</li> </ul>

	value of the outer VLAN tag to a specified value so that the packet is transmitted based on the priority policy.
<b>PE 1</b>	<p>Step 1: Create an ACL to permit flows of PPPoE type (0x8863/0x8864) and IPoE type (0x0800) to pass through.</p> <pre>PE1#configure terminal Enter configuration commands, one per line. End with CNTL/Z. PE1(config)# expert access-list extended acl1 PE1(config-exp-nacl)# permit 0x8863 any any PE1(config-exp-nacl)# permit 0x8864 any any PE1(config-exp-nacl)#exit PE1(config)# expert access-list extended acl2 PE1(config-exp-nacl)#permit 0x0800 any any</pre> <p>Step 2: Configure VLAN 100 and VLAN 200 on the SP network to segregate data.</p> <pre>PE#configure terminal Enter configuration commands, one per line. End with CNTL/Z. PE1(config)#vlan 100 PE1(config-vlan)#exit PE1(config)#vlan 200 PE1(config-vlan)#exit</pre> <p>Step 3: On the Downlink port of the access switch, configure a selective QinQ policy to add outer VLAN tags based on ACLs. Configure port Gi 0/1 as a Tunnel port.</p> <pre>PE1(config)#interface gigabitEthernet 0/1 PE1(config-if)# switchport mode dot1q-tunnel</pre> <p>Add VLAN 100 and VLAN 200 of the SP to the VLAN list of the Tunnel port and configure the Tunnel port to strip off the outer tag from incoming packets.</p> <pre>PE1(config-if)#switchport dot1q-tunnel allowed vlan add untagged 100,200</pre> <p>Configure the Tunnel port to add outer tag VLAN 100 to the incoming data frames which match ACL 1.</p> <pre>PE1(config-if)# traffic-redirect access-group acl1 nested-vlan 100 in</pre> <p>Configure the Tunnel port to add outer tag VLAN 200 to the incoming data frames which match ACL 2.</p> <pre>PE1(config-if)# traffic-redirect access-group acl1 nested-vlan 200 in</pre> <p>Step 4: Configure the port connected to the SP network as an Uplink port.</p> <pre>PE1(config)# interface gigabitEthernet 0/2</pre>

	<pre>PE1(config-if-GigabitEthernet 0/2)#switchport mode uplink</pre>												
<p><b>Verification</b></p>	<p>Check whether the users of the same service in different branch offices can communicate with each other and whether specified service data is transmitted preferentially.</p> <ul style="list-style-type: none"> <li>● Check whether Layer-2 VPN is implemented.</li> <li>● Check whether the ACL is correct.</li> <li>● Check whether the service priority is correct.</li> <li>● Check whether the Downlink port is configured as a Tunnel port, whether the outer tag VLAN is added to the VLAN list of the Tunnel port, and whether the mapping policy on the Tunnel port is correct.</li> </ul>												
<p><b>PE1</b></p>	<p>Step 1: Check whether the Tunnel port is configured correctly.</p> <pre>Ruijie#show running-config interface gigabitEthernet 0/1</pre> <pre>interface GigabitEthernet 0/1 switchport mode dot1q-tunnel switchport dot1q-tunnel allowed vlan add untagged 100,200 traffic-redirect access-group acl1 nested-vlan 100 in traffic-redirect access-group acl2 nested-vlan 200 in spanning-tree bpdupfilter enable !</pre> <p>Step 2: Check the ACL-based selective QinQ policy. Check whether the mapping relationship between the inner and outer VLAN tags is correct.</p> <pre>PE1#show traffic-redirect</pre> <table border="1" data-bbox="332 1281 901 1480"> <thead> <tr> <th>Ports</th> <th>Type</th> <th>VID</th> <th>Match-filter</th> </tr> </thead> <tbody> <tr> <td>Gi0/1</td> <td>Nested-vid</td> <td>101</td> <td>acl1</td> </tr> <tr> <td>Gi0/1</td> <td>Nested-vid</td> <td>201</td> <td>acl2</td> </tr> </tbody> </table>	Ports	Type	VID	Match-filter	Gi0/1	Nested-vid	101	acl1	Gi0/1	Nested-vid	201	acl2
Ports	Type	VID	Match-filter										
Gi0/1	Nested-vid	101	acl1										
Gi0/1	Nested-vid	201	acl2										

**Common Errors**

- No ACL policy is configured.
- ACL policies are used to segregate flows based on MAC addresses. Packet floods will occur if MAC address replication is not configured.

**12.5.4 Configuring VLAN Mapping**

**Configuration Effect**

- Replace the inner tags of the packets with the outer tags to allow the packets to be transmitted based on the VLAN planning on the SP network.

## Notes

- VLAN mapping can be configured only on Access ports, Trunk ports, Hybrid ports, or Uplink ports.

 After VLAN mapping is configured, the VLAN IDs of the packets sent to the CPU are changed to the specified VLAN ID.

 It is not recommended to configure VLAN mapping and selective QinQ on one port.

## Configuration Steps

### ▾ Configuring 1:1 VLAN Mapping

- Mandatory if the 1:1 mode is used. Configure a 1:1 VLAN mapping rule.
- Run the **vlan-mapping-in vlan CVID remark SVID** command or the **vlan-mapping-out vlan SVID remark CVID** command on a Trunk port or an Uplink port to enable 1:1 VLAN mapping.

<b>Command</b>	<b>vlan-mapping-in vlan <i>src-vlan-list</i> remark <i>dest-vlan</i></b>
<b>Parameter</b>	<i>src-vlan-list</i> : Indicates the customer VLAN.
<b>Description</b>	<i>dest-vlan</i> : Indicates the service VLAN, which is the VLAN where the SP network is located.
<b>Defaults</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure 1:1 VLAN mapping in the inbound direction.

<b>Command</b>	<b>vlan-mapping-out vlan <i>src-vlan</i> remark <i>dest-vlan</i></b>
<b>Parameter</b>	<i>src-vlan</i> : Indicates the service VLAN, which is the VLAN where the SP network is located.
<b>Description</b>	<i>dest-vlan</i> : Indicates the customer VLAN.
<b>Defaults</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure 1:1 VLAN mapping in the outbound direction.

## Verification

Check whether VLAN mapping is configured correctly.

- Run the **show interfaces [ *intf-id* ] vlan-mapping** command to display the VLAN mapping.

## Configuration Example

### ▾ Implementing VLAN Aggregation for Different Services Through VLAN Mapping

<p><b>Scenario</b></p> <p><b>Figure 13-13</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure Home Gateway 1 and Home Gateway 2.</li> </ul> <p>Step 1: On the home gateways, configure the original VLANs for different services.</p> <pre>Ruijie#configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#vlan range 10-12 Ruijie(config-vlan-range)#exit</pre> <p>Step 2: Configure the attributes of the ports connected to PC, IPTV, and VoIP. Assume that the connected ports are Gi 0/2, Gi 0/3, and Gi 0/4 respectively.</p> <pre>Ruijie(config)#interface gigabitEthernet 0/2 Ruijie(config-if-GigabitEthernet 0/2)#switchport access vlan 10 Ruijie(config-if-GigabitEthernet 0/2)#exit Ruijie(config)#interface gigabitEthernet 0/3 Ruijie(config-if-GigabitEthernet 0/3)#switchport access vlan 11 Ruijie(config-if-GigabitEthernet 0/3)#exit Ruijie(config)#interface gigabitEthernet 0/4 Ruijie(config-if-GigabitEthernet 0/4)#switchport access vlan 12 Ruijie(config-if-GigabitEthernet 0/4)#exit</pre> <p>Step 3: Configure an Uplink port.</p> <pre>Ruijie(config)# interface gigabitEthernet 0/1</pre>

```
Ruijie(config-if-GigabitEthernet 0/1)#switchport mode uplink
```

- Configure a floor switch with 1:1 VLAN mapping policies.

**Step 1: On the home gateways, configure the original VLANs and mapped VLANs for different services.**

```
Ruijie#configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

```
Ruijie(config)#vlan range 10-12
```

```
Ruijie(config-vlan-range)#exit
```

```
Ruijie(config)#vlan range 100-102
```

```
Ruijie(config-vlan-range)#exit
```

```
Ruijie(config)#vlan range 200-202
```

```
Ruijie(config-vlan-range)#exit
```

**Step 2: On the Downlink port of Home Gateway 1, configure 1:1 VLAN mapping policies in the inbound and outbound directions.**

```
Ruijie(config)#interface gigabitEthernet 0/2
```

```
Ruijie(config-if-GigabitEthernet 0/2)#switchport mode uplink
```

```
Ruijie(config-if-GigabitEthernet 0/2)#vlan-mapping-in vlan 10 remark 100
```

```
Ruijie(config-if-GigabitEthernet 0/2)#vlan-mapping-in vlan 11 remark 101
```

```
Ruijie(config-if-GigabitEthernet 0/2)#vlan-mapping-in vlan 12 remark 102
```

```
Ruijie(config-if-GigabitEthernet 0/2)#vlan-mapping-out vlan 100 remark 10
```

```
Ruijie(config-if-GigabitEthernet 0/2)#vlan-mapping-out vlan 101 remark 11
```

```
Ruijie(config-if-GigabitEthernet 0/2)#vlan-mapping-out vlan 102 remark 12
```

**Step 3: On the Downlink port of Home Gateway 2, configure 1:1 VLAN mapping policies in the inbound and outbound directions.**

```
Ruijie(config)#interface gigabitEthernet 0/3
```

```
Ruijie(config-if-GigabitEthernet 0/3)#switchport mode uplink
```

```
Ruijie(config-if-GigabitEthernet 0/3)#vlan-mapping-in vlan 10 remark 200
```

```
Ruijie(config-if-GigabitEthernet 0/3)#vlan-mapping-in vlan 11 remark 201
```

```
Ruijie(config-if-GigabitEthernet 0/3)#vlan-mapping-in vlan 12 remark 202
```

```
Ruijie(config-if-GigabitEthernet 0/3)#vlan-mapping-out vlan 200 remark 10
```

```
Ruijie(config-if-GigabitEthernet 0/3)#vlan-mapping-out vlan 201 remark 11
```

```
Ruijie(config-if-GigabitEthernet 0/3)#vlan-mapping-out vlan 202 remark 12
```

**Step 4: Configure an Uplink port.**

	<pre>Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#switchport mode uplink</pre>																																																																	
<p><b>Verification</b></p>	<p>Display the 1:1 VLAN mapping policies configured on the floor switch.</p> <pre>Ruijie#show interfaces vlan-mapping</pre> <table border="1"> <thead> <tr> <th>Ports</th> <th>type</th> <th>Status</th> <th>Service-Vlan</th> <th>Customer-Vlan-list</th> </tr> </thead> <tbody> <tr><td>Gi0/2</td><td>in</td><td>active</td><td>100</td><td>10</td></tr> <tr><td>Gi0/2</td><td>in</td><td>active</td><td>101</td><td>11</td></tr> <tr><td>Gi0/2</td><td>in</td><td>active</td><td>102</td><td>12</td></tr> <tr><td>Gi0/2</td><td>out</td><td>active</td><td>100</td><td>10</td></tr> <tr><td>Gi0/2</td><td>out</td><td>active</td><td>101</td><td>11</td></tr> <tr><td>Gi0/2</td><td>out</td><td>active</td><td>102</td><td>12</td></tr> <tr><td>Gi0/3</td><td>in</td><td>active</td><td>200</td><td>10</td></tr> <tr><td>Gi0/3</td><td>in</td><td>active</td><td>201</td><td>11</td></tr> <tr><td>Gi0/3</td><td>in</td><td>active</td><td>202</td><td>12</td></tr> <tr><td>Gi0/3</td><td>out</td><td>active</td><td>200</td><td>10</td></tr> <tr><td>Gi0/3</td><td>out</td><td>active</td><td>201</td><td>11</td></tr> <tr><td>Gi0/3</td><td>out</td><td>active</td><td>202</td><td>12</td></tr> </tbody> </table>	Ports	type	Status	Service-Vlan	Customer-Vlan-list	Gi0/2	in	active	100	10	Gi0/2	in	active	101	11	Gi0/2	in	active	102	12	Gi0/2	out	active	100	10	Gi0/2	out	active	101	11	Gi0/2	out	active	102	12	Gi0/3	in	active	200	10	Gi0/3	in	active	201	11	Gi0/3	in	active	202	12	Gi0/3	out	active	200	10	Gi0/3	out	active	201	11	Gi0/3	out	active	202	12

### 12.5.5 Configuring TPIDs

#### Configuration Effect

Configure the TPIDs in the tags on SP network devices to realize TPID compatibility.

#### Notes

If a PE connected to a third-party switch on which the TPID is not 0x8100, you need to configure the TPID on the port of the PE connected to the third-party switch.

 Do not set the TPIDs to any of the following values: 0x0806 (ARP), 0x0200 (PUP), 0x8035 (RARP), 0x0800 (IP), 0x86DD (IPv6), 0x8863/0x8864 (PPPoE), 0x8847/0x8848 (MPLS), 0x8137 (IPX/SPX), 0x8000 (IS-IS), 0x8809 (LACP), 0x888E (802.1X), 0x88A7 (clusters), and 0x0789 (reserved by Ruijie Networks).

#### Configuration Steps

- If a PE connected to a third-party switch on which the TPID is not 0x8100, you need to configure the TPID on the port of the PE connected to the third-party switch.
- TPIDs can be configured in interface configuration mode and global configuration mode. The following example adopts interface configuration mode.

Configure the **frame-tag tpid 0x9100** command in interface configuration mode to change the TPID to 0x9100. For details about the TPID value, see section 1.4.5.

<b>Command</b>	<b>frame-tag tpid tpid</b>
<b>Parameter</b>	<i>tpid</i> : Indicates the new value of the TPID.
<b>Description</b>	
<b>Defaults</b>	The default value of the TPID is 0x8100.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If a PE is connected to a third-party switch on which the TPID is not 0x8100, use this command to configure the TPID on the port connected to the third-party switch.

### Verification

Check whether the TPID is configured.

### Configuration Example

#### Configuring the TPID on a port

<b>Configuration Steps</b>	Configure the TPID on a port. <pre>Ruijie(config)# interface gigabitethernet 0/1 Ruijie(config-if)# frame-tag tpid 9100</pre>
<b>Verification</b>	Display the TPID on the port. <pre>Ruijie# show frame-tag tpid interfaces gigabitethernet 0/1  Port      tpid ----- Gi0/1     0x9100</pre>

## 12.5.6 Configuring MAC Address Replication

### Configuration Effect

- Replicate the dynamic address learned on a port from one VLAN to another.
- Avoid packet floods when service flows are segregated through MAC-based ACLs.

### Notes

-  After MAC address replication is disabled, the system will delete all the learned MAC address entries from the destination VLAN.
-  MAC address replication can be configured on a port only once. If you need to modify the configuration, delete the current configuration and configure it again.
-  VLAN MAC address replication cannot be used together with VLAN sharing, and the MAC addresses cannot be replicated to dynamic VLANs.

-  Up to eight destination VLANs can be configured on each port. MAC address replication takes effect even if the port does not belong to the specified destination VLAN.
-  MAC address replication cannot be configured on the Host and Promiscuous ports, monitoring ports, and port security-/802.1X-enabled ports.
-  Only dynamic addresses can be replicated. Address replication is disabled when the address table is full. If source addresses already exist before replication is enabled, corresponding MAC addresses will not be replicated.
-  Replicated addresses have a higher priority than dynamic addresses but have a lower priority than other types of addresses.
-  When a MAC address ages, the replicated MAC address will also age. When the MAC address is deleted, the replicated address will be deleted automatically.
-  Hot backup is not supported. After primary/secondary switchover occurs, it is recommended that you disable MAC address replication and then enable it again.
-  The MAC address entries obtained through MAC address replication cannot be deleted manually. If you need to delete these entries, disable MAC address replication.

## Configuration Steps

### Configuring MAC Address Replication

- Perform this configuration to replicate MAC addresses from one VLAN to another to avoid packet floods.
- Run the **mac-address-mapping** <1-8> **source-vlan** *src-vlan-list* **destination-vlan** *dst-vlan-id* command on a Trunk port to enable MAC address replication. *src-vlan-list* and *dst-vlan-id* specify the VLAN range.

<b>Command</b>	<b>mac-address-mapping</b> <i>x</i> <b>source-vlan</b> <i>src-vlan-list</i> <b>destination-vlan</b> <i>dst-vlan-id</i>
<b>Parameter</b>	<i>x</i> : Indicates the index number for MAC address replication. The value ranges from 1 to 8.
<b>Description</b>	<i>src-vlan-list</i> : Indicates the source VLAN list. <i>dst-vlan-id</i> : Indicates the destination VLAN list.
<b>Defaults</b>	By default, MAC address replication is disabled.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## Verification

- Check whether the MAC address of the specified VLAN is replicated to another VLAN.

## Configuration Example

### Configuring MAC Address Replication

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure MAC address replication.</li> </ul> <pre>Ruijie(config)# interface gigabitethernet 0/1 Ruijie(config-if)# switchport mode trunk Ruijie(config-if)#mac-address-mapping 1 source-vlan 1-3 destination-vlan 5</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check whether the configuration takes effect on the port.</li> <li>Send a packet from the source VLAN and check whether the source MAC address of the packet is replicated to the destination VLAN.</li> </ul> <pre>Ruijie# show interfaces mac-address-mapping Ports      destination-VID  Source-VID-list ----- Gi0/1      5                1-3</pre>

### Common Errors

- See "Notes".

## 12.5.7 Configuring an Inner/Outer VLAN Tag Modification Policy

### Configuration Effect

- Modify outer or inner tags based on the actual networking requirements.

### Notes

- The ACL-based QinQ policy prevails over the port-based and C-TAG-based QinQ policy.
- When an ACL is deleted, the related policy will be automatically deleted.
- Tag modification policies take effect only on Access ports, Trunk ports, Hybrid ports, and Uplink ports.
- Tag modification policies are mainly used to modify inner and outer tags on the SP network.
- If a packet matches two or more ACL-based selective QinQ policies without priority, only one policy is executed. It is recommended to specify the priority.

### Configuration Steps

#### Configuring the Policy to Change the VLAN IDs of Outer Tags Based on Inner Tags

- Optional.
- Perform this configuration to change the VLAN IDs of outer tags based on the VLAN IDs of inner tags.
- You can change the VLAN IDs of the outer tags in the packets that enter Access ports, Trunk ports, Hybrid ports, and Uplink ports based on the VLAN IDs of the inner tags in these packets.

<b>Command</b>	<b>dot1q relay-vid VID translate inner-vid v_list</b>
----------------	---

<b>Parameter</b>	<i>VID</i> : Indicates the modified VLAN ID of the outer tag.
<b>Description</b>	<i>v_list</i> : Indicates the VLAN ID of the inner tag.
<b>Defaults</b>	By default, no policy is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring the Policy to Change the VLAN IDs of Outer Tags Based on the VLAN IDs of Outer and Inner Tags

- Optional.
- Perform this configuration to change the VLAN IDs of outer tags based on the VLAN IDs of inner and outer tags.
- You can change the VLAN IDs of the outer tags in the packets that enter Access ports, Trunk ports, Hybrid ports, and Uplink ports based on the VLAN IDs of the inner and outer tags in these packets.

<b>Command</b>	<b>dot1q new-outer-vlan <i>new-vid</i> translate old-outer-vlan <i>vid</i> inner-vlan <i>v_list</i></b>
<b>Parameter</b>	<i>new-vid</i> : Indicates the modified VLAN ID of the outer tag.
<b>Description</b>	<i>vid</i> : Indicates the original VLAN ID of the outer tag. <i>v_list</i> : Indicates the VLAN ID of the inner tag.
<b>Defaults</b>	By default, no policy is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring the Policy to Change the VLAN IDs of Outer Tags Based on the Outer Tags

- Optional.
- Perform this configuration to change the VLAN IDs of outer tags based on these VLAN IDs.
- You can change the VLAN IDs of the outer tags in the packets that enter Access ports, Trunk ports, Hybrid ports, and Uplink ports based on these VLAN IDs.

<b>Command</b>	<b>dot1q relay-vid <i>VID</i> translate local-vid <i>v_list</i></b>
<b>Parameter</b>	<i>VID</i> : Indicates the modified VLAN ID of the outer tag.
<b>Description</b>	<i>v_list</i> : Indicates the original VLAN ID of the outer tag.
<b>Defaults</b>	By default, no policy is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring a Policy to Change the VLAN IDs of Inner Tags Based on ACLs

- Optional.
- You can change the VLAN IDs of the inner tags in the packets that exit Access ports, Trunk ports, Hybrid ports, and Uplink ports based on the packet content.

- Before you configure such a policy, configure an ACL.

<b>Command</b>	<b>traffic-redirect access-group <i>acl</i> inner-vlan <i>vid</i> out</b>
<b>Parameter</b>	<i>acl</i> : Indicates the ACL.
<b>Description</b>	<i>vid</i> : Indicates the modified VLAN ID of the inner tag.
<b>Defaults</b>	By default, no policy is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### 📌 Configuring a Policy to Change the VLAN IDs of Outer Tags Based on ACLs

- Optional.
- You can change the VLAN IDs of the outer tags in the packets that exit Access ports, Trunk ports, Hybrid ports, and Uplink ports based on the packet content.
- Before you configure such a policy, configure an ACL.

<b>Command</b>	<b>traffic-redirect access-group <i>acl</i> outer-vlan <i>vid</i> in</b>
<b>Parameter</b>	<i>acl</i> : Indicates the ACL.
<b>Description</b>	<i>vid</i> : Indicates the modified VLAN ID of the outer tag.
<b>Defaults</b>	By default, no policy is configured.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### Verification

Check whether the configuration takes effect and whether the port modifies the tags in received packets based on the policy.

### Configuration Example

#### 📌 Configuring the Policy to Change the VLAN IDs of Outer Tags Based on the Outer Tags

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure inner/outer tag modification policies on a port based on the actual networking requirements.</li> <li>● The following example shows how to change VLAN IDs of outer tags based on outer tags and ACLs respectively. For details about other policies, see the description above.</li> </ul> <p>Configure a policy to change outer VLAN tags based on the outer VLAN tags.</p> <pre>Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if)# switchport mode trunk Ruijie(config-if)# dot1q relay-vid 100 translate local-vid 10-20</pre> <p>Configure a policy to change outer VLAN tags based on ACLs.</p> <pre>Ruijie# configure terminal Ruijie(config)# ip access-list standard 2 Ruijie(config-acl-std)# permit host 1.1.1.1 Ruijie(config-acl-std)# exit Ruijie(config)# interface gigabitEthernet 0/2 Ruijie(config-if)# switchport mode trunk Ruijie(config-if)# traffic-redirect access-group 2 outer-vlan 3 in</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the configuration takes effect on the port.</li> <li>● Check whether the port changes the VLAN IDs of the outer tags in received packets based on the configured policy.</li> </ul>

## 12.5.8 Configuring Priority Mapping and Priority Replication

### Configuration Effect

- If an SP network provides a QoS policy based on the User Priority field of the inner tag, configure priority replication to apply the QoS policy to the outer tag.
- If an SP network provides a QoS policy based on the User Priority field of the inner tag, configure priority mapping to apply the User Priority field provided by the SP network to the outer tag.

### Notes

- ⚠ Only a Tunnel port can be configured with priority replication, which has a higher priority than trusted QoS but lower than ACL-based QoS.
- ⚠ Priority replication and priority mapping cannot be both enabled on one port.
- ⚠ Only a Tunnel port can be configured with priority mapping, which prevails over QoS.
- ⚠ The configuration of priority mapping does not take effect if no trust mode is configured (trust none) or the trust mode is not matched with priority mapping.

### Configuration Steps

- Only a Tunnel port can be configured with priority mapping or priority replication.
- Configure priority replication to apply the inner tag-based QoS policy provided by the SP network.
- Configure priority mapping to configure the User Priority field of the outer VLAN tag based on the inner tag and apply the QoS policy flexibly.
- To enable priority replication, run the **inner-priority-trust enable** command on the Tunnel port.
- To enable priority mapping, run the **dot1q-Tunnel cos inner-cos-value remark-cos outer-cos-value** command on the Tunnel port.

*inner-cos-value* and *outer-cos-value* range from 0 to 7.

 The following priority mapping is used when no priority mapping is configured:

inner pri	0	1	2	3	4	5	6	7
-----								
outer pri	0	1	2	3	4	5	6	7

<b>Command</b>	<b>inner-priority-trust enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, priority replication is disabled.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

<b>Command</b>	<b>dot1q-Tunnel cos inner-cos-value remark-cos outer-cos-value</b>
<b>Parameter Description</b>	<i>inner-cos-value</i> : Indicates the CoS value of the inner tag. <i>outer-cos-value</i> : Indicates the CoS value of the outer tag.
<b>Defaults</b>	By default, priority mapping is disabled.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## Verification

- Run the **show inner-priority-trust interfaces type intf-id** command and the **show interfaces type intf-id remark** command to check whether priority mapping or priority replication takes effect.

## Configuration Example

### Configuring Priority Mapping and Priority Replication

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>To maintain the packet priority, you need to replicate the priority of the inner tag in a packet to the outer tag on the Tunnel port.</li> <li>To flexibly control the packet priority on the Tunnel port, you can add outer tags of different priorities to packets based on the priorities of the inner tags in the packets.</li> </ul> <p>Configure priority replication.</p> <pre>Ruijie(config)# interface gigabitethernet 0/1 Ruijie(config-if)# mls qos trust cos Ruijie(config-if)# inner-priority-trust enable Ruijie(config)# end</pre> <p>Configure priority mapping.</p> <pre>Ruijie(config)# interface gigabitethernet 0/2 Ruijie(config-if)# dot1q-tunnel cos 3 remark-cos 5</pre>												
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>Display the priority configuration on the port.</li> </ul> <p>Check whether priority replication is enabled on the Tunnel port.</p> <pre>Ruijie# show inner-priority-trust interfaces gigabitethernet 0/1</pre> <table border="1"> <thead> <tr> <th>Port</th> <th>inner-priority-trust</th> </tr> </thead> <tbody> <tr> <td>Gi0/1</td> <td>enable</td> </tr> </tbody> </table> <p>Display the priority mapping configured on the Tunnel port.</p> <pre>Ruijie# show interfaces gigabitethernet 0/1 remark</pre> <table border="1"> <thead> <tr> <th>Ports</th> <th>Type</th> <th>From value</th> <th>To value</th> </tr> </thead> <tbody> <tr> <td>Gi0/1</td> <td>Cos-To-Cos</td> <td>3</td> <td>5</td> </tr> </tbody> </table>	Port	inner-priority-trust	Gi0/1	enable	Ports	Type	From value	To value	Gi0/1	Cos-To-Cos	3	5
Port	inner-priority-trust

Ports	Type	From value	To value										
Gi0/1	Cos-To-Cos	3	5										

**Common Errors**

See "Notes".

**12.5.9 Configuring Layer-2 Transparent Transmission**

**Configuration Effect**

Transmit Layer-2 packets transparently without impact on the SP network and the customer network.

**Notes**

- ⚠ If STP is not enabled, you need to run the **bridge-frame forwarding protocol bpdu** command to enable STP transparent transmission.
- ⚠ Transparent transmission enabled on a port takes effect only after enabled globally. When transparent transmission takes effect on the port, the port does not participate in related protocol calculation. If the port receives a packet whose destination MAC address is the special broadcast address, it determines that a networking error occurs and discards the packet.

## Configuration Steps

### 📌 Configuring STP Transparent Transmission

- Mandatory if you need to transparently transmit BPDU packets through STP.
- Enable STP transparent transmission in global configuration mode and interface configuration mode.
- Run the **I2protocol-tunnel stp** command in global configuration mode to enable STP transparent transmission.
- Run the **I2protocol-tunnel stp enable** command in interface configuration mode to enable STP transparent transmission.

<b>Command</b>	<b>I2protocol-tunnel stp</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, STP transparent transmission is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

<b>Command</b>	<b>I2protocol-tunnel stp enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, STP transparent transmission is disabled.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### 📌 Configuring GVRP Transparent Transmission

- Mandatory if you need to transparently transmit GVRP packets.
- Enable GVRP transparent transmission in global configuration mode and interface configuration mode.
- Run the **I2protocol-tunnel gvrp** command in global configuration mode to enable GVRP transparent transmission.
- Run the **I2protocol-tunnel gvrp enable** command in interface configuration mode to enable GVRP transparent transmission.

<b>Command</b>	<b>I2protocol-tunnel gvrp</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Defaults</b>	By default, GVRP transparent transmission is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

<b>Command</b>	<b>I2protocol-tunnel gvrp enable</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, GVRP transparent transmission is disabled.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ↘ [Configuring a Transparent Transmission Address](#)

- Optional.
- Configure a transparent transmission address.

<b>Command</b>	<b>I2protocol-tunnel { stp   gvrp } tunnel-dmac mac-address</b>
<b>Parameter Description</b>	<i>mac-address</i> : Indicates the address used to transparently transmit packets.
<b>Defaults</b>	By default, the first three bytes of the transparent transmission address is 01d0f8, and the last three bytes are 000005 and 000006 for STP and GVTP respectively.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p><b>i</b> The following addresses are available for STP: 01d0.f800.0005, 011a.a900.0005, 010f.e200.0003, 0100.0ccd.cdd0, 0100.0ccd.cdd1, and 0100.0ccd.cdd2. The following addresses are available for GVRP: 01d0.f800.0006 and 011a.a900.0006.</p> <p><b>i</b> When no transparent transmission address is configured, the default settings are used.</p>

### [Verification](#)

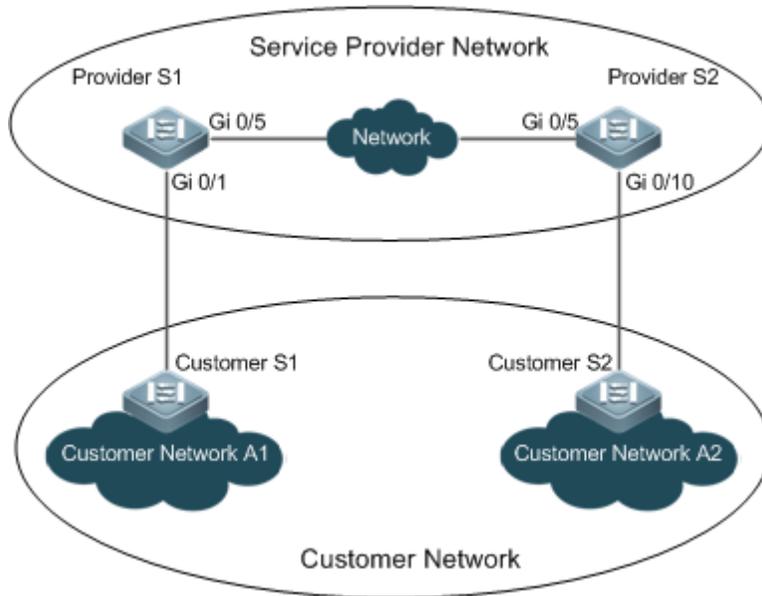

Run the **show I2protocol-tunnel stp** command and the **show I2protocol-tunnel gvrp** command to check whether the transparent transmission address is configured correctly.

### [Configuration Example](#)

The following example shows how to configure STP transparent transmission.

### ↘ [Configuring STP Transparent Transmission](#)

**Scenario**  
Figure 13-14

**Configuration Steps**

- On the PEs (Provider S1 and Provider S2), enable STP transparent transmission in global configuration mode and interface configuration mode.
- Before you enable STP transparent transmission, enable STP in global configuration mode to allow the switches to forward STP packets.

**Provider S1**

Step 1: Enable STP.

```
bridge-frame forwarding protocol bpdu
```

Step 2: Configure the VLAN for transparent transmission.

```
ProviderS1#configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

```
ProviderS1(config)#vlan 200
```

```
ProviderS1(config-vlan)#exit
```

Step 3: Enable basic QinQ on the port connected to the customer network and use VLAN 200 for tunneling.

```
ProviderS1(config)#interface gigabitEthernet 0/1
```

```
ProviderS1(config-if-GigabitEthernet 0/1)#switchport mode dot1q-tunnel
```

```
ProviderS1(config-if-GigabitEthernet 0/1)#switchport dot1q-tunnel native vlan 200
```

Step 4: Enable STP transparent transmission on the port connected to the customer network.

```
ProviderS1(config-if-GigabitEthernet 0/1)#l2protocol-tunnel stp enable
```

```
ProviderS1(config-if-GigabitEthernet 0/1)#exit
```

Step 5: Enable STP transparent transmission in global configuration mode.

```
ProviderS1(config)#l2protocol-tunnel stp
```

	<p>Step 4: Configure an Uplink port.</p> <pre>ProviderS1(config)# interface gigabitEthernet 0/5 ProviderS1(config-if-GigabitEthernet 0/5)#switchport mode uplink</pre>
<b>Provider S2</b>	Configure Provider S2 by performing the same steps.
<b>Verification</b>	<p>Step 1: Check whether STP transparent transmission is enabled in global configuration mode and interface configuration mode.</p> <pre>ProviderS1#show l2protocol-tunnel stp  L2protocol-tunnel: Stp Enable GigabitEthernet 0/1 l2protocol-tunnel stp enable</pre> <p>Step 2: Verify the configuration by checking whether:</p> <ul style="list-style-type: none"> <li>• The port type is dot1q-tunnel.</li> <li>• The outer tag VLAN is consistent with the native VLAN and added to the VLAN list of the Tunnel port.</li> <li>• The port that accesses the SP network is configured as an Uplink port.</li> </ul> <pre>ProviderS1#show running-config  interface GigabitEthernet 0/1   switchport mode dot1q-tunnel   switchport dot1q-tunnel allowed vlan add untagged 200   switchport dot1q-tunnel native vlan 200   l2protocol-tunnel stp enable   spanning-tree bpduser enable ! interface GigabitEthernet 0/5   switchport mode uplink</pre>

**Common Errors**

- STP is not enabled in global configuration mode.
- Transparent transmission is not enabled in global configuration mode and interface configuration mode.

## 12.6 Monitoring

**Displaying**

Description	Command
Displays whether the specified port is a Tunnel port.	<b>show dot1q-tunnel [ interfaces <i>intf-id</i> ]</b>

Displays the configuration of the Tunnel port.	<b>show interfaces dot1q-tunnel</b>
Displays the C-TAG-based selective QinQ policies on the Tunnel port.	<b>show registration-table [ interfaces <i>intf-id</i> ]</b>
Displays the C-TAG-based selective QinQ policies on the Access port, Trunk port or Hybrid port.	<b>show translation-table [ interfaces <i>intf-id</i> ]</b>
Displays VLAN mapping on ports.	<b>show interfaces [ <i>intf-id</i> ] vlan-mapping</b>
Displays the ACL-based selective QinQ policies.	<b>show traffic-redirect [ interfaces <i>intf-id</i> ]</b>
Displays the TPID configuration on ports.	<b>show frame-tag tpid interfaces [ <i>intf-id</i> ]</b>
Displays the configuration of priority replication.	<b>show inner-priority-trust</b>
Displays the configuration of priority mapping.	<b>show interface intf-name remark</b>
Displays the configuration of MAC address replication.	<b>show mac-address-mapping</b>
Displays the configuration of Layer-2 transparent transmission.	<b>show l2protocol-tunnel { gvrp   stp }</b>

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs QinQ.	<b>debug bridge qinq</b>

# 13 Configuring HASH Simulator

## 13.1 Overview

HASH simulator is a program that simulates the HASH algorithm of the switch. HASH simulator supports Aggregate Port (AP) load-balancing modes.

- AP HASH simulator simulates the HASH algorithm to calculate the AP member port for packet forwarding based on the packet field, load-balancing mode and specified AP information. The calculation result conforms to the real forwarding port.

**i** If you configure AP on a switch, use the AP simulator to calculate the AP member port for packet forwarding by specifying the packet field.

HASH simulator can be used to track and monitor the forwarding path of specified packets, facilitating user management and troubleshooting.

### Protocols and Standards

- IEEE 802.3ad

## 13.2 Applications

Application	Description
<a href="#">AP HASH Simulator</a>	Combining multiple physical links into one logical link is an effective way to increase port bandwidth and improve reliability on a L3 switch. Packets are forwarded through a physical link according to load balance algorithm. AP simulator calculation enables users to check the member link, which serves as reference for troubleshooting and topology deployment.

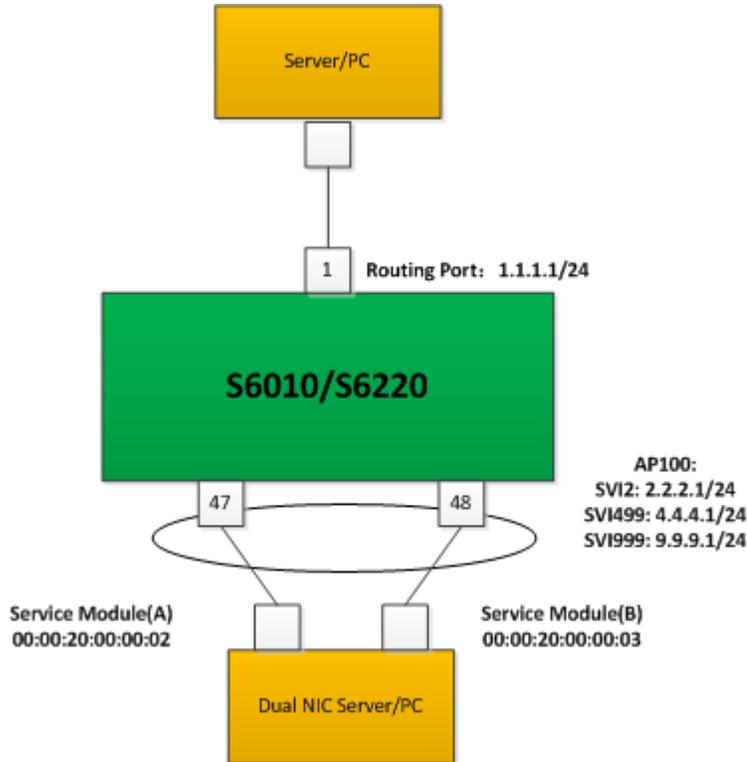

### 13.2.1 AP HASH Simulator

#### Scenario

With HASH simulator, you can calculate the AP load-balanced forwarding port.

- AP load balancing: The dual-NIC server is aggregated into one logical link to share service data flow.
- You should know which NIC on the server receives the packets with destination IP addresses of 2.2.2.1/24, 4.4.4.1/24, and 9.9.9.1/24 sent by the uplinked server.

Figure 13-1

**Note** N/A

### Deployment

- The ports connecting the dual NIC server and S6010/S6220 are aggregated into an AP to share service data flow.
- Use VLAN 2, VLAN 499 and VLAN 999 to separate the network and undertake different types of service.
- You can identify the AP load-balanced forwarding port on S6010/S6220 according to packet features.

**i** The packet feature can be Source IP, Destination IP, Source L4 port, or Destination L4 port.

## 13.3 Features

### Basic Concepts

#### AP

AP is a logical port that consists of several physical ports. AP can be divided into static AP and dynamic AP (LACP AP) based on protocol or into L2 AP and L3 AP based on port feature.

#### L2 AP

L2 AP is a logical port that consists of several L2 ports with the same L2 features.

#### L3 AP

L3 AP is a logical port that consists of several L3 ports with the same L3 features.

#### Load-balancing Mode

Packets are forwarded by an AP member port based on its load-balancing mode. The following AP load-balancing modes are available:

- Source MAC address/ destination MAC address (Src-mac/Dst-mac)
- Source MAC address + destination MAC address (Src-dst-mac)
- Source IP address/ destination IP address (Src-ip/Dst-ip)
- Source IP address + destination IP address (Src-dst-ip)
- Source IP address + destination IP address + source L4 port + destination L4 port (Src-dst-ip-l4port)
- Panel port of incoming packets
- Enhanced Mode (Enhanced)

### **HASH Simulator**

HASH simulator is a program that simulates the HASH algorithm of the switch.

### **Quintuple**

The quintuple refers to the source IP address, destination IP address, protocol, source L4 port and destination L4 port.

### **Overview**

Overview	Description
<a href="#">AP HASH Simulator</a>	Calculates the AP member port for packet forwarding according to the packet field, AP load balance mode and specified AP information.

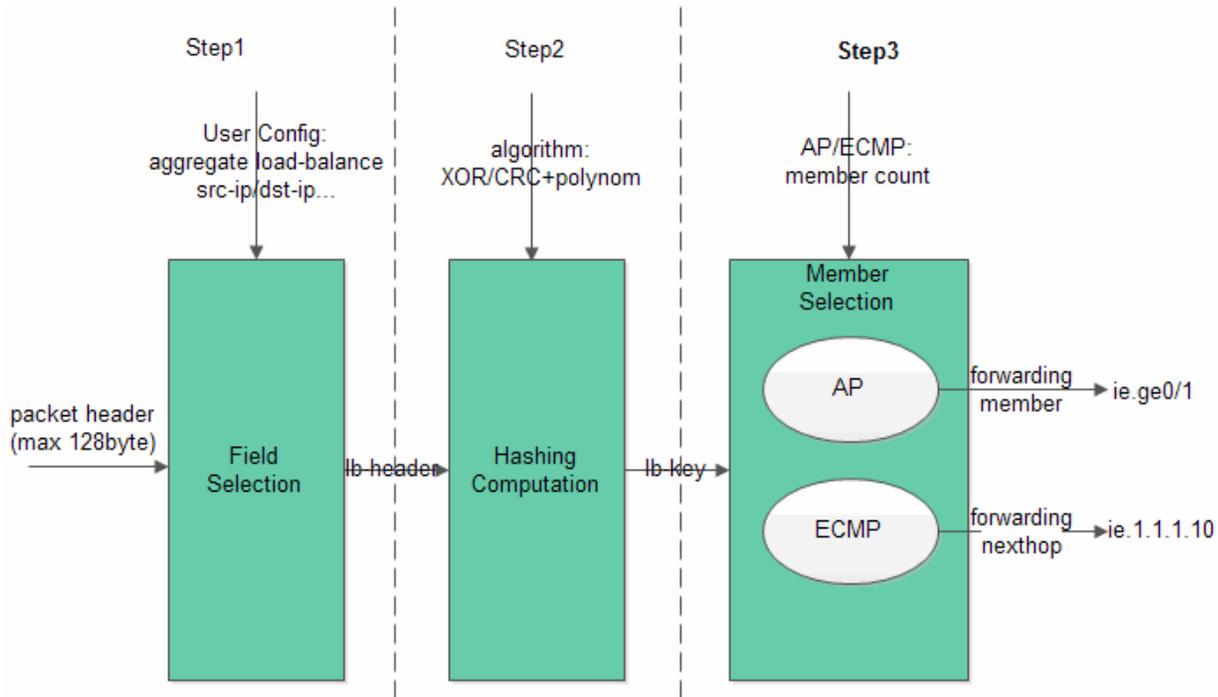

### **13.3.1 AP HASH Simulator**

AP HASH simulator is used to calculate the AP member port for packet forwarding by specifying the packet field.

### **Working Principle**

HASH simulator simulates the HASH algorithm on the switch. The process of AP load-balancing calculation on a switch follows the following steps:

Figure 13-3

- Step1: Field Selection. Fields are extracted according to the configured load-balancing mode.

Different fields are selected as HASH factors based on the configured load-balancing mode:

Load-balancing Mode	HASH Factor
Src-mac	mac address source
Dst-mac	mac address destination
Src-dst-mac	mac address source and destination
Src-ip	IP address source
Dst-ip	IP address destination
Src-dst-ip	IP address source and destination
Src-dst-ip-l4port	IP address source and destination , L4 port source and destination
Enhanced	Fields are extracted according to load-balance profile. Use the <b>show load-balance profile profile-name</b> command to display all packet fields corresponding to supported packet types.

- ✔ AP HASH simulator supports src- mac, dst-mac, src-dst-mac, src-ip, dst-ip, src-dst-ip, src-dst-ip-l4port and enhanced load-balancing modes.

**i** Selected HASH factors for AP load-balancing may vary with different products.

- Step2: HASH Computation

HASH algorithm is used to compute the HASH lb-key (load-balance key) based on the HASH factor selected in step 1. HASH algorithms vary with different switches, such as XOR, CRC and CRC+ scramble.

HASH simulator simulates the HASH algorithm on the switch.

- Step3: Member Selection

Divide the AP member number by HASH lb-key, and the remainder is the forwarding port index. The index is unique on Ruijie BCM series switch (including core switch and access switch). Therefore, it can be used to identify the forwarding port.

### Related Configuration

#### Displaying AP simulator calculation result

Users can check the IPv4 AP load-balanced forwarding port by specifying the quintuple feature of IPv4 packets.

Users can check the IPv6 AP load-balanced forwarding port by specifying the quintuple feature of IPv6 packets.

 AP HASH simulator supports simulative calculation of unicast packet forwarding only.

## 13.4 Configuration

Configuration	Description and Command	
<a href="#">Displaying AP load-balanced forwarding port</a>	 Optional	
	<b>show aggregate load-balance to interface aggregateport</b> <i>ap-id ip</i> [ <b>source</b> <i>source-ip</i> ] [ <b>destination</b> <i>dest-ip</i> ] [ <b>ip-protocol</b> <i>protocol-id</i> ] [ <b>I4-source-port</b> <i>src-port</i> ] [ <b>I4-dest-port</b> <i>dest-port</i> ]	Displaying IPv4 AP load-balanced forwarding port
	<b>show aggregate load-balance to interface aggregateport</b> <i>ap-id ipv6</i> [ <b>source</b> <i>source-ip</i> ] [ <b>destination</b> <i>dest-ip</i> ] [ <b>ip-protocol</b> <i>protocol-id</i> ] [ <b>I4-source-port</b> <i>src-port</i> ] [ <b>I4-dest-port</b> <i>dest-port</i> ]	Displaying IPv6 AP load-balanced forwarding port
	<b>show aggregate load-balance interface interface-type interface-number to interface aggregateport</b> <i>ap-id forward</i> [L2   L3] <b>mac</b> [ <b>src-mac</b> <i>source-mac</i> ] [ <b>dst-mac</b> <i>dest-mac</i> ] [ <b>vlan</b> <i>vlan-id</i> ] [ <b>etype</b> <i>value</i> ]	Displaying layer-2 AP load-balanced forwarding port

### 13.4.1 Displaying AP Load-Balanced Forwarding Port

#### Configuration Effect

- Display the AP member port for packet forwarding.

## Notes

- AP hash simulator works based on the AP load-balancing mode. Therefore, use the aggregate load-balance command to configure the AP load-balancing mode first.
- Create AP and add member ports.

 See Configuring Aggregate Port in Ethernet Switching Configuration Guide.

## Configuration Steps

### Displaying Layer-2 AP load-balanced forwarding port

- Monitor forwarding path and troubleshooting.
- Enter the command to display AP forwarding ports on the switch.

### Displaying IPv4 AP load-balanced forwarding port

- The same as above.

### Displaying IPv6 AP load-balanced forwarding port

- The same as above.

## Verification

- Verify the configuration by pumping real traffic. Observe and record the forwarding port.
- Check whether the real forwarding port conforms to the displayed port.

## Related Commands

### Displaying Layer-2 AP load-balanced forwarding port

<b>Command</b>	<b>show aggregate load-balance interface</b> <i>interface-type interface-number</i> <b>to interface aggregateport</b> <i>ap-id</i> <b>forward</b> [ <i>L2   L3</i> ] <b>mac</b> [ <b>src-mac</b> <i>source-mac</i> ] [ <b>dst-mac</b> <i>dest-mac</i> ] [ <b>vlan</b> <i>vlan-id</i> ] [ <b>etype</b> <i>value</i> ]
<b>Parameter</b>	<b>interface</b> <i>interface-type interface-number</i> : Traffic ingress. <b>aggregateport</b> <i>ap-id</i> : Destination AP ID. <b>forward</b> [ <i>L2   L3</i> ]: Layer-2 or layer-3 forwarding mode. <b>src-mac</b> <i>source-mac</i> : Source MAC address. <b>dst-mac</b> <i>dest-mac</i> : Destination MAC address <b>vlan</b> <i>vlan-id</i> : TAG ID <b>etype</b> <i>value</i> : Ethernet type of packet.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

### Displaying IPv4 AP load-balanced forwarding port

<b>Command</b>	<b>show aggregate load-balance interface</b> <i>interface-type interface-number</i> <b>to interface aggregateport</b> <i>ap-id</i> <b>forward</b> [ <i>L2   L3</i> ] <b>ip</b> [ <b>source</b> <i>source-ip</i> ] [ <b>destination</b> <i>dest-ip</i> ] [ <b>ip-protocol</b> <i>protocol-id</i> ] [ <b>I4-source-port</b>
----------------	--

	<i>src-port</i> ] [ <b>I4-dest-port</b> <i>dest-port</i> ]
<b>Parameter</b>	<b>interface</b> <i>interface-type interface-number</i> : Traffic ingress. <b>aggregateport</b> <i>ap-id</i> : Destination AP ID. <b>forward</b> [L2   L3]: Layer-2 or layer-3 forwarding mode. <b>source</b> <i>source-ip</i> : Source IPv4 address <b>destination</b> <i>dest-ip</i> : Destination IPv4 address <b>ip-protocol</b> <i>protocol-id</i> : IP protocol ID. For example, the protocol ID of TCP and UDP are 6 and 17 respectively. <b>I4-source-port</b> <i>src-port</i> : L4 source port ID <b>I4-dest-port</b> <i>dst-port</i> : L4 destination port ID
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

### Displaying IPv6 AP load-balanced forwarding port

<b>Command</b>	<b>show aggregate load-balance interface</b> <i>interface-type interface-number</i> <b>to interface aggregateport</b> <i>ap-id</i> <b>forward</b> [L2   L3] <b>ipv6</b> [ <b>source</b> <i>source-ip</i> ] [ <b>destination</b> <i>dest-ip</i> ] [ <b>ip-protocol</b> <i>protocol-id</i> ] [ <b>I4-source-port</b> <i>src-port</i> ] [ <b>I4-dest-port</b> <i>dest-port</i> ]
<b>Parameter</b>	<b>interface</b> <i>interface-type interface-number</i> : Traffic ingress. <b>aggregateport</b> <i>ap-id</i> : Destination AP ID. <b>forward</b> [L2   L3]: Layer-2 or layer-3 forwarding mode. <b>source</b> <i>source-ip</i> : Source IPv6 address <b>destination</b> <i>dest-ip</i> : Destination IPv6 address <b>ip-protocol</b> <i>protocol-id</i> : IP protocol ID. For example, the protocol ID of TCP and UDP are 6 and 17 respectively. <b>I4-source-port</b> <i>src-port</i> : L4 source port ID <b>I4-dest-port</b> <i>dst-port</i> : L4 destination port ID
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/interface configuration mode
<b>Usage Guide</b>	N/A

### Common Errors

- AP HASH simulator does not support the configured load-balancing mode.
- The current switch does not support AP HASH simulator.
- AP is not created or does not have member ports.

### Configuration Example

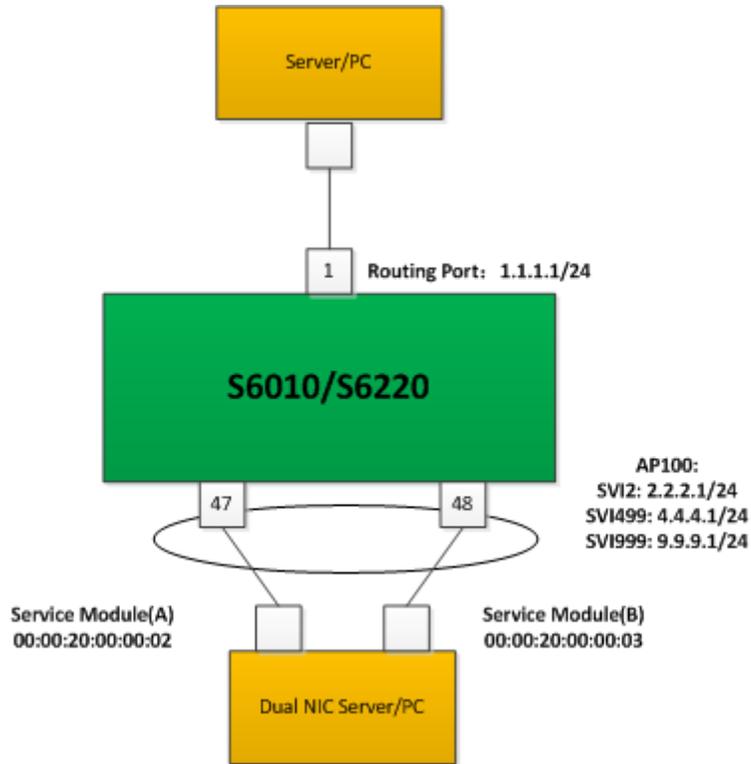

#### ▾ [Displaying Layer-2 AP load-balanced forwarding port](#)

<b>Configuration Steps</b>	<p>Configures load-balancing mode.</p> <pre>Ruijie# configure terminal Ruijie(config)# aggregateport load-balance dst-mac Ruijie(config)# show agg load-balance Load-balance   : Destination MAC Ruijie# end</pre>

# 14 Configuring Single Fiber

## 14.1 Overview

Single Fiber (SF) is a function developed to meet the special requirement for only receiving packets but not sending packets. In normal cases, when Ethernet standard devices interwork with each other by using optical transceivers, dual-fiber optical transceivers must be used so that the link becomes up and packets are forwarded normally. The disadvantage, however, is that physical isolation cannot be smoothly achieved in the transmission direction when Ethernet standard devices send data through dual fibers. As a result, the peer switch may receive unpredictable packets, affecting the switch security. For this, the SF mode can be configured to physically isolate data in the transmission direction to ensure data security. The application of SF-mode ports does not conform to the link specifications of Ethernet device ports. Therefore, for the implementation of SF receiving, a single-core fiber needs to be connected to the Rx end of a switch port so that data from the Tx end of the peer optical transceiver can be received normally.

## 14.2 Applications

Application	Description
<a href="#">SF Receiving</a>	The Rx end of a switch port is connected to the Tx end of an optical splitter through a single-core fiber.

### 14.2.1 SF Receiving

#### Scenario

The Rx end of a switch port is connected to the Tx end of an optical splitter through a single-core fiber, and the Rx end of the optical splitter is not connected to the Tx end of the connected switch, to ensure physical isolation.

Figure 14-1

#### Deployment

- The switch can only receive packets from the optical splitter but cannot send packets to the optical splitter.

## 14.3 Configuration

Configuration	Description and Command	
Configuring the SF Mode	 (Mandatory) It is used to configure the SF mode.	
	<b>transport mode { rx }</b>	Configures the SF Rx mode.
	<b>no transport mode</b>	Restores the default mode, that is, dual-fiber bidirectional Rx/Tx mode.

### 14.3.1 Configuring the SF Mode

#### Configuration Effect

- Configure a port of the switch to support the SF mode and the Rx direction only.

#### Notes

#### Configuration Steps

##### ▾ Configuring the SF Mode

- Mandatory.
- The SF mode should be configured on the port that requires the SF Rx function unless otherwise stated.

<b>Command</b>	<b>transport mode {rx}</b>
<b>Parameter Description</b>	<b>rx:</b> Indicates the mode in which only packets are received.
<b>Defaults</b>	The SF mode is disabled by default.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### Verification

Verify the SF configuration:

- Check whether the port on which the SF Rx function is configured can be up normally.

- Check whether the light emission function is disabled for the port on which the SF Rx function is configured.
- Verify that the port on which the SF Rx function is configured can only receive packets but cannot send packets.

## 14.4 Monitoring

### Displaying

Description	Command
Displays information about the port on which the SF Rx function is configured.	<b>show transport mode {rx}</b>

# 1 Configuring IP Addresses and Services

## 1.1 Overview

Internet Protocol (IP) sends packets to the destination from the source by using logical (or virtual) addresses, namely IP addresses. At the network layer, routers forward packets based on IP addresses.

### Protocols and Standards

- RFC 1918: Address Allocation for Private Internets
- RFC 1166: Internet Numbers

## 1.2 Applications

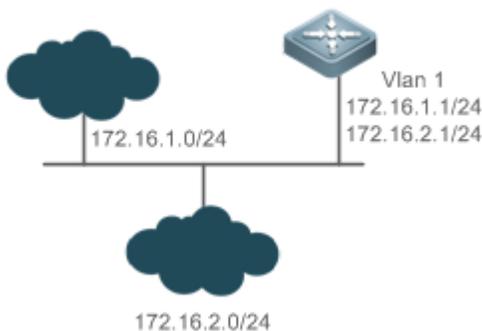

Application	Description
<a href="#">Configuring an IP Address for Communication</a>	Two networks communicate through one switch interface.

### 1.2.1 Configuring an IP Address for Communication

#### Scenario

A switch is connected to a Local Area Network (LAN), which is divided into two network segments, namely, 172.16.1.0/24 and 172.16.2.0/24. Computers in the two network segments can communicate with the Internet through switches and computers between the two network segments can communicate with each other.

Figure 1-1 Configuring IP Addresses

#### Deployment

- Configure two IP addresses on VLAN1. One is a primary IP address and the other is a secondary IP address.

- On hosts in the network segment 172.16.1.0/24, set the gateway to 172.16.1.1; on hosts in the network segment 172.16.2.0/24, set the gateway to 172.16.2.1.

## 1.3 Features

### Basic Concepts

#### ▾ IP Address

An IP address consists of 32 bits in binary. To facilitate writing and description, an IP address is generally expressed in decimal. When expressed in decimal, an IP address is divided into four groups, with eight bits in each group. The value range of each group is from 0 to 255, and groups are separated by a full stop ".". For example, "192.168.1.1" is an IP address expressed in decimal.

IP addresses are used for interconnection at the IP layer. A 32-bit IP address consists of two parts, namely, the network bits and the host bits. Based on the values of the first several bits in the network part, IP addresses in use can be classified into four classes.

For a class A address, the most significant bit is 0. 7 bits indicate a network ID, and 24 bits indicate a local address. There are 128 class A networks in total.

Figure 1-2

				8	16	24	32
Class A IP address	0		Network ID	Host ID			

For a class B address, the first two most significant bits are 10. 14 bits indicate a network ID, and 16 bits indicate a local address. There are 16,384 class B networks in total.

Figure 1-3

				8	16	24	32
Class B IP address	1	0	Network ID	Host ID			

For a class C address, the first three most significant bits are 110. 21 bits indicate a network ID, and 8 bits indicate a local address. There are 2,097,152 class C networks in total.

Figure 1-4

					8	16	24	32
Class C IP address	1	1	0	Network ID			Host ID	

For a class D address, the first four most significant bits are 1110 and other bits indicate a multicast address.

Figure 1-5

						8	16	24	32
Class D IP address	1	1	1	0	Multicast address				

**i** The addresses with the first four most significant bits 1111 cannot be assigned. These addresses are called class E addresses and are reserved.

When IP addresses are planned during network construction, IP addresses must be assigned based on the property of the network to be built. If the network needs to be connected to the Internet, users should apply for IP addresses to the corresponding agency. In China, you can apply to China Internet Network Information Center (CNNIC) for IP addresses. Internet Corporation for Assigned Names and Numbers (ICANN) is the final organization responsible for IP address assignment. If the network to be built is an internal private network, users do not need to apply for IP addresses. However, IP addresses cannot be assigned at random. It is recommended to assign dedicated private network addresses.

The following table lists reserved and available addresses.

Class	Address Range	Status
Class A network	0.0.0.0 - 0.255.255.255	Reserved
	1.0.0.0 - 126.255.255.255	Available
	127.0.0.0 - 127.255.255.255	Reserved
Class B network	128.0.0.0 - 191.254.255.255	Available
	191.255.0.0 - 191.255.255.255	Reserved
Class C network	192.0.0.0 - 192.0.0.255	Reserved
	192.0.1.0 - 223.255.254.255	Available
	223.255.255.0 - 223.255.255.255	Reserved
Class D network	224.0.0.0 - 239.255.255.255	Multicast address
Class E network	240.0.0.0 - 255.255.255.254	Reserved
	255.255.255.255	Broadcast address

Three address ranges are dedicated to private networks. These addresses are not used in the Internet. If the networks to which these addresses are assigned need to be connected to the Internet, these IP addresses need to be converted into valid Internet addresses. The following table lists private address ranges. Private network addresses are defined in RFC 1918.

Class	Address Range	Status
Class A network	10.0.0.0 - 10.255.255.255	1 class A network
Class B network	172.16.0.0 - 172.31.255.255	16 class B networks
Class C network	192.168.0.0 - 192.168.255.255	256 class C networks

For assignment of IP addresses, TCP/UDP ports, and other codes, refer to RFC 1166.

### Subnet Mask

A subnet mask is also a 32-bit value. The bits that identify the IP address are the network address. In a subnet mask, the IP address bits corresponding to the bits whose values are 1s are the network address, and the IP address bits corresponding to the bits whose values are 0s are the host address. For example, for class A networks, the subnet mask is 255.0.0.0. By using network masks, you can divide a network into several subnets. Subnetting means to use some bits of the host address as the network address, thus decreasing the host capacity, and increasing the number of networks. In this case, network masks are called subnet masks.

### Broadcast Packet

Broadcast packets refer to the packets destined for all hosts on a physical network. Ruijie products support two types of broadcast packets: (1) directed broadcast, which indicates that all hosts on the specified network are packet receivers and the host bits of a destination address are all 1s; (2) limited broadcast, which indicates that all hosts on all networks are packet receivers and the 32 bits of a destination address are all 1s.

### ICMP Packet

Internet Control Message Protocol (ICMP) is a sub-protocol in the TCP/IP suite for transmitting control messages between IP hosts and network devices. It is mainly used to notify corresponding devices when the network performance becomes abnormal.

### TTL

Time To Live (TTL) refers to the number of network segments where packets are allowed to pass before the packets are discarded. The TTL is a value in an IP packet. It informs the network whether packets should be discarded as the packets stay on the network for a long time.

## Features

Feature	Description
<a href="#">IP Address</a>	The IP protocol can run on an interface only after the interface is configured with an IP address.
<a href="#">Broadcast Packet Processing</a>	Broadcast addresses are configured and broadcast packets are forwarded and processed.
<a href="#">Sending ICMP Packets</a>	ICMP packets are sent and received.
<a href="#">Limiting Transmission Rate of ICMP Error Packets</a>	This function prevents Denial of Service (DoS) attacks.
<a href="#">IP MTU</a>	Maximum Transmission Unit (MTU) of IP packets on an interface is configured.
<a href="#">IP TTL</a>	The TTL of unicast packets and broadcast packets is configured.
<a href="#">IP Source Route</a>	Source routes are checked.

### 1.3.1 IP Address

IP addresses are obtained on an interface in the following ways:

1. Manually configuring IP addresses
2. Obtaining IP addresses through DHCP
3. Borrowing IP addresses of other interfaces

These approaches are mutually exclusive. If you configure a new approach to obtain an IP address, the old IP address will be overwritten.

- 
-  For details on how to obtain IP addresses through DHCP, see the “DHCP” chapter. The following describes the other three approaches for obtaining IP addresses.
- 

### **Configuring the IP Address for an Interface**

A device can receive and send IP packets only after the device is configured with an IP address. Only the interface configured with an IP address can run the IP protocol.

### **Configuring Multiple IP Addresses for an Interface**

Ruijie products support multiple IP address configuration on one interface, of which one is a primary IP address and the others are secondary IP addresses. Theoretically, the number of secondary IP addresses is not limited. However, secondary IP addresses must belong to different networks and secondary IP addresses must be in different networks from primary IP addresses. In network construction, secondary IP addresses are often used in the following circumstances:

- A network does not have enough host addresses. For example, a LAN now needs one class C network to allocate 254 addresses. However, when the number of hosts exceeds 254, one class C network is not enough and another class C network is needed. In this case, two networks need to be connected. Therefore, more IP addresses are needed.
- Many old networks are based on L2 bridged networks without subnetting. You can use secondary IP addresses to upgrade the network to a routing network based on IP layer. For each subnet, one device is configured with one IP address.
- When two subnets of one network are isolated by another network, you can connect the isolated subnets by creating a subnet of the isolated network and configuring a secondary address. One subnet cannot be configured on two or more interfaces of a device.

### **Borrowing an IP Addresses from Another Interface**

One interface may not be configured with an IP address. To enable the interface, it must borrow an IP address from another interface.

- 
-  IP addresses of Ethernet interfaces, tunnel interfaces, and loopback interfaces can be borrowed. However, these interfaces cannot borrow IP addresses from other interfaces.
  -  The IP addresses of borrowed interfaces cannot be borrowed from other interfaces.
  -  If a borrowed interface has multiple IP addresses, only the primary IP address can be borrowed.
  -  The IP address of one interface can be lent to multiple interfaces.
  -  IP addresses of borrowing interfaces are always consistent with and vary with IP addresses of borrowed interfaces.
-

## Related Configuration

---

### ▾ Configuring an Interface with One or More IP Addresses

- By default, an interface is not configured with an IP address.
- The **ip address** command is used to configure an IP address for an interface.
- After an IP address is configured, the IP address can be used for communication when it passes conflict detection.
- The **ip address ip-address mask secondary** command can be used to configure multiple secondary IP addresses.

### ▾ Borrowing an IP Address from Other Interfaces

- By default, an interface is not configured with an IP address.
- The **ip unnumbered** command can be used to borrow IP addresses from other interfaces.

## 1.3.2 Broadcast Packet Processing

### Working Principle

---

Broadcast is divided into two types. One is limited broadcast, and the IP address is 255.255.255.255. Because the broadcast is prohibited by routers, the broadcast is called local network broadcast. The other is directed broadcast. All host bits are 1s, for example, 192.168.1.255/24. The broadcast packets with these IP addresses can be forwarded.

If IP network devices forward limited broadcast packets (destination IP address is 255.255.255.255), the network may be overloaded, which severely affects network performance. This circumstance is called broadcast storm. Devices provide some approaches to confine broadcast storms within the local network and prevent continuous spread of broadcast storms. L2 network devices such as bridges and switches forward and spread broadcast storms.

The best way to avoid broadcast storm is to assign a broadcast address to each network, which is directed broadcast. This requires the IP protocol to use directed broadcast rather than limited broadcast to spread data.

For details about broadcast storms, see RFC 919 and RFC 922.

Directed broadcast packets refer to the broadcast packets destined for a subnet. For example, packets whose destination address is 172.16.16.255 are called directed broadcast packets. However, the node that generates the packets is not a member of the destination subnet.

After receiving directed broadcast packets, the devices not directly connected to the destination subnet forward the packets. After directed broadcast packets reach the devices directly connected to the subnet, the devices convert directed broadcast packets to limited broadcast packets (destination IP address is 255.255.255.255) and broadcast the packets to all hosts on the destination subnet at the link layer.

## Related Configuration

---

### ▾ Configuring an IP Broadcast Address

- By default, the IP broadcast address of an interface is 255.255.255.255.
- To define broadcast packets of other addresses, run the **ip broadcast-address** command on the interface.

### ↘ Forwarding Directed Broadcast Packets

- By default, directed broadcast packets cannot be forwarded.
- On the specified interface, you can run the **ip directed-broadcast** command to enable directed broadcast packets forwarding. In this way, the interface can forward directed broadcast packets to networks that are directly connected. Broadcast packets can be transmitted within the destination subnet without affecting forwarding of other directed broadcast packets.
- On an interface, you can define an Access Control List (ACL) to transmit certain directed broadcast packets. After an ACL is defined, only directed broadcast packets that match the ACL are forwarded.

## 1.3.3 Sending ICMP Packets

### Working Principle

#### ↘ ICMP Protocol Unreachable Message

A device receives non-broadcast packets destined for itself, and the packets contain the IP protocol that cannot be processed by the device. The device sends an ICMP protocol unreachable message to the source host. Besides, if the device does not know a route to forward packets, it also sends an ICMP host unreachable message.

#### ↘ ICMP Redirection Message

Sometimes, a route may be less than optimal, which makes a device send packets from the interface that receives packets. If a device sends packets from an interface on which it receives the packets, the device sends an ICMP redirection message to the source, informing the source that the gateway is another device on the same subnet. In this way, the source sends subsequent packets according to the optimal path.

#### ↘ Error Message for TTL Timeout

When forwarding an IP packet whose TTL expires, a device responds to the source end with an error message indicating exceeded TTL. To prevent attacks after the route is traced, the functionality of sending such error messages can be disabled.

#### ↘ Timestamp Query

RFC 792 requires the system, after receiving an ICMP timestamp request query message, to return its current time. You can disable sending of such reply messages to avoid attacks aimed at time-based protocols. By this means, once received, ICMP timestamp request query messages are discarded.

### Related Configuration

#### ↘ Enabling ICMP Protocol Unreachable Message

- By default, the ICMP Protocol unreachable message function is enabled on an interface.
- You can run the **[no] ip unreachables** command to disable or enable the function.

#### ↘ Enabling ICMP Redirection Message

- By default, the ICMP redirection message function is enabled on an interface.

- You can run the **[no] ip redirects** command to disable or enable the function.

#### ↘ Enabling ICMP Mask Response Message

- By default, the ICMP mask response message function is enabled on an interface.
- You can run the **[no] ip mask-reply** command to disable or enable the function.

#### ↘ Enabling Error Message for TTL Timeout

- By default, the error message for TTL timeout function is enabled.
- You can run the **[no] ip ttl-expires enable** command to disable or enable the function.

#### ↘ Enabling Timestamp Query

- By default, the timestamp query function is enabled on an interface.
- You can run the **[no] ip icmp timestamp** command to disable or enable the function.

### 1.3.4 Limiting Transmission Rate of ICMP Error Packets

#### Working Principle

This function limits the transmission rate of ICMP error packets to prevent DoS attacks by using the token bucket algorithm.

If an IP packet needs to be fragmented but the Don't Fragment (DF) bit in the header is set to 1, the device sends an ICMP destination unreachable packet (code 4) to the source host. This ICMP error packet is used to discover the path MTU. When there are too many other ICMP error packets, the ICMP destination unreachable packet (code 4) may not be sent. As a result, the path MTU discovery function fails. To avoid this problem, you should limit the transmission rate of ICMP destination unreachable packets and other ICMP error packets respectively.

#### Related Configuration

##### ↘ Configuring the Transmission Rate of ICMP Destination Unreachable Packets Triggered by DF Bit in the IP Header

- The default transmission rate is 10 packets every 100 milliseconds.
- The **ip icmp error-interval DF** command can be used to configure the transmission rate.

##### ↘ Configuring the Transmission Rate of Other ICMP Error Packets

- The default transmission rate is 10 packets every 100 milliseconds.
- The **ip icmp error-interval** command can be used to configure the transmission rate.

### 1.3.5 IP MTU

#### Working Principle

If an IP packet exceeds the IP MTU size, the RGOS software splits the packet. For all devices in the same physical network segment, the IP MTU of interconnected interfaces must be the same. You can adjust the link MTU of interfaces on Ruijie

products. After the link MTU of interfaces is changed, the IP MTU of interfaces will be changed. The IP MTU of interfaces automatically keeps consistent with the link MTU of interfaces. However, if the IP MTU of interfaces is adjusted, the link MTU of interfaces will not be changed.

## Related Configuration

### ↘ **Setting the IP MTU**

- By default, the IP MTU of an interface is 1500.
- The **ip mtu** command can be used to set the IP packet MTU.

## 1.3.6 IP TTL

### Working Principle

An IP packet is transmitted from the source address to the destination address through routers. After a TTL value is set, the TTL value decreases by 1 every time when the IP packet passes a router. When the TTL value drops to zero, the router discards the packet. This prevents infinite transmission of useless packets and waste of bandwidth.

## Related Configuration

### ↘ **Setting the IP TTL**

- By default, the IP TTL of an interface is 64.
- The **ip ttl** command can be used to set the IP TTL of an interface.

## 1.3.7 Protecting IP Routed Ports

### Working Principle

This command is used to forbid packets to come in and go out via the same routed port.

## Related Configuration

### ↘ **Enabling Protection of IP Routed Ports**

- By default, protection of IP routed ports is disabled.
- The **ip redirect-drop** command can be used to enable or disable the function.

## 1.3.8 IP Source Route

### Working Principle

Ruijie products support IP source routes. When a device receives an IP packet, it checks the options such as source route, loose source route, and record route in the IP packet header. These options are detailed in RFC 791. If the device detects that the packet enables one option, it responds; if the device detects an invalid option, it sends an ICMP parameter error message to the source and then discards the packet.

After the IP source route is enabled, the source route option is added to an IP packet to test the throughput of a specific network or help the packet bypasses the failed network. However, this may cause network attacks such as source address spoofing and IP spoofing.

### Related Configuration

#### ↳ [Configuring an IP Source Route](#)

- By default, the IP source route function is enabled.
- The **ip source-route** command can be used to enable or disable the function.

## 1.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring the IP Addresses of an Interface</a>	 (Mandatory) It is used to configure an IP address and allow the IP protocol to run on an interface.	
	<b>ip address</b>	Manually configures the IP address of an interface.
	<b>ip unnumbered</b>	Borrows an IP address from another interface.
<a href="#">Configuring Broadcast Forwarding</a>	 (Optional) It is used to set an IP broadcast address and enable directed broadcast forwarding.	
	<b>ip broadcast-address</b>	Configures an IP broadcast address.
	<b>ip directed-broadcast</b>	Enables directed broadcast forwarding.
<a href="#">Configuring ICMP Forwarding</a>	 (Optional) It is used to enable ICMP packet forwarding.	
	<b>ip unreachable</b>	Enables ICMP unreachable messages and host unreachable messages.
	<b>ip redirects</b>	Enables ICMP redirection messages.
	<b>ip mask-reply</b>	Enables ICMP mask response messages.
	<b>ip ttl-expires enable</b>	Enables error messages for TTL timeout.
	<b>ip icmp timestamp</b>	Enables ICMP timestamp query.
<a href="#">Configuring the Transmission Rate of ICMP Error Packets</a>	 Optional.	
	<b>ip icmp error-interval DF</b>	Configures the transmission rate of ICMP destination unreachable packets triggered by the DF bit in the IP header.
	<b>ip icmp error-interval</b>	Configures the transmission rate of ICMP error packets and ICMP redirection packets.
<a href="#">Setting the IP MTU</a>	 (Optional) It is used to configure the IP MTU on an interface.	

Configuration	Description and Command	
	<b>ip mtu</b>	Sets the MTU value.
<a href="#">Setting the IP TTL</a>	 (Optional) It is used to configure the TTL of unicast packets and broadcast packets.	
	<b>ip ttl</b>	Sets the TTL value.
<a href="#">Configuring an IP Source Route</a>	 (Optional) It is used to check the source routes.	
	<b>ip source-route</b>	Enables the IP source route function.

### 1.4.1 Configuring the IP Addresses of an Interface

#### Configuration Effect

Configure the IP address of an interface for communication.

#### Notes

- N/A

#### Configuration Steps

##### ▾ [Configuring the IP Address of an Interface](#)

- Mandatory
- Perform the configuration in L3 interface configuration mode.

##### ▾ [Borrowing an IP Addresses from Another Interface](#)

- Optional
- If a point-to-point interface is not configured with an IP address, borrow an IP address from another interface.
- Perform the configuration in L3 interface configuration mode.

#### Verification

Run the **show ip interface** command to check whether the configuration takes effect.

#### Related Commands

##### ▾ [Manually Configuring the IP Address of an Interface](#)

<b>Command</b>	<b>ip address</b> <i>ip-address network-mask</i> [ <b>secondary</b> ]
<b>Parameter Description</b>	<p><i>ip- address</i>: 32-bit IP address, with 8 bits for each group. The IP address is expressed in decimal and groups are separated by a full stop (.).</p> <p><i>network-mask</i>: 32-bit network mask. Value 1 indicates the mask bit and 0 indicates the host bit. Every 8 bits form one group. The network mask is expressed in decimal and groups are separated by a full stop (.).</p> <p><b>secondary</b>: Secondary IP address.</p>
<b>Command</b>	Interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	N/A

↳ **Borrowing an IP Addresses from Another Interface**

<b>Command</b>	<b>ip unnumbered</b> <i>interface-type interface-number</i>
<b>Parameter</b>	<i>interface-type</i> : Interface type.
<b>Description</b>	<i>interface-number</i> : Interface ID.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>An unnumbered interface indicates that the interface is enabled with the IP protocol without an IP address assigned. An unnumbered interface needs to be associated with an interface configured with an IP address. For an IP packet generated on an unnumbered interface, the source IP address of the packet is the IP address of the associated interface. In addition, the routing protocol process decides whether to send a route update packet to the unnumbered interface according to its associated IP address. If you want to use an unnumbered interface, pay attention to the following limitations:</p> <p>An Ethernet interface cannot be set to an unnumbered interface.</p> <p>When a serial interface encapsulates SLIP, HDLC, PPP, LAPB, and Frame-Relay, the serial interface can be set to an unnumbered interface. During Frame-Relay encapsulation, however, only a point-to-point interface can be configured as an unnumbered interface. An X.25 interface cannot be configured as an unnumbered interface.</p> <p>The <b>ping</b> command cannot be used to check whether an unnumbered interface is working properly because an unnumbered interface is not configured with an IP address. However, you can monitor the status of an unnumbered interface remotely through SNMP.</p> <p>A device cannot be cold started through an unnumbered interface.</p>

**Configuration Example**

↳ **Configuring an IP Address for an Interface**

<b>Configuration Steps</b>	Configure IP address 192.168.23.110 255.255.255.0 on interface GigabitEthernet 0/0.
	<pre>Ruijie#configure terminal Ruijie(config)#interface gigabitEthernet 0/0 Ruijie(config-if-GigabitEthernet 0/0)# no switchport Ruijie(config-if-GigabitEthernet 0/0)#ip address 192.168.23.110 255.255.255.0</pre>
<b>Verification</b>	Run the <b>show ip interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie# show ip interface gigabitEthernet 0/0 GigabitEthernet 0/0</pre>

```

IP interface state is: UP

IP interface type is: BROADCAST

IP interface MTU is: 1500

IP address is:

    192.168.23.110/24 (primary)
    
```

## 1.4.2 Configuring Broadcast Forwarding

### Configuration Effect

Set the broadcast address of an interface to 0.0.0.0 and enable directed broadcast forwarding.

### Notes

N/A

### Configuration Steps

#### ▾ Configuring an IP Broadcast Address

- (Optional) Some old hosts may identify broadcast address 0.0.0.0 only. In this case, set the broadcast address of the target interface to 0.0.0.0.
- Perform the configuration in L3 interface configuration mode.

#### ▾ Enabling Directed Broadcast Forwarding

- (Optional) If you want to enable a host to send broadcast packets to all hosts in a domain that it is not in, enable directed broadcast forwarding.
- Perform the configuration in L3 interface configuration mode.

### Verification

Run the **show running-config interface** command to check whether the configuration takes effect.

### Related Commands

#### ▾ Configuring an IP Broadcast Address

<b>Command</b>	<b>ip broadcast-address</b> <i>ip-address</i>
<b>Parameter Description</b>	<i>ip-address</i> : Broadcast address of an IP network.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Generally, the destination address of IP broadcast packets is all 1s, which is expressed as 255.255.255.255. The RGOS software can generate broadcast packets of other IP addresses through definition and receive

	self-defined broadcast packets and the broadcast packets with address 255.255.255.255.
--	--

▾ **Allowing Forwarding of Directed Broadcast Packets**

<b>Command</b>	<b>ip directed-broadcast</b> [ <i>access-list-number</i> ]
<b>Parameter</b>	<i>access-list-number</i> : Access list number, ranging from 1 to 199 and from 1300 to 2699. After an ACL is defined, only directed broadcast packets that match the ACL are forwarded.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If the <b>no ip directed-broadcast</b> command is run on an interface, the RGOS software will discard directed broadcast packets received from the network that is directly connected.

**Configuration Example**

<b>Configuration Steps</b>	<p>On interface gigabitEthernet 0/1, set the destination address of IP broadcast packets to 0.0.0.0 and enable directed broadcast forwarding.</p> <pre>Ruijie#configure terminal Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# no switchport Ruijie(config-if-GigabitEthernet 0/1)#ip broadcast-address 0.0.0.0 Ruijie(config-if-GigabitEthernet 0/1)#ip directed-broadcast</pre>
<b>Verification</b>	<p>Run the <b>show ip interface</b> command to check whether the configuration takes effect.</p> <pre>Ruijie#show running-config interface gigabitEthernet 0/1 ip directed-broadcast ip broadcast-address 0.0.0.0</pre>

**1.4.3 Configuring ICMP Forwarding**

**Configuration Effect**

Enable ICMP unreachable messages, ICMP redirection messages, and mask response messages on an interface.

**Notes**

N/A

**Configuration Steps**

▾ **Enabling ICMP Unreachable Messages**

- By default, ICMP unreachable messages are enabled.
- (Optional) The **no ip unreachables** command can be used to disable ICMP unreachable messages.
- Perform the configuration in L3 interface configuration mode.

### ↳ Enabling ICMP Redirection Messages

- By default, ICMP redirection messages are enabled.
- (Optional) The **no ip redirects** command can be used to disable ICMP redirection messages.
- Perform the configuration in L3 interface configuration mode.

### ↳ Enabling Error Messages for TTL Timeout

- By default, error messages for TTL timeout are enabled.
- (Optional) The **no ip ttl-expires enable** command can be used to disable error messages for TTL timeout.
- Perform the configuration in global configuration mode.

### ↳ Enabling Timestamp Query

- By default, timestamp query is enabled.
- (Optional) The **no ip icmp timestamp** command can be used to disable timestamp query.
- Perform the configuration in global configuration mode.

## Verification

Run the **show ip interface** command to check whether the configuration takes effect.

Run the **show running-config** command to check whether error messages for TTL timeout are disabled.

Run the **show running-config** command to check whether timestamp query is disabled.

<b>Configuration Steps</b>	<p>Enable ICMP unreachable messages, ICMP redirection messages, and mask response messages on interface gigabitEthernet 0/1.</p> <pre>Ruijie#configure terminal Ruijie(config)# no ip ttl-expires enable Ruijie(config)# no ip icmp timestamp Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# no switchport Ruijie(config-if-GigabitEthernet 0/1)# ip unreachable Ruijie(config-if-GigabitEthernet 0/1)# ip redirects Ruijie(config-if-GigabitEthernet 0/1)# ip mask-reply</pre>
<b>Verification</b>	Run the <b>show ip interface</b> command to check whether the configuration takes effect.

```

Ruijie#show running-config | include ip ttl-expires enable
no ip ttl-expires enable

Ruijie#show running-config | include ip icmp timestamp
no ip icmp timestamp

Ruijie#show ip interface gigabitEthernet 0/1
GigabitEthernet 0/1
    ICMP mask reply is: ON
    Send ICMP redirect is: ON
    Send ICMP unreachable is: ON

```

## 1.4.4 Configuring the Transmission Rate of ICMP Error Packets

### Configuration Effect

Configure the transmission rate of ICMP error packets.

### Notes

N/A

### Configuration Steps

#### ▾ Configuring the Transmission Rate of ICMP Destination Unreachable Packets Triggered by the DF Bit in the IP Header

- Optional
- Perform the configuration in global configuration mode.

#### ▾ Configuring the Transmission Rate of Other ICMP Error Packets

- Optional
- Perform the configuration in global configuration mode.

### Verification

Run the **show running-config** command to check whether the configuration takes effect.

### Related Commands

#### ▾ Configuring the Transmission Rate of ICMP Destination Unreachable Packets Triggered by the DF Bit in the IP Header

<b>Command</b>	<b>ip icmp error-interval DF</b> <i>milliseconds</i> [ <i>bucket-size</i> ]
<b>Parameter</b>	<i>milliseconds</i> : Refresh cycle of a token bucket. The value range is from 0 to 2,147,483,647 and the default

<b>Description</b>	value is 100 milliseconds. When the value is 0, the transmission rate of ICMP error packets is not limited. <i>bucket-size</i> : Number of tokens contained in a token bucket. The value range is from 1 to 200 and the default value is 10.
<b>Command Mode</b>	Global configuration mode.
<b>Usage Guide</b>	<p>This function limits the transmission rate of ICMP error packets to prevent DoS attacks by using the token bucket algorithm.</p> <p>If an IP packet needs to be fragmented but the DF bit in the header is set to 1, the device sends an ICMP destination unreachable packet (code 4) to the source host. This ICMP error packet is used to discover the path MTU. When there are too many other ICMP error packets, the ICMP destination unreachable packet (code 4) may not be sent. As a result, the path MTU discovery function fails. To avoid this problem, you should limit the transmission rate of ICMP destination unreachable packets and other ICMP error packets respectively.</p> <p>It is recommended to set the refresh cycle to integral multiples of 10 milliseconds. If the refresh cycle is set to a value greater than 0 and smaller than 10 milliseconds, the refresh cycle that actually takes effect is 10 milliseconds. For example, if the refresh rate is set to 1 per 5 milliseconds, the refresh rate that actually takes effect is 2 per 10 milliseconds. If the refresh cycle is not integral multiples of 10 milliseconds, the refresh cycle that actually takes effect is automatically converted to integral multiples of 10 milliseconds. For example, if the refresh rate is set to 3 per 15 milliseconds, the refresh rate that actually takes effect is 2 per 10 milliseconds.</p>

### 📌 Configuring the Transmission Rate of Other ICMP Error Packets

<b>Command</b>	<b>ip icmp error-interval</b> <i>milliseconds</i> [ <i>bucket-size</i> ]
<b>Parameter Description</b>	<i>milliseconds</i> : Refresh cycle of a token bucket. The value range is 0 to 2,147,483,647, and the default value is <b>100</b> (ms). When the value is <b>0</b> , the transmission rate of ICMP error packets is not limited. <i>bucket-size</i> : Number of tokens contained in a token bucket. The value range is 1 to 200 and the default value is <b>10</b> .
<b>Command Mode</b>	Global configuration mode.
<b>Usage Guide</b>	<p>This function limits the transmission rate of ICMP error packets to prevent DoS attacks by using the token bucket algorithm.</p> <p>It is recommended to set the refresh cycle to integral multiples of 10 milliseconds. If the refresh cycle is set to a value greater than 0 and smaller than 10 milliseconds, the refresh cycle that actually takes effect is 10 milliseconds. For example, if the refresh rate is set to 1 per 5 milliseconds, the refresh rate that actually takes effect is 2 per 10 milliseconds. If the refresh cycle is not integral multiples of 10 milliseconds, the refresh cycle that actually takes effect is automatically converted to integral multiples of 10 milliseconds. For example, if the refresh rate is set to 3 per 15 milliseconds, the refresh rate that actually takes effect is 2 per 10 milliseconds.</p>

### Configuration Example

<b>Configuration Steps</b>	Set the transmission rate of ICMP destination unreachable packets triggered the DF bit in IP header to 100 packets per second and the transmission rate of other ICMP error packets to 10 packets per second.
	<pre>Ruijie(config)# ip icmp error-interval DF 1000 100 Ruijie(config)# ip icmp error-interval 1000 10</pre>
<b>Verification</b>	Run the <b>show running-config</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config   include ip icmp error-interval ip icmp error-interval 1000 10 ip icmp error-interval DF 1000 100</pre>

## 1.4.5 Setting the IP MTU

### Configuration Effect

Adjust the IP packet MTU.

### Notes

N/A

### Configuration Steps

- (Optional) When the IP MTU of interconnected interfaces is different on devices in the same physical network segment, set the IP MTU to the same value.
- Perform the configuration in L3 interface configuration mode.

### Verification

Run the **show ip interface** command to check whether the configuration takes effect.

### Related Commands

#### ↳ Setting the IP MTU

<b>Command</b>	<b>ip mtubytes</b>
<b>Parameter Description</b>	<i>bytes</i> : IP packet MTU. The value range is from 68 to 1,500 bytes.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

<b>Configuration Steps</b>	Set the IP MTU of interface gigabitEthernet 0/1 to 512 bytes.
----------------------------	---

	<pre>Ruijie#configure terminal Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# no switchport Ruijie(config-if-GigabitEthernet 0/1)#ip mtu 512</pre>
<b>Verification</b>	Run the <b>show ip interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie# show ip interface gigabitEthernet 0/1 IP interface MTU is: 512</pre>

### 1.4.6 Setting the IP TTL

#### Configuration Effect

Modify the IP TTL value of an interface.

#### Notes

N/A

#### Configuration Steps

- Optional
- Perform the configuration in L3 interface configuration mode.

#### Verification

Run the **show run-config** command to check whether the configuration takes effect.

#### Related Commands

##### Setting the IP TTL

<b>Command</b>	<b>ip ttl value</b>
<b>Parameter Description</b>	<i>value</i> : TTL value. The value range is from 0 to 255.
<b>Command Mode</b>	Global configuration mode.
<b>Usage Guide</b>	N/A

#### Configuration Example

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Set the TTL of unicast packets to 100.</li> </ul>
----------------------------	--

	<pre>Ruijie#configure terminal Ruijie(config)#ip ttl 100</pre>
<b>Verification</b>	Run the <b>show run-config</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config ip ttl 100</pre>

### 1.4.7 Configuring Protection of IP Routed Ports

#### Configuration Effect

Enable or disable protection of IP routed ports.

#### Notes

This configuration is supported on Layer 3 routed ports.

#### Configuration Steps

- By default, protection of IP routed ports is disabled.
- (Optional) The **ip redirect-drop** command can be used to enable or disable the function.

#### Verification

Run the **show run-config** command to check whether the configuration takes effect.

#### Related Commands

##### ⌵ Configuring Protection of IP Routed Ports

<b>Command</b>	<b>ip redirect-drop</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode.
<b>Usage Guide</b>	N/A

#### Configuration Example

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Requires packets coming in via the fastEthernet 0/1 interface to go out via other routed ports .</li> </ul>
	<pre>Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#ip redirect-drop</pre>
<b>Verification</b>	Run the <b>show run-config</b> command to check whether the configuration takes effect.

```
Ruijie#show running-config
ip redirect-drop
```

### 1.4.8 Configuring an IP Source Route

#### Configuration Effect

Enable or disable the IP source route function.

#### Notes

N/A

#### Configuration Steps

- By default, the IP source route function is enabled.
- Optional) The **no ip source-route** command can be used to disable the IP source route function.

#### Verification

Run the **show run-config** command to check whether the configuration takes effect.

#### Related Commands

##### ▾ Configuring an IP Source Route

<b>Command</b>	<b>ip source-route</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode.
<b>Usage Guide</b>	N/A

#### Configuration Example

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Disable the IP source route function.</li> </ul> <pre>Ruijie#configure terminal Ruijie(config)#no ip source-route</pre>
<b>Verification</b>	Run the <b>show run-config</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config no ip source-route</pre>

## 1.5 Monitoring

### Displaying

Description	Command
Displays the IP address of an interface.	<b>show ip interface</b> [ <i>interface-type interface-number</i>   <b>brief</b> ]
Displays IP packet statistics.	<b>show ip packet statistics</b> [ <b>total</b>   <i>interface-name</i> ]
Displays statistics on sent and received IP packets in the protocol stack.	<b>show ip packet queue</b>

## 2 Configuring ARP

### 2.1 Overview

In a local area network (LAN), each IP network device has two addresses: 1) local address. Since the local address is contained in the header of the data link layer (DLL) frame, it is a DLL address. However, it is processed by the MAC sublayer at the DLL and thereby is usually called the MAC address. MAC addresses represent IP network devices on LANs. 2) network address. Network addresses on the Internet represent IP network devices and also indicate the networks where the devices reside.

In a LAN, two IP devices can communicate with each other only after they learn the 48-bit MAC address of each other. The process of obtaining the MAC address based on the IP address is called address resolution. There are two types of address resolution protocols: 1) Address Resolution Protocol (ARP); 2) Proxy ARP. ARP and Proxy ARP are described respectively in RFC 826 and RFC 1027.

ARP is used to bind the MAC address with the IP address. When you enter an IP address, you can learn the corresponding MAC address through ARP. Once the MAC address is obtained, the IP-MAC mapping will be saved to the ARP cache of the network device. With the MAC address, the IP device can encapsulate DLL frames and send them to the LAN. By default, IP and ARP packets on the Ethernet are encapsulated in Ethernet II frames.

#### Protocols and Standards

- RFC 826: An Ethernet Address Resolution Protocol
- RFC 1027: Using ARP to implement transparent subnet gateways

### 2.2 Applications

Application	Description
<a href="#">LAN-based ARP</a>	A user learns the MAC addresses of other users in the same network segment through ARP.
<a href="#">Proxy ARP-based Transmission</a>	With Proxy ARP, a user can directly communicate with users in another network without knowing that it exists.

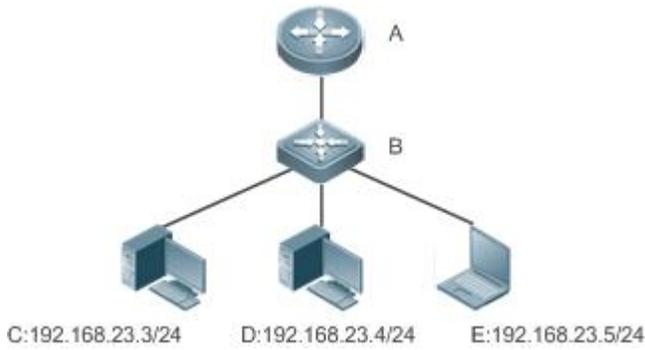

#### 2.2.1 LAN-based ARP

##### Scenario

ARP is required in all IPv4 LANs.

- A user needs to learn the MAC addresses of other users through ARP to communicate with them.

Figure 2-1

<b>Remarks</b>	<p>A is a router.</p> <p>B is a switch. It acts as the gateway.</p> <p>C, D, and E are hosts.</p>
----------------	---

**Deployment**

- Enable ARP in a LAN to implement IP-MAC mapping.

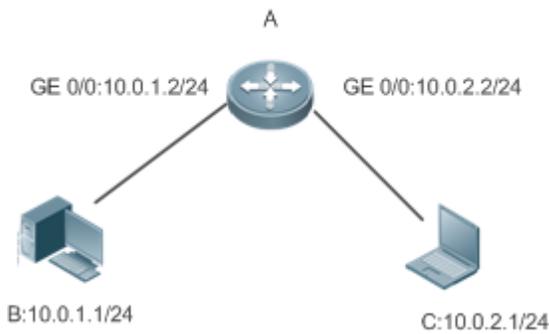

**2.2.2 Proxy ARP-based Transparent Transmission**

**Scenario**

Transparent transmission across IPv4 LANs is performed.

- Enable Proxy ARP on the router to achieve direct communication between users in different network segments.

Figure 2-2

<b>Remarks</b>	<p>A is a router connecting two LANs.</p> <p>B and C are hosts in different subnets. No default gateway is configured for them.</p>
----------------	---

**Deployment**

- Enable Proxy ARP on the subnet gateway. After configuration, the gateway can act as a proxy to enable a host without any route information to obtain MAC addresses of IP users in other subnets.

## 2.3 Features

### Overview

Feature	Description
<a href="#">Static ARP</a>	Users can manually specify IP-MAC mapping to prevent the device from learning incorrect ARP entries.
<a href="#">ARP Attributes</a>	Users can specify the ARP entry timeout, ARP request retransmission times and interval, and maximum number of unresolved ARP entries.
<a href="#">Gratuitous ARP</a>	Gratuitous ARP is used to detect IP address conflicts and enable peripheral devices to update ARP entries.
<a href="#">Proxy ARP</a>	A proxy replies to the ARP requests from other devices in different subnets.
<a href="#">Local Proxy ARP</a>	A proxy replies to the ARP requests from other devices in the same subnet.
<a href="#">Any IP ARP</a>	Users can access the network without changing the IP address and gateway.
<a href="#">ARP Trustworthiness Detection</a>	Neighbor Unreachable Detection (NUD) is used to ensure that correct ARP entries are learned.
<a href="#">Scheduled Automatic ARP Scanning</a>	Enable scheduled automatic ARP scanning on neighbors in the LAN.
<a href="#">ARP-based IP Guard</a>	You can set the number of IP packets for triggering ARP drop to prevent a large number of unknown unicast packets from being sent to the CPU.
<a href="#">Refraining from Sending ARP Requests to Authentication VLANs</a>	The device refrains from sending ARP broadcast requests to authentication VLANs to reduce the number of ARP broadcast requests in the network.
<a href="#">Fast Aging of ARP Entries</a>	Enable fast aging of fast aging of ARP entries on an interface.

### 2.3.1 Static ARP

Static ARP entries can be configured manually or assigned by the authentication server. The manually configured ones prevail. Static ARP can prevent the device from learning incorrect ARP entries.

#### Working Principle

If static ARP entries are configured, the device does not actively update ARP entries and these ARP entries permanently exist.

When the device forwards Layer-3 packets, the static MAC address is encapsulated in the Ethernet header as the destination MAC address.

#### Related Configuration

##### 📄 Enabling Static ARP

Run the **arp [vrf name] ip-address mac-address type** command in global configuration mode to configure static ARP entries. By default, no static ARP entry is configured. Users can bind static ARP entries to individual VRF instances or the global VRF instance. ARP encapsulation supports only the Ethernet II type, which is represented by ARPA.

## 2.3.2 ARP Attributes

Users can specify the ARP timeout, ARP request retransmission interval and times, maximum number of unresolved ARP entries, and maximum number of ARP entries on an interface.

### Working Principle

#### ↳ ARP Timeout

The ARP timeout only applies to the dynamically learned IP-MAC mapping. When the ARP entry timeout expires, the device sends a unicast ARP request packet to detect whether the peer end is online. If it receives an ARP reply from the peer end, it does not delete this ARP entry. Otherwise, the device deletes this ARP entry.

When the ARP timeout is set to a smaller value, the mapping table stored in the ARP cache is more accurate but ARP consumes more network bandwidth.

#### ↳ ARP Request Retransmission Interval and Times

The device consecutively sends ARP requests to resolve an IP address to a MAC address. The shorter the retransmission interval is, the faster the resolution is. The more times the ARP request is retransmitted, the more likely the resolution will succeed and the more bandwidth ARP will consume.

#### ↳ Maximum Number of Unresolved ARP Entries

In a LAN, ARP attacks and scanning may cause a large number of unresolved ARP entries generated on the gateway. As a result, the gateway fails to learn the MAC addresses of the users. To prevent such attacks, users can configure the maximum number of unresolved ARP entries.

#### ↳ Maximum Number of ARP Entries on an Interface

Configure the maximum number of ARP entries on a specified interface to prevent ARP entry resource waste.

### Related Configuration

#### ↳ Configuring the ARP Timeout

Run the **arp timeout seconds** command in interface configuration mode to configure the ARP timeout. The default timeout is 3,600 seconds. You can change it based on actual situations.

#### ↳ Configuring the ARP Request Retransmission Interval and Times

- Run the **arp retry interval seconds** command in global configuration mode to configure the ARP request retransmission interval. The default interval is 1 second. You can change it based on actual situations.
- Run the **arp retry times number** command in global configuration mode to configure the ARP request retransmission times. The default number of retransmission times is 5. You can change it based on actual situations.

### ↘ Configuring the Maximum Number of Unresolved ARP Entries

Run the **arp unresolve *number*** command in global configuration mode to configure the maximum number of unresolved ARP entries. The default value is the maximum number of ARP entries supported by the device. You can change it based on actual situations.

### ↘ Configuring the Maximum Number of ARP Entries on an Interface

Run the **arp cache interface-limit *limit*** command in interface configuration mode to configure the maximum number of ARP entries learned on an interface. The default number is 0. You can change it based on actual situations. This command also applies to static ARP entries.

## 2.3.3 Gratuitous ARP

### Working Principle

Gratuitous ARP packets are a special type of ARP packets. In a gratuitous ARP packet, the source and destination IP addresses are the IP address of the local device. Gratuitous ARP packets have two purposes:

4. IP address conflict detection. If the device receives a gratuitous packet and finds the IP address in the packet the same as its own IP address, it sends an ARP reply to notify the peer end of the IP address conflict.
5. ARP update. When the MAC address of an interface changes, the device sends a gratuitous ARP packet to notify other devices to update ARP entries.

The device can learn gratuitous ARP packets. After receiving a gratuitous ARP packet, the device checks whether the corresponding dynamic ARP entry exists. If yes, the device updates the ARP entry based on the information carried in the gratuitous ARP packet.

### Related Configuration

#### ↘ Enabling Gratuitous ARP

Run the **arp gratuitous-send interval *seconds* [*number*]** command in interface configuration mode to enable gratuitous ARP. This function is disabled on interfaces by default. Generally you need to enable this function on the gateway interface to periodically update the MAC address of the gateway on the downlink devices, which prevents others from faking the gateway.

## 2.3.4 Proxy ARP

### Working Principle

The device enabled with Proxy ARP can help a host without any route information to obtain MAC addresses of IP users in other subnets. For example, if the device receiving an ARP request finds the source IP address in a different network segment from the destination IP address and knows the route to the destination address, the device sends an ARP reply containing its own Ethernet MAC address. This is how Proxy ARP works.

### Related Configuration

### ↘ Enabling Proxy ARP

- Run the **ip proxy-arp** command in interface configuration mode to enable Proxy ARP.
- This function is disabled by default.

## 2.3.5 Local Proxy ARP

### Working Principle

Local Proxy ARP means that a device acts as a proxy in the local VLAN (common VLAN or sub VLAN).

After local Proxy ARP is enabled, the device can help users to obtain the MAC addresses of other users in the same subnet. For example, when port protection is enabled on the device, users connected to different ports are isolated at Layer 2. After local Proxy ARP is enabled, the device receiving an ARP request acts as a proxy to send an ARP reply containing its own Ethernet MAC address. In this case, different users communicate with each other through Layer-3 routes. This is how local Proxy ARP works.

### Related Configuration

#### ↘ Enabling Local Proxy ARP

- Run the **local-proxy-arp** command in interface configuration mode to enable local Proxy ARP.
- This function is disabled by default.
- This command is supported only on switch virtual interfaces (SVIs).

## 2.3.6 Any IP ARP

### Working Principle

If any IP ARP is enabled, users can access the network with any IP address. This applies when a user is using his own laptop in a hotel and wants to access the network without changing the IP address and gateway. If the gateway receiving an ARP request finds the source IP address in a different subnet and the destination address possibly not its own address, the gateway still sends an ARP reply and creates a direct route for the user.

### Related Configuration

#### ↘ Enabling Any IP ARP

Run the **arp any-ip** command in interface configuration mode to enable any IP ARP. This function is disabled on interfaces by default.

## 2.3.7 ARP Trustworthiness Detection

### Working Principle

The **arp trust-monitor enable** command is used to enable anti-ARP spoofing to prevent excessive useless ARP entries from occupying device resources. After ARP trustworthiness detection is enabled on a Layer-3 interface, the device receives ARP request packets from this interface:

1. If the corresponding entry does not exist, the device creates a dynamic ARP entry and performs NUD after 1 to 5 seconds. That is, the device begins to age the newly learned ARP entry and sends a unicast ARP request. If the device receives an ARP update packet from the peer end within the aging time, it stores the entry. If not, it deletes the entry.
2. If the corresponding ARP entry exists, NUD is not performed.
3. If the MAC address in the existing dynamic ARP entry is updated, the device also performs NUD.

Since this function adds a strict confirmation procedure in the ARP learning process, it affects the efficiency of ARP learning.

After this function is disabled, NUD is not required for learning and updating ARP entries.

### Related Configuration

#### ↳ Enabling ARP Trustworthiness Detection

Run the **arp trust-monitor enable** command in interface configuration mode to enable ARP trustworthiness detection. This function is disabled by default.

## 2.3.8 Scheduled Automatic ARP Scanning

### Working Principle

When scheduled automatic ARP scanning is enabled, the network segment configured on the interface is scanned in a scheduled manner to learn the ARP entries of neighbors. The scanning interval ranges from 1 to 30 minutes, and the default interval is 5 minutes. The scanning rate ranges from 1 to 100 pps, and the default rate is 20 pps.

### Related Configuration

#### ↳ Configuring ARP Scanning

- Run the **arp scan auto** *start-ip-address end-ip-address* command in interface configuration mode to enable scheduled automatic ARP scanning. By default, this function is disabled.
- Run the **arp scan interval** *minutes* command in global configuration mode to configure the scanning interval.
- Run the **arp scan rate** *rate-value* command in global configuration mode to configure the scanning rate.

## 2.3.9 ARP-based IP Guard

### Working Principle

When receiving unresolved IP packets, the switch cannot forward them through the hardware and thereby need to send them to the CPU for address resolution. If a large number of such packets are sent to the CPU, the CPU will be congested, affecting other services on the switch.

After ARP-based IP guard is enabled, the switch receiving ARP request packets counts the number of packets in which the destination IP address hits this ARP entry. If this number is equal to the configured number, the switch sets a drop entry in

the hardware so that the hardware will not send the packets with this destination IP address to the CPU. After the address resolution is complete, the switch continues to forward the packets with this destination IP address.

## Related Configuration

### ↳ Enabling ARP-based IP Guard

- Run the **arp anti-ip-attack** command in global configuration mode to configure the number of IP packets for triggering ARP drop.
- By default, the switch discards the corresponding ARP entry after it receives three unknown unicast packets containing the same destination IP address.

## 2.3.10 Refraining from Sending ARP Requests to Authentication VLANs

### Working Principle

In gateway authentication mode, all sub VLANs in a Super VLAN are authentication VLANs by default. Users in an authentication VLAN have to pass authentication to access the network. After authentication, a static ARP entry is generated on the device. Therefore, when accessing an authenticated user, the device does not need to send ARP requests to the authentication VLAN. If the device attempts to access users in an authentication-exemption VLAN, it only needs to send ARP requests to the authentication-exemption VLAN.

In gateway authentication mode, this function is enabled on the device by default. If the device needs to access authentication-exemption users in an authentication VLAN, disable this function.

### Related Configuration

### ↳ Refraining from Sending ARP Requests to Authentication VLANs

- Run the **arp suppress-auth-vlan-req** command in interface configuration mode to refrain from sending ARP requests to authentication VLANs.
- This function is enabled by default.

## 2.3.11 ARP Packet Statistics Collection

### Working Principle

The device counts the total numbers of sent/received ARP requests/responses and packets of unknown types on all interfaces from power-on.

## 2.3.12 ARP Packet Rate Statistics Collection

### Working Principle

The device measures, at a minimum interval of 1s, the rate of ARP requests, ARP responses, and packets of unknown types received on each interface in a period of time.

### 2.3.13 Enabling Fast Aging of ARP Entries

#### Working Principle

ARP entries cannot be learned under unusual circumstances. After MAC addresses age, ARP entries age fast so as to achieve fast route convergence.

#### Related Configuration

##### ▾ Enabling Fast Aging of ARP Entries

- In interface configuration mode, run the **arp fast-aging enable** command to enable fast aging of ARP entries.
- By default, this function is disabled.

## 2.4 Configuration

Configuration	Description and Command
<a href="#">Enabling Static ARP</a>	 (Optional) It is used to enable static IP-MAC binding.
	<b>arp</b> Enables static ARP.
<a href="#">Configuring ARP Attributes</a>	 (Optional) It is used to specify the ARP timeout, ARP request retransmission interval and times, maximum number of unresolved ARP entries, and maximum number of ARP entries on an interface.
	<b>arp timeout</b> Configures the ARP timeout.
	<b>arp retry interval</b> Configures the ARP request retransmission interval.
	<b>arp unresolve</b> Configures the maximum number of unresolved ARP entries.
	<b>arp cache interface-limit</b> Configures the maximum number of ARP entries on an interface.
<a href="#">Enabling Trusted ARP</a>	 (Optional) It is used to enable anti-ARP spoofing.
	<b>service trustedarp</b> Enables trusted ARP.
	<b>arp trusted user-vlan</b> Enables VLAN redirection when a trusted ARP entry is added.
	<b>arp trusted aging</b> Enables trusted ARP aging.
	<b>arp trusted</b> Configures the capacity of trusted ARP entries.
<a href="#">Enabling Gratuitous ARP</a>	 (Optional) It is used to detect IP address conflicts and enables peripheral devices to update ARP entries.
	<b>arp gratuitous-send interval</b> Enables gratuitous ARP.

Configuration	Description and Command
<a href="#">Enabling Proxy ARP</a>	 (Optional) It is used to act as a proxy to reply to ARP requests from the devices in different subnets.
	<b>ip proxy-arp</b> Enables Proxy ARP.
<a href="#">Enabling Local Proxy ARP</a>	 (Optional) It is used to act as a proxy to reply to ARP requests from other devices in the same subnet.
	<b>local-proxy-arp</b> Enables local Proxy ARP.
<a href="#">Enabling Any IP ARP</a>	 (Optional) It is used to allow users to access the network without changing the IP address and gateway.
	<b>arp any-ip</b> Enables any IP ARP.
<a href="#">Enabling <u>                    </u> ARP Trustworthiness Detection</a>	 (Optional) It is used to unicast ARP request packets to ensure that correct ARP entries are learned.
	<b>arp trusted-monitor enable</b> Enables ARP trustworthiness detection.
<a href="#">Configuring <u>          </u> Scheduled Automatic ARP Scanning</a>	 (Optional) It is used to enable scheduled automatic ARP scanning on an interface.
	<b>arp scan auto</b> Enables scheduled automatic ARP scanning on an interface.
	<b>arp scan interval</b> Configures the scheduled automatic ARP scanning interval in global configuration mode.
	<b>arp scan rate</b> Configures the scheduled automatic ARP scanning rate in global configuration mode.
<a href="#">Enabling <u>  </u> ARP-based <u>  </u> IP Guard</a>	 (Optional) It is used to prevent a large number of IP packets from being sent to the CPU.
	<b>arp anti-ip-attack</b> Configures the number of IP packets for triggering ARP drop.
<a href="#">Refraining from Sending <u>  </u> ARP <u>  </u> Requests <u>  </u> to <u>  </u> Authentication VLANs</a>	 (Optional) It is used to refrain from sending ARP requests to authentication VLANs.
	<b>arp suppress-auth-vlan-req</b> Refrains from sending ARP requests to authentication VLANs.
<a href="#">Configuring <u>  </u> ARP <u>  </u> Packet <u>  </u> Rate Statistics Collection</a>	 (Optional) It is used to enable ARP packet rate statistics collection and configure the interval for collecting rate statistics.
	<b>arp rate-statistic enable</b> Enables ARP packet rate statistics collection.
	<b>arp rate-statistic compute interval</b> Configures the interval for collecting ARP packet rate statistics.
<a href="#">Enabling Fast Aging of ARP</a>	 (Optional) It is used to enable fast aging of ARP entries.

Configuration	Description and Command	
<a href="#">Entries</a>	<b>arp fast-aging enable</b>	Enables fast aging of ARP entries.

## 2.4.1 Enabling Static ARP

### Configuration Effect

Users can manually specify IP-MAC mapping to prevent the device from learning incorrect ARP entries.

### Notes

After a static ARP entry is configured, the Layer-3 switch learns the physical port corresponding to the MAC address in the static ARP entry before it performs Layer-3 routing.

### Configuration Steps

#### ▾ [Configuring Static ARP Entries](#)

- Optional.
- You can configure a static ARP entry to bind the IP address of the uplink device with its MAC address to prevent MAC change caused by ARP attacks.
- Configure static ARP entries in global configuration mode.

### Verification

Run the **show running-config** command to check whether the configuration takes effect. Or run the **show arp static** command to check whether a static ARP cache table is created.

### Related Commands

#### ▾ [Configuring Static ARP Entries](#)

<b>Command</b>	<b>arp</b> [ <i>vrf name</i>   <i>oob</i> ] <i>ip-address mac-address type</i>
<b>Parameter Description</b>	<p><b>vrf name</b>: Specifies a VRF instance. The <b>name</b> parameter indicates the name of the VRF instance.</p> <p><b>oob</b>: Configures a static ARP entry for a management port.</p> <p><i>ip-address</i>: Indicates the IP address mapped to a MAC address, which is in four-part dotted-decimal format.</p> <p><i>mac-address</i>: Indicates the DLL address, consisting of 48 bits.</p> <p><i>type</i>: Indicates the ARP encapsulation type. For an Ethernet interface, the keyword is <b>arpa</b>.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The RGOS queries a 48-bit MAC address based on a 32-bit IP address in the ARP cache table.</p> <p>Since most hosts support dynamic ARP resolution, usually the static ARP mapping are not configured. Use the <b>clear arp-cache</b> command to delete the dynamic ARP entries.</p>

### Configuration Example

<b>Scenario</b>	For the network topology, see Figure 2-1.
-----------------	---

<b>Configuration Steps</b>	Configure a static ARP entry on B to statically bind the IP address of A with the MAC address. <pre>Ruijie(config)#arp 192.168.23.1 00D0.F822.334B arpa</pre>												
<b>Verification</b>	Run the <b>show arp static</b> command to display the static ARP entry. <pre>Ruijie(config)#show arp static</pre> <table border="1" data-bbox="337 415 1162 499"> <thead> <tr> <th>Protocol</th> <th>Address</th> <th>Age(min)</th> <th>Hardware</th> <th>Type</th> <th>Interface</th> </tr> </thead> <tbody> <tr> <td>Internet</td> <td>192.168.23.1</td> <td>&lt;static&gt;</td> <td>00D0.F822.334B</td> <td>arpa</td> <td></td> </tr> </tbody> </table> <pre>1 static arp entries exist.</pre>	Protocol	Address	Age(min)	Hardware	Type	Interface	Internet	192.168.23.1	<static>	00D0.F822.334B	arpa	
Protocol	Address	Age(min)	Hardware	Type	Interface								
Internet	192.168.23.1	<static>	00D0.F822.334B	arpa									

### Common Errors

- The MAC address in static ARP is incorrect.

## 2.4.2 Configuring ARP Attributes

### Configuration Effect

Users can specify the ARP timeout, ARP request retransmission interval and times, maximum number of unresolved ARP entries, and maximum number of ARP entries on an interface.

### Configuration Steps

#### ▾ Configuring the ARP Timeout

- Optional.
- In a LAN, if a user goes online/offline frequently, it is recommended to set the ARP timeout small to delete invalid ARP entries as soon as possible.
- Configure the ARP timeout in interface configuration mode.

#### ▾ Configuring the ARP Request Retransmission Interval and Times

- Optional.
- If the network resources are insufficient, it is recommended to set the ARP request retransmission interval great and the retransmission times small to reduce the consumption of network bandwidths.
- Configure the ARP request retransmission interval and times in global configuration mode.

#### ▾ Configuring the Maximum Number of Unresolved ARP Entries

- Optional.
- If the network resources are insufficient, it is recommended to set the maximum number of unresolved ARP entries small to reduce the consumption of network bandwidths.
- Configure the maximum number of unresolved ARP entries in global configuration mode.

#### ▾ Configuring the Maximum Number of ARP Entries on an Interface

- Optional.
- Configure the maximum number of ARP entries on an interface in interface configuration mode.

## Verification

Run the **show arp timeout** command to display the timeouts of all interfaces.

Run the **show running-config** command to display the ARP request retransmission interval and times, maximum number of unresolved ARP entries, and maximum number of ARP entries on an interface.

## Related Commands

### ↘ Configuring the ARP Timeout

<b>Command</b>	<b>arp timeout</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the timeout in seconds, ranging from 0 to 2,147,483. The default value is 3,600.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The ARP timeout only applies to the dynamically learned IP-MAC mapping. When the ARP timeout is set to a smaller value, the mapping table stored in the ARP cache is more accurate but ARP consumes more network bandwidth. Unless otherwise specified, do not configure the ARP timeout.

### ↘ Configuring the ARP Request Retransmission Interval and Times

<b>Command</b>	<b>arp retry interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the ARP request retransmission interval in seconds, ranging from 1 to 3,600. The default value is 1.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If a device frequently sends ARP requests, affecting network performance, you can set the ARP request retransmission interval longer. Ensure that this interval does not exceed the ARP timeout.

### ↘ Configuring the Maximum Number of Unresolved ARP Entries

<b>Command</b>	<b>arp unresolve</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of unresolved ARP entries, ranging from 1 to 8,192. The default value is 8,192.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If a large number of unresolved entries exist in the ARP cache table and remain in the table after a while, it is recommended to use this command to limit the number of unresolved ARP entries.

### ↘ Configuring the Maximum Number of ARP Entries on an Interface

<b>Command</b>	<b>arp cache interface-limit</b> <i>limit</i>
----------------	---

<b>Parameter Description</b>	<i>limit</i> : Indicates the maximum number of ARP entries that can be learned on an interface, including configured ARP entries and dynamically learned ARP entries. The value ranges from 0 to the ARP entry capacity supported by the device. 0 indicates no limit on this number.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Limiting the number of ARP entries on an interface can prevent malicious ARP attacks from generating excessive ARP entries on the device and occupying entry resources. The configured value must be equal to or greater than the number of the ARP entries learned by the interface. Otherwise, the configuration does not take effect. The configuration is subject to the ARP entry capacity supported by the device.

### Configuration Example

<b>Scenario</b>	For the network topology, see Figure 2-1.
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Set the ARP timeout to 60 seconds on port GigabitEthernet 0/1.</li> <li>● Set the maximum number of learned ARP entries to 300 on port GigabitEthernet 0/1.</li> <li>● Set the ARP request retransmission interval to 3 seconds.</li> <li>● Set the ARP request retransmission times to 4.</li> <li>● Set the maximum number of unresolved ARP entries to 4,096.</li> <li>● Set the maximum number of learned ARP entries to 1,000 on Sub Slot 2 of Slot 1.</li> </ul>
	<pre>Ruijie(config)#interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)#arp timeout 60 Ruijie(config-if-GigabitEthernet 0/1)#arp cache interface-limit 300 Ruijie(config-if-GigabitEthernet 0/1)#exit Ruijie(config)#arp retry interval 3 Ruijie(config)#arp retry times 4 Ruijie(config)#arp unresolve 4096</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show arp timeout</b> command to display the timeout of the interface.</li> <li>● Run the <b>show running-config</b> command to display the ARP request retransmission interval and times, maximum number of unresolved ARP entries, and maximum number of ARP entries on the interface.</li> </ul>
	<pre>Ruijie#show arp timeout  Interface                arp timeout(sec) ----- GigabitEthernet 0/1      60 GigabitEthernet 0/2      3600 GigabitEthernet 0/4      3600 GigabitEthernet 0/5      3600</pre>

GigabitEthernet 0/7	3600
VLAN 100	3600
VLAN 111	3600
Mgmt 0	3600
Ruijie(config)# show running-config	
arp unresolve 4096	
arp retry times 4	
arp retry interval 3	
interface GigabitEthernet 0/1	
arp cache interface-limit 300	

### 2.4.3 Enabling Gratuitous ARP

#### Configuration Effect

The interface periodically sends gratuitous ARP packets.

#### Configuration Steps

- Optional.
- When a switch acts as the gateway, enable gratuitous ARP on an interface to prevent other users from learning incorrect gateway MAC address in case of ARP spoofing.
- Enable gratuitous ARP in interface configuration mode.

#### Verification

Run the **show running-config interface <name>** command to check whether the configuration is successful.

#### Related Commands

##### ↳ Enabling Gratuitous ARP

<b>Command</b>	<b>arp gratuitous-send interval</b> <i>seconds</i> [ <i>number</i> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the interval for sending a gratuitous ARP request. The unit is second. The value ranges from 1 to 3,600. <i>number</i> : Indicates the number of gratuitous ARP requests that are sent. The default value is 1. The value ranges from 1 to 100.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If a network interface of a device acts as the gateway for downstream devices but a downstream device

	pretends to be the gateway, enable gratuitous ARP on the interface to advertise itself as the real gateway.
--	---

### Configuration Example

<b>Scenario</b>	For the network topology, see Figure 2-1.
<b>Configuration Steps</b>	Configure the GigabitEthernet 0/0 interface to send a gratuitous ARP packet every 5 seconds.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#arp gratuitous-send interval 5</pre>
<b>Verification</b>	Run the <b>show running-config interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie#sh running-config interface gigabitEthernet 0/0  Building configuration...  Current configuration : 127 bytes ! interface GigabitEthernet 0/0  duplex auto  speed auto  ip address 30.1.1.1 255.255.255.0  arp gratuitous-send interval 5</pre>

## 2.4.4 Enabling Proxy ARP

### Configuration Effect

The device acts as a proxy to reply to ARP request packets from other users.

### Notes

By default, Proxy ARP is disabled.

### Configuration Steps

- Optional.
- If a user without any route information needs to obtain the MAC addresses of the IP users in other subnets, enable Proxy ARP on the device so that the device can act as a proxy to send ARP replies.
- Enable Proxy ARP in interface configuration mode.

### Verification

Run the **show ip interface** [ *name* ] command to check whether the configuration takes effect.

## Related Commands

### ▾ Enabling Proxy ARP

<b>Command</b>	<b>ip proxy-arp</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

<b>Scenario</b>	For the network topology, see Figure 2-1.
<b>Configuration Steps</b>	Enable Proxy ARP on port GigabitEthernet 0/0 .
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#ip proxy-arp</pre>
<b>Verification</b>	Run the <b>show ip interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show ip interface gigabitEthernet 0/0 GigabitEthernet 0/0   IP interface state is: DOWN   IP interface type is: BROADCAST   IP interface MTU is: 1500   IP address is:     No address configured   IP address negotiate is: OFF   Forward direct-broadcast is: OFF   ICMP mask reply is: ON   Send ICMP redirect is: ON   Send ICMP unreachable is: ON   DHCP relay is: OFF   Fast switch is: ON   Help address is: 0.0.0.0   Proxy ARP is: ON ARP packet input number: 0   Request packet      : 0</pre>

## 2.4.5 Enabling Local Proxy ARP

### Configuration Effect

The device acts as a proxy to reply to ARP request packets from other users in the same subnet.

### Notes

Local Proxy ARP is supported only on SVIs.

### Configuration Steps

- Optional.
- If a user enabled with port protection needs to communicate with users in the VLAN, enable local Proxy ARP on the device.
- Enable local Proxy ARP in interface configuration mode.

### Verification

Run the **show run interface** [ *name* ] command to check whether the configuration takes effect.

### Related Commands

#### ↳ Enabling Local Proxy ARP

<b>Command</b>	<b>local-proxy-arp</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

<b>Scenario</b>	For the network topology, see Figure 2-1.
<b>Configuration Steps</b>	Enable local Proxy ARP on the VLAN 1 interface.
	<pre>Ruijie(config-if-VLAN 1)#local-proxy-arp</pre>
<b>Verification</b>	Run the <b>show ip interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config interface vlan 1  Building configuration...  Current configuration : 53 bytes  interface VLAN 1  ip address 192.168.1.2 255.255.255.0  local-proxy-arp</pre>

## 2.4.6 Enabling Any IP ARP

### Configuration Effect

Users can access the network with any IP address.

### Notes

Any IP ARP is supported only on egress gateway products.

In the following two scenarios, users must modify the configuration before they can access the network.

1. The user's IP address is in the same network segment as the interface directly connected to the device. However, the IP address configured on the interface directly connected to the device is not the gateway address.
2. The user's IP address is not in the same network segment as the interface directly connected to the device, but in the network segment of another interface. That means an IP address conflict occurs.

As the user' IP address is not in the same network segment as the interface directly connected to the device, the dynamic ARP entries and direct routes are generated only when the user initiates ARP requests. Therefore, in some scenarios (including but not limited to the following ones), the user will not be able to access the network unless it clears the ARP entries and relearn the gateway address.

3. The device acts as a proxy to respond to ARP requests. After the user learns the MAC address of the device, dynamic ARP entries are cleared on the device. As a result, the user's dynamic ARP entries and direct routes are removed and the user cannot receive the reply packets.
4. The device acts as a proxy to respond to ARP requests. After the user learns the MAC address of the device, any IP ARP is disabled and then enabled again on the interface.

Note: Disabling any IP ARP on an interface will cause users' dynamic ARP entries and direct routes to be removed. Consequently, users cannot receive response packets.

On the other hand, if static ARP entries or ARP entries with VRRP IP addresses exist, dynamic ARP entries generated by any IP ARP will be overwritten or fail to be added, disabling the any IP ARP function.

### Configuration Steps

- Optional.
- In a hotel, enable any IP ARP on the gateway so that users can access the network without changing the IP address.
- Enable any IP ARP in interface configuration mode.

### Verification

Run the **show running-config interface [ name ]** command to check whether the configuration takes effect.

### Related Commands

#### ↘ Enabling Any IP ARP

<b>Command</b>	<b>arp any-ip</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>❗ Disabling any IP ARP on an interface will cause users' dynamic ARP entries and direct routes to be removed. Consequently, users cannot receive response packets.</p> <p>❗ If static ARP entries or ARP entries with VRRP IP addresses exist, dynamic ARP entries generated by any IP ARP will be overwritten or fail to be added, disabling the any IP ARP function.</p>

### Configuration Example

<b>Scenario</b> Figure 2-3	<p style="text-align: center;">C:192.168.23.3/24      D:192.168.23.4/24      E:192.168.23.5/24</p>
<b>Configuration Steps</b>	Enable any IP ARP on port GigabitEthernet 0/0.

	<pre>Ruijie(config-if-GigabitEthernet 0/0)#arp any-ip</pre>
<b>Verification</b>	Run the <b>show running-config interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#sh run int gi0/0  Building configuration...  Current configuration : 140 bytes  ! interface GigabitEthernet 0/0  duplex auto  speed auto  ip address 30.1.1.1 255.255.255.0  arp gratuitous-send interval 5  arp any-ip</pre>

## 2.4.7 Enabling ARP Trustworthiness Detection

### Configuration Effect

Enable ARP trustworthiness detection. If the device receiving an ARP request packet fails to find the corresponding entry, it performs NUD. If the MAC address in the existing dynamic ARP entry is updated, the device immediately performs NUD to prevent ARP attacks.

### Notes

Since this function adds a strict confirmation procedure in the ARP learning process, it affects the efficiency of ARP learning.

### Configuration Steps

- Optional.
- If there is a need for learning ARP entries, enable ARP trustworthiness detection on the device. If the device receiving an ARP request packet fails to find the corresponding entry, it needs to send a unicast ARP request packet to check whether the peer end exists. If yes, the device learns the ARP entry. If not, the device does not learn the ARP entry. If the MAC address in the ARP entry changes, the device will immediately perform NUD to prevent ARP spoofing.
- Enable ARP trustworthiness detection in interface configuration mode.

### Verification

Run the **show running-config interface <name>** command to check whether the configuration take effect

### Related Commands

➤ **Enabling ARP Trustworthiness Detection**

<b>Command</b>	<b>arp trust-monitor enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<ul style="list-style-type: none"> <li>❗ Enable this function. If the corresponding ARP entry exists and the MAC address is not updated, the device does not perform NUD.</li> <li>❗ Enable this function. If the MAC address of the existing dynamic ARP entry is updated, the device immediately performs NUD.</li> <li>❗ After this function is disabled, the device does not perform NUD for learning or updating ARP entries.</li> </ul>

**Configuration Example**

<b>Scenario</b>	For the network topology, see Figure 2-1.
<b>Configuration Steps</b>	Enable ARP trustworthiness detection on port GigabitEthernet 0/0.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#arp trust-monitor enable</pre>
<b>Verification</b>	Run the <b>show running-config interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config interface gigabitEthernet 0/0  Building configuration...  Current configuration : 184 bytes ! interface GigabitEthernet 0/0  duplex auto  speed auto  ip address 30.1.1.1 255.255.255.0  arp trust-monitor enable</pre>

**2.4.8 Configuring Scheduled Automatic ARP Scanning**

**Configuration Effect**

After scheduled automatic ARP scanning is configured on an interface, the device scans neighbors in the specified range and learns ARP entries from the neighbors. After a time period of the scanning interval (5 minutes by default), the device

starts the next scanning and learns the remaining ARP entries. The device repeats these operations until all ARP entries are learnt.

## Notes

N/A

## Configuration Steps

- Optional.
- Perform this configuration in interface configuration mode.

## Verification

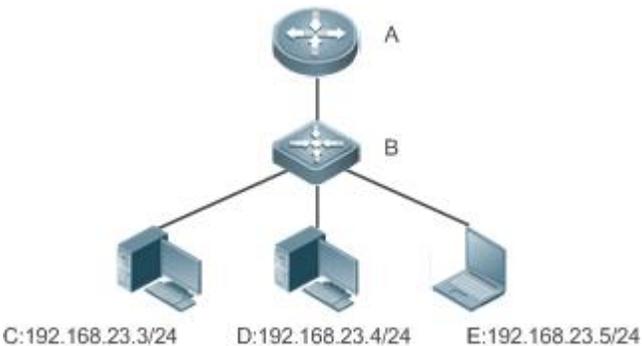

Run the **show running-config interface** [*name*] command to display configurations.

## Related Commands

### ▾ Enabling Scheduled Automatic ARP Scanning

<b>Command</b>	<b>arp scan auto</b> <i>start-ip-address end-ip-address</i>
<b>Parameter Description</b>	<i>start-ip-address</i> : Specifies the start IP address of the ARP scan range. The start IP address must be smaller than or equal to the end IP address. <i>end-ip-address</i> : Specifies the end IP address of the ARP scan range. The end IP address must be greater than or equal to the start IP address.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This function is enabled to perform scheduled automatic ARP scanning once every 5 minutes by default. The IP address with existing neighboring ARP entries is not scanned. If you know the allocated IP address range in a LAN, you can specify the ARP scan range. The number of the specified IP addresses cannot be greater than 1,024. The start/end IP address of the ARP scan range must be in the same network segment as the interface IP address. ARP scanning takes effect on UP interfaces only.

## Configuration Example

<p><b>Scenario</b> Figure 2-4</p>	 <p>A is a router. B is a switch, serving as the gateway in the network segment where terminals reside. C, D, and E are terminals.</p>
<p><b>Configuration Steps</b></p>	<p>Enable ARP scanning on an SVI.</p>
	<pre>Ruijie(config-if-VLAN 20)# arp scan auto 192.168.23.1 192.168.23.100</pre>
<p><b>Verification</b></p>	<p>Run the <b>show running-config interface</b> command to display configurations.</p>
	<pre>Ruijie#sho running-config interface vlan 20  Building configuration... Current configuration : 57 bytes  interface VLAN 20   arp scan auto 192.168.23.1 192.168.23.100 dut4(config-if-VLAN 20)#</pre>

### Common Errors

1. The start IP address is greater than the end IP address in the configured ARP scanning range.
2. The start/end IP address is not in the same network segment as the interface IP address.

## 2.4.9 Enabling ARP-based IP Guard

### Configuration Effect

When the CPU receives the specified number of packets in which the destination IP address hits the ARP entry, all packets with this destination IP address will not be sent to the CPU afterwards.

### Notes

N/A

### Configuration Steps

- Optional.

- By default, when three unknown unicast packets are sent to the CPU, the drop entry is set. Users can run this command to adjust the number of packets for triggering ARP drop based on the network environment. Users can also disable this function.
- Configure ARP-based IP guard in global configuration mode.

### Verification

Run the **show run** command to check whether the configuration takes effect.

### Related Commands

#### ↳ Enabling ARP-based IP Guard

<b>Command</b>	<b>arp anti-ip-attack num</b>
<b>Parameter</b>	<i>num</i> : Indicates the number of IP packets for triggering ARP drop. The value ranges from 0 to 100.
<b>Description</b>	0 indicates that ARP-based IP guard is disabled. The default value is 3.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	 If hardware resources are sufficient, run the <b>arp anti-ip-attack num</b> command to set the number of IP packets for triggering ARP drop to a small value. If hardware resources are insufficient, run the <b>arp anti-ip-attack num</b> command to set the number of IP packets for triggering ARP drop to a large value, or disable this function.

### Configuration Example

<b>Scenario</b>	For the network topology, see Figure 2-1.
<b>Configuration Steps</b>	Enable ARP-based IP guard on B. <pre>Ruijie(config)#arp anti-ip-attack 10</pre>
<b>Verification</b>	Run the <b>show running-config</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config  Building configuration...  Current configuration : 53 bytes  arp anti-ip-attack 10</pre>

## 2.4.10 Refraining from Sending ARP Requests to Authentication VLANs

### Configuration Effect

The device does not send ARP request packets to authentication VLANs.

## Notes

This function is supported only on SVIs.

## Configuration Steps

- Optional.
- In gateway authentication mode, the device does not send ARP request packets to authentication VLANs by default. If the device needs to send ARP request packets to authentication VLANs, run the **no arp suppress-auth-vlan-req** command to disable this function.
- Perform this configuration in interface configuration mode.

## Verification

Run the **show run interface <name>** command to check whether the configuration takes effect.

## Related Commands

### ↘ Refraining from Sending ARP Requests to Authentication VLANs

<b>Command</b>	<b>arp suppress-auth-vlan-req</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

<b>Scenario</b>	For the network topology, see Figure 2-1.
<b>Configuration Steps</b>	Disable the VLAN 2 interface from refraining from sending ARP requests to authentication VLANs. <pre>Ruijie(config-if-VLAN 2)#no arp suppress-auth-vlan-req</pre>
<b>Verification</b>	Run the <b>show running-config interface &lt;name&gt;</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config interface vlan 2  Building configuration...  Current configuration : 53 bytes  interface VLAN 2  ip address 192.168.1.2 255.255.255.0  no arp suppress-auth-vlan-req</pre>

## 2.4.11 Configuring ARP Packet Rate Statistics Collection

### Configuration Effect

Measure the rate of receiving/sending ARP packets on each interface.

### Notes

The default sampling interval is 5s, but the rate is measured at an interval of 1s.

### Configuration Steps

- (Optional) Configure ARP packet rate statistics collection when needed.
- Perform the configuration in global configuration mode.

<b>Command</b>	<b>arp rate-statistic enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	ARP packet rate statistics collection is disabled by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	ARP packet rate statistics collection is disabled by default. If the command result of <b>show arp rate-statistic</b> shows that statistics are all 0s, run the <b>show run-config</b> command to display configurations. If the function is not enabled, run the <b>arp rate-statistic enable</b> command to enable the function. To disable the function, run the <b>no arp rate-statistic enable</b> command.

### ↘ Configuring the Interval for Collecting ARP Packet Rate Statistics

- (Optional) Configure the interval for collecting ARP packet rate statistics if the default value (5s) does not meet requirements.
- Perform the configuration in global configuration mode.

<b>Command</b>	<b>arp rate-statistic compute interval <i>seconds</i></b>
<b>Parameter</b>	<i>seconds</i> : Indicates the interval in seconds, which cannot be less than 1s.
<b>Description</b>	
<b>Defaults</b>	The default value is 5s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If ARP packets are received/sent at an undesired rate on many interfaces, appropriately adjust the interval for collecting ARP packet rate statistics.

### Verification

Run the **show running-config** command to display configurations.

### Configuration Example

<b>Configuration Steps</b>	Enable ARP packet rate statistics collection in global configuration mode.
	<pre>Ruijie(config)#arp rate-statistic enable</pre>
<b>Verification</b>	Run the <b>show running-config</b> command to display configurations.

<b>Verification</b>	Run the <b>show running-config</b> command to display configurations.
	<pre>Ruijie(config)#arp rate-statistic enable Ruijie(config)#show running-config ! arp rate-statistic enable arp rate-statistic compute interval 10 ! Ruijie(config)#</pre>

## 2.4.12 Enabling Fast Aging of ARP Entries

### Configuration Effect

ARP entries cannot be learned under unusual circumstances. After MAC addresses age, ARP entries age fast.

### Notes

N/A

### Configuration Steps

- Optional.
- Perform the configuration in interface configuration mode.
- Only SVI and Overlay Router interfaces are supported.

### Verification

Run the **show run** command to check whether the configuration is successful.

### Related Commands

#### ↳ Enabling Fast Aging of ARP Entries

<b>Command</b>	<b>arp fast-aging enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>By default, dynamic ARP entries start aging one hour after the aging of their corresponding MAC addresses. If this feature is configured, after their corresponding MAC address age, the dynamic ARP entries age immediately.</p> <ul style="list-style-type: none"> <li><span style="color: blue;">i</span> This command is supported on SVI and Overlay Router interfaces.</li> <li><span style="color: blue;">i</span> When ARP-to-host conversion is configured, it is recommended to enable this function at the same time, to help achieve fast route convergence.</li> </ul>

### Configuration Example

<p><b>Scenario</b> Figure 2-5</p>	<p>C:192.168.23.3/24    D:192.168.23.4/24    E:192.168.23.5/24</p> <p>A: Router B: Switch serving as the gateway for the users C, D and E: Users</p>
<p><b>Configuration Steps</b></p>	<p>Enabling fast aging of ARP entries on the SVI 2 interface.</p> <pre>Ruijie(config-if-VLAN 2)#arp fast-aging enable</pre>
<p><b>Verification</b></p>	<p>Run the <b>show running-config</b> command to check whether the configuration is successful.</p> <pre>Ruijie#show running-config interface VLAN 2 ! arp fast-aging enable !</pre>

### Common Errors

N/A

## 2.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears dynamic ARP entries. In gateway authentication mode, dynamic ARP entries in authentication VLANs are not cleared.	<b>clear arp-cache</b>
Clears ARP packet statistics.	<b>clear arp-cache packet statistics</b> [ <i>interface</i> ]

### Displaying

Description	Command
Displays the ARP table in detail.	<b>show arp [detail] [ interface-type interface-number / [vrf vrf-name] [ip [mask]   mac-address   static   complete   incomplete ]</b>
Displays the ARP table.	<b>show ip arp [ vrf vrf-name ]</b>
Displays the ARP entry counter.	<b>show arp counter</b>
Displays the timeout of dynamic ARP entries.	<b>show arp timeout</b>
Displays ARP packet statistics.	<b>show arp packet statistics</b> [ <i>interface</i> ]
Displays ARP packet rate statistics.	<b>show arp rate-statistic</b> [ <i>interface</i> ]

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable the debugging switch immediately after use.

Description	Command
Debugs ARP packet sending and receiving.	<b>debug arp</b>
Debugs the creation and deletion of ARP entries.	<b>debug arp event</b>

## 3 Configuring IPv6

### 3.1 Overview

As the Internet develops rapidly and IPv4 address space is becoming exhausted, IPv4 limitations become more and more obvious. At present, many researches and practices on Internet Protocol Next Generation (IPng) have been conducted. The IPng working group of the Internet Engineering Task Force (IETF) has formulated an IPng protocol named IP Version 6 (IPv6), which is described in RFC 2460.

#### Main Features

##### ↳ Larger Address Space

Compared with 32 bits in an IPv4 address, the length of an IPv6 address is extended to 128 bits. Therefore, the address space has approximately  $2^{128}$  addresses. IPv6 adopts a hierarchical address allocation mode to support address allocation of multiple subnets from the Internet core network to intranet subnet.

##### ↳ Simpler Packet Header Format

Since the design principle of the IPv6 packet header is to minimize the overhead of the packet header, some non-key fields and optional fields are removed from the packet header to the extended packet header. Therefore, although the length of an IPv6 address is four times of that of an IPv4 address, the IPv6 packet header is only two times of the IPv4 packet header. The IPv6 packet header makes device forwarding more efficient. For example, with no checksum in the IPv6 packet header, the IPv6 device does not need to process fragments (fragmentation is completed by the initiator).

##### ↳ Efficient Hierarchical Addressing and Routing Structure

IPv6 uses a convergence mechanism and defines a flexible hierarchical addressing and routing structure. Multiple networks at the same layer are represented as a uniform network prefix on the upstream device, greatly reducing routing entries maintained by the device and routing and storage overheads of the device.

##### ↳ Easy Management: Plug and Play (PnP)

IPv6 provides automatic discovery and auto-configuration functions to simplify management and maintenance of network nodes. For example, Neighbor Discovery (ND), MTU Discovery, Router Advertisement (RA), Router Solicitation (RS), and auto-configuration technologies provide related services for PnP. Particularly, IPv6 offers two types of auto-configuration: stateful auto-configuration and stateless auto-configuration. In IPv4, Dynamic Host Configuration Protocol (DHCP) realizes auto-configuration of the host IP address and related parameters. IPv6 inherits this auto-configuration service from IPv4 and called it stateful auto-configuration (see DHCPv6). Besides, IPv6 also offers the stateless auto-configuration service. During stateless auto-configuration, a host automatically obtains the local address of the link, address prefix of the local device, and other related configurations.

##### ↳ Security

As an optional extension protocol of IPv4, Internet Protocol Security (IPSec) is a part of IPv6 to provide security for IPv6 packets. At present, IPv6 provides two mechanisms: Authentication Header (AH) and Encapsulated Security Payload (ESP). AH provides data integrity and authenticates IP packet sources to ensure that the packets originate from the nodes identified by the source addresses. ESP provides data encryption to realize end-to-end encryption.

### ↘ Better QoS Support

A new field in the IPv6 packet header defines how to identify and process data streams. The Flow Label field in the IPv6 packet header is used to authenticate a data flow. Using this field, IPv6 allows users to propose requirements on the communication quality. , A device can identify all packets belonging to a specific data stream based on this field and process these packets according to user requirements.

### ↘ New Protocol for Neighboring Node Interaction

IPv6 Neighbor Discovery Protocol (NDP) uses a series of Internet Control Message Protocol Version 6 (ICMPv6) packets to implement interactive management of neighboring nodes (nodes on the same link). IPv6 uses NDP packets and efficient multicast/unicast ND packets instead of broadcast-based Address Resolution Protocol (ARP) and Control Message Protocol Version 4 (ICMPv4) router discovery packets.

### ↘ Extensibility

With strong extensibility, IPv6 features can be added to the extended packet header following the IPv6 packet header. Unlike IPv4, the IPv6 packet header can support at most 40 bytes of options. For an IPv6 packet, the length of the extended packet header is restricted only by the maximum number of bytes in the packet.

## Protocols and Standards

- RFC 4291 - IP Version 6 Addressing Architecture
- RFC 2460 - Internet Protocol, Version 6 (IPv6) Specification
- RFC 4443 - Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification
- RFC 4861 - Neighbor Discovery for IP version 6 (IPv6)
- RFC 4862 - IPv6 Stateless Address Auto-configuration
- RFC 5059 - Deprecation of Type 0 Routing Headers in IPv6

## 3.2 Applications

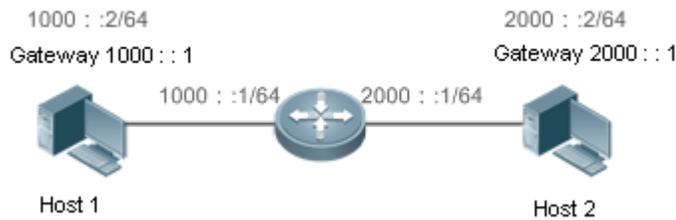

Application	Description
<a href="#">Communication Based on IPv6 Addresses</a>	Two PCs communicate with each other using IPv6 addresses.

### 3.2.1 Communication Based on IPv6 Addresses

#### Scenario

As shown in Figure 3-1, Host 1 and Host 2 communicate with each other using IPv6 addresses.

Figure 3-1

## Deployment

Hosts can use the stateless address auto-configuration or DHCPv6 address assignment mode. After addresses are configured, hosts can communicate with each other using IPv6 addresses.

## 3.3 Features

### Overview

Feature	Description
<a href="#">IPv6 Address Format</a>	The IPv6 address format makes IPv6 have a larger address space and flexible representation approach.
<a href="#">IPv6 Address Type</a>	IPv6 identifies network applications based on addresses.
<a href="#">IPv6 Packet Header Format</a>	IPv6 simplifies the fixed and extended packet headers to improve the data packet processing and forwarding efficiency of the device.
<a href="#">IPv6 PMTUD</a>	A host dynamically discovers and adjusts the MTU size on the data Tx path, saving router resources and improving IPv6 network efficiency.
<a href="#">IPv6 Neighbor Discovery</a>	ND functions include router discovery, prefix discovery, parameter discovery, address auto-configuration, address resolution (like ARP), next-hop determination, Neighbor Unreachability Detection (NUD), Duplicate Address Detection (DAD), and redirection.
<a href="#">IPv6 Source Routing</a>	This feature is used to specify the intermediate nodes that a packet passes through along the path to the destination address. It is similar to the IPv4 loose source routing option and loose record routing option.
<a href="#">Restricting the Sending Rate of ICMPv6 Error Messages</a>	This feature prevents DoS attacks.
<a href="#">IPv6 HOP-LIMIT</a>	This feature prevents useless unicast packets from being unlimitedly transmitted on the network and wasting network bandwidth.

Feature	Description
<a href="#">Refraining from Sending NS Packets to Authentication VLANs</a>	In gateway authentication mode, a device is refrained from sending NS packets to authentication VLANs.
<a href="#">Default Gateway on the Management Interface</a>	The default gateway is configured on the management interface to generate a default route for this interface.

### 3.3.1 IPv6 Address Format

An IPv6 address is represented in the X:X:X:X:X:X:X format, where X is a 4-digit hexadecimal integer (16 bits). Each address consists of 8 integers, with a total of 128 bits (each integer contains 4 hexadecimal digits and each digit contains four bits). The following are three valid IPv6 addresses:

```
2001:ABCD:1234:5678:AAAA:BBBB:1200:2100
```

```
800:0:0:0:0:0:0:1
```

```
1080:0:0:0:8:800:200C:417A
```

These integers are hexadecimal, where A to F represent 10 to 15. Each integer in the address must be represented, except the leading zeros in each integer. If an IPv6 address contains a string of zeros (as shown in the second and third examples above), a double colon (::) can be used to represent these zeros. That is, 800:0:0:0:0:0:0:1 can be represented as 800::1.

A double colon indicates that this address can be extended to a complete 128-bit address. In this approach, only when the 16-bit integers are all 0s, can they can be replaced with a double colon. A double colon can exist once in an IPv6 address.

In IPv4/IPv6 mixed environment, an address has a mixed representation. In an IPv6 address, the least significant 32 bits can be used to represent an IPv4 address. This IPv6 address can be represented in a mixed manner, that is, X:X:X:X:X:d.d.d.d, where X is a hexadecimal integer and d is a 8-bit decimal integer. For example, 0:0:0:0:0:0:192.168.20.1 is a valid IPv6 address. It can be abbreviated to ::192.168.20.1. Typical applications are IPv4-compatible IPv6 addresses and IPv4-mapped IPv6 addresses. If the first 96 bits are 0 in an IPv4-compatible IPv6 address, this address can be represented as ::A.B.C.D, e.g., ::1.1.1.1. IPv4-compatible addresses have been abolished at present. IPv4-mapped IPv6 addresses are represented as ::FFFF:A.B.C.D to represent IPv4 addresses as IPv6 addresses. For example, IPv4 address 1.1.1.1 mapped to an IPv6 address is represented as ::FFFF:1.1.1.1.

Since an IPv6 address is divided into two parts: subnet prefix and interface ID, it can be represented as an address with an additional value according to an address allocation method like Classless Inter-Domain Routing (CIDR). The additional value indicates how many bits (subnet prefix) in the address represent the network part. That is, the IPv6 node address contains the prefix length. The prefix length is separated from the IPv6 address by a slash. For example, in 12AB::CD30:0:0:0:0/60, the prefix length used for routing is 60 bits.

#### [Related Configuration](#)

##### ↘ [Configuring an IPv6 Address](#)

- No IPv6 address is configured on interfaces by default.

- Run the **ipv6 address** command to configure an IPv6 address on an interface.
- After configuration, a host can communicate with others using the configured IPv6 address based on DAD.

### 3.3.2 IPv6 Address Type

RFC 4291 defines three types of IPv6 addresses:

- Unicast address: ID of a single interface. Packets destined to a unicast address are sent to the interface identified by this address.
- Multicast address: ID of an interface group (the interfaces generally belong to different nodes). Packets destined to a multicast address are sent to all interfaces included in this address.
- Anycast address: ID of an interface group. Packets destined to an anycast address are sent to one interface included in this address (the nearest interface according to the routing protocol).

 IPv6 does not define broadcast addresses.

These three types of addresses are described as follows:

#### Unicast Addresses

Unicast addresses fall into five types: unspecified address, loopback address, link-local address, site-local address, and global unicast address. At present, site-local addresses have been abolished. Except unspecified, loopback, and link-local addresses, all other addresses are global unicast addresses.

- Unspecified address

The unspecified address is 0:0:0:0:0:0:0:0, which is usually abbreviated to ::. It has two general purposes:

5. If a host has no unicast address when started, it uses the unspecified address as the source address to send an RS packet to obtain prefix information from the gateway and thereby generate a unicast address.
6. When an IPv6 address is configured for a host, the device detects whether the address conflicts with addresses of other hosts in the same network segment and uses the unspecified address as the source address to send a Neighbor Solicitation (NS) packet (similar to a free ARP packet).

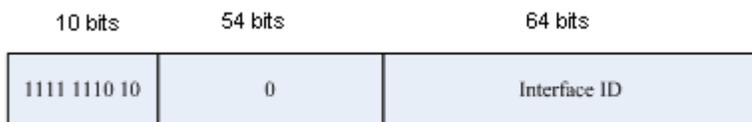

- Loopback address

The loopback address is 0:0:0:0:0:0:0:1, which is usually abbreviated to ::1. Similar to IPv4 address 127.0.0.1, the loopback address is generally used by a node to send itself packets.

- Link-local address

The format of a link-local address is as follows:

Figure 3-2

The link-local address is used on a single network link to assign IDs to hosts. The address identified by the first 10 bits in the prefix is the link-local address. A device never forwards packets in which the source or destination address contains the link-local address. The intermediate 54 bits in the address are all 0s. The last 64 bits represent the interface ID, which allows a single network to connect  $2^{64}-1$  hosts.

- Site-local address

The format of a site-local address is as follows:

Figure 3-3

A site-local address is used to transmit data within a site. A device never forwards packets in which the source or destination address contains the site-local address to the Internet. That is, these packets can be forwarded only within the site. A site can be assumed as an enterprise's local area network (LAN). Such addresses are similar to IPv4 private addresses such as 192.168.0.0/16. RFC 3879 has abolished site-local addresses. New addresses do not support the first 10 bits as the prefix and are all regarded as global unicast addresses. Existing addresses can continue to use this prefix.

- Global unicast address

The format of a global unicast address is as follows:

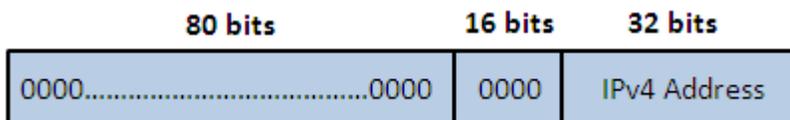

Figure 3-4

Among global unicast addresses, there is a type of IPv4-embedded IPv6 addresses, including IPv4-compatible IPv6 addresses and IPv4-mapped IPv6 addresses. They are used for interconnection between IPv4 nodes and IPv6 nodes.

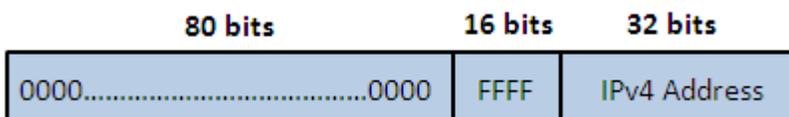

The format of an IPv4-compatible IPv6 address is as follows:

Figure 3-5

The format of an IPv4-mapped IPv6 address is as follows:

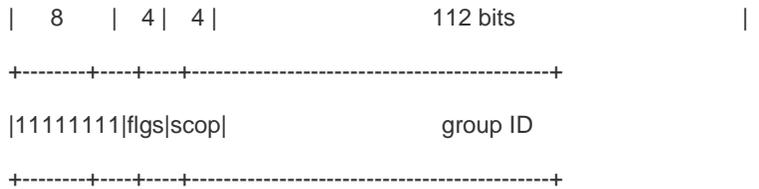

Figure 3-6

IPv4-compatible IPv6 addresses are mainly used on automatic tunnels. Nodes on automatic tunnels support both IPv4 and IPv6. Using these addresses, IPv4 devices transmit IPv6 packets over tunnels. At present, IPv4-compatible IPv6 addresses have been abolished. IPv4-mapped IPv6 addresses are used by IPv6 nodes to access IPv4-only nodes. For example, if the IPv6 application on an IPv4/IPv6 host requests to resolve the name of an IPv4-only host, the name server dynamically generates an IPv4-mapped IPv6 address and returns it to the IPv6 application.

▾ **Multicast Addresses**

The format of an IPv6 multicast address is as follows:

The first byte in the address is all 1s, representing a multicast address.

- Flag field

The flag field consists of four bits. Currently only the fourth bit is specified to indicate whether this address is a known multicast address assigned by the Internet Assigned Numbers Authority (IANA) or a temporary multicast address in a certain scenario. If the flag bit is 0, this address is a known multicast address. If the flag bit is 1, this address is a temporary multicast address. The remaining three flag bits are reserved for future use.

- Scope field

The scope field consists of four bits to indicate the multicast range. That is, a multicast group includes the local node, local link, local site, and any node in the IPv6 global address space.

- Group ID field

The group ID consists of 112 bits to identify a multicast group. A multicast ID can represent different groups based on the flag and scope fields.

IPv6 multicast addresses are prefixed with FF00::/8. One IPv6 multicast address usually identifies interfaces on a series of different nodes. After a packet is sent to a multicast address, the packet is then forwarded to the interfaces on each node identified by this multicast address. For a node (host or device), you must add the following multicast addresses:

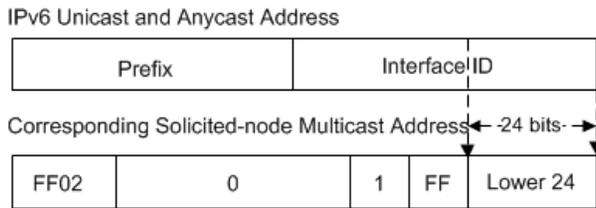

7. Multicast address for all nodes on the local link, that is, FF02::1
8. Solicited-node multicast address, prefixed with FF02:0:0:0:1:FF00:0000/104

If the node is a device, it also has to be added to the multicast address of all devices on the local link, that is, FF02::2.

The solicited-node multicast address corresponds to the IPv6 unicast and anycast address. You must add a corresponding solicited-node multicast address for each configured unicast and anycast address of an IPv6 node. The solicited-node multicast address is prefixed with FF02:0:0:0:1:FF00:0000/104. The remaining 24 bits are composed of the least significant 24 bits of the unicast or anycast address. For example, if the unicast address is FE80::2AA:FF:FE21:1234, the solicited-node multicast address is FF02::1:FF21:1234.

The solicited-node multicast address is usually used in NS packets. Its address format is as follows:

Figure 3-7

### ↘ Anycast Addresses

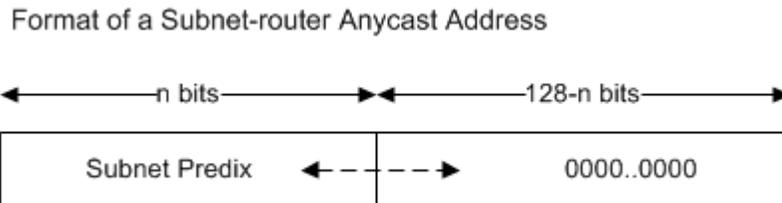

Similar to a multicast address, an anycast address can also be shared by multiple nodes. The difference is that only one node in the anycast address receives data packets while all nodes included in the multicast address receive data packets. Since anycast addresses are allocated to the normal IPv6 unicast address space, they have the same formats with unicast addresses. Every member in an anycast address must be configured explicitly for easier recognition.

**!** Anycast addresses can be allocated only to devices and cannot be used as source addresses of packets.

RFC 2373 redefines an anycast address called subnet-router anycast address. Figure 3-8 shows the format of a subnet-router anycast address. Such an address consists of the subnet prefix and a series of 0s (interface ID).

The subnet prefix identifies a specified link (subnet). Packets destined to the subnet-router anycast address will be forwarded to a device on this subnet. A subnet-router anycast address is usually used by the application on a node to communicate with a device on a remote subnet.

Figure 3-8

## Related Configuration

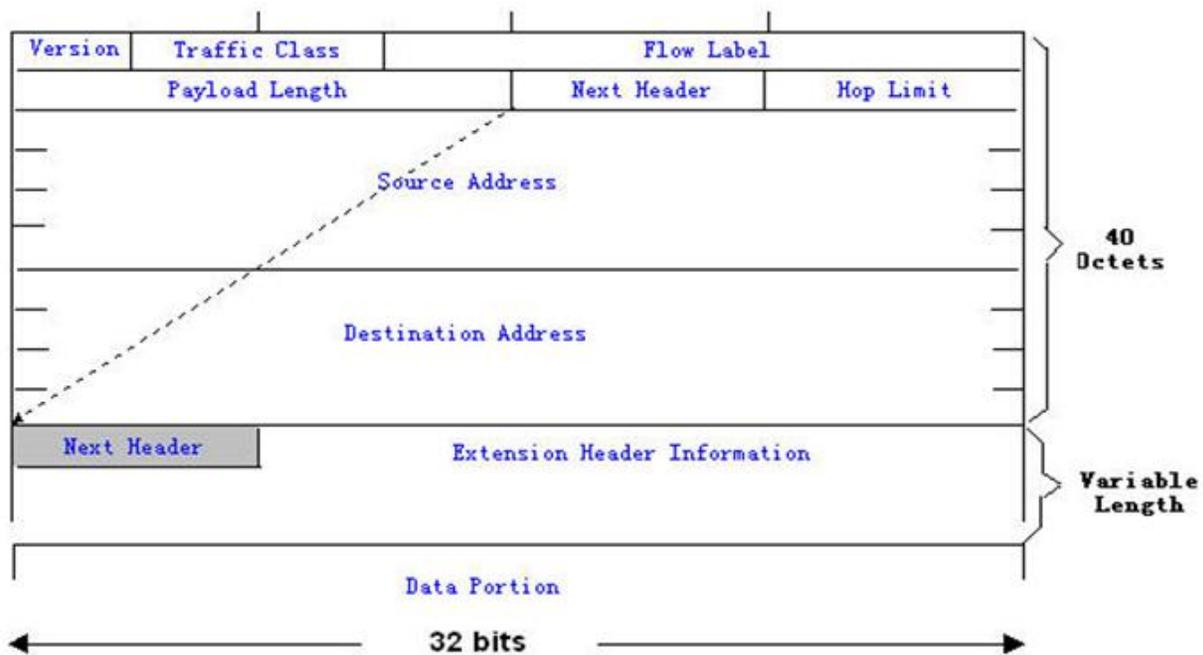

### ↘ Configuring an IPv6 Address

- No IPv6 address is configured on interfaces by default.
- Run the **ipv6 address** command to configure the IPv6 unicast address and anycast address of an interface.
- After an interface goes up, it will automatically join the corresponding multicast group.

### 3.3.3 IPv6 Packet Header Format

Figure 3-9 shows the format of the IPv6 packet header.

Figure 3-9

The IPv4 packet header is in unit of four bytes. The IPv6 packet header consists of 40 bytes, in unit of eight bytes. The IPv6 packet header has the following fields:

- Version

This field consists of 4 bits. In an IPv6 address, this field must be 6.

- Traffic Class

This field consists of 8 bits. This field indicates the service provided by this packet, similar to the TOS field in an IPv4 address.

- Flow Label

This field consists of 20 bits to identify packets belonging to the same service flow. One node can act as the Tx source of multiple service flows. The flow label and source address uniquely identify one service flow.

- Payload Length

This field consists of 16 bits, including the packet payload length and the length of IPv6 extended options (if available). That is, it includes the IPv6 packet length except the IPv6 packet header.

- Next Header

This field indicates the protocol type in the header field following the IPv6 packet header. Similar to the Protocol field in the IPv4 address header, the Next Header field is used to indicate whether the upper layer uses TCP or UDP. It can also be used to indicate existence of the IPv6 extension header.

- Hop Limit

This field consists of 8 bits. Every time a device forwards a packet, the field value reduced by 1. If the field value reaches 0, this packet will be discarded. It is similar to the Lifetime field in the IPv4 packet header.

- Source Address

This field consists of 128 bits and indicates the sender address in an IPv6 packet.

- Destination Address

This field consists of 128 bits and indicates the receiver address in an IPv6 packet.

At present, IPv6 defines the following extension headers:

- Hop-By-Hop Options

This extension header must follow the IPv6 packet header. It consists of option data to be checked on each node along the path.

- Routing Options (Type 0 routing header)

This extension header indicates the nodes that a packet passes through from the source address to the destination address. It consists of the address list of the passerby nodes. The initial destination address in the IPv6 packet header is the first address among the addresses in the routing header, but not the final destination address of the packet. After the node corresponding to the destination address in the IPv6 packet header receives a packet, it processes the IPv6 packet header and routing header, and sends the packet to the second address, the third address, and so on in the routing header list till the packet reaches the final destination address.

- Fragment

The source node uses this extension header to fragment the packets of which the length exceeds the path MTU (PMTU).

- Destination Options

This extension header replaces the option fields of IPv4. At present, the Destination Options field can only be filled with integral multiples of 64 bits (eight bytes) if required. This extension header can be used to carry information to be checked by the destination node.

- Upper-layer header

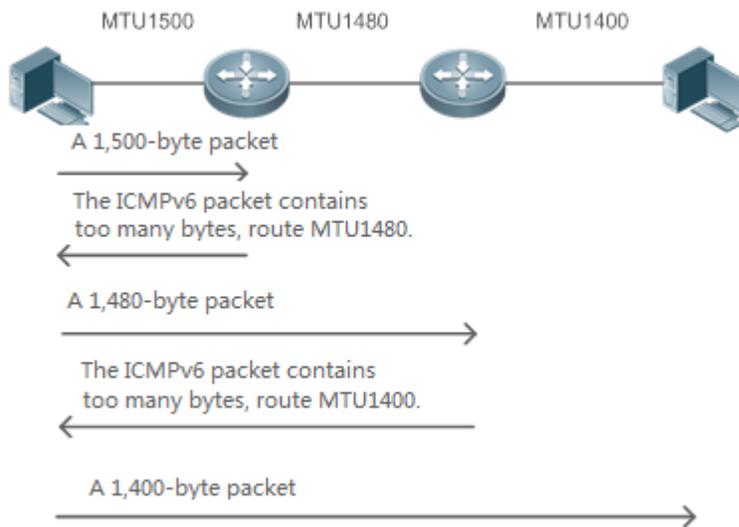

This extension header indicates the protocol used at the upper layer, such as TCP (6) and UDP (17).

Another two extension headers AH and ESP will be described in the *Configuring IPsec*.

### 3.3.4 IPv6 PMTUD

Similar to IPv4 Path MTU Discovery (PMTUD), IPv6 PMTUD allows a host to dynamically discover and adjust the MTU size on the data Tx path. If the length of a data packet to be sent by a host is greater than the PMTU, the host performs packet fragmentation on its own. In this manner, the IPv6 device does not need to perform fragmentation, saving device resources and improving the IPv6 network efficiency.

Figure 3-10

As shown in Figure 3-10, if the length of a packet to be sent by the host is greater than the PMTU, the router discards this packet and sends an ICMPv6 Packet Too Big message containing its PMTU to the host. The host then fragments the packet based on the new PMTU. In this manner, the router does not need to perform fragmentation, saving router resources and improving the IPv6 network efficiency.

## Related Configuration

### Configuring the IPv6 MTU of an Interface

- The default IPv6 MTU is 1500 on an Ethernet interface.
- To reduce traffic caused by dropping packets, a proper MTU value needs to be set according to the actual networking environment. Run the **ipv6 mtu** command to modify the IPv6 MTU of an interface.

## 3.3.5 IPv6 Neighbor Discovery

NDP is a basic part of IPv6. Its main functions include router discovery, prefix discovery, parameter discovery, address auto-configuration, address resolution (like ARP), next-hop determination, NUD, DAD, and redirection. NDP defines five ICMP packets: RS (ICMP type: 133), RA (ICMP type: 134), NS (similar to ARP request, ICMP type: 135), NA (similar to ARP reply, ICMP type: 136), ICMP Redirect (ICMP type: 137).

All the above ICMP packets carry one or multiple options. These options are optional in some cases but are significant in other cases. NDP mainly defines five options: Source Link-Layer Address Option, Type=1; Target Link-Layer Address Option, Type=2; Prefix Information Option, Type=3; Redirection Header Option, Type=4; MTU Option, Type=5.

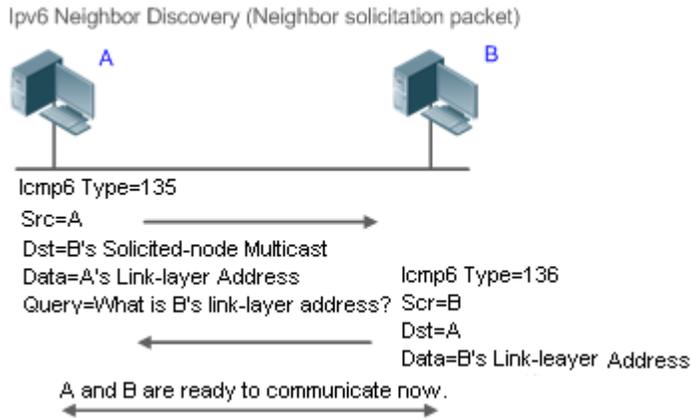

### Address Resolution

When a node attempts to communicate with another, the node has to obtain the link-layer address of the peer end by sending it an NS packet. In this packet, the destination address is the solicited-node multicast address corresponding to the IPv6 address of the destination node. This packet also contains the link-layer address of the source node. After receiving this NS packet, the peer end replies with an NA packet in which the destination address is the source address of the NS packet,

that is, the link-layer address of the solicited node. After receiving this NA packet, the source node can communicate with the destination node.

Figure 3-11 shows the address resolution process.

Figure 3-11

➤ **NUD**

If the reachable time of a neighbor has elapsed but an IPv6 unicast packet needs to be sent to it, the device performs NUD. While performing NUD, the device can continue to forward IPv6 packets to the neighbor.

➤ **DAD**

To know whether the IPv6 address configured for a host is unique, the device needs to perform DAD by sending an NS packet in which the source IPv6 address is the unspecified address.

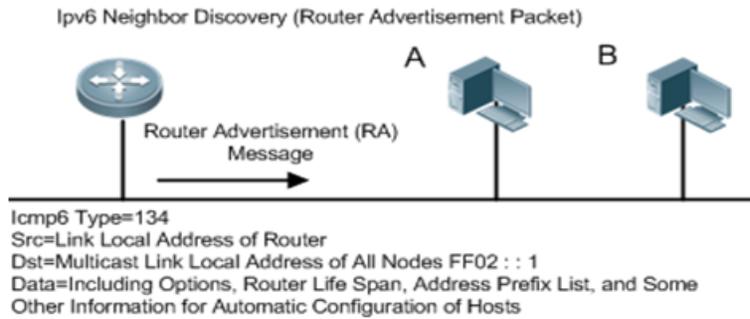

If a device detects an address conflict, this address is set to the duplicate status so that the device cannot receive IPv6 packets with this address being the destination address. Meanwhile, the device also starts a timer for this duplicate address to periodically perform DAD. If no address conflict is detected in re-detection, this address can be properly used.

➤ **Router, Prefix, and Parameter Discovery**

A device periodically sends RA packets to all local nodes on the link.

Figure 3-12 shows the RA packet sending process.

Figure 3-12

An RA packet usually contains the following content:

- One or multiple IPv6 address prefixes (used for on-link determination or stateless address auto-configuration)
- Validity of the IPv6 address prefix
- Host auto-configuration method (stateful or stateless)
- Default device information (whether the device acts as the default device; if yes, the interval for acting as the default device is also included.)
- Other information provided for host configuration, such as hop limit, MTU, and NS retransmission interval

RA packets can also be used as replies to the RS packets sent by a host. Using RS packets, a host can obtain the auto-configured information immediately after started rather than wait for the RA packets sent by the device. If no unicast address is configured for a newly started host, the host includes the unspecified address (0:0:0:0:0:0:0:0) as the source address in the RS packet. Otherwise, the host uses the configured unicast address as the source address and the multicast address of all local routing devices (FF02::2) as the destination address in the RS packet. As a reply to the RS packet, the RA packet uses the source address of the RS packet as the destination address (if the source address is the unspecified address, it uses the multicast address of all local nodes (FF02::1)).

In an RA packet, the following parameters can be configured:

- Ra-interval: Interval for sending the RA packet.
- Ra-lifetime: Lifetime of a router, that is, whether the device acts as the default router on the local link and the interval for acting as the default router.
- Prefix: Prefix of an IPv6 address on the local link. It is used for on-link determination or stateless address auto-configuration, including other parameter configurations related to the prefix.
- Ns-interval: NS packet retransmission interval.
- Reachabletime: Period when the device regards a neighbor reachable after detecting a Confirm Neighbor Reachability event.
- Ra-hoplimit: Hops of the RA packet, used to set the hop limit for a host to send a unicast packet.
- Ra-mtu: MTU of the RA packet.
- Managed-config-flag: Whether a host receiving this RA packet obtains the address through stateful auto-configuration.

- Other-config-flag: Whether a host receiving this RA packet uses DHCPv6 to obtain other information except the IPv6 address for auto-configuration.

Configure the above parameters when configuring IPv6 interface attributes.

### ↘ Redirection

If a router receiving an IPv6 packet finds a better next hop, it sends the ICMP Redirect packet to inform the host of the better next hop. The host will directly send the IPv6 packet to the better next hop next time.

### ↘ Maximum Number of Unresolved ND Entries

- You can configure the maximum number of unresolved ND entries to prevent malicious scanning network segments from generating a large number of unresolved ND entries and occupying excessive memory space.

### ↘ Maximum Number of Neighbor Learning Entries on an Interface

- You can configure the maximum number of neighbor learning entries on an interface to prevent neighbor learning attacks from occupying ND entries and memory space of the device and affecting forwarding efficiency of the device.

## Related Configuration

### ↘ Enabling IPv6 Redirection

- By default, ICMPv6 Redirect packets can be sent on IPv6 interfaces.
- Run the **no ipv6 redirects** command in interface configuration mode to prohibit an interface from sending Redirect packets.

### ↘ Configuring IPv6 DAD

- By default, an interface sends one NS packet to perform IPv6 DAD.
- Run the **ipv6 nd dad attempts value** command in interface configuration mode to configure the number of NS packets consecutively sent by DAD. Value 0 indicates disabling DAD for IPv6 addresses on this interface.
- Run the **no ipv6 nd dad attempts** command to restore the default configuration.
- By default, the device performs DAD on duplicate IPv6 addresses every 60 seconds.
- Run the **ipv6 nd dad retry value** command in global configuration mode to configure the DAD interval. Value 0 indicates disabling DAD for the device.
- Run the **no ipv6 nd dad retry** command to restore the default configuration.

### ↘ Configuring the Reachable Time of a Neighbor

- The default reachable time of an IPv6 neighbor is 30s.
- Run the **ipv6 nd reachable-time milliseconds** command in interface configuration mode to modify the reachable time of a neighbor.

### ↘ Configuring the Stale Time of a Neighbor

- The default stale time of an IPv6 neighbor is 1 hour. After the time elapses, the device performs NUD.
- Run the **ipv6 nd stale-time** *seconds* command in interface configuration mode to modify the stale time of a neighbor.

↘ **Configuring Prefix Information**

- By default, the prefix in an RA packet on an interface is the prefix configured in the **ipv6 address** command on the interface.
- Run the **ipv6 nd prefix** command in interface configuration mode to add or delete prefixes and prefix parameters that can be advertised.

↘ **Enabling/disabling RA Suppression**

- By default, an IPv6 interface does not send RA packets.
- Run the **no ipv6 nd suppress-ra** command in interface configuration mode to disable RA suppression.

↘ **Configuring the Maximum Number of Unresolved ND Entries**

- The default value is 0, indicating no restriction. It is only restricted to the ND entry capacity supported by the device.
- Run the **ipv6 nd unresolved** *number* command in global configuration mode to restrict the number of unresolved neighbors. After the entries exceed this restriction, the device does not actively resolve subsequent packets.

↘ **Configuring the Maximum Number of ND Entries Learned on an Interface**

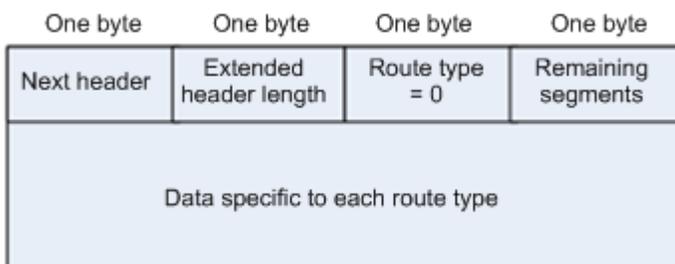

- Run the **ipv6 nd cache interface-limit** *value* command in interface configuration mode to restrict the number of neighbors learned on an interface. The default value is 0, indicating no restriction.

### 3.3.6 IPv6 Source Routing

#### Working Principle

Similar to the IPv4 loose source routing and loose record routing options, the IPv6 routing header is used to specify the intermediate nodes that the packet passes through along the path to the destination address. It uses the following format:

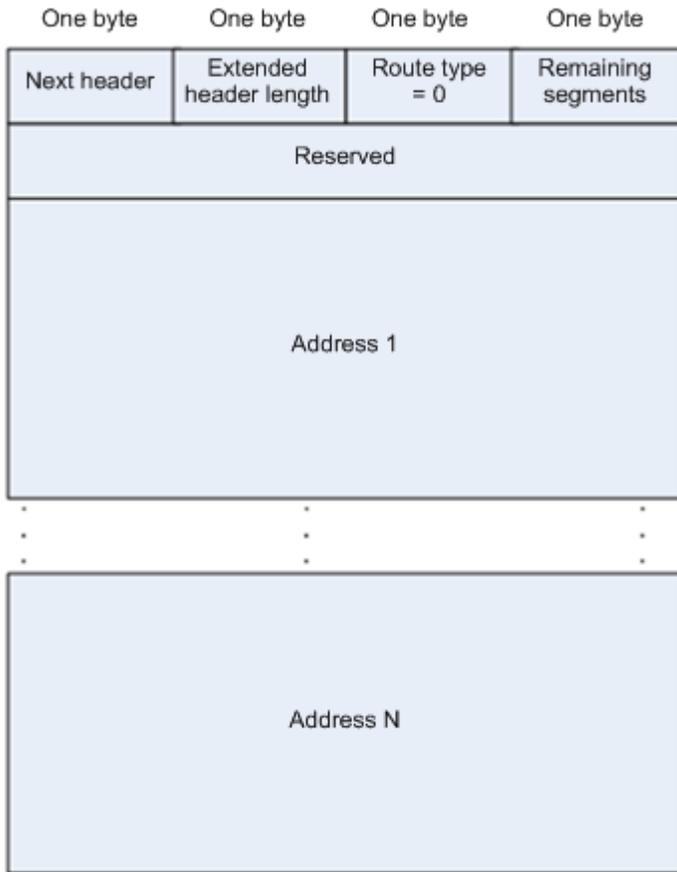

Figure 3-13

The Segments Left field is used to indicate how many intermediate nodes are specified in the routing header for the packet to pass through from the current node to the final destination address.

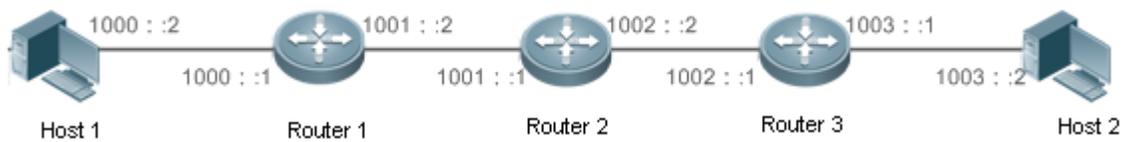

Currently, two routing types are defined: 0 and 2. The Type 2 routing header is used for mobile communication. RFC 2460 defines the Type 0 routing header (similar to the loose source routing option of IPv4). The format of the Type 0 routing header is as follows:

Figure 3-14

The following example describes the application of the Type 0 routing header, as shown in Figure 3-15.

Figure 3-15

Host 1 sends Host 2 a packet specifying the intermediate nodes Router 2 and Router 3. The following table lists the changes of fields related to the IPv6 header and routing header during the forwarding process.

Transmission Node	Fields in the IPv6 Header	Fields Related to the Type 0 Routing Header
Host 1	Source address=1000::2 Destination address=1001::1 (Address of Router 2)	Segments Left=2 Address 1=1002::1 (Address of Router 3)

		Address 2=1003::2 (Address of Host 2)
Router 1	No change	
Router 2	Source address=1000::2 Destination address=1002::1 (Address of Router 3)	Segments Left=1 Address 1=1001::1 (Address of Router 2) Address 2=1003::2 (Address of Host 2)
Router 3	Source address=1000::2 Destination address=1003::2 (Address of Host 2)	Segments Left=0 Address 1=1001::1 (Address of Router 2) Address 1=1002::2 (Address of Router 3)
Host 2	No change	

The forwarding process is as follows:

9. Host 1 sends a packet in which the destination address is Router 2's address 1001::1, the Type 0 routing header is filled with Router 3's address 1002::1 and Host 2's address 1003::2, and the value of the Segments Left field is 2.
10. Router 1 forwards this packet to Router 2.
11. Router 2 changes the destination address in the IPv6 header to Address 1 in the routing header. That is, the destination address becomes Router 3's address 1002::1, Address 1 in the routing header becomes Router 2's address 1001::1, and the value of the Segments Left field becomes 1. After modification, Router 2 forwards the packet to Router 3.
12. Router 3 changes the destination address in the IPv6 header to Address 2 in the routing header. That is, the destination address becomes Host 2's address 1003::2, Address 2 in the routing header becomes Router 3's address 1002::1, and the value of the Segments Left field becomes 0. After modification, Router 3 forwards the packet to Host 2.

The Type 0 routing header may be used to initiate DoS attacks. As shown in Figure 3-16, Host 1 sends packets to Host 2 at 1 Mbps and forges a routing header to cause multiple round-trips between Router 2 and Router 3 (50 times from Router 2 to Router 3 and 49 times from Router 3 to Router 2). At the time, the routing header generates the traffic amplification effect: "50 Mbps from Router 2 to Router 3 and 49 Mbps from Router 3 to Router 2." Due to this security problem, RFC 5095 abolished the Type 0 routing header.

Figure 3-16

```

IPv6 Packet
Source Address 1000::2
Destination Address 1001::1

Segments Left in the Type 0
Routing Header: 100
Address 1: 1002::1
Address 2: 1001::1
Address 3: 1002::1
Address 4: 1002::1
...
Address 99: 1002::1
Address 100: 1003::2
    
```

Host 1 sends packets to Host 2, passing through Router 2, Router 3, Router 2, and Router 3, ...  
 Each packet is sent 50 times from Router 2 to Router 3 and 49 times from Router 3 to Router 2.

### Related Configuration

#### ▾ Enabling IPv6 Source Routing

- The Type 0 routing header is not supported by default.
- Run the **ipv6 source-route** command in global configuration mode to enable IPv6 source routing.

### 3.3.7 Restricting the Sending Rate of ICMPv6 Error Messages

#### Working Principle

The destination node or intermediate router sends ICMPv6 error messages to report the errors incurred during IPv6 data packet forwarding and transmission. There are mainly four types of error messages: Destination Unreachable, Packet Too Big, Time Exceeded, and Parameter Problem.

When receiving an invalid IPv6 packet, a device discards the packet and sends back an ICMPv6 error message to the source IPv6 address. In the case of invalid IPv6 packet attacks, the device may continuously reply to ICMPv6 error messages till device resources are exhausted and thereby fail to properly provide services. To solve this problem, you can restrict the sending rate of ICMPv6 error messages.

If the length of an IPv6 packet to be forwarded exceeds the IPv6 MTU of the outbound interface, the router discards this IPv6 packet and sends back an ICMPv6 Packet Too Big message to the source IPv6 address. This error message is mainly used as part of the IPv6 PMTUD process. If the sending rate of ICMPv6 error messages is restricted due to excessive other ICMPv6 error messages, ICMPv6 Packet Too Big messages may be filtered, causing failure of IPv6 PMTUD. Therefore, it is recommended to restrict the sending rate of ICMPv6 Packet Too Big messages independently of other ICMPv6 error messages.

Although ICMPv6 Redirect packets are not ICMPv6 error messages, Ruijie recommends restricting their rates together with ICMPv6 error messages except Packet Too Big messages.

## Related Configuration

### ↘ [Configuring the Sending Rate of ICMPv6 Packet Too Big Messages](#)

- The default rate is 10 per 100 ms.
- Run the **ipv6 icmp error-interval too-big** command to configure the sending rate of ICMPv6 Packet Too Big messages.

### ↘ [Configuring the Sending Rate of Other ICMPv6 Error Messages](#)

- The default rate is 10 per 100 ms.
- Run the **ipv6 icmp error-interval** command to configure the sending rate of other ICMPv6 error messages.

## 3.3.8 IPv6 Hop Limit

### Working Principle

An IPv6 data packet passes through routers from the source address and destination address. If a hop limit is configured, it decreases by one every time the packet passes through a router. When the hop limit decreases to 0, the router discards the packet to prevent this useless packet from being unlimitedly transmitted on the network and wasting network bandwidth. The hop limit is similar to the TTL of IPv4.

### Related Configuration

#### ↘ [Configuring the IPv6 Hop Limit](#)

- The default IPv6 hop limit of a device is 64.
- Run the **ipv6 hop-limit** command to configure the IPv6 hop limit of a device.

## 3.3.9 Refraining from Sending NS Packets to Authentication VLANs

### Working Principle

In gateway authentication mode, all sub VLANs in a super VLAN are authentication VLANs by default. Users in an authentication VLAN have to pass authentication to access the network. After authentication, a static ND entry is generated on the device. Therefore, when accessing an authenticated user, the device does not need to send NS packets to the authentication VLAN. If the device attempts to access users in an authentication-free VLAN, it only needs to send NS requests to the authentication-free VLAN.

In gateway authentication mode, the function of refraining from sending NS packets to authentication VLANs is enabled on the device by default. If the device needs to access authentication-free users in an authentication VLAN, disable this function.

### Related Configuration

#### ↘ [Enabling the Function of Refraining from Sending NS Packets to Authentication VLANs](#)

- Run the **ipv6 nd suppress-auth-vlan-ns** command in interface configuration mode to enable the function of refraining from sending NS packets to authentication VLANs.
- This function is enabled by default.
- This function is supported only on switch virtual interfaces (SVIs) and takes effect only in gateway authentication mode.

### 3.3.10 Default Gateway on the Management Interface

#### Working Principle

The default gateway is configured on the management interface to generate a default route for this interface.

#### Related Configuration

##### ▾ [Configuring the Default Gateway on the Management Interface](#)

- Run the **ipv6 gateway** *ipv6-address* command in interface configuration mode to configure the default gateway on the management interface.
- No default gateway is configured on the management interface by default.

## 3.4 Configuration

Configuration	Description and Command
<a href="#">Configuring an IPv6 Address</a>	 (Mandatory) It is used to configure IPv6 addresses and enable IPv6.
	<b>ipv6 enable</b>   Enables IPv6 on an interface.
	<b>ipv6 address</b>   Configures the IPv6 unicast address of an interface.
<a href="#">Configuring IPv6 NDP</a>	 (Optional) It is used to enable IPv6 redirection on an interface.
	<b>ipv6 redirects</b>   Enables IPv6 redirection on an interface.
	 (Optional) It is used to enable DAD.
	<b>ipv6 nd dad attempts</b>   Configures the number of consecutive NS packets sent during DAD.
	 (Optional) It is used to configure ND parameters.
	<b>ipv6 nd reachable-time</b>   Configures the reachable time of a neighbor.
	<b>ipv6 nd prefix</b>   Configures the address prefix to be advertised in an RA packet.
	<b>ipv6 nd suppress-ra</b>   Enables RA suppression on an interface.
	 (Optional) It is used to configure the maximum number of unresolved ND entries.
<b>ipv6 nd unresolved</b>   Configures the maximum number of unresolved ND entries.	

Configuration	Description and Command	
	 (Optional) It is used to configure the maximum number of neighbors learned on an interface.	
	<b>ipv6 nd cache interface-limit</b>	Configures the maximum number of neighbors learned on an interface.
<a href="#">Enabling MTD on an Interface</a>	 (Optional) It is used to restrict the MTU of IPv6 packets sent on an interface.	
	<b>ipv6 mtu</b>	Configures the IPv6 MTU.
<a href="#">Enabling IPv6 Source Routing</a>	 (Optional) It is used to enable IPv6 source routing.	
	<b>ipv6 source-route</b>	Configures the device to forward IPv6 packets carrying the routing header.
<a href="#">Configuring the Sending Rate of ICMPv6 Error Messages</a>	 Optional.	
	<b>ipv6 icmp error-interval too-big</b>	Configures the sending rate of ICMPv6 Packet Too Big messages.
	<b>ipv6 icmp error-interval</b>	Configures the sending rates of other ICMPv6 error messages and ICMPv6 Redirect packets.
<a href="#">Configuring the IPv6 Hop Limit</a>	 (Optional) It is used to restrict the hop limit of IPv6 unicast packets sent on an interface.	
	<b>ipv6 hop-limit</b>	Configures the IPv6 hop limit.
<a href="#">Enabling Refraining from Sending NS Packets to Authentication VLANs</a>	 (Optional) It is used to restrict sending NS packets to authentication VLANs in gateway authentication mode.	
	<b>ipv6 nd suppress-auth-vlan-ns</b>	Enables NS broadcast suppression in authentication VLANs.
<a href="#">Configuring the Default Gateway on the Management Interface</a>	 (Optional) It is used to configure the default gateway on the management interface.	
	<b>ipv6 gateway</b> <i>ipv6-address</i>	Configures the default gateway on the management interface.

### 3.4.1 Configuring an IPv6 Address

#### [Configuration Effect](#)

Configure the IPv6 address of an interface to implement IPv6 network communication.

#### [Configuration Steps](#)

##### ➤ Enabling IPv6 on an Interface

- (Optional) If you do not want to enable IPv6 by configuring an IPv6 address, run the **ipv6 enable** command.

##### ➤ Configuring the IPv6 Unicast Address of an Interface

- Mandatory.

## Verification

Run the **show ipv6 interface** command to check whether the configured address takes effect.

## Related Commands

### ↳ Enabling IPv6 on an Interface

<b>Command</b>	<b>ipv6 enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>IPv6 can be enabled on an interface by two methods: 1) running the <b>ipv6 enable</b> command in interface configuration mode; 2) configuring an IPv6 address on the interface.</p> <p> If an interface is bound to a multiprotocol VRF instance configured with no IPv6 address family, IPv6 cannot be enabled on this interface. You can enable IPv6 on this interface only after configuring an IPv6 address family for the multiprotocol VRF.</p> <p>If an IPv6 address is configured on an interface, IPv6 is automatically enabled on this interface. In this case, IPv6 cannot be disabled even when you run the <b>no ipv6 enable</b> command.</p>

### ↳ Configuring the IPv6 Unicast Address of an Interface

<b>Command</b>	<b>ipv6 address</b> <i>ipv6-address / prefix-length</i> <b>ipv6 address</b> <i>ipv6-prefix / prefix-length eui-64</i> <b>ipv6 address</b> <i>prefix-name sub-bits / prefix-length [ eui-64 ]</i>
<b>Parameter Description</b>	<p><i>ipv6-address</i>: Indicates the IPv6 address, which must comply with the address format defined in RFC 4291. Separated by a colon (:), each address field consists of 16 bits and is represented by hexadecimal digits.</p> <p><i>ipv6-prefix</i>: Indicates the IPv6 address prefix, which must comply with the address format defined in RFC 4291.</p> <p><i>prefix-length</i>: Indicates the length of the IPv6 address prefix, that is, the part representing the network in the IPv6 address.</p> <p><i>prefix-name</i>: Indicates the name of the universal prefix. This specified universal prefix is used to create the interface address.</p> <p><i>sub-bits</i>: Indicates the subprefix bits and host bits of the address to be concatenated with the prefixes provided by the general prefix specified with the <i>prefix-name</i> parameter. This value is combined with the universal prefix to create the interface address. This value must be in the form documented in RFC 4291.</p> <p><i>eui-64</i>: Indicates the created IPv6 address, consisting of the configured address prefix and 64-bit interface ID.</p>
<b>Command Mode</b>	Interface configuration mode

<p><b>Usage Guide</b></p>	<p> If an interface is bound to a multiprotocol VRF instance configured with no IPv6 address family, the IPv6 address cannot be configured for this interface. You can configure the IPv6 address of this interface only after configuring an IPv6 address family for the multiprotocol VRF.</p> <hr/> <p>If an IPv6 interface is created and is Up state, the system automatically generates a link-local address for this interface.</p> <p>The IPv6 address of an interface can also be created by the universal prefix mechanism. That is, IPv6 address = Universal prefix + Sub prefix + Host bits. The universal prefix can be configured by running the <b>ipv6 general-prefix</b> command or learned by the prefix discovery function of the DHCPv6 client (see the <i>Configuring DHCPv6</i>). Sub prefix + Host bits are specified by the <i>sub-bits</i> and <i>prefix-length</i> parameters in the <b>ipv6 address</b> command.</p> <p>If you run the <b>no ipv6 address</b> command without specifying an address, all manually configured addresses will be deleted.</p> <p>Run the <b>no ipv6 address ipv6-prefix/prefix-length eui-64</b> command to delete the configured address.</p>
---------------------------	--

## Configuration Example

### Configuring an IPv6 Address on an Interface

<p><b>Configuration Steps</b></p>	<p>Enable IPv6 on the GigabitEthernet 0/0 interface and add IPv6 address 2000::1 to the interface.</p>
	<pre>Ruijie(config)#interface gigabitEthernet 0/0 Ruijie(config-if-GigabitEthernet 0/0)#ipv6 enable Ruijie(config-if-GigabitEthernet 0/0)#ipv6 address 2000::1/64</pre>
<p><b>Verification</b></p>	<p>Run the <b>show ipv6 interface</b> command to verify that an address is successfully added to the GigabitEthernet 0/0 interface.</p>
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#show ipv6 interface gigabitEthernet 0/0  interface GigabitEthernet 0/0 is Down, ifindex: 1, vrf_id 0 address(es):   Mac Address: 00:00:00:00:00:00   INET6: FE80::200:FF:FE00:1 [ TENTATIVE ], subnet is FE80::/64   INET6: 2000::1 [ TENTATIVE ], subnet is 2000::/64  Joined group address(es): MTU is 1500 bytes ICMP error messages limited to one every 100 milliseconds ICMP redirects are enabled ND DAD is enabled, number of DAD attempts: 1</pre>

```
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND retransmit interval is 1000 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds<160--240>
ND router advertisements live for 1800 seconds
```

## 3.4.2 Configuring IPv6 NDP

### Configuration Effect

Configure NDP-related attributes, for example, enable IPv6 redirection and DAD.

### Notes

RA suppression is enabled on interfaces by default. To configure a device to send RA packets, run the **no ipv6 nd suppress-ra** command in interface configuration mode.

### Configuration Steps

#### ↳ Enabling IPv6 Redirection on an Interface

- (Optional) IPv6 redirection is enabled by default.
- To disable IPv6 redirection on an interface, run the **no ipv6 redirects** command.

#### ↳ Configuring the Number of Consecutive NS Packets Sent During DAD

- Optional.
- To prevent enabling DAD for IPv6 addresses on an interface or modify the number of consecutive NS packets sent during DAD, run the **ipv6 nd dad attempts** command.

#### ↳ Configuring the Reachable Time of a Neighbor

- Optional.
- To modify the reachable time of a neighbor, run the **ipv6 nd reachable-time** command.

#### ↳ Configuring the Address Prefix to Be Advertised in an RA Packet

- By default, the prefix in an RA packet on an interface is the prefix configured in the **ipv6 address** command on the interface.
- (Optional) Run the **ipv6 nd prefix** command to add or delete prefixes and prefix parameters that can be advertised.

#### ↳ Enabling/Disabling RA Suppression on an Interface

- Optional.

- If a device needs to send RA packets, run the **no ipv6 nd suppress-ra** command.

### ↘ Configuring the Maximum Number of Unresolved ND Entries

- Optional.
- If a large number of unresolved ND entries are generated due to scanning attacks, run the **ipv6 nd unresolved** command to restrict the number of unresolved neighbors.

### ↘ Configuring the Maximum Number of ND Entries Learned on an Interface

- Optional.
- If the number of IPv6 hosts is controllable, run the **ipv6 nd cache interface-limit** command to restrict the number of neighbors learned on an interface. This prevents ND learning attacks from occupying the memory space and affecting device performance.

## Verification

Run the following commands to check whether the configuration is correct:

- **show ipv6 interface** *interface-type interface-num*: Check whether the configurations such as the redirection function, reachable time of a neighbor, and NS sending interval take effect.
- **show ipv6 interface** *interface-type interface-num ra-inifo*: Check whether the prefix and other information configured for RA packets are correct.
- **show run**

## Related Commands

### ↘ Enabling IPv6 Redirection on an Interface

<b>Command</b>	<b>ipv6 redirects</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	All ICMPv6 error messages are transmitted at a limited transmission rate. By default, a maximum number of 10 ICMPv6 error messages are transmitted per second (10 pps).

### ↘ Configuring the Number of Consecutive NS Packets Sent During DAD

<b>Command</b>	<b>ipv6 nd dad attempts</b> <i>value</i>
<b>Parameter Description</b>	<i>value</i> : Indicates the number of NS packets.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	You need to enable DAD before configuring an IPv6 address on an interface. Then the address is in tentative state. If no address conflict is detected by DAD, this address can be correctly used. If an address

	<p>conflict is detected and the interface ID of this address uses EUI-64, duplicate link-layer addresses exist on this link. In this case, the system automatically disables this interface to prevent IPv6-related operations on this interface). At the time, you must configure a new address and restart the interface to re-enable DAD. When an interface changes from the down state to the up state, DAD is re-enabled for the addresses on this interface.</p>
--	--

### ↘ Configuring the Reachable Time of a Neighbor

<b>Command</b>	<code>ipv6 nd reachable-time <i>milliseconds</i></code>
<b>Parameter Description</b>	<i>milliseconds</i> : Indicates the reachable time of a neighbor, ranging from 0 to 3,600,000. The unit is millisecond. The default value is 30s.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>A device detects unreachable neighbors based on the configured reachable time. The shorter the configured reachable time, the faster the device detects unreachable neighbors but the more it consumes network bandwidth and device resources. Therefore, it is not recommended to set this time too small.</p> <p>The configured value is advertised in an RA packet and is also used on the device. If the value is 0, the reachable time is not specified on the device and it is recommended to use the default value.</p>

### ↘ Configuring the Address Prefix to Be Advertised in an RA Packet

<b>Command</b>	<code>ipv6 nd prefix {<i>ipv6-prefix/prefix-length</i>   <b>default</b>} [ [ <i>valid-lifetime</i> { <b>infinite</b>   <i>preferred-lifetime</i> } ]   [ <i>at valid-date preferred-date</i> ]   [<b>infinite</b> {<b>infinite</b>   <i>preferred-lifetime</i>}]] [ <b>no-advertise</b> ]   [[ <b>off-link</b> ] [ <b>no-autoconfig</b> ]]</code>
<b>Parameter Description</b>	<p><i>ipv6-prefix</i>: Indicates the network ID of IPv6, which must comply with the address representation format in RFC 4291.</p> <p><i>prefix-length</i>: Indicates the length of the IPv6 address prefix. A slash (/) must be added before the prefix.</p> <p><i>valid-lifetime</i>: Indicates the period when a host receiving the prefix of an RA packet regards the prefix valid. The value ranges from 0 to 4,294,967,295. The default value is 30 days.</p> <p><i>preferred-lifetime</i>: Indicates the preferred period when a host receiving the prefix of an RA packet regards the prefix valid. The value ranges from 0 to 4,294,967,295. The default value is 7 days.</p> <p><b>at</b> <i>valid-date preferred-date</i>: Indicates the valid date and preferred deadline configured for the RA prefix. It uses the format of <i>dd+mm+yyyy+hh+mm</i>.</p> <p><b>infinite</b>: Indicates that the prefix is permanently valid.</p> <p><b>default</b>: Indicates that the default parameter configuration is used.</p> <p><b>no-advertise</b>: Indicates that the prefix is not advertised by a router.</p> <p><b>off-link</b>: If the prefix of the destination address in the IPv6 packet sent by a host matches the configured prefix, the device regards the destination address on the same link and directly reachable. This parameter indicates that this prefix does not require on-link determination.</p> <p><b>no-autoconfig</b>: Indicates that the prefix in the RA packet received by a host cannot be used for address auto-configuration.</p>
<b>Command Mode</b>	Interface configuration mode

<b>Usage Guide</b>	<p>This command can be used to configure parameters related to each prefix, including whether to advertise this prefix. By default, an RA packet uses the prefix configured by running the <b>ipv6 address</b> command. Run the <b>ipv6 nd prefix</b> command to add other prefixes.</p> <p>Run the <b>ipv6 nd prefix default</b> command to configure the default parameters for an interface. That is, if no parameter is specified when a prefix is added, use the parameters configured in the <b>ipv6 nd prefix default</b> command as the parameters of the new prefix. The default parameter configurations are abandoned once a parameter is specified for the prefix. That is, when you use the <b>ipv6 nd prefix default</b> command to modify the default parameter configurations, only the prefix configured for the default parameters changes and configurations of the prefix remain the same.</p> <p><b>at valid-date preferred-date:</b> You can specify the valid date of the prefix in two methods: 1) specifying a fixed time for each prefix in an RA packet; 2) specifying the deadline. In the second method, the valid date of the prefix in each RA packet decreases till it becomes 0.</p>
--------------------	---

### ▾ Enabling/Disabling RA Suppression on an Interface

<b>Command</b>	<b>ipv6 nd suppress-ra</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To enable RA suppression on an interface, run the <b>ipv6 suppress-ra</b> command.

### ▾ Configuring the Maximum Number of Unresolved ND Entries

<b>Command</b>	<b>ipv6 nd unresolved</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of unresolved ND entries.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To prevent malicious scanning attacks from creating a large number of unresolved ND entries and occupying entry resources, you can restrict the number of unresolved ND entries.

### ▾ Configuring the Maximum Number of ND Entries Learned on an Interface

<b>Command</b>	<b>ipv6 nd cache interface-limit</b> <i>value</i>
<b>Parameter Description</b>	<i>value</i> : Indicates the maximum number of neighbors learned by an interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Restricting the number of ND entries learned on an interface can prevent malicious neighbor attacks. If this number is not restricted, a large number of ND entries will be generated on the device, occupying excessive memory space. The configured value must be equal to or greater than the number of the ND entries learned by the interface. Otherwise, the configuration does not take effect. The configuration is subject to the ND entry capacity supported by the device.

## Configuration Example

### ↳ Enabling IPv6 Redirection on an Interface

<b>Configuration Steps</b>	Enable IPv6 redirection on interface GigabitEthernet 0/0.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#ipv6 redirects</pre>
<b>Verification</b>	Run the <b>show ipv6 interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show ipv6 interface gigabitEthernet 0/0  interface GigabitEthernet 0/0 is Down, ifindex: 1, vrf_id 0 address(es):   Mac Address: 00:00:00:00:00:00   INET6: FE80::200:FF:FE00:1 [ TENTATIVE ], subnet is FE80::/64 Joined group address(es): MTU is 1500 bytes ICMP error messages limited to one every 100 milliseconds ICMP redirects are enabled ND DAD is enabled, number of DAD attempts: 1 ND reachable time is 30000 milliseconds ND advertised reachable time is 0 milliseconds ND retransmit interval is 1000 milliseconds ND advertised retransmit interval is 0 milliseconds ND router advertisements are sent every 200 seconds&lt;160--240&gt; ND router advertisements live for 1800 seconds</pre>

### ↳ Configuring IPv6 DAD

<b>Configuration Steps</b>	Configure the interface to send three consecutive NS packets during DAD.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)# ipv6 nd dad attempts 3</pre>
<b>Verification</b>	Run the <b>show ipv6 interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show ipv6 interface gigabitEthernet 0/0  interface GigabitEthernet 0/0 is Down, ifindex: 1, vrf_id 0</pre>

```

address(es):
  Mac Address: 00:00:00:00:00:00
  INET6: FE80::200:FF:FE00:1 [ TENTATIVE ], subnet is FE80::/64
Joined group address(es):
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 3
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND retransmit interval is 1000 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds<160--240>
ND router advertisements live for 1800 seconds
Ruijie(config-if-GigabitEthernet 0/0)#
    
```

📌 **Configuring Prefix Information in an RA Packet**

<b>Configuration Steps</b>	Add a prefix 1234::/64 to interface GigabitEthernet 0/0.
	Ruijie(config-if-GigabitEthernet 0/0)#ipv6 nd prefix 1234::/6
<b>Verification</b>	Run the <b>show ipv6 interface</b> command to check whether the configuration takes effect.
	<pre> Ruijie#show ipv6 interface gigabitEthernet 0/0 ra-info  GigabitEthernet 0/0: DOWN (RA is suppressed)    RA timer is stopped   waits: 0, initcount: 0   statistics: RA(out/in/inconsistent): 0/0/0, RS(input): 0   Link-layer address: 00:00:00:00:00:00   Physical MTU: 1500   ND router advertisements live for 1800 seconds   ND router advertisements are sent every 200 seconds&lt;160--240&gt;   Flags: !M!0, Adv MTU: 1500     </pre>

<b>Configuration Steps</b>	Add a prefix 1234::/64 to interface GigabitEthernet 0/0.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#ipv6 nd prefix 1234::/6</pre>
<b>Verification</b>	Run the <b>show ipv6 interface</b> command to check whether the configuration takes effect.
	<pre>ND advertised reachable time is 0 milliseconds ND advertised retransmit time is 0 milliseconds ND advertised CurHopLimit is 64 Prefixes: &lt;total: 1&gt; 1234::/64(Def, CFG, vtime: 2592000, pltime: 604800, flags: LA)</pre>

### 📌 Configuring RA Packets to Obtain Prefixes from the Prefix Pool

<b>Configuration Steps</b>	Configure RA packets to obtain prefixes from the prefix pool "ra-pool".
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#peel default ipv6 pool ra-pool</pre>
<b>Verification</b>	Run the <b>show run</b> command to check whether the configuration takes effect.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#show run interface gigabitEthernet 0/0  Building configuration... Current configuration : 125 bytes  interface GigabitEthernet 0/0   ipv6 enable   no ipv6 nd suppress-ra   peel default ipv6 pool ra-pool !</pre>

### 📌 Disabling RA Suppression

<b>Configuration Steps</b>	Disable RA suppression on an interface.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)# no ipv6 nd suppress-ra</pre>
<b>Verification</b>	Run the <b>show run</b> command to check whether the configuration takes effect.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#show run interface gigabitEthernet 0/0</pre>

<b>Configuration Steps</b>	Disable RA suppression on an interface.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)# no ipv6 nd suppress-ra</pre>
<b>Verification</b>	Run the <b>show run</b> command to check whether the configuration takes effect.
	<pre>Building configuration... Current configuration : 125 bytes  interface GigabitEthernet 0/0   ipv6 enable   no ipv6 nd suppress-ra !</pre>

### 📌 Configuring the Maximum Number of Unresolved ND Entries

<b>Configuration Steps</b>	Set the maximum number of unresolved ND entries to 200.
	<pre>Ruijie(config)# ipv6 nd unresolved 200</pre>
<b>Verification</b>	Run the <b>show run</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show run  ipv6 nd unresolved 200 !</pre>

### 📌 Configuring the Maximum Number of ND Entries Learned on an Interface

<b>Configuration Steps</b>	Set the maximum number of ND entries learned on an interface to 100.
	<pre>Ruijie(config-if-GigabitEthernet 0/1)# ipv6 nd cache interface-limit 100</pre>
<b>Verification</b>	Run the <b>show run</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show run ! interface GigabitEthernet 0/1   ipv6 nd cache interface-limit 100 !</pre>

### 3.4.3 Configuring IPv6 MTU on an Interface

#### Configuration Effect

According to the actual networking environment, configure a proper IPv6 to avoid package loss.

#### Notes

The IPv6 MTU of an interface must be less than or equal to the interface MTU. Generally, the range of the IPv6 MTU is from 1,280 to 1,500.

#### Configuration Steps

##### Configuring the IPv6 MTU of an Interface

- Optional.
- When the internet minimum MTU is less than the IPv6 MTU of the interface, use this configuration to set a proper interface MTU.

#### Verification

- Run the **show run** or **show ipv6 interface** command to check whether the configuration is correct.
- Capture the locally sent IPv6 packets of which the length exceeds the IPv6 MTU. The packet capture result shows that the IPv6 packet is fragmented based on the IPv6 MTU of the interface.

#### Related Commands

##### Configuring the IPv6 MTU of an Interface

<b>Command</b>	<code>ipv6 mtu bytes</code>
<b>Parameter Description</b>	<i>bytes</i> : Indicates the MTU of an IPv6 packet, ranging from 1,280 to 1,500. The unit is byte.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### Configuration Example

##### Configuring the IPv6 MTU of an Interface

<b>Configuration Steps</b>	Change the IPv6 MTU of interface GigabitEthernet 0/0 to 1,300.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#ipv6 mtu 1300</pre>
<b>Verification</b>	Run the <b>show ipv6 interface</b> command to check whether the configuration takes effect.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#show ipv6 interface</pre>

<b>Configuration Steps</b>	Change the IPv6 MTU of interface GigabitEthernet 0/0 to 1,300.
	<pre>Ruijie(config-if-GigabitEthernet 0/0)#ipv6 mtu 1300</pre>
<b>Verification</b>	Run the <b>show ipv6 interface</b> command to check whether the configuration takes effect.
	<pre>interface GigabitEthernet 0/ is Down, ifindex: 1, vrf_id 0  address(es):    Mac Address: 00:d0:f8:22:33:47    INET6: FE80::2D0:F8FF:FE22:3347 [ TENTATIVE ], subnet is FE80::/64    INET6: 1020::1 [ TENTATIVE ], subnet is 1020::/64    INET6: 1023::1 [ TENTATIVE ], subnet is 1023::/64  Joined group address(es):  MTU is 1300 bytes  ICMP error messages limited to one every 100 milliseconds  ICMP redirects are enabled  ND DAD is enabled, number of DAD attempts: 1  ND reachable time is 30000 milliseconds  ND advertised reachable time is 0 milliseconds  ND retransmit interval is 1000 milliseconds  ND advertised retransmit interval is 0 milliseconds  ND router advertisements are sent every 200 seconds&lt;160--240&gt;  ND router advertisements live for 1800 seconds</pre>

### 3.4.4 Enabling IPv6 Source Routing

#### Configuration Effect

RFC 5095 abolished the Type 0 routing header. Ruijie devices do not support the Type 0 routing header by default. The administrator can run the **ipv6 source-route** command to in global configuration mode to enable IPv6 source routing.

#### Configuration Steps

##### 📌 Enabling IPv6 Source Routing

- Optional.
- To enable IPv6 source routing, run the **ipv6 source-route** command.

#### Verification

The device can properly forward packets carrying the Type 0 routing header.

## Related Commands

### ▾ Enabling IPv6 Source Routing

<b>Command</b>	<b>ipv6 source-route</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Since the Type 0 header may cause the device prone to DoS attacks, the device does not forward IPv6 packets carrying the routing header by default, but still processes IPv6 packets with itself being the final destination address and the Type 0 routing header.

## Configuration Example

### ▾ Enabling IPv6 Source Routing

<b>Configuration Steps</b>	Enable IPv6 source routing.
	<pre>Ruijie(config)#ipv6 source-route</pre>
<b>Verification</b>	Run the <b>show run</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show run   inc ipv6 source-route ipv6 source-route</pre>

## 3.4.5 Configuring the Sending Rate of ICMPv6 Error Messages

### Configuration Effect

Configure the sending rate of ICMPv6 error messages.

### Configuration Steps

#### ▾ Configuring the Sending Rate of ICMPv6 Packet Too Big Messages

- Optional.
- If a device receives many IPv6 packets with the packet length exceeding the IPv6 MTU of the outbound interface and thereby sends many ICMPv6 Packet Too Big messages to consume much CPU resources, run the **ipv6 icmp error-interval too-big** command to restrict the sending rate of this error message.

#### ▾ Configuring the Sending Rate of Other ICMPv6 Error Messages

- Optional.

- If a device receives many illegal IPv6 packets and thereby generates many ICMPv6 error messages, run the **ipv6 icmp error-interval** command to restrict the sending rate of ICMPv6 error messages. (This command does not affect the sending rate of ICMPv6 Packet Too Big messages.)

## Verification

Run the **show running-config** command to check whether the configuration takes effect.

## Related Commands

### 📌 Configuring the Sending Rate of ICMPv6 Packet Too Big Messages

<b>Command</b>	<b>ipv6 icmp error-interval too-big</b> <i>milliseconds</i> [ <i>bucket-size</i> ]
<b>Parameter Description</b>	<p><i>milliseconds</i>: Indicates the refresh period of a token bucket, ranging from 0 to 2,147,483,647. The unit is millisecond. The default value is 100. If the value is 0, the sending rate of ICMPv6 error messages is not restricted.</p> <p><i>bucket-size</i>: Indicates the number of tokens in a token bucket, ranging from 1 to 200. The default value is 10.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>To prevent DoS attacks, use the token bucket algorithm to restrict the sending rate of ICMPv6 error messages.</p> <p>If the length of an IPv6 packet to be forwarded exceeds the IPv6 MTU of the outbound interface, the router discards this IPv6 packet and sends back an ICMPv6 Packet Too Big message to the source IPv6 address. This error message is mainly used as part of the IPv6 PMTUD process. If other ICMPv6 error messages are excessive, ICMPv6 Packet Too Big messages cannot be sent, causing failure of IPv6 PMTUD. Therefore, it is recommended to restrict the sending rate of ICMPv6 Packet Too Big messages independently of other ICMPv6 error messages.</p> <p>Since the precision of the timer is 10 milliseconds, it is recommended to set the refresh period of a token bucket to an integer multiple of 10 milliseconds. If the refresh period of the token bucket is between 0 and 10, the actual refresh period is 10 milliseconds. For example, if the sending rate is set to 1 every 5 milliseconds, two error messages are sent every 10 milliseconds in actual situations. If the refresh period of the token bucket is not an integer multiple of 10 milliseconds, it is automatically converted to an integer multiple of 10 milliseconds. For example, if the sending rate is set to 3 every 15 milliseconds, two tokens are refreshed every 10 milliseconds in actual situations.</p>

### 📌 Configuring the Sending Rate of Other ICMPv6 Error Messages

<b>Command</b>	<b>ipv6 icmp error-interval</b> <i>milliseconds</i> [ <i>bucket-size</i> ]
<b>Parameter Description</b>	<p><i>milliseconds</i>: Indicates the refresh period of a token bucket, ranging from 0 to 2,147,483,647. The unit is millisecond. The default value is 100. If the value is 0, the sending rate of ICMPv6 error messages is not restricted.</p> <p><i>bucket-size</i>: Indicates the number of tokens in a token bucket, ranging from 1 to 200. The default value is 10.</p>

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>To prevent DoS attacks, use the token bucket algorithm to restrict the sending rate of ICMPv6 error messages.</p> <p>Since the precision of the timer is 10 milliseconds, it is recommended to set the refresh period of a token bucket to an integer multiple of 10 milliseconds. If the refresh period of the token bucket is between 0 and 10, the actual refresh period is 10 milliseconds. For example, if the sending rate is set to 1 every 5 milliseconds, two error messages are sent every 10 milliseconds in actual situations. If the refresh period of the token bucket is not an integer multiple of 10 milliseconds, it is automatically converted to an integer multiple of 10 milliseconds. For example, if the sending rate is set to 3 every 15 milliseconds, two tokens are refreshed every 10 milliseconds in actual situations.</p>

### Configuration Example

#### 📌 Configuring the Sending Rate of ICMPv6 Error Messages

<b>Configuration Steps</b>	<p>Set the sending rate of the ICMPv6 Packet Too Big message to 100 pps and that of other ICMPv6 error messages to 10 pps.</p> <pre>Ruijie(config)#ipv6 icmp error-interval too-big 1000 100 Ruijie(config)#ipv6 icmp error-interval 1000 10</pre>
<b>Verification</b>	<p>Run the <b>show running-config</b> command to check whether the configuration takes effect.</p> <pre>Ruijie#show running-config   include ipv6 icmp error-interval ipv6 icmp error-interval 1000 10 ipv6 icmp error-interval too-big 1000 100</pre>

## 3.4.6 Configuring the IPv6 Hop Limit

### Configuration Effect

Configure the number of hops of a unicast packet to prevent the packet from being unlimitedly transmitted.

### Configuration Steps

#### 📌 Configuring the IPv6 Hop Limit

- Optional.
- To modify the number of hops of a unicast packet, run the **ipv6 hop-limit value** command.

### Verification

- Run the **show running-config** command to check whether the configuration is correct.
- Capture the IPv6 unicast packets sent by a host. The packet capture result shows that the hop-limit field value in the IPv6 header is the same as the configured hop limit.

## Related Commands

### ↘ Configuring the IPv6 Hop Limit

<b>Command</b>	<b>ipv6 hop-limit value</b>
<b>Parameter Description</b>	<i>value</i> : Indicates the number of hops of a unicast packet sent by the device. The value ranges from 1 to 255.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ↘ Configuring the IPv6 Hop Limit

<b>Configuration Steps</b>	Change the IPv6 hop limit of a device to 250.
	<pre>Ruijie(config)#ipv6 hop-limit 250</pre>
<b>Verification</b>	Run the <b>show running-config</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config ipv6 hop-limit 254</pre>

## 3.4.7 Enabling/Disabling the Function of Refraining from Sending NS Packets to Authentication VLANs

### Configuration Effect

Enable or disable the function of refraining from sending NS packets to authentication VLANs on an SVI.

### Notes

The configuration is supported only on SVIs and takes effect only in gateway authentication mode.

### Configuration Steps

#### ↘ Enabling/Disabling the Function of Refraining from Sending NS Packets to Authentication VLANs

- Optional.
- In gateway authentication mode, run the **no ipv6 nd suppress-auth-vlan-ns** command so that the device can send NS packets to authentication VLANs.

### Verification

- Run the **show running-config** command to check whether the configuration is correct.

### Related Commands

### ▾ Enabling/Disabling the Function of Refraining from Sending NS Packets to Authentication VLANs

<b>Command</b>	<b>ipv6 nd suppress-auth-vlan-ns</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use the <b>no</b> form of this command to disable this function.

### Configuration Example

#### ▾ Disabling the Function of Refraining from Sending NS Packets to Authentication VLANs

<b>Configuration Steps</b>	Disable the function of refraining from sending NS packets to authentication VLANs.
	<pre>Ruijie(config-if-VLAN 2)#no ipv6 nd suppress-auth-vlan-ns</pre>
<b>Verification</b>	Run the <b>show running-config interface vlan 2</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config interface vlan 2 no ipv6 nd suppress-auth-vlan-ns</pre>

## 3.4.8 Configuring the Default Gateway on the Management Interface

### Configuration Effect

Configure the default gateway on the management interface. A default route is generated, with the outbound interface being the management interface and the next hop being the configured gateway.

### Notes

The configuration is supported only on the management interface.

### Configuration Steps

#### ▾ Configuring the Default Gateway on the Management Interface

- Optional.
- To configure a default route and the next hop for the management interface, run the **ipv6 gateway** command.

### Verification

- Run the **show running-config** command to check whether the configuration is correct.

### Related Commands

#### ▾ Configuring the Default Gateway on the Management Interface

<b>Command</b>	<code>ipv6 gateway ipv6-address</code>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command is supported only on the management interface.

## Configuration Example

### Configuring the Default Gateway on the Management Interface

<b>Configuration Steps</b>	Set the default gateway of the management interface to 2000::1.
	<pre>Ruijie(config)# interface mgmt 0 Ruijie(config-mgmt)# ipv6 gateway 2000::1</pre>
<b>Verification</b>	Run the <b>show running-config interface vlan 2</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show running-config interface mgmt 0 Ipv6 gateway 2000::1</pre>

## 3.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the dynamically learned neighbors.	<code>clear ipv6 neighbors [ vrf vrf-name ] [ oob ] [interface-id]</code>

### Displaying

Description	Command
Displays IPv6 information of an interface.	<code>show ipv6 interface [[interface-id] [ra-info] ] [brief [interface-id]]</code>
Displays neighbor information.	<code>show ipv6 neighbors [vrf vrf-name] [verbose] [interface-id] [ipv6-address] [static] [oob]</code>
Displays information of the IPv6 routing table.	<code>show ipv6 route [vrf vrf-name] [ static   local   connected   bgp   rip   ospf   isis ]</code>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable the debugging switch immediately after use.

Description	Command
Debugs ND entry learning.	<b>debug ipv6 nd</b>

## 4 Configuring DHCP

### 4.1 Overview

The Dynamic Host Configuration Protocol (DHCP) is a LAN protocol based on the User Datagram Protocol (UDP) for dynamically assigning reusable network resources, for example, IP addresses.

The DHCP works in Client/Server mode. A DHCP client sends a request message to a DHCP server to obtain an IP address and other configurations. When a DHCP client and a DHCP server are not in a same subnet, they need a DHCP relay to forward DHCP request and reply packets.

#### Protocols and Standards

- RFC2131: Dynamic Host Configuration Protocol
- RFC2132: DHCP Options and BOOTP Vendor Extensions
- RFC3046: DHCP Relay Agent Information Option

### 4.2 Applications

Application	Description
<a href="#">Providing DHCP Service in a LAN</a>	Assigns IP addresses to clients in a LAN.
<a href="#">Enabling DHCP Client</a>	Enable DHCP Client.
<a href="#">Applying AM Rule on DHCP Server</a>	Apply DHCP Server in Super VLAN environment.
<a href="#">Deploying DHCP Relay in Wired Network</a>	In a wired network, users from different network segments requests IP addresses.
<a href="#">Applying AM Rule on DHCP Relay</a>	In a Super VLAN, users from different network segments requests IP addresses.

#### 4.2.1 Providing DHCP Service in a LAN

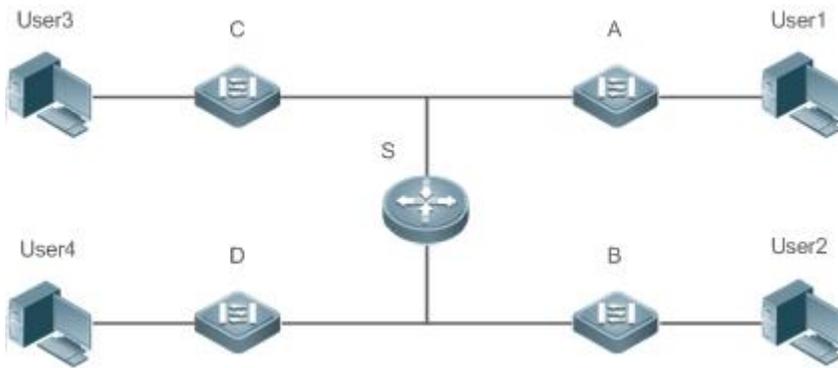

##### Scenario

Assign IP addresses to four users in a LAN.

For example, assign IP addresses to User 1, User 2, User 3 and User 4, as shown in the following figure.

- The four users are connected to Server S through A, B, C and D.

Figure 4-1

<b>Remarks</b>	S is an egress gateway working as a DHCP server. A, B, C and D are access switches achieving layer-2 transparent transmission. User 1, User 2, User 3 and User 4 are LAN users.
----------------	---

### Deployment

- Enable DHCP Server on S.
- Deploy layer-2 VLAN transparent transmission on A, B, C and D.
- User 1, User 2, User 3 and User 4 initiate DHCP client requests.

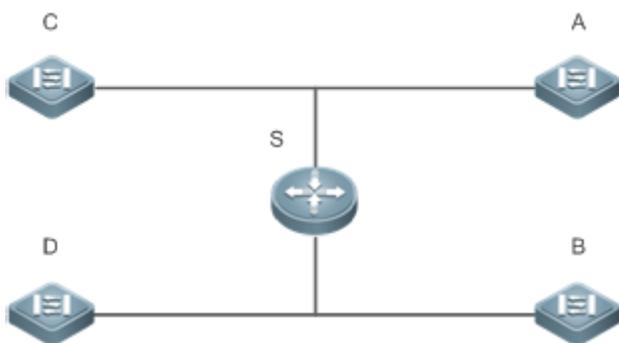

## 4.2.2 Enabling DHCP Client

### Scenario

Access switches A, B, C and D in a LAN request server S to assign IP addresses.

For example, enable DHCP Client on the interfaces of A, B, C and D to request IP addresses, as shown in the following figure.

Figure 4-2

<b>Remarks</b>	S is an egress gateway working as a DHCP server. A, B, C and D are access switches with DHCP Client enabled on the interfaces.
----------------	---

**Deployment**

- Enable DHCP Server on S.
- Enable DHCP Client on the interfaces of A, B, C and D.

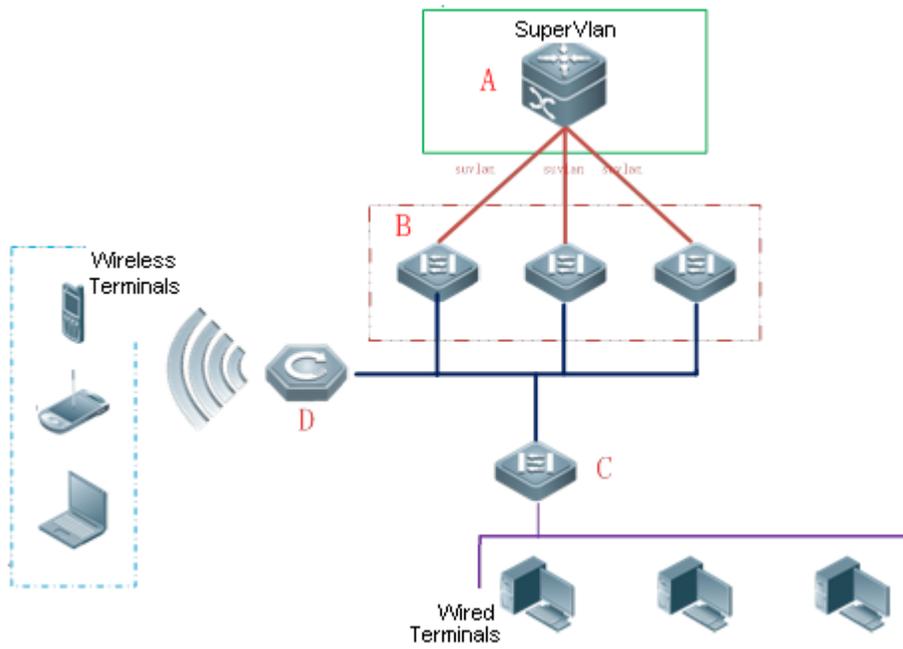

**4.2.3 Applying AM Rule on DHCP Server**

**Scenario**

As shown in Figure 4-3, create a Super VLAN, configure an AM rule and enable DHCP Server on the core switch A. B is an aggregation switch, C an access switch, and D a wireless access device. The requirements are listed as follows:

- Assign IP addresses dynamically based on the VLAN and port;
- Assign IP addresses statically based on the VLAN;
- Assign IP addresses dynamically based on the default AM rule.

Figure 4-3 Applying AM Rule on a DHCP Server

<b>Remarks</b>	A is a core device. B is an aggregation device. C is a wired access device. D is a wireless access device.
----------------	---

**Deployment**

- Configure an AM rule, enable DHCP Server and create a Super VLAN on A.
- Create VLANs on B and C to transparently transmit DHCP packets from wired users to A to request IP addresses.
- Enable the wireless function on D to transparently transmit DHCP packets from wireless users to A to request IP addresses.

### 4.2.4 Deploying DHCP Relay in Wired Network

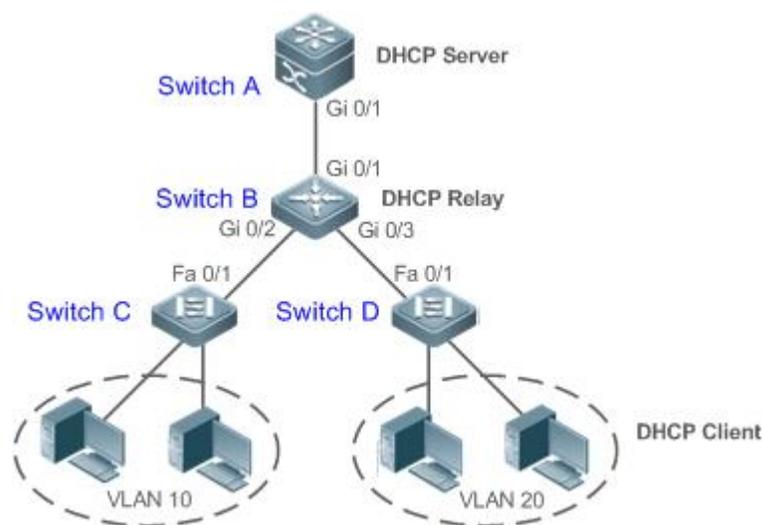

#### Scenario

As shown in the following figure, Switch C and Switch D are access devices for the users in VLAN 10 and VLAN 20 respectively. Switch B is a gateway, and Switch A a core device. The requirements are listed as follows:

Switch A works as a DHCP server to assign IP addresses of different network segments dynamically to users in different VLANs.

Users in VLAN 10 and VLAN 20 obtain IP addresses dynamically.

Figure 4-4 DHCP Relay

<b>Remarks</b>	Switch C and Switch D are access devices. Switch B is a gateway. Switch A is a core device.
----------------	---

#### Deployment

- Configure layer-2 communication between Switch B and Switch C as well as between Switch B and Switch D.
- On Switch B, specify a DHCP server address and enable DHCP Relay.
- On Switch A, create DHCP address pools for VLAN 10 and VLAN 20 respectively, and enable DHCP Server.

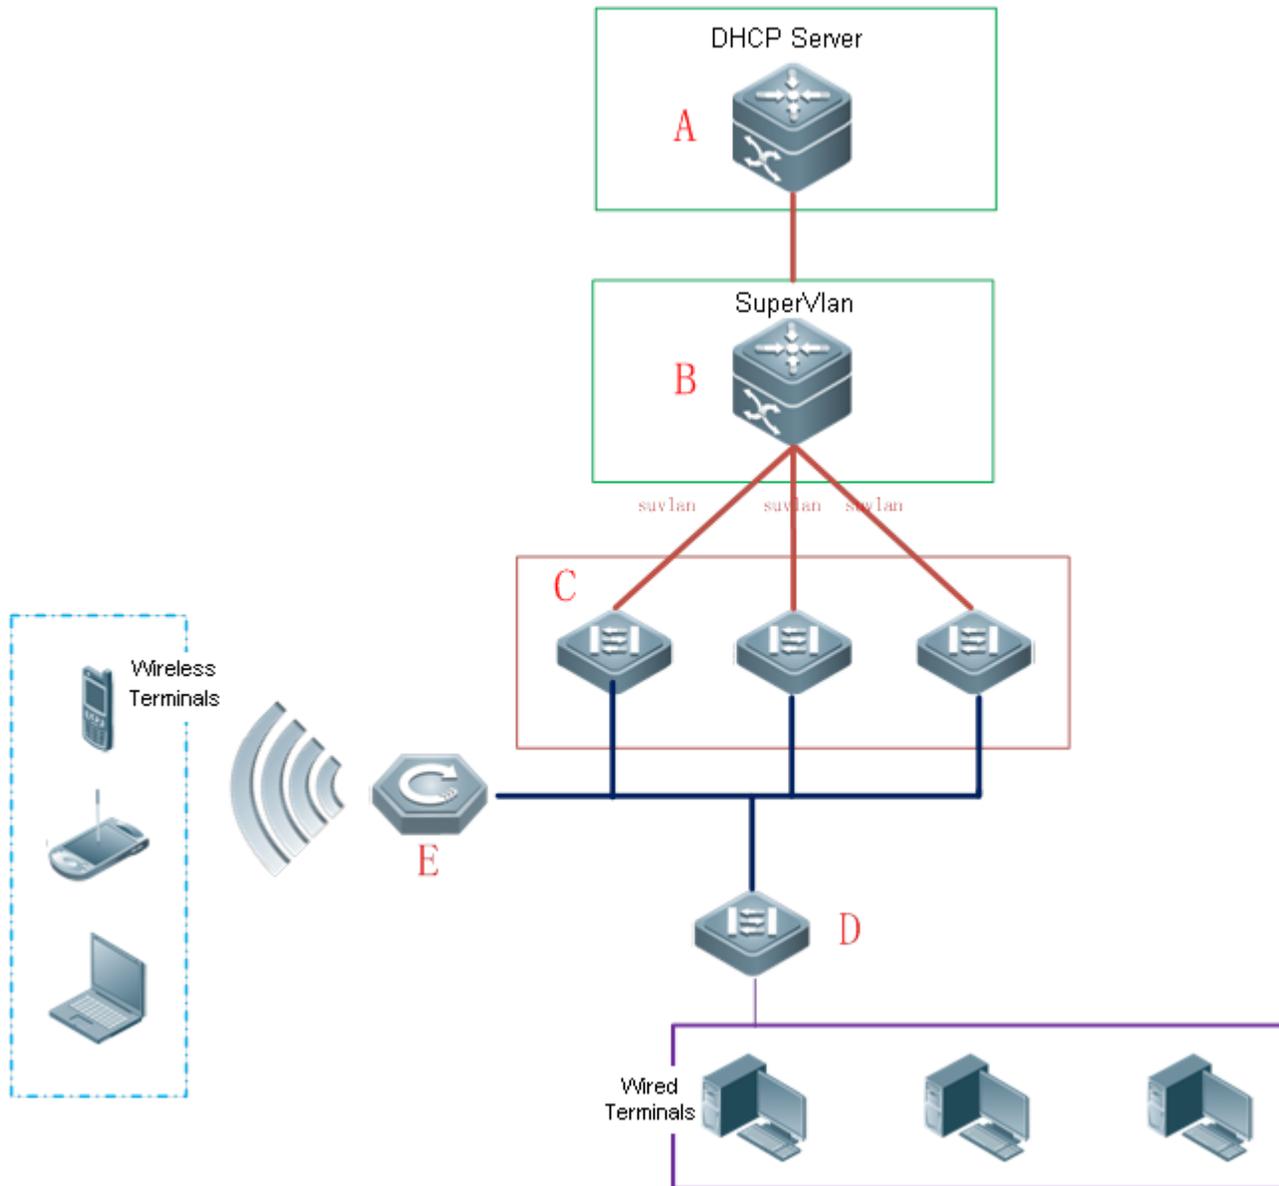

### 4.2.5 Applying AM Rule on DHCP Relay

#### Scenario

As shown in Figure 4-5, A is a DHCP server, B a core switch configured with Super VLAN, an AM rule and DHCP Relay, C an aggregation switch, D an access switch, and E a wireless access device. The requirements are listed as follows:

- Based on the VLAN-port AM rule, the DHCP relay agent chooses a subnet address as Giaddress of relay packets and forwards them to the DHCP server to request an IP address for the client.
- Based on default AM rule, the DHCP relay agent chooses a subnet address as Giaddress of relaying packets and forwards them to the DHCP server to request an IP address for the client.

Figure 4-5 Applying AM Rule on DHCP Relay

<b>Remarks</b>	A is a core device. B is a core device. C is an aggregation device. D is a wired access device.
----------------	--

E is a wireless access device.
--------------------------------

## Deployment

- Enable DHCP Server on A.
- Configure an AM rule, enable DHCP Relay and create a Super VLAN on B.
- Create VLANs on C and D to transparently transmit DHCP packets from wired users to B to request IP addresses.
- Enable the wireless function on E to transparently transmit DHCP packets from wireless users to B to request IP addresses.

## 4.3 Features

### Basic Concepts

#### ↳ DHCP Server

Based on the RFC 2131, Ruijie DHCP server assigns IP addresses to clients and manages these IP addresses.

#### ↳ DHCP Client

DHCP Client enables a device to automatically obtain an IP address and configurations from a DHCP server.

#### ↳ DHCP Relay

When a DHCP client and a DHCP server are not in a same subnet, they need a DHCP relay to forward DHCP request and reply packets.

#### ↳ Lease

Lease is a period of time specified by a DHCP server for a client to use an assigned IP address. An IP address is active when leased to a client. Before a lease expires, a client needs to renew the lease through a server. When a lease expires or is deleted from a server, the lease becomes inactive.

#### ↳ Excluded Address

An excluded address is a specified IP address not assigned to a client by a DHCP server.

#### ↳ Address Pool

An address pool is a collection of IP addresses that a DHCP server may assign to clients.

#### ↳ Option Type

An option type is a parameter specified by a DHCP server when it provides lease service to a DHCP client. For example, a public option include the IP addresses of a default gateway (router), WINS server and a DNS server. DHCP server allows configuration of other options. Though most options are defined in the RFC 2132, you can add user-defined options.

### Overview

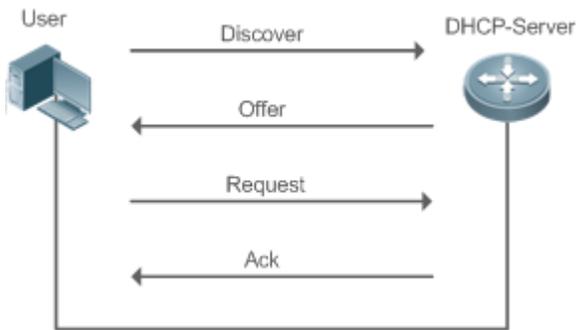

Feature	Description
<a href="#">DHCP Server</a>	Enable DHCP Server on a device, and it may assign IP addresses dynamically and pushes configurations to DHCP clients.
DHCP Relay	Enable DHCP Relay on a device, and it may forward DHCP request and reply packets across different network segments.
<a href="#">DHCP Client</a>	Enable DHCP Client on a device, and it may obtain IP addresses and configurations automatically from a DHCP server.
<a href="#">AM Rule</a>	Enable an AM rule on a device, and it may assign IP addresses according to the rule.

### 4.3.1 DHCP Server

#### Working Principle

##### ↘ DHCP Working Principle

Figure 4-6

A host requests an IP address through DHCP as follows:

13. A host broadcasts a DHCP discover packet to find DHCP servers in a network.
14. DHCP servers unicast/broadcast (based on the property of the host packet) DHCP offer packets to the host, containing an IP address, a MAC address, a domain name and a lease.
15. The host broadcasts a DHCP request packet to formally request an IP address.
16. A DHCP server sends a DHCP ACK unicast packet to the host to acknowledge the request.

**i** A DHCP client may receive DHCPOFFER packets from multiple DHCP servers, but usually it accepts only the first DHCPOFFER packet. Besides, the address specified in a DHCPOFFER packet is not necessarily assigned. Instead, it is retained by the DHCP server until a client sends a formal request.

To formally request an IP address, a client broadcasts a DHCPREQUEST packet so that all DHCP servers sending DHCPOFFER packets may receive the packet and release OFFER IP addresses.

If a DHCPOFFER packet contains invalid configuration parameters, a client will send a DHCPDECLINE packet to the server to decline the configuration.

During the negotiation, if a client does not respond to the DHCPOFFER packets in time, servers will send DHCPNAK packets to the client and the client will reinitiate the process.

During network construction, Ruijie DHCP servers have the following features:

- Low cost. Usually the static IP address configuration costs more than DHCP configuration.
- Simplified configuration. Dynamic IP address assignment dramatically simplifies device configuration
- Centralized management. You can modify the configuration for multiple subnets by simply modifying the DHCP server configuration.

#### ▾ Address Pool

After a server receives a client's request packet, it chooses a valid address pool, determines an available IP address from the pool through PING, and pushes the pool and address configuration to the client. The lease information is saved locally for validity check upon lease renewal.

An address pool may carry various configuration parameters as follows:

- An IP address range, which is the range of IP addresses that are available.
- A gateway address. A maximum of 8 gateway addresses are supported.
- A DNS address. A maximum of 8 DNS addresses are supported.
- A lease period notifying clients of when to age an address and request a lease renewal.

#### ▾ VRRP Monitoring

In a Virtual Router Redundancy Protocol (VRRP) scenario, Ruijie devices enabled with DHCP provide a command to monitor the VRRP status of the interface. To an interface configured with VRRP address and VRRP monitoring, a DHCP server only processes the DHCP clients' request packets from the interface in Master state, and other packets are discarded. If no VRRP address is configured, the DHCP server does not monitor the VRRP status, and all DHCP packets are processed. VRRP monitoring is configured on only layer-3 interfaces. It is disabled by default, namely, only the Master device processes the DHCP service.

#### ▾ IP Address Assignment Based on VLANs, Ports and IP Range

After an IP address pool is deployed, the specified IP address range is assigned based on VLANs and ports. There are three scenarios. 1. Global configuration. 2. Configuration based on VLANs, ports and IP range. 3. Both 1 and 2. In scenario 1, the addresses are assigned globally. In scenario 2, the addresses in the specified IP range are assigned only to the clients of the specified VLANs and ports. In scenario 3, the clients of the specified VLANs and ports are assigned the addresses in the specified IP range, and the other clients are configured with default global addresses.

### Related Configuration

#### ▾ Enabling DHCP Server Globally

- By default, DHCP Server is disabled.
- Run the **service dhcp** command to enable the DHCP Server.
- Run the **service dhcp** command globally to enable DHCP service.

#### ▾ Configuring Address Pool

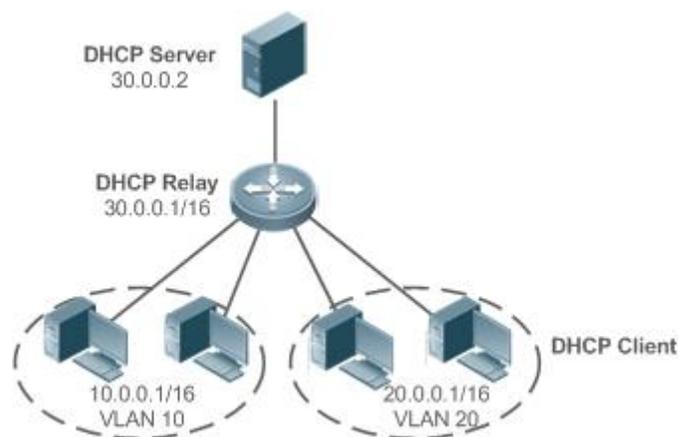

- By default, no address pool is configured.
- Run the **ip dhcp pool** command to configure an IP address range, a gateway and a DNS.
- If no address pool is configured, no addresses will be assigned.

### 4.3.2 DHCP Relay Agent

#### Working Principle

The destination IP address of DHCP request packets is 255.255.255.255, and these packets are forwarded within a subnet. To achieve IP address assignment across network segments, a DHCP relay agent is needed. The DHCP relay agent unicasts DHCP request packets to a DHCP server and forwards DHCP reply packets to a DHCP client. The DHCP relay agent serves as a repeater connecting a DHCP client and a DHCP server of different network segments by forwarding DHCP request packets and DHCP reply packets. The Client-Relay-Server mode achieves management of IP addresses across multiple network segments by only one DHCP server. See the following figure.

Figure 4-7 DHCP Relay Scenario

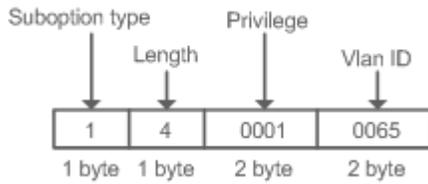

VLAN 10 and VLAN 20 correspond to the segments 10.0.0.1/16 and 20.0.0.1/16 respectively. A DHCP server with IP address 30.0.0.2 is in segment 30.0.0.1/16. To achieve management of dynamic IP addresses in VLAN 10 and VLAN 20 by the DHCP server, you only need to enable DHCP Relay on a gateway and configure IP address 30.0.0.2 for the DHCP server.

#### 📌 DHCP Relay Agent Information (Option 82)

As defined in RFC3046, an option can be added to indicate a DHCP client's network information when DHCP Relay is performed, so that a DHCP server may assign IP addresses of various privileges based on more accurate information. The option is called Option 82. Currently, Ruijie devices support four schemes of relay agent information, which are described respectively as follows:

17. Relay agent information option dot1x: This scheme should be implemented with 802.1X authentication and the RG-SAM products. Specifically, RG-SAM products push the IP privilege during 802.1X authentication. A DHCP relay agent forms a Circuit ID sub-option based on the IP privilege and the VLAN ID of a DHCP client. The option format is shown in the following figure.

Figure 4-8 Option Format

18. Relay agent information option82: This scheme serves without correlation with other protocol modules. A DHCP relay agent forms an Option 82 based on the physical port receiving DHCP request packets and the MAC address of the device. The option format is shown in the following figure.

Figure 4-9 Agent Circuit ID

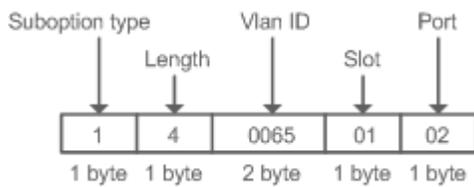

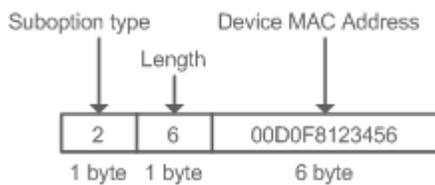

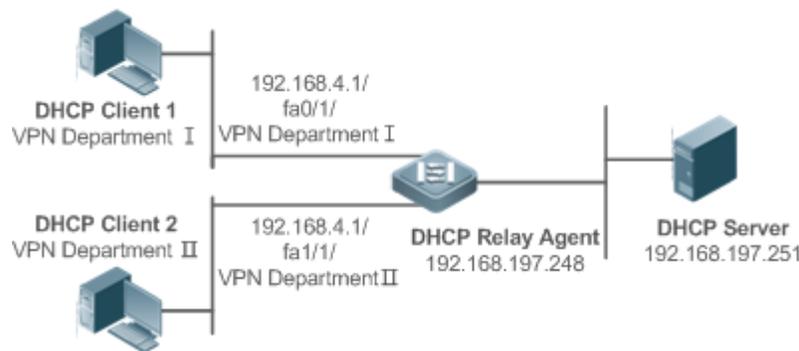

Figure 4-10 Agent Remote ID

19. Relay agent information option VPN: This scheme should be implemented with MPLS VPN functions.

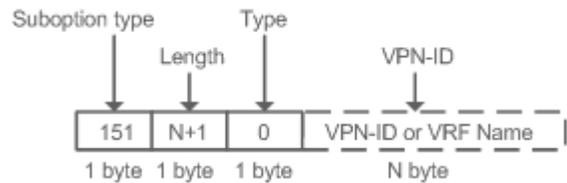

Figure 4-11 Application in MPLS VPN Environment

As shown in Figure 4-11, in MPLS VPN environment, DHCP Client 1 is connected to fa0/1 on a DHCP relay agent and DHCP Client 2 to fa1/1. Interfaces fa0/1 and fa1/1 belongs to different VRFs. DHCP Client 1 and DHCP Client 2 obtain IP addresses through DHCP. According to network planning, VPN Department I and VPN Department II are in a same segment 192.168.4.0/24. In this case, conventional DHCP application cannot meet the demand. To support DHCP Relay in MPLS VPN environment, **option vpn** is introduced, which includes the three sub-options, namely, VPN-ID, Subnet-Selection and Server-Identifier-Override.

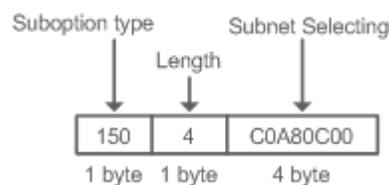

- **VPN-ID:** When a DHCP relay agent receives a DHCP request packet, it adds the information of the VPN the DHCP client resides to the packet as an option. The DHCP server keeps the VPN-ID in a reply packet, and the DHCP relay agent forwards the packet to the corresponding VRF according to the option. The option format is shown in the following figure.

Figure 4-12 VPN-ID

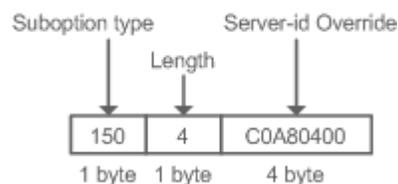

- **Subnet-Selection:** In conventional DHCP Relay, the information of a client network and the addresses of a DHCP server and a DHCP relay agent are indicated by the **gateway address[ giaddr ]** field. In MPLS VPN environment, set **giaddr** to the IP address of the interface of a DHCP relay agent connected to a DHCP server, so that the server may communicate directly with the relay agent. Besides, the information of the client subnet is indicated by a Subnet-Selection option. The option format is shown in the following figure.

Figure 4-13 Subnet-Selection

- **Server-Identifier-Override:** In MPLS VPN environment, request packets from a DHCP client cannot be sent directly to a DHCP server. A DHCP relay agent use this option to carry the information of the interface connecting the relay agent and the DHCP server. When the server sends a reply message, this option overrides the Server-Identifier option. In this way, the DHCP client sends packets to DHCP relay agent, and the DHCP relay agent forwards them to the DHCP server. The option format is shown in the following figure.

Figure 4-14 Server-Identifier-Override

### 📌 DHCP Relay Check Server-ID

In DHCP environment, multiple DHCP servers are deployed for a network, achieving server backup to ensure uninterrupted network operation. After this function is enabled, the DHCP request packet sent by a client contains a **server-id** option specifying a DHCP server. In alleviating the burden on servers in specific environments, you need to enable this function on a relay agent to send a packet to a specified DHCP server rather than all DHCP servers.

### ↘ DHCP Relay suppression

After you configure the **ip DHCP Relay suppression** command on an interface, DHCP request packets received on the interface will be filtered, and the other DHCP request packets will be forwarded.

### Related Configuration

#### ↘ Enabling DHCP Relay

- By default, DHCP Relay is disabled.
- You may run the **service dhcp** command to enable DHCP Relay.
- You need to enable DHCP Relay before it works.

#### ↘ Configuring IP Address for DHCP Server

- By default, no IP address is configured for a DHCP server.
- You may run the **ip helper-address** command to configure an IP address for a DHCP server. The IP address can be configured globally or on a layer-3 interface. A maximum of 20 IP addresses can be configured for a DHCP server.
- When an interface receives a DHCP request packet, the DHCP server configuration on the interface prevails over that configured globally. If the interface is not configured with DHCP server addresses, the global configuration takes effect.

#### ↘ Enabling DHCP Option 82

- By default, DHCP Option 82 is disabled.
- You may run the **ip dhcp relay information option82** command to enable DHCP Option 82.

#### ↘ Enabling DHCP Relay Check Server-ID

- By default, DHCP Relay check server-id is disabled.
- You may run the **ip dhcp relay check server-id** command to enable DHCP Relay check server-id.

#### ↘ Enabling DHCP Relay Suppression

- By default, DHCP Relay suppression is disabled on all interfaces.
- You may run the **ip dhcp relay suppression** command to enable it on an interface.

#### ↘ Enabling the Function of Multiple Gateway IP Addresses

- By default, the function of multiple gateway IP addresses is enabled.
- You may run the **ip dhcp relay multiple-giaddr** command to enable the function of multiple gateway IP addresses.

## 4.3.3 DHCP Client

### Working Principle

A DHCP client broadcasts a DHCP discover packet after entering the Init state. Then it may receive multiple DHCP offer packets. It chooses one of them and responds to the corresponding DHCP server. After that, it sends lease renewal request packets in the Renew and Rebind processes of an aging period to request lease renewal.

### Related Configuration

#### ↘ Enabling DHCP Client on Interface

- By default, DHCP Client is disabled.
- In interface configuration mode, you may run the **ip address dhcp** command to enable DHCP Client.
- You need to enable DHCP Client to enable DHCP service.
- The configuration takes effect on a layer-3 interface, for example, an SVI or a routed port.

## 4.3.4 AM Rule

### Working Principle

An AM rule defines the range of IP addresses assigned to DHCP clients in different VLANs and ports. It can be used to quickly identify the VLAN and port of a faulty DHCP client and effectively assign addresses. After an AM rule is configured, all DHCP clients from the set VLAN and ports may obtain IP addresses. If no AM rule is configured, there are two following cases: If a default AM rule is configured, the client obtains an IP address from the default range; if no default AM rule is configured, the client cannot obtain an IP address.

### Related Configuration

#### ↘ Configuring AM Rule in Global Configuration Mode

- In global configuration mode, run the **address-manage** command to enter AM rule configuration mode.
- Run the **match ip default** command to configure a default AM rule.
- Run the **match ip** command to configure an AM rule based on VLAN & port or port.

## 4.4 Configuration

### ↘ Configuring DHCP Server

Configuration	Description and Command
<a href="#">Configuring Dynamic IP Address</a>	 (Mandatory) It is used to enable DHCP Server to achieve dynamic IP address assignment.
	<b>service dhcp</b> Enables DHCP Server.
	<b>ip dhcp pool</b> Configures an address pool.
	<b>network</b> Configures the network number and subnet mask of a DHCP address pool.

Configuration	Description and Command	
	 (Optional) It is used to configure the properties of an address pool.	
	<b>default-router</b>	Configures a default gateway of a client.
	<b>lease</b>	Configures an address lease.
	<b>next-server</b>	Configures a TFTP server address
	<b>bootfile</b>	Configures a boot file of a client.
	<b>domain-name</b>	Configures a domain name of a client.
	<b>dns-server</b>	Configures a domain name server.
	<b>netbios-name-server</b>	Configures a NetBIOS WINS server.
	<b>netbios-node-type</b>	Configures a NetBIOS node type on a client.
	<b>lease-threshold</b>	Configures an alarm threshold of an address pool.
	<b>option</b>	Configures a user-defined option.
<b>pool-status</b>	Enables or disables an address pool.	
<a href="#">Configuring Static IP Address</a>	 (Optional) It is used to statically assign an IP address to a client.	
	<b>ip dhcp pool</b>	Configures an address pool name and enters address pool configuration mode.
	<b>host</b>	Configures the IP address and subnet mask of a client host.
	<b>hardware-address</b>	Configures a client hardware address.
	<b>client-identifier</b>	Configures a unique client identifier.
	<b>client-name</b>	Configures a client name.
<a href="#">Configuring AM Rule for DHCP Server</a>	 (Optional) It is used to configure the properties of a DHCP server.	
	<b>ip dhcp excluded-address</b>	Configures an excluded IP address.
	<b>ip dhcp force-send-nak</b>	Configures Compulsory NAK reply by a DHCP server.
	<b>ip dhcp monitor-vrrp-state</b>	Configures VRRP status monitoring.
	<b>ip dhcp ping packets</b>	Configures ping times.
	<b>ip dhcp ping timeout</b>	Configures a ping timeout.
	<b>ip dhcp server arp-detect</b>	Configures a DHCP server to detect user offline.
<a href="#">Configuring Global Properties of DHCP Server</a>	 (Optional) It is used to configure the AM rule of a DHCP server.	
	<b>match ip default</b>	Configures a default AM rule.
	<b>match ip ip-address</b>	Configures an AM rule based on the VLAN and port.

📌 [Configuring DHCP Relay](#)

Configuration	Description and Command	
---------------	-------------------------	--

Configuration	Description and Command
<a href="#">Configuring Basic DHCP Relay Functions</a>	 (Mandatory) It is used to enable DHCP Relay.
	<b>service dhcp</b> Enables DHCP Relay.
	<b>ip helper-address</b> Configures an IP Address of a DHCP Server.
<a href="#">Configuring DHCP Relay Option 82</a>	 (Optional) It is used to assign IP addresses of different privileges to clients in combination with the information of a physical port. This function cannot be used together with the <b>dhcp option dot1x</b> command.
	<b>ip dhcp relay information option82</b> Enables DHCP option82.
<a href="#">Configuring DHCP Relay Check Server-ID</a>	 (Optional) It is used to enable a DHCP Relay agent to send DHCP request packets only to a specified server.
	<b>ip dhcp relay check server-id</b> Enables a DHCP Relay agent to send DHCP request packets only to a specified server
<a href="#">Configuring DHCP Relay Suppression</a>	 (Optional) It is used to shield DHCP request packets on an interface.
	<b>ip dhcp relay suppression</b> Enables DHCP Relay Suppression.
<a href="#">Enabling DHCP Relay to Discard DHCP Request Packets from VxLAN Tunnels</a>	 (Optional) It is used to discard DHCP request packets from VxLAN tunnels.
	<b>ip dhcp relay discard overlay-tunnel</b> Discards DHCP request packets from VxLAN tunnels.

↘ **Configuring DHCP Client**

Configuration	Description and Command
<a href="#">Configuring DHCP Client</a>	 (Mandatory) It is used to enable DHCP Client.
	<b>ip address dhcp</b> Enables an Ethernet interface, a PPP/HDLC-encapsulated or FR-encapsulated interface to obtain IP addresses through DHCP.

### 4.4.1 Configuring Dynamic IP Address

#### Configuration Effect

Provide all DHCP clients with DHCP service including assigning IP addresses and gateways.

#### Notes

A DHCP server and a DHCP relay share the **service dhcp** command, but a device cannot function as a DHCP server and relay at the same time. When a device is configured with a valid address pool, it acts as a server and forwards packets. Otherwise, it serves as a relay agent.

## Configuration Steps

### ↳ Enabling DHCP Server

- Mandatory. It achieves dynamic IP address assignment.
- Run the **service dhcp** command in global configuration mode.

### ↳ Configuring Address Pool

- Mandatory. It is used to create an IP address pool.
- Run the **ip dhcp pool** command in global configuration mode.

### ↳ Configuring Network Number and Subnet Mask of DHCP Address Pool

- Mandatory. It defines a range of dynamically assigned addresses.
- Run the **network** command in DHCP address pool configuration mode.

### ↳ Configuring Default Gateway of Client

- Optional. It is used to configure a gateway address.
- Run the **default-router** command in DHCP address pool configuration mode.

### ↳ Configuring Address Lease

- Optional. It is used to configure an IP address lease, which is 24h by default.
- Run the **lease** command in DHCP address pool configuration mode.

### ↳ Configuring TFTP Server Address

- Optional. It is used to configure a TFTP server address.
- Run the **next-server** command in DHCP address pool configuration mode.

### ↳ Configuring Domain Name of Client

- Optional. It is used to configure the domain name of a client.
- Run the **domain-name** command in DHCP address pool configuration mode.

### ↳ Configuring DNS

- Optional. It is used to configure a DNS address.
- Run the **dns** command in DHCP address pool configuration mode.

### ↳ Configuring NetBIOS WINS Server

- Optional. It is used to configure a NetBIOS WINS server address.
- Run the **netbios-name-server** command in DHCP address pool configuration mode.

#### ↘ Configuring NetBIOS Node Type on Client

- Optional. It is used to configure a NetBIOS node type.
- Run the **netbios-name-type** command in DHCP address pool configuration mode.

#### ↘ Configuring Alarm Threshold of Address Pool

- Optional. It is used to manage the number of leases. When a threshold (90% by default) is reached, an alarm will be printed.
- Run the **lease-threshold** command in DHCP address pool configuration mode.

#### ↘ Configuring User-Defined Option

- Optional. It is used to configure user-defined options.
- Run the **option** command in DHCP address pool configuration mode.

#### ↘ Enabling or Disabling Address Pool

- Optional. It is used to enable or disable an address pool. It is enabled by default.
- Run the **pool-status** command in DHCP address pool configuration mode.

### Verification

Connect a DHCP client and a DHCP server.

- Check whether the client obtains configurations on the server.

### Related Commands

#### ↘ Enabling DHCP Server

<b>Command</b>	<b>service dhcp</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Enable DHCP Server and DHCP Relay. A DHCP server and a DHCP relay share the <b>service dhcp</b> command. When a device is configured with a valid address pool, it acts as a server and forwards packets. Otherwise, it serves as a relay agent.

#### ↘ Configuring Address Pool

<b>Command</b>	<b>ip dhcp pool</b> <i>dhcp-pool</i>
<b>Parameter</b>	<i>pool-name</i> : Indicates the name of an address pool.

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Before assigning an IP address to a client, you need to configure an address pool name and enter DHCP address pool configuration mode.

### ↘ Configuring Network Number and Subnet Mask of DHCP Address Pool

<b>Command</b>	<b>network</b> <i>network-number mask [low-ip-address high-ip-address]</i>
<b>Parameter Description</b>	<i>network-number</i> : Indicates the network number of an IP address pool. <i>mask</i> : Indicates the subnet mask of an IP address pool. If no subnet mask is defined, the natural subnet mask is applied.
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	<p>To configure dynamic address assignment, you need to configure a network number and subnet mask of an address pool to provide a DHCP server with a range of addresses. The IP addresses in a pool are assigned in order. If an address is assigned or exists in the target network segment, the next address will be checked until a valid address is assigned.</p> <p>Ruijie wireless products provide available network segments by specifying start and end addresses. The configuration is optional. If the start and end address are not specified, all IP addresses in the network segment are assignable.</p> <p>For Ruijie products, addresses are assigned based on the client's physical address and ID. Therefore, one client will not be assigned two leases from one address pool. In case of topological redundancy between a client and a server, address assignment may fail.</p> <p>To avoid such failures, a network administrator needs to prevent path redundancy in network construction, for example, by adjusting physical links or network paths.</p>

### ↘ Configuring Default Gateway of Client

<b>Command</b>	<b>default-router</b> <i>address [address2...address8]</i>
<b>Parameter Description</b>	<i>address</i> : Indicates the IP address of a default gateway. Configure at least one IP address. <i>ip-address2...ip-address8</i> : (Optional) A maximum of 8 gateways can be configured.
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	Configure a default gateway of a client, and a server will push the gateway configuration to the client. The IP addresses of the default gateway and the client should be in a same network.

### ↘ Configuring Address Lease

<b>Command</b>	<b>lease</b> { <i>days [hours] [minutes]</i>   <b>infinite</b> }
<b>Parameter Description</b>	<i>days</i> : Defines a lease in the unit of day. <i>hours</i> : (Optional) Defines a lease in the unit of hour. Please define <i>days</i> before <i>hours</i> . <i>minutes</i> : (Optional) Defines a lease in the unit of minute. Please define <i>days</i> and <i>hours</i> before <i>minutes</i> . <b>infinite</b> : Defines an unlimited lease.

<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	The default lease of an IP address assigned by a DHCP server is 1 day. When a lease is expiring soon, a client needs to request a lease renewal. Otherwise the IP address cannot be used after the lease is expired.

#### ↘ Configures Boot File on Client

<b>Command</b>	<b>bootfile</b> <i>filename</i>
<b>Parameter Description</b>	<i>file-name</i> : Defines a boot file name.
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	A boot file is a bootable image file used when a client starts up. The file is usually an OS downloaded by a DHCP client.

#### ↘ Configuring Domain Name of Client

<b>Command</b>	<b>domain-name</b> <i>domain</i>
<b>Parameter Description</b>	<i>domain-name</i> : Defines a domain name of a DHCP client.
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	You may define a domain name for a client. When the client accesses network through the host name, the domain name will be added automatically to complete the host name.

#### ↘ Configuring DNS

<b>Command</b>	<b>dns-server</b> { <i>ip-address</i> [ <i>ip-address2</i> ... <i>ip-address8</i> ]
<b>Parameter Description</b>	<i>ip-address</i> : Defines an IP address of a DNS server. Configure at least one IP address. <i>ip-address2</i> ... <i>ip-address8</i> : (Optional) A maximum of 8 DNS servers can be configured.
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	If a client accesses network resources through the domain name, you need to configure a DNS server to resolve the domain name.

#### ↘ Configuring NetBIOS WINS Server

<b>Command</b>	<b>netbios-name-server</b> <i>address</i> [ <i>address2</i> ... <i>address8</i> ]
<b>Parameter Description</b>	<i>address</i> : Defines an IP address of a WINS server. Configure at least one IP address. <i>ip-address2</i> ... <i>ip-address8</i> : (Optional) A maximum of 8 WINS servers can be configured.
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	WINS is a domain name service through which a Microsoft TCP/IP network resolves a NetBIOS name to an IP address. A WINS server is a Windows NT server. When a WINS server starts, it receives a registration

	request from a WINS client. When the client shuts down, it sends a name release message, so that the computers in the WINS database and on the network are consistent.
--	--

### ↘ Configuring NetBIOS Node Type on Client

<b>Command</b>	<b>netbios-node-type</b> <i>type</i>
<b>Parameter Description</b>	<p><i>type</i>: Defines a NetBIOS node type with one of the following approaches.</p> <ol style="list-style-type: none"> <li>1. A hexadecimal number, ranging from 0 to FF. Only followings values are available. <ul style="list-style-type: none"> <li>● b-node</li> <li>● p-node</li> <li>● m-node</li> <li>● 8 for h-node</li> </ul> </li> <li>2. A character string. <ul style="list-style-type: none"> <li>● b-node for a broadcast node;</li> <li>● p-node for a peer-to-peer node;</li> <li>● m-node for a mixed node;</li> <li>● h-node for a hybrid mode.</li> </ul> </li> </ol>
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	<p>There are four types of NetBIOS nodes of a Microsoft DHCP client. 1) A broadcast node. For such a node, NetBIOS name resolution is requested through broadcast. 2) A peer-to-peer node. The client sends a resolution request to the WINS server. 3) A mixed node. The client broadcasts a resolution request and sends the resolution request to the WINS server.. 4) A hybrid node. The client sends a resolution request to the WINS server. If no reply is received, the client will broadcast the resolution request. By default, a Microsoft operating system is a broadcast or hybrid node. If no WINS server is configured, it is a broadcast node. Otherwise, it is a hybrid node.</p>

### ↘ Configuring User-Defined Option

<b>Command</b>	<b>option</b> <i>code</i> { <b>ascii</b> <i>string</i>   <b>hex</b> <i>string</i>   <b>ip</b> <i>ip-address</i> }
<b>Parameter Description</b>	<p><i>code</i>: Defines a DHCP option code.</p> <p><b>ascii</b> <i>string</i>: Defines an ASCII character string.</p> <p><b>hex</b> <i>string</i>: Defines a hexadecimal character string.</p> <p><b>ip</b> <i>ip-address</i>: Defines an IP address.</p>
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	<p>The DHCP allows transmitting configuration information to a host via a TCP/IP network. DHCP packets contain the option field of definable content. A DHCP client should be able to receive a DHCP packet carrying at least 312 bytes option. Besides, the fixed data field in a DHCP packet is also called an option.</p> <p>In a WLAN, a DHCP client on an AP dynamically requests the IP address of an AC. You may configure on a DHCP server the <b>option</b> command specifying the AC address.</p>

### ↘ Enabling or Disabling Address Pool

<b>Command</b>	<b>pool-status {enable   disable}</b>
<b>Parameter</b>	<b>enable:</b> Enables an address pool.
<b>Description</b>	<b>disable:</b> Disable an address pool. It is enabled by default.
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	A Ruijie wireless product provides a command for you to enable/disable a DHCP address pool.

## Configuration Example

### Configuring Address Pool

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Define an address pool net172.</li> <li>The network segment is 172.16.1.0/24.</li> <li>The default gateway is 172.16.1.254.</li> <li>The address lease is 1 day.</li> <li>xcluded addresses range from 172.16.1.2 to 172.16.1.100.</li> </ul>
	<pre>Ruijie(config)# ip dhcp excluded-address 172.16.1.2 172.16.1.100 Ruijie(dhcp-config)# ip dhcp pool net172 Ruijie(dhcp-config)# network 172.16.1.0 255.255.255.0 default-router 172.16.1.254 lease 1</pre>
<b>Verification</b>	Run the <b>show run</b> command to display the configuration.
	<pre>Ruijie(config)#show run   begin ip dhcp ip dhcp excluded-address 172.16.1.2 172.16.1.100 ip dhcp pool net172 network 172.16.1.0 255.255.255.0 default-router 172.16.1.254lease 1</pre>

## 4.4.2 Configuring Static IP Address

### Configuration Effect

Assign specific IP addresses and push configuration to specific DHCP clients.

### Notes

N/A

### Configuration Steps

### ↘ Configuring Address Pool Name and Entering Address Pool Configuration Mode

- Mandatory. It is used to create an IP address pool.
- Run the **ip dhcp pool** command in global configuration mode.

### ↘ Configuring IP Address and Subnet Mask of Client

- Mandatory. It is used to configure a static IP address and a subnet mask.
- Run the **host** command in DHCP address pool configuration mode.

### ↘ Configuring Hardware Address of Client

- Optional. It is used to configure a MAC address.
- Run the **hardware** command in DHCP address pool configuration mode.

### ↘ Configures Unique Client Identifier

- Optional. It is used to configure a static user identifier (UID).
- Run the **client-identifier** command in DHCP address pool configuration mode.

### ↘ Configuring Client Name

- Optional. It is used to configure a static client name.
- Run the **host-name** command in DHCP address pool configuration mode.

## Verification

Check whether the client obtains the IP address when it is online.

## Related Commands

### ↘ Configuring Address Pool

<b>Command</b>	<b>ip dhcp pool</b> <i>dhcp-pool</i>
<b>Parameter</b>	<i>pool-name</i> : Indicates the name of an address pool.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Before assigning an IP address to a client, you need to configure an address pool name and enter address pool configuration mode.

### ↘ Manual IP Address Binding

<b>Command</b>	<b>host</b> <i>ip-address</i> [ <i>netmask</i> ] <b>client-identifier</b> <i>unique-identifier</i> <b>client-name</b> <i>name</i>
<b>Parameter</b>	<i>ip-address</i> : Defines the IP address of a DHCP client.

<b>Description</b>	<p><i>netmask</i>: Defines the subnet mask of a DHCP client.</p> <p><i>unique-identifier</i>: Defines the hardware address (for example, aabb.bbbb.bb88) and identifier (for example, 01aa.bbbb.bbbb.88) of a DHCP client.</p> <p><i>name</i>: (Optional) It defines a client name using ASCII characters. The name excludes a domain name. For example, name a host <b>mary</b> rather than <b>mary.rg.com</b>.</p>
<b>Command Mode</b>	DHCP address pool configuration mode
<b>Usage Guide</b>	<p>Address binding means mapping between an IP address and a client's MAC address. There are two kind of address binding. 1) Manual binding. Manual binding can be deemed as a special DHCP address pool with only one address. 2) Dynamic binding. A DHCP server dynamically assigns an IP address from a pool to a client when it receives a DHCP request, creating mapping between the IP address and the client's MAC address.</p> <p>To configure manual binding, you need to define a host pool and then specify a DHCP client's IP address and hardware address or identifier. A hardware address is a MAC address. A client identifier includes a network medium type and a MAC address. A Microsoft client is usually identified by a client identifier rather than a MAC address. For the codes of medium types, refer to the <i>Address Resolution Protocol Parameters</i> section in the RFC 1700. The Ethernet type is <b>01</b>.</p>

### Configuration Example

#### Dynamic IP Address Pool

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure address pool VLAN 1 with IP address 20.1.1.0 and subnet mask 255.255.255.0.</li> <li>The default gateway is 20.1.1.1.</li> <li>The lease time is 1 day.</li> </ul>
	<pre>Ruijie(config)# ip dhcp pool vlan1 Ruijie(dhcp-config)# network 20.1.1.0 255.255.255.0 Ruijie(dhcp-config)# default-router 20.1.1.1 Ruijie(dhcp-config)# lease 1 0 0</pre>
<b>Verification</b>	Run the <b>show run</b> command to display the configuration.
	<pre>Ruijie(config)#show run   begin ip dhcp ip dhcp pool vlan1 network 20.1.1.0 255.255.255.0 default-router 20.1.1.1 lease 1 0 0</pre>

#### Manual Binding

<b>Configuration</b>	<ul style="list-style-type: none"> <li>The host address is 172.16.1.101 and the subnet mask is 255.255.255.0.</li> </ul>
----------------------	--

<b>Steps</b>	<ul style="list-style-type: none"> <li>● The host name is Billy.rg.com.</li> <li>● The default gateway is 172.16.1.254.</li> <li>● The MAC address is 00d0.df34.32a3.</li> </ul>
	<pre>Ruijie(config)# ip dhcp pool Billy Ruijie(dhcp-config)# host 172.16.1.101 255.255.255.0 Ruijie(dhcp-config)# client-name Billy Ruijie(dhcp-config)# hardware-address 00d0.df34.32a3 Ethernet Ruijie(dhcp-config)# default-router 172.16.1.254</pre>
<b>Verification</b>	Run the <b>show run</b> command to display the configuration.
	<pre>Ruijie(config)#show run   begin ip dhcp ip dhcp pool Billy host 172.16.1.101 255.255.255.0 client-name Billy hardware-address 00d0.df34.32a3 Ethernet default-router 172.16.1.254</pre>

### 4.4.3 Configuring AM Rule for DHCP Server

#### Configuration Effect

Assign IP addresses according to an AM rule based on a port and a VLAN.

#### Notes

Ruijie products support AM rule configuration on Ethernet, GB, FR, PPP and HDLC interfaces.

#### Configuration Steps

##### ↘ **Configuring Address Management**

- Mandatory. Enter address management mode.
- Run the **address-manage** command in address management configuration mode.

##### ↘ **Configuring AM Rule**

- Mandatory. Configure an AM rule based on a port and a VLAN.
- Run the **match ip** command in address management configuration mode.

## Verification

Check whether clients in different VLANs and ports obtain the valid IP addresses.

## Related Commands

### ↘ Configuring Default Range

<b>Command</b>	<code>match ip default ip-address netmask</code>
<b>Parameter</b>	<i>ip-address</i> : Defines an IP address.
<b>Description</b>	<i>netmask</i> : Defines a subnet mask.
<b>Command Mode</b>	Address management mode
<b>Usage Guide</b>	After configuration, all DHCP clients are assigned IP addresses from the default range based on the VLAN and port. If this command is not configured, IP addresses will be assigned through the regular process.

### ↘ Assigning Dynamic IP Address Based on VLAN and Port

<b>Command</b>	<code>match ip ip-address netmask interface [add/remove] vlan vlan-list</code>
<b>Parameter</b>	<i>ip-address</i> : Defines an IP address.
<b>Description</b>	<i>netmask</i> : Defines a subnet mask. <i>interface</i> : Defines an interface name. <i>add/remove</i> : Adds or deletes a specific VLAN. <i>vlan-list</i> : Indicates a VLAN index.
<b>Command Mode</b>	Address management mode
<b>Usage Guide</b>	After configuration, DHCP clients are assigned IP addresses from the default address range based on the VLAN and port.

### ↘ Assigning Static IP Address Based on VLAN

<b>Command</b>	<code>match ip ip-address netmask [add/remove] vlan vlan-list</code>
<b>Parameter</b>	<i>ip-address</i> : Defines an IP address.
<b>Description</b>	<i>netmask</i> : Defines a subnet mask. <i>add/remove</i> : Adds or deletes a specific VLAN. <i>vlan-list</i> : Indicates a VLAN index.
<b>Command Mode</b>	Address management mode
<b>Usage Guide</b>	In a Super VLAN, a client may be assigned a fixed static address no matter which Super VLAN the client resides in. You do not need to configure an AM rule for this IP address based on all sub-VLANs and ports, but only configure an AM rule based on the VLAN. This rule takes effect for only static address assignment.

## Configuration Example

### ▾ Configuring AM Rule

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure a default rule.</li> <li>● Configure a rule based on a specific VLAN + port + address range.</li> <li>● Configure a rule based on a specific VLAN + address range.</li> </ul>
	<pre>Ruijie(config)# address-manage Ruijie(config-address-manage)# match ip default 172.50.128.0 255.255.128.0 Ruijie(config-address-manage)# match ip 10.1.5.0 255.255.255.0 Gi5/3 vlan 1005 Ruijie(config-address-manage)# match ip 10.1.6.0 255.255.255.0 vlan 1006</pre>
<b>Verification</b>	1: Run the <b>show run</b> command to display the configuration.
	<pre>address-manage match ip default 172.50.128.0 255.255.128.0 match ip 10.1.5.0 255.255.255.0 Gi5/3 vlan 1005 match ip 10.1.6.0 255.255.255.0 vlan 1006</pre>

## 4.4.4 Configuring Global Properties of DHCP Server

### Configuration Effect

Enable a server with specific functions, for example, ping and compulsory NAK.

### Notes

Configuring the command may cause exceptions on other servers.

### Configuration Steps

#### ▾ Configuring Excluded IP Address

- Optional. Configure some addresses or address ranges as unavailable.
- Run the **ip dhcp excluded-address** command in global configuration mode.

#### ▾ Configuring Compulsory NAK Reply

- Optional. A server replies to a wrong address request with a NAK packet.
- Run the **ip dhcp force-send-nak** command in global configuration mode.

#### ▾ Configuring VRRP Status Monitoring

- Optional. After configuration, DHCP packets are processed by the Master server.
- Run the **ip dhcp monitor-vrrp-state** command in global configuration mode.

↘ **Configuring Ping Times**

- Optional. Check the address reachability with the **ping** command. The default is 2.
- Run the **ip dhcp ping packet** command in global configuration mode.

↘ **Configuring Ping Timeout**

- Optional. Check the address reachability with the **ping** command. The default is 500 ms.
- Run the **ip dhcp ping timeout** command in global configuration mode.

↘ **Detecting User Offline Detection**

- Configure a DHCP server to detect whether the client is offline or not. If a client does not get online after being offline for a period, the address assigned to the client will be retrieved.
- Run the **ip dhcp server arp-detect** command in global configuration mode.

**Verification**

Run the **dhcp-server** command, and check the configuration during address assignment.

**Related Commands**

↘ **Configuring Excluded IP Address**

<b>Command</b>	<b>ip dhcp excluded-address</b> <i>low-ip-address</i> [ <i>high-ip-address</i> ]
<b>Parameter</b>	<i>low-ip-address</i> : Indicates a start IP address.
<b>Description</b>	<i>high-ip-address</i> : Indicates an end IP address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Unless otherwise specified, a DHCP server assigns all the addresses from an IP address pool to DHCP clients. To reserve some addresses(e.g., addresses already assigned to the server or devices), you need to configure these addresses as excluded addresses. To configure a DHCP server, it is recommended to configure excluded addresses to avoid address conflict and shorten detection time during address assignment.

↘ **Configuring Compulsory NAK Reply**

<b>Command</b>	<b>ip dhcp force-send-nak</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In a WLAN, a DHCP client often moves from one network to another. When a DHCP server receives a lease renewal request from a client but finds that the client crosses the network segment or that the lease is expired, it replies with a NAK packet to require the client to obtain an IP address again. This prevents the client from sending request packets continually before obtaining an IP address again after timeout.

The server sends a NAK packet only when it finds the client's lease record. When a DHCP client crosses the network, a DHCP server cannot find lease record of the client and will not reply with a NAK packet. The client sends request packets continually before obtaining an IP address again after timeout. Consequently, it takes a long to obtain an IP address. This also occurs when a DHCP server loses a lease after restart and a client requests lease renewal. In this case, you may configure a command to force the DHCP server to reply with a NAK packet even though it cannot find the lease record so that the client may obtain an IP address rapidly. Please note that the command is disabled by default. To enable it, only one DHCP server can be configured in a broadcast domain.

↘ **Configuring Ping Times**

<b>Command</b>	<b>ip dhcp ping packets</b> [ <i>number</i> ]
<b>Parameter Description</b>	<i>number</i> : (Optional) Ranges from 0 to 10. 0 indicates the ping function is disabled. The default is two pings.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, when a DHCP server assigns an IP address from a pool, it runs the <b>Ping</b> command twice (one packet per time). If there is no reply, the server takes the address as idle and assigns it to a client. If there is a reply, the server takes the address as occupied and assigns another address.

↘ **Configuring Ping Timeout**

<b>Command</b>	<b>ip dhcp ping timeout</b> <i>milliseconds</i>
<b>Parameter Description</b>	<i>milli-seconds</i> : Indicates the time that it takes for a DHCP server to wait for a ping reply. The value ranges from 100 ms to 10,000 ms.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, if a DHCP server receives no Ping reply within 500 ms, the IP address is available. You may adjust the ping timeout to change the time for a server to wait for a reply.

**Configuration Example**

↘ **Configuring Ping**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Set ping times to 5.</li> <li>● Set ping timeout to 800 ms.</li> </ul>
	<pre>Ruijie(config)# ip dhcp ping packet 5 Ruijie(config)# ip dhcp ping timeout 800</pre>
<b>Verification</b>	Run the <b>show run</b> command to display the configuration.
	<pre>Ruijie(config)#show run   begin ip dhcp ip dhcp ping packet 5</pre>

```
ip dhcp ping timeout 800
```

↘ **Configuring Excluded IP Address**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the excluded IP address from 192.168.0.0 to 192.168.255.255.</li> </ul>
	<pre>Ruijie(config)# ip dhcp excluded-address 192.168.0.0 192.168.255.255</pre>
<b>Verification</b>	Run the <b>show run</b> command to display the configuration.
	<pre>Ruijie(config)#show run   begin ip dhcp ip dhcp excluded-address 192.168.0.0 192.168.255.255</pre>

### 4.4.5 Configuring Basic DHCP Relay Functions

#### Configuration Effect

- Deploy dynamic IP management in Client-Relay-Server mode to achieve communication between a DHCP client and a DHCP server, which are in different network segments.

#### Notes

- To enable DHCP Relay, you need to configure IPv4 unicast routing in a network.

#### Configuration Steps

↘ **Enabling DHCP Relay**

- Mandatory.
- Unless otherwise specified, you need to enable DHCP Relay on a device.

↘ **Configuring IP Address for DHCP Server**

- Mandatory.
- You need to configure an IP address for a DHCP server.

#### Verification

- Check whether a client obtains an IP address through DHCP Relay.

#### Related Commands

↘ **Enabling DHCP Relay**

<b>Command</b>	<b>service dhcp</b>
<b>Parameter</b>	N/A
<b>Description</b>	

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

↘ **Configuring IP Address for DHCP Server**

<b>Command</b>	<b>ip helper-address { cycle-mode   [ vrf { vrf-name } ] A.B.C.D }</b>
<b>Parameter Description</b>	<i>cycle-mode</i> : Indicates that DHCP request packets are forwarded to all DHCP servers. <i>vrf-name</i> : Indicates a VPN Routing & Forwarding (VRF) name. <i>A.B.C.D</i> : Indicates the IP address of a server.
<b>Command Mode</b>	Global configuration mode/interface configuration mode
<b>Usage Guide</b>	You may configure the function on a layer-3 interface, such as a routed port, a L3 AP port, SVI and loopback interface. The configured interface must be accessible via IPv4 unicast routing.

Configuration Example

↘ **Configuring DHCP Relay in Wired Connection**

<b>Scenario</b> Figure 4-15	<p>DHCP Client                      DHCP Relay Agent                      DHCP Server</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable a client with DHCP to obtain an IP address.</li> <li>● Enable the DHCP Relay function on a DHCP relay agent.</li> <li>● Configure DHCP Server.</li> </ul>
<b>A</b>	Enable a client with DHCP to obtain an IP address.
<b>B</b>	Enable DHCP Relay. <pre>Ruijie(config)# service dhcp</pre> Configure a global IP address of a DHCP server. <pre>Ruijie(config)# ip helper-address 172.2.2.1</pre> Configure an IP address for the port connected to the client. <pre>Ruijie(config)# interface gigabitEthernet 0/1</pre> <pre>Ruijie(config-if)# ip address 192.1.1.1 255.255.255.0</pre> Configure an IP address for the port connected to the server. <pre>Ruijie(config)# interface gigabitEthernet 0/2</pre> <pre>Ruijie(config-if-gigabitEthernet 0/2)# ip address 172.2.2.2 255.255.255.0</pre>
<b>C</b>	Enable DHCP Server.

	<pre>Ruijie(config)# service dhcp</pre> <p>Configure an address pool.</p> <pre>Ruijie(config)# ip dhcp pool relay</pre> <pre>Ruijie (dhcp-config)#network 192.1.1.0 255.255.255.0</pre> <pre>Ruijie (dhcp-config)#default-router 192.1.1.1</pre> <p>Configure an IP address for the port connected to the relay agent.</p> <pre>Ruijie(config)# interface gigabitEthernet 0/1</pre> <pre>Ruijie(config-if-gigabitEthernet 0/2)# ip address 172.2.2.1 255.255.255.0</pre>
<b>Verification</b>	<p>Check whether the client obtains an IP address.</p> <ul style="list-style-type: none"> <li>● Check whether the client obtains an IP address.</li> <li>● Check the DHCP Relay configuration.</li> </ul>
<b>A</b>	The user device obtains an IP address.
<b>B</b>	<p>After login to the DHCP relay agent, run the <b>show running-config</b> command in privileged EXEC mode to display DHCP Relay configuration.</p> <pre>Ruijie# show running-config</pre> <pre>service dhcp</pre> <pre>ip helper-address 172.2.2.1</pre> <pre>!</pre> <pre>interface GigabitEthernet 0/1</pre> <pre>ip address 192.1.1.1 255.255.255.0</pre> <pre>!</pre> <pre>interface GigabitEthernet 0/2</pre> <pre>ip address 172.2.2.2 255.255.255.0</pre> <pre>!</pre>

### Common Errors

- IPv4 unicast routing configuration is incorrect.
- DHCP Relay is disabled.
- No routing between DHCP relay agent and DHCP server is configured.
- No IP address is configured for the DHCP server.

## 4.4.6 Configuring DHCP Relay Option 82

### Configuration Effect

- Through a DHCP relay agent, a server may assign IP addresses of different privileges to the clients more accurately based on the option information.

## Notes

- You need to enable the DHCP Relay function.

## Configuration Steps

### ↳ Enabling Basic DHCP Relay Functions

- Mandatory.
- Unless otherwise specified, you need to enable DHCP Relay on a device.

### ↳ Enables DHCP Option82

- By default, DHCP Option 82 is disabled.
- You may run the **ip dhcp relay information option82** command to enable or disable DHCP Option 82.

## Verification

- Check whether the client obtains an IP address based on Option 82.

## Related Commands

### ↳ Enabling DHCP Option 82

<b>Command</b>	<b>ip dhcp relay information option82</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ↳ Enabling DHCP Option 82

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable DHCP Option 82.</li> </ul>
	<pre>Ruijie(config)# ip dhcp relay information option82</pre>
<b>Verification</b>	After login to the DHCP relay agent, run the <b>show running-config</b> command in privileged EXEC mode to display DHCP Relay configuration.
	<pre>Ruijie#show ru   incl ip dhcp relay</pre>

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Enable DHCP Option 82.</li> </ul>
	<pre>Ruijie(config)# ip dhcp relay information option82</pre>
<b>Verification</b>	After login to the DHCP relay agent, run the <b>show running-config</b> command in privileged EXEC mode to display DHCP Relay configuration.
	<pre>ip dhcp relay information option82</pre>

### Common Errors

- Basic DHCP Relay functions are not configured.

## 4.4.7 Configuring DHCP Relay Check Server-ID

### Configuration Effect

- After you configure the **ip dhcp relay check server-id**, a DHCP Relay agent will forward DHCP request packets only to the server specified by the **option server-id** command. Otherwise, they are forwarded to all DHCP servers.

### Notes

- You need to enable basic DHCP Relay functions.

### Configuration Steps

#### ▾ Enabling DHCP Relay Check Server-ID

- By default, DHCP Relay check server-id is disabled.
- You may run the **ip dhcp relay check server-id** command to enable DHCP Relay check server-id.

### Verification

Check whether a DHCP Relay agent sends DHCP request packets only to the server specified by the **option server-id** command.

### Related Commands

#### ▾ Configuring DHCP Relay Check Server-ID

<b>Command</b>	<b>ip dhcp relay check server-id</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

➤ **Configuring DHCP Relay Check Server-ID**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable DHCP Relay.Omitted.</li> <li>● Enable <b>DHCP Relay check server-id</b> on an interface.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# ip dhcp relay check server-id</pre>
<b>Verification</b>	After login to the DHCP relay agent, run the <b>show running-config</b> command in privileged EXEC mode to display DHCP Relay configuration.
	<pre>Ruijie# show running-config   include check server-id ip dhcp relay check server-id Ruijie#</pre>

**Common Errors**

- Basic DHCP Relay functions are not configured.

**4.4.8 Configuring DHCP Relay Suppression**

**Configuration Effect**

- After you configure the **ip DHCP Relay suppression** command on an interface, DHCP request packets received on the interface will be filtered, and the other DHCP requests will be forwarded.

**Notes**

- You need to enable basic DHCP Relay functions.

**Configuration Steps**

➤ **Enabling DHCP Relay Suppression**

By default, DHCP Relay suppression is disabled on all interfaces.

You may run the **ip dhcp relay suppression** command to enable DHCP Relay suppression.

**Verification**

- Check whether the DHCP request packets received on the interface are filtered.

**Related Commands**

➤ **Configuring DHCP Relay Suppression**

<b>Command</b>	<b>ip dhcp relay suppression</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure basic DHCP Relay functions.</li> <li>Configure DHCP Relay suppression on an interface.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# interface gigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# ip dhcp relay suppression Ruijie(config-if-GigabitEthernet 0/1)#end Ruijie#</pre>
<b>Verification</b>	After login to the DHCP relay agent, run the <b>show running-config</b> command in privileged EXEC mode to display DHCP Relay configuration.
	<pre>Ruijie# show running-config   include relay suppression ip dhcp relay suppression Ruijie#</pre>

## Common Errors

Basic DHCP Relay functions are not configured.

## 4.4.9 Configuring Multiple Gateway IP Addresses on DHCP Relay

### Configuration Effect

Enable the function of multiple gateway IP addresses by running the `ip dhcp relay multiple-giaddr` command.

### Notes

Basic DHCP Relay functions should be configured.

### Configuration Steps

By default, this function is disabled.

Run the `ip dhcp relay multiple-giaddr` command to enable this function.

### Verification

When more than one IP address is configured on a specified interface, check whether the DHCP request packet forwarded to the DHCP server contains different IP addresses.

	<pre>Ruijie# show running-config ip dhcp relay multiple-giaddr</pre>

## Common Errors

Basic DHCP Relay functions are not configured.

## 4.4.10 Configuring DHCP Client

### Configuration Effect

Enable DHCP Client on a device so that it obtains IP addresses and configurations dynamically.

### Notes

Ruijie products support DHCP Client configuration on Ethernet, FR, PPP and HDLC interfaces.

### Configuration Steps

Run the **ip address dhcp** command on an interface.

## Verification

Check whether the interface obtains an IP address.

## Related Commands

### Configuring DHCP Client

<b>Command</b>	<code>ip address dhcp</code>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<ul style="list-style-type: none"> <li>● Ruijie products support dynamic IP address obtainment by an Ethernet interface.</li> <li>● Ruijie products support dynamic IP address obtainment by a PPP-encapsulated interface.</li> <li>● Ruijie products support dynamic IP address obtainment by an FR-encapsulated interface.</li> <li>● Ruijie products support dynamic IP address obtainment by an HDLC-encapsulated interface.</li> </ul>

## Configuration Example

### Configuring DHCP Client

<b>Configuration Steps</b>	1: Enable port FastEthernet 0/0 with DHCP to obtain an IP address.
	<pre>Ruijie(config)# interface FastEthernet0/0 Ruijie(config-if-FastEthernet 0/0)#ip address dhcp</pre>
<b>Verification</b>	1: Run the <b>show run</b> command to display the configuration.
	<pre>Ruijie(config)#show run   begin ip address dhcp ip address dhcp</pre>

## 4.4.11 Configuring the Source IP Address of DHCP Relay Packets

### Configuration Effect

Run the **ip dhcp relay source** command on an interface to configure the source IP address of DHCP Relay packets.

### Notes

- Basic DHCP Relay functions should be enabled.
- Only one source IP address of DHCP Relay packets can be configured on one interface.
- To assign correct subnet addresses to users, this function should be used with Option 82.

### Configuration Steps

### ↘ Configuring the Source IP Address of DHCP Relay Packets

- By default, no source IP address of DHCP Relay packets is configured.
- Run the **ip dhcp relay source** *ip-address* command on an interface to configure the source IP address of DHCP Relay packets.

### Verification

After this function is enabled, the source IP address of Relay packets sent to the DHCP server is the configured address.

### Related Commands

#### ↘ Configuring the Source IP Address of DHCP Relay Packets

<b>Command</b>	<b>ip dhcp relay source</b> <i>ip-address</i>
<b>Parameter Description</b>	<i>ip-address</i> : Specifies the source IP address of DHCP Relay packets.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### ↘ Configuring the Source IP Address of DHCP Relay Packets

<b>Configuration Steps</b>	1: Enable basic DHCP Relay functions. 2: Configure the source IP address of DHCP Relay packets.
	<pre>Ruijie(config-if)# ip dhcp relay source 1.1.1.1</pre>
<b>Verification</b>	1: Login the DHCP Relay Agent. 2: Enter the Privileged EXEC mode. 3: Run the <b>show running-config</b> command to display DHCP Relay configurations.

### Common Errors

Basic DHCP Relay functions are not configured.

## 4.4.12 Enabling DHCP Relay to Discard DHCP Request Packets from VxLAN Tunnels

### Configuration Effect

Run the **ip dhcp relay discard overlay-tunnel** command in global configuration mode to enable DHCP relay to discard DHCP request packets from VxLAN tunnels.

### Notes

- Basic DHCP Relay functions should be enabled.

## Configuration Steps

### ↘ Enabling DHCP Relay to Discard DHCP Request Packets from VxLAN Tunnels

- By default, DHCP Relay is allowed to receive DHCP request packets from VxLAN tunnels.
- Run the command to stop DHCP Relay from receiving DHCP request packets from VxLAN tunnels.

## Verification

After the command in run, DHCP request packets from VxLAN tunnels are not further forwarded to DHCP servers.

## Related Commands

### ↘ Enabling DHCP Relay to Discard DHCP Request Packets from VxLAN Tunnels

<b>Command</b>	<b>ip dhcp relay discard overlay-tunnel</b>
<b>Parameter Description</b>	N/A

<b>Verification</b>	1: Run the <b>show run</b> command to display the configuration.
	<pre>Ruijie(config)#show run   begin ip address dhcp ip address dhcp</pre>

## 4.5 Monitoring

### Clearing

 Running the clear commands may lose vital information and interrupt services.

Description	Command
-------------	---------

Clears DHCP address binding.	<b>clear ip dhcp binding</b> { <i>address</i>   * }
Clears DHCP address conflict.	<b>clear ip dhcp conflict</b> { <i>address</i>   * }
Clears statistics of a DHCP server.	<b>clear ip dhcp server statistics</b>
Clears statistics of a DHCP relay.	<b>clear ip dhcp relay statistics</b>
Clears statistics of DHCP server performance.	<b>clear ip dhcp server rate</b>

## Displaying

Description	Command
Displays DHCP lease.	<b>show dhcp lease</b>
Displays DHCP sockets.	<b>show ip dhcp socket</b>
Displays assigned IP addresses.	<b>show ip dhcp binding</b>
Displays created address pools.	<b>show ip dhcp pool</b>
Displays statistics of DHCP Server.	<b>show ip dhcp server statistic</b>
Displays statistics of DHCP Relay.	<b>show ip dhcp relay statistic</b>
Displays conflicted addresses.	<b>show ip dhcp conflict</b>
Displays DHCP lease history.	<b>show ip dhcp history</b>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs DHCP agent.	<b>debug ip dhcp server agent</b>
Debugs DHCP hot backup.	<b>debug ip dhcp server ha</b>
Debugs DHCP address pools.	<b>debug ip dhcp server pool</b>
Debugs DHCP VRRP.	<b>debug ip dhcp server vrrp</b>
Debugs all DHCP servers.	<b>debug ip dhcp server all</b>
Debugs DHCP packets.	<b>debug ip dhcp client</b>
Debugs DHCP Relay events.	<b>debug ip dhcp relay</b>

## 5 Configuring DHCPv6

### 5.1 Overview

The Dynamic Host Configuration Protocol for IPv6 (DHCPv6) is a protocol that allows a DHCP server to transfer configurations (such as IPv6 addresses) to IPv6 nodes.

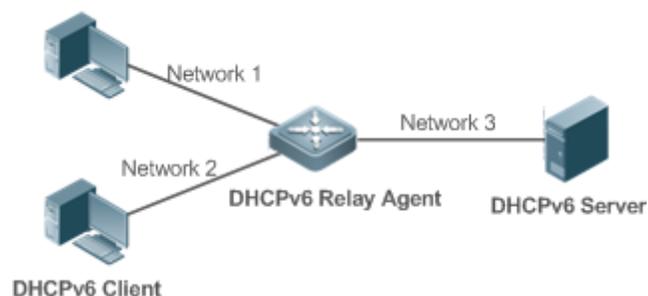

As compared with other IPv6 address allocation methods, such as manual configuration and stateless automatic address configuration, DHCPv6 provides the address allocation, prefix delegation, and configuration parameter allocation.

- DHCPv6 is a stateful protocol for automatically configuring addresses and flexibly adding and reusing network addresses, which can record allocated addresses and enhance network manageability.
- By using the prefix delegation of DHCPv6, uplink network devices can allocate address prefixes to downlink network devices, which implements flexible station-level automatic configuration and flexible control of station address space.
- The DHCPv6 configuration parameter allocation solves the problem that parameters cannot be obtained through a stateless automatic address configuration protocol and allocates DNS server addresses and domain names to hosts.

DHCPv6 is a protocol based on the client/server model. A DHCPv6 client is used to obtain various configurations whereas a DHCPv6 server is used to provide various configurations. If the DHCPv6 client and DHCPv6 server are not on the same network link, they can interact with each other by using a DHCPv6 relay agent.

The DHCPv6 client usually discovers the DHCPv6 server by reserving multicast addresses within a link; therefore, the DHCPv6 client and DHCPv6 server must be able to directly communicate with each other, that is, they must be deployed within the same link. This may cause management inconvenience, economic waste (a DHCPv6 server is deployed for each subnet) and upgrade inconvenience. The DHCPv6 relay agent function can solve these problems by enabling a DHCPv6 client to send packets to a DHCPv6 server on a different link. The DHCP relay agent is often deployed within the link where a DHCPv6 client resides and is used to relay interaction packets between the DHCPv6 client and DHCPv6 server. The DHCP relay agent is transparent to the DHCPv6 client.

Figure 5-1

#### Protocols and Standards

- RFC3315: Dynamic Host Configuration Protocol for IPv6

- RFC3633: IPv6 Prefix Options for Dynamic Host Configuration Protocol (DHCP) Version 6
- RFC3646: DNS Configuration Options for Dynamic Host Configuration Protocol for IPv6 (DHCPv6)
- RFC3736: Stateless DHCP Service for IPv6
- RFC5417: Control And Provisioning of Wireless Access Points (CAPWAP) Access Controller DHCP Option

## 5.2 Applications

Application	Description
<a href="#">Requesting/Allocating Addresses and Configuration Parameters</a>	A DHCPv6 client requests addresses from a DHCPv6 server. The DHCPv6 server allocates addresses and configuration parameters to the DHCPv6 client.
<a href="#">Requesting/Allocating Prefixes</a>	The DHCPv6 client requests a prefix from the DHCPv6 server. The DHCPv6 server allocates a prefix to the DHCPv6 client and then the DHCPv6 client configures IPv6 addresses by using this prefix.
<a href="#">Relay Service</a>	The DHCPv6 relay is used to enable communication between the DHCPv6 client and DHCPv6 server on different links.

### 5.2.1 Requesting/Allocating Addresses and Configuration Parameters

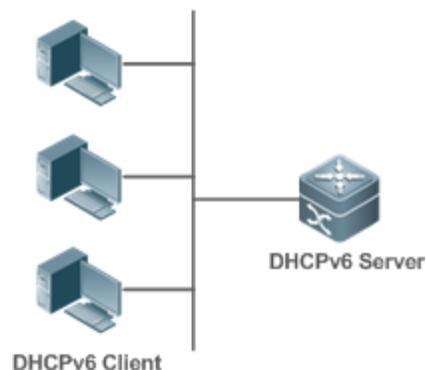

#### Scenario

In a subnet, a DHCPv6 client requests addresses from a DHCPv6 server. The DHCPv6 server allocates addresses and configuration parameters to the DHCPv6 client.

As shown in Figure 5-2:

- The DHCPv6 server is configured with IPv6 addresses, DNS servers, domain names and other configuration parameters to be allocated.
- A host works as a DHCPv6 client to request an IPv6 address from the DHCPv6 server. After receiving the request, the DHCPv6 server selects an available address and allocates the address to the host.
- The host can also request a DNS server, domain name and other configuration parameters from the DHCPv6 server.

Figure 5-2

## Deployment

- Run the DHCPv6 client on a host in the subnet to obtain an IPv6 address and other parameters.
- Run the DHCPv6 server on a device and configure the IPv6 address and other parameters to allocate the IPv6 address and parameters.

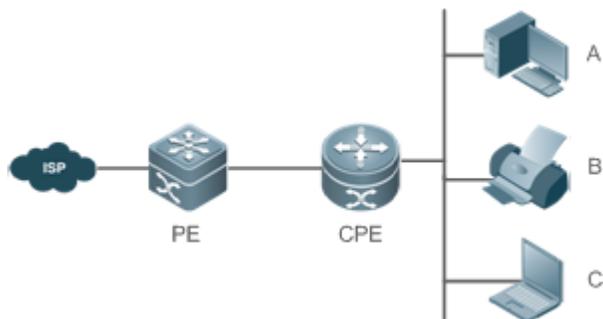

### 5.2.2 Requesting/Allocating Prefixes

#### Scenario

As shown in Figure 5-3, an uplink device (PE) allocates an IPv6 address prefix for a downlink device (CPE). The CPE generates a new address prefix for the internal subnet based on the obtained prefix. Hosts in the internal subnet of the CPE are configured with addresses through Router Advertisement (RA) by using the new address prefix.

- The PE provides the prefix delegation service as a DHCPv6 server.
- The CPE requests an address prefix from the PE as a DHCPv6 client. After obtaining the address prefix, the CPE generates a new address prefix for the internal subnet and sends an RA message to hosts in the internal subnet.
- The hosts in the internal subnet where CPE resides configure their addresses based on the RA message sent by the CPE.

Figure 5-3

<b>Remarks</b>	<p>The Provider Edge (PE) works as a DHCPv6 server for providing prefixes and is also called a delegating router.</p> <p>The Customer Premises Equipment (CPE) works as a DHCPv6 client for requesting prefixes and is also called a requesting router.</p> <p>A, B and C are various hosts.</p>
----------------	--

## Deployment

- Run the DHCPv6 server on the PE to implement the prefix delegation service.
- Run the DHCPv6 client on the CPE to obtain address prefixes.
- Deploy IPv6 ND between the CPE and the hosts to configure the host addresses in the subnet through RA.

### 5.2.3 Relay Service

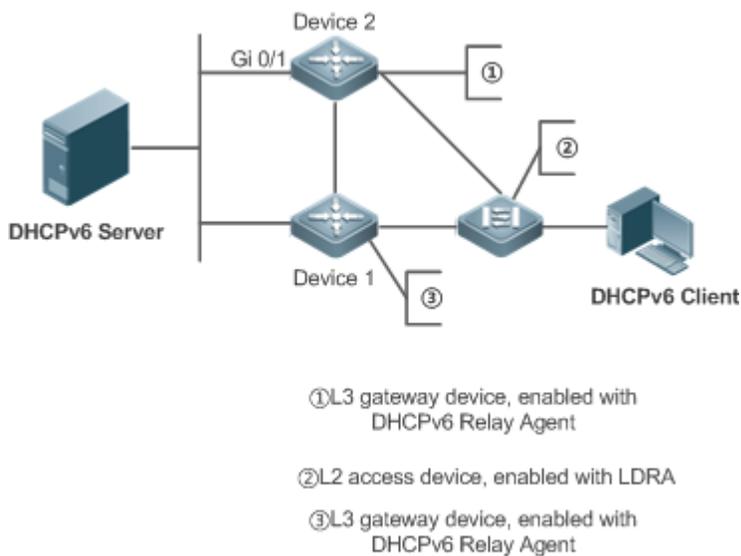

#### Scenario

The DHCPv6 relay agent provides the relay service for the DHCPv6 client and DHCPv6 server on different links to enable communication between them.

As shown in Figure 5-4:

- Device 1 is enabled with the DHCPv6 relay agent and destined to 3001::2.
- Device 2 wants to forward packets to other servers through a next-level relay service. Enable the DHCPv6 relay agent on Device 2, set the destination address to FF02::1:2 (all servers and Relay multicast addresses) and specify the egress interface as the layer-3 interface gi 0/1.

Figure 5-4

## Deployment

- Enable the DHCPv6 relay agent on device 1 and specify the address as 3000::1.
- Enable the DHCPv6 relay agent on device 2 and specify the address as FF02::1:2.

## 5.3 Features

### Basic Concept

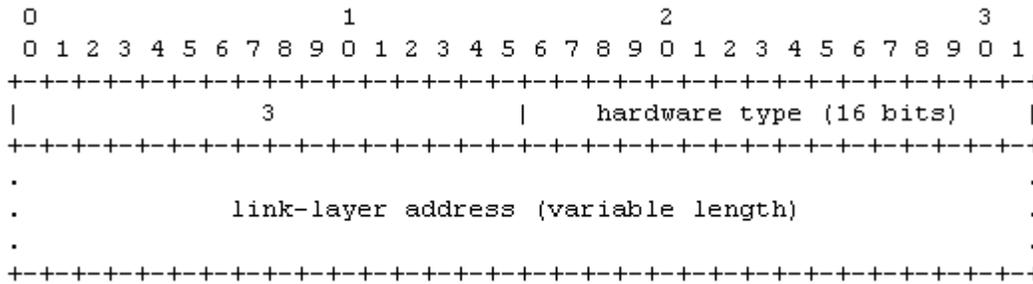

#### ↘ DUID

The DHCP Unique Identifier (DUID) identifies a DHCPv6 device. As defined in RFC3315, each DHCPv6 device (DHCPv6 client, relay or server) must have a DUID, which is used for mutual authentication during DHCPv6 message exchange.

RFC3315 defines three types of DUIDs:

- DUID Based on Link-Layer address plus Time (DUID-LLT).
- DUID Assigned by Vendor Based on Enterprise Number (DUID-EN).
- Link-Layer address (DUID-LL).

Ruijie DHCPv6 devices use DUID-LLs. The structure of a DUID-LL is as follows:

The values of *DUID-LL*, *Hardware type*, and *Link-layer address* are 0x0003, 0x0001 (indicating the Ethernet), and MAC address of a device respectively.

### Identity Association (IA)

A DHCPv6 server allocates IAs to DHCPv6 clients. Each IA is uniquely identified by an identity association identifier (IAID). IAIDs are generated by DHCPv6 clients. A one-to-one mapping is established between IAs and clients. An IA may contain several addresses, which can be allocated by the client to other interfaces. An IA may contain one of the following types of addresses:

- Non-temporary Addresses (NAs), namely, globally unique addresses.
- Temporary Addresses (TAs), which are hardly used.
- Prefix Delegation (PD).

Based on the address type, IAs are classified into IA\_NA, IA\_TA, and IA\_PD (three IA-Types). Ruijie DHCPv6 servers support only IA\_NA and IA\_PD.

### Binding

A DHCPv6 binding is a manageable address information structure. The address binding data on a DHCPv6 server records the IA and other configurations of every client. A client can request multiple bindings. The address binding data on a server is present in the form of an address binding table with DUID, IA-Type and IAID as the indexes. A binding containing configurations uses DUID as the index.

### DHCPv6 Conflict

When an address allocated by a DHCPv6 client is in conflict, the client sends a Decline packet to notify the DHCPv6 server that the address is rebound. Then, the server adds the address to the address conflict queue. The server will not allocate the addresses in the address conflict queue. The server supports viewing and clearing of address information in the address conflict queue.

### Packet Type

RFC3315 stipulates that DHCPv6 uses UDP ports 546 and 547 for packet exchange. Specifically, a DHCPv6 client uses port 546 for receiving packets, while a DHCPv6 server and DHCPv6 relay agent use port 547 for receiving packets. RFC3315 defines the following types of packets that can be exchanged among the DHCPv6 server, client, and relay agent:

- Packets that may be sent by a DHCPv6 client to a DHCPv6 server include Solicit, Request, Confirm, Renew, Rebind, Release, Decline, and Information-request.
  - Packets that may be sent by a DHCPv6 server to a DHCPv6 client include Advertise, Reply, and Reconfigure.
  - Packets that may be sent by a DHCPv6 relay agent to another DHCPv6 relay agent or a DHCPv6 server include Relay-forward.
  - Packets that may be sent by a DHCPv6 relay agent to another DHCPv6 relay agent or a DHCPv6 server include Relay-reply.
- 
- ✔ Ruijie DHCPv6 servers do not support the Reconfigure packet.
  - ✔ Ruijie DHCPv6 clients do not support the Confirm and Reconfigure packets.
- 

## Overview

Feature	Description
<a href="#">Requesting/Allocating Addresses</a>	Dynamically obtains/allocates IPv6 addresses in a network in the client/server mode.
<a href="#">Requesting/Allocating Prefixes</a>	Dynamically obtains/allocates IPv6 prefixes in a network in the client/server mode.
<a href="#">Stateless Service</a>	Provides stateless configuration service for hosts in a network.
<a href="#">Relay Service</a>	Provides the DHCPv6 server service for hosts in different networks by using the relay service.

### 5.3.1 Requesting/Allocating Addresses

A DHCPv6 client can request IPv6 addresses from a DHCPv6 server.

After being configured with available addresses, a DHCPv6 server can provide IPv6 addresses to hosts in the network, record the allocated addresses and improve the network manageability.

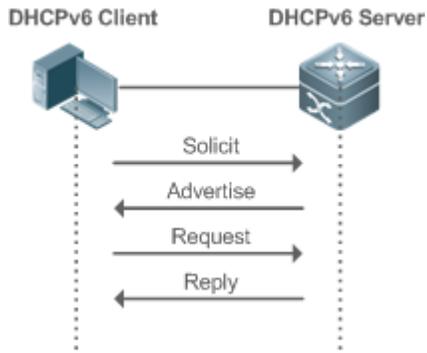

#### Working Principle

Network hosts serve as DHCPv6 clients and DHCPv6 servers to implement address allocation, update, confirmation, release and other operations through message exchange.

#### ↘ Four-Message Exchange

Figure 1-3 shows the four-message exchange process.

Figure 5-5

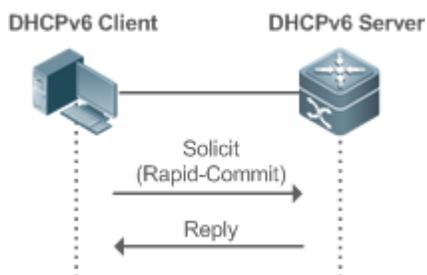

- A DHCPv6 client sends a Solicit message whose destination address is FF02::1:2 and destination port number is 547 within the local link to request address, prefix and configuration parameter allocation. All DHCPv6 servers or DHCPv6 relay agents within the link will receive the Solicit message.
- After receiving the Solicit message, a DHCPv6 server will send an Advertise message in the unicast mode if it can provide the information requested in the Solicit message. The Advertise message includes the address, prefix and configuration parameters.
- The DHCPv6 client may receive the Advertise message from multiple DHCPv6 servers. After selecting the most suitable DHCPv6 server, the DHCPv6 client sends a Request message whose destination address is FF02::1:2 and destination port number is 547 to request address, prefix and configuration parameter allocation.
- After receiving the Request message, the DHCPv6 server creates a binding locally and sends a Reply message in the unicast mode. The Reply message includes the address, prefix and configuration parameters that the DHCPv6 server will allocate to the DHCPv6 client. The DHCPv6 client obtains address, prefix or configuration parameters based on the information in the Reply message.

↘ **Two-Message Exchange**

Two-message exchange can be used to complete address, prefix and parameter configuration for DHCPv6 clients more quickly.

Figure 5-6

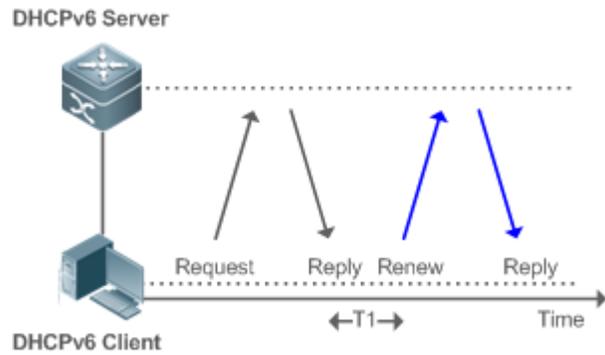

- A DHCPv6 client sends a Solicit message whose destination address is FF02::1:2 and destination port number is 547 within the local link to request address, prefix and configuration parameter allocation. The Solicit message contains Rapid Commit.
- If a DHCPv6 server supports the Rapid Commit option, the DHCPv6 server creates a binding locally and sends a Reply message in the unicast mode. The Reply message includes the address, prefix and configuration parameters to be

allocated to the DHCPv6 client. The DHCPv6 client completes configuration based on the information in the Reply message.

↘ **Update and Rebinding**

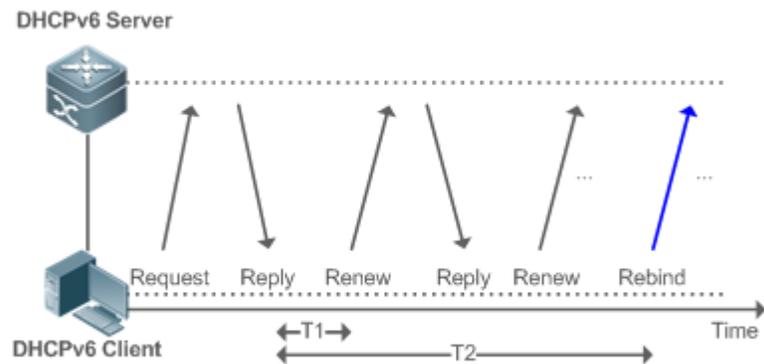

The DHCPv6 server provides the control address and the updated T1 and T2 in the IA of the message sent to the DHCPv6 client.

Figure 5-7

- The DHCPv6 client will send a Renew multicast message to the DHCPv6 server for updating the address and prefix after T1 seconds. The Renew message contains the DUID of the DHCPv6 server and the IA information to be updated.
- After receiving the Renew message, the DHCPv6 server checks whether the DUID value in the Renew message is equal to the DUID value of the local device. If yes, the DHCPv6 server updates the local binding and sends a Reply message in the unicast mode. The Reply message contains the new T1 and other parameter s.

Figure 5-8

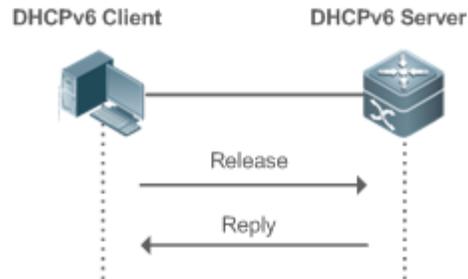

- If no response is received after the DHCPv6 client sends a Renew message to the DHCPv6 server, the DHCPv6 client will send a Rebind multicast message to the DHCPv6 server for rebinding the address and prefix after T2 expires.
- After receiving the Rebind message, the DHCPv6 server (perhaps a new DHCPv6 server) sends a Reply message according to the content of the Rebind message.

↘ **Release**

If a DHCPv6 client needs to release an address or a prefix, the DHCPv6 client needs to send a Release message to a DHCPv6 server to notify the DHCPv6 server of the released addresses or prefixes. In this way, the DHCPv6 server can allocate these addresses and prefixes to other DHCPv6 clients.

Figure 5-9

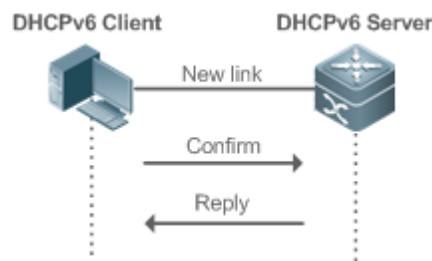

- After receiving the Release message, the DHCPv6 server removes the corresponding bindings based on the addresses or prefixes in the Release message, and sends a Reply message carrying the state option to the DHCPv6 client.

### Confirmation

After moving to a new link (for example, after restart), a DHCPv6 client will send a Confirm message to the DHCPv6 server on the new link to check whether the original addresses are still available.

Figure 5-10

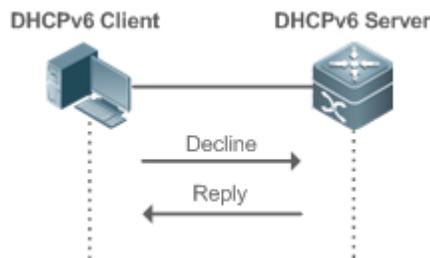

- After receiving the Confirm message, the DHCPv6 server performs confirmation based on the address information in the Confirm message, and sends a Reply message carrying the state option to the DHCPv6 client. If the confirmation fails, the DHCPv6 client may initiate a new address allocation request.

### DHCPv6 Conflict

If the DHCPv6 client finds that the allocated addresses have been used on the link after address allocation is completed, the DHCPv6 client sends a Decline message to notify the DHCPv6 server of the address conflict.

Figure 5-11

- The DHCPv6 client includes the IA information of the conflicted addresses in the Decline message.
- After receiving the Decline message, the DHCPv6 server marks the addresses in the Decline message as "declined" and will not allocate these addresses. Then, the DHCPv6 server sends a Reply message carrying the state option to the DHCPv6 client. You can manually clear addresses marked as "declined" to facilitate re-allocation.

## Related Configuration

### ▾ Enabling the DHCPv6 Server Function on an Interface

- By default, an interface is not enabled with the DHCPv6 server function.
- You can run the **ipv6 dhcp server** command to enable the DHCPv6 server function for the interface.

**!** The DHCPv6 server function must be enabled on a layer-3 interface.

### ▾ Allocating Addresses Through the DHCPv6 Server

- By default, the DHCPv6 server has no configuration pool and is not configured with addresses to be allocated.
- You can run the **ipv6 dhcp pool** command to create a configuration pool.
- You can run the **iana-address** command to configure addresses to be allocated and the **preferred lifetime** and **valid lifetime** values.

### ▾ Clearing Conflicted Addresses Through the DHCPv6 Server

- By default, the DHCPv6 server does not clear conflicted addresses that are detected.
- You can run the **clear ipv6 dhcp conflict** command to clear conflicted addresses so that these addresses can be reused.

## 5.3.2 Requesting/Allocating Prefixes

Configure available prefixes on the DHCPv6 server. By using the prefix delegation of DHCPv6, uplink network devices can allocate address prefixes to downlink network devices, which implements flexible station-level automatic configuration and flexible control of station address space.

### Working Principle

Downlink network devices serve as DHCPv6 clients to exchange messages with the DHCPv6 server to implement address allocation, update, release and other operations. Downlink network devices obtain, update, rebind and release prefixes by

using the four-/two-message exchange mechanism similar to that for allocating addresses. However, prefix allocation is different from address allocation in the following aspects:

- In message exchange using the prefix delegation, the Confirm and Decline messages are not used.
- If a DHCPv6 client moves to a new link and needs to check whether the prefix information is available, it performs confirmation through Rebind and Reply message exchange.
- The IA type in various messages is IA\_PD.

---

 For the message exchange using the prefix delegation, refer to the section "Requesting/Allocating Addresses".

---

## Related Configuration

### ↳ Enabling the DHCPv6 Server Function on an Interface

- By default, an interface is not enabled with the DHCPv6 server function.
- You can run the **ipv6 dhcp server** command to enable the DHCPv6 server function for the interface.

---

 The DHCPv6 server function is effective only on a layer-3 interface.

---

### ↳ Prefix Delegation of the DHCPv6 Server

- By default, the DHCPv6 server has no configuration pool and is not configured with prefixes.
- You can run the **ipv6 dhcp pool** command to create a configuration pool.
- You can run the **prefix-delegation** command to allocate specified prefixes to a specific DHCPv6 client.
- You can run the **prefix-delegation pool** command to configure a prefix pool so that all prefixes requested by the DHCPv6 client are allocated from this pool.

## 5.3.3 Stateless Service

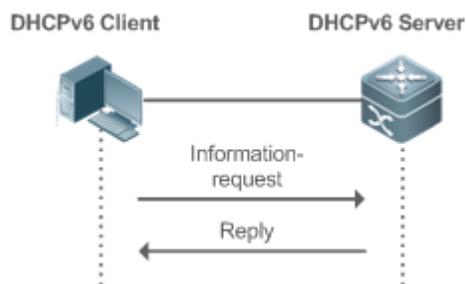

When a DHCPv6 client needs only configuration parameters, the DHCPv6 stateless service can be used to obtain related configuration parameters which cannot be obtained through a stateless automatic address configuration protocol, such as the DNS server address.

### Working Principle

Network hosts serve as DHCPv6 clients to exchange messages with the DHCPv6 server to obtain and update configuration parameters.

### ↳ Message Exchange Using the Stateless Service

Figure 5-12

- A DHCPv6 client sends an Information-request message to a DHCPv6 server to request stateless messages. Usually, this message does not contain the DUID of the specified DHCPv6 server.
- The DHCPv6 server sends a Reply message containing the configuration parameters to the DHCPv6 client.

## Related Configuration

### ↘ Enabling the DHCPv6 Server Function on an Interface

- By default, an interface is not enabled with the DHCPv6 server function.
- You can run the **ipv6 dhcp server** command to enable or disable the DHCPv6 server function for the interface.

⚠ The DHCPv6 server function is effective only on a layer-3 interface.

### ↘ Stateless Service of a DHCPv6 Server

- By default, the DHCPv6 server has no configuration pool and is not configured with configuration parameters.
- You can run the **ipv6 dhcp pool** command to create a configuration pool.
- You can run the **dns-server** command to add a DNS server.
- You can run the **domain-name** command to add a domain name.
- You can run the **option52** command to add the IPv6 address of the CAPWAP AC.

## 5.3.4 Relay Service

When the DHCPv6 client and DHCPv6 server are on different links, the DHCPv6 client can relay related messages to the DHCPv6 server through the DHCPv6 relay agent. The DHCPv6 server also relays the response to the DHCPv6 client through the relay agent.

### Working Principle

When receiving a message from the DHCPv6 client, the DHCPv6 relay agent creates a Relay-forward message. This message contains the original message from the DHCPv6 client and some options added by the relay agent. Then, the relay agent sends the Relay-forward message to a specified DHCPv6 server or a specified multicast address FF05::1:3.

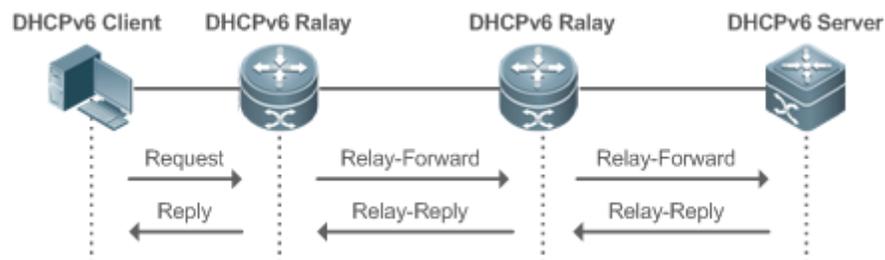

After receiving the Relay-forward message, the DHCPv6 server extracts the original message from the DHCPv6 client for processing. Then, the DHCPv6 server constructs a response to the original message, encapsulates the response in a Relay-reply message, and then sends the Relay-reply message to the DHCPv6 relay agent.

After receiving the Relay-reply message, the DHCPv6 relay agent extracts the original message from the DHCPv6 server for processing, and forwards the message to the DHCPv6 client.

Multi-level relay agents are allowed between the DHCPv6 client and DHCPv6 server.

➤ DHCPv6 Relay Agent

Figure 5-13

- The DHCPv6 relay agent performs message encapsulation and decapsulation between the DHCPv6 client and DHCPv6 server to enable communication between the DHCPv6 client and DHCPv6 server on different links.

## 5.4 Configuration

Configuration	Description and Command
	<p>⚠ (Mandatory) It is used to create a configuration pool.</p>
<b>ipv6 dhcp pool</b>	Configures a configuration pool for a DHCPv6 server.
	<p>⚠ (Optional) It is used to allocate addresses.</p>
<b>iana-address prefix</b>	Configures the address prefixes to be allocated on the DHCPv6 server.
	<p>⚠ (Optional) It is used to allocate prefixes.</p>
<b>prefix-delegation</b>	Configures prefixes of statically bound addresses on the DHCPv6 server.
<b>prefix-delegation pool</b>	Configures the DHCPv6 server to allocate prefixes from a local prefix pool.
<b>ipv6 local pool</b>	Configures a local IPv6 prefix pool.
	<p>⚠ (Optional) It is used to allocate configuration parameters.</p>
<b>dns-server</b>	Configures the DNS server on the DHCPv6 server.
<b>domain-name</b>	Configures the domain name of the DHCPv6 server.

[Configuring the DHCPv6 Server](#)

Configuration	Description and Command	
	<b>option52</b>	Configures the IPv6 address of the CAPWAP AC on the DHCPv6 server.
	 (Mandatory) It is used to enable the DHCPv6 server service.	
	<b>ipv6 dhcp server</b>	Enables the DHCPv6 server service on an interface.
<a href="#">Configuring the DHCPv6 Relay</a>	 (Mandatory) It is used to enable the DHCPv6 relay agent service.	
	<b>ipv6 dhcp relay destination</b>	Configures the DHCPv6 relay agent function.

## 5.4.1 Configuring the DHCPv6 Server

### Configuration Effect

- An uplink device can automatically allocate DHCPv6 addresses, prefixes and configuration parameters to a downlink device.

### Notes

- To provide the DHCPv6 server service, you must specify a DHCPv6 server configuration pool.
- The name of the configuration pool cannot be too long.
- When enabling the DHCPv6 server service, you must specify a configuration pool.
- Only the Switch Virtual Interface (SVI), routed port and L3 aggregate port (AP) support this configuration.

### Configuration Steps

#### ▾ Configuring a DHCPv6 Server Configuration Pool

- Mandatory.
- Unless otherwise specified, you should configure a DHCPv6 server configuration pool on all devices that need to provide the DHCPv6 server service.

#### ▾ Configuring the Address Prefixes to Be Allocated on the DHCPv6 Server

- Optional.
- To provide the address allocation service, you should configure address prefixes to be allocated on all devices that need to provide the DHCPv6 server service.

#### ▾ Configuring Prefixes of Static Addresses on the DHCPv6 Server

- Optional.
- To provide the prefix delegation service for statically bound addresses, you should configure prefixes of statically bound addresses on all devices that need to provide the DHCPv6 server service.

#### ▾ Configuring the DHCPv6 Server to Allocate Prefixes from a Local Prefix Pool

- Optional.
- To provide the prefix delegation service, you should specify a local prefix pool on all devices that need to provide the DHCPv6 server service.

#### ▾ Configuring a Local IPv6 Prefix Pool

- Optional.
- To provide the prefix delegation service through a prefix pool, you should specify a local prefix pool on all devices that need to provide the DHCPv6 server service.

#### ▾ Configuring the DNS Server on the DHCPv6 Server

- Optional.
- To allocate DNS servers, you should configure the DNS server on all devices that need to provide the DHCPv6 server service.

#### ▾ Configuring Domain Names on the DHCPv6 Server

- Optional.
- To allocate domain names, you should configure domain names on all devices that need to provide the DHCPv6 server service.

#### ▾ Configuring the IPv6 Address of the CAPWAP AC on the DHCPv6 Server

- Optional.
- To allocate CAPWAP AC information, you should configure the IPv6 address of the CAPWAP AC on all devices that need to provide the DHCPv6 server service.

#### ▾ Enabling the DHCPv6 Server Service

- Mandatory.
- Unless otherwise specified, you should enable the DHCPv6 server service on specific interfaces of all devices that need to provide the DHCPv6 server service.

### Verification

The DHCPv6 server allocates addresses, prefixes or configuration parameters for the DHCPv6 client.

- The DHCPv6 client obtains the required information.
- The DHCPv6 server successfully creates a local binding.

### Related Commands

#### ▾ Configuring a DHCPv6 Server Configuration Pool

<b>Command</b>	<code>ipv6 dhcp pool <i>poolname</i></code>
<b>Parameter</b>	<i>poolname</i> : Indicates the name of a user-defined DHCPv6 configuration pool.

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Run the <b>ipv6 dhcp pool</b> command to create a DHCPv6 server configuration pool. After configuring this command, you may enter the DHCPv6 pool configuration mode, in which you can configure the pool parameters such as the prefix and DNS server.</p> <p>After creating a DHCPv6 server configuration pool, you can run the <b>ipv6 dhcp server</b> command to associate the configuration pool with the DHCPv6 server service on an interface.</p>

### ▾ Configuring the IA\_NA Address Prefix for the DHCPv6 Server

<b>Command</b>	<b>iana-address prefix</b> <i>ipv6-prefix/prefix-length</i> [ <b>lifetime</b> { <i>valid-lifetime</i>   <i>preferred-lifetime</i> } ]
<b>Parameter Description</b>	<p><i>ipv6-prefix/prefix-length</i>: Indicates an IPv6 address prefix and the prefix length.</p> <p><b>lifetime</b>: Sets the valid time of the address allocated to a client. This keyword must be configured together with <i>valid-lifetime</i> and <i>preferred-lifetime</i>.</p> <p><i>valid-lifetime</i>: Indicates the valid time of the address allocated to a client.</p> <p><i>preferred-lifetime</i>: Indicates the time when an address is preferentially allocated to a client.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Run the <b>iana-address prefix</b> command to configure IA_NA address prefixes for a DHCPv6 server, some of which are allocated to the client.</p> <p>When receiving an IA_NA address request from a client, the DHCPv6 server selects an available address according to the IA_NA address range and allocates the address to the client. When the client does not use this address, the DHCPv6 server marks this address as available for another client.</p>

### ▾ Configuring Prefixes of Statically Bound Addresses on the DHCPv6 Server

<b>Command</b>	<b>prefix-delegation</b> <i>ipv6-prefix/prefix-length client-DUID</i> [ <i>lifetime</i> ]
<b>Parameter Description</b>	<p><i>ipv6-prefix/prefix-length</i>: Indicates an IPv6 address prefix and the prefix length.</p> <p><i>client-DUID</i>: Indicates the DUID of a client.</p> <p><i>lifetime</i>: Sets the time when the client can use this prefix.</p>
<b>Command Mode</b>	DHCPv6 pool configuration mode
<b>Usage Guide</b>	<p>You can run the <b>prefix-delegation</b> command to manually configure a prefix list for an IA_PD of a client and specify the valid time of these prefixes.</p> <p>Use the <i>client-DUID</i> parameter to specify the client to which the address prefix is allocated. The address prefix will be allocated to the first IA_PD of the client.</p> <p>After receiving a request for the address prefix from the client, the DHCPv6 server checks whether a static binding is available. If yes, the DHCPv6 server directly returns the static binding. If not, the DHCPv6 server allocates the address prefix from another prefix source.</p>

### ▾ Configuring the DHCPv6 Server to Allocate Prefixes from a local prefix pool

<b>Command</b>	<b>prefix-delegation pool</b> <i>poolname</i> [ <b>lifetime</b> { <i>valid-lifetime</i>   <i>preferred-lifetime</i> } ]
----------------	---

<b>Parameter Description</b>	<p><b>poolname:</b> Indicates the name of a user-defined local prefix pool.</p> <p><b>lifetime:</b> Sets the valid time of the prefix allocated to a client. This keyword must be configured together with <i>valid-lifetime</i> and <i>preferred-lifetime</i>.</p> <p><i>valid-lifetime:</i> Indicates the valid time of the prefix allocated to the client.</p> <p><i>preferred-lifetime:</i> Indicates the time when a prefix is preferentially allocated to a client.</p>
<b>Command Mode</b>	DHCPv6 pool configuration mode
<b>Usage Guide</b>	<p>Run the <b>prefix-delegation pool</b> command to configure a prefix pool for a DHCPv6 server to allocate prefixes to clients. The <b>ipv6 local pool</b> command is used to configure a prefix pool.</p> <p>When receiving a prefix request from a client, the DHCPv6 server selects an available prefix from the prefix pool and allocates the prefix to the client. When the client does not use this prefix, the DHCPv6 server retrieves the prefix .</p>

### ↘ Configuring a Local IPv6 Prefix Pool

<b>Command</b>	<b>ipv6 local pool</b> <i>poolname prefix/prefix-length assigned-length</i>
<b>Parameter Description</b>	<p><i>poolname:</i> Indicates the name of a local prefix pool.</p> <p><i>prefix/prefix-length:</i> Indicates the prefix and prefix length.</p> <p><i>assigned-length:</i> Indicates the length of the prefix allocated to a user.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ipv6 local pool</b> command to create a local prefix pool. If the DHCPv6 server needs prefix delegation, you can run the <b>prefix-delegation pool</b> command to specify a local prefix pool. Afterwards, prefixes will be allocated from the specified local prefix pool.

### ↘ Configuring the DNS Server on the DHCPv6 Server

<b>Command</b>	<b>dns-server</b> <i>ipv6-address</i>
<b>Parameter Description</b>	<i>ipv6-address:</i> Indicates the IPv6 address of the DNS server.
<b>Command Mode</b>	DHCPv6 pool configuration mode
<b>Usage Guide</b>	You can run the <b>dns-server</b> command for multiple times to configure multiple DNS server addresses. A new DNS server address will not overwrite old DNS server addresses.

### ↘ Configuring Domain Names on the DHCPv6 Server

<b>Command</b>	<b>domain-name</b> <i>domain</i>
<b>Parameter Description</b>	<i>domain:</i> Defines a domain name to be allocated to a user.
<b>Command Mode</b>	DHCPv6 pool configuration mode
<b>Usage Guide</b>	You can run the <b>domain-name</b> command for multiple times to create multiple domain names. A new domain name will not overwrite old domain names.

### ▾ Configuring the option52 on the DHCPv6 Server

<b>Command</b>	<b>option52</b> <i>ipv6-address</i>
<b>Parameter</b>	<i>ipv6-address</i> : Specifies the IPv6 address of the CAPWAP AC.
<b>Description</b>	
<b>Command Mode</b>	DHCPv6 pool configuration mode
<b>Usage Guide</b>	You can run the <b>option52</b> command to configure IPv6 addresses for the multiple CAPWAP ACs. A new CAPWAP AC IPv6 address will not overwrite old IPv6 addresses.

### ▾ Enabling the DHCPv6 Server Service

<b>Command</b>	<b>ipv6 dhcp server</b> <i>poolname</i> [ <b>rapid-commit</b> ] [ <b>preference</b> <i>value</i> ]
<b>Parameter</b>	<i>poolname</i> : Indicates the name of a user-defined DHCPv6 configuration pool.
<b>Description</b>	<b>rapid-commit</b> : Permits the two-message exchange process. <b>preference value</b> : Configures the priority of the advertise message, ranging from 0 to 255. The default value is 0.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Run the <b>ipv6 dhcp server</b> command to enable the DHCPv6 service on an interface. When the <b>rapid-commit</b> keyword is configured, the two-message exchange with a client is permitted during allocation of address prefixes and other configurations. After this keyword is configured, if the Solicit message from a client contains the <b>rapid-commit</b> option, the DHCPv6 server will send a Reply message directly. If <b>preference</b> is set to a non-0 value, the advertise message sent by the DHCPv6 server contains the <b>preference</b> option. The <b>preference</b> field affects the server selection by a client. If an advertise message does not contain this field, the value of <b>preference</b> is considered 0. If the value of <b>preference</b> received by the client is 255, the client sends a request to the server immediately to obtain configurations. The DHCPv6 client, server, and relay functions are mutually exclusive. An interface can be configured with only one function at a time.

## Configuration Example

### ▾ Configuring the DHCPv6 Server

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure a configuration pool named "pool1".</li> <li>● Configure the IA_NA address prefix for the DHCPv6 server.</li> <li>● Configure prefixes of statically bound addresses on the DHCPv6 server.</li> <li>● Configure two DNS servers.</li> <li>● Configure the domain name.</li> <li>● Enable the DHCPv6 server service on an interface.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# ipv6 dhcp pool pool1</pre>

	<pre>Ruijie(config-dhcp)# iana-address prefix 2008:50::/64 lifetime 2000 1000 Ruijie(config-dhcp)# prefix-delegation 2008:2::/64 0003000100d0f82233ac Ruijie(config-dhcp)# dns-server 2008:1::1 Ruijie(config-dhcp)# dns-server 2008:1::2 Ruijie(config-dhcp)# domain-name example.com Ruijie(config-dhcp)#exit Ruijie(config)# interface GigabitEthernet 0/1 Ruijie(config-if)# ipv6 dhcp server pool1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show ipv6 dhcp pool</b> command to display the created configuration pool.</li> </ul>
	<pre>Ruijie# show ipv6 dhcp pool DHCPv6 pool: pool1 Static bindings:   Binding for client 0003000100d0f82233ac     IA PD prefix: 2008:2::/64       preferred lifetime 3600, valid lifetime 3600     IANA address range: 2008:50::1/64 -&gt; 2008:50::ffff:ffff:ffff:ffff/64       preferred lifetime 1000, valid lifetime 2000 DNS server: 2008:1::1 DNS server: 2008:1::2 Domain name: example.com</pre>

## Common Errors

- The specified pool name is too long.
- The number of the configuration pools exceeds the system limit (256).
- The configuration is performed on other interfaces than the Switch Virtual Interface (SVI), routed port and L3 AP port.
- The number of interfaces configured with the DHCPv6 server service exceeds the system limit (256).
- The specified value of **valid lifetime** is larger than that of **preferred lifetime**.
- An invalid IA\_NA address is specified.
- The number of address ranges exceeds the system limit (20).
- When prefixes of statically bound addresses are configured, the specified DUIDs are too long.
- The number of prefixes of statically bound addresses exceeds the system limit (1024).

- When a local prefix pool is configured, the specified value of **valid lifetime** is smaller than that of **preferred lifetime**.
- The number of DNS servers exceeds the system limit (10).
- The number of domain names exceeds the system limit (10).
- The number of option52 addresses exceeds the system limit (10).

## 5.4.2 Configuring the DHCPv6 Relay

### Configuration Effect

- A DHCPv6 relay agent can be configured for address allocation, prefix delegation and parameter allocation to enable communication between the DHCPv6 client and server on different links.

### Notes

- A destination address must be specified. If the destination address is a multicast address (such as FF05::1:3), you also need to specify an egress interface.

### Configuration Steps

#### ↳ Configuring the DHCPv6 Relay Agent Function

- Mandatory.
- Unless otherwise specified, you should configure the DHCPv6 relay agent function on all devices that need to provide the DHCPv6 relay agent service.

### Verification

The DHCPv6 client and DHCPv6 server exchange messages through the relay agent.

- Check whether the interface is enabled with the DHCPv6 relay.
- Check whether the DHCPv6 relay agent can receive and send messages.

### Related Commands

#### ↳ Configuring the DHCPv6 Relay Agent Function

<b>Command</b>	<b>ipv6 dhcp relay destination</b> <i>ipv6-address</i> [ <i>interface-type interface-number</i> ]
<b>Parameter Description</b>	<i>ipv6-address</i> : Specifies the destination address of the relay agent. <i>interface-type</i> : Specifies the type of the destination interface (optional). <i>interface-number</i> : Specifies the destination interface number (optional).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	All DHCPv6 packets from clients received by an interface enabled with the DHCPv6 relay function will be encapsulated and sent to a specified destination address (or multiple destination addresses) through a specified interface (optional).

## Configuration Example

### Configuring the DHCPv6 Relay

<b>Configuration Steps</b>	Specify an interface enabled with the relay service to forward received DHCPv6 client packets to a specified destination address through the specified interface (optional).
	<pre>Ruijie#configure terminal Enter configuration commands, one per line. End with CNTL/Z. Ruijie(config)#interface vlan 1 Ruijie(config-if)#ipv6 dhcp relay destination 3001::2 Ruijie(config-if)#ipv6 dhcp relay destination ff02::1:2 vlan 2</pre>
<b>Verification</b>	Run the <b>show ipv6 dhcp relay destination all</b> command to display the configured destination addresses.
	<pre>Interface:VLAN 1 Destination address(es)           Output Interface 3001::2 ff02::1:2                         VLAN 2</pre>

### Common Errors

- The configuration is performed on other interfaces than the Switch Virtual Interface (SVI), routed port and L3 AP port.

## 5.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears DHCPv6 bindings.	<b>clear ipv6 dhcp binding</b> [ <i>ipv6-address</i> ]
Clears DHCPv6 server statistics.	<b>clear ipv6 dhcp server statistics</b>
Clears conflicted addresses on the DHCPv6 server.	<b>clear ipv6 dhcp conflict</b> { <i>ipv6-address</i>   * }
Clears the statistics on sent and received packets after the DHCPv6 relay is enabled on the current device.	<b>clear ipv6 dhcp relay statistics</b>

### Displaying

Description	Command
-------------	---------

Displays the DUID of a device.	<b>show ipv6 dhcp</b>
Displays address bindings on the DHCPv6 server.	<b>show ipv6 dhcp binding</b> [ <i>ipv6-address</i> ]
Displays DHCPv6 interface.	<b>show ipv6 dhcp interface</b> [ <i>interface-name</i> ]
Displays DHCPv6 pool.	<b>show ipv6 dhcp pool</b> [ <i>poolname</i> ]
Displays conflicted DHCPv6 addresses.	<b>show ipv6 dhcp conflict</b>
Displays the statistics on the DHCPv6 server.	<b>show ipv6 dhcp server statistics</b>
Displays the destination address of the DHCPv6 relay agent.	<b>show ipv6 dhcp relay destination</b> { <b>all</b>   <i>interface-type interface-number</i> }
Displays the statistics on sent and received packets after the DHCPv6 relay is enabled on a device.	<b>show ipv6 dhcp relay statistics</b>
Displays the local IPv6 prefix pool.	<b>show ipv6 local pool</b> [ <i>poolname</i> ]

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs DHCPv6.	<b>debug ipv6 dhcp</b> [ <b>detail</b> ]

## 6 Configuring DNS

### 6.1 Overview

A Domain Name System (DNS) is a distributed database containing mappings between domain names and IP addresses on the Internet, which facilitate users to access the Internet without remembering IP strings that can be directly accessed by computers. The process of obtaining an IP address through the corresponding host name is called domain name resolution (or host name resolution).

#### Protocols and Standards

- RFC1034: DOMAIN NAMES - CONCEPTS AND FACILITIES
- RFC1035: DOMAIN NAMES - IMPLEMENTATION AND SPECIFICATION

### 6.2 Applications

Application	Description
<a href="#">Static Domain Name Resolution</a>	Performs domain name resolution directly based on the mapping between a domain name and an IP address on a device.
<a href="#">Dynamic Domain Name Resolution</a>	Obtains the IP address mapped to a domain name dynamically from a DNS server on the network.

#### 6.2.1 Static Domain Name Resolution

##### Scenario

- Preset the mapping between a domain name and an IP address on a device.
- When you perform domain name operations (such as Ping and Telnet) through application programs, the system can resolve the IP address without being connected to a server on the network.

##### Deployment

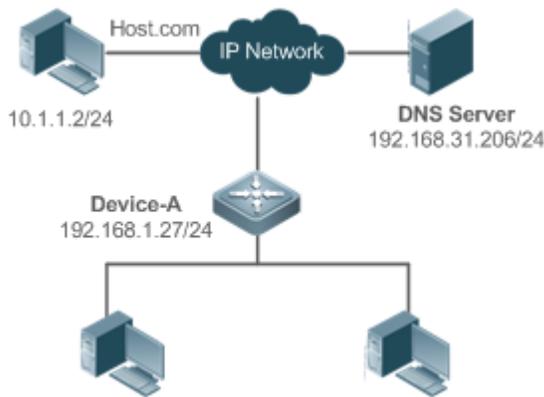

- Preset the mapping between a domain name and an IP address on a device.

#### 6.2.2 Dynamic Domain Name Resolution

##### Scenario

- DNS Server is deployed on the network to provide the domain name service.
- Domain name "host.com" is deployed on the network.
- Device-A applies to DNS Server for domain name "host.com".

Figure 6-1 Dynamic Domain Name Resolution

### Deployment

- Deploy DNS Server as the DNS server of Device-A.

## 6.3 Features

### Basic Concepts

#### ↳ DNS

The DNS consists of a resolver and a DNS server. The DNS server stores the mappings between domain names and IP addresses of all hosts on the network, and implements mutual conversion between the domain names and IP addresses. Both the TCP and UDP port IDs of DNS are 53, and generally a UDP port is used.

### Features

Feature	Description
<a href="#">Domain Name Resolution</a>	IP addresses are obtained based on domain names from a DNS server or a local database.

### 6.3.1 Domain Name Resolution

#### Working Principle

##### ↳ Static Domain Name Resolution

Static domain name resolution means that a user presets the mapping between a domain name and an IP address on a device. When you perform domain name operations (such as Ping and Telnet) through application programs, the system can resolve the IP address without being connected to a server on the network.

##### ↳ Dynamic Domain Name Resolution

Dynamic domain name resolution means that when a user perform domain name operations through application programs, the DNS resolver of the system queries an external DNS server for the IP address mapped to the domain name.

The procedure of dynamic domain name resolution is as follows:

20. A user application program (such as Ping or Telnet) requests the IP address mapped to a domain name from the DNS resolver of the system.
21. The DNS resolver queries the dynamic cache at first. If the domain name on the dynamic cache does not expire, the DNS resolver returns the domain name to the application program.
22. If all domain names expire, the DNS resolver initiates a request for domain name-IP address conversion to the external DNS server.
23. After receiving a response from the DNS server, the DNS resolver caches and transfers the response to the application program.

## Related Configuration

### ▾ Enabling Domain Name Resolution

- By default, domain name resolution is enabled.
- Run the **ip domain-lookup** command to enable domain name resolution.

### ▾ Configuring the IP Address Mapped to a Static Domain Name

- By default, no mapping between a domain name and an IP address is configured.
- Run the **ip host** command to specify the IPv4 address mapped to a domain name.

### ▾ Configuring a DNS Server

- By default, no DNS server is configured.
- Run the **ip name-server** command to configure a DNS server.

## 6.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Static Domain Name Resolution</a>	 Optional.	
	<b>ip domain-lookup</b> [oob [ via <i>mgmt-name</i> ]   vrf <i>vrf-name</i> ]	Enables domain name resolution.
	<b>ip host</b> [ oob [ via <i>mgmt-name</i> ]   vrf <i>vrf-name</i> ]	Configures the IPv4 address mapped to a domain name.
<a href="#">Configuring Dynamic Domain Name Resolution</a>	 Optional.	
	<b>ip domain-lookup</b> [oob [ via <i>mgmt-name</i> ]   vrf <i>vrf-name</i> ]	Enables domain name resolution.
	<b>ip name-server</b> [oob [ via <i>mgmt-name</i> ]   vrf <i>vrf-name</i> ]	Configures a DNS server.

## 6.4.1 Configuring Static Domain Name Resolution

### Configuration Effect

The system resolver resolves the IP address mapped to a domain name on a local device.

### Configuration Steps

#### ▾ Enabling Domain Name Resolution

- The domain name resolution function is enabled by default.
- If this function is disabled, static domain name resolution does not take effect.

#### ▾ Configuring the IPv4 Address Mapped to a Domain Name

- (Mandatory) Domain names to be used must be configured with mapped IP addresses.

### Verification

- Run the **show run** command to check the configuration.
- Run the **show hosts [ oob [ via *mgmt-name* ] | vrf *vrf-name* ]** command to check the mapping between the domain name and the IP address.

### Related Commands

#### ▾ Configuring the IPv4 Address Mapped to a Domain Name

<b>Command</b>	<b>ip host [ oob   vrf <i>vrf-name</i> ] <i>host-name ip-address [ via <i>mgmt-name</i> ]</i></b>
<b>Parameter Description</b>	<p><b>vrf <i>vrf-name</i></b>: specifies the name of a VRF instance. If this parameter is not specified, it indicates the public network.</p> <p><b>oob</b>: enables the out-band channel. It must be set when MGMT is specified as the source port.</p> <p><b>via</b>: configures MGMT port.</p> <p><b><i>mgmt-name</i></b>: specifies the MGMT port in <b>oob</b> mode.</p> <p><b><i>host-name</i></b>: indicates a domain name.</p> <p><b><i>ip-address</i></b>: indicates a mapped IPv4 address.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### ▾ Configuring Static Domain Name Resolution

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Set the IP address of static domain name www.test.com to 192.168.1.1 on the VRFM.</li> <li>● Set the IP address of static domain name www.test.com to 192.168.1.1 on MGMT port.</li> </ul>
	<pre>Ruijie#configure terminal</pre>

	<pre>Ruijie(config)# ip host vrf VRFM www.test.com 192.168.1.1 Ruijie(config)# ip oob host www.test.com 192.168.1.1 Ruijie(config)# exit</pre>
<b>Verification</b>	<p>Run the <b>show hosts vrf VRFM</b> command to check whether the static domain name entry is configured.</p> <p>Run the <b>show hosts oob</b> command to check whether the static domain name entry is configured.</p> <p>Run the <b>show hosts</b> command to check whether the static domain name entry is configured.</p>
	<pre>Ruijie#show hosts vrf VRFM Name servers are:  Host                type    Address      TTL(sec) www.test.com        static  192.168.1.1  ---  Ruijie#show hosts oob Name servers are:  Host                type    Address      TTL(sec) www.test.com        static  192.168.1.1  ---  Ruijie#show hosts Name servers are:  Host                type    Address      TTL(sec) www.test.com        static  192.168.1.1  ---</pre>

## 6.4.2 Configuring Dynamic Domain Name Resolution

### Configuration Effect

The system resolver resolves the IP address mapped to a domain name through a DNS server.

### Configuration Steps

#### ▾ Enabling Domain Name Resolution

- Domain name resolution is enabled by default.
- If this function is disabled, dynamic domain name resolution does not take effect.

➤ **Configuring a DNS Server**

- (Mandatory) To use dynamic domain name resolution, you must configure an external DNS server.

**Verification**

- Run the **show run** command to check the configuration.

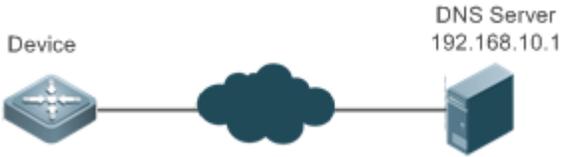

**Related Commands**

➤ **Configuring a DNS Server**

<b>Command</b>	<b>ip name-server [ oob   vrf vrf-name ] { ip-address } [ via mgmt-name ]</b>
<b>Parameter Description</b>	<p><b>oob</b>: indicates that the DNS server supports an out-of-band management interface (interface of mgmt).</p> <p><b>vrf vrf-name</b>: specifies the name of a VRF instance. If this parameter is not specified, it indicates the public network.</p> <p><i>ip-address</i>: indicates the IPv4 address of the DNS server.</p> <p><b>via</b>: configures an egress management interface.</p> <p><i>mgmt-name</i>: specifies the egress management interface for packets in oob mode.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

➤ **Configuring Dynamic Domain Name Resolution**

<b>Scenario</b> Figure 6-2	 <p>The diagram shows a network topology. On the left is a 'Device' represented by a blue server icon. A horizontal line connects it to a central cloud icon representing the network. To the right of the cloud is a 'DNS Server' represented by a blue server icon, with the IP address '192.168.10.1' written above it.</p>
	Device resolves the domain name through the DNS server (192.168.10.1) on the network.
<b>Configuration Steps</b>	<p>Set the IP address of the DNS server to 192.168.10.1 on the device.</p> <p>Set the IP address of the DNS server to 192.168.10.1 on MGMT port.</p> <p>Set the IP address of the DNS server to 192.168.10.1 on the VRFM.</p>
	<pre> DEVICE#configure terminal DEVICE(config)# ip name-server oob 192.168.10.1 DEVICE(config)# ip name-server vrf VRFM 192.168.10.1 DEVICE(config)# ip name-server 192.168.10.1 DEVICE(config)# exit                     </pre>

<b>Verification</b>	<p>Run the <b>show hosts</b> command to check whether the DNS server is specified.</p> <p>Run the <b>show hosts oob</b> command to check whether the DNS server is specified.</p> <p>Run the <b>show hosts vrf VRFM</b> command to check whether the DNS server is specified.</p>
	<pre> Ruijie(config)#show hosts  Name servers are:  192.168.10.1 static  2001::1 static  Host          type    Address                               TTL(sec)  Ruijie(config)#show hosts oob  Name servers are:  192.168.10.1 static  2001::1 static  Host          type    Address                               TTL(sec)  Ruijie(config)#show hosts vrf VRFM  Name servers are:  192.168.10.1 static  2001::1 static  Host          type    Address                               TTL(sec) </pre>

### 6.4.3 Configuring the Source IP Address for DNS Query

#### Configuration Effect

The prime IP address of the interface is configured as the source IP address of DNS query.

#### Configuration Steps

##### 📌 Configuring the Source IP Address for DNS Query

- (Optional) You can configure the source IP address of DNS query.
- By default, no source IP address is specified for DNS query.

#### Verification

- Run the **show run** command to check the configuration.

## Related Commands

### Configuring the Source IP Address for DNS Query

<b>Command</b>	<code>ip domain-lookup [ oob [ via <i>mgmt-name</i> ]   vrf <i>vrf-name</i> ] [ source { <i>interface</i>   ip <i>ip-address</i> } ]</code>
<b>Parameter Description</b>	<p><b>oob</b>: indicates that the DNS server supports an out-of-band management interface (interface of mgmt).</p> <p><b>via</b>: configures an egress management interface.</p> <p><b>mgmt-name</b>: specifies the egress management interface for packets in oob mode.</p> <p><b>vrf vrf-name</b>: specifies the name of a VRF instance. If this parameter is not specified, it indicates the public network.</p> <p><b>interface</b>: indicates a Layer 3 interface.</p> <p><b>ip-address</b>: indicates the IPv4 address of the DNS server.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>By default, no source IP address of DNS query is configured, so the source IP address of DNS query is decided through the routing process.</p> <p>If the <i>interface</i> parameter is specified, when IPv4 DNS query is sent, its source address is the prime IPv4 address of the source interface.</p>

## Configuration Example

### Configuring the Source IP Address for DNS Query

<b>Scenario</b> Figure 6-3	 <p>The diagram shows a network topology. On the left is a 'Device' represented by a blue square with a white cross. A line connects it to a central cloud representing the network. Another line connects the cloud to a 'DNS Server' represented by a blue server rack on the right. The DNS Server is labeled with the IP address '192.168.10.1'.</p>
	The source address configured on the device is 10.1.1.1.
<b>Configuration Steps</b>	<p>Set 10.1.1.1 as the source IP address for DNS query on the device.</p> <p>Set 10.1.1.1 as the source IP address for DNS query on MGMT port.</p> <p>Set 10.1.1.1 as the source IP address for DNS query on the VRFM.</p>

	<pre> DEVICE#configure terminal DEVICE(config)# ip domain-lookup source ip 10.1.1.1 DEVICE(config)# exit DEVICE#configure terminal DEVICE(config)# ip domain-lookup oob source ip 10.1.1.1 DEVICE(config)# exit DEVICE#configure terminal DEVICE(config)# ip domain-lookup vrf VRFM source ip 10.1.1.1 DEVICE(config)# exit </pre>
<b>Verification</b>	Run the <b>show run</b> command to check whether the source IP address is specified.
	<pre> Ruijie(config)#show run   include domain-lookup ip domain-lookup source ip 10.1.1.1 ip domain-lookup oob source ip 10.1.1.1 ip domain-lookup vrf VRFM source ip 10.1.1.1 </pre>

## 6.5 Monitoring

### Clearing

 Running the **clear** command during device operation may cause data loss or even interrupt services.

Description	Command
Clears the dynamic host name cache table.	<b>clear host</b> [ <i>host-name</i> ]

### Displaying

Description	Command
Displays DNS parameters.	<b>show hosts</b> [ <i>oob</i> [ <i>via mgmt-name</i> ]   <i>vrf vrf-name</i> ] [ <i>host-name</i> ]

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the DNS function.	<b>debug ip dns</b>

## 7 Configuring FTP Server

### 7.1 Overview

The File Transfer Protocol (FTP) server function enables a device to serve as an FTP server. In this way, a user can connect an FTP client to the FTP server and upload files to and download files from the FTP server through FTP.

A user can use the FTP server function to easily obtain files such as syslog files from a device and copy files to the file system of the device through FTP.

#### Protocols and Standards

- RFC959: FILE TRANSFER PROTOCOL (FTP)
- RFC3659: Extensions to FTP
- RFC2228: FTP Security Extensions
- RFC2428: FTP Extensions for IPv6 and NATs
- RFC1635: How to Use Anonymous FTP

### 7.2 Applications

Application	Description
<a href="#">Providing FTP Services in a LAN</a>	Provides the uploading and downloading services for a user in a Local Area Network (LAN).

#### 7.2.1 Providing FTP Services in a LAN

##### Scenario

Provide the uploading and downloading services for a user in a LAN.

As shown in Figure 7-1, enable the FTP server function only in a LAN.

- G and S are enabled with the FTP server function and layer-2 transparent transmission function respectively.
- A user initiates a request for FTP uploading and downloading services.

Figure 7-1

**Remarks** G is an egress gateway device.  
S is an access device.

## Deployment

- G is enabled with the FTP server function.
- As a layer-2 switch, S provides the function of layer-2 transparent transmission.

## 7.3 Features

### Basic Concepts

#### ↳ FTP

FTP is a standard protocol defined by the IETF Network Working Group. It implements file transfer based on the Transmission Control Protocol (TCP). FTP enables a user to transfer files between two networked computers and is the most important approach to transferring files on the Internet. A user can obtain abundant Internet for free through anonymous FTP. In addition, FTP provides functions such as login, directory query, file operation, and other session control. Among the TCP/IP protocol family, FTP is an application-layer protocol and uses TCP ports 20 and 21 for transmission. Port 20 is used to transmit data and port 21 is used to transmit control messages. Basic operations of FTP are described in RFC959.

#### ↳ User Authorization

To connect an FTP client to an FTP server, you should have an account authorized by the FTP server. That is, a user can enjoy services provided by the FTP server after logging in to the FTP server with a user name and password. A maximum of 10 accounts can be configured, a maximum of 2 connections are allowed for each account, and a maximum of 10 connections are supported by the server.

#### ↳ FTP File Transmission Modes

FTP provides two file transmission modes:

- Text transmission mode (ASCII mode): It is used to transfer text files (such as .txt, .bat, and .cfg files). This mode is different from the binary mode in carriage return and line feed processing. In ASCII mode, carriage return and line feed are changed to local CRC characters, for example, \n in Unix, \r\n in Windows, and \r in Mac. Assume that a file being copied contains ASCII text. If a remote computer does not run Unix, FTP automatically converts the file format to suit the remote computer.
- Binary transmission mode: It is used to transfer program files (for example, .app, .bin and .btm files), including executable files, compressed files and image files without processing data. Therefore, Binary mode facilitates faster transfer of all files and more reliable transfer of ASCII files.

#### ↳ FTP Working Modes

FTP provides two working modes:

Figure 7-2

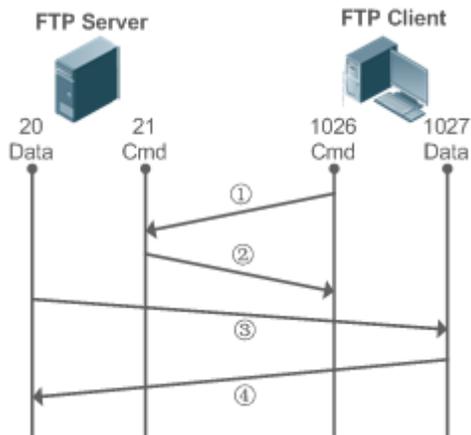

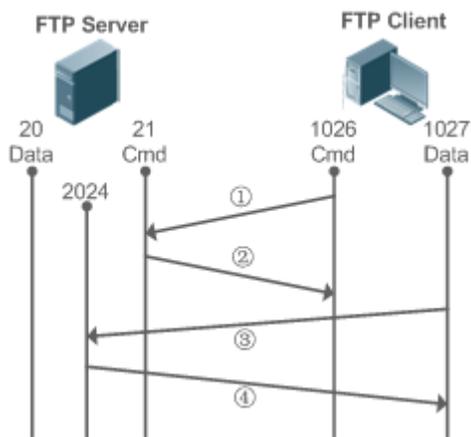

Figure 7-3

- Figure 7-2 shows the active (PORT) mode. The FTP client uses port 1026 to connect to the FTP server through port 21. The client sends commands through this channel. Before receiving data, the client sends the **PORT** command on this channel. The **PORT** command contains information on the channel port (1027) of the client for receiving data. The server uses port 20 to connect to the client through port 1027 for establishing a data channel to receive and transmit data. The FTP server must establish a new connection with the client for data transmission.
- Figure 7-3 shows the passive (PASV) mode. The process for establishing a control channel is similar to that in the PORT mode. However, after the connection is established, the client sends the **PASV** command rather than the **PORT** command. After receiving the **PASV** command, the FTP server enables a high-end port (2024) at random and notifies the client that data will be transmitted on this port. The client uses port 1027 to connect the FTP server through port 2024. Then, the client and server can transmit and receive data on this channel. In this case, the FTP server does not need to establish a new connection with the client.

➤ **Supported FTP Commands**

After receiving an FTP connection request, the FTP server requires the client to provide the user name and password for authentication.

If the client passes the authentication, the FTP client commands can be executed for operations. The available FTP client commands are listed as follows:

ascii	delete	mdelete	mput	quit	send
bin	dir	mdir	nlist	recv	size
bye		mget		rename	system
cd	get	mkdir	passive		type
cdup		mls	put	rmdir	user
close	ls		pwd		

For usage of these FTP client commands, please refer to your FTP client software document. In addition, many FTP client tools (such as CuteFTP and FlashFXP) provide the graphic user interface. These tools facilitate operations by freeing users from configuring FTP commands.

## Overview

Feature	Description
<a href="#">Enabling the FTP Server Function</a>	Provides the functions of uploading, downloading, displaying, creating and deleting files for an FTP client.

### 7.3.1 Enabling the FTP Server Function

#### Working Principle

The basic working principle is described in the previous chapter. Ruijie devices provide FTP services after the user name, password, and top-level directory are configured.

#### Related Configuration

##### 📌 Enabling the FTP Server Function Globally

The FTP server function is disabled by default.

Run the **ftp-server enable** command to enable the FTP server function.

You must enable the FTP server function globally before using it.

##### 📌 Configuring a User Name, Password, and Top-Level Directory

There is no authorized user or top-level directory by default.

Run the **ftp-server username** and **ftp-server topdir** commands to set an authorized user and top-level directory.

The three configurations above are mandatory; otherwise, the FTP server function cannot be enabled.

## 7.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic Functions</a>	 (Mandatory) It is used to enable an FTP server.	
	<b>ftp-server enable</b>	Enables the FTP server function.
	<b>ftp-server login timeout</b>	Configures Login timeout for an FTP session.
	<b>ftp-server login times</b>	Configures the valid login count.
	<b>ftp-server topdir</b>	Configures the top-level directory of the FTP server.
	<b>ftp-server username</b> <i>username</i>	Configures a user name.
	<b>ftp-server password</b> [ <i>type</i> ] <i>password</i>	Configures a password.
	<b>ftp-server timeout</b>	Configures the idle timeout of an FTP session.

### 7.4.1 Configuring Basic Functions

#### Configuration Effect

- Create an FTP server to provide FTP services for an FTP client.

#### Notes

- The user name, password, and top-level directory need to be configured.
- To enable the server to close an abnormal session within a limited period, you need to configure the idle timeout of a session.

#### Configuration Steps

##### ▾ Enabling the FTP Server Function

- Mandatory.
- Unless otherwise noted, enable the FTP server function on every router.

##### ▾ Configuring a Top-Level Directory

- Mandatory.
- Unless otherwise noted, configure the top-level directory as the root directory on every router.

##### ▾ Configuring a User Name and Password for Login

- Mandatory.
- The lengths of the user name and password are restricted.

➤ **Configuring the Login Timeout for an FTP Session**

- Optional.
- When the client is disconnected from the server due to an error or other abnormal causes, the FTP server may not know that the user is disconnected and continues to keep the connection. Consequently, the FTP connection is occupied for a long time and the server cannot respond to the login requests of other users. This configuration can ensure that other users can connect to the FTP server within a period of time upon an error.

**Verification**

Connect an FTP client to the FTP server.

- Check whether the client is connected.
- Check whether operations on the client are normal.

**Related Commands**

➤ **Enabling the FTP Server Function**

<b>Command</b>	<b>ftp-server enable</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The client cannot access the FTP server unless the top-level directory, user name and password are configured. Therefore, it is recommended that you configure the top-level directory, user name and password for login by referring to the subsequent chapters before enabling the service for the first time.

➤ **Configuring the Valid Login Count**

<b>Command</b>	<b>ftp-server login times</b> <i>times</i>
<b>Parameter Description</b>	<i>times</i> : Indicates the valid login count, ranging from 1 to 10.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The valid login count refers to the number of times you can perform account verification during an FTP session. The default value is 3, which means that your session will be terminated if you enter an incorrect user name or password for three times and other users can go online.

➤ **Configuring the Login Timeout for an FTP Session**

<b>Command</b>	<b>ftp-server login timeout</b> <i>timeout</i>
----------------	--

<b>Parameter Description</b>	<i>timeout</i> : Indicates the login timeout, ranging from 1 to 30 minutes.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The login timeout refers to the maximum duration that the session lasts since being established. If you do not pass the password verification again during the login timeout, the session will be terminated to ensure that other users can log in.

### ↘ Configuring the Top-Level Directory of the FTP Server

<b>Command</b>	<b>ftp-server topdir</b> <i>directory</i>
<b>Parameter Description</b>	<i>directory</i> : Indicates the user access path.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the top-level directory of the server is set to "/syslog", the FTP client can access only the files and directories in the "/syslog" directory on the device after login. Due to restriction on the top-level directory, the client cannot return to the upper directory of "/syslog".

### ↘ Configuring a User Name and Password for Server Login

<b>Command</b>	<b>ftp-server username</b> <i>username password [type] password</i>
<b>Parameter Description</b>	<b>username</b> : Indicates a user name. <i>type</i> : 0 or 7. 0 indicates that the password is not encrypted (plaintext) and 7 indicates that the password is encrypted (cipher text). <b>password</b> : Indicates a password.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The FTP server does not support anonymous login; therefore, a user name must be configured. A user name consists of up to 64 characters including letters, half-width digits and symbols without spaces. A password consists of only letters or digits. Spaces at the beginning and end of the password are ignored. Spaces inside the password are viewed as part of the password. A plaintext password consists of 1 to 25 characters. A cipher text password consists of 4 to 52 characters. User names and passwords must match. A maximum of 10 users can be configured.

### ↘ Configuring the Idle Timeout for an FTP Session

<b>Command</b>	<b>ftp-server timeout</b> <i>time</i>
<b>Parameter Description</b>	<i>time</i> : Indicates the idle timeout, ranging from 1 to 3,600 minutes.
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	The idle timeout of a session refers to the duration from the end of an FTP operation to the start of the next FTP operation in an FTP session. After the server responds to an FTP client command operation (for example, after a file is completely transferred), the server starts to count the idle time again, and stops when the next FTP client command operation arrives. Therefore, the configuration of the idle timeout has no effect on some time-consuming file transfer operations.
--------------------	---

▾ **Displaying Server Status**

<b>Command</b>	<b>show ftp-server</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Run this command to display FTP server status.

▾ **Debugging**

<b>Command</b>	<b>debug ftp-server pro/err</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Run this command to debug message/error events of the FTP server.

**Configuration Example**

▾ **Creating an FTP Server on an IPv4 Network**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● A TCP connection is established for transmission from a server to a client.</li> <li>● Configure the top-level directory/syslog.</li> <li>● Set the user name <b>user</b> and password to <b>password</b>.</li> <li>● Set the session idle timeout to 5 minutes.</li> </ul>
	<pre>Ruijie(config)#ftp-server username user Ruijie(config)#ftp-server password password Ruijie(config)#ftp-server timeout 5 Ruijie(config)#ftp-server topdir / Ruijie(config)#ftp-server enable</pre>
<b>Verification</b>	Run the <b>show ftp-server</b> command to check whether the configuration takes effect.
	<pre>Ruijie#show ftp-server ftp-server information</pre>

```

=====
enable : Y
topdir : tmp:/
timeout: 10min
username:aaaa      password:(PLAIN)bbbb      connect num[2]
    [0]trans-type:BINARY (ctrl)server IP:192.168.21.100[21]
                client IP:192.168.21.26[3927]
    [1]trans-type:ASCII (ctrl)server IP:192.168.21.100[21]
                client IP:192.168.21.26[3929]
username:a1      password:(PLAIN)bbbb      connect num[0]
username:a2      password:(PLAIN)bbbb      connect num[0]
username:a3      password:(PLAIN)bbbb      connect num[0]
username:a4      password:(PLAIN)bbbb      connect num[0]
username:a5      password:(PLAIN)bbbb      connect num[0]
username:a6      password:(PLAIN)bbbb      connect num[0]
username:a7      password:(PLAIN)bbbb      connect num[0]
username:a8      password:(PLAIN)bbbb      connect num[0]
username:a9      password:(PLAIN)bbbb      connect num[0]
    
```

### Common Errors

- No user name is configured.
- No password is configured.
- No top-level directory is configured.

## 7.5 Monitoring

### Displaying

Description	Command
Displays the FTP server configuration.	show ftp-server

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the FTP server error events.	<b>debug ftp-server err</b>
Debugs the FTP server message events.	<b>debug ftp-server pro</b>

## 8 Configuring FTP Client

### 8.1 Overview

The File Transfer Protocol (FTP) is an application of TCP/IP. By establishing a connection-oriented and reliable TCP connection between the FTP client and server, a user can access a remote computer that runs the FTP server program.

An FTP client enables file transfer between a device and the FTP server over the FTP protocol. A user uses the client to send a command to the server. The server responds to the command and sends the execution result to the client. By means of command interaction, the user can view files in the server directory, copy files from a remote computer to a local computer, or transfer local files to a remote computer.

FTP is intended to facilitate sharing of program/data files and encourage remote operation (by using programs). Users do not need to be concerned with differences of different files systems on different hosts. Data is transmitted in an efficient and reliable manner. FTP enables remote file operation securely.

Ruijie FTP clients are different from standard FTP clients that run interactive commands. Instead, you enter the **copy** command in CLI to perform control-connection instructions such as **open**, **user**, and **pass**. After a control connection is established, the file transfer process starts, and then a data connection is established to upload or download files.

-  Old devices support TFTP. However, TFTP is used to transfer small files whereas FTP is used to transfer large files. Implementing FTP on a device enables the file transfer between the local device and other clients or servers.

#### Protocols and Standards

- RFC959: FILE TRANSFER PROTOCOL (FTP)

### 8.2 Applications

Application	Description
<a href="#">Uploading a Local File to a Remote Server</a>	Local and remote files need to be shared, for example, uploading a local file to a remote server.
<a href="#">Downloading a File from a Remote Server to a Local Device</a>	Local and remote files need to be shared, for example, downloading a file from a remote server to a local device.

#### 8.2.1 Uploading a Local File to a Remote Server

##### Scenario

Local and remote files need to be shared, for example, uploading a local file to a remote server.

As shown in Figure 8-1, resources are shared only on the Intranet.

Figure 8-1

## Deployment

- Implement only communication on the Intranet.
- Enable file uploading on the FTP client.
- Enable file uploading on the FTP server.

## 8.2.2 Downloading a File from a Remote Server to a Local Device

### Scenario

Local and remote files need to be shared, for example, downloading a file from a remote server to a local device.

As shown in Figure 8-2, resources are shared only on the Intranet.

Figure 8-2

## Deployment

- Implement only communication on the Intranet.
- Enable file downloading on the FTP client.
- Enable file downloading on the FTP server.

## 8.3 Features

### Basic Concepts

#### 📄 Uploading FTP Files

Upload files from an FTP client to an FTP server.

#### 📄 Downloading FTP Files

Download files from an FTP server to an FTP client.

#### 📄 FTP Connection Mode

An FTP client and an FTP server can be connected in the active or passive mode.

## 📄 FTP Transmission Mode

The transmission between an FTP client and an FTP server is available in two modes, namely, text (ASCII) and binary (Binary).

## 📄 Specifying the Source Interface IP Address for FTP Transmission

An FTP client is configured with a source IP address for communication with an FTP server.

### Overview

Feature	Description
<a href="#">Uploading FTP Files</a>	Uploads files from an FTP client to an FTP server.
<a href="#">Downloading FTP Files</a>	Downloads files from an FTP server to an FTP client.
<a href="#">FTP Connection Mode</a>	Specifies the connection mode between an FTP client and an FTP server.
<a href="#">FTP Transmission Mode</a>	Specifies the transmission mode between an FTP client and an FTP server.
<a href="#">Specifying the Source Interface IP Address for FTP Transmission</a>	Configures a source IP address of an FTP client for communication with an FTP server.

### 8.3.1 Uploading FTP Files

FTP enables file uploading. Start the FTP client and FTP server simultaneously, and upload files from the FTP client to the FTP server.

### 8.3.2 Downloading FTP Files

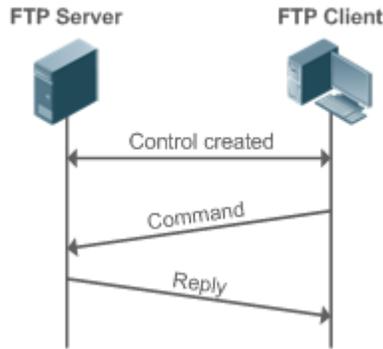

FTP enables file downloading. Start the FTP client and FTP server simultaneously, and download files from the FTP server to the FTP client.

### 8.3.3 FTP Connection Mode

FTP needs to use two TCP connections: one is a control link (command link) that is used to transfer commands between the FTP client and server; the other one is a data link that is used to upload or download data.

1. Control connection: Some simple sessions are enabled with the control connection only. A client sends a command to a server. After receiving the command, the server sends a response. The process is shown in Figure 8-3.

Figure 8-3 Control Connection

2. Control connection and data connection: When a client sends a command for uploading or downloading data, both the control connection and data connection need to be established.

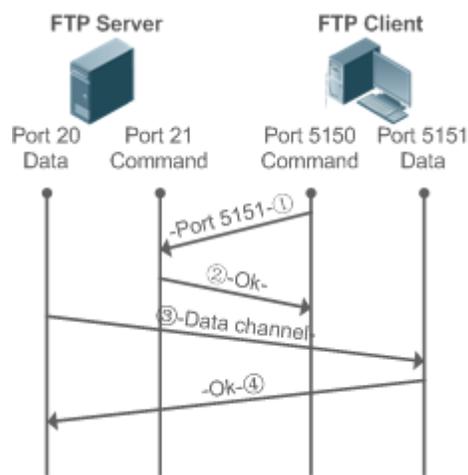

FTP supports two data connection modes: active (PORT) and passive (PASC). The two modes are different in establishing a data connection.

● Active mode

In this mode, an FTP server connects to an FTP client actively when a data connection is established. This mode comprises four steps:

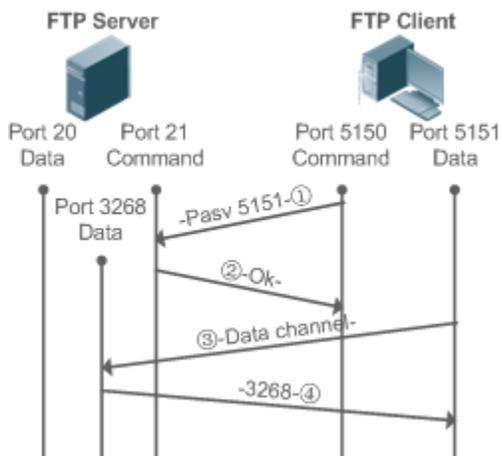

1. The client uses source port 5150 to communicate with the server through port 21 as shown in Figure 1-1 to send a connection request and tell the server that the port to be used is port 5151.
2. After receiving the request, the server sends a response OK(ACK). The client and server exchanges control signaling by console ports.
3. The server enables port 20 as the source port to send data to port 5151 of the client.
4. The client sends a response. Data transmission ends.

Figure 8-4 Active (PORT) Mode

● Passive mode

Figure 8-5 Passive (PASV) Mode

This mode is often set by the **passive** command. When a data connection is established, the FTP server is connected to the FTP client passively. This mode comprises four steps:

1. In the passive mode, the client initializes the control signaling connection. The client uses source port 5150 to connect to the server through port 21 as shown in Figure 1-5, and runs the **passive** command to request the server to enter the PASV mode.
2. The server agrees to enter the PASV mode, selects a port number greater than 1024 at random, and tells the port number to the client.
3. After receiving the message, the client uses port 5151 as shown in Figure 1-5 to communicate with the server through port 3268. Here, port 5151 is the source port and port 3268 is the destination port.
4. After receiving the message, the server sends data and responds an ACK(OK) response.

After the data connection is established, you can perform file uploading and downloading. Besides, you can perform some operations on the server file from the client.

**i** The control connection for command and feedback transmission is always present whereas the data connection is established as required. Only an FTP client has the right to select and set the PASV or PORT mode. The FTP client sends a command to establish a data connection. Ruijie FTP clients use the PASV mode by default.

### 8.3.4 FTP Transmission Mode

FTP provides two transmission modes: text (ASCII) and binary (Binary). At present, Ruijie FTP clients support both the ASCII and Binary modes and use the BINARY mode by default.

- ASCII mode

The difference between the ASCII and Binary modes lies in carriage return and line feed processing. In ASCII mode, carriage return and line feed are changed to a local Carriage Return Character (CRC), for example, `\n` in Unix, `\r\n` in Windows, and `\r` in Mac.

- Binary mode

The Binary mode can be used to transfer executable files, compressed files and image files without processing data. For example, a text file needs to be transferred from Unix to Windows. When the Binary mode is used, the line breaks in Unix will not be converted from \r to \r\n; therefore in Windows, this file has no line feeds and displays many black squares. Therefore, Binary mode facilitates faster transfer of all files and more reliable transfer of ASCII files.

### 8.3.5 Specifying the Source Interface IP Address for FTP Transmission

An FTP client is configured with a source IP address for communication with an FTP server. In this way, the FTP client connects to the server and shares files with the server through the specified source IP address.

## 8.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring Basic Functions</a>	 (Mandatory) It is used to configure the functions of an FTP client.	
	<b>copy flash</b>	Uploads a file.
	<b>copy ftp</b>	Downloads a file.
<a href="#">Configuring Optional Functions</a>	 (Optional) It is used to configure the working mode of the FTP client.	
	<b>ftp-client port</b>	Sets the connection mode to active (port).
	<b>ftp-client ascii</b>	Sets the transmission mode to ASCII.
	<b>ftp-client source-address</b>	Configures the source IP address of the FTP client.
	<b>default ftp-client</b>	Restores the default settings, namely, connection mode set to passive (PASV), transmission mode to Binary and source IP address removed.

### 8.4.1 Configuring Basic Functions

#### Configuration Effect

- Implement file uploading and downloading.

#### Notes

- Pay attention to the command formats for uploading and downloading.

#### Configuration Steps

##### ↳ Uploading a File

- This configuration is mandatory when a file needs to be uploaded.

- Configure the FTP URL as the destination address of **copy** in Privileged EXEC mode.

↳ **Downloading a File**

- This configuration is mandatory when a file needs to be downloaded.
- Configure the FTP URL as the source address of **copy** in Privileged EXEC mode.

Verification

- Check whether the uploaded file exists on the FTP server.
- Check whether the downloaded file exists at the destination address.

Related Commands

↳ **Uploading a File**

<b>Command</b>	<b>copy flash:</b> [ <i>local-directory/</i> ] <i>local-file</i> <b>ftp:</b> <i>//username:password@dest-address</i> [ <i>/remote-directory</i> ] <i>/remote-file</i>
<b>Parameter Description</b>	<i>local-directory</i> : Specifies a directory on the local device. If it is not specified, it indicates the current directory. <i>local-file</i> : Specifies a local file to be uploaded. <i>username</i> : Specifies a user name for accessing the FTP server, consisting of no more than 32 bytes and excluding delimiters such as /, :, @ and space. This parameter is mandatory. <i>password</i> : Specifies a password for accessing the FTP server, consisting of no more than 32 bytes and excluding delimiters such as /, :, @ and space. This parameter is mandatory. <i>dest-address</i> : Specifies an IP address for the FTP server. <i>remote-directory</i> : Specifies a directory on the server. <i>remote-file</i> : Renames the file on the server.   The directory specified by the <i>local-directory</i> field must have been created on the device. This command will not automatically create a directory.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to upload a file from the flash of a local device to an FTP server.

↳ **Downloading an FTP File**

<b>Command</b>	<b>copy ftp:</b> <i>//username:password@dest-address</i> [ <i>/remote-directory</i> ] <i>/remote-file</i> <b>flash:</b> [ <i>local-directory/</i> ] <i>local-file</i>
<b>Parameter Description</b>	<i>username</i> : Specifies a user name for accessing the FTP server, consisting of no more than 32 bytes and excluding delimiters such as /, :, @ and space. This parameter is mandatory. <i>password</i> : Specifies a password for accessing the FTP server, consisting of no more than 32 bytes and excluding delimiters such as /, :, @ and space. This parameter is mandatory. <i>dest-address</i> : Specifies an IP address for the FTP server. <i>remote-directory</i> : Specifies a directory on the server.

	<p><i>remote-file</i>: Specifies a file to be downloaded.</p> <p><i>local-directory</i>: Specifies a directory on the local device. If it is not specified, it indicates the current directory.</p> <p><i>local-file</i>: Renames the file in the local flash.</p> <hr/> <p> The directory specified by the <i>local-directory</i> field must have been created on the device. This command will not automatically create a directory.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to download a file from an FTP server to the flash of a local device.

### Configuration Example

#### ↘ Uploading a File

<b>Configuration Steps</b>	Upload the <b>local-file</b> file in the <b>home</b> directory of a device to the <b>root</b> directory of an FTP server whose user name is <b>user</b> , password is <b>pass</b> and IP address is <b>192.168.23.69</b> and name the file as <b>remote-file</b> .
	<pre>Ruijie# copy flash: home/local-file ftp://user:pass@192.168.23.69/root/remote-file</pre>
<b>Verification</b>	Check whether the <b>remote-file</b> file exists on the FTP server.

#### ↘ Downloading a File

<b>Configuration Steps</b>	Download the <b>remote-file</b> file from the <b>root</b> directory of an FTP server whose user name is <b>user</b> , password is <b>pass</b> and IP address is <b>192.168.23.69</b> to the <b>home</b> directory of a device and save the file as <b>local-file</b> .
	<pre>Ruijie# copy ftp://user:pass@192.168.23.69/root/remote-file flash: home/local-file</pre>
<b>Verification</b>	Check whether the <b>remote-file</b> file exists in the <b>home</b> directory of the flash.

### Common Errors

- The command formats for uploading and downloading are incorrect.
- The user name or password is incorrect.

## 8.4.2 Configuring Optional Functions

### Configuration Effect

- Set the connection and transmission modes and configure a source IP address of the client for file uploading and download.

### Notes

- If an FTP client needs to be configured based on VRF, specify a VRF first.

## Configuration Steps

### Setting the Connection Mode to Active (Port)

- Optional.
- Configure the connection mode of FTP.

### Setting the Transmission Mode to ASCII

- Optional.
- Configure the transmission mode of FTP.

### Configuring the Source IP Address of the FTP Client

- Optional.
- Configure the source IP address of the FTP client.

### Restoring the Default Settings

- Optional.
- Restore the default settings of the FTP client.

## Verification

Run the **show run** command to check whether the configuration takes effect.

## Related Commands

### Setting the Connection Mode to Active (Port)

<b>Command</b>	<b>ftp-client [ vrf <i>vrf-name</i> ] port</b>
<b>Parameter</b>	<b>vrf <i>vrf-name</i></b> : Specifies a VRF.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to set the connection mode to active (port). The default connection mode is passive (PASV).

### Configuring the Source IP Address of the FTP Client

<b>Command</b>	<b>ftp-client [ vrf <i>vrfname</i> ] source-address {<i>ip-address</i>   <i>ipv6-address</i>}</b>
<b>Parameter</b>	<b>vrf <i>vrf-name</i></b> : Specifies a VRF.
<b>Description</b>	<i>ip-address</i> : Specifies the IPv4 address of a local interface. <i>ipv6-address</i> : Specifies the IPv6 address of a local interface.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure an interface IP address of the client for connection to the server. By default,

	the client is not configured with a local IP address. Instead, the route selects an IP address for the client.
--	--

▾ **Setting the Transmission Mode to ASCII**

<b>Command</b>	<b>ftp-client [ vrf <i>vrf-name</i> ] ascii</b>
<b>Parameter</b>	<b>vrf <i>vrf-name</i></b> : Specifies a VRF.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to set the transmission mode to ASCII. The default transmission mode is Binary.

▾ **Restoring the Default Settings**

<b>Command</b>	<b>default ftp-client [ vrf <i>vrf-name</i> ]</b>
<b>Parameter</b>	<b>vrf <i>vrf-name</i></b> : Specifies a VRF.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to restore the default settings, namely, connection mode set to passive (PASV), transmission mode to Binary and source IP address removed.

**Configuration Example**

▾ **Configuring Optional Functions**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Set the connection mode of FTP to port.</li> <li>● Set the transmission mode to ASCII.</li> <li>● Set the source IP address to 192.168.23.167.</li> <li>● Set the connection mode of vrf 123 to port.</li> <li>● Set the transmission mode of vrf 123 to ASCII.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# ftp-client ascii Ruijie(config)# ftp-client port Ruijie(config)# ftp-client source-address 192.168.23.167 Ruijie(config)# ftp-client vrf 123 port Ruijie(config)# ftp-client vrf 123 ascii Ruijie(config)# end</pre>
<b>Verification</b>	<p>Run the <b>show run</b> command on the device to check whether the configuration takes effect.</p> <pre>Ruijie# show run</pre>

```
!  
ftp-client ascii  
ftp-client port  
ftp-client source-address 192.168.23.167  
!
```

### Common Errors

- The source IP address is not a local IP address.
- Before configuring the **ftp-client vrf** command, configure the **vrf** command.

## 8.5 Monitoring

### Displaying

Description	Command
Displays the FTP client configuration.	<b>show run</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the FTP Client.	<b>debug ftp-client</b>

## 9 Configuring Tunnel Interfaces

### 9.1 Overview

Tunnel interfaces are virtual interfaces used to implement tunneling. A tunnel interface provides a standard transmission link and you do not need to specify a transport protocol or payload protocol. Each tunnel interface represents a transmission link.

Tunneling function includes the following parts:

- **Payload protocol:** Is used to encapsulate the data transmitted in tunnels. For example, the IPv4 and IPv6 protocols work as payload protocols. Generic routing encapsulation (GRE) tunnels can carry IPv4 or IPv6 data.
- **Bearer protocol:** Is used for secondary encapsulation and identification of the data to be transmitted. Among the tunnels described in this document, only the GRE tunnel uses a bearer protocol, that is, the GRE protocol. The other tunnels use the IPv4 and IPv6 protocols. Packets are encapsulated with outer IPv4 and IPv6 headers.
- **Transport protocol:** Is used to transmit the data encapsulated for the second time through a bearer protocol. Ruijie products use the widely applied IPv4 and IPv6 protocols as transport protocols.

The tunnel mode can be used to set up communication between two private networks running the same protocol through a heterogeneous public network.

Tunneling is applicable to the following scenarios:

- Because tunneling supports different payload protocols, it allows the communication between local networks running non-IP protocols through a single network (IP network). Because tunneling operates on routes running transport protocols (IP protocols), it allows wider application of the protocols with hop limit.
- Tunneling allows discrete subnets to be connected through a single network (IP network).
- Tunneling allows the virtual private network (VPN) feature to be enabled on wide area networks (WANs).

Encapsulated data is transmitted through tunnels, which is a complex process. In some cases, you need to pay attention to the following changes:

- Because a tunnel is a logical link, it appears to be a single hop in routing. However, actually its path cost may be more than one hop. When you use a tunnel for transmission, note that the route of the tunnel link is different from the actual route.
- When you configure a firewall or an access control list (ACL), take the tunnel configuration into consideration. The transmission bandwidth and maximum transmission unit (MTU) allowed by payload protocols are smaller than the theoretical values.

#### Protocols and Standards

- RFC2784: Generic Routing Encapsulation (GRE)
- RFC2890: Key and Sequence Number Extensions to GRE

- RFC3056: Connection of IPv6 Domains via IPv4 Clouds
- RFC3068: An Anycast Prefix for 6to4 Relay Routers
- RFC3964: Security Considerations for 6to4
- RFC4023: Encapsulating MPLS in IP or Generic Routing Encapsulation (GRE)
- RFC4087: IP Tunnel MIB
- RFC4213: Basic Transition Mechanisms for IPv6 Hosts and Routers
- RFC4797: Use of Provider Edge to Provider Edge (PE-PE) Generic Routing Encapsulation (GRE) or IP in BGP/MPLS IP Virtual Private Networks
- RFC5158: 6to4 Reverse DNS Delegation Specification
- RFC5214: Intra-Site Automatic Tunnel Addressing Protocol (ISATAP)
- RFC5332: MPLS Multicast Encapsulations
- RFC5579: Transmission of IPv4 Packets over Intra-Site Automatic Tunnel Addressing Protocol (ISATAP) Interfaces
- RFC5845: Generic Routing Encapsulation (GRE) Key Option for Proxy Mobile IPv6
- RFC6245: Generic Routing Encapsulation (GRE) Key Extension for Mobile IPv4
- RFC6343: Advisory Guidelines for 6to4 Deployment
- RFC6372: 6to4 Provider Managed Tunnels
- draft-zhou-dhc-gre-option-00 DHCPv4 and DHCPv6 options for GRE
- draft-templin-v6ops-isops-18 Operational Guidance for IPv6 Deployment in IPv4 Sites using ISATAP

## 9.2 Applications

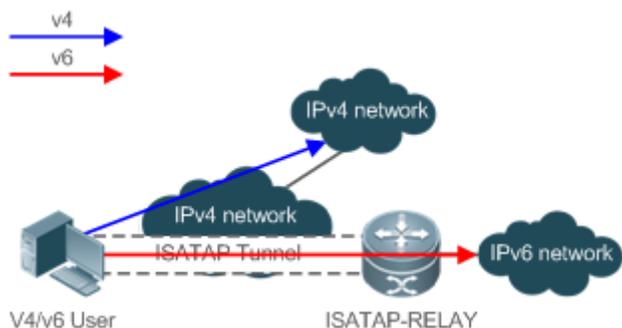

Application	Description
<a href="#">Accessing the IPv6 Sites on a Campus Network</a>	Accesses the IPv6 sites on a campus network.
<a href="#">Connecting a Campus Network to an IPv6 Backbone Network</a>	Connects a campus network to an IPv6 backbone network.

### 9.2.1 Accessing the IPv6 Sites on a Campus Network

#### Scenario

IPv6 servers are deployed on some campus networks, and PCs need to access the servers. The Intra-Site Automatic Tunnel Addressing Protocol (ISATAP) can be used to realize the access.

Figure 9-1

<b>Remarks</b>	ISATAP-RELAY supports tunneling. Users on the campus network can access IPv4 servers directly through the IPv4 network, but need to access IPv6 servers through the ISATAP tunnel.
----------------	--

### Deployment

- IPv4 and IPv6 users access the IPv4 network by using IPv4 addresses.
- IPv4 and IPv6 users access the IPv6 network through the ISATAP tunnel.
- The ISATAP tunnel is established between PCs and the ISATAP-RELAY router.

## 9.3 Configuration

Configuration	Description and Command	
<a href="#">Configuring Tunnel Interfaces</a>	⚠ (Mandatory) It is used to create tunnels.	
	<b>interface tunnel</b>	Creates a tunnel interface.
	<b>tunnel source</b>	Configures the local address of a tunnel.
<a href="#">Configuring a Tunnel Mode</a>	⚠ (Optional) It is used to configure a tunnel mode.	
	<b>tunnel mode</b>	Configures a tunnel encapsulation mode.
Configuring a Local Address	⚠ (Optional) It is used to configure the local address of a tunnel.	
	<b>tunnel source</b>	Configures the address of a tunnel.
<a href="#">Configuring a Peer Address</a>	⚠ (Optional) It is used to configure the peer address of a tunnel.	
	<b>tunnel destination</b>	Configures the peer address of a tunnel.
<a href="#">Configuring the TOS of a Tunnel</a>	⚠ (Optional) It is used to configure the type of service (TOS) of a tunnel.	
	<b>tunnel tos</b>	Configures the TOS of a tunnel.
<a href="#">Configuring the TTL of a Tunnel</a>	⚠ (Optional) It is used to configure the time to live (TTL) of a tunnel.	
	<b>tunnel ttl</b>	Configures the TTL of a tunnel.

### 9.3.1 Configuring Tunnel Interfaces

#### Configuration Effect

- Create a tunnel interface.

### Configuration Steps

#### ↳ Creating a Tunnel Interface

- Run the **interfaces tunnel** *number* command in global configuration mode to create a tunnel interface.
- The tunneling service is available only after a tunnel interface is created.

### Verification

- Run the **show interfaces tunnel** *number* command to check whether the tunnel interface is created successfully.

### Related Commands

#### ↳ Configuring a Tunnel Interface

<b>Command</b>	<b>interface tunnel</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the number of a tunnel interface.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ↳ Checking the Tunnel Configuration

<b>Command</b>	<b>show interfaces tunnel</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the number of a tunnel interface.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### ↳ Creating a Tunnel Interface

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Create a tunnel interface.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# interface tunnel 1 Ruijie(config-if-Tunnel 1)# end</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the configuration of the tunnel interface.</li> </ul> <pre>Ruijie# show interfaces tunnel 1</pre>

```
.....
Tunnel attributes:
.....
Tunnel protocol/transport is gre ip
```

### Common Errors

- A tunnel interface cannot be created due to memory deficiency.
- A tunnel interface cannot be created due to insufficient hardware resource deficiency.

## 9.3.2 Configuring a Tunnel Mode

### Configuration Effect

- Configure a tunnel encapsulation mode in tunnel interface configuration mode when you need to use a tunnel in non-default encapsulation mode.

### Configuration Steps

#### ▾ Configuring a Tunnel Mode

- Optional.
- The default encapsulation mode for switches is tunnel mode ipv6ip.
- To change the default encapsulation mode, run the **tunnel mode** command in tunnel interface configuration mode.

### Verification

- Run the **show interfaces tunnel number** command to check whether the tunnel encapsulation mode is configured.

### Related Commands

#### ▾ Configuring a Tunnel Mode

<b>Command</b>	<b>tunnel mode { gre {ip   ipv6}   ipv6   ipip   ipv6ip [6to4   isatap ] }</b>
<b>Parameter</b>	Each mode corresponds to different encapsulation format of the packets sent out by the tunnel interface.
<b>Description</b>	<p><b>gre ip</b> indicates that a packet is encapsulated with a GRE header and an IPv4 header in sequence and then is transmitted over a new IPv4 network.</p> <p><b>gre ipv6</b> indicates that a packet is encapsulated with a GRE header and an IPv6 header in sequence and then is transmitted over a new IPv6 network.</p> <p><b>ipv6</b> indicates that a packet sent out by the tunnel interface is encapsulated with an IPv6 header and then transmitted over a new IPv6 network.</p> <p><b>ipip</b> indicates that the tunnel interface carries only IPv4 packets and a packet sent out by the tunnel interface is encapsulated with an IPv4 header and then transmitted over a new IPv4 network.</p> <p><b>ipv6ip</b> indicates that the tunnel interface carries only IPv6 packets and a packet sent out by the tunnel</p>

	interface is encapsulated with an IPv4 header and then transmitted over a new IPv4 network. The preceding tunnels are manual tunnels, whereas IPv6IP, 6to4, and ISATAP are automatic tunnels. During packet encapsulation, the destination IPv4 address is mapped from the destination IPv6 address.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Both ends of a tunnel must be configured with the same encapsulation mode. Otherwise, the tunnel cannot work.

### Configuration Example

#### Configuring the IPv4 over IPv4 Encapsulation Mode

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the IPv4 over IPv4 encapsulation mode on a tunnel interface.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# interface tunnel 1 Ruijie(config-if-Tunnel 1)# tunnel mode ipip Ruijie(config)# end</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check the configuration of the tunnel interface.</li> </ul> <pre>Ruijie# show interfaces tunnel 1 ..... Tunnel attributes: ..... Tunnel protocol/transport is ipv6ip</pre>

### Common Errors

- A 6to4 tunnel or ISATAP tunnel is configured for a virtual routing and forwarding (VRF) instance that is already configured with a 6to4/ISATAP tunnel.

### 9.3.3 Configuring a Local Address

#### Configuration Effect

- Configure the local address of a tunnel.

#### Notes

- The local address of a tunnel must match the transport protocol used by the tunnel. Otherwise, the tunnel interface will not be up (be disabled).

- When the local address is specified indirectly by configuring another interface, the local address is the primary IPv4 address or the first global public IPv6 address of IPv6.

### Configuration Steps

#### ▾ Configuring a Local Address

- Mandatory.
- Run the **tunnel source** command in tunnel interface configuration mode to specify the local address of a tunnel.

### Verification

- Run the **show interfaces tunnel number** command to display the local address of the tunnel.

### Related Commands

#### ▾ Configuring a Local Address

<b>Command</b>	<b>tunnel source</b> { <i>ip-address</i>   <i>interface-name interface-number</i> }
<b>Parameter</b>	<b>ip-address:</b> Indicates an IPv4 or IPv6 address.
<b>Description</b>	<i>Interface-name interface-number:</i> Indicates a Layer-3 interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If you specify an IPv4 or IPv6 address directly, you need to configure the address of the device.

### Configuration Example

#### ▾ Configuring a Local Address

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the local address of a tunnel as 1.1.1.1.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# interface tunnel 1 Ruijie(config-if-Tunnel 1)# tunnel mode ipv6ip Ruijie(config-if-Tunnel 1)# tunnel source 1.1.1.1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the configuration of the tunnel interface.</li> </ul> <pre>Ruijie# show interfaces tunnel 1 ..... Tunnel attributes:   Tunnel source 1.1.1.1, destination UNKNOWN, unrouteable   Tunnel TOS/Traffic Class not set, Tunnel TTL 254</pre>

```
Tunnel config nested limit is 0, current nested number is 0

Tunnel protocol/transport ipv6ip

Tunnel transport VPN is no set

.....
```

### 9.3.4 Configuring a Peer Address

#### Configuration Effect

- A manual tunnel can be used (the tunnel interface is up) only after its peer address is configured.

#### Notes

- Peer addresses cannot be configured for automatic tunnels.

#### Configuration Steps

##### ▾ Configuring a Peer Address

- The peer addresses must be configured for all tunnels except 6to4, and ISATAP tunnels.
- Run the **tunnel destination** command in interface configuration mode to configure the peer address of a tunnel.

#### Verification

- Run the **show interfaces tunnel** command to check whether the destination address is configured.

#### Related Commands

##### ▾ Configuring a Peer Address

<b>Command</b>	<b>tunnel destination</b> { <i>ip-address</i> }
<b>Parameter Description</b>	<i>ip-address</i> : Indicates an IPv4 or IPv6 address.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The peer address of a manual tunnel must be configured. The protocol suite type of the configured peer address must be consistent with the transport protocol used by the tunnel. If they are not consistent, the tunnel interface will be disabled (down).

#### Configuration Example

##### ▾ Configuring a Peer Address

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the peer address of a tunnel as 2.2.2.2.</li> </ul>
----------------------------	--

	<pre>Ruijie# configure terminal Ruijie(config)# interface tunnel 1 Ruijie(config-if-Tunnel 1)# tunnel mode ipv6ip Ruijie(config-if-Tunnel 1)# tunnel destination 2.2.2.2</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the configuration of the tunnel interface.</li> </ul>
	<pre>Ruijie# show interfaces tunnel 1 ..... Tunnel attributes:   Tunnel source: UNKNOWN, destination 2.2.2.2, unroutable   Tunnel TOS/Traffic Class not set, Tunnel TTL 254   Tunnel config nested limit is 0, current nested number is 0   Tunnel protocol/transport ipv6ip .....</pre>

### Common Errors

- A peer address is configured for an automatic tunnel.
- The peer address configured for a tunnel is the same as that of another tunnel.

## 9.3.5 Configuring the TOS of a Tunnel

### Configuration Effect

- Specify the TOS or Traffic Class field in the transport protocol header.

### Notes

- If the TOS or Traffic Class field in the transport protocol header is not specified, the TOS or Traffic Class field of the protocol is copied to the header.

### Configuration Steps

#### 📌 Configuring the TOS of a Tunnel

- Optional.
- To change the priority of tunnel data on a network, run the **tunnel tos** command in interface configuration mode.

### Verification

- Run the **show interfaces tunnel** command to check whether the TOS is configured.

## Related Commands

### Configuring the TOS of a Tunnel

<b>Command</b>	<code>tunnel tos number</code>
<b>Parameter Description</b>	<i>number</i> : Indicates the TOS of a tunnel.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, if the IPv4 protocol is used for the inner bearer and outer encapsulation in a tunnel, the TOS bytes in the inner IPv4 header are copied to the outer IPv4 header. If the IPv6 protocol is used for the inner bearer and outer encapsulation in a tunnel, the Traffic Class 8 bit in the inner IPv6 header is copied to the outer IPv6 header. In other cases, the TOS field in the outer IPv4 header and the Traffic Class field in the IPv6 header are 0.

## Configuration Example

### Configuring the TOS of a Tunnel

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the TOS of a tunnel.</li> </ul>
	<pre>Ruijie# configure terminal Ruijie(config)# interface tunnel 1 Ruijie(config-if-Tunnel 1)# tunnel mode ipv6ip Ruijie(config-if-Tunnel 1)# tunnel tos 2</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check the configuration of the tunnel interface.</li> </ul>
	<pre>Ruijie# show interfaces tunnel 1 ..... Tunnel attributes:   Tunnel source 1.1.1.1, destination UNKNOWN, unrouteable   Tunnel TOS/Traffic Class 0x2, Tunnel TTL 254   Tunnel config nested limit is 0, current nested number is 0   Tunnel protocol/transport ipv6ip   Tunnel transport VPN is VPN1 .....</pre>

### 9.3.6 Configuring the TTL of a Tunnel

#### Configuration Effect

- Specify the TTL or hop limit of tunnel encapsulation protocol headers.

#### Configuration Steps

##### Configuring the TTL of a Tunnel

- Optional.
- By default, the TTL is 254.
- To specify the tunnel link length limit, run the **tunnel ttl** command.

#### Verification

- Run the **show interfaces tunnel** command to check whether the TTL is configured.

#### Related Commands

##### Configuring the TTL of a Tunnel

<b>Command</b>	<b>tunnel ttl</b> <i>hop-limit</i>
<b>Parameter Description</b>	<i>hop-limit</i> : Indicates the hop limit of a tunnel.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The hop limit specifies the maximum number of routers that a packet can pass through. The default value is 254. This command is used to specify the hop quantity limit.

#### Configuration Example

##### Configuring the TTL of a Tunnel

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the TTL of a tunnel.</li> </ul> <pre>Ruijie# configure terminal Ruijie(config)# interface tunnel 1 Ruijie(config-if-Tunnel 1)# tunnel mode ipv6ip Ruijie(config-if-Tunnel 1)# tunnel ttl 3</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Check the configuration of the tunnel interface.</li> </ul> <pre>Ruijie# show interfaces tunnel 1 .....</pre>

	<pre>Tunnel attributes:  Tunnel source 1.1.1.1, destination UNKNOWN, unrouteable  Tunnel TOS/Traffic Class 0x2, Tunnel TTL 3  Tunnel config nested limit is 0, current nested number is 0  Tunnel protocol/transport ipv6ip  Tunnel transport VPN is VPN1</pre>
--	---

## 9.4 Monitoring

### Displaying

Description	Command
Displays the information about a tunnel interface.	<b>show interfaces tunnel <i>number</i></b>

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Enables tunnel interface debugging.	<b>debug tunnel</b>

# 10 Configuring Network Communication Test Tools

## 10.1 Overview

Network communication test tools can be used to check the connectivity of a network and helps you analyze and locate network faults. Network communication test tools include Packet Internet Groper (PING) and Traceroute. Ping is used to check the connectivity and delay of a network. A greater delay indicates a slower network speed. Traceroute helps you learn about the topology of physical and logical links and transmission rate. On a network device, you can run the **ping** and **traceroute** commands to use the two tools respectively.

### Protocols and Standards

- RFC792: Internet Control Message Protocol
- RFC4443: Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification

## 10.2 Applications

Application	Description
<a href="#">End-to-End Connectivity Test</a>	Both the network device and the destination host are connected to the IP network and configured with IP addresses.
<a href="#">Host Route Test</a>	Both the network device and the destination host are connected to the IP network and configured with IP addresses.

### 10.2.1 End-to-End Connectivity Test

#### Scenario

As shown in Figure 10-1, Network Device A and Target Host B are connected to the IP network.

If both the network device and the target host are connected to the IP network, the end-to-end connectivity test aims to check whether IP packets can be transmitted between the two ends. The target host can be the network device itself. In this case, the connectivity test aims to check the network interface and TCP/IP configurations on the device.

Figure 10-1

#### Deployment

Execute the ping function on the network device.

## 10.2.2 Host Route Test

### Scenario

As shown in Figure 10-2, Network Device A and Target Host B are connected to the IP network.

If both the network device and the target host are connected to the IP network, the host route test aims to check gateways (or routers) that IP packets pass through between the two ends. Generally, the target host is not within the same IP network segment as the network device.

Figure 10-2

### Deployment

Execute the traceroute function on the network device.

## 10.3 Features

### Overview

Feature	Description
<a href="#">Ping Test</a>	Test whether the specified IPv4 or IPv6 address is reachable and display the related information.
<a href="#">Traceroute Test</a>	Display the gateways that IPv4 or IPv6 packets pass through when transmitted from the source to the destination.

### 10.3.1 Ping Test

#### Working Principle

The ping tool sends an Internet Control Message Protocol (ICMP) Request message to the destination host to request the for an ICMP Echo Reply message. In this way, the ping tool determines the delay and the connectivity between the two network devices.

#### Related Configuration

- Run the **ping** command.

### 10.3.2 Traceroute Test

#### Working Principle

The traceroute tool uses the Time To Live (TTL) field in the headers of the ICMP and IP messages for the test First, the traceroute tool on the network device sends an ICMP Request message with TTL 1 to the destination host. After receiving

the message, the first router on the path decreases the TTL by 1. As the TTL becomes 0, the router drops the packets and returns an ICMP time exceeded message to the network device. After receiving this message, the traceroute tool learns that this router exists on this path, and then sends an ICMP Request packet with TTL 2 to the destination host to discover the second router. Each time the traceroute tool increases the TTL in the ICMP Request message by 1 to discover one more router. This process is repeated until a data packet reaches the destination host. After the packet reaches the destination host, the host returns an ICMP Echo message instead of an ICMP time exceeded message to the network device. Then, the traceroute tool finishes the test and displays the path from the network device to the destination host.

### Related Configuration

- Run the **traceroute** command.

## 10.4 Configuration

Configuration	Description and Command
<a href="#">Ping Test</a>	 (Optional) It is used to check whether an IPv4 or IPv6 address is reachable.
	<b>ping</b>   Executes the Ping function.
<a href="#">Traceroute Test</a>	 (Optional) It is used to display the gateways that IPv4 or IPv6 packets pass through when transmitted from the source to the destination.
	<b>traceroute</b>   Executes the traceroute function.

### 10.4.1 Ping Test

#### Configuration Effect

After conducting a ping test on a network device, you can learn whether the network device is connected to the destination host and whether packets can be transmitted between the network device and the destination host.

#### Notes

The network device must be configured with an IP address.

#### Configuration Steps

- To check whether an IPv4 address is reachable, use the **ping IPv4** command.
- To check whether an IPv6 address is reachable, use the **ping IPv6** command.

#### Verification

Run the **ping** command to display related information on the command line interface (CLI) window.

#### Related Commands

- [Ping IPv4](#)

<b>Command</b>	<b>ping</b> [ <b>oob</b>   <b>vrf</b> <i>vrf-name</i>   <b>ip</b> ] [ <i>address</i> [ <b>via</b> <i>mgmt-name</i> ] ] [ <b>length</b> <i>length</i> ] [ <b>ntimes</b> <i>times</i> ] [ <b>timeout</b> <i>seconds</i> ] [ <b>data</b> <i>data</i> ] [ <b>source</b> <i>source</i> ] [ <b>df-bit</b> ] [ <b>validate</b> ] [ <b>detail</b> ] [ <b>interval</b> millisecond]]
<b>Parameter Description</b>	<p><b>oob</b>: Indicates out-of-band management. This parameter must be configured if the MGMT port is specified as the source port.</p> <p><i>vrf-name</i>: Indicates the VPN routing and forwarding (VRF) name.</p> <p><i>address</i>: Specifies the destination IPv4 address or domain name.</p> <p><i>mgmt-name</i>: Specifies the MGMT port in OOB mode.</p> <p><i>length</i>: Specifies the length of the data packet. The value ranges from 36 to 18,024. The default length is 100.</p> <p><i>times</i>: Specifies the number of probes. The value ranges from 1 to 4,294,967,295</p> <p><i>seconds</i>: Specifies the timeout. The value ranges from 1s to 10s.</p> <p><i>data</i>: Specifies the data in the packet. The data is a string of 1 to 255 bytes. By default, the string is "abcd".</p> <p><i>source</i>: Specifies the source IPv4 address or source port of the packet. The loopback interface address, for example, 127.0.0.1, cannot be used as the source address.</p> <p><b>df-bit</b>: Configures the DF bit of the IP address. When the DF bit is set to 1, the packet is not fragmented. By default, the DF bit is 0.</p> <p><b>validate</b>: Configures whether to verify the response packet.</p> <p><b>detail</b>: Configures whether to display the Echo Reply message in detail. By default, only the exclamation mark (!) and dot (.) are displayed.</p> <p>millisecond: Specifies the interval at which the ping packet is sent. The value ranges from 10 ms to 300,000 ms. The default interval is 100 ms.</p>
<b>Command Mode</b>	<p>In User EXEC mode, you can execute only the basic ping function. In Privileged EXEC mode, you can execute the extended ping function.</p> <p>In other configuration modes, you can run the <b>do</b> command to execute the extended ping function. For details about the configuration, see the description about the <b>do</b> command.</p>
<b>Configuration Usage</b>	<p>When the ping function is executed, information about the response (if any) will be displayed, and then related statistics will be output. Using the extended ping function, you can specify the number, length and timeout of packets to be sent. Like the basic ping function, related statistics will be output.</p> <p>To use the domain name, you must first configure the domain name server (DNS). For details about the configuration, see <i>Configuring DNS</i>.</p>

## 📌 Ping IPv6

<b>Command</b>	<b>ping</b> [ <b>vrf</b> <i>vrf-name</i>   [ <b>oob</b> ] <b>ipv6</b> ] [ <i>address</i> [ <b>via</b> <i>mgmt-name</i> ] ] [ <b>length</b> <i>length</i> ] [ <b>ntimes</b> <i>times</i> ] [ <b>timeout</b> <i>seconds</i> ] [ <b>data</b> <i>data</i> ] [ <b>source</b> <i>source</i> ] [ <b>detail</b> ] [ <b>interval</b> millisecond] [ <b>out-interface</b> interface]]
<b>Parameter Description</b>	<p><b>oob</b>: Indicates out-of-band management. This parameter must be configured if the MGMT port is specified as the source port.</p> <p><i>vrf-name</i>: Indicates the VRF name.</p> <p><i>address</i>: Specifies the destination IPv6 address or domain name.</p> <p><i>mgmt-name</i>: Specifies the MGMT port in OOB mode.</p> <p><i>length</i>: Specifies the length of data packet. The value ranges from 16 to 18,024. The default length is 100.</p> <p><i>times</i>: Specifies the number of probes. The value ranges from 1 to 4,294,967,295.</p>

	<p><i>seconds</i>: Specifies the timeout. The value ranges from 1s to 10s.</p> <p><i>data</i>: Specifies the data in the packet. The data is a string of 1 to 255 bytes.</p> <p><i>source</i>: Specifies the source IPv6 address or source port of the packet. The loopback interface address, for example, ::1, cannot be used as the source address.</p> <p><b>detail</b>: Configures whether to display the Echo Reply message in detail. By default, only the exclamation mark (!) and dot (.) are displayed.</p> <p><i>millisecond</i>: Specifies the interval at which the ping packet is sent. The value ranges from 10 ms to 300,000 ms. The default interval is 100 ms.</p>
<b>Command Mode</b>	<p>In User EXEC mode, you can execute only the basic ping IPv6 function. In Privileged EXEC mode, you can execute the extended ping IPv6 function.</p> <p>In other configuration modes, you can run the <b>do</b> command to execute the extended ping function. For details about the configuration, see the description about the <b>do</b> command.</p>
<b>Configuration Usage</b>	<p>When the ping IPv6 function is executed, information about the response (if any) will be displayed, and then related statistics will be output.</p> <p>Using the extended ping IPv6 function, you can specify the number, length and timeout of packets to be sent. Like the basic ping IPv6 function, related statistics will be output.</p> <p>To use the domain name, you must first configure the DNS. For details about the configuration, see <i>Configuring DNS</i>.</p>

## Configuration Example

### ↳ Executing the Common Ping Function

<b>Configuration Steps</b>	<p>In Privileged EXEC mode, run the <b>ping 192.168.21.26</b> command.</p>
	<pre> Common ping command: Ruijie# ping 192.168.21.26  Sending 5, 100-byte ICMP Echoes to 192.168.21.26, timeout is 2 seconds: &lt; press Ctrl+C to break &gt;  !!!!  Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/10 ms  Detailed ping command: Ruijie#ping 192.168.21.26 detail  Sending 5, 100-byte ICMP Echoes to 192.168.21.26, timeout is 2 seconds:    &lt; press Ctrl+C to break &gt;  Reply from 192.168.21.26: bytes=100 time=4ms TTL=64 Reply from 192.168.21.26: bytes=100 time=3ms TTL=64 Reply from 192.168.21.26: bytes=100 time=1ms TTL=64 </pre>

	<pre>Reply from 192.168.21.26: bytes=100 time=1ms TTL=64 Reply from 192.168.21.26: bytes=100 time=1ms TTL=64  Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms.</pre>
<b>Verification</b>	Send five 100-byte packets to the specified IP address, and the response information will be displayed in the specified time (2s by default). Finally the statistics is output.

📌 Executing the Extended Ping Function

<b>Configuration Steps</b>	In Privileged EXEC mode, run the <b>ping 192.168.21.26</b> command. In addition, specify the length, number, and timeout of the packets.
	<pre>Common ping command: Ruijie# ping 192.168.21.26 length 1500 ntimes 100 data ffff source 192.168.21.99 timeout 3 Sending 100, 1500-byte ICMP Echoes to 192.168.21.26, timeout is 3 seconds:  &lt; press Ctrl+C to break &gt; !! !!!!!! Success rate is 100 percent (100/100), round-trip min/avg/max = 2/2/3 ms  Detailed ping command: ping 192.168.21.26 length 1500 ntimes 20 data ffff source 192.168.21.99 timeout 3 detail Sending 20, 1500-byte ICMP Echoes to 192.168.21.26, timeout is 3 seconds:  &lt; press Ctrl+C to break &gt; Reply from 192.168.21.26: bytes=1500 time=1ms TTL=64 Reply from 192.168.21.26: bytes=1500 time=2ms TTL=64 Reply from 192.168.21.26: bytes=1500 time=1ms TTL=64</pre>

	<pre>Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms.</pre>
<b>Verification</b>	Send five 100-byte packets to the specified IP address, and the response information will be displayed in the specified time (2s by default). Finally the statistics is output.

↘ Executing the Extended Ping IPv6 Function

<b>Configuration Steps</b>	In Privileged EXEC mode, run the <b>ping ipv6 2001::5</b> command. In addition, specify the length, number, and timeout of the packets.
	<pre>Common ping command: Ruijie# ping ipv6 2001::5 length 1500 ntimes 100 data ffff source 2001::9 timeout 3 Sending 100, 1500-byte ICMP Echoes to 2000::1, timeout is 3 seconds:  &lt; press Ctrl+C to break &gt; !! !!!!!! Success rate is 100 percent (100/100), round-trip min/avg/max = 2/2/3 ms Detailed ping command: Ruijie#ping 2001::5 length 1500 ntimes 10 data ffff source 2001::9 timeout 3 Sending 10, 1500-byte ICMP Echoes to 2001::5, timeout is 3 seconds:  &lt; press Ctrl+C to break &gt; Reply from 2001::5: bytes=1500 time=1ms Success rate is 100 percent (10/10), round-trip min/avg/max = 1/1/1 ms.</pre>
<b>Verification</b>	Send one hundred 1500-byte packets to the specified IPv6 address, and the response information (if any)

	will be displayed in the specified time (3s by default). Finally the statistics is output.
--	--

## 10.4.2 Traceroute Test

### Configuration Effect

After conducting a traceroute test on a network device, you can learn about the routing topology between the network device and the destination host, and the gateways through which packets are sent from the network device to the destination host.

### Notes

The network device must be configured with an IP address.

### Configuration Steps

- To trace the route an IPv4 packet would follow to the destination host, run the **traceroute IPv4** command.
- To trace the route an IPv6 packet would follow to the destination host, run the **traceroute IPv6** command.

### Verification

Run the **traceroute** command to display related information on the CLI window.

### Related Commands

#### Traceroute IPv4

<b>Command</b>	<b>traceroute</b> [ <b>oob</b>   <b>vrf</b> <i>vrf-name</i>   <b>ip</b> ] [ <i>adress</i> [ <b>via</b> <i>mgmt-name</i> ] ] [ <b>probe</b> <i>number</i> ] [ <b>source</b> <i>source</i> ] [ <b>timeout</b> <i>seconds</i> ] [ <b>t</b> <i>tl</i> <i>minimum maximum</i> ]
<b>Parameter Description</b>	<p><b>oob</b>: Indicates out-of-band management. This parameter must be configured if the MGMT port is specified as the source port.</p> <p><i>vrf-name</i>: Indicates the VRF name.</p> <p><i>adress</i>: Specifies the destination IPv4 address or domain name.</p> <p><i>mgmt-name</i>: Specifies the MGMT port in OOB mode.</p> <p><i>number</i>: Specifies the number of probes. The value ranges from 1 to 255.</p> <p><i>source</i>: Specifies the source IPv4 address or source port of the packet. The loopback interface address, for example, 127.0.0.1, cannot be used as the source address.</p> <p><i>seconds</i>: Specifies the timeout. The value ranges from 1s to 10s.</p> <p><i>minimum maximum</i>: Specifies the minimum and maximum TTL values. The value ranges from 1 to 255.</p>
<b>Command Mode</b>	In User EXEC mode, you can execute only the basic traceroute function. In privileged EXEC mode, you can execute the extended traceroute function.
<b>Configuration Usage</b>	The <b>traceroute</b> command is used to test the network connectivity and accurately locate a fault when the fault occurs. To use the domain name, you must first configure the DNS. For details about the configuration, see <i>Configuring DNS</i> .

#### Traceroute IPv6

<b>Command</b>	<b>tracertool</b> [ vrf <i>vrf-name</i>   [ oob ] ipv6 ] [ address [ via <i>mgmt-name</i> ] [ probe <i>number</i> ] [ timeout <i>seconds</i> ] [ ttl <i>minimum maximum</i> ]
<b>Parameter Description</b>	<p><b>oob</b>: Indicates out-of-band management. This parameter must be configured if the MGMT port is specified as a source port.</p> <p><i>vrf-name</i>: Indicates the VRF name.</p> <p><i>address</i>: Specifies the destination IPv6 address or domain name.</p> <p><i>mgmt-name</i>: Specifies the MGMT port in OOB mode.</p> <p><i>number</i>: Specifies the number of probes. The value ranges from 1 to 255.</p> <p><i>seconds</i>: Specifies the timeout. The value ranges from 1s to 10s.</p> <p><i>minimum maximum</i>: Specifies the minimum and maximum TTL values. The value ranges from 1 to 255.</p>
<b>Command Mode</b>	In User EXEC mode, you can execute only the basic tracertool IPv6 function. In privileged EXEC mode, you can execute the extended tracertool IPv6 function.
<b>Configuration Usage</b>	The tracertool IPv6 command is used to test the network connectivity and accurately locate a fault when the fault occurs. To use the domain name, you must first configure the DNS. For details about the configuration, see <i>Configuring DNS</i> .

### Configuration Example

#### ↘ Executing the Tracertool Function on a Properly Connected Network

<b>Configuration Steps</b>	In Privileged EXEC mode, run the <b>tracertool ipv6 3004::1</b> command.
	<pre> Ruijie# Ruijie# tracertool ipv6 3004::1   &lt; press Ctrl+C to break &gt;  Tracing the route to 3004::1   1   3000::1      0 msec  0 msec  0 msec  2   3001::1      4 msec  4 msec  4 msec  3   3002::1      8 msec  8 msec  4 msec                     </pre>
	The preceding test result indicates that the network device accesses host 3004::1 by transmitting packets through gateways 1–3. In addition, the time required to reach each gateway is displayed.

#### ↘ Executing the Tracertool Function on a Faulty Network

<b>Configuration Steps</b>	In Privileged EXEC mode, run the <b>tracertool 202.108.37.42</b> command.
----------------------------	---

<pre> Ruijie# traceroute 202.108.37.42  &lt; press Ctrl+C to break &gt;  Tracing the route to 202.108.37.42   1   192.168.12.1      0 msec  0 msec  0 msec  2   192.168.9.2      0 msec  4 msec  4 msec  3   192.168.110.1   16 msec 12 msec 16 msec  4   * * *  5   61.154.8.129    12 msec 28 msec 12 msec  6   61.154.8.17     8 msec 12 msec 16 msec  7   61.154.8.250    12 msec 12 msec 12 msec  8   218.85.157.222  12 msec 12 msec 12 msec  9   218.85.157.130  16 msec 16 msec 16 msec 10   218.85.157.77   16 msec 48 msec 16 msec 11   202.97.40.65    76 msec 24 msec 24 msec 12   202.97.37.65    32 msec 24 msec 24 msec 13   202.97.38.162   52 msec 52 msec 224 msec 14   202.96.12.38    84 msec 52 msec 52 msec 15   202.106.192.226 88 msec 52 msec 52 msec 16   202.106.192.174 52 msec 52 msec 88 msec 17   210.74.176.158 100 msec 52 msec 84 msec 18   202.108.37.42   48 msec 48 msec 52 msec                 </pre>
<p>The preceding test result indicates that the network device accesses host 202.108.37.42 by transmitting packets through gateways 1–17, and Gateway 4 is faulty.</p>

Executing the Traceroute IPv6 Function on a Properly Connected Network

<b>Configuration Steps</b>	In Privileged EXEC mode, run the <b>traceroute ipv6 3004::1</b> command.
----------------------------	--

	<pre>Ruijie# traceroute ipv6 3004::1 &lt; press Ctrl+C to break &gt; Tracing the route to 3004::1 1    3000::1      0 msec  0 msec  0 msec 2    3001::1      4 msec  4 msec  4 msec 3    3002::1      8 msec  8 msec  4 msec 4    3004::1      4 msec  28 msec 12 msec</pre>
	<p>The preceding test result indicates that the network device accesses host 3004::1 by transmitting packets through gateways 1-4. In addition, the time required to reach each gateway is displayed.</p>

### ↘ Executing the Traceroute IPv6 Function on a Faulty Network

<p><b>Configuration Steps</b></p>	<p>In Privileged EXEC mode, run the <b>traceroute ipv6 3004::1</b> command.</p>
	<pre>Ruijie# traceroute ipv6 3004::1 &lt; press Ctrl+C to break &gt; Tracing the route to 3004::1 1    3000::1      0 msec  0 msec  0 msec 2    3001::1      4 msec  4 msec  4 msec 3    3002::1      8 msec  8 msec  4 msec 4    * * * 5    3004::1      4 msec  28 msec 12 msec</pre>
	<p>The preceding test result indicates that the network device accesses host 3004::1 by transmitting packets through gateways 1–5, and Gateway 4 is faulty.</p>

# 11 Configuring TCP

## 11.1 Overview

The Transmission Control Protocol (TCP) is a transport-layer protocol providing reliable connection-oriented and IP-based services to for the application layer.

Internetwork data flows in 8-bit bytes are sent from the application layer to the TCP layer, and then fragmented into packet segments of a proper length via the TCP. The Maximum Segment Size (MSS) is usually limited by the Maximum Transmission Unit (MTU) of the data link layer. After that, the packets are sent to the IP layer and then to the TCP layer of a receiver through the network.

To prevent packet loss, every byte is identified by a sequence number via the TCP, and this ensures that packets destined for the peer are received in order. Then, the receiver responds with a TCP ACK packet upon receiving a packet. If the sender does not receive ACK packets in a reasonable Round-Trip Time (RTT), the corresponding packets (assumed lost) will be retransmitted.

- TCP uses the checksum function to check data integrity. Besides, MD5-based authentication can be used to verify data.
- Timeout retransmission and piggyback mechanism are adopted to ensure reliability.
- The Sliding Window Protocol is adopted to control flows. As documented in the Protocol, unidentified groups in a window should be retransmitted.

### Protocols and Standards

- RFC 793: Transmission Control Protocol
- RFC 1122: Requirements for Internet Hosts -- Communication Layers
- RFC 1191: Path MTU Discovery
- RFC 1213: Management Information Base for Network Management of TCP/IP-based Internets: MIB-II
- RFC 2385: Protection of BGP Sessions via the TCP MD5 Signature Option
- RFC 4022: Management Information Base for the Transmission Control Protocol (TCP)

## 11.2 Applications

Application	Description
<a href="#">Optimizing TCP Performance</a>	To avoid TCP packet fragmentation on a link with a small MTU, Path MTU Discovery (PMTUD) is enabled.
<a href="#">Detecting TCP Connection Exception</a>	TCP checks whether the peer works normally.

## 11.2.1 Optimizing TCP Performance

### Scenario

For example, TCP connection is established between A and D, as shown in the following figure. The MTU of the link between A and B is 1500 bytes, 1300 bytes between B and C, and 1500 bytes between C and D. To optimize TCP transmission performance, packet fragmentation should be avoided between B and C.

Figure 11-1

**Remarks:** A, B, C and D are routers.

### Deployment

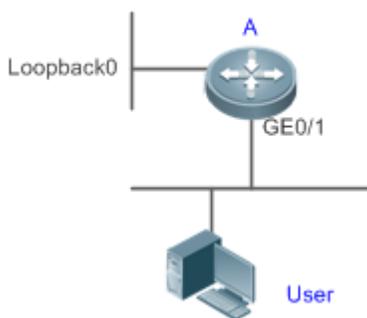

- Enable PMTUD on A and D.

## 11.2.2 Detecting TCP Connection Exception

### Scenario

For example, in the following figure, User logs in to A through telnet but is shut down abnormally, as shown in the following figure. In case of TCP retransmission timeout, the User's TCP connection remains for a long period. Therefore, TCP keepalive can be used to rapidly detect TCP connection exception.

Figure 11-2

**Remarks:** A is a router.

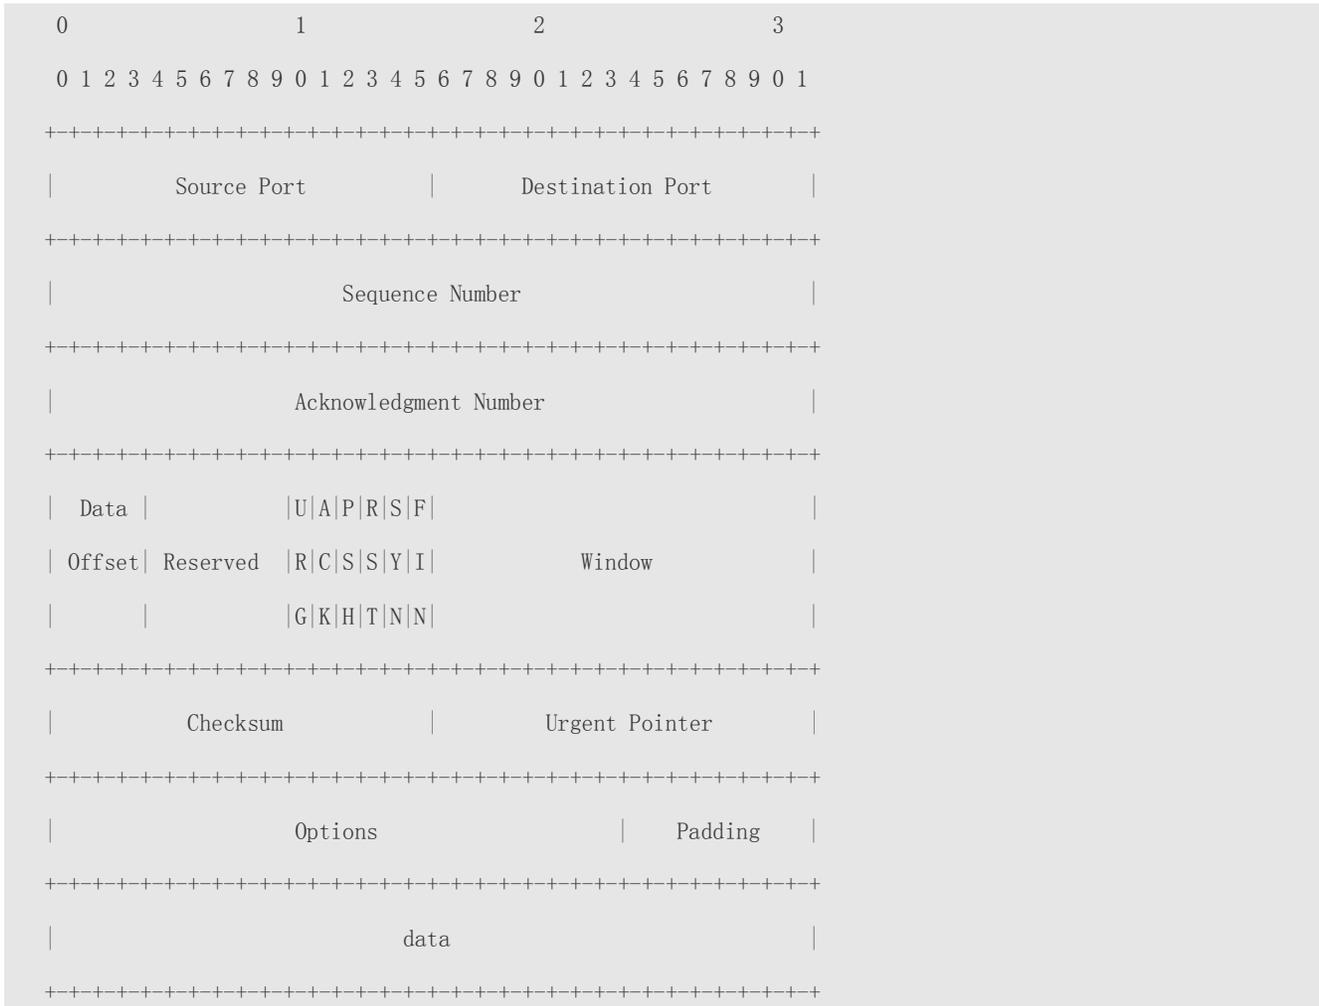

### Deployment

- Enable TCP keepalive on A.

## 11.3 Features

### Basic Concepts

#### ↳ TCP Header Format

- **Source Port** is a 16-bit source port number.
- **Destination Port** is a 16-bit destination port number.
- **Sequence Number** is a 32-bit sequence number.
- **Acknowledgment Number** is a 32-bit number that identifies the next sequence number that the receiver is expecting to receive.
- **Data Offset** is a 4-bit number that indicates the total number of bytes in the TCP header (option included) divided by 4.
- A flag bit is 6-bit. URG: the urgent pointer field is significant; ACK: the acknowledgment field is significant; PSH: indicates the push function; RST: resets TCP connection; SYN: synchronizes the sequence number (establishing a TCP connection); FIN: no more data from the sender (closing a TCP connection).

- A 16-bit Window value is used to control flows. It specifies the amount of data that may be transmitted from the peer between ACK packets.
- **Checksum** is a 16-bit checksum.
- **Urgent Pointer** is 16-bit and shows the end of the urgent data so that interrupted data flows can continue. When the URG bit is set, the data is given priority over other data flows.

### ↘ TCP Three-Way Handshake

- The process of TCP three-way handshake is as follows:
  24. A client sends a SYN packet to the server.
  25. The server receives the SYN packet and responds with a SYN ACK packet.
  26. The client receives the SYN packet from the server and responds with an ACK packet.
- After the three-way handshake, the client and server are connected successfully and ready for data transmission.

### Overview

Feature	Description
<a href="#">Configuring SYN Timeout</a>	Configure a timeout waiting for a response packet after an SYN or SYN ACK packet is sent.
<a href="#">Configuring Window Size</a>	Configure a window size.
<a href="#">Configuring Reset Packet Sending</a>	Configure the sending of TCP reset packets after receiving port unreachable messages.
<a href="#">Configuring MSS</a>	Configure an MSS for TCP connection.
<a href="#">Path MTU Discovery</a>	Discover the smallest MTU on TCP transmission path, and adjust the size of TCP packets based on this MTU to avoid fragmentation.
<a href="#">TCP Keepalive</a>	Check whether the peer works normally.

## 11.3.1 Configuring SYN Timeout

### Working Principle

A TCP connection is established after three-way handshake: The sender sends an SYN packet, the receiver replies with a SYN ACK packet, and then the sender replies with an ACK packet.

- If the receiver does not reply with a SYN ACK packet after the sender sends an SYN packet, the sender keeps retransmitting the SYN packet for certain times or until timeout period expires.
- If the receiver replies with a SYN ACK packet after the sender sends an SYN packet but the sender does not reply with an ACK packet, the receiver keeps retransmitting the SYN ACK packet for certain times or until timeout period expires. (This occurs in the case of SYN flooding.)

### Related Configuration

#### ↘ Configuring TCP SYN Timeout

- The default TCP SYN timeout is 20 seconds.

- Run the **ip tcp synwait-time** *seconds* command in global configuration mode to configure a SYN timeout ranging from 5 to 300 seconds.
- In case of SYN flooding, shortening SYN timeout reduces resource consumption. However, it does not work in continuous SYN flooding. When a device actively makes a request for a connection with an external device, through telnet for example, shortening SYN timeout reduces user's wait time. You may prolong SYN timeout properly on a poor network.

---

 In version 11.0 or later, it applies to both IPv4 TCP and IPv6 TCP.

---

## 11.3.2 Configuring Window Size

### Working Principle

---

Data from the peer is cached in the TCP receiving buffer and subsequently read by applications. The TCP window size indicates the size of free space of the receiving buffer. For wide-bandwidth bulk-data connection, enlarging the window size dramatically promotes TCP transmission performance.

### Related Configuration

---

#### ▾ Configuring Window Size

- Run the **ip tcp window-size** *size* command in global configuration mode to configure a window size ranging from 128 to (65535<< 14) bytes. The default is 65535 bytes. If the window size is greater than 65535 bytes, window enlarging will be enabled automatically.
- The window size advertised to the peer is the smaller value between the configured window size and the free space of the receiving buffer.

---

 In version 11.0 or later, it applies to both IPv4 TCP and IPv6 TCP.

---

## 11.3.3 Configuring Reset Packet Sending

### Working Principle

---

When TCP packets are distributed to applications, if the TCP connection a packet belongs to cannot be identified, the local end sends a reset packet to the peer to terminate the TCP connection. Attackers may use port unreachable messages to attack the device.

### Related Configuration

---

#### ▾ Configuring the Sending of TCP Reset Packets After Receiving Port Unreachable Messages

By default, TCP reset packet sending upon receiving port unreachable messages is enabled.

Run the **no ip tcp send-reset** command in global configuration mode to disable TCP reset packet sending upon receiving port unreachable messages.

After this function is enabled, attackers may use port unreachable messages to attack the device.

**i** In version 11.0 or later, it applies to both IPv4 TCP and IPv6 TCP.

## 11.3.4 Configuring MSS

### Working Principle

The MSS refers to the total amount of data contained in a TCP segment excluding TCP options.

Three-way handshake is implemented through MSS negotiation. Both parties add the MSS option to SYN packets, indicating the largest amount of data that the local end can handle, namely, the amount of data allowed from the peer. Both parties take the smaller MSS between them as the advertised MSS.

The MSS value is calculated as follows:

- IPv4 TCP:  $MSS = \text{Outgoing interface MTU} - \text{IP header size (20-byte)} - \text{TCP header size (20-byte)}$ .
- IPv6 TCP:  $MSS = \text{IPv6 Path MTU} - \text{IPv6 header size (40-byte)} - \text{TCP header size (20-byte)}$ .

**i** In version 11.0 or later, it applies to both IPv4 TCP and IPv6 TCP.

**i** The effective MSS is the smaller one between the calculated MSS and the configured MSS.

**i** If a connection supports certain options, the option length (with **data offset** taken into consideration) should be deducted from an MSS value. For example, 20 bytes for MD5 digest (with **data offset** taken into consideration) should be subtracted from the MSS.

### Related Configuration

#### Configuring MSS

- Run the **ip tcp mss max-segment-size** command in global configuration mode to set an MSS. It ranges from 68 to 1000 bytes. By default, the MSS is calculated based on MTU. If an MSS is configured, the effective MSS is the smaller one between the calculated MSS and the configured MSS.
- An excessively small MSS reduces transmission performance. You can promote TCP transmission by increasing the MSS. Choose an MSS value by referring to the interface MTU. If the former is bigger, TCP packets will be fragmented and transmission performance will be reduced.

## 11.3.5 Path MTU Discovery

### Working Principle

The Path MTU Discovery stipulated in RFC1191 is used to discover the smallest MTU in a TCP path to avoid fragmentation, enhancing network bandwidth utilization. The process of TCPv4 Path MTU Discovery is described as follows:

27. The source sends TCP packets with the Don't Fragment (DF) bit set in the outer IP header.
28. If the outgoing interface MTU value of a router in the TCP path is smaller than the IP packet length, the packet will be discarded and an ICMP error packet carrying this MTU will be sent to the source.
29. Through parsing the ICMP error packet, the source knows the smallest MTU in the path (path MTU) is.

30. The size of subsequent data segments sent by the source will not surpass the MSS, which is calculated as follows: TCP MSS = Path MTU – IP header size – TCP header size.

## Related Configuration

### ↳ Enabling Path MTU Discovery

By default, Path MTU Discovery is disabled.

Run the **ip tcp path-mtu-discovery** command to enable PMTUD in global configuration mode.

 In version 11.0 or later, it applies to only IPv4 TCP. TCPv6 PMTUD is enabled permanently and cannot be disabled.

## 11.3.6 TCP Keepalive

### Working Principle

You may enable TCP keepalive to check whether the peer works normally. If a TCP end does not send packets to the other end for a period of time (namely idle period), the latter starts sending keepalive packets successively to the former for several times. If no response packet is received, the TCP connection is considered inactive and then closed.

## Related Configuration

### ↳ Enabling Keepalive

- By default, TCP keepalive is disabled.
- Run the **ip tcp keepalive [interval num1] [times num2] [idle-period num3]** command to in global configuration mode to enable TCP keepalive. See **Configuration** for parameter description.

 In version 11.0 or later, it applies to both IPv4 TCP and IPv6 TCP.

 This command applies to both TCP server and client.

## 11.4 Configuration

Configuration	Description and Command
<a href="#">Optimizing TCP Performance</a>	 (Optional) It is used to optimize TCP connection performance.
	<b>ip tcp synwait-time</b>   Configures a timeout for TCP connection.
	<b>ip tcp window-size</b>   Configures a TCP window size.
	<b>ip tcp send-reset</b>   Configures the sending of TCP reset packets after receiving port unreachable messages.
	<b>ip tcp mss</b>   Configures an MSS for TCP connection.
	<b>ip tcp path-mtu-discovery</b>   Enables Path MTU Discovery.
<a href="#">Detecting TCP Connection</a>	 (Optional) It is used to detect whether the peer works normally.

<a href="#">Exception</a>	<code>ip tcp keepalive</code>	Enables TCP keepalive.
---------------------------	-------------------------------	------------------------

## 11.4.1 Optimizing TCP Performance

### Configuration Effect

- Ensure optimal TCP performance and prevent fragmentation.

### Notes

N/A

### Configuration Steps

#### ↘ **Configuring SYN Timeout**

- Optional.
- Configure this on the both ends of TCP connection.

#### ↘ **Configuring TCP Window Size**

- Optional.
- Configure this on the both ends of TCP connection.

#### ↘ **Configuring the Sending of TCP Reset Packets After Receiving Port Unreachable Messages.**

- Optional.
- Configure this on the both ends of TCP connection.

#### ↘ **Configuring MSS**

- Optional.
- Configure this on the both ends of TCP connection.

#### ↘ **Enabling Path MTU Discovery**

- Optional.
- Configure this on the both ends of TCP connection.

### Verification

N/A

### Related Commands

#### ↘ **Configuring SYN Timeout**

<b>Command</b>	<code>ip tcp synwait-time seconds</code>
<b>Parameter</b>	<code>seconds</code> : Indicates SYN packet timeout. It ranges from 5 to 300 seconds. The default is 20 seconds.

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In case of SYN flooding, shortening SYN timeout reduces resource consumption. However, it does not work in continuous SYN flooding. When a device actively makes a request for a connection with an external device, through telnet for example, shortening SYN timeout reduces user's wait time. You may prolong SYN timeout properly on a poor network.

### ↘ Configuring TCP Window Size

<b>Command</b>	<b>ip tcp window-size</b> <i>size</i>
<b>Parameter Description</b>	<i>size</i> : Indicates a TCP window size. It ranges from 128 to (65535 << 14) bytes. The default is 65535 bytes.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↘ Configuring the Sending of TCP Reset Packets After Receiving Port Unreachable Messages

<b>Command</b>	<b>ip tcp send-reset</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, TCP reset packet sending upon receiving port unreachable messages is enabled.

### ↘ Configuring MSS

<b>Command</b>	<b>ip tcp mss</b> <i>max-segment-size</i>
<b>Parameter Description</b>	<i>max-segment-size</i> : Indicates the maximum segment size. It ranges from 68 to 10000 bytes. By default, the MSS is calculated based on MTU.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command defines the MSS for a TCP communication to be established. The negotiated MSS for a new connection should be smaller than this MSS. If you want to reduce the MSS, run this command. Otherwise, do not perform the configuration.

### ↘ Configuring Path MTU Discovery

<b>Command</b>	<b>ip tcp path-mtu-discovery</b> [ <b>age-timer</b> <i>minutes</i>   <b>age-timer</b> <i>infinite</i> ]
<b>Parameter Description</b>	<b>age-timer</b> <i>minutes</i> : Indicates the interval for a new probe after a path MTU is discovered. It ranges from 10 to 30 minutes. The default is 10 minutes. <b>age-timer</b> <i>infinite</i> : No probe is implemented after a path MTU is discovered.
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>The PMTUD is an algorithm documented in RFC1191 aimed to improve bandwidth utilization. When the TCP is applied to bulk data transmission, this function may facilitate transmission performance.</p> <p>If the MSS used for the connection is smaller than what the peer connection can handle, a larger MSS is tried every time the age timer expires. The age timer is a time interval for how often TCP estimates the path MTU with a larger MSS. The discovery process is stopped when either the send MSS is as large as the peer negotiated, or the user has disabled the timer on the router. You may turn off the timer by setting it to <b>infinite</b>.</p>

## Configuration Example

### ▾ Enabling Path MTU Discovery

<b>Configuration Steps</b>	<p>Enable PMTUD for a TCP connection. Adopt the default age timer settings.</p> <pre>Ruijie# configure terminal Ruijie(config)# ip tcp path-mtu-discovery Ruijie(config)# end</pre>								
<b>Verification</b>	<p>Run the <b>show tcp pmtu</b> command to display the IPv4 TCP PMTU.</p> <pre>Ruijie# show tcp pmtu</pre> <table border="1"> <thead> <tr> <th>Number</th> <th>Local Address</th> <th>Foreign Address</th> <th>PMTU</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>192.168.195.212.23</td> <td>192.168.195.112.13560</td> <td>1440</td> </tr> </tbody> </table>	Number	Local Address	Foreign Address	PMTU	1	192.168.195.212.23	192.168.195.112.13560	1440
Number	Local Address	Foreign Address	PMTU						
1	192.168.195.212.23	192.168.195.112.13560	1440						
	<p>Run the <b>show ipv6 tcp pmtu</b> command to display the IPv6 TCP PMTU.</p> <pre>Ruijie# show ipv6 tcp pmtu</pre> <table border="1"> <thead> <tr> <th>Number</th> <th>Local Address</th> <th>Foreign Address</th> <th>PMTU</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>1000::1:23</td> <td>1000::2.13560</td> <td>1440</td> </tr> </tbody> </table>	Number	Local Address	Foreign Address	PMTU	1	1000::1:23	1000::2.13560	1440
Number	Local Address	Foreign Address	PMTU						
1	1000::1:23	1000::2.13560	1440						

## Common Errors

N/A

## 11.4.2 Detecting TCP Connection Exception

### Configuration Effect

- Check whether the peer works normally.

### Notes

N/A

## Configuration Steps

### ↳ Enabling TCP Keepalive

- Optional.

## Verification

## Related Commands

### ↳ Enabling TCP Keepalive

<b>Command</b>	<code>ip tcp keepalive [interval num1] [times num2] [idle-period num3]</code>
<b>Parameter Description</b>	<p><b>interval num1:</b> Indicates the interval to send keepalive packets. Ranging from 1 to 120 seconds. The default is 75 seconds.</p> <p><b>times num2:</b> Indicates the maximum times for sending keepalive packets. It ranges from 1 to 10. The default is 6.</p> <p><b>idle-period num3:</b> Indicates the time when the peer sends no packets to the local end, It ranges from 60 to 1800 seconds. The default is 15 minutes.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>You may enable TCP keepalive to check whether the peer works normally. The function is disabled by default.</p> <p>Suppose a user enables TCP keepalive function with the default interval, times and idle period settings. The user does not receive packets from the other end within 15 minutes and then starts sending Keepalive packets every 75 seconds for 6 times. If the user receives no TCP packets, the TCP connection is considered inactive and then closed.</p>

## Configuration Example

### ↳ Enabling TCP Keepalive

<b>Configuration Steps</b>	Enable TCP keepalive on a device with <b>interval</b> and <b>idle-period</b> set to 3 minutes and 60 seconds respectively. If the user receives no TCP packets from the other end after sending keepalive packets four times, the TCP connection is considered inactive.
	<pre>Ruijie# configure terminal Ruijie(config)# ip tcp keepalive interval 60 times 4 idle-period 180 Ruijie(config)# end</pre>
<b>Verification</b>	A user logs in to a device through telnet, and then shuts down the local device. Run the <b>show tcp connect</b> command on the remote device to observe when IPv4 TCP connection is deleted.

## Common Errors

N/A

## 11.5 Monitoring

### Displaying

Description	Command
Displays basic information on IPv4 TCP connection.	<b>show tcp connect</b> [local-ip <i>a.b.c.d</i> ] [local-port <i>num</i> ] [peer-ip <i>a.b.c.d</i> ] [peer-port <i>num</i> ]
Displays IPv4 TCP connection statistics.	<b>show tcp connect statistics</b>
Displays IPv4 TCP PMTU.	<b>show tcp pmtu</b> [local-ip <i>a.b.c.d</i> ] [local-port <i>num</i> ] [peer-ip <i>a.b.c.d</i> ] [peer-port <i>num</i> ]
Displays IPv4 TCP port information.	<b>show tcp port</b> [ <i>num</i> ]
Displays IPv4 TCP parameters.	<b>show tcp parameter</b>
Displays IPv4 TCP statistics.	<b>show tcp statistics</b>
Displays basic information on IPv6 TCP connection.	<b>show ipv6 tcp connect</b> [local-ipv6 <i>X:X:X:X::X</i> ] [local-port <i>num</i> ] [peer-ipv6 <i>X:X:X:X::X</i> ] [peer-port <i>num</i> ]
Displays IPv6 TCP connection statistics.	<b>show ipv6 tcp connect statistics</b>
Displays IPv6 TCP PMTU.	<b>show ipv6 tcp pmtu</b> [local-ipv6 <i>X:X:X:X::X</i> ] [local-port <i>num</i> ] [peer-ipv6 <i>X:X:X:X::X</i> ] [peer-port <i>num</i> ]
Displays IPv6 TCP port information.	<b>show ipv6 tcp port</b> [ <i>num</i> ]

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Displays the debugging information on IPv4 TCP packets.	<b>debug ip tcp packet</b> [ in   out] [local-ip <i>a.b.c.d</i> ] [peer-ip <i>a.b.c.d</i> ] [global   vrf <i>vrf-name</i> ] [local-port <i>num</i> ] [peer-port <i>num</i> ] [deeply]
Displays the debugging information on IPv4 TCP connection.	<b>debug ip tcp transactions</b> [local-ip <i>a.b.c.d</i> ] [peer-ip <i>a.b.c.d</i> ] [local-port <i>num</i> ] [peer-port <i>num</i> ]
Displays the debugging information on IPv6 TCP packets.	<b>debug ipv6 tcp packet</b> [ in   out] [local-ipv6 <i>X:X:X:X::X</i> ] [peer-ipv6 <i>X:X:X:X::X</i> ] [global   vrf <i>vrf-name</i> ] [local-port <i>num</i> ] [peer-port <i>num</i> ] [deeply]
Displays the debugging information on IPv6 TCP connection.	<b>debug ipv6 tcp transactions</b> [local-ipv6 <i>X:X:X:X::X</i> ] [peer-ipv6 <i>X:X:X:X::X</i> ] [local-port <i>num</i> ] [peer-port <i>num</i> ]

# 12 Configuring IPv4/IPv6 REF

## 12.1 Overview

On products incapable of hardware-based forwarding, IPv4/IPv6 packets are forwarded through the software. To optimize the software-based forwarding performance, Ruijie introduces IPv4/IPv6 express forwarding through software (Ruijie Express Forwarding, namely REF).

REF maintains two tables: forwarding table and adjacency table. The forwarding table is used to store route information. The adjacency table is derived from the ARP table and IPv6 neighbor table, and it contains Layer 2 rewrite(MAC) information for the next hop..

REF is used to actively resolve next hops and implement load balancing.

### Protocols and Standards

N/A

## 12.2 Applications

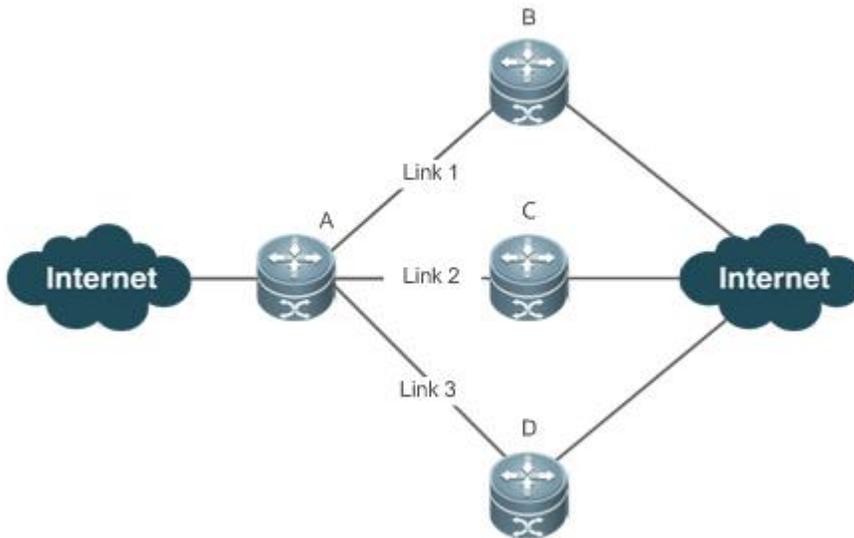

Application	Description
<a href="#">Load Balancing</a>	During network routing, when a route prefix is associated with multiple next hops, REF can implement load balancing among the multiple next hops.

### 12.2.1 Load Balancing

#### Scenario

As shown in Figure12-1, a route prefix is associated with three next hops on router A, namely, link 1, link 2, and link 3. By default, REF implements load balancing based on the destination IP address. Load balancing can be implemented based on the source IP address and destination IP address as well.

Figure 122-1

<b>Remarks</b>	A is a router that runs REF. B, C and D are forwarding devices.
----------------	--

## Deployment

- Run REF on router A.

## 12.3 Features

### Basic Concepts

IPv4/IPv6 REF involves the following basic concepts:

#### ↳ Routing table

An IPv4/IPv6 routing table stores routes to the specific destinations and contains the topology information. During packet forwarding, IPv4/IPv6 REF selects packet transmission paths based on the routing table.

#### ↳ Adjacent node

An adjacent node contains output interface information about routed packets, for example, the next hop, the next component to be processed, and the link layer encapsulation. When a packet is matched with an adjacent node, the packet is directly encapsulated and then forwarded. For the sake of query and update, an adjacent node table is often organized into a hash table. To support routing load balancing, the next hop information is organized into a load balance entry. An adjacent node may not contain next hop information. It may contain indexes of next components (such as other line cards and multi-service cards) to be processed.

#### ↳ Active resolution

REF supports next hop resolution. If the MAC address of the next hop is unknown, REF will actively resolve the next hop. IPv4 REF requests the ARP module for next hop resolution while IPv6 REF applies the ND module to resolution.

## Packet forwarding path

Packets are forwarded based on their IPv4/IPv6 addresses. If the source and destination IPv4/IPv6 addresses of a packet are specified, the forwarding path of this packet is determined.

### 12.3.1 Load Balancing Policies

Load balancing is configured to distribute traffic load among multiple network links.

#### Working Principle

So far, the switch supports the load balancing policies based on destination IP addresses. In the REF model, a route prefix is associated with multiple next hops, in other words, it is a multi-path route. The route will be associated with a load balance table and implement weight-based load balancing. When an IPv4/IPv6 packet is matched with a load balance entry based on the longest prefix match, REF performs hash calculation based on the IPv4/IPv6 address of the packet and selects a path to forward the packet.

## 12.4 Configuration

By default, the switch supports destination address-based load balancing. Run the following commands for monitoring.

### Displaying REF Packet Statistics

REF packet statistics includes the number of forwarded packets and the number of packets discarded due to various causes. You can determine whether packets are forwarded as expected by displaying and clearing REF packet statistics.

Command	Description
<b>show ip ref packet statistics</b>	Displays IPv4 REF packet statistics.
<b>clear ip ref packet statistics</b>	Clears IPv4 REF packet statistics.
<b>show ipv6 ref packet statistics</b>	Displays IPv6 REF packet statistics.
<b>clear ipv6 ref packet statistics</b>	Clears IPv6 REF packet statistics.

### Displaying Adjacency Information

You can run the following commands to display adjacency information:

Command	Description
<b>show ip ref adjacency [glean   local   <i>ip-address</i>   {interface <i>interface_type interface_number</i> }   discard   statistics]</b>	Displays the gleaned adjacencies, local adjacencies, adjacencies of a specified IP address, adjacencies associated with a specified interface, and all adjacent nodes in IPv4 REF.

<pre>show ipv6 ref adjacency [glean   local   ipv6-address   (interface interface_type interface_number)   discard   statistics]</pre>	<p>Displays the gleaned adjacencies, local adjacencies, adjacencies of a specified IPv6 address, adjacencies associated with a specified interface, and all adjacent nodes in IPv6 REF.</p>
--	---

### Displaying Active Resolution Information

You can run the following commands to display next hops to be resolved:

Command	Description
show ip ref resolve-list	Displays the next hop to be resolved .
show ipv6 ref resolve-list	Displays the next hop to be resolved.

### Displaying Packet Forwarding Path Information

Packets are forwarded based on their IPv4/IPv6 addresses. If the source and destination IPv4/IPv6 addresses of a packet are specified, the forwarding path of this packet is determined. Run the following commands and specify the IPv4/IPv6 source and destination addresses of a packet. The forwarding path of the packet is displayed, for example, the packet is discarded, submitted to a CPU, or forwarded. Furthermore, the interface that forwards the packet is displayed.

Command	Description
show ip ref exact-route [ oob   vrf vrf_name] source-ipaddress dest_ipaddress	Displays the forwarding path of a packet. oob indicates out-of-band management network.
show ipv6 ref exact-route [ oob   vrf vrf-name ] src-ipv6-address dst-ipv6-address	Displays the forwarding path of an IPv6 packet. oob indicates out-of-band, management network.

### Displaying Route Information in an REF Table

Run the following commands to display the route information in an REF table:

Command	Description
show ip ref route [ oob   vrf vrf_name] [default   {ip mask}] statistics]	Displays route information in the IPv4 REF table. The parameter <b>default</b> indicates a default route. oob indicates out-of-band management network.
show ipv6 ref route [ oob   vrf vrf-name ] [ default   statistics   prefix/len ]	Displays route information in the IPv6 REF table. The parameter <b>default</b> indicates a default route. oob indicates out-of-band management network.

## IP Routing Configuration

# 1 Configuring Routing Policies

## 1.1 Overview

Routing policies are a policy set for changing the packet forwarding path or routing information and are often implemented by a filtering list and a route map. Routing policies are flexibly and widely applied in the following methods:

- Use a filtering list in a routing protocol to filter or modify routing information.
- Use a route map in a routing protocol to filter or modify routing information. Where, the route map can further use a filtering list.
- Use a route map in policy-based routing (PBR) to control packet forwarding or modify packet fields.

## 1.2 Applications

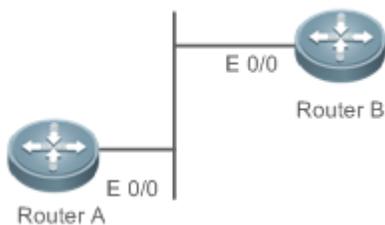

Application	Description
<a href="#">Route Filtering</a>	Use a filtering list in a routing protocol to filter the routing information sent or received by the protocol.
<a href="#">Route Re-distribution</a>	Use a route map in a routing protocol to filter or modify routing information and re-distribute RIP routes to OSPF. Only RIP routes with 4 hops can be re-distributed.
<a href="#">PBR</a>	Use a route map in PBR to control packet forwarding or modify packet fields and specify optimum output interfaces for packets from different subnets.

### 1.2.1 Route Filtering

By default, a routing protocol advertises and learns all routing information. When a filtering list is used, the routing protocol advertises only required routes or receives only required routing information.

#### Scenario

Figure 1-1

As shown in Figure 1-1, router A has routes to 3 networks: 10.0.0.0, 20.0.0.0 and 30.0.0.0.

Configure a filtering list on the routers to achieve the following purposes:

- Filter the sent routing information on router A to filter routes that router A does not need to send.
- Filter the received routing information on router B to filter routes that router B does not need to learn.

## Deployment

- Filter the sent routing information 30.0.0.0 on router A.
- Filter the received routing information 20.0.0.0 on router B to ensure that router B learns only routing information 10.0.0.0.

## 1.2.2 Route Re-distribution

By default, route re-distribution will re-distribute all routing information in a routing protocol to another routing protocol. All routing attributes will also be inherited. You can use a route map to perform conditional control for re-distribution between two routing protocols, including:

- Specify the range for re-distributing routes and re-distribute only routing information that meets certain rules.
- Set the attributes of routes generated by re-distribution.

## Scenario

Figure 1-2

As shown in Figure 1-2, configure route re-distribution on the devices to achieve the following purposes:

- Re-distribute only RIP routes with 4 hops to OSPF.
- In the OSPF routing domain, the initial metric of this route is 40, the route type is the external route type-1 and the route tag value is set to 40.

## Deployment

- Configure a route with 4 hops in the route map `rip_to_ospf`: match, and set the initial metric of this route to 40, the route type to the external route type-1 and the route tag value to 40.
- Configure route re-distribution to re-distribute RIP routes to OSPF and use the route map `rip_to_ospf`.

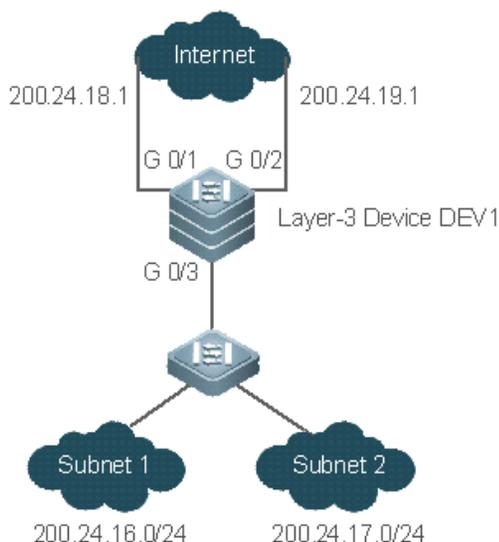

## 1.2.3 PBR

PBR is implemented by applying a route map including policies to interfaces and devices.

Similar to static routing, PBR is also manually configured, where recursive routing supports automatic update with network changes. As compared with static and dynamic routing, PBR is more flexible. Static and dynamic routing can forward packets only based on destination addresses. PBR can forward packets based on the source and destination addresses, packet length and input interface.

## Scenario

Figure 1-3

Configure PBR on the layer-3 device DEV1 to achieve the following purposes:

- Packets from subnet 1 (200.24.16.0/24) are sent from GE0/1 first.
- Packets from subnet 2 (200.24.17.0/24) are sent from GE0/2 first.

### Deployment

- Configure two different ACLs to match packets from subnets 1 and 2 respectively.
- Configure the route map RM\_FOR\_PBR: policy 10 is used to ensure that "packets from subnet 1 are sent from GE0/1 first"; policy 20 is used to ensure that "packets from subnet 2 are sent from GE0/2 first".
- Perform PBR for packets received from GE0/3 and use the route map RM\_FOR\_PBR.

## 1.3 Features

### Overview

Feature	Description
<a href="#">Filtering List</a>	Define a group of lists based on a route attribute, which can be used by a routing protocol for route filtering.
<a href="#">Route Map</a>	A policy defines "if certain conditions are matched, you can perform certain processing actions".

#### 1.3.1 Filtering List

Filtering lists are a group of lists defined based on a routing attribute and are a tool for filtering routing policies. Independent filtering lists are meaningless and can be used to filter routes only when they are applied in a routing protocol.

### Working Principle

Based on different routing attributes, filtering lists are classified into the following types:

### ↳ Access Control List (ACL)

ACLs comprise IPv4 and IPv6 ACLs. When defining ACLs, you can specify IPv4/IPv6 addresses and masks to match the destination network segment or next-hop addresses of routing information.

For description about ACLs, see the *ACL Configuration Guide*.

### ↳ Address Prefix List (prefix-list)

Similar to ACLs, prefix-lists, including IPv4 prefix-lists and IPv6 prefix-lists, are used to match destination network segments of routing information during route filtering.

### ↳ AS-Path List

AS-path lists are used only for BGP. They are used to match AS paths during BGP route filtering.

### ↳ Community Attribute Filtering List (Community-List)

Community-lists are used only for BGP. They are used to match community attributes during BGP route filtering.

### ↳ Extended Community Attribute Filtering List (Extcommunity-List)

Extcommunity-lists are used only for BGP. They are used to match extended community attributes during BGP route filtering.

## Related Configuration

### ↳ Creating an ACL

By default, no ACL is configured and no policy is set.

In the global configuration mode, run the **ip access-list { extended | standard } { id | name }** command to create an IPv4 ACL.

You can set multiple policies in an ACL, sorted by their sequence numbers. Policies have two working modes: permit and deny.

### ↳ Creating a Prefix-List

By default, no prefix-list is configured and no entry is set.

In the global configuration mode, run the **ip prefix-list prefix-list-name [ seq seq-number ] { deny | permit } ip-prefix [ ge minimum-prefix-length ] [ le maximum-prefix-length ]** command to create an IPv4 prefix-list and add a prefix entry to the list.

You can set multiple entries in the prefix-list, sorted by their sequence numbers. Entries have two working modes: permit and deny.

Run the **ip prefix-list prefix-list-name description description-text** command to add description to the prefix-list.

Run the **ip prefix-list sequence-number** command to enable the sorting function for the prefix-list.

### ↳ Creating an AS-Path List

By default, no AS-path list is configured and no entry is set.

In the global configuration mode, run the **ip as-path access-list** *path-list-num* { **permit** | **deny** } *regular-expression* command to create an AS-path list and add an entry to the list.

You can set multiple entries in the AS-path list. Entries have two working modes: permit and deny.

### ↳ Creating a Community-List

By default, no community-list is configured and no entry is set.

In the global configuration mode, run the **ip community-list** { { **standard** | **expanded** } *community-list-name* | *community-list-number* } { **permit** | **deny** } [ *community-number..* ] command to create a community-list and add an entry to the list.

You can set multiple entries in the community-list. Entries have two working modes: permit and deny.

### ↳ Creating an Extcommunity-List

By default, no extcommunity-list is configured and no entry is set.

In the global configuration mode, run the **ip extcommunity-list** { *standard-list* | **standard** *list-name* } { **permit** | **deny** } [ *rt value* ] [ *soo value* ] command to create a standard extcommunity list and add an entry to the list.

Run the **ip extcommunity-list** { *expanded-list* | **expanded** *list-name* } { **permit** | **deny** } [ *regular-expression* ] command to create an extcommunity list and add an entry to the list.

You can also run the **ip extcommunity-list** { *expanded-list* | **expanded** *list-name* | *standard-list* | **standard** *list-name* } command to create an extcommunity list and enter the configuration mode of **ip extcommunity-list** to add entries.

You can set multiple entries in the extcommunity-list. Entries have two working modes: permit and deny.

## 1.3.2 Route Map

A policy is a "match ..., set..." statement, which indicates that "if certain conditions are matched, you can perform some processing actions".

### Working Principle

#### ↳ Executing policies

A route map may contain multiple policies. Each policy has a corresponding sequence number. A smaller sequence number means a higher priority. Policies are executed based on their sequence numbers. Once the matching condition of a policy is met, the processing action for this policy needs to be performed and the route map exits. If no matching condition of any policy is met, no processing action will be performed.

#### ↳ Working Modes Of Policies

Policies have two working modes:

- **permit**: When the matching condition of a policy is met, the processing action for this policy will be performed and the route map will exit.
- **deny**: When the matching condition of a policy is met, the processing action for this policy will not be performed and the route map will exit.

### ↘ Matching Conditions Of Policies

The matching condition of a policy may contain 0, 1 or more match rules.

- If the matching condition contains 0 match rule, no packet will be matched.
- If the matching condition contains one or more match rules, all rules must be matched.

### ↘ Processing Action for a Policy

The processing action of a policy may contain 0, 1 or more set rules.

- If the processing action contains 0 set rule, no processing action will be performed and the route map will directly exit.
- If the processing action contains one or more set rules, all processing actions will be performed and then the route map will exit.

 If set rules have different priorities, the set rule with the highest priority will take effect.

## Related Configuration

### ↘ Creating a Route Map (Policy)

By default, no route map is configured and no policy is set.

In the global configuration mode, you can run the **route-map** *route-map-name* [ **permit** | **deny** ] [ *sequence-number* ] command to create a route map and add a policy to the route map.

You can set multiple policies in a route map. Each policy uses different sequence numbers.

### ↘ Setting Matching Conditions of a Policy

By default, no match rule is set (that is, the matching condition of a policy contains 0 match rule).

In the route map mode, run the **match** command to set match rules. One **match** command is mapped to one match rule.

RGOS provides abundant **match** commands for setting flexible matching conditions.

Command	Description
<b>match as-path</b>	Uses the AS_PATH attribute of a BGP route as the matching condition.
<b>match community</b>	Uses the community attribute of a BGP route as the matching condition.
<b>match extcommunity</b>	Uses the extended community attribute of a BGP route as the matching condition.
<b>match interface</b>	Uses the output interface of a route as the matching condition.
<b>match ip address</b>	Uses the destination IPv4 address of a route as the matching condition.
<b>match ip next-hop</b>	Uses the next-hop IPv4 address of a route as the matching condition.
<b>match ip route-source</b>	Uses the source IPv4 address of a route as the matching condition.
<b>match ipv6 address</b>	Uses the destination IPv6 address of a route as the matching condition.
<b>match ipv6 next-hop</b>	Uses the next-hop IPv6 address of a route as the matching condition.
<b>match ipv6 route-source</b>	Uses the source IPv6 address of a route as the matching condition.
<b>match metric</b>	Uses the metric of a route as the matching condition.
<b>match origin</b>	Uses the source of a route as the matching condition.

Command	Description
<b>match route-type</b>	Uses the type of a route as the matching condition.
<b>match tag</b>	Uses the tag value of a route as the matching condition.

### 📌 Setting the Processing Actions of a Policy

By default, no set rule is configured (that is, the processing action of a policy contains 0 set rule).

In the route map mode, run the **set** command to configure set rules. One **set** command is mapped to one set rule.

RGOS provides abundant **set** commands for setting flexible processing actions.

Command	Description
<b>set aggregator as</b>	Modifies the AS attribute value of a route aggregator.
<b>set as-path prepend</b>	Adds a specified as-path attribute value.
<b>set as-path replace</b>	Replace the specified as-path attribute value.
<b>set atomic-aggregate</b>	Sets the <b>atomic-aggregate</b> attribute of a route.
<b>set comm-list delete</b>	Deletes all community attribute values from the community attribute list for a route matching the match rules.
<b>set community</b>	Sets the community attribute value of a route.
<b>set dampening</b>	Sets the flapping parameters of a route.
<b>set extcomm-list delete</b>	Deletes all extended community attribute values from the extcommunity attribute list for a route matching the match rules.
<b>set extcommunity</b>	Sets the extended community attribute value of a route.
<b>set fast-reroute</b>	Sets the backup output interface and next hop of a fast reroute.
<b>set ip default nexthop</b>	Specifies the default next hop of a route. This command has a lower priority than a common route and a higher priority than <b>set default interface</b> .
<b>set ip dscp</b>	Modifies the <b>dscp</b> field of an IP packet.
<b>set ip global next-hop</b>	Specifies the next hop of a route.
<b>set ip global default next-hop</b>	Specifies the default next hop of a route.
<b>set ip nexthop</b>	Specifies the next hop of a route. This command has a higher priority than <b>set interface</b> .
<b>set ip next-hop recursive</b>	Specifies the recursive next-hop IP address of a route.
<b>set ip next-hop verify-availability</b>	Specifies the next-hop IP address of a route and checks the accessibility of the next hop by using BFD.
<b>set ip precedence</b>	Modifies the <b>precedence</b> field of an IP packet.
<b>set ip tos</b>	Modifies the <b>tos</b> field of an IP packet.
<b>set ipv6 default next-hop</b>	Specifies the default next hop of a route. This command has a lower priority than a common route and a higher priority than the default route.
<b>set ipv6 global next-hop</b>	Specifies the IPv6 next hop of a route.
<b>set ipv6 global default next-hop</b>	Specifies the default IPv6 next hop of a route.
<b>set ipv6 next-hop</b>	Specifies the IPv6 next hop of a route. This command has a higher priority than a common route.

Command	Description
<b>set ipv6 next-hop verify-availability</b>	Specifies the next-hop IP address of a route and checks the accessibility of the next hop by using BFD.
<b>set ipv6 precedence</b>	Sets the priority of an IPv6 packet header.
<b>set level</b>	Sets the destination area type to which a route will be directed.
<b>set local-preference</b>	Sets the local-preference attribute value of a route.
<b>set metric</b>	Modifies the metric value of a route.
<b>set metric-type</b>	Sets the metric type of a route.
<b>set next-hop</b>	Sets the next-hop IP address of a route.
<b>set ip next-hop verify-availability</b>	Specifies the next-hop IP address of a route and checks the accessibility of the next hop by using a third-party protocol.
<b>set origin</b>	Sets the source attribute of a route.
<b>set originator-id</b>	Sets the originator IP address of a route.
<b>set tag</b>	Sets the tag value of a route.
<b>set distance</b>	Sets the administrative distance.
<b>set weight</b>	Sets the weight value of a route.

## 1.4 Configuration

Configuration	Description and Command
<a href="#">Configuring a Route Map</a>	 (Optional) It is used to define a policy.
	<b>route-map</b> Creates a policy (route map).
	<b>match</b> Sets the matching conditions of the policy.
	<b>set</b> Sets the processing actions of the policy.
<a href="#">Configuring a Filtering List</a>	 (Optional) It is used to define a filtering list.
	<b>ip as-path</b> Defines AS path filtering rules.
	<b>ip community-list</b> Defines a community list.
	<b>ip extcommunity-list</b> Defines an extcommunity list.
	<b>ip prefix-list</b> Creates a prefix-list.
	<b>ip prefix-list description</b> Adds description to a prefix-list.
	<b>ip prefix-list sequence-number</b> Enables the sorting function for a prefix-list.
	<b>ipv6 prefix-list</b> Creates an IPv6 prefix-list.
<b>ipv6 prefix-list description</b> Adds description to an IPv6 prefix-list.	
<b>ipv6 prefix-list sequence-number</b> Enables the sorting function for an IPv6 prefix-list.	

### 1.4.1 Configuring a Route Map

#### [Configuration Effect](#)

- Define a set of routing policies to be used by routing protocols or PBR.

## Notes

- If a **match** command uses an ACL to define packet matching conditions, the ACL must be configured.
- The following **match** commands cannot be configured at the same time:

The Following match Commands	Cannot Be Configured with the Following match Commands At the Same Time
<b>match ip address</b>	<b>match ip prefix-list</b>
<b>match ipv6 address</b>	<b>match ipv6 prefix-list</b>
<b>match ip next-hop</b>	<b>match ip next-hop prefix-list</b>
<b>match ipv6 next-hop</b>	<b>match ipv6 next-hop prefix-list</b>
<b>match ip route-source</b>	<b>match ip route-source prefix-list</b>
<b>match ipv6 route-source</b>	<b>match ipv6 route-source prefix-list</b>

- The following **set** commands cannot be configured at the same time:

The Following set Commands	Cannot Be Configured with the Following set Commands At the Same Time
<b>set ip next-hop</b>	<b>set ip next-hop verify-availability</b>
<b>set ip dscp</b>	<b>set ip tos</b>
<b>set ip dscp</b>	<b>set ip precedence</b>

## Configuration Steps

### ↳ Creating a Policy (Route Map)

- Mandatory.
- Perform this configuration on a device to which a policy needs to be applied.

### ↳ Setting Matching Conditions of a Policy

- Optional.
- If no match rule is configured, no packet will be matched.
- If multiple match rules are configured, all the match rules must be matched.
- Perform this configuration on a device to which a policy needs to be applied.

### ↳ Setting the Processing Actions of a Policy

- Optional.
- If no set rule is configured, no processing action will be performed.
- If multiple set rules are configured, all set rules must be executed (if the set rules have different priorities, the set rule with the highest priority takes effect).
- Perform this configuration on a device to which a policy needs to be applied.

## Verification

- Check the configurations of the route map.

## Related Commands

### ↳ Creating a Policy (Route Map)

<b>Command</b>	<b>route-map</b> <i>route-map-name</i> [ { <b>permit</b>   <b>deny</b> } <i>sequence</i> ]
<b>Parameter</b>	<i>route-map-name</i> : Indicates the name of a route map, comprising not more than 32 characters.
<b>Description</b>	<b>permit</b> : Specifies the working mode of this policy as permit, which is the default mode. <b>deny</b> : Specifies the working mode of this policy as deny. The default mode is permit. <i>sequence</i> : Specifies the sequence number of this policy. A smaller value means a higher priority. The default value is 10.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If this route map is unavailable, this command will create a route map and add a policy to the route map. If this route map is available, this command will add a policy to the route map.

### ↳ Setting Matching Conditions of a Policy

<b>Command</b>	<b>match as-path</b> <i>as-path-acl-list-number</i> [ <i>as-path-acl-list-number</i> ..... ]
<b>Parameter</b>	<i>as-path-acl-list-number</i> : Indicates the AS-PATH list number, ranging from 1 to 500.
<b>Description</b>	
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule is used to match the AS-PATH attribute of a BGP route. Run the <b>ip as-path access-list</b> <i>path-list-num</i> { <b>permit</b>   <b>deny</b> } <i>regular-expression</i> command to configure the AS-PATH list.

<b>Command</b>	<b>match community</b> { <i>community-list-number</i>   <i>community-list-name</i> } [ <b>exact-match</b> ] [ { <i>community-list-number</i>   <i>community-list-name</i> } [ <b>exact-match</b> ] ... ]
<b>Parameter</b>	<i>community-list-number</i> : Indicates the community list number. For a standard community list, the value ranges from 1 to 99. For an extcommunity list, the value ranges from 100 to 199.
<b>Description</b>	<i>community-list-name</i> : Indicates the community list name, comprising not more than 80 characters. <b>exact-match</b> : Indicates the exact match list. It is a non-exact match list by default, that is, the match rule is met as long as the routing attributes contain the attributes specified by a community list.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule is used to match the community attribute specified in a community list.

<b>Command</b>	<b>match extcommunity</b> { <i>standard-list-number</i>   <i>standard-list-name</i>   <i>expanded-list-num</i>   <i>expanded-list-name</i> }
----------------	--

<b>Parameter Description</b>	<p><i>standard-list-number</i>: Indicates an ID, ranging from 1 to 99. It is used to identify a standard extcommunity list. One extcommunity list may contain multiple extcommunity values.</p> <p><i>standard-list-name</i>: Indicates the name of a standard extcommunity list. It is used to identify the name of a standard extcommunity list. One extcommunity list may contain multiple extcommunity values.</p> <p><i>expanded-list-num</i>: Indicates an ID, ranging from 100 to 199. It is used to identify an extcommunity list. One extcommunity list may contain multiple extcommunity values.</p> <p><i>expanded-list-name</i>: Indicates the name of an extcommunity. It is used to identify the name of an extcommunity list. One extcommunity list may contain multiple extcommunity values.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule is used to match the extended community attribute specified in an extcommunity list.

<b>Command</b>	<b>match interface</b> <i>interface-type interface-number</i> [ ... <i>interface-type interface-number</i> ]
<b>Parameter Description</b>	<i>interface-type interface-number</i> : Indicates the interface type and interface number.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule is used to match the next-hop output interface of a route or a packet.

<b>Command</b>	<b>match ip address</b> { <i>access-list-number</i> [ <i>access-list-number...</i>   <i>access-list-name...</i> ]   <i>access-list-name</i> [ <i>access-list-number...</i>   <i>access-list-name</i> ]   <b>prefix-list</b> <i>prefix-list-name</i> [ <i>prefix-list-name...</i> ] }
<b>Parameter Description</b>	<p><i>access-list-number</i>: Indicates the access list number. For a standard access list, the value ranges are 1 to 99 and 1300 to 1999. For an extended access list, the value ranges are 100 to 199 and 2000 to 2699.</p> <p><i>access-list-name</i>: Indicates the access list name.</p> <p><b>prefix-list</b> <i>prefix-list-name</i>: Indicates the name of a prefix-list to be matched.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule matches the destination IPv4 address of a packet or route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.

<b>Command</b>	<b>match ip next-hop</b> { <i>access-list-number</i> [ <i>access-list-number...</i>   <i>access-list-name...</i> ]   <i>access-list-name</i> [ <i>access-list-number...</i>   <i>access-list-name</i> ]   <b>prefix-list</b> <i>prefix-list-name</i> [ <i>prefix-list-name...</i> ] }
<b>Parameter Description</b>	<p><i>access-list-number</i>: Indicates the access list number. For a standard access list, the value ranges are 1 to 99 and 1300 to 1999. For an extended access list, the value ranges are 100 to 199 and 2000 to 2699.</p> <p><i>access-list-name</i>: Indicates the access list name.</p> <p><b>prefix-list</b> <i>prefix-list-name</i>: Indicates the name of a prefix-list to be matched.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule matches the next-hop IPv4 address of a route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.

<b>Command</b>	<b>match ip route-source</b> { <i>access-list-number</i> [ <i>access-list-number...</i>   <i>access-list-name...</i> ]   <i>access-list-name</i> [ <i>access-list-number...</i>   <i>access-list-name</i> ]   <b>prefix-list</b> <i>prefix-list-name</i> [ <i>prefix-list-name...</i> ] }
<b>Parameter Description</b>	<i>access-list-number</i> : Indicates the access list number. For a standard access list, the value ranges are 1 to 99 and 1300 to 1999. For an extended access list, the value ranges are 100 to 199 and 2000 to 2699. <i>access-list-name</i> : Indicates the access list name. <b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of a prefix-list to be matched.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule matches the source IPv4 address of a route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.

<b>Command</b>	<b>match ipv6 address</b> { <i>access-list-name</i>   <b>prefix-list</b> <i>prefix-list-name</i> }
<b>Parameter Description</b>	<i>access-list-name</i> : Indicates the access list name. <b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of an IPv6 prefix-list to be matched.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule matches the destination IPv6 address of a packet or route by using an ACL or a prefix-list. An ACL and a prefix list cannot be configured at the same time.

<b>Command</b>	<b>match ipv6 next-hop</b> { <i>access-list-name</i>   <b>prefix-list</b> <i>prefix-list-name</i> }
<b>Parameter Description</b>	<i>access-list-name</i> : Indicates the access list name. <b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of an IPv6 prefix-list to be matched.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule matches the next-hop IPv6 address of a route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.

<b>Command</b>	<b>match ipv6 route-source</b> { <i>access-list-name</i>   <b>prefix-list</b> <i>prefix-list-name</i> }
<b>Parameter Description</b>	<i>access-list-name</i> : Indicates the access list name. <b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of an IPv6 prefix-list to be matched.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule matches the source IPv6 address of a route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.

<b>Command</b>	<b>match metric</b> <i>metric</i>
<b>Parameter Description</b>	<i>metric</i> : Indicates the metric value of a route, ranging from 0 to 4,294,967,295.

<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule is used to match the metric value of a route.

<b>Command</b>	<b>match origin { <i>egp</i>   <i>igp</i>   <i>incomplete</i> }</b>
<b>Parameter Description</b>	<b>egp:</b> Indicates the source is remote EGP. <b>igp:</b> Indicates the source is local IGP. <b>incomplete:</b> Indicates that the source is an incomplete type.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule is used to match the source of a route.

<b>Command</b>	<b>match route-type { <i>local</i>   <i>internal</i>   <i>external</i> [ <i>type-1</i>   <i>type-2</i> ]   <i>level-1</i>   <i>level-2</i> }</b>
<b>Parameter Description</b>	<b>local:</b> Indicates a route locally generated. <b>Internal:</b> Indicates an internal OSPF route. <b>external:</b> Indicates an external route (that of BGP or OSPF). <b>type-1   type-2:</b> Indicates type-1 or type-2 external route of OSPF. <b>level-1   level-2:</b> Indicates level-1 or level-2 route of ISIS.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule is used to match the type of a route.

<b>Command</b>	<b>match tag <i>tag</i> [ ...<i>tag</i> ]</b>
<b>Parameter Description</b>	<i>tag</i> : Indicates the tag value of a route.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This match rule is used to match the tag value of a route.

### 📌 Setting the Processing Actions of a Policy

<b>Command</b>	<b>set aggregator as <i>as-number ip-address</i></b>
<b>Parameter Description</b>	<i>as-number</i> : Indicates the AS number of an aggregator. The AS number ranges from 1 to 4,294,967,295, which can be indicated by 1 to 65535.65535 in the dot mode. <i>ip-address</i> : Indicates the address of an aggregator.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to modify the AS attribute value of a route's aggregator.

<b>Command</b>	<b>set as-path prepend <i>as-number</i></b>
<b>Parameter</b>	<i>as-number</i> : Indicates the AS number to be added to the AS_PATH attribute. The AS number ranges from 1

<b>Description</b>	to 4,294,967,295, which can be indicated by 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to add a specified as-path attribute value.

<b>Command</b>	set as-path replace as-number
<b>Parameter Description</b>	<i>as-number</i> : Indicates the AS number which will replace the AS_PATH attribute. The AS number ranges from 1 to 4,294,967,295, which can be indicated by 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to replace the specified as-path attribute value.

<b>Command</b>	<b>set atomic-aggregate</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the atomic-aggregate attribute of a route.

<b>Command</b>	<b>set comm-list { community-list-number   community-list-name } delete</b>
<b>Parameter Description</b>	<i>community-list-number</i> : Indicates the community list number. For a standard community list, the value ranges from 1 to 99. For an extcommunity list, the value ranges from 100 to 199. <i>community-list-name</i> : Indicates the community list name, comprising not more than 80 characters.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This rule is used to delete all community attribute values from the community list for a route matching the match rules.

<b>Command</b>	<b>set community { community-number [ community-number ... ] additive   none }</b>
<b>Parameter Description</b>	<i>community-number</i> : Indicates the community attribute value. <b>additive</b> : Adds a number based on the original community attribute. <b>none</b> : Keeps the community attribute empty.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the community attribute value of a route.

<b>Command</b>	<b>set dampening half-life reuse suppress max-suppress-time</b>
<b>Parameter Description</b>	<i>half-life</i> : half-life when a route is accessible or not accessible, ranging from 1 to 45 minutes. The default value is 15 minutes. <i>reuse</i> : When the penalty value of a route is smaller than this value, route suppression will be canceled. The

	<p>value ranges from 1 to 20,000 and the default value is 750.</p> <p><i>suppress</i>: When the penalty value of a route is greater than this value, the route will be suppressed. The value ranges from 1 to 20,000 and the default value is 2,000.</p> <p><i>max-suppress-time</i>: Indicates the longest time that a route can be suppressed, ranging from 1 to 255 minutes. The default value is 4 x <b>half-life</b>.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the flapping parameters of a route.

<b>Command</b>	<b>set extcomm-list</b> { <i>extcommunity-list-number</i>   <i>extcommunity-list-name</i> } <b>delete</b>
<b>Parameter Description</b>	<p><i>extcommunity-list-number</i>: Indicates the extcommunity list number. For a standard extcommunity list, the value ranges from 1 to 99. For an extended extcommunity list, the value ranges from 100 to 199.</p> <p><i>extcommunity-list-name</i>: Indicates the extcommunity list name, comprising not more than 80 characters.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to delete all extended community attribute values from the extcommunity attribute list for a route matching the match rules.

<b>Command</b>	<b>set extcommunity</b> { <i>rt extend-community-value</i>   <b>soo</b> <i>extend-community-value</i> }
<b>Parameter Description</b>	<p><b>rt</b>: Sets the RT attribute value of a route.</p> <p><b>soo</b>: Sets the SOO attribute value of a route.</p> <p><i>extend-community-value</i>: Indicates the value of an extended community.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the extended community attribute value of a route.

<b>Command</b>	<b>set fast-reroute backup-interface</b> <i>interface-type interface-number</i> [ <b>backup-nexthop</b> <i>ip-address</i> ]
<b>Parameter Description</b>	<p><i>interface-type interface-number</i>: Specifies a backup output interface.</p> <p><b>backup-nexthop</b> <i>ip-address</i>: Specifies a backup next hop. For a non-point-to-point interface, a backup next hop must be specified.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the backup output interface and next hop of a fast reroute.

<b>Command</b>	<b>set ip default next-hop</b> <i>ip-address</i> [ <i>weight</i> ] [ <i>...ip-address</i> [ <i>weight</i> ] ]
<b>Parameter Description</b>	<p><i>ip-address</i>: Indicates the next-hop IP address.</p> <p><i>weight</i>: Indicates the weight of this next hop.</p>
<b>Command</b>	Route map configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	This set rule is used to specify the default next hop of a route.

<b>Command</b>	<b>set ip dscp</b> <i>dscp_value</i>
<b>Parameter Description</b>	<i>dscp_value</i> : Sets the DSCP value in the IP header of an IP packet.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to modify the dscp field of an IP packet.

<b>Command</b>	<b>set ip next-hop recursive</b> <i>ip-address</i>
<b>Parameter Description</b>	<i>ip-address</i> : Indicates the recursive next-hop IP address.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This command is used only for PBR configuration. This set rule is used to specify the recursive next hop of a route. An IP address can recur to a static or dynamic route that has an output interface and a next-hop IP address. A maximum of 32 next hops are supported. If a recursive route is a static route, only one next hop is supported for the static recursive route.

<b>Command</b>	<b>set ip next-hop verify-availability</b> <i>ip-address</i> [ <b>track</b> <i>track-obj-number</i>   <b>bfd</b> <i>interface-type interface-number gateway</i> ]
<b>Parameter Description</b>	<i>ip-address</i> : Indicates the next-hop IP address. <b>track</b> : Judges whether the next hop is effective by using <i>Track</i> . <b>bfd</b> : Indicates that BFD is used for neighbor detection. <i>interface-type</i> : Configures the interface type. <i>interface-number</i> : Configures the interface number. <i>gateway</i> : Configures the gateway IP address, which is the neighbor IP address of BFD. If the next hop is configured as the neighbor, BFD will be used to detect the accessibility of the forwarding path.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to specify the next hop of a route, and BFD is used to fast detect the effectiveness of the next hop.

<b>Command</b>	<b>set ip precedence</b> { <i>number</i>   <b>critical</b>   <b>flash</b>   <b>flash-override</b>   <b>immediate</b>   <b>internet</b>   <b>network</b>   <b>priority</b>   <b>routine</b> }
<b>Parameter Description</b>	<i>number</i> : Indicates the priority of the IP header with a number, ranging from 0 to 7. 7: critical 6: flash 5: flash-override

	<p>4: immediate                      3: internet                      2: network                      1: priority                      0: routine</p> <p><b>critical   flash   flash-override   immediate   internet   network   priority   routine:</b> priority of an IP header.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to modify the <b>precedence</b> field of an IP packet header.

<b>Command</b>	<b>set ip tos { number   max-reliability   max-throughput   min-delay   min-monetary-cost   normal }</b>
<b>Parameter Description</b>	<p><i>number:</i> Indicates the TOS value of an IP header with a number, ranging from 0 to 15.</p> <p>2: <b>max-reliability</b>                      4: <b>max-throughput</b>                      8: <b>min-delay</b>                      1: <b>min-monetary-cost</b>                      0: <b>normal</b></p> <p><b>max-reliability   max-throughput   min-delay   min-monetary-cost   normal:</b> priority of an IP header.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to modify the tos field of an IP packet.

<b>Command</b>	<b>set ipv6 default next-hop global-ipv6-address [ weight ] [ global-ipv6-address [ weight ] ... ]</b>
<b>Parameter Description</b>	<p><i>global-ipv6-address:</i> Indicates the next-hop IPv6 address for packet forwarding. The next-hop router must be a neighbor router.</p> <p><i>weight:</i> Indicates the weight in the load balancing mode, ranging from 1 to 8. A larger value means larger packet traffic to be shared by the next hop.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to specify the default next hop IPv6 address of a route.

<b>Command</b>	<b>set ipv6 next-hop global-ipv6-address [ weight ] [ global-ipv6-address [ weight ] ... ]</b>
<b>Parameter Description</b>	<p><i>global-ipv6-address:</i> Indicates the next-hop IPv6 address for packet forwarding. The next-hop router must be a neighbor router.</p> <p><i>weight:</i> Indicates the weight in the load balancing mode, ranging from 1 to 8. A larger value means larger packet traffic to be shared by the next hop.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to specify the next hop IPv6 address of a route.

<b>Command</b>	<b>set ipv6 next-hop verify-availability global-ipv6-address bfd interface-type interface-number gateway</b>
----------------	--

<b>Parameter Description</b>	<p><b>global-ipv6-address:</b> Indicates the next-hop IPv6 address.</p> <p><b>bfd:</b> Indicates that BFD is used for neighbor detection.</p> <p><i>interface-type:</i> Configures the interface type.</p> <p><i>interface-number:</i> Configures the interface number.</p> <p><i>gateway:</i> Configures the gateway IPv6 address, which is the neighbor IPv6 address of BFD. If the next hop is configured as the neighbor, BFD will be used to detect the accessibility of the forwarding path.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to specify the next hop of a route and BFD is used to fast detect the effectiveness of the next hop.

<b>Command</b>	<b>set ipv6 precedence { number   critical   flash   flash-override   immediate   internet   network   priority   routine }</b>
<b>Parameter Description</b>	<p><i>number:</i> Indicates the priority of the IP header with a number, ranging from 0 to 7.</p> <p>7: critical</p> <p>6: flash</p> <p>5: flash-override</p> <p>4: immediate</p> <p>3: internet</p> <p>2: network</p> <p>1: priority</p> <p>0: routine</p> <p><b>critical   flash   flash-override   immediate   internet   network   priority   routine:</b> priority of an IP header.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the priority of an IPv6 packet header.

<b>Command</b>	<b>set level { level-1   level-2   level-1-2   stub-area   backbone }</b>
<b>Parameter Description</b>	<p><b>level-1:</b> Indicates that the re-distribution route is advertised to ISIS Level 1.</p> <p><b>level-2:</b> Indicates that the re-distribution route is advertised to ISIS Level 2.</p> <p><b>level-2:</b> Indicates that the re-distribution route is advertised to ISIS Level 1 and Level 2.</p> <p><b>stub-area:</b> Indicates that the re-distribution route is advertised to OSPF Stub Area.</p> <p><b>backbone:</b> Indicates that the re-distribution route is advertised to the OSPF backbone area.</p>
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the destination area type to which a route will be redirected.

<b>Command</b>	<b>set local-preference number</b>
<b>Parameter Description</b>	<i>number:</i> Indicates the metric value of a local priority, ranging from 0 to 4,294,967,295. A larger value means a higher priority.
<b>Command</b>	Route map configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	This set rule is used to set the local-preference attribute value of a route.

<b>Command</b>	<b>set metric</b> [ + <i>metric-value</i>   - <i>metric-value</i>   <i>metric-value</i> ]
<b>Parameter</b>	+: Increases (based on the metric value of the original route).
<b>Description</b>	-: Decreases (based on the metric value of the original route). <i>metric-value</i> : Sets the metric value of a re-distribution route. A larger value means a lower priority.
<b>Command</b>	Route map configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	This set rule is used to modify the metric value of a route.

<b>Command</b>	<b>set metric-type</b> <i>type</i>
<b>Parameter</b>	<i>type</i> : Sets the type of a re-distribution route. The default type of an OSPF re-distribution route is type-2.
<b>Description</b>	
<b>Command</b>	Route map configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	This set rule is used to set the metric type.

<b>Command</b>	<b>set next-hop</b> <i>ip-address</i>
<b>Parameter</b>	<i>ip-address</i> : Indicates the next-hop IP address.
<b>Description</b>	
<b>Command</b>	Route map configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	This set rule is used to set the next-hop IP address.

<b>Command</b>	<b>set origin</b> { <b>egp</b>   <b>igp</b>   <b>incomplete</b> }
<b>Parameter</b>	<b>egp</b> : Indicates the source is remote EGP.
<b>Description</b>	<b>igp</b> : Indicates the source is local IGP. <b>incomplete</b> : Indicates that the source is the incomplete type and generally refers to a route generated due to re-distribution.
<b>Command</b>	Route map configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	This set rule is used to set the source attribute of a route.

<b>Command</b>	<b>set originator-id</b> <i>ip-address</i>
<b>Parameter</b>	<i>ip-address</i> : Indicates the address of an originator.
<b>Description</b>	
<b>Command</b>	Route map configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	This set rule is used to set the originator IP address of a route.

<b>Command</b>	<b>set tag</b> <i>tag</i>
<b>Parameter Description</b>	<i>tag</i> : Sets the tag of a re-distribution route.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the tag value of a route.

<b>Command</b>	<b>set distance</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : The greater the administrative value, the lower the priority.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the administrative distance.

<b>Command</b>	<b>set weight</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Sets the weight of a route, ranging from 0 to 65,535. A larger value means a higher priority.
<b>Command Mode</b>	Route map configuration mode
<b>Usage Guide</b>	This set rule is used to set the weight of a route.

### ▾ Displaying the Configurations of a Route Map

<b>Command</b>	<b>show route-map</b> [ <i>name</i> ]
<b>Parameter Description</b>	<i>name</i> : Specifies a route map.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	Run the <b>show route-map</b> command to display the configurations of a route map. If an ACL is used when a route map is configured, you can run the <b>show access-list</b> command to display the configurations of the ACL.

## Configuration Example

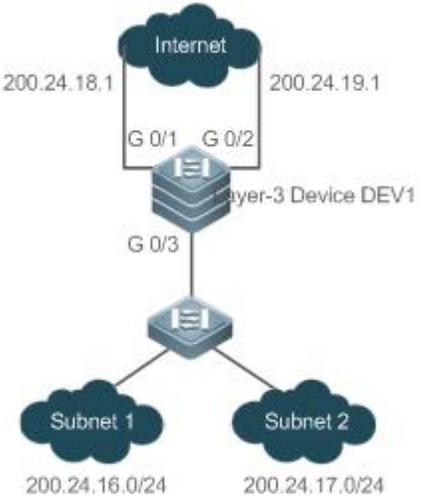

### ▾ Using a Route Map in Route Re-distribution to Filter and Modify Routing Information

<b>Scenario Figure 1-4</b>	As shown in Figure 1-4, a device is connected to both an OSPF routing domain and RIP routing domain. 
	<ul style="list-style-type: none"> <li>Re-distribute only RIP routes with 4 hops to OSPF. In the OSPF route domain, if the route type is the external route type-1, set the tag value of the route to 40.</li> </ul>

	<ul style="list-style-type: none"> <li>● Re-distribute only OSPF routes with the tag value 10 to RIP. In the RIP route domain, set the initial metric value of this route to 10.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the route map redrip: Match a route with 4 hours, set the initial metric value of the route to 40, set the route type to the external route type-1, and set the tag value of the route to 40.</li> <li>● Configure the route map redospf: match a route with the tag value 10 and set the initial metric value of the route to 10.</li> <li>● Configure re-distribution of the RIP route to OSPF and apply the route map redrip.</li> <li>● Configure re-distribution of the OSPF route to RIP and apply the route map redospf.</li> </ul>
	<pre>Ruijie(config)# route-map redrip permit 10 Ruijie(config-route-map)# match metric 4 Ruijie(config-route-map)# set metric-type type-1 Ruijie(config-route-map)# set tag 40 Ruijie(config-route-map)# exit Ruijie(config)# route-map redospf permit 10 Ruijie(config-route-map)# match tag 10 Ruijie(config-route-map)# set metric 10 Ruijie(config-route-map)# exit Ruijie(config)# router ospf 1 Ruijie(config-router)# redistribute rip subnets route-map redrip Ruijie(config-router)# exit Ruijie(config)# router rip Ruijie(config-router)# redistribute ospf 1 route-map redospf Ruijie(config-router)# exit</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Check the configurations of the route map to verify the policy rules.</li> <li>● Check the OSPF routing information library to verify that the rules matching the policy rules are re-distributed.</li> </ul>
	<pre>Ruijie# show route-map route-map redrip, permit, sequence 10   Match clauses:     metric 4   Set clauses:     metric 40     metric-type type-1</pre>

	<pre>tag 40  route-map redospf, permit, sequence 10  Match clauses:  tag 10  Set clauses:  metric 10</pre>
	<pre>Ruijie# show ip ospf database external            OSPF Router with ID (192.100.1.9) (Process ID 1)            AS External Link States  LS age: 5 Options: 0x2 (- - - - - E -) LS Type: AS-external-LSA Link State ID: 192.168.199.0 (External Network Number) Advertising Router: 192.100.1.9 LS Seq Number: 80000001 Checksum: 0x554d Length: 36 Network Mask: /24  Metric Type: 1 TOS: 0 Metric: 4 Forward Address: 0.0.0.0 External Route Tag: 40</pre>

## ➤ Applying a Route Map in PBR

<p><b>Scenario</b> <b>Figure 1-5</b></p>	 <p>The diagram illustrates a network topology. At the top, a cloud labeled 'Internet' is connected to a 'Layer-3 Device DEV1' through two interfaces: GE0/1 with IP address 200.24.18.1 and GE0/2 with IP address 200.24.19.1. The Layer-3 Device DEV1 is connected to a second Layer-3 Device below it via interface GE0/3. This second device is connected to two subnets: 'Subnet 1' (200.24.16.0/24) and 'Subnet 2' (200.24.17.0/24).</p>
	<p>Configure PBR on the device DEV1 to achieve the following purposes:</p> <ul style="list-style-type: none"> <li>● Packets from subnet 1 (200.24.16.0/24) are sent from GE0/1 first.</li> <li>● Packets from subnet 2 (200.24.17.0/24) are sent from GE0/2 first.</li> <li>● The two output links work in the mutual backup mode.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure two different ACLs to match packets from subnets 1 and 2 respectively.</li> <li>● Configure the route map RM_FOR_PBR: policy 10 is used to ensure that "packets from subnet 1 are sent from GE0/1 first"; policy 20 is used to ensure that "packets from subnet 2 are sent from GE0/2 first".</li> <li>● Configure PBR for packets received from GE0/3 and apply the route map RM_FOR_PBR.</li> <li>● Set PBR to implement redundant backup among multiple next hops.</li> </ul> <p><b>⚠</b> In the redundant backup mode, the sequence of multiple set next hops is the sequence of the priorities for taking effect.</p>

	<pre>Ruijie(config)# access-list 1 permit 200.24.16.0 0.0.0.255 Ruijie(config)# access-list 2 permit 200.24.17.0 0.0.0.255 Ruijie(config)# route-map RM_FOR_PBR 10 Ruijie(config-route-map)# match ip address 1 Ruijie(config-route-map)# set ip next-hop 200.24.18.1 Ruijie(config-route-map)# set ip next-hop 200.24.19.1 Ruijie(config-route-map)# exit Ruijie(config)# route-map RM_FOR_PBR 20 Ruijie(config-route-map)# match ip address 2 Ruijie(config-route-map)# set ip next-hop 200.24.19.1 Ruijie(config-route-map)# set ip next-hop 200.24.18.1 Ruijie(config-route-map)# exit Ruijie(config)# interface GigabitEthernet 0/3 Ruijie(config-if)# ip policy route-map RM_FOR_PBR Ruijie(config)# ip policy redundance</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Check the configurations of PBR to verify that the route map is applied to the interfaces.</li> <li>● Check the configurations of the route map to verify the policy rules.</li> <li>● Check the ACL configurations to verify the packet filtering rules.</li> </ul>
	<pre>Ruijie# show ip policy Balance mode: redundance Interface                               Route map GigabitEthernet 0/3                     RM_FOR_PBR !</pre>
	<pre>Ruijie# show route-map route-map RM_FOR_PBR, permit, sequence 10   Match clauses:     ip address 1   Set clauses:     ip next-hop 200.24.18.1     ip next-hop 200.24.19.1 route-map RM_FOR_PBR, permit, sequence 20</pre>

	<pre>Match clauses:   ip address 2  Set clauses:   ip next-hop 200.24.19.1   ip next-hop 200.24.18.1</pre>

## Common Errors

- After matching of ACLs and prefix-lists is configured, the corresponding ACLs and prefix lists are not defined.

## 1.4.2 Configuring a Filtering List

### Configuration Effect

- Define a set of route filtering rules to be used by routing protocols.

### Notes

- A configured filtering list can take effect only after it is associated with a routing protocol.

### Configuration Steps

#### ▾ Configuring a Prefix-List

- To filter address prefixes, you should perform this configuration.
- If there is no special requirement, you should perform this configuration on a route for which filtering based on a prefix-list needs to be performed.

#### ▾ Configuring an AS Path List

- To filter address prefixes, you should perform this configuration.
- If there is no special requirement, you should perform this configuration on a route for which filtering based on an AS path needs to be performed.

#### ▾ Configuring a Community List

- To filter community attributes, you should perform this configuration.

- If there is no special requirement, you should perform this configuration on a route for which community attributes need to be filtered.

### ↘ Configuring an Extcommunity List

- To filter extended community attributes, you should perform this configuration.
- If there is no special requirement, you should perform this configuration on a route for which extended community attributes need to be filtered.

### Verification

- Check whether the filtering list is correctly configured.
- Check the routing table to verify that routes can be correctly filtered.

### Related Commands

#### ↘ Defining AS Path Filtering Rules

<b>Command</b>	<code>ip as-path access-list path-list-num { permit   deny } regular-expression</code>
<b>Parameter Description</b>	<p><b>path-list-num:</b> Indicates an AS-path ACL name based on a regular expression and is an AS path list identifier, ranging from 1 to 500.</p> <p><b>permit:</b> Permits access.</p> <p><b>deny:</b> Denies access.</p> <p><b>regular-expression:</b> Indicates a regular expression, ranging from 1 to 255.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

#### ↘ Defining a Community List

<b>Command</b>	<code>ip community-list { { standard   expanded } community-list-name   community-list-number } { permit   deny } [ community-number.. ]</code>
<b>Parameter Description</b>	<p><b>standard:</b> Indicates a standard community list.</p> <p><b>expanded:</b> Indicates an extended community list.</p> <p><b>community-list-name:</b> Indicates the community list name, comprising not more than 80 characters.</p> <p><b>community-list-number:</b> Indicates the community list number. For a standard community list, the value ranges from 1 to 99. For an extended community list, the value ranges from 100 to 199.</p> <p><b>permit:</b> Permits access.</p> <p><b>deny:</b> Denies access.</p> <p><b>community-number:</b> Indicates the community attribute value.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to define a community list used for BGP.

#### ↘ Defining an Extcommunity List

<b>Command</b>	<code>ip extcommunity-list {<i>expanded-list</i>   <b>expanded</b> <i>list-name</i> } { <b>permit</b>   <b>deny</b> } [ <i>regular-expression</i> ]</code>
<b>Parameter Description</b>	<p><b>expand-list:</b> Indicates an extended extcommunity list, ranging from 100 to 199. One extcommunity list may contain multiple rules.</p> <p><b>standard-list:</b> Indicates a standard extcommunity list, ranging from 1 to 99. One extcommunity list may contain multiple rules.</p> <p><b>expanded list-name:</b> Indicates the name of an extended extcommunity, comprising not more than 32 characters. When using this parameter, you enter the extcommunity list configuration mode.</p> <p><b>standard list-name:</b> Indicates the name of a standard extcommunity list, comprising not more than 32 characters. When using this parameter, you enter the extcommunity list configuration mode.</p> <p><b>permit:</b> Defines an extcommunity rule for permitting.</p> <p><b>deny:</b> Defines an extcommunity rule for denying.</p> <p><b>regular-expression:</b> (optional) Defines a matching template that is used to match an extcommunity.</p> <p><b>sequence-number:</b> (Optional) Defines the sequence number of a rule, ranging from 1 to 2,147,483,647. If no sequence number is specified, the sequence number automatically increases by 10 when a rule is added by default. The initial number is 10.</p> <p><b>rt:</b> (Optional) Sets the RT attribute value. This command can be used only for the standard extcommunity configuration, but not for the extended extcommunity configuration.</p> <p><b>soo:</b> (Optional) Sets the SOO attribute value. This command can be used only for the standard extcommunity configuration, but not for the extended extcommunity configuration.</p> <p><b>value:</b> Indicates the value of an extended community (<code>extend_community_value</code>).</p>
<b>Command Mode</b>	Global configuration mode and ip extcommunity-list configuration mode
<b>Usage Guide</b>	-

### 📄 Creating a Prefix-List

<b>Command</b>	<code>ip prefix-list <i>prefix-list-name</i> [ <b>seq</b> <i>seq-number</i> ] { <b>deny</b>   <b>permit</b> } <i>ip-prefix</i> [ <b>ge</b> <i>minimum-prefix-length</i> ] [ <b>le</b> <i>maximum-prefix-length</i> ]</code>
<b>Parameter Description</b>	<p><b>prefix-list-name:</b> Indicates the prefix-list name.</p> <p><b>seq-number:</b> Assigns a sequence number to an prefix-list entry, ranging from 1 to 2,147,483,647. If this command does not contain the sequence number, the system will assign a default sequence number to the prefix-list entry. The default sequence number of the first entry is 5. Subsequently, the default sequence number of each entry not assigned with a value is the first multiple of 5 greater than the previous sequence number.</p> <p><b>deny:</b> Denies access when certain conditions are matched.</p> <p><b>permit:</b> Permits access when certain conditions are matched.</p> <p><b>ip-prefix:</b> Configures the IP address and mask, ranging from 0 to 32 digits.</p> <p><b>minimum-prefix-length:</b> Specifies the minimum range (namely, the start length of a range).</p> <p><b>maximum-prefix-length:</b> Specifies the maximum range (namely, the end length of a range).</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ▾ Adding Description to a Prefix-List

<b>Command</b>	<b>ip prefix-list</b> <i>prefix-list-name</i> <b>description</b> <i>descripton-text</i>
<b>Parameter</b>	<b><i>prefix-list-name</i></b> : Indicates the prefix-list name.
<b>Description</b>	<b><i>descripton-text</i></b> : Describes the prefix-list.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ▾ Enabling the Sorting Function for a Prefix-List

<b>Command</b>	<b>ip prefix-list</b> <b>sequence-number</b>
<b>Parameter</b>	-
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ▾ Creating an IPv6 Prefix-List

<b>Command</b>	<b>ipv6 prefix-list</b> <i>prefix-list-name</i> [ <b>seq</b> <i>seq-number</i> ] { <b>deny</b>   <b>permit</b> } <i>ipv6-prefix</i> [ <b>ge</b> <i>minimum-prefix-length</i> ] [ <b>le</b> <i>maximum-prefix-length</i> ]
<b>Parameter</b>	<b><i>prefix-list-name</i></b> : Indicates the prefix-list name.
<b>Description</b>	<p><b><i>seq-number</i></b>: Assigns a sequence number to an prefix-list entry, ranging from 1 to 2,147,483,647. If this command does not contain the sequence number, the system will assign a default sequence number to the prefix-list entry. The default sequence number of the first entry is 5. Subsequently, the default sequence number of each entry not assigned with a value is the first multiple of 5 greater than the previous sequence number.</p> <p><b><i>deny</i></b>: Denies access when certain conditions are matched.</p> <p><b><i>permit</i></b>: Permits access when certain conditions are matched.</p> <p><b><i>ipv6-prefix</i></b>: Configures the IP address and mask, ranging from 0 to 128 digits.</p> <p><b><i>minimum-prefix-length</i></b>: Specifies the minimum range (namely, the start length of a range).</p> <p><b><i>maximum-prefix-length</i></b>: Specifies the maximum range (namely, the end length of a range).</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ▾ Adding Description to an IPv6 Prefix List

<b>Command</b>	<b>ipv6 prefix-list</b> <i>prefix-list-name</i> <b>description</b> <i>descripton-text</i>
<b>Parameter</b>	<b><i>prefix-list-name</i></b> : Indicates the prefix list name.
<b>Description</b>	<b><i>descripton-text</i></b> : Describes the prefix list.
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	-
--------------------	---

▾ **Enabling the Sorting Function for an IPv6 Prefix-List**

**Configuration Example**

▾ **Configuring a Prefix-List**

<p><b>Scenario</b> Figure 1-6</p>	<p>The diagram illustrates a network topology within AS 100. At the top is Router B, and at the bottom is Router A. They are connected via a link labeled 'IBGP' with interface 'G0/1' and IP address '1.1.1.2/24' on Router B and '1.1.1.1/24' on Router A. Router A is connected to three subnets: Subnet 1 (192.168.1.0/24), Subnet 2 (192.168.2.0/24), and Subnet 3 (192.168.3.0/24).</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an IBGP neighbor and advertise the neighbor to the three connected subnets.</li> <li>● Configure a prefix-list.</li> <li>● Associate a prefix-list with A to filter sent routes.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ip prefix-list pre1 permit 192.168.1.0/24 A(config)# router bgp 100 A(config-router)# neighbor 1.1.1.2 prefix-list pre1 out A(config-router)# end</pre>

<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run the <b>show</b> command to display the prefix-list.</li> <li>● Run the <b>show</b> command to display the BGP routing table to check whether the filtering behavior is correct.</li> </ul>
<p><b>A</b></p>	<pre>A# show ip prefix-list ip prefix-list prel: 1 entries     seq 5 permit 192.168.1.0/24  A# show ip bgp BGP table version is 2, local router ID is 1.1.1.1 Status codes: s suppressed, d damped, h history, * valid, &gt; best, i - internal,                 S Stale, b - backup entry Origin codes: i - IGP, e - EGP, ? - incomplete      Network          Next Hop           Metric      LocPrf   Weight Path *&gt; 192.168.1.0      0.0.0.0            0           32768    i *&gt; 192.168.2.0      0.0.0.0            0           32768    i *&gt; 192.168.3.0      0.0.0.0            0           32768    i  Total number of prefixes 3</pre>
<p><b>B</b></p>	<pre>B# show ip bgp BGP table version is 4, local router ID is 1.1.1.2 Status codes: s suppressed, d damped, h history, * valid, &gt; best, i - internal,                 S Stale Origin codes: i - IGP, e - EGP, ? - incomplete      Network          Next Hop           Metric      LocPrf   Weight Path *&gt;i192.168.1.0      1.1.1.1            0           100      0      i  Total number of prefixes 1</pre>

➤ **Configuring an AS Path List**

<p><b>Scenario</b> Figure 1-7</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Create an AS-path filtering rule to match path information including only AS 200.</li> <li>● Establish EBGP neighborship on A with B and C.</li> <li>● Associate an AS-path list with A to filter the routes received from B and C.</li> </ul>
<p><b>A</b></p>	<pre>A(config)# ip as-path access-list 123 permit ^200\$ A(config)# router bgp 100 A(config)# neighbor 192.168.1.2 filter-list 123 in A(config)# neighbor 192.168.2.2 filter-list 123 in</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run the <b>show</b> command to display the AS-path list.</li> <li>● Run the <b>show</b> command to display the BGP routing table to check whether the filtering behavior is correct.</li> </ul>
<p><b>A</b></p>	<pre>A# show ip as-path-access-list AS path access list 123 permit ^200\$  //When no AS-path list is associated with A, run the show command to check the BGP routing table. A(config)# show ip bgp BGP table version is 1, local router ID is 1.1.1.1 Status codes: s suppressed, d damped, h history, * valid, &gt; best, i - internal,                 S Stale, b - backup entry Origin codes: i - IGP, e - EGP, ? - incomplete  Network          Next Hop          Metric      LocPrf      Weight Path *&gt; 10.0.0.0/24    192.168.1.2      0           0           200 i</pre>

## 2 Configuring Keys

### 2.1 Overview

Keys are a kind of parameters that are used in algorithms for conversion from plain text to cipher text or from cipher text to plain text.

Plain text and cipher text authentication are supported for packet authentication in a routing protocol, during which keys need to be used.

**i** At present, keys are used only for RIP and ISIS packet authentication.

### 2.2 Applications

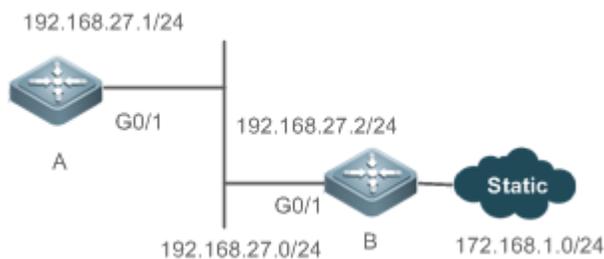

Application	Description
<a href="#">RIP Authentication</a>	RIP uses keys for packet authentication.

#### 2.2.1 RIP Authentication

##### Scenario

Network devices run RIP and use the MD5 authentication mode to increase the protocol security.

Figure 2-1

##### Deployment

- Configure a key chain on A. Configure RIP to enable packet authentication and use the key chain.
- Configure a key chain on B. Configure RIP to enable packet authentication and use the key chain.

### 2.3 Features

##### Overview

Feature	Description
<a href="#">Key Chain</a>	Provide a tool for authentication in a routing protocol.

## 2.3.1 Key Chain

### Working Principle

A key chain may contain multiple different keys. Each key contains the following attributes:

- Key ID: Identifies a key. In the current key chain, keys and IDs are mapped in the one-to-one manner.
- Authentication string: Indicates a set of key characters used for verifying the consistency of authentication strings in a routing protocol.
- Lifetime: Specifies the lifetime of the current key for sending or receiving packets. Different authentication keys can be used in different periods.

### Related Configuration

#### ↘ [Creating a Key Chain and a Key](#)

In the global configuration mode, run the **key chain** *key-chain-name* command to define a key chain and enter the key chain configuration mode.

In the key chain configuration mode, run the **key** *key-id* command to define a key and enter the key chain key configuration mode.

#### ↘ [Configuring an Authentication String](#)

In the key chain key configuration mode, run the **key-string** **[0|7]** *text* command to specify an authentication string.

- A plain text authentication string is configured by default. The value **0** indicates that a plain text authentication key is configured.
- The value **7** indicates that a cipher text authentication string is configured.
- The encryption authentication service is disabled by default. You can run the **service password-encryption** command to enable the encryption service to forcibly convert plain text authentication into cipher text.

#### ↘ [Configuring Lifetime](#)

In the key chain key configuration mode, you can configure the lifetime of a key chain in the receiving and sending directions.

- **accept-lifetime** *start-time* { **infinite** | *end-time* | **duration** *seconds* }: Configures the lifetime of a key chain in the receiving direction.
- **send-lifetime** *start-time* { **infinite** | *end-time* | **duration** *seconds* }: Configures the lifetime of a key chain in the sending direction.

## 2.4 Configuration

Configuration	Description and Command
---------------	-------------------------

<a href="#">Configuring a Key Chain</a>	 (Mandatory) It is used to create a key.	
	<b>key chain</b>	Creates a key chain.
	<b>key</b>	Configures a key ID.
	<b>key-string</b>	Configures a key string.
	<b>accept-lifetime</b>	Configures the lifetime in the receiving direction.
<b>send-lifetime</b>	Configures the lifetime in the sending direction.	

## 2.4.1 Configuring a Key Chain

### Configuration Effect

- Define a key chain to be used by a routing protocol.

### Notes

- A key chain can take effect only after it is associated with a routing protocol.

### Configuration Steps

#### ↳ Creating a Key Chain

- This configuration is mandatory if a key chain needs to be used.
- If there is no special requirement, you should perform this configuration on all routers for which routing protocol authentication needs to be performed.

#### ↳ Configuring a Key ID

- This configuration is mandatory if a key chain needs to be used.
- If there is no special requirement, you should perform this configuration on all routers for which routing protocol authentication needs to be performed.

#### ↳ Configuring a Key String

- This configuration is mandatory if a key chain needs to be used.
- If there is no special requirement, you should perform this configuration on all routers for which routing protocol authentication needs to be performed.

#### ↳ Configure the Lifetime in the Receiving Direction

- Optional.
- If the lifetime in the sending direction is not configured, the key chain will be always effective.

#### ↳ Configure the Lifetime in the Sending Direction

- Optional.

- If the lifetime in the sending direction is not configured, the key chain will be always effective.

## Verification

- Use keys in a routing protocol and observe the neighborhood established by the routing protocol. If the keys are inconsistent, the neighborhood fails to be established.

## Related Commands

### ▾ Configuring a Key Chain

<b>Command</b>	<b>key chain</b> <i>key-chain-name</i>
<b>Parameter Description</b>	<i>key-chain-name</i> : Indicates the name of a key chain.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To make a key chain take effect, you must configure at least one key.

### ▾ Configuring a Key ID

<b>Command</b>	<b>key</b> <i>key-id</i>
<b>Parameter Description</b>	<i>key-id</i> : Indicates the authentication key ID in a key chain, ranging from 0 to 2,147,483,647.
<b>Command Mode</b>	Key chain configuration mode.
<b>Usage Guide</b>	-

### ▾ Configuring a Key Authentication String

<b>Command</b>	<b>key-string [0 7]</b> <i>text</i>
<b>Parameter Description</b>	<b>0</b> : Specifies that the key is displayed in plain text. <b>7</b> : Specifies that the key is displayed in cipher text. <i>text</i> : Specifies the authentication string characters.
<b>Command Mode</b>	Key chain key configuration mode.
<b>Usage Guide</b>	-

### ▾ Configuring the Lifetime in the Sending Direction

<b>Command</b>	<b>send-lifetime</b> <i>start-time</i> { <b>infinite</b>   <i>end-time</i>   <b>duration</b> <i>seconds</i> }
<b>Parameter Description</b>	<b>start-time</b> : Indicates the start time of the lifetime. <b>infinite</b> : Indicates that the key is always effective. <b>end-time</b> : Indicates the end time of the lifetime, which must be later than start-time. <b>duration seconds</b> : Specifies the duration from the start time to the end time, ranging from 1 to 2,147,483,646.
<b>Command</b>	Key chain key configuration mode.

<b>Mode</b>	
<b>Usage Guide</b>	Run this command to define the lifetime of the key in the sending direction.

↘ **Configuring the Lifetime in the Receiving Direction**

<b>Command</b>	<b>accept-lifetime</b> <i>start-time</i> {infinite   <i>end-time</i>   <b>duration</b> <i>seconds</i> }
<b>Parameter Description</b>	<p><b>start-time</b>: Indicates the start time of the lifetime.</p> <p><b>infinite</b>: Indicates that the key is always effective.</p> <p><b>end-time</b>: Indicates the end time of the lifetime, which must be later than start-time.</p> <p><b>duration seconds</b>: Specifies the duration from the start time to the end time, ranging from 1 to 2,147,483,646.</p>
<b>Command Mode</b>	Key chain key configuration mode.
<b>Usage Guide</b>	Run this command to define the lifetime of the key in the receiving direction.

**Configuration Example**

↘ **Configuring a Key Chain and Using the Key Chain in RIP Packet Authentication**

<b>Scenario</b> Figure 2-2	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure a key on all routers.</li> <li>● Configure RIP on all routers.</li> <li>● Enable RIP authentication on all routers.</li> </ul>

	<pre>A(config-keychain-key)#key-string World A(config-keychain-key)#accept-lifetime 04:00:00 Oct 2 2013 infinite A(config-keychain-key)#send-lifetime 04:00:00 Oct 2 2013 infinite A(config-keychain-key)#exit A(config)#interface gigabitEthernet 0/1 A(config-if)#ip address 192.168.27.1 255.255.255.0 A(config-if)#ip rip authentication key-chain ripchain A(config-if)#ip rip authentication mode md5 A(config-if)#exit A(config)#router rip A(config-router)#version 2 A(config-router)#network 192.168.27.0</pre>
<b>B</b>	<pre>B&gt;enable B#configure terminal B(config)#key chain ripchain B(config-keychain)#key 1 B(config-keychain-key)#key-string Hello B(config-keychain-key)#accept-lifetime 16:30:00 Oct 1 2013 duration 43200 B(config-keychain-key)#send-lifetime 16:30:00 Oct 1 2013 duration 43200 B(config-keychain-key)#exit B(config-keychain)#key 2 B(config-keychain-key)#key-string World B(config-keychain-key)#accept-lifetime 04:00:00 Oct 2 2013 infinite B(config-keychain-key)#send-lifetime 04:00:00 Oct 2 2013 infinite B(config-keychain-key)#exit B(config)#interface gigabitEthernet 0/1 B(config-if)#ip address 192.168.27.2 255.255.255.0 B(config-if)#ip rip authentication key-chain ripchain B(config-if)#ip rip authentication mode md5 B(config-if)#exit B(config)#router rip</pre>

	<pre>B(config-router)#version 2 B(config-router)#network 192.168.27.0 B(config-router)#redistribute static</pre>
<b>Verification</b>	Run the <b>show ip route rip</b> command to check whether router A can receive an RIP route from router B.
<b>A</b>	<pre>A(config)#show ip route rip R    172.168.0.0/16 [120/1] via 192.168.27.2, 00:05:16, GigabitEthernet 0/1</pre>

### Common Errors

- A key is not correctly associated with a routing protocol, which causes that authentication does not take effect.
- The keys configured on multiple routers are not consistent, which causes authentication failure.

## 2.5 Monitoring

### Displaying

Description	Command
Displays the configurations of a key chain.	<b>show key chain</b> [ <i>key-chain-name</i> ]

## 3 Configuring RIP

### 3.1 Overview

Routing Information Protocol (RIP) is a unicast routing protocol applied on IPv4 networks. RIP-enabled routers exchange routing information to obtain routes to remote networks.

As an Interior Gateway Protocol (IGP), RIP can run only within the autonomous system (AS) and is applicable to small-sized networks whose longest path involves less than 16 hops.

#### Protocols and Standards

- RFC1058: Defines RIPv1.
- RFC2453: Defines RIPv2.

### 3.2 Applications

Application	Description
<a href="#">Basic RIP Application</a>	The routing information is automatically maintained through RIP on a small-sized network.
<a href="#">Interworking Between RIP and BGP</a>	Several ASs are interconnected. RIP runs within each AS, and Border Gateway Protocol (BGP) runs between ASs.

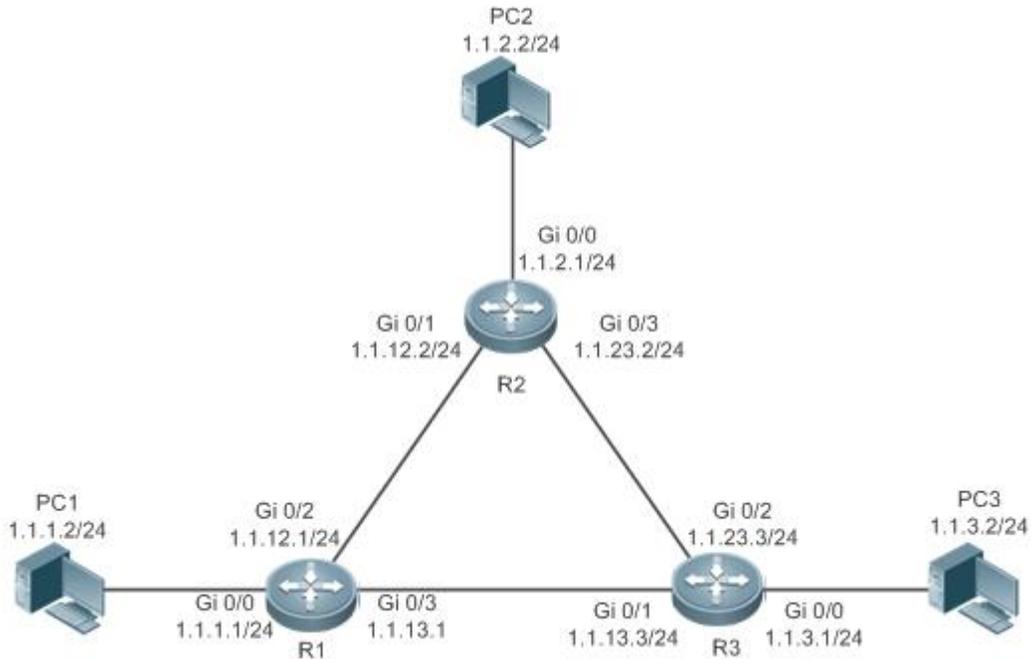

#### 3.2.1 Basic RIP Application

##### Scenario

On a network with a simple structure, you can configure RIP to implement network interworking. Configuring RIP is simpler than configuring other IGP protocols like Open Shortest Path First (OSPF). Compared with static routes, RIP can dynamically adapt to the network structure changes and is easier to maintain.

As shown in Figure 3-1, to implement interworking between PC1, PC2, and PC3, you can configure RIP routes on R1, R2, and R3.

Figure 3-1

## Deployment

- Configure IP addresses and gateways on three PCs.
- Configure IP addresses and subnet masks on three routers.
- Configure RIP on three routers.

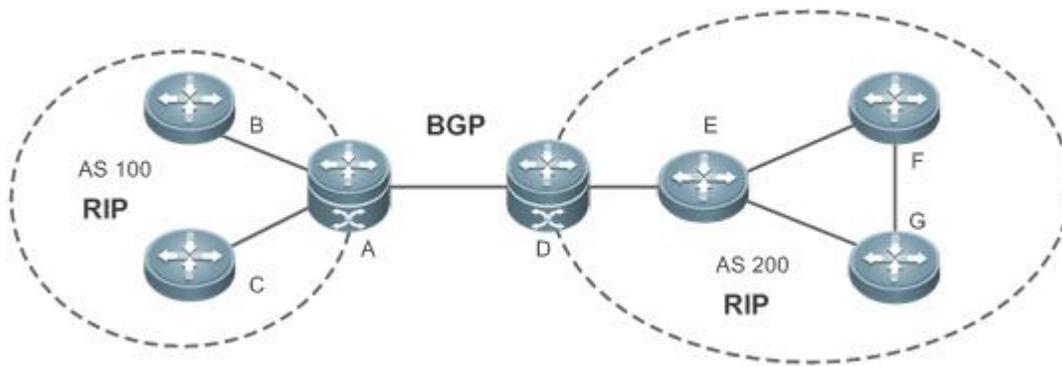

## 3.2.2 Interworking Between RIP and BGP

### Scenario

Several ASs are interconnected. RIP runs within each AS, and BGP runs between ASs. Generally, RIP and BGP learn the routing information from each other.

As shown in Figure 3-2, unicast routing is implemented within AS 100 and AS 200 using RIP, and between the two ASs using BGP.

Figure 3-2 Interworking Between RIP and BGP

<b>Remarks</b>	RIP and BGP run concurrently on Router A and Router D.
----------------	--

### Deployment

- RIP runs within AS 100 and AS 200 to implement unicast routing.
- BGP runs between the two ASs to implement unicast routing.

## 3.3 Features

### Basic Concepts

#### ↳ IGP and EGP

IGP runs within an AS. For example, RIP is a type of IGP.

Exterior Gateway Protocol (EGP) runs between ASs. For example, BGP is a type of EGP.

#### ↳ Classful Routing Protocol and Classless Routing Protocol

Protocols can be classified based on the type of routes supported:

- Classful routing protocol: It supports classful routes. For example, RIPv1 is a classful routing protocol.
- Classless routing protocol: It supports classless routes. For example, RIPv2 is a classless routing protocol.

### Overview

Feature	Description
<a href="#">RIPv1 and RIPv2</a>	RIP is available in two versions: RIPv1 and RIPv2.
<a href="#">Exchanging Routing Information</a>	By exchanging routing information, RIP-enabled devices can automatically obtain routes to a remote network and update the routes in real time.
<a href="#">Routing Algorithm</a>	RIP is a protocol based on the distance-vector algorithm. It uses the vector addition method to compute the routing information.
<a href="#">Avoiding Route Loops</a>	RIP uses functions, such as split horizon and poison reverse, to avoid route loops.

Feature	Description
<a href="#">Security Measures</a>	RIP uses functions, such as authentication and source address verification, to ensure protocol security.
<a href="#">Reliability Measures</a>	RIP uses functions, such as bidirectional forwarding detection (BFD) correlation, fast reroute, and graceful restart (GR), to enhance reliability of the protocol.
<a href="#">Multiple Instances</a>	RIP supports multiple instances and VPN applications.

### 3.3.1 RIPv1 and RIPv2

Two RIP versions are available: RIPv1 and RIPv2.

#### Working Principle

##### ↘ RIPv1

RIPv1 packets are broadcast. The broadcast address is 255.255.255.255, and the UDP port ID is 520. RIPv1 cannot identify the subnet mask, and supports only classful routes.

##### ↘ RIPv2

RIPv2 packets are multicast. The multicast address is 224.0.0.9, and the UDP port ID is 520. RIPv2 can identify the subnet mask, and supports classless routes, summarized route, and supernetting routes. RIPv2 supports plain text authentication and message digest 5 (MD5) authentication.

#### Related Configuration

##### ↘ Enabling the RIP Process

The RIP process is disabled by default.

Run the **router rip** command to enable the RIP process.

You must enable the RIP process on a device; otherwise, all functions related to RIP cannot take effect.

##### ↘ Running RIP on an Interface

By default, RIP does not run on an interface.

Run the **network** command to define an address range. RIP runs on interfaces that belong to this address range.

After RIP runs on an interface, RIP packets can be exchanged on the interface and RIP can learn routes to the network segments directly connected to the device.

##### ↘ Defining the RIP Version

By default, an interface receives RIPv1 and RIPv2 packets, and sends RIPv1 packets.

Run the **version** command to define the version of RIP packets sent or received on all interfaces.

Run the **ip rip send version** command to define the version of RIP packets sent on an interface.

Run the **ip rip receive version** command to define the version of RIP packets received on an interface.

---

 If the versions of RIP running on adjacent routers are different, the RIPv1-enabled router will learn incorrect routes.

---

### ⌵ Preventing an Interface from Sending or Receiving Packets

By default, a RIP-enabled interface is allowed to send and receive RIP packets.

Run the **no ip rip receive enable** command to prevent an interface from receiving RIP packets.

Run the **no ip rip send enable** command to prevent an interface from sending RIP packets.

Run the **passive-interface** command to prevent an interface from sending broadcast or multicast RIP packets.

### ⌵ Configuring the Mode for Sending RIP Packets

By default, broadcast RIPv1 packets and multicast RIPv2 are sent.

Run the **ip rip v2-broadcast** command to send broadcast RIPv2 packets on an interface.

Run the **neighbor** command to send unicast RIP packets to a specified neighbor router.

## 3.3.2 Exchanging Routing Information

Compared with static routing, the dynamic routing protocol has a significant advantage, that is, by exchanging routing information, devices can automatically obtain routes to a remote network and update the routes in real time.

### Working Principle

---

#### ⌵ Initialization

After RIP is enabled on a router, the router sends a request packet to its neighbor router, requesting for all routing information, that is, the routing table. After receiving the request message, the neighbor router returns a response packet containing the local routing table. After receiving the response packet, the router updates the local routing table, and sends an update packet to the neighbor router, informing the neighbor router of the route update information. After receiving the update packet, the neighbor router updates the local routing table, and sends the update packet to other adjacent routers. After a series of updates, all routers can obtain and retain the latest routing information.

#### ⌵ Periodical Update

By default, periodical update is enabled for RIP. Adjacent routers exchange complete routing information with each other every 30s (update timer), that is, the entire routing table is sent to neighbor routers. One update packet contains at most 25 routes. Therefore, a lot of update packets may be required to send the entire routing table. You can set the sending delay between update packets to avoid loss of routing information.

---

 For every non-local route, if the route is not updated within 180s (invalid timer), the metric of the route is changed to 16 (unreachable). If the route is still not updated in the next 120s (flush timer), the route is deleted from the routing table.

---

#### ⌵ Triggered Updates

After the triggered updates function is enabled, periodical update is automatically disabled. When routing information changes on a router, the router immediately sends routes related to the change (instead of the complete routing table) to the neighbor router, and use the acknowledgment and retransmission mechanisms to ensure that the neighbor router receives

the routes successfully. Compared with periodical update, triggered updates help reduce flooding and accelerates route convergence.

Events that can trigger update include router startup, interface status change, changes in routing information (such as the metric), and reception of a request packet.

### ↘ Route Summarization

When sending routing information to a neighbor router, the RIP-enabled router summarizes subnet routes that belong to the same classful network into a route, and sends the route to the neighbor router. For example, summarize 80.1.1.0/24 (metric=2) and 80.1.2.0/24 (metric=3) into 80.0.0.0/8 (metric=2), and set the metric of the summarized route to the optimum metric.

Only RIPv2 supports route summarization. Route summarization can reduce the size of the routing table and improve the efficiency of routing information exchange.

### ↘ Supernetting Route

If the subnet mask length of a route is smaller than the natural mask length, this route is called supernetting route. For example, in the 80.0.0.0/6 route, as 80.0.0.0 is a Class A network address and the natural mask is 8 bits, 80.0.0.0/6 route is a supernetting route.

Only RIPv2 supports supernetting routes.

### ↘ Default Route

In the routing table, a route to the destination network 0.0.0.0/0 is called default route.

The default route can be learned from a neighbor router, or sent to a neighbor router.

### ↘ Route Redistribution

For RIP, other types of routes (such as direct routes, static routes, and routes of other routing protocols) are called external routes.

External routes (excluding the default route) can be redistributed to RIP and advertised to neighbors.

### ↘ Route Filtering

Filtering conditions can be configured to limit the routing information exchanged between adjacent routers. Only the routing information that meets filtering conditions can be sent or received.

## Related Configuration

### ↘ Sending Delay Between Update Packets

By default, the update packets are sent continuously without any delay.

Run the **output-delay** command to set the sending delay between update packets.

### ↘ RIP Timers

By default, the update timer is 30s, the invalid timer is 180s, and the flush timer is 120s.

Run the **timers basic** command to modify durations of the RIP timers.

Increasing the duration of the flush timer can reduce the route flapping. Decreasing the duration of the flush timer helps accelerate route convergence.

The durations of RIP timers must be consistent on adjacent routers. Unless otherwise required, you are advised not to modify the RIP timers.

#### ↳ Triggered Updates

By default, periodical update is enabled.

Run the **ip rip triggered** command to enable triggered updates on the interface and disable periodical update.

Run the **ip rip triggered retransmit-timer** command to modify the retransmission interval of update packets. The default value is 5s.

Run the **ip rip triggered retransmit-count** command to modify the maximum retransmission times of update packets. The default value is 36.

#### ↳ Route Summarization

By default, route summarization is automatically enabled if an interface is allowed to send RIPv2 packets.

Run the **no auto-summary** command to disable route summarization.

Run the **ip rip summary-address** command to configure route summarization on an interface.

#### ↳ Supernetting Route

By default, supernetting routes can be sent if an interface is allowed to send RIPv2 packets.

Run the **no ip rip send supernet-routes** command to prevent the sending of supernetting routes.

#### ↳ Default Route

Run the **ip rip default-information** command to advertise the default route to neighbors on an interface.

Run the **default-information originate** command to advertise the default route to neighbors from all interfaces.

#### ↳ Route Redistribution

Run the **redistribute** command to redistribute external routes (excluding the default route) to RIP and advertise them to neighbors.

#### ↳ Route Filtering

Run the **distribute-list out** command to set filtering rules to limit the routing information sent by the device.

Run the **distribute-list in** command to set filtering rules to limit the routing information received by the device.

### 3.3.3 Routing Algorithm

RIP is a protocol based on the distance-vector algorithm. It uses the vector addition method to compute the routing information.

## Working Principle

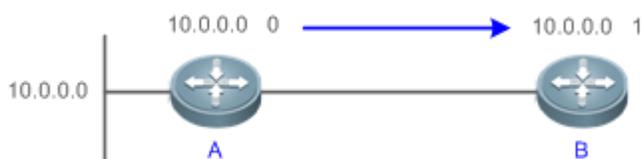

### Distance-Vector Algorithm

RIP is a protocol based on the distance-vector algorithm. The distance-vector algorithm treats a route as a vector that consists of the destination network and distance (metric). The router obtains a route from its neighbor and adds the distance vector from itself to the neighbor to the route to form its own route.

RIP uses the hop count to evaluate the distance (metric) to the destination network. By default, the hop count from a router to its directly connected network is 0, the hop count from a router to a network that can be reached through the router is 1, and so on. That is, the metric is equal to the number of routers from the local network to the destination network. To restrict the convergence time, RIP stipulates that the metric must be an integer between 0 and 15. If the metric is equal to or greater than 16, the destination network or host is unreachable. For this reason, RIP cannot be applied on a large-scale network.

As shown in Figure 3-3, Router A is connected to the network 10.0.0.0. Router B obtains the route (10.0.0.0,0) from Router A and adds the metric 1 to the route to obtain its own route ((10.0.0.0,1), and the next hop points to Router A.

Figure 3-3

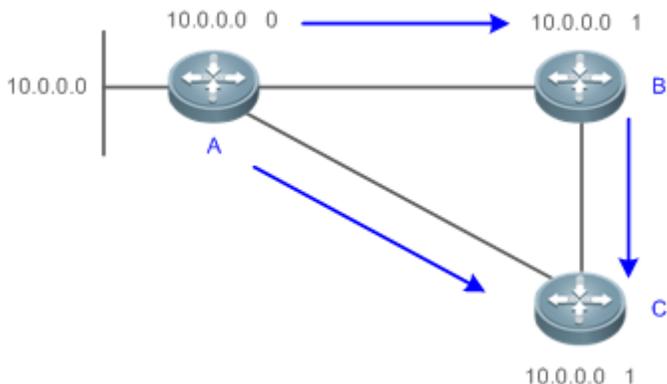

### Selecting the Optimum Route

RIP selects an optimum route based on the following principle: If multiple routes to the same destination network is available, a router preferentially selects the route with the smallest metric.

As shown in Figure 3-4, Router A is connected to the network 10.0.0.0. Router C obtains the route (10.0.0.0,0) from Router A and the route (10.0.0.0,1) from Router B. Router C will select the route that is obtained from Router A and add metric 1 to this route to form its own route (10.0.0.0,1), and the next hop points to Router A.

Figure 3-4

**i** When routes coming from different sources exist on a router, the route with the smallest distance is preferentially selected.

Route Source	Default Distance
Directly-connected network	0
Static route	1
OSPF route	110
IS-IS route	115
RIP route	120
Unreachable route	255

## Related Configuration

### ✚ Modifying the Distance

By default, the distance of a RIP route is 120.

Run the **distance** command to modify the distance of a RIP route.

### ✚ Modifying the Metric

For a RIP route that is proactively discovered by a device, the default metric is equal to the number of hops from the local network to the destination network. For a RIP router that is manually configured (default route or redistributed route), the default metric is 1.

Run the **offset-list in** command to increase the metric of a received RIP route.

Run the **offset-list out** command to increase the metric of a sent RIP route.

Run the **default-metric** command to modify the default metric of a redistributed route.

Run the **redistribute** command to modify the metric of a route when the route is redistributed.

Run the **default-information originate** command to modify the metric of a default route when the default route is introduced.

Run the **ip rip default-information** command to modify the metric of a default route when the default route is created.

## 3.3.4 Avoiding Route Loops

RIP uses functions, such as split horizon and poison reverse, to avoid route loops.

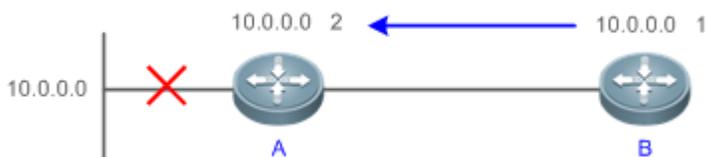

### Working Principle

#### ✚ Route Loop

A RIP route loop occurs due to inherent defects of the distance-vector algorithm.

As shown in Figure 3-5, Router A is connected to the network 10.0.0.0, and sends an update packet every 30s. Router B receives the route 10.0.0.0 from Router A every 30s. If Router A is disconnected from 10.0.0.0, the route to 10.0.0.0 will be deleted from the routing table on Router A. Next time, the update packet sent by Router A no longer contains this route. As Router B does not receive an update packet related to 10.0.0.0, Router B determines that the route to 10.0.0.0 is valid within 180s and uses the Update packet to send this route to Router A. As the route to 10.0.0.0 does not exist on Router A, the route learned from Router B is added to the routing table. Router B determines that data can reach 10.0.0.0 through Router A, and Router A determines that data can reach 10.0.0.0 through Router B. In this way, a route loop is formed.

Figure 3-5

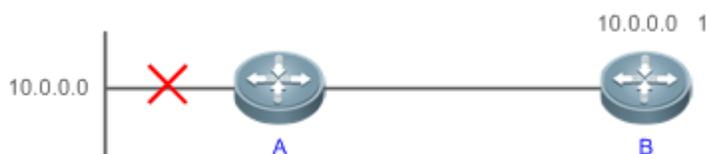

### Split Horizon

Split horizon can prevent route loops. After split horizon is enabled on an interface, a route received on this interface will not be sent out from this interface.

As shown in Figure 3-6, after split horizon is enabled on the interface between Router A and Router B, Router B will not send the route 10.0.0.0 back to Router A. Router B will learn 180s later that 10.0.0.0 is not reachable.

Figure 3-6

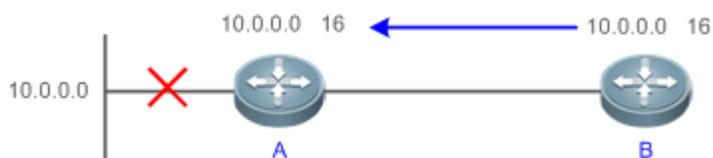

### Poison Reverse

Poison reverse can also prevent route loops. Compared with split horizon, poison reverse is more reliable, but brings more protocol packets, which makes network congestion more severe.

After poison reverse is enabled on an interface, a route received from this interface will be sent out from this interface again, but the metric of this route will be changed to 16 (unreachable).

As shown in Figure 3-7, after learning the route 10.0.0.0 from Router A, Router B sets the metric of this route to 16 and sends the route back to Router A. After this route becomes invalid, Router B advertises the route 10.0.0.0 (metric = 16) to Router A to accelerate the process of deleting the route from the routing table.

Figure 3-7

## Related Configuration

### Split Horizon

By default, split horizon is enabled.

Run the **no ip rip split-horizon** command to disable split horizon.

### Poison Reverse

By default, poison reverse is disabled.

Run the **ip rip split-horizon poisoned-reverse** command to enable poison reverse. (After poison reverse is enabled, split horizon is automatically disabled.)

### 3.3.5 Security Measures

RIP uses functions, such as authentication and source address verification, to ensure protocol security.

#### Working Principle

##### Authentication

RIPv2 supports authentication, but RIPv1 does not.

After authentication is enabled on an interface, the routing information cannot be exchanged between adjacent devices if authentication fails. The authentication function is used to prevent unauthorized devices from accessing the RIP routing domain.

RIPv2 supports plain text authentication and MD5 authentication.

##### Source Address Verification

When a RIP-enabled device receives an Update packet, it checks whether the source IP address in the packet and the IP address of the inbound interface are in the same network segment. If not, the device drops the packet. Source address verification is used to ensure that RIP routing information is exchanged only between adjacent routing devices.

-  On an unnumbered IP interface, source address verification is not performed (not configurable).
-  If the triggered updates function is enabled, source address verification is automatically enabled (not configurable).
-  If split horizon is disabled, source address verification is automatically enabled (not configurable).

#### Related Configuration

##### Authentication

By default, authentication is disabled.

Run the **ip rip authentication mode text** command to enable plain text authentication on an interface.

Run the **ip rip authentication mode md5** command to enable MD5 authentication on an interface.

Run the **ip rip authentication text-password** command to set the password for plain text authentication on an interface.

Run the **ip rip authentication key-chain** command to reference the key in the configured key chain as the authentication key on an interface.

##### Source Address Verification

By default, source address verification is enabled.

Run the **no validate-update-source** command to disable source address verification.

### 3.3.6 Reliability Measures

RIP uses functions, such as BFD correlation, fast reroute, and GR to enhance reliability of the protocol.

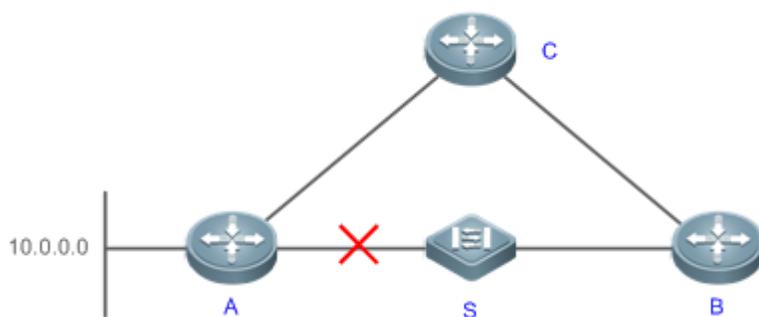

#### Working Principle

##### ↘ BFD Correlation and Fast Reroute

When a link or a device is faulty on the network, packets transmitted through this route will be lost until the route is converged again.

As shown in Figure 3-8, after the link between Router A and Router S is faulty, Router B may wait 180s before it can detect the failure of the route (Destination network: 10.0.0.0; Next hop: Router A). Later, Router B may need to wait 30s to re-obtain the route (Destination network: 10.0.0.0; Next hop: Router C) from Router C. Therefore, the traffic is interrupted for 210s.

Figure 3-8

Quick detection of a route failure or fast switchover to the standby route helps shorten the traffic interruption time.

- A BFD session can be set up between Router A and Router B, and correlated with RIP. BFD can quickly test the connectivity between adjacent routers. Once a link is faulty, RIP can detect the route failure within 1s.
- The fast reroute function can be enabled. A standby route (Destination network: 10.0.0.0; Next hop: Router C) can be configured on Router B in advance. Once RIP detects a route failure, the standby route is immediately enabled.
- GR

GR ensures uninterrupted data transmission when the protocol is restarted. If RIP is restarted on a GR-enabled device, the forwarding table before restart will be retained and a request packet will be sent to the neighbor so that the route can be learned again. During the GR period, RIP completes re-convergence of the route. After the GR period expires, RIP updates the forwarding entry and advertises the routing table to the neighbor.

#### Related Configuration

##### ↘ BFD Correlation

By default, RIP is not correlated with BFD.

Run the **bfd all-interfaces** command to set up the correlation between RIP and BFD. This configuration takes effect on all interfaces.

Run the **ip rip bfd** command to set up the correlation between RIP and BFD on the current interface.

#### Fast Reroute

By default, fast reroute is disabled.

Run the **fast-reroute route-map** command to enable fast reroute and reference the route map.

Run the **set fast-reroute backup-interface backup-nexthop** command to configure a standby route in the route map.

### 3.3.7 Multiple Instances

#### Working Principle

Multiple VPN instances may exist on a device.

RIP supports multiple instances. You can enable the RIP process in VPN routing and forwarding (VRF) address family mode to run RIP on VPN instances. One VRF address family is mapped to one VPN instance.

VPN instances cannot be distinguished from each other when you perform RIP operations using SNMP. You must bind the management information base (MIB) of RIP with a VPN instance before the SNMP operations take effect on the VPN instance.

#### Related Configuration

##### VRF Address Family

By default, the RIP process runs on a public network instance.

Run the **address-family** command to create a VRF address family and enter VRF address family mode.

Run the **exit-address-family** command to exit from VRF address family mode.

Run the **no address-family** command to delete a VRF address family.

##### MIB Binding

By default, the RIP MIB is bound with a public network instance.

Run the **enable mib-binding** command to bind the RIP MIB with a VPN instance.

## 3.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring RIP Basic Functions</a>	 (Mandatory) It is used to build a RIP routing domain.	
	<b>router rip</b>	Enables a RIP routing process and enters routing process configuration mode.
	<b>network</b>	Runs RIP on interfaces in the specified address range.
	<b>version</b>	Defines the RIP version.

Configuration	Description and Command	
	<b>ip rip split-horizon</b>	Enables split horizon or poison reverse on an interface.
	<b>passive-interface</b>	Configures a passive interface.
<a href="#">Controlling Interaction of RIP Packets</a>	 (Optional) This configuration is required if you wish to change the default mechanism for sending or receiving RIP packets.	
	<b>neighbor</b>	Sends unicast RIP packets to a specified neighbor.
	<b>ip rip v2-broadcast</b>	Sends broadcast RIPv2 packets on an interface.
	<b>ip rip receive enable</b>	Allows the interface to receive RIP packets.
	<b>ip rip send enable</b>	Allows the interface to send RIP packets.
	<b>ip rip send version</b>	Defines the version of RIP packets sent on an interface.
	<b>ip rip receive version</b>	Defines the version of RIP packets received on an interface.
<a href="#">Enabling Triggered Updates</a>	 Optional.	
	<b>ip rip triggered</b>	Enables triggered updates on an interface.
<a href="#">Enabling Source Address Verification</a>	 Optional.	
	<b>validate-update-source</b>	Enables source address verification.
<a href="#">Enabling Authentication</a>	 (Optional) Only RIPv2 supports authentication.	
	<b>ip rip authentication mode</b>	Enables authentication and sets the authentication mode on an interface.
	<b>ip rip authentication text-password</b>	Configures the password for plain text authentication on an interface.
	<b>ip rip authentication key-chain</b>	Configures the authentication key chain on an interface.
<a href="#">Enabling Route Summarization</a>	 (Optional) Only RIPv2 supports route summarization.	
	<b>auto-summary</b>	Enables automatic summarization of RIP routes.
	<b>ip rip summary-address</b>	Configures route summarization on an interface.
<a href="#">Enabling Supernetting Routes</a>	 (Optional) Only RIPv2 supports supernetting routes.	
	<b>ip rip send supernet-routes</b>	Enables advertisement of RIP supernetting routes on an interface
<a href="#">Advertising the Default Route or External Routes</a>	 Optional.	
	<b>ip rip default-information</b>	Advertises the default route to neighbors on an interface.

Configuration	Description and Command	
	<b>default-information originate</b>	Advertises the default route to neighbors.
	<b>redistribute</b>	Redistributes routes and advertises external routes to neighbors.
<a href="#">Setting Route Filtering Rules</a>	 Optional.	
	<b>distribute-list in</b>	Filters the received RIP routing information.
	<b>distribute-list out</b>	Filters the sent RIP routing information.
<a href="#">Modifying Route Selection Parameters</a>	 Optional.	
	<b>distance</b>	Modifies the administrative distance (AD) of a RIP route.
	<b>offset-list</b>	Increases the metric of a received or sent RIP route.
	<b>default-metric</b>	Configures the default metric of an external route redistributed to RIP.
<a href="#">Modifying Timers</a>	 Optional.	
	<b>timers basic</b>	Modifies the update timer, invalid timer, and flush timer.
	<b>output-delay</b>	Sets the sending delay between RIP route update packets.
<a href="#">Enabling BFD Correlation</a>	 Optional.	
	<b>bfd all-interfaces</b>	Correlates RIP with BFD on all interfaces.
	<b>ip rip bfd</b>	Correlates RIP with BFD on an interface.
<a href="#">Enabling Fast Reroute</a>	 Optional.	
	<b>fast-reroute route-map</b>	Enables fast reroute and references the route map.
	<b>set fast-reroute backup-interface backup-nexthop</b>	Configures the standby interface and standby next hop for fast reroute in the route map.
<a href="#">Enabling GR</a>	 Optional.	
	<b>graceful-restart</b>	Configures the GR restarter capability.
<a href="#">Enabling Multiple Instances</a>	 (Optional) It is used to run RIP on VPN instances.	
	<b>address-family ipv4 vrf</b>	Creates a VRF address family and enters IPv4 VRF address family mode.
	<b>exit-address-family</b>	Exits from an IPv4 VRF address family.
	<b>enable mib-binding</b>	Binds RIP MIB with a VPN instance.

### 3.4.1 Configuring RIP Basic Functions

#### [Configuration Effect](#)

- Build a RIP routing domain on the network.
- Routers in the domain obtain routes to a remote network through RIP.

## Notes

---

- IPv4 addresses must be configured.
- IPv4 unicast routes must be enabled.

## Configuration Steps

---

### ↳ Enabling a RIP Routing Process

- Mandatory.
- Unless otherwise required, this configuration must be performed on every router in the RIP routing domain.

### ↳ Associating with the Local Network

- Mandatory.
- Unless otherwise required, this configuration must be performed on every router in the RIP routing domain.
- Unless otherwise required, the local network associated with RIP should cover network segments of all L3 interfaces.

### ↳ Defining the RIP Version

- If RIPv2 functions (such as the variable length subnet mask and authentication) are required, enable the RIPv2.
- Unless otherwise required, you must define the same RIP version on every router.

### ↳ Enabling Split Horizon or Poison Reverse

- By default, split horizon is enabled and poison reverse is disabled.
- Unless otherwise required, enable split horizon on every interface connected to the broadcast network, such as the Ethernet. (Retain the default setting.)
- Unless otherwise required, enable split horizon on every interface connected to the point-to-point (P2P) network, such as the PPP and HDLC. (Retain the default setting.)
- It is recommended that split horizon and poison reverse be disabled on an interface connected to a non-broadcast multi-access (NBMA) network, such as FR and X.25; otherwise, some devices may fail to learn the complete routing information.
- If the secondary IP address is configured for an interface connected to a non-broadcast, it is recommended that split horizon and poison reverse be disabled.

### ↳ Configuring a Passive Interface

- If you want to suppress Update packets on a RIP interface, configure the interface as a passive interface.
- Use the passive interface to set the boundary of the RIP routing domain. The network segment of the passive interface belongs to the RIP routing domain, but RIP packets cannot sent over the passive interface.

- If RIP routes need to be exchanged on an interface (such as the router interconnect interface) in the RIP routing domain, this interface cannot be configured as a passive interface.

## Verification

- Check the routing table on a router to verify that the route to a remote network can be obtained through RIP.

## Related Commands

### ↳ Enabling a RIP Routing Process

<b>Command Syntax</b>	<b>router rip</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	This command is used to create a RIP routing process and enter routing process configuration mode.

### ↳ Associating with the Local Network

<b>Command Syntax</b>	<b>network</b> <i>network-number</i> [ <i>wildcard</i> ]
<b>Parameter Description</b>	<i>network-number</i> : Indicates the number of a network. <i>wildcard</i> : Defines the IP address comparison bit. <b>0</b> indicates accurate matching, and <b>1</b> indicates that no comparison is performed.
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	RIP can run and learn direct routes and RIP packets can be exchanged only on an interface covered by <b>network</b> . If <b>network</b> 0.0.0.0 255.255.255.255 is configured, all interfaces are covered. If <i>wildcard</i> is not configured, the classful address range is used by default, that is, the interfaces whose addresses fall into the classful address range participate in RIP operations.

### ↳ Defining the RIP Version

<b>Command Syntax</b>	<b>version</b> { <b>1</b>   <b>2</b> }
<b>Parameter Description</b>	<b>1</b> : Indicates RIPv1. <b>2</b> : Indicates RIPv2.
<b>Command Mode</b>	Global configuration mode
<b>Configuration Usage</b>	This command takes effect on the entire router. You can run this command to define the version of RIP packets sent or received on all interfaces.

↳ Enabling Split Horizon

<b>Command Syntax</b>	<code>ip rip split-horizon [ poisoned-reverse ]</code>
<b>Parameter Description</b>	<b>poisoned-reverse:</b> Indicates poison reverse.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	After poison reverse is enabled, split horizon is automatically disabled.

↳ Configuring a Passive Interface

<b>Command Syntax</b>	<code>passive-interface { default   interface-type interface-num }</code>
<b>Parameter Description</b>	<b>default:</b> Indicates all interfaces. <b>interface-type interface-num:</b> Specifies an interface.
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	First, run the <b>passive-interface default</b> command to configure all interfaces as passive interfaces. Then, run the <b>no passive-interface interface-type interface-num</b> command to cancel the interfaces used for interconnection between routers in the domain.

Configuration Example

↳ Building a RIP Routing Domain

<b>Scenario</b> Figure 3-9		
	<b>Remarks</b>	The interface IP addresses are as follows: A: GE0/1 110.11.2.1/24 GE0/2 155.10.1.1/24 B: GE0/1 110.11.2.2/24 GE0/2 196.38.165.1/24 C: GE0/1 110.11.2.3/24 GE0/2 117.102.0.1/16
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers.</li> <li>● Configure the RIP basic functions on all routers.</li> </ul>	

<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip address 110.11.2.1 255.255.255.0 A(config-if-GigabitEthernet 0/1)# exit A(config)# interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)# ip address 155.10.1.1 255.255.255.0 A(config)# router rip A(config-router)# version 2 A(config-router)# network 0.0.0.0 255.255.255.255 A(config-router)# passive-interface default A(config-router)# no passive-interface GigabitEthernet 0/1</pre>

R 155.10.0.0/16 [120/1] via 110.11.2.1, 00:20:55, GigabitEthernet 0/1 R 196.38.165.0/24 [120/1] via 110.11.2.3, 00:19:18, GigabitEthernet 0/1 </pre>

## Common Errors

- The IPv4 address is not configured on an interface.
- The RIP version is not defined on a device, or the RIP version on the device is different from that on other routers.
- The address range configured by the **network** command does not cover a specific interface.

- The **wildcard** parameter in the **network** command is not correctly configured. **0** indicates accurate matching, and **1** indicates that no comparison is performed.
- The interface used for interconnection between devices is configured as a passive interface.

### 3.4.2 Controlling Interaction of RIP Packets

#### Configuration Effect

Change the default running mechanism of RIP through configuration and manually control the interaction mode of RIP packets, including:

- Allowing or prohibiting the sending of unicast RIP packets to a specified neighbor on an interface
- Allowing or prohibiting the sending of unicast RIPv2 packets instead of broadcast packets to a specified neighbor on an interface
- Allowing or prohibiting the receiving of RIP packets on an interface
- Allowing or prohibiting the sending of RIP packets on an interface
- Allowing or prohibiting the receiving of RIP packets of a specified version on an interface
- Allowing or prohibiting the sending of RIP packets of a specified version on an interface

#### Notes

- The RIP basic functions must be configured.
- On an interface connecting to a neighbor device, the configured version of sent RIP packets must be the same as the version of received RIP packets.

#### Configuration Steps

##### ↘ Sending Unicast RIP Route Update Packets to a Specified Neighbor

- Configure this function if you wish that only some of devices connected to an interface can receive the updated routing information.
- By default, RIPv1 uses the IP broadcast address (255.255.255.255) to advertise the routing information, whereas RIPv2 uses the multicast address (224.0.0.9) to advertise the routing information. If you do not wish all devices on the broadcast network or NBMA network to receive routing information, configure the related interface as the passive interface and specify the neighbors that can receive the routing information. This command does not affect the receiving of RIP packets. RIPv2 packets are broadcast on an interface.
- Unless otherwise required, this function must be enabled on a router that sends the unicast Update packets.

##### ↘ Broadcasting RIPv2 Packets on an Interface

- This function must be configured if the neighbor router does not support the receiving of multicast RIPv2 packets.
- Unless otherwise required, this function must be configured on every router interface that broadcasts RIPv2 packets.

##### ↘ Allowing an Interface to Receive RIP Packets

- This function is enabled by default, and must be disabled if an interface is not allowed to receive RIP packets.
- Unless otherwise required, this function must be configured on every router interface that is not allowed to receive RIP packets.

#### ↘ Allowing an Interface to Send RIP Packets

- This function is enabled by default, and must be disabled if an interface is not allowed to send RIP packets.
- Unless otherwise required, this function must be configured on every router interface that is not allowed to send RIP packets.

#### ↘ Allowing an Interface to Send RIP Packets of a Specified Version

- This function must be configured if the version of RIP packets that can be sent on an interface is required to be different from the global configuration.
- Unless otherwise required, this function must be configured on every router interface that is allowed to send RIP packets of a specified version.

#### ↘ Allowing an Interface to Receive RIP Packets of a Specified Version

- This function must be configured if the version of RIP packets that can be received on an interface is required to be different from the global configuration.
- Unless otherwise required, this function must be configured on every router interface that is allowed to receive RIP packets of a specified version.

### Verification

Run the **debug ip rip packet** command to verify the packet sending result and packet type.

### Related Commands

#### ↘ Sending Unicast RIP Route Update Packets to a Specified Neighbor

<b>Command Syntax</b>	<b>neighbor</b> <i>ip-address</i>
<b>Parameter Description</b>	<i>ip-address</i> : Indicates the IP address of the neighbor. It should be the address of the network directly connected to the local device.
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	Generally, you can first run the <b>passive-interface</b> command in routing process configuration mode to configure the related interface as a passive interface, and then specify the neighbors that can receive the routing information. This command does not affect the receiving of RIP packets. After an interface is configured as a passive interface, the interface does not send the request packets even after the device is restarted.

#### ↘ Broadcasting RIPv2 Packets on an Interface

<b>Command Syntax</b>	<b>ip rip v2-broadcast</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	The default behavior is determined by the configuration of the <b>version</b> command. The configuration result of this command can overwrite the default configuration of the <b>version</b> command. This command affects the behavior of sending RIP packets on the current interface, and the interface is allowed to send RIPv1 and RIPv2 packets simultaneously. If this command does not contain any parameter, the behavior of receiving RIP packets is determined by the configuration of the <b>version</b> command.

### ▾ Allowing an Interface to Receive RIP Packets

<b>Command Syntax</b>	<b>ip rip receive enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	To prohibit the receiving of RIP packets on an interface, use the <b>no</b> form of this command. This command takes effect only on the current interface. You can use the <b>default</b> form of the command to restore the default setting, that is, allowing the interface to receive RIP packets.

### ▾ Allowing an Interface to Send RIP Packets

<b>Command Syntax</b>	<b>ip rip send enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	To prohibit the sending of RIP packets on an interface, use the <b>no</b> form of this command in interface configuration mode. This command takes effect only on the current interface. You can use the <b>default</b> form of the command to restore the default setting, that is, allowing the interface to send RIP packets.

### ▾ Allowing an Interface to Send RIP Packets of a Specified Version

<b>Command Syntax</b>	<b>ip rip send version [ 1 ] [ 2 ]</b>
<b>Parameter Description</b>	1: Indicates that only RIPv1 packets are sent. 2: Indicates that only RIPv2 packets are sent.
<b>Command Mode</b>	Interface configuration mode

<b>Mode</b>	
<b>Configuration Usage</b>	The default behavior is determined by the configuration of the <b>version</b> command. The configuration result of this command can overwrite the default configuration of the <b>version</b> command. This command affects the behavior of sending RIP packets on the current interface, and the interface is allowed to send RIPv1 and RIPv2 packets simultaneously. If this command does not contain any parameter, the behavior of receiving RIP packets is determined by the configuration of the <b>version</b> command.

📌 **Allowing an Interface to Receive RIP Packets of a Specified Version**

<b>Command Syntax</b>	<b>ip rip receive version [ 1 ] [ 2 ]</b>
<b>Parameter Description</b>	1: Indicates that only RIPv1 packets are received. 2: Indicates that only RIPv2 packets are received.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	The default behavior is determined by the configuration of the <b>version</b> command. The configuration result of this command can overwrite the default configuration of the <b>version</b> command. This command affects the behavior of receiving RIP packets on the current interface, and the interface is allowed to receive RIPv1 and RIPv2 packets simultaneously. If this command does not contain any parameter, the behavior of receiving RIP packets is determined by the configuration of the <b>version</b> command.

**Configuration Example**

📌 **Prohibiting an Interface from Sending RIP Packets**

<b>Scenario</b> Figure 3-10	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Prohibit the sending of RIP packets on an interface of Router A.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# no ip rip send enable</pre>
<b>Verification</b>	Run the <b>debug ip rip packet send</b> command on Router A, and verify that packets cannot be sent.

<p><b>Scenario</b> Figure 3-10</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Prohibit the sending of RIP packets on an interface of Router A.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 Ruijie(config-if-GigabitEthernet 0/1)# no ip rip send enable</pre>
<p><b>Verification</b></p>	<p>Run the <b>debug ip rip packet send</b> command on Router A, and verify that packets cannot be sent.</p>
<p><b>A</b></p>	<pre>A# debug ip rip packet recv *Nov 4 08:19:31: %RIP-7-DEBUG: [RIP] Prepare to send BROADCAST response... *Nov 4 08:19:31: %RIP-7-DEBUG: [RIP] Building update entries on GigabitEthernet 0/1 *Nov 4 08:19:31: %RIP-7-DEBUG:          117.0.0.0/8 via 0.0.0.0 metric 1 tag 0 *Nov 4 08:19:31: %RIP-7-DEBUG: [RIP] Interface GigabitEthernet 0/1 is disabled to send RIP packet!</pre>

### Common Errors

A compatibility error occurs because the RIP version configured on the neighbor is different from that configured on the local device.

## 3.4.3 Enabling Triggered Updates

### Configuration Effect

- Enable the RIP triggered updates function, after which RIP does not periodically send the route update packets.

### Notes

- The RIP basic functions must be configured.
- It is recommended that split horizon with poisoned reverse be enabled; otherwise, invalid routing information may exist.
- This function cannot be enabled together with the function of correlating RIP with BFD.
- Ensure that the triggered updates function is enabled on every router on the same link; otherwise, the routing information cannot be exchanged properly.

## Configuration Steps

### ↳ Enabling Triggered Updates

- This function must be enabled if demand circuits are configured on the WAN interface.
- The triggered updates function can be enabled in either of the following cases: (1) The interface has only one neighbor; (2) The interface has multiple neighbors but the device interacts with these neighbors in unicast mode.
- It is recommended that triggered updates be enabled on a WAN interface (running the PPP, Frame Relay, or X.25 link layer protocol) to meet the requirements of demand circuits.
- If the triggered updates function is enabled on an interface, source address verification is performed no matter whether the source address verification function is enabled by the **validate-update-source** command.
- Unless otherwise required, triggered updates must be enabled on demand circuits of every router.

## Verification

When the RIP triggered updates function is enabled, RIP cannot periodically send the route update packets. RIP sends the route update packets to the WAN interface only in one of the following cases:

- A route request packet is received.
- The RIP routing information changes.
- The interface state changes.
- The router is started.

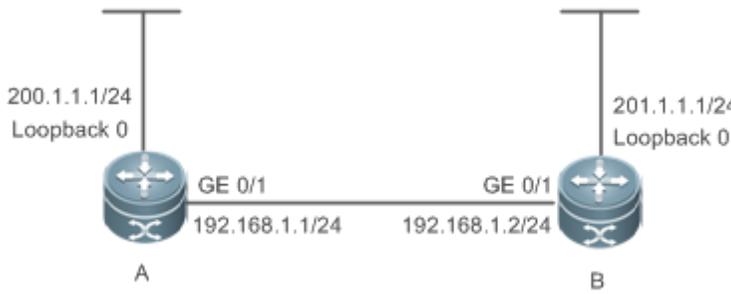

## Related Commands

### ↳ Enabling Triggered Updates

<b>Command Syntax</b>	<b>ip rip triggered</b> { <b>retransmit-timer</b> <i>timer</i>   <b>retransmit-count</b> <i>count</i> }
<b>Parameter Description</b>	<b>retransmit-timer</b> <i>timer</i> : Configures the interval at which the update request or update response packet is retransmitted. The default value is 5s. The value ranges from 1 to 3,600. <b>retransmit-count</b> <i>count</i> : Configures the maximum retransmission times of the update request or update response packet. The default value is 36. The value ranges from 1 to 3,600.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	You can run the <b>ip rip triggered</b> command to enable the RIP triggering function. When this function is enabled, the RIP periodical update function is automatically disabled. Therefore, the acknowledgment and retransmission mechanisms must be used to ensure that the Update packets are successfully sent or received on the WAN. You can use the <b>retransmit-timer</b> and <b>retransmit-count</b> parameters to specify the retransmission interval and maximum retransmission times of the request and update packets.

## Configuration Example

## ▾ Enabling Triggered Updates

<b>Scenario</b> <b>Figure 3-11</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● On Router A, enable the RIP triggered updates function, and set the retransmission interval and maximum retransmission times of the request and update packets to 10s and 18, respectively.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# encapsulation ppp A(config-if-GigabitEthernet 0/1)# ip rip triggered A(config-if-GigabitEthernet 0/1)# ip rip triggered retransmit-timer 10 A(config-if-GigabitEthernet 0/1)# ip rip triggered retransmit-count 18 A(config-if-GigabitEthernet 0/1)# ip rip split-horizon poisoned-reverse A(config)# router rip A(config-router)# network 192.168.1.0 A(config-router)# network 200.1.1.0</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# encapsulation ppp B(config-if-GigabitEthernet 0/1)# ip rip triggered B(config-if-GigabitEthernet 0/1)# ip rip split-horizon poisoned-reverse B(config)# router rip B(config-router)# network 192.168.1.0 B(config-router)# network 201.1.1.0</pre>
<b>Verification</b>	<p>On Router A and Router B, check the RIP database and verify that the corresponding routes are permanent.</p>

<b>A</b>	<pre>A# sho ip rip database 201.1.1.0/24  auto-summary 201.1.1.0/24     [1] via 192.168.12.2 GigabitEthernet 0/1  06:25  permanent</pre>
<b>B</b>	<pre>B# sho ip rip database 200.1.1.0/24  auto-summary 200.1.1.0/24     [1] via 192.168.12.1 GigabitEthernet 0/1  06:25  permanent</pre>

### Common Errors

- The triggered updates function is enabled when the RIP configurations at both ends of the link are consistent.
- Both the triggered updates and BFD functions are enabled.
- The triggered updates function is not enabled on all routers on the same link.

## 3.4.4 Enabling Source Address Verification

### Configuration Effect

- The source address of the received RIP route update packet is verified.

### Notes

- The RIP basic functions must be configured.

### Configuration Steps

#### ▾ Enabling Source Address Verification

- This function is enabled by default, and must be disabled when source address verification is not required.
- After split horizon is disabled on an interface, the RIP routing process will perform source address verification on the Update packet no matter whether the **validate-update-source** command is executed in routing process configuration mode.
- For an IP unnumbered interface, the RIP routing process does not perform source address verification on the Update packet no matter whether the **validate-update-source** command is executed in routing process configuration mode.
- Unless otherwise required, this function must be disabled on every router that does not require source address verification.

### Verification

Only the route update packets coming from the same IP subnet neighbor are received.

**Related Commands**

<b>Command Syntax</b>	<b>validate-update-source</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	Source address verification of the Update packet is enabled by default. After this function is enabled, the source address of the RIP route update packet is verified. The purpose is to ensure that the RIP routing process receives only the route update packets coming from the same IP subnet neighbor.

**Configuration Example**

<p><b>Scenario</b> Figure 3-12</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Disable source address verification of Update packets on all routers.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# router rip A(config-router)# no validate-update-source</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# router rip B(config-router)# no validate-update-source</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A, check the routing table and verify that the entry 201.1.1.0/24 is loaded.</li> <li>● On Router B, check the routing table and verify that the entry 200.1.1.0/24 is loaded.</li> </ul>
<p><b>A</b></p>	<pre>A# show ip route rip R 201.1.1.0/24 [120/1] via 192.168.2.2, 00:06:11, GigabitEthernet 0/1</pre>
<p><b>B</b></p>	<pre>B# show ip route rip</pre>

<p><b>Scenario</b> Figure 3-12</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Disable source address verification of Update packets on all routers.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# router rip A(config-router)# no validate-update-source</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# router rip B(config-router)# no validate-update-source</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A, check the routing table and verify that the entry 201.1.1.0/24 is loaded.</li> <li>● On Router B, check the routing table and verify that the entry 200.1.1.0/24 is loaded.</li> </ul>
	<pre>R 200.1.1.0/24 [120/1] via 192.168.1.1, 00:06:11, GigabitEthernet 0/1</pre>

### 3.4.5 Enabling Authentication

#### Configuration Effect

- Prevent learning unauthenticated and invalid routes and advertising valid routes to unauthorized devices, ensuring stability of the system and protecting the system against intrusions.

#### Notes

- The RIP basic functions must be configured.
- Only RIPv2 supports authentication of RIP packets, and RIPv1 does not.

#### Configuration Steps

##### ▾ Enabling Authentication and Specifying the Key Chain Used for RIP Authentication

- This configuration is mandatory if authentication must be enabled.
- If the key chain is already specified in the interface configuration, run the **key chain** command in global configuration mode to define the key chain; otherwise, authentication of RIP packets may fail.

- Unless otherwise required, this configuration must be performed on every router that requires authentication.

### ▾ Defining the RIP Authentication Mode

- This configuration is mandatory if authentication must be enabled.
- The RIP authentication modes configured on all devices that need to directly exchange RIP routing information must be the same; otherwise, RIP packets may fail to be exchanged.
- If plain text authentication is used, but the key chain for plain text authentication is not configured or associated, authentication is not performed. Similarly, if MD5 authentication is used, but the key chain is not configured or associated, authentication is not performed.
- Unless otherwise required, this configuration must be performed on every router that requires authentication.

### ▾ Enabling RIP Plain Text Authentication and Configuring the Key Chain

- This configuration is mandatory if authentication must be enabled.
- If RIP plain text authentication should be enabled, use this command to configure the key chain for plain text authentication. Alternatively, you can obtain the key chain for plain text authentication by associating the key chain. The key chain obtained using the second method takes precedence over that obtained using the first method.
- Unless otherwise required, this configuration must be performed on every router that requires authentication.

## Verification

- RIP plain text authentication provides only limited security because the password transferred through the packet is visible.
- RIP MD5 authentication can provide higher security because the password transferred through the packet is encrypted using the MD5 algorithm.
- Routes can be learned properly if the correct authentication parameters are configured.
- Routes cannot be learned if the incorrect authentication parameters are configured.

## Related Commands

### ▾ Enabling Source Address Verification

<b>Command Syntax</b>	<code>ip rip authentication key-chain <i>name-of-keychain</i></code>
<b>Parameter Description</b>	<i>name-of-keychain</i> : Specifies the name of the key chain used for RIP authentication.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	The specified key chain must be defined by the <b>key chain</b> command in global configuration mode in advance.

### ▾ Defining the RIP Authentication Mode

<b>Command Syntax</b>	<code>ip rip authentication mode { text   md5 }</code>
<b>Parameter Description</b>	<b>text:</b> Indicates that the RIP authentication mode is plain text authentication. <b>md5:</b> Indicates that the RIP authentication mode is MD5 authentication.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	For all devices that need to directly exchange the RIP routing information, the RIP authentication mode of these devices must be the same.

📌 **Enabling RIP Plain Text Authentication and Configuring the Key Chain**

<b>Command Syntax</b>	<code>ip rip authentication text-password [ 0   7 ] password-string</code>
<b>Parameter Description</b>	<b>0:</b> Indicates that the key is displayed in plain text. <b>7:</b> Indicates that the key is displayed in cipher text. <i>password-string:</i> Indicates the key chain used for plain text authentication. The key chain is a string of 1 to 16 bytes.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	This commands takes effect only in plain text authentication mode.

Configuration Example

📌 **Configuring RIP Basic Functions and Enabling MD5 Authentication**

<b>Scenario</b> Figure 3-13	<p>The diagram illustrates a network setup with two routers, A and B, connected via their GE 0/1 interfaces. Router A has a loopback interface 200.1.1.1/24 and a physical interface 192.168.1.1/24. Router B has a loopback interface 201.1.1.1/24 and a physical interface 192.168.1.2/24. A blue double-headed arrow between the physical interfaces is labeled 'MD5 Authentication'.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Configure the authentication type and MD5 authentication key on all routers.</li> </ul>

<b>A</b>	<pre>A# configure terminal A(config)# key chain hello A(config-keychain)# key 1 A(config-keychain-key)# key-string world A(config-keychain-key)# exit A(config-keychain)# exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip rip authentication mode md5 A(config-if-GigabitEthernet 0/1)# ip rip authentication key-chain hello</pre>
<b>B</b>	<pre>B# configure terminal B(config)# key chain hello B(config-keychain)# key 1 B(config-keychain-key)# key-string world B(config-keychain-key)# exit B(config-keychain)# exit B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ip rip authentication mode md5 B(config-if-GigabitEthernet 0/1)# ip rip authentication key-chain hello</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router A, check the routing table and verify that the entry 201.1.1.0/24 is loaded.</li> <li>● On Router B, check the routing table and verify that the entry 200.1.1.0/24 is loaded.</li> </ul>
<b>A</b>	<pre>A# show ip route rip R    201.1.1.0/24 [120/1] via 192.168.1.2, 00:06:11, GigabitEthernet 0/1</pre>
<b>B</b>	<pre>A# show ip route rip R    200.1.1.0/24 [120/1] via 192.168.1.1, 00:06:11, GigabitEthernet 0/1</pre>

### Common Errors

- The keys configured on routers that need to exchange RIP routing information are different.
- The authentication modes configured on routers that need to exchange RIP routing information are different.

### 3.4.6 Enabling Route Summarization

#### Configuration Effect

Reduce the size of the routing table, improve the routing efficiency, avoid route flapping to some extent, and improve scalability and effectiveness of the network.

-  If a summarized route exists, subroutes included by the summarized route cannot be seen in the routing table, which greatly reduces the size of the routing table.
-  Advertising a summarized route is more efficient than advertising individual routes because: (1) A summarized route is processed first when RIP looks through the database; (2) All subroutes are ignored when RIP looks through the database, which reduces the processing time required.

## Notes

- The RIP basic functions must be configured.
- The range of supernetting routes is larger than that of the classful network. Therefore, the automatic route summarization function is invalid for supernetting routes.
- RIPv1 always performs automatic route summarization. If the detailed routes should be advertised, you must set the RIP version to RIPv2.

## Configuration Steps

### ▾ Enabling Automatic Route Summarization

- This function is enabled by default.
- To learn specific subnet routes instead of summarized network routes, you must disable automatic route summarization.
- You can disable automatic route summarization only in RIPv2. RIPv1 always performs automatic route summarization.

### ▾ Configuring RIP Route Summarization on an Interface

- This function must be configured if it is required to summarize classful subnets.
- The **ip rip summary-address** command is used to summarize an address or a subnet under a specified interface. RIP automatically summarizes to the classful network boundary. Each classful subnet can be configured only in the **ip rip summary-address** command.
- The summary range configured in this command cannot be supernetting routes, that is, the configured subnet mask length cannot be smaller than the natural mask length of the network.
- Unless otherwise required, this configuration should be performed on a router that requires classful subnet summarization.

## Verification

Verify that the routes are summarized in the routing table of the peer end.

## Related Commands

### ▾ Enabling Automatic Route Summarization

<b>Command Syntax</b>	<b>auto-summary</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	Route summarization is enabled by default for RIPv1 and RIPv2. You can disable automatic route summarization only in RIPv2. RIPv1 always performs automatic route summarization.

📌 **Configuring RIP Route Summarization on an Interface**

<b>Command Syntax</b>	<b>ip rip summary-address</b> <i>ip-address ip-network-mask</i>
<b>Parameter Description</b>	<i>ip-address</i> : Indicates the IP address to be summarized. <i>ip-network-mask</i> : Indicates the subnet mask of the IP address to be summarized.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	This command is used to summarize an address or a subnet under a specified interface.

**Configuration Example**

📌 **Configuring Route Summarization**

<p><b>Scenario</b> Figure 3-14</p>	
<p><b>Remarks</b></p>	<p>The interface IP addresses are as follows:</p> <p>A: GE0/1 192.168.1.1</p> <p>B: GE0/1 192.168.1.2 GE0/2 172.16.2.1 GE0/3 172.16.3.1</p> <p>C: GE0/2 172.16.2.2 GE0/3 172.16.4.2</p> <p>D: GE0/2 172.16.3.2 GE0/3 172.16.5.2</p>

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Configure route summarization on Router B.</li> </ul>
	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ip rip summary-address 172.16.0.0 255.255.0.0 B(config)# router rip B(config-router)# version 2 B(config-router)# no auto-summary</pre>
<b>Verification</b>	Check the routing table on Router A, and verify that the entry 172.16.0.0/16 is generated.
	<pre>A# show ip route rip R 172.16.0.0/16 [120/2] via 192.168.1.2, 00:01:04, GigabitEthernet 0/1</pre>

### Common Errors

- RIP basic functions are not configured or fail to be configured.

## 3.4.7 Enabling Supernetting Routes

### Configuration Effect

- Allow RIP to send RIP supernetting routes on a specified interface.

### Notes

- The RIP basic functions must be configured.

### Configuration Steps

#### ↳ Enabling Supernetting Routes

- If a supernetting route is detected when a RIPv1-enabled router monitors the RIPv2 route response packets, the router will learn an incorrect route because RIPv1 ignores the subnet mask in the routing information of the packet. In this case, the **no** form of the command must be used on the RIPv2-enabled router to prohibit advertisement of supernetting routes on the related interface. This command takes effect only on the current interface.
- The command is effective only when RIPv2 packets are sent on the interface, and is used to control the sending of supernetting routes.

### Verification

Verify that the peer router cannot learn the supernetting route.

**Related Commands**

<b>Command Syntax</b>	<b>ip rip send supernet-routes</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	By default, an interface is allowed to send RIP supernetting routes.

**Configuration Example**

▾ **Disabling Supernetting Routes**

<b>Scenario</b> Figure 3-15	<p>The diagram shows two routers, A and B, connected via their GigabitEthernet 0/1 interfaces. Router A has the IP address 192.168.1.1/24. Router B has the IP address 192.168.1.2/24. Router B also has a static route to the network 207.0.0.0/8 and 208.1.1.0/24. The word 'Static' is written in orange above the connection to Router B.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Prohibit the sending of RIP supernetting routes on the GigabitEthernet 0/1 interface of Router B.</li> </ul>
	<pre> B# configure terminal B(config)# ip route 207.0.0.0 255.0.0.0 Null 0 B(config)# ip route 208.1.1.0 255.255.255.0 Null 0 B(config)# router rip B(config-router)# redistribute static B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# no ip rip send supernet-routes                     </pre>
<b>Verification</b>	<p>Check the routing table on Router A, and verify that Router A can learn only the non-supernetting route 208.1.1.0/24, but not the supernetting route 207.0.0.0/8.</p>
	<pre> A#show ip route rip R    208.1.1.0/24 [120/1] via 192.168.1.2, 00:06:11, GigabitEthernet 0/1                     </pre>

## 3.4.8 Advertising the Default Route or External Routes

### Configuration Effect

- In the RIP domain, introduce a unicast route of another AS so that the unicast routing service to this AS can be provided for users in the RIP domain.
- In the RIP domain, inject a default route to another AS so that the unicast routing service to this AS can be provided for users in the RIP domain.

### Notes

- The RIP basic functions must be configured.
- Route redistribution cannot introduce default routes of other protocols to the RIP routing domain.

### Configuration Steps

#### ↘ Advertising the Default Route to Neighbors

This function must be enabled if it is required to advertise the default route to neighbors.

By default, a default route is not generated, and the metric of the default route is 1.

If the RIP process can generate a default route using this command, RIP does not learn the default route advertised by the neighbor.

Unless otherwise required, this configuration should be performed on a router that needs to advertise the default route.

#### ↘ Advertising the Default Route to Neighbors on an Interface

This function must be enabled if it is required to advertise the default route to neighbors on a specified interface.

By default, a default route is not configured and the metric of the default route is 1.

After this command is configured on an interface, a default route is generated and advertised through this interface.

Unless otherwise required, this configuration should be performed on a router that needs to advertise the default route.

#### ↘ Redistributes Routes and Advertises External Routes to Neighbors

This function must be enabled if routes of other protocols need to be redistributed.

By default,

- If OSPF redistribution is configured, redistribute the routes of all sub-types of the OSPF process.
- If IS-IS redistribution is configured, redistribute the level-2 routes of the IS-IS process.
- In other cases, redistribute all external routes.
- The metric of a redistributed route is 1 by default.
- The route map is not associated by default.

During route redistribution, it is not necessary to convert the metric of one routing protocol to the metric of another routing protocol because different routing protocols use completely different metric measurement methods. RIP measures the metric

based on the hop count, and OSPF measures the metric based on the bandwidth. Therefore, the computed metrics cannot be compared with each other. During route redistribution, however, it is necessary to configure a symbolic metric; otherwise, route redistribution fails.

Unless otherwise required, this configuration should be performed on a router that needs to redistribute routes.

## Verification

- On a neighbor device, verify that a default route exists in the RIP routing table.
- On the local and neighbor devices, verify that external routes (routes to other ASs) exist in the RIP routing table.

## Related Commands

### ↘ Advertising the Default Route to Neighbors

<b>Command Syntax</b>	<b>default-information originate</b> [ <b>always</b> ] [ <b>metric</b> <i>metric-value</i> ] [ <b>route-map</b> <i>map-name</i> ]
<b>Parameter Description</b>	<b>always</b> : Enables RIP to generate a default route no matter whether the local router has a default route. <b>metric</b> <i>metric-value</i> : Indicates the initial metric of the default route. The value ranges from 1 to 15. <b>route-map</b> <i>map-name</i> : Indicates the associated route map name. By default, no route map is associated.
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	<p>If a default route exists in the routing table of a router, RIP does not advertise the default route to external entities by default. You need to run the <b>default-information originate</b> command in routing process configuration mode to advertise the default route to neighbors.</p> <p>If the <b>always</b> parameter is selected, the RIP routing process advertises a default route to neighbors no matter the default route exists, but this default route is not displayed in the local routing table. To check whether the default route is generated, run the <b>show ip rip database</b> command to check the RIP routing information database.</p> <p>To further control the behavior of advertising the RIP default route, use the <b>route-map</b> parameter. For example, run the <b>set metric</b> rule to set the metric of the default route.</p> <p>You can use the <b>metric</b> parameter to set the metric of the advertised default value, but the priority of this configuration is lower than that of the set metric rule of the <b>route-map</b> parameter. If the <b>metric</b> parameter is not configured, the default route uses the default metric configured for RIP.</p> <p>You still need to run the <b>default-information originate</b> command to introduce the default route generated by <b>ip default-network</b> to RIP.</p>

### ↘ Advertising the Default Route to Neighbors on an Interface

<b>Command Syntax</b>	<b>ip rip default-information</b> { <b>only</b>   <b>originate</b> } [ <b>metric</b> <i>metric-value</i> ]
<b>Parameter Description</b>	<b>only</b> : Indicates that only the default route is advertised. <b>originate</b> : Indicates that the default route and other routes are advertised. <b>metric</b> <i>metric-value</i> : Indicates the metric of the default route. The value ranges from 1 to 15.

<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	If you configure the <b>ip rip default-information</b> command for the interface, and the <b>default-information originate</b> command for the RIP process, only the default route configured for the interface is advertised. So far as <b>ip rip default-information</b> is configured for one interface, RIP does not learn the default route advertised by the neighbor.

### ↘ Redistributes Routes and Advertises External Routes to Neighbors

<b>Command Syntax</b>	<b>redistribute</b> { <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]   <b>ospf</b> <i>process-id</i>   <b>static</b> } [ { <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> } ] [ <b>match</b> { <b>internal</b>   <b>external</b> [ <b>1</b>   <b>2</b> ]   <b>nssa-external</b> [ <b>1</b>   <b>2</b> ] } ] [ <b>metric</b> <i>metric-value</i> ] [ <b>route-map</b> <i>route-map-name</i> ]
<b>Parameter Description</b>	<p><b>bgp</b>: Indicates redistribution from BGP.</p> <p><b>connected</b>: Indicates redistribution from direct routes.</p> <p><b>isis</b> <i>area-tag</i>: Indicates redistribution from IS-IS. <i>area-tag</i> indicates the IS-IS process ID.</p> <p><b>ospf</b> <i>process-id</i>: Indicates redistribution from OSPF. <i>process-id</i> indicates the OSPF process ID. The value ranges from 1 to 65535.</p> <p><b>static</b>: Indicates redistribution from static routes.</p> <p><b>level-1</b>   <b>level-1-2</b>   <b>level-2</b>: Used only when IS-IS routes are redistributed. Only the routes of the specified level are redistributed.</p> <p><b>match</b>: Used only when OSPF routes are redistributed. Only the routes that match the filtering conditions are redistributed.</p> <p><b>metric</b> <i>metric-value</i>: Sets the metric of the redistributed route. The value ranges from 1 to 16.</p> <p><b>route-map</b> <i>route-map-name</i>: Sets the redistribution filtering rules.</p>
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	<p>When you configure redistribution of IS-IS routes without specifying the <b>level</b> parameter, only level-2 routes can be redistributed by default. If you specify the <b>level</b> parameter during initial configuration of redistribution, routes of the specified level can be redistributed. If both <b>level-1</b> and <b>level-2</b> are configured, the two levels are combined and saved as <b>level-1-2</b> for the convenience sake.</p> <p>If you configure redistribution of OSPF routes without specifying the <b>match</b> parameter, OSPF routes of all sub-types can be distributed by default. The latest setting of the <b>match</b> parameter is used as the initial <b>match</b> parameter. Only routes that match the sub-types can be redistributed. You can use the <b>no</b> form of the command to restore the default value of <b>match</b>.</p> <p>The configuration rules for the <b>no</b> form of the <b>redistribute</b> command are as follows:</p> <ol style="list-style-type: none"> <li>1. If some parameters are specified in the <b>no</b> form of the command, default values of these parameters will be restored.</li> <li>2. If no parameter is specified in the <b>no</b> form of the command, the entire command will be deleted.</li> </ol> <p>For example, if <b>redistribute isis 112 level-2</b> is configured, you can run the <b>no redistribute isis 112 level-2</b> command to restore the default value of <b>level-2</b>. As level-2 itself is the default value of the parameter, the configuration saved is still <b>redistribute isis 112 level-2</b> after the preceding <b>no</b> form of the command is executed.</p>

To delete the entire command, run the **no redistribute isis 112** command.

### Configuration Example

#### Redistributing Routes and Advertising External Routes to Neighbors

<p><b>Scenario</b> Figure 3-16</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Configure the interface IP addresses on all routers. (Omitted)</li> <li>Configure the RIP basic functions on all routers. (Omitted)</li> <li>On Router B, configure redistribution of static routes.</li> </ul>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# router rip B(config-router)# redistribute static</pre>
<p><b>Verification</b></p>	<p>On Router A, check the routing table and verify that the entry 172.10.10.0/24 is loaded.</p>
	<pre>A# show ip route rip R 172.10.10.0/24 [120/1] via 192.168.1.2, 00:06:11, GigabitEthernet 0/1</pre>

### 3.4.9 Setting Route Filtering Rules

#### Configuration Effect

- Routes that do not meet filtering criteria cannot be loaded to the routing table, or advertised to neighbors. In this way, users within the network can be prevented from accessing specified destination networks.

#### Notes

- The RIP basic functions must be configured.
- In regard to the filtering rules of sent routes, you must configure route redistribution first, and then filter the redistributed routes.

#### Configuration Steps

##### Filtering the Received RIP Routing Information

- This function must be configured if it is required to filter received routing information.
- To refuse receiving some specified routes, you can configure the route distribution control list to process all the received route update packets. If no interface is specified, route update packets received on all interfaces will be processed.

- Unless otherwise required, this configuration should be performed on a router that requires route filtering.

### Filtering the Sent RIP Routing Information

- This function must be configured if it is required to filter the redistributed routing information that is sent.
- If this command does not contain any optional parameter, route update advertisement control takes effect on all interfaces. If the command contains the interface parameter, route update advertisement control takes effect only on the specified interface. If the command contains other routing process parameters, route update advertisement control takes effect only on the specified routing process.
- Unless otherwise required, this configuration should be performed on a router that requires route filtering.

### Verification

- Run the **show ip route rip** command to verify that the routes that have been filtered out are not loaded to the routing table.

### Related Commands

#### Filtering the Received RIP Routing Information

<b>Command Syntax</b>	<b>distribute-list</b> { [ <i>access-list-number</i>   <i>name</i> ]   <b>prefix</b> <i>prefix-list-name</i> [ <b>gateway</b> <i>prefix-list-name</i> ] } <b>in</b> [ <i>interface-type</i> <i>interface-number</i> ]
<b>Parameter Description</b>	<i>access-list-number</i>   <i>name</i> : Specifies the access list. Only routes permitted by the access list can be received. <b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list to filter routes. <b>gateway</b> <i>prefix-list-name</i> : Uses the prefix list to filter the route sources. <i>interface-type</i> <i>interface-number</i> : Indicates that the distribution list is applied to the specified interface.
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	N/A

#### Filtering the Sent RIP Routing Information

<b>Command Syntax</b>	<b>distribute-list</b> { [ <i>access-list-number</i>   <i>name</i> ]   <b>prefix</b> <i>prefix-list-name</i> } <b>out</b> [ <i>interface</i>   [ <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>static</b> ] ]
<b>Parameter Description</b>	<i>access-list-number</i>   <i>name</i> : Specifies the access list. Only routes permitted by the access list can be sent. <b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list to filter routes. <i>Interface</i> : Applies route update advertisement control only on the specified interface. <b>bgp</b> : Applies route update advertisement control only on the routes introduced from BGP. <b>connected</b> : Applies route update advertisement control only on direct routes introduced through redistribution. <b>isis</b> [ <i>area-tag</i> ]: Applies route update advertisement control only on the routes introduced from IS-IS. <i>area-tag</i> specifies an IS-IS process.

	<p><b>ospf process-id:</b> Applies route update advertisement control only on the routes introduced from OSPF. <i>process-id</i> specifies an OSPF process.</p> <p><b>rip:</b> Applies route update advertisement control only on RIP routes.</p> <p><b>static:</b> Applies route update advertisement control only on static routes introduced through redistribution.</p>
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	N/A

### Configuration Example

#### Filtering the Received RIP Routing Information

<b>Scenario</b> Figure 3-17	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Enable the RIP routing process to control routes received over the GigabitEthernet 0/1 port and receive only the route 200.1.1.0.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# router rip A(config-router)# distribute-list 10 in GigabitEthernet 0/1 A(config-router)# no auto-summary A(config)# access-list 10 permit 200.1.1.0 0.0.0.255</pre>
<b>Verification</b>	On Router A, check the routing table and verify that only the entry 200.1.1.0/24 exists.
<b>A</b>	<pre>A# show ip route rip R    200.1.1.0/24 [120/1] via 192.168.1.2, 00:06:11, GigabitEthernet 0/1</pre>

#### Filtering the Sent RIP Routing Information

<p><b>Scenario</b> Figure 3-18</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Enable the RIP routing process to advertise only the route 200.1.1.0/24.</li> </ul>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# router rip B(config-router)# redistribute connected B(config-router)# distribute-list 10 out B(config-router)# version 2 B(config)# access-list 10 permit 200.1.1.0 0.0.0.255</pre>
<p><b>Verification</b></p>	<p>Check the routing table on Router A, and verify that route in the 200.1.1.0 network segment exists.</p>
<p><b>A</b></p>	<pre>A# show ip route rip R    200.1.1.0/24 [120/1] via 192.168.1.2, 00:06:11, GigabitEthernet 0/1</pre>

**Common Errors**

- Filtering fails because the filtering rules of the access list are not properly configured.

**3.4.10 Modifying Route Selection Parameters**

**Configuration Effect**

- Change the RIP routes to enable the traffic pass through specified nodes or avoid passing through specified nodes.
- Change the sequence that a router selects various types of routes so as to change the priorities of RIP routes.

**Notes**

- The RIP basic functions must be configured.

**Configuration Steps**

📌 **Modifying the Administrative Distance of a RIP Route**

- Optional.
- This configuration is mandatory if you wish to change the priorities of RIP routes on a router that runs multiple unicast routing protocols.

#### ↘ Increasing the Metric of a Received or Sent RIP Route

- Optional.
- Unless otherwise required, this configuration should be performed on a router where the metrics of routes need to be adjusted.

#### ↘ Configuring the Default Metric of an External Route Redistributed to RIP

- Optional.
- Unless otherwise required, this configuration must be performed on an ASBR to which external routes are introduced.

### Verification

Run the **show ip rip** command to display the administrative distance currently configured. Run the **show ip rip data** command to display the metrics of redistributed routes to verify that the configuration takes effect.

### Related Commands

#### ↘ Modifying the Administrative Distance of a RIP Route

<b>Command Syntax</b>	<b>distance</b> <i>distance</i> [ <i>ip-address wildcard</i> ]
<b>Parameter Description</b>	<i>distance</i> : Sets the administrative distance of a RIP route. The value is an integer ranging from 1 to 255. <i>ip-address</i> : Indicates the prefix of the source IP address of the route. <i>wildcard</i> : Defines the IP address comparison bit. <b>0</b> indicates accurate matching, and <b>1</b> indicates that no comparison is performed.
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	Run this command to configure the administrative distance of a RIP route.

#### ↘ Increasing the Metric of a Received or Sent RIP Route

<b>Command Syntax</b>	<b>offset-list</b> { <i>access-list-number</i>   <i>name</i> } { <b>in</b>   <b>out</b> } <i>offset</i> [ <i>interface-type interface-number</i> ]
<b>Parameter Description</b>	<i>access-list-number</i>   <i>name</i> : Specifies the access list. <b>in</b> : Uses the ACL to modify the metric of a received route. <b>out</b> : Uses the ACL to modify the metric of a sent route. <i>offset</i> : Indicates the offset of the modified metric. The value ranges from 0 to 16. <i>interface-type</i> : Uses the ACL on the specified interface. <i>interface-number</i> : Specifies the interface number.

<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	Run this command to increase the metric of a received or sent RIP route. If the interface is specified, the configuration takes effect only on the specified interface; otherwise, the configuration takes effect globally.

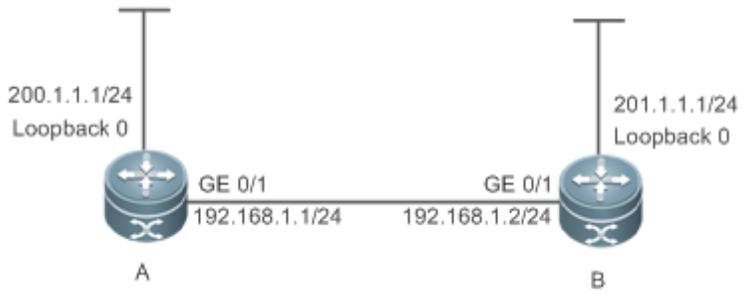

📌 **Configuring the Default Metric of an External Route Redistributed to RIP**

<b>Command Syntax</b>	<b>default-metric</b> <i>metric-value</i>
<b>Parameter Description</b>	<i>metric-value</i> : Indicates the default metric. The valid value ranges from 1 to 16. If the value is equal to or greater than 16, the RGOS determines that this route is unreachable.
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	This command must be used together with the routing protocol configuration command <b>redistribute</b> .

**Configuration Example**

📌 **Increasing the Metric of a Received or Sent RIP Route**

<b>Scenario</b> Figure 3-19	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Increase by 7 the metric of each RIP route in the range specified by ACL 7.</li> <li>● Increase by 7 the metric of each learned RIP route in the range specified by ACL 8.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# access-list 7 permit host 200.1.1.0 A(config)# access-list 8 permit host 201.1.1.0 A(config)# router rip A(config-router)# offset-list 7 out 7 A(config-router)# offset-list 8 in 7</pre>
<b>Verification</b>	Check the routing table on Router A and Router B to verify that the metrics of RIP routes are 8.

<p><b>Scenario</b> Figure 3-19</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Increase by 7 the metric of each RIP route in the range specified by ACL 7.</li> <li>● Increase by 7 the metric of each learned RIP route in the range specified by ACL 8.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# access-list 7 permit host 200.1.1.0 A(config)# access-list 8 permit host 201.1.1.0 A(config)# router rip A(config-router)# offset-list 7 out 7 A(config-router)# offset-list 8 in 7</pre>
<p><b>Verification</b></p>	<p>Check the routing table on Router A and Router B to verify that the metrics of RIP routes are 8.</p>
<p><b>A</b></p>	<pre>A# show ip route rip R    201.1.1.0/24 [120/8] via 192.168.1.2, 00:06:11, GigabitEthernet 0/1</pre>
<p><b>B</b></p>	<pre>B# show ip route rip R    200.1.1.0/24 [120/8] via 192.168.1.1, 00:06:11, GigabitEthernet 0/1</pre>

### 3.4.11 Modifying Timers

#### Configuration Effect

- Change the duration of RIP timers to accelerate or slow down the change of the protocol state or occurrence of an event.

#### Notes

- The RIP basic functions must be configured.
- Modifying the protocol control parameters may result in protocol running failures. Therefore, you are advised not to modify the timers.

#### Configuration Steps

### ✚ Modifying the Update Timer, Invalid Timer, and Flush Timer

This configuration must be performed if you need to adjust the RIP timers.

By adjusting the timers, you can reduce the convergence time and fault rectification time of the routing protocol. For routers connected to the same network, values of the three RIP timers must be the same. Generally, you are advised not to modify the RIP timers unless otherwise required.

Setting timers to small values on a low-speed link brings risks because a lot of Update packets consume the bandwidth. You can set timers to small values generally on the Ethernet or a 2 Mbps (or above) link to reduce the convergence time of network routes.

Unless otherwise required, this configuration should be performed on a router where RIP timers need to be modified.

### ✚ Setting the Sending Delay Between RIP Route Update Packets

This configuration must be performed if you need to adjust the sending delay between RIP Update packets.

Run the **output-delay** command to increase the sending delay between packets on a high-speed device so that a low-speed device can receive and process all Update packets.

Unless otherwise required, this configuration should be performed on a router where the sending delay needs to be adjusted.

### Verification

Run the **show ip rip** command to display the current settings of RIP timers.

### Related Commands

#### ✚ Modifying the Update Timer, Invalid Timer, and Flush Timer

<b>Command Syntax</b>	<b>timers basic</b> <i>update invalid flush</i>
<b>Parameter Description</b>	<p><i>update</i>: Indicates the route update time in second. It defines the interval at which the device sends the route update packet. Each time an Update packet is received, the invalid timer and flush timer are reset. By default, a routing update packet is sent every 30s.</p> <p><i>invalid</i>: Indicates the route invalid time in second, counted from the last time when a valid update packet is received. It defines the time after which the route in the routing list becomes invalid because the route is not updated. The duration of the invalid timer must be at least three times the duration of the update timer. If no Update packet is received before the invalid timer expires, the corresponding route enters the invalid state. If the Update packet is received before the invalid timer expires, the timer is reset. The default duration of the invalid timer is 180s.</p> <p><i>flush</i>: Indicates the route flushing time in second, counted from the time when the RIP route enters the invalid state. When the flush timer expires, the route in the invalid state will be deleted from the routing table. The default duration of the flush timer is 120s.</p>
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration</b>	By default, the update timer is 30s, the invalid timer is 180s, and the flush timer is 120s.

Usage	
-------	--

▾ **Setting the Sending Delay Between RIP Route Update Packets**

<b>Command Syntax</b>	<b>output-delay</b> <i>delay</i>
<b>Parameter Description</b>	<i>delay</i> : Sets the sending delay between packets in ms. The value ranges from 8 to 50.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	Normally, a RIP route update packet is 512 bytes long and can contain 25 routes. If the number of routes to be updated exceeds 25, more than one update packet will be sent as fast as possible. When a high-speed device sends a lot of update packets to a low-speed device, the low-speed device may not be able to process all update packets in time, causing a loss of routing information. In this case, you need to run the <b>output-delay</b> command to increase the sending delay between packets on a high-speed device so that a low-speed device can receive and process all update packets.

**Configuration Example**

▾ **Setting the Sending Delay Between RIP Route Update Packets**

<b>Scenario</b> Figure 3-20	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Configure the sending delay of update packets on Router A.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# router rip A(config-router)# output-delay 30</pre>
<b>Verification</b>	Capture packets on Router A and compare the sending time of update packets before and after the configuration, and verify that a delay of 30 ms is introduced.

**Common Errors**

For routers connected to the same network, values of the three RIP timers are not the same.

## 3.4.12 Enabling BFD Correlation

### Configuration Effect

- Once a link is faulty, RIP can quickly detect the failure of the route. This configuration helps shorten the traffic interruption time.

### Notes

- The RIP basic functions must be configured.
- The BFD correlation configured in interface configuration mode takes precedence over the global configuration.

### Configuration Steps

#### ↘ Correlating RIP with BFD on All Interfaces

- This configuration must be performed if you need to enable BFD correlation.
- After BFD is enabled on RIP, a BFD session will be set up for the RIP routing information source (that is, the source address of RIP route update packets). Once the BFD neighbor fails, the corresponding RIP route directly enters the invalid state and is not forwarded.
- You can also run the **ip ospf bfd [disable]** command in interface configuration mode to enable or disable the BFD function on a specified interface, and this configuration takes precedence over the **bfd all-interfaces** command used in routing process configuration mode.
- Unless otherwise required, this configuration should be performed on every router.

#### ↘ Correlating RIP with BFD on an Interface

- This configuration must be performed if you need to enable or disable BFD correlation on a specified interface.
- The interface-based configuration takes precedence over the **bfd all-interfaces** command used in routing process configuration mode.
- Based on the actual environment, you can run the **ip ospf bfd** command to enable BFD on a specified interface for link detection, or run the **bfd all-interfaces** command in RIP process configuration mode to enable BFD on all interface of the OSPF process, or run the **ospf bfd disable** command to disable BFD on a specified interface.
- Unless otherwise required, configure this function on a router interface where BFD correlation should be configured separately.

### Verification

- Verify that the BFD session is properly set up with RIP.
- After a link fails, the RIP route can quickly converges.

### Related Commands

#### ↘ Correlating RIP with BFD on All Interfaces

<b>Command Syntax</b>	<b>bfd all-interfaces</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	N/A

↘ **Correlating RIP with BFD on an Interface**

<b>Command Syntax</b>	<b>ip rip bfd [ disable ]</b>
<b>Parameter Description</b>	<b>disable:</b> Disables BFD for link detection on a specified RIP-enabled interface.
<b>Command Mode</b>	Interface configuration mode
<b>Configuration Usage</b>	By default, BFD correlation is not configured for a specified interface, and the configuration is subject to that configured in routing process configuration mode.

**Configuration Example**

↘ **Enabling BFD Correlation with RIP**

<p><b>Scenario</b> Figure 3-21</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Configure the BFD parameters for interfaces of all routers.</li> <li>● Correlate RIP with BFD on all routers.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# bfd interval 200 min_rx 200 multiplier 5 A(config)# router rip A(config-router)# bfd all-interfaces</pre>
<p><b>B</b></p>	<pre>B# configure terminal</pre>

	<pre>B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# bfd interval 200 min_rx 200 multiplier 5 B(config)# router rip B(config-router)# bfd all-interfaces</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On routers A and B, verify that the BFD session is in Up state.</li> <li>● Disconnect Router B from the switch, and verify that the RIP route is deleted on Router A.</li> </ul>
<b>A</b>	<pre>A# show ip rip peer Peer 192.168.1.2:   Local address: 192.168.1.1   Input interface: GigabitEthernet 0/1   Peer version: RIPv2   Received bad packets: 0   Received bad routes: 0   BFD session state up</pre>
<b>B</b>	<pre>A# show ip rip peer Peer 192.168.1.1:   Local address: 192.168.1.2   Input interface: GigabitEthernet 0/1   Peer version: RIPv2   Received bad packets: 0   Received bad routes: 0   BFD session state up</pre>

### Common Errors

- The preceding two commands are executed in RIP before the BFD function is enabled.

### 3.4.13 Enabling Fast Reroute

#### Configuration Effect

- Once RIP detects a route failure, the router can immediately switch to the second-best route. This configuration helps shorten the traffic interruption time.

#### Notes

- The RIP basic functions must be configured.
- The route map and the standby next hop must be configured.
- To accelerate the convergence, set carrier-delay of the interface to 0 and enable BFD correlation with RIP.

## Configuration Steps

### ↳ Enabling Fast Reroute and Referencing the Route Map

This configuration must be performed if you need to enable fast reroute.

If **route-map** is configured, a standby path can be specified for a successfully matched route through the route map.

When the RIP fast reroute function is used, it is recommended that BFD be enabled at the same time so that the device can quickly detect any link failure and therefore shorten the forwarding interruption time. If the interface is up or down, to shorten the forwarding interruption time during RIP fast reroute, you can configure **carrier-delay 0** in interface configuration mode to achieve the fastest switchover speed.

Unless otherwise required, this configuration should be performed on every router.

## Verification

- The standby route can be correctly computed and generated.
- When the active link fails, the data can be quickly switch over to the standby link for forwarding.

## Related Commands

### ↳ Enabling Fast Reroute and Referencing the Route Map

<b>Command Syntax</b>	<b>fast-reroute route-map</b> <i>route-map-name</i>
<b>Parameter Description</b>	<i>route-map-name</i> : Specifies a standby path through the route map.
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	Currently, the RIP fast reroute function is subject to the following constraints: (1) Only one standby next hop can be generated for one route; (2) No standby next hop can be generated for equal and equal-cost multi-path routing (ECMP).

## Configuration Example

### ↳ Enabling Fast Reroute and Referencing the Route Map

<p><b>Scenario</b> Figure 3-22</p>	<div style="text-align: center;"> </div> <table border="1" style="width: 100%; margin-top: 10px;"> <tr> <td style="width: 15%;"><b>Remarks</b></td> <td>The interface IP addresses are as follows: A: GE0/1 192.168.1.1    GE0/2 192.168.2.1 B: GE0/1 192.168.1.2    GE0/2 192.168.3.1    GE0/3 192.168.4.1 C: GE0/1 192.168.3.2    GE 0/2 192.168.2.2</td> </tr> </table>	<b>Remarks</b>	The interface IP addresses are as follows: A: GE0/1 192.168.1.1    GE0/2 192.168.2.1 B: GE0/1 192.168.1.2    GE0/2 192.168.3.1    GE0/3 192.168.4.1 C: GE0/1 192.168.3.2    GE 0/2 192.168.2.2
<b>Remarks</b>	The interface IP addresses are as follows: A: GE0/1 192.168.1.1    GE0/2 192.168.2.1 B: GE0/1 192.168.1.2    GE0/2 192.168.3.1    GE0/3 192.168.4.1 C: GE0/1 192.168.3.2    GE 0/2 192.168.2.2		
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Configure fast re-route on Router A.</li> <li>● Configure <b>carrier-delay 0</b> for the interface on Router A.</li> </ul>		
<p><b>A</b></p>	<pre>A# configure terminal A(config)# route-map fast-reroute A(config-route-map)# match interface GigabitEthernet 0/2 A(config-route-map)# set fast-reroute backup-interface GigabitEthernet 0/1 backup-nexthop 192.168.1.1 A(config)# router rip A(config-router)# fast-reroute route-map fast-reroute A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# carrier-delay 0 A(config-if-GigabitEthernet 0/1)# exit A(config)# interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)# carrier-delay 0</pre>		
<p><b>Verification</b></p>	<p>On Router A, check the routing table and verify that a standby route exists for the entry 192.168.4.0/24.</p>		
<p><b>A</b></p>	<pre>A# show ip route fast-reroute   begin 192.168.4.0 R 192.168.4.0/24 [ma] via 192.168.1.2, 00:39:28, GigabitEthernet 0/1 [b] via 192.168.2.2, 00:39:28, GigabitEthernet 0/2</pre>		

**Common Errors**

- The standby next hop is not properly configured for the route map.
- The carrier-delay is not configured for the interface or BFD correlation is not configured. Consequently, the switchover speed of the forwarding line is slow.

### 3.4.14 Enabling GR

#### Configuration Effect

- When a distributed route switches services from the active board to the standby board, traffic forwarding continues and is not interrupted.
- When the RIP process is being restarted, traffic forwarding continues and is not interrupted.

#### Notes

- The RIP basic functions must be configured.
- The GR period is at least twice the RIP route update period.
- During the RIP GR process, ensure that the network environment is stable.

#### Configuration Steps

##### 📌 Configuring the GR Restarter Capability

This configuration must be performed if RIP needs to be gracefully restarted to ensure data forwarding during hot standby switchover.

The GR function is configured based on the RIP process. You can configure different parameters for different RIP processes based on the actual conditions.

The GR period is the maximum time from restart of the RIP process to completion of GR. During this period, the forwarding table before the restart is retained, and the RIP route is restored so as to restore the RIP state before the restart. After the restart period expires, RIP exits from the GR state and performs common RIP operations.

Unless otherwise required, this configuration should be performed on every router that needs to be gracefully restarted.

#### Verification

- Run the **show ip rip** command to display the GR state and configured time.
- Trigger a hot standby switchover, and verify that data forwarding is not interrupted.

#### Related Commands

##### 📌 Configuring the GR Restarter Capability

<b>Command Syntax</b>	<b>graceful-restart</b> [ <b>grace-period</b> <i>grace-period</i> ]
<b>Parameter Description</b>	<b>graceful-restart</b> : Enables the GR function. <b>grace-period</b> : Explicitly configures the grace period.

	<p><i>grace-period</i>: Indicates the GR period. The value ranges from 1s to 1800s.</p> <p>The default value is twice the update time or 60s, whichever is the smaller.</p>
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	<p>This command allows you to explicitly modify the GR period. Note that GR must be completed after the update timer of the RIP route expires and before the invalid timer of the RIP route expires. An inappropriate GR period cannot ensure uninterrupted data forwarding during the GR process. A typical case is as follows: If the GR period is longer than the duration of the invalid timer, GR is not completed when the invalid timer expires. The route is not re-advertised to the neighbor, and forwarding of the route of the neighbor stops after the invalid timer expires, causing interruption of data forwarding on the network. Unless otherwise required, you are advised not to adjust the GR period. If it is necessary to adjust the GR period, ensure that the GR period is longer than the duration of the update timer but shorter than the duration of the invalid timer based on the configuration of the <b>timers basic</b> command.</p>

### Configuration Example

#### Configuring the GR Restarter Capability

<p><b>Scenario</b> Figure 3-23</p>	
<p><b>Remarks</b></p>	<p>The interface IP addresses are as follows:</p> <p>A: GE 0/1 192.168.1.1</p> <p>B: GE 0/1 192.168.1.1    GE 0/2 192.168.2.1    GE 0/3 192.168.3.1</p> <p>C: GE 0/1 192.168.4.2    GE 0/3 192.168.3.2</p> <p>D: GE 0/1 192.168.5.2    GE 0/2 192.168.2.2</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Configure the interface IP addresses on all routers. (Omitted)</li> <li>Configure the RIP basic functions on all routers. (Omitted)</li> <li>On Router B, enable the GR function.</li> </ul>
	<pre>B# configure terminal B(config)# router rip B(config-router)# graceful-restart grace-period 90</pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Trigger a hot standby switchover on Router B, and verify that the routing tables of destination Network 1 and Network 2 remain unchanged on Router A during the switchover.</li> <li>● Trigger a hot standby switchover on Router B, ping destination Network 1 from Router A, and verify that traffic forwarding is not interrupted during the switchover.</li> </ul>
---------------------	---

### 3.4.15 Enabling Multiple Instances

#### Configuration Effect

- Run RIP on VPN instances.

#### Notes

- The RIP basic functions (with the VRF parameter) must be configured.

#### Configuration Steps

##### ↘ **Creating a VRF Instance and Entering the IPv4 VRF Address Family**

- This configuration must be performed if you need to configure RIP multiple instances and associate these RIP instances with VRF.
- Unless otherwise required, this configuration should be performed on every router that requires the RIP multiple instances.

##### ↘ **Binding the RIP MIB with a VPN Instance**

- This configuration must be performed if you configure RIP multiple instances and wish to manage non-default RIP instances using the MIB.
- The RIP MIB does not have the RIP instance information. Therefore, you must perform operations only on one instance through SNMP. By default, the RIP MIB is bound with the RIP instance of the default VRF, and all user operations take effect on this instance.
- If you wish to perform operations on a specified RIP instance through SNMP, run this command to bind the MIB with the instance.
- Unless otherwise required, this configuration should be performed on a router where the instance is managed using the MIB.

#### Verification

- Check the VRF routing table on a router to verify that the route to a remote network can be obtained through RIP.
- Use the MIB management software to manage the bound instance.

#### Related Commands

##### ↘ **Creating a VRF Instance and Entering the IPv4 VRF Address Family**

<b>Command</b>	<b>address-family ipv4 vrf <i>vrf-name</i></b>
----------------	--

<b>Syntax</b>	
<b>Parameter Description</b>	<b>vrf vrf-name:</b> Specifies the name of the VRF associated with the address family configuration sub-mode.
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	Run the <b>address-family</b> command to enter address family configuration sub-mode, the prompt of which is (config-router-af)#. When the VRF associated with the address family configuration sub-mode is specified for the first time, the RIP instance corresponding to the VRF will be created. In this submode, you can configure the RIP routing information for the related VRF.  To exit from address family configuration sub-mode and return routing process configuration mode, run the <b>exit-address-family</b> or <b>exit</b> command.

### ↳ Exiting From an IPv4 VRF Address Family

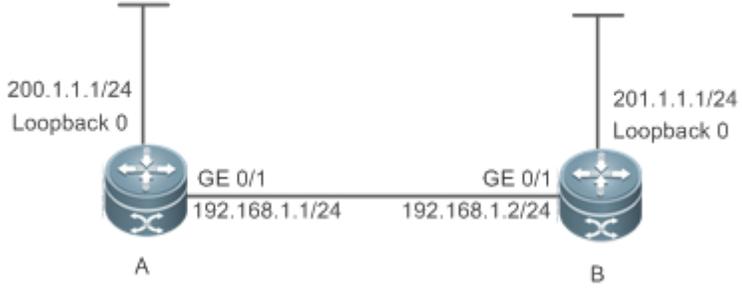

<b>Command Syntax</b>	<b>exit-address-family</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Address family configuration mode
<b>Configuration Usage</b>	Run this command in address family configuration mode to exit from this configuration mode.  This command can be abbreviated as <b>exit</b> .

### ↳ Binding the RIP MIB with a VPN Instance

<b>Command Syntax</b>	<b>enable mib-binding</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Routing process configuration mode
<b>Configuration Usage</b>	N/A

## Configuration Example

### ↳ Creating a VRF Instance and Enabling Network Management of This Instance

<p><b>Scenario</b> Figure 3-24</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the RIP basic functions on all routers. (Omitted)</li> <li>● Create a VRF named "vpn1" and create a RIP instance for this VRF.</li> <li>● On Router A, bind the MIB with the RIP vpn1 instance.</li> </ul>
	<pre>A# configure terminal A(config)# snmp-server community public rw A(config)# ip vrf vpn1 A(config-vrf)# exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)# ip vrf forwarding vpn1 A(config-if-GigabitEthernet0/1)# ip address 192.168.1.1 255.255.255.0 A(config)# router rip A(config-router)# address-family ipv4 vrf vpn1 A(config-router)# enable mib-binding A(config-router-af)# network 192.168.1.0 A(config-router-af)# exit-address-family</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Check the routing table on Router A, and verify that the VRF route 201.1.1.0/24 can be learned.</li> <li>● Read and configure parameters of the RIP vpn1 instance using the MIB tool.</li> </ul>
	<pre>A# show ip route vrf vpn1 rip R    201.1.1.0/24 [120/1] via 192.168.1.2, 00:06:11, GigabitEthernet 0/1</pre>

### 3.5 Monitoring

#### Displaying

Description	Command
-------------	---------

Displays the basic information about a RIP process.	<b>show ip rip</b>
Displays the RIP routing table.	<b>show ip rip database</b> [ <b>vrf</b> <i>vrf-name</i> ] [ <i>network-number network-mask</i> ] [ <b>count</b> ]
Displays information about external routes redistributed by RIP.	<b>show ip rip external</b> [ <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>process-id</i> ]   <b>ospf</b> <i>process-id</i>   <b>static</b> ] [ <b>vrf</b> <i>vrf-name</i> ]
Displays the RIP interface information.	<b>show ip rip interface</b> [ <b>vrf</b> <i>vrf-name</i> ] [ <i>interface-type interface-number</i> ]
Displays the RIP neighbor information.	<b>show ip rip peer</b> [ <i>ip-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs events that occur when the RIP process is running.	<b>debug ip rip event</b>
Debugs interaction with the NSM process.	<b>debug ip rip nsm</b>
Debugs the sent and received packets.	<b>debug ip rip packet</b> [ <b>interface</b> <i>interface-type interface-number</i>   <b>recv</b>   <b>send</b> ]
Debugs the RIP GR process.	<b>debug ip rip restart</b>
Debugs the route changes of the RIP process.	<b>debug ip rip route</b>

## 4 Configuring OSPFv2

### 4.1 Overview

Open Shortest Path First (OSPF) is an Interior Gateway Protocol (IGP) that is used within the Autonomous System (AS) to allow routers to obtain a route to a remote network.

- i** OSPF Version 2 (OSPFv2) is applicable to IPv4, and OSPF Version 3 (OSPFv3) is applicable to IPv6. The protocol running mechanism and most configurations are the same.

OSPF has the following characteristics:

- Wide scope of application: OSPF is applicable to a larger-scale network that supports hundreds of routers.
- Fast convergence: Once the network topology changes, notifications can be quickly sent between routers to update routes.
- No self-loop: Only the link status information is synchronized between routers. Each router computes routes independently, and a self-loop will not occur.
- Area division: A large routing domain is divided into multiple small areas to save system resources and network bandwidth and ensure stability and reliability of routes.
- Route classification: Routes are classified into several types to support flexible control.
- Equivalent routes: OSPF supports equivalent routes.
- Authentication: OSPF supports packet authentication to ensure security of protocol interaction.
- Multicast transmission: Protocol packets are sent using the multicast address to avoid interfering with irrelevant entities and save system resources.

- i** In this chapter, the term "router" refers to any network device that supports the routing function. These network devices can be L3 switches, routers, or firewall.

- i** Unless otherwise specified, "OSPF" in the following descriptions refers to OSPFv2.

#### Protocols and Standards

<b>RFC2328</b>	This memo documents version 2 of the OSPF protocol. OSPF is a link-state routing protocol.
<b>RFC 2370</b>	This memo defines enhancements to the OSPF protocol to support a new class of link-state advertisements (LSA) called Opaque LSAs. Opaque LSAs provide a generalized mechanism to allow for the future extensibility of OSPF.
<b>RFC3137</b>	This memo describes a backward-compatible technique that may be used by OSPF (Open Shortest Path First) implementations to advertise unavailability to forward transit traffic or to lower the preference level for the paths through such a router.

<a href="#">RFC3623</a>	This memo documents an enhancement to the OSPF routing protocol, whereby an OSPF router can stay on the forwarding path even as its OSPF software is restarted.
<a href="#">RFC3630</a>	This document describes extensions to the OSPF protocol version 2 to support intra-area Traffic Engineering (TE), using Opaque Link State Advertisements.
<a href="#">RFC3682</a>	The use of a packet's Time to Live (TTL) (IPv4) or Hop Limit (IPv6) to protect a protocol stack from CPU-utilization based attacks has been proposed in many settings.
<a href="#">RFC3906</a>	This document describes how conventional hop-by-hop link-state routing protocols interact with new Traffic Engineering capabilities to create Interior Gateway Protocol (IGP) shortcuts.
<a href="#">RFC4576</a>	This document specifies the necessary procedure, using one of the options bits in the LSA (Link State Advertisements) to indicate that an LSA has already been forwarded by a PE and should be ignored by any other PEs that see it.
<a href="#">RFC4577</a>	This document extends that specification by allowing the routing protocol on the PE/CE interface to be the OSPF protocol.
<a href="#">RFC4750</a>	This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in TCP/IP-based Internets. In particular, it defines objects for managing version 2 of the Open Shortest Path First Routing Protocol. Version 2 of the OSPF protocol is specific to the IPv4 address family.

## 4.2 Applications

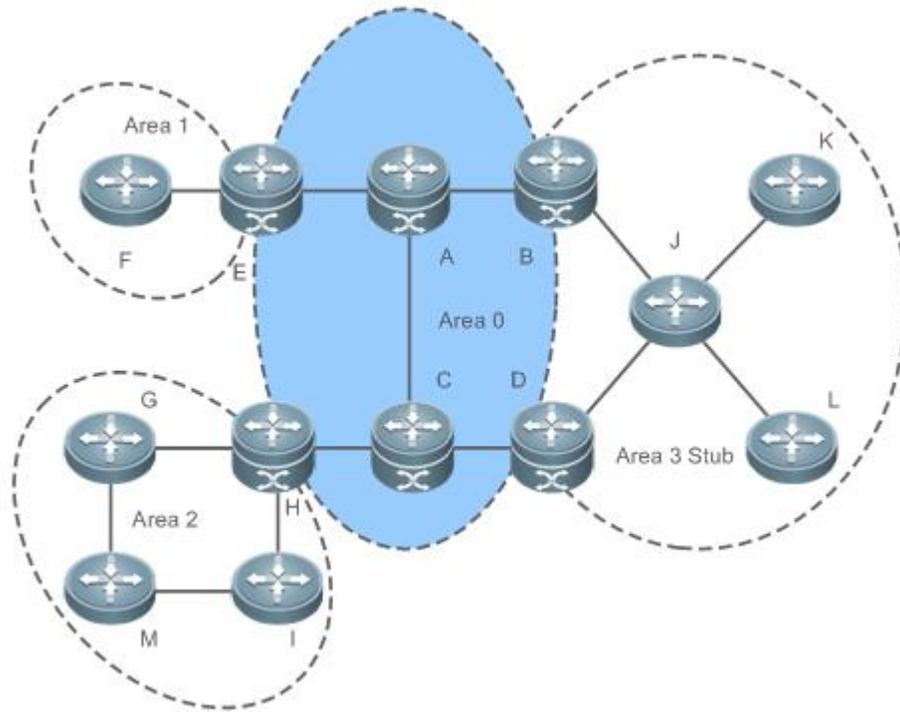

Application	Description
<a href="#">Intra-Domain Interworking</a>	OSPF runs within the AS, which is divided into several areas.
<a href="#">Inter-Domain Interworking</a>	Several ASs are interconnected. OSPF runs within each AS, and Border Gateway Protocol (BGP) runs between ASs.

### 4.2.1 Intra-Domain Interworking

#### Scenario

OSPF runs within the AS. If the number of routers exceeds 40, it is recommended that the AS be divided into several areas. Generally, high-end devices featuring reliable performance and fast processing speed are deployed in a backbone area, and low-end or medium-range devices with relatively lower performance can be deployed in a normal area. All normal areas must be connected to the backbone area. It is recommended that a normal area allocated on the stub be configured as a stub area. As shown in Figure 4-1, the network is divided into four areas. Communication between these areas must go through the backbone area, that is area 0.

Figure 4-1 Division of the OSPF Areas

<b>Remarks</b>	A, B, C, D, E, and H are located in the backbone area, and are backbone routers. Area 3 is configured as a stub area.
----------------	--

### Deployment

- OSPF runs on all routers within the AS to implement unicast routing.

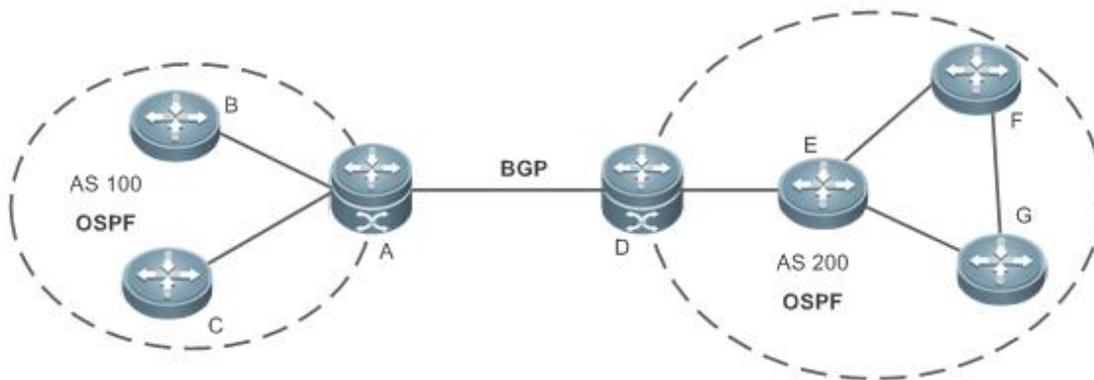

## 4.2.2 Inter-Domain Interworking

### Scenario

Several ASs are interconnected. OSPF runs within each AS, and BGP runs between ASs. Generally, OSPF and BGP learn the routing information from each other.

As shown in Figure 4-2, unicast routing is implemented within AS 100 and AS 200 using OSPF, and between the two ASs using BGP.

Figure 4-2 Interworking Between OSPF and BGP

<b>Remarks</b>	OSPF and BGP run concurrently on Router A and Router D.
----------------	---

### Deployment

- OSPF runs within AS 100 and AS 200 to implement unicast routing.
- BGP runs between the two ASes to implement unicast routing.

## 4.3 Features

### Basic Concepts

#### Routing Domain

All routers in an AS must be interconnected and use the same routing protocol. Therefore, the AS is also called routing domain.

An AS on which OSPF runs is also called OSPF routing domain, or OSPF domain for short.

#### OSPF Process

OSPF supports multiple instances, and each instance corresponds to an OSPF process.

One or more OSPF processes can be started on a router. Each OSPF process runs OSPF independently, and the processes are mutually isolated.

The process ID takes effect only on the local router, and does not affect exchange of OSPF packets on adjacent interfaces.

#### RouterID

The router ID uniquely identifies a router in an OSPF domain. Router IDs of any two routers cannot be the same.

If multiple OSPF processes exist on a router, each OSPF process uses one router ID. Router IDs of any two OSPF processes cannot be the same.

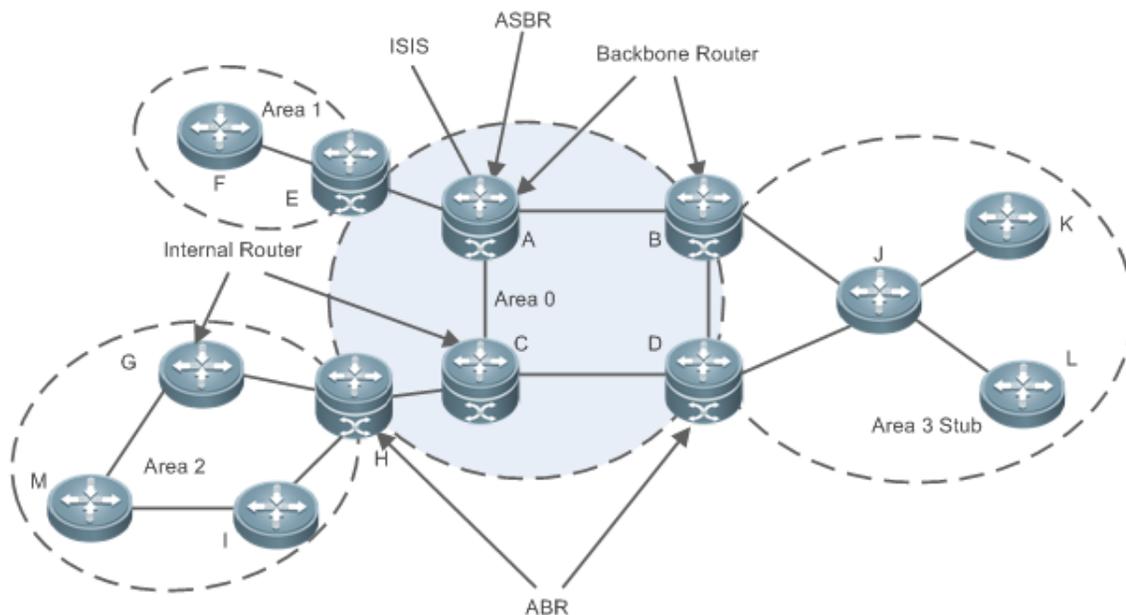

#### Area

OSPF supports multiple areas. An OSPF domain is divided into multiple areas to ease the computing pressure of a large-scale network.

An area is a logical group of routers, and each group is identified by an area ID. The border between areas is a router. A router may belong to one area or multiple areas. One network segment (link) can belong to only one area, or each OSPF-enabled interface must belong to a specified area.

Area 0 is the backbone area, and other areas are normal areas. Normal areas must be directly connected to the backbone area.

Figure 4-3 Division of the OSPF Areas

### OSPF Router

The following types of routers are defined in OSPF, and assigned with different responsibilities:

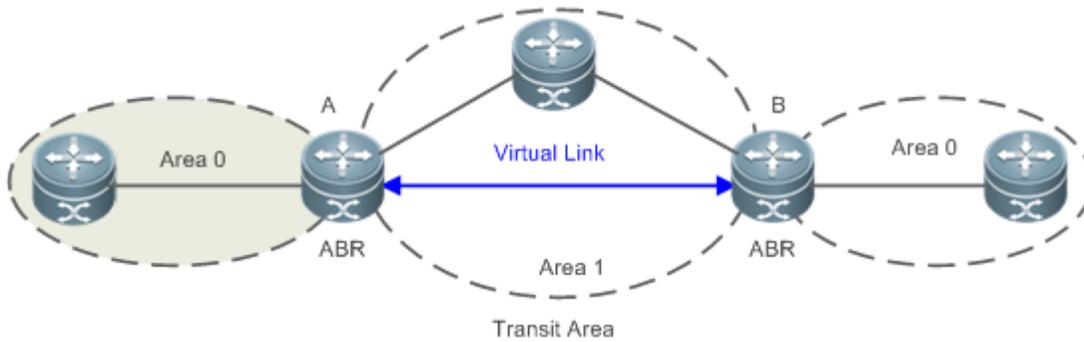

- Internal router  
All interface of an interval router belong to the same OSPF area. As shown in Figure 1-3, A, C, F, G, I, M, J, K, and L are internal routers.
- Area border router (ABR)  
An ABR is used to connect the backbone area with a normal area. An ABR belongs to two or more areas, and one of the areas must be the backbone area. As shown in Figure 1-3, B, D, E, and H are ABRs.
- Backbone router  
A backbone router has at least one interface that belongs to the backbone area. All ABRs and all routers in area 0 are backbone routers. As shown in Figure 4-3, A, B, C, D, E, and H are backbone routers.

- AS boundary router (ASBR)  
 An ASBR is used to exchange routing information with other ASs. An ASBR is not necessarily located on the border of an AS. It may be a router inside an area, or an ABR. As shown in Figure 1-3, A is an ASBR.

Virtual Link

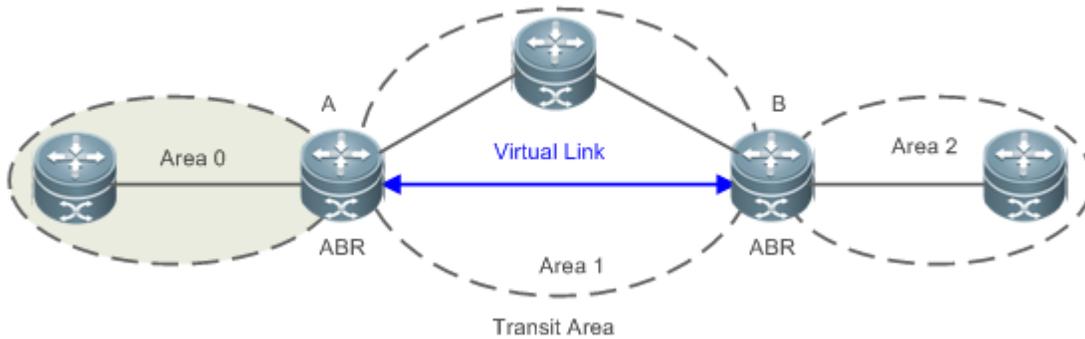

OSPF supports virtual links. A virtual link is a logical link that belongs to the backbone area. It is used to resolve the problems such as a discontinuous backbone area or a failure to directly connect a normal area to the backbone area on the physical network. A virtual link supports traversal of only one normal area, and this area is called transit area. Routers on both ends of a virtual link are ABRs.

Figure 4-4 Discontinuous Backbone Area on the Physical Network

As shown in Figure 4-4, a virtual link is set up between A and B to connect two separated area 0s. Area 1 is a transit area, and A and B are ABRs of area 1.

Figure 4-5 Failure to Directly Connect a Normal Area to the Backbone Area on the Physical Network

As shown in Figure 4-4, a virtual link is set up between A and B to extend area 0 to B so that area 0 can be directly connected to area 2 on B. Area 1 is a transit area, A is an ABR of area 1, and B is an ABR of area 0 and area 2.

LSA

OSPF describes the routing information by means of Link State Advertisement (LSA).

LSA Type	Description
Router-LSA(Type 1)	This LSA is originated by every router. It describes the link state and cost of the router, and is advertised only within the area where the originating router is located.

LSA Type	Description
Network-LSA(Type 2)	This LSA is originated by a designated routers (DR) on the NBMA network. It describes the link state in the current network segment, and is advertised only within the area where the DR is located.
Network-summary-LSA(Type 3)	This LSA is originated by an ABR. It describes a route to another area, and is advertised to areas except totally stub areas or Not-So-Stubby Area (NSSA) areas.
ASBR-summary-LSA(Type 4)	This LSA is originated by an ABR. It describes a route to an ASBR, and is advertised to areas except areas where the ASBR is located.
AS-external-LSA(Type 5)	This LSA is originated by an ABR. It describes a route to a destination outside the AS, and is advertised to all areas except the stub and NSSA areas.
NSSA LSA(Type 7)	This LSA is originated by an ABR. It describes a route to a destination outside the AS, and is advertised only within the NASSA areas.
Opaque LSA(Type 9/Type 10/Type 11)	Opaque LSAs provide a generalized mechanism to allow for the future extensibility of OSPF, wherein, <ul style="list-style-type: none"> <li>● Type 9 LSAs are only advertised within the network segment where interfaces resides. The Grace LSA used to support graceful restart (GR) is one of Type 9 LSAs.</li> <li>● Type 10 LSAs are advertised within an area. The LSA used to support Traffic Engineering (TE) is one of Type 10 LSAs.</li> <li>● Type 11 LSAs are advertised within an AS. At present, there are no application examples of Type 11 LSAs.</li> </ul>

 Stub areas, NSSA areas, totally stub areas, and totally NSSA areas are special forms of normal areas and help reduce the load of routers and enhance reliability of OSPF routes.

## ↳ OSPF Packet

The following table lists the protocol packets used by OSPF. These OSPF packets are encapsulated in IP packets and transmitted in multicast or unicast mode.

Packet Type	Description
Hello	Hello packets are sent periodically to discover and maintain OSPF neighbor relationships.
Database Description (DD)	DD packets carry brief information about the local Link-State Database (LSDB) and are used to synchronize the LSDBs between OSPF neighbors.
Link State Request (LSR)	LSR packets are used to request the required LSAs from neighbors. LSR packets are sent only after DD packets are exchanged successfully between OSPF neighbors.
Link State Update (LSU)	LSU packets are used to send the required LSAs to peers.
Link State Acknowledgment (LSAck)	LSAck packets are used to acknowledge the received LSAs.

## Overview

Feature	Description
<a href="#">Link-State Routing Protocols</a>	Run OSPF on the router to obtain routes to different destinations on the network.
<a href="#">OSPF Route Management</a>	Plan or optimize OSPF routes through manual configuration to implement management of OSPF routes.
<a href="#">Enhanced Security and Reliability</a>	Use functions such as authentication and bidirectional forwarding detection (BFD) correlation to enhance security, stability, and reliability of OSPF.
<a href="#">Network Management</a>	Use functions such as the management information base (MIB) and Syslog to facilitate OSPF management.

### 4.3.1 Link-State Routing Protocols

OSPF is a type of link-state routing protocols. Its working process is as follows:

- Neighbor discovery → Bidirectional communication  
An OSPF neighbor relationship is set up between adjacent routers, and bidirectional communication is maintained.
- Database synchronization → Full adjacency  
A router uses LSAs to advertise all its link states. LSAs are exchanged between neighbors and the link state database (LSDB) is synchronized to achieve full adjacency.
- Shortest Path Tree (SPT) computation → Formation of a routing table  
The router computes the shortest path to each destination network based on the LSDB and forms an OSPF routing table.

#### Working Principle

##### ↘ Neighbor Discovery → Bidirectional Communication

Routers send Hello packets through all OSPF-enabled interfaces (or virtual links). If Hello packets can be exchanged between two routers, and parameters carried in the Hello packets can be successfully negotiated, the two routers become neighbors. Routers that are mutually neighbors find their own router IDs from Hello packets sent from neighbors, and bidirectional communication is set up.

A Hello packet includes, but is not limited to, the following information:

- Router ID of the originating router
- Area ID of the originating router interface (or virtual link)
- Subnet mask of the originating router interface (or virtual link)
- Authentication information of the originating router interface (or virtual link)
- Hello interval of the originating router interface (or virtual link)
- Neighbor dead interval of the originating router interface (or virtual link)
- Priority of the originating router interface (used for DR/BDR election)
- IP addresses of the DR and Backup Designated Router (BDR)
- Router ID of the neighbor of the originating router

### Database Synchronization → Full Adjacency

After bidirectional communication is set up between neighbor routers, the DD, LSR, LSU, and LSAck packets are used to exchange LSAs and set up the adjacency. The brief process is as follows:

- A router generates an LSA to describe all link states on the router.
- The LSA is exchanged between neighbors. When a router receives the LSA from its neighbor, it copies the LSA and saves the copy in the local LSDB, and then advertises the LSA to other neighbors.
- When the router and its neighbors obtain the same LSDB, full adjacency is achieved.

---

**i** OSPF will be very quiet without changes in link costs or network addition or deletion. If any change takes place, the changed link states are advertised to quickly synchronize the LSDB.

---

### SPT Computation → Formation of a Routing Table

After the complete LSDB is obtained from the router, the Dijkstra algorithm is run to generate an SPT from the local router to each destination network. The SPT records the destination networks, next-hop addresses, and costs. OSPF generates a routing table based on the SPT.

If changes in link costs or network addition or deletion take place, the LSDB will be updated. The router again runs the Dijkstra algorithm, generates a new SPT, and updates the routing table.

---

**i** The Dijkstra algorithm is used to find a shortest path from a vertex to other vertices in a weighted directed graph.

---

### OSPF Network Types

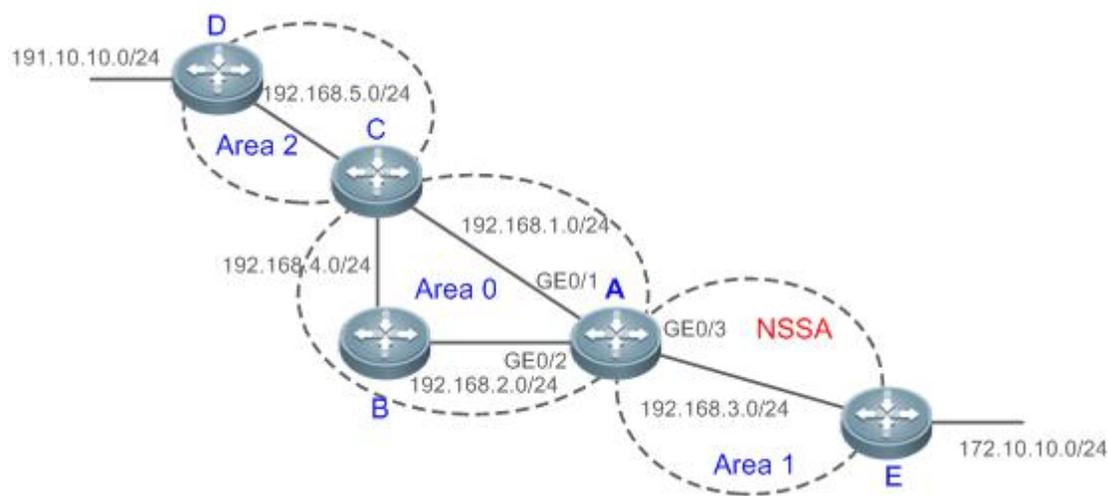

A router does not necessarily need to exchange LSAs with every neighbor and set up an adjacency with every neighbor. To improve efficiency, OSPF classifies networks that use various link layer protocols into five types so that LSAs are exchanged in different ways to set up an adjacency:

- **Broadcast**  
Neighbors are discovered, and the DR and BDR are elected.  
The DR (or BDR) exchanges LSAs with all other routers to set up an adjacency. Except the DR and BDR, all other routers do not exchange LSAs with each other, and the adjacency is not set up.  
Ethernet and fiber distributed data interface (FDDI) belong to the broadcast network type by default.
- **Non-broadcast multiple access (NBMA)**  
Neighbors are manually configured, and the DR and BDR are elected.  
The DR (or BDR) exchanges LSAs with all other routers to set up an adjacency. Except the DR and BDR, all other routers do not exchange LSAs with each other, and the adjacency is not set up.  
X.25, frame relay, and ATM belong to NBMA networks by default.
- **Point-to-point (P2P)**  
Neighbors are automatically discovered, and the DR or BDR is not elected.  
LSAs are exchanged between routers at both ends of the link, and the adjacency is set up.  
PPP, HDLC, and LAPB belongs to the P2P network type by default.

- Point-to-multipoint(P2MP)
  - Neighbors are automatically discovered, and the DR or BDR is not elected.
  - LSAs are exchanged between any two routers, and the adjacency is set up.
  - Networks without any link layer protocol belong to the P2MP network type by default. P2MP broadcast
  - Neighbors are manually configured, and the DR or BDR is not elected.
  - LSAs are exchanged between any two routers, and the adjacency is set up.
  - Networks without any link layer protocol belong to the P2MP network type by default.

OSPF Route Types

Figure 4-6

Display the OSPF routes (marked in red) in the routing table of Router A.

```
A#show ip route

Codes: C - connected, S - static, R - RIP, B - BGP
0 - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, * - candidate default

Gateway of last resort is no set

0 N2 172.10.10.0/24 [110/20] via 192.168.3.2, 00:01:00, GigabitEthernet 0/3
0 E2 191.10.10.0/24 [110/20] via 192.168.1.2, 01:11:26, GigabitEthernet 0/1

```

```
C 192.168.1.1/32 is local host.
C 192.168.2.0/24 is directly connected,GigabitEthernet 0/2
C 192.168.2.1/32 is local host.
C 192.168.3.0/24 is directly connected,GigabitEthernet 0/3
C 192.168.3.1/32 is local host.
O 192.168.4.0/24 [110/2] via 192.168.2.2, 00:00:02,GigabitEthernet 0/2
O IA 192.168.5.0/24 [110/3] via 192.168.1.2, 00:01:02,GigabitEthernet 0/1
```

A mark is displayed in front of each OSPF route to indicate the type of the route. There are six types of OSPF routes:

- **O: Intra-area route**  
This type of route describes how to arrive at a destination network in the local area. The cost of this type of route is equal to the cost of the route from the local router to the destination network.
  - **IA: Inter-area route**  
This type of route describes how to arrive at a destination network in another area. The cost of this type of route is equal to the cost of the route from the local router to the destination network.
  - **E1: Type 1 external route**  
This type of route describes how to arrive at a destination network outside the AS. The cost of this type of route is equal to the cost of the route from the local router to the ASBR plus the cost of the route from the ASBR to the destination network. This type of route does not exist on routers in the stub or NSSA area.
  - **E2: Type 2 external route**  
This type of route describes how to arrive at a destination network outside the AS. The cost of this type of route is equal to the cost of the route from the ASBR to the destination network. This type of route does not exist on routers in the stub or NSSA area.
  - **N1: Type 1 external route of the NSSA area**  
This type of route describes how to arrive at a destination network outside the AS through the ASBR in the NSSA area. The cost of this type of route is equal to the cost of the route from the local router to the ASBR plus the cost of the route from the ASBR to the destination network. This type of route exists only on routers in the NSSA area.
  - **N2: Type 2 external route of the NSSA area**  
This type of route describes how to arrive at a destination network outside the AS through the ASBR in the NSSA area. The cost of this type of route is equal to the cost of the route from the ASBR to the destination network. This type of route exists only on routers in the NSSA area.
- 
- i** Reliability of E2 and N2 routes is poor. OSPF believes that the cost of the route from the ASBR to a destination outside an AS is far greater than the cost of the route to the ASBR within the AS. Therefore, when the route cost is computed, only the cost of the route from the ASBR to a destination outside an AS is considered.
- 

## Related Configuration

### ↳ Enabling OSPF

OSPF is disabled by default.

Run the **router ospf 1** command to create an OSPF process on the router.

Run the **network area** command to enable OSPF on the interface and specify the area ID.

Run the **area virtual-link** command to create a virtual link on the router. The virtual link can be treated as a logical interface.

### Router ID

By default, the OSPF process elects the largest IP address among the IP addresses of all the loopback interfaces as the router ID. If the loopback interfaces configured with IP addresses are not available, the OSPF process elects the largest IP address among the IP addresses of all the loopback interfaces as the router ID.

Alternatively, you can run the **router-id** command to manually specify the router ID.

### Protocol Control Parameters

Run the **ip ospf hello-interval** command to modify the Hello interval on the interface. The default value is 10s (or 30s for NBMA networks).

Run the **ip ospf dead-interval** command to modify the neighbor dead interval on the interface. The default value is four times the Hello interval.

Use the **poll-interval** parameter in the **neighbor** command to modify the neighbor polling interval on the NBMA interface. The default value is 120s.

Run the **ip ospf transmit-delay** command to modify the LSU packet transmission delay on the interface. The default value is 1s.

Run the **ip ospf retransmit-interval** command to modify the LSU packet retransmission interval on the interface. The default value is 5s.

Use the **hello-interval** parameter in the **area virtual-link** command to modify the Hello interval on the virtual link. The default value is 10s.

Use the **dead-interval** parameter in the **area virtual-link** command to modify the neighbor dead interval on the virtual link. The default value is four times the Hello interval.

Use the **transmit-delay** parameter in the **area virtual-link** command to modify the LSU packet transmission delay on the virtual link. The default value is 1s.

Use the **retransmit-interval** parameter in the **area virtual-link** command to modify the LSU packet retransmission interval on the virtual link. The default value is 5s.

Run the **timers throttle lsa all** command to modify parameters of the exponential backoff algorithm that generates LSAs. The default values of these parameters are 0 ms, 5000 ms, and 5000 ms.

Run the **timers pacing lsa-group** command to modify the LSA group update interval. The default value is 30s.

Run the **timers pacing lsa-transmit** command to modify the LS-UPD packet sending interval and the number of sent LS-UPD packets. The default values are 40 ms and 1.

Run the **timers lsa arrival** command to modify the delay after which the same LSA is received. The default value is 1000 ms.

Run the **timers throttle spf** command to modify the SPT computation delay, minimum interval between two SPT computations, and maximum interval between two SPT computations. The default values are 1000 ms, 5000 ms, and 10000 ms.

↳ **OSPF Network Types**

By default, Ethernet and FDDI belong to the broadcast type, X.25, frame relay, and ATM belong to the NBMA type, and PPP, HDLC, and LAPB belong to the P2P type.

Run the **ip ospf network** command to manually specify the network type of an interface.

Run the **neighbor** command to manually specify a neighbor. For the NBMA and P2MP non-broadcast types, you must manually specify neighbors.

Run the **ip ospf priority** command to adjust the priorities of interfaces, which are used for DR/BDR election. The DR/BDR election is required for the broadcast and NBMA types. The router with the highest priority wins in the election, and the router with the priority of 0 does not participate in the election. The default value is 1.

### 4.3.2 OSPF Route Management

Plan or optimize OSPF routes through manual configuration to implement management of OSPF routes.

#### Working Principle

↳ **(Totally) Stub Area and (Totally)NSSA Area**

The (totally) stub and (totally)NSSA areas help reduce the protocol interaction load and the size of the routing table.

- If an appropriate area is configured as a (totally) stub or NSSA area, advertisement of a large number of Type 5 and Type 3 LSAs can be avoided within the area.

Area	Type1 and Type2 LSAs	Type 3 LSA	Type 4 LSA	Type 5 LSA	Type 7 LSA
Non (totally) stub area and NSSA area	Allowed	Allowed	Allowed	Allowed	Not allowed
Stub area	Allowed	Allowed (containing one default route)	Not allowed	Not allowed	Not allowed
Totally stub area	Allowed	Only one default route is allowed.	Not allowed	Not allowed	Not allowed
NSSA area	Allowed	Allowed (containing one default route)	Allowed	Not allowed	Allowed
Totally NSSA area	Allowed	Only one default route is allowed.	Allowed	Not allowed	Allowed

**i** The ABR uses Type 3LSAs to advertise a default route to the (totally) stub or NSSA area.

**i** The ABR converts Type 7 LSAs in the totally NSSA area to Type 5LSAs, and advertise Type5LSAs to the backbone area.

- If an area is appropriately configured as a (totally) stub area or an NSSA area, a large number of E1, E2, and IA routes will not be added to the routing table of a router in the area.

Area	Routes Available in the Routing Table of a Router Inside the Area
Non (totally) stub area and NSSA area	O: a route to a destination network in the local area IA: a route to a destination network in another area E1 or E2: a route or default route to a destination network segment outside the AS (via any ASBR in the AS)
Stub area	O: a route to a destination network in the local area IA: a route or a default route to a destination network in another area
Totally stub area	O: a route to a destination network in the local area IA: a default route
NSSA area	O: a route to a destination network in the local area IA: a route or a default route to a destination network in another area N1 or N2: a route or default route to a destination network segment outside the AS (via any ASBR in the local area)
Totally NSSA area	O: a route to a destination network in the local area IA: a default route N1 or N2: a route or default route to a destination network segment outside the AS (via any ASBR in the local area)

### Route Redistribution

Route redistribution refers to the process of introducing routes of other routing protocols, routes of other OSPF processes, static routes, and direct routes that exist on the device to an OSPF process so that these routes can be advertised to neighbors using Type 5 and Type 7 LSAs. A default route cannot be introduced during route redistribution.

Route redistribution is often used for interworking between ASs. You can configure route redistribution on an ASBR to advertise routes outside an AS to the interior of the AS, or routes inside an AS to the exterior of the AS.

### Default Route Introduction

By configuring a command on an ASBR, you can introduce a default route to an OSPF process so that the route can be advertised to neighbors using Type 5 and Type 7 LSAs.

Default route introduction is often used for interworking between ASs. One default route is used to replace all the routes outside an AS.

### Route Summarization

Route summarization is a process of summarizing routing information with the same prefix into one route, and advertising the summarized route (replacing a large number of individual routes) to neighbors. Route summarization helps reduce the protocol interaction load and the size of the routing table.

By default, the ABR advertises inter-area routing information by using Type3 LSAs within a network segment, and advertises redistributed routing information by using Type 5 and Type 7 LSAs. If continuous network segments exist, it is recommended that you configure route summarization.

When configuring route summarization, the summarization range may exceed the actual network scope of routes. If data is sent to a network beyond the summarization range, a routing loop may be formed and the router processing load may increase. To prevent these problems, the ABR or ASBR automatically adds a discard route to the routing table. This route will not be advertised.

### Route Filtering

OSPF supports route filtering to ensure security and facilitate control when the routing information is being learned, exchanged, or used.

Using configuration commands, you can configure route filtering for the following items:

- **Interface:** The interface is prevented from sending routing information (any LSAs) or exchanging routing information (any LSAs) with neighbors.
- **Routing information advertised between areas:** Only the routing information that meets the filtering conditions can be advertised to another area (Type 3 LSAs).
- **Routing information outside an AS:** Only the routing information that meets the filtering conditions can be redistributed to the OSPF process (Type 5 and Type 7 LSAs).
- **LSAs received by a router:** In the OSPF routing table, only the routes that are computed based on the LSAs meeting the filtering conditions can be advertised.

### Route Cost

If redundancy links or devices exist on the network, multiple paths may exist from the local device to the destination network. OSPF selects the path with the minimum total cost to form an OSPF route. The total cost of a path is equal to the sum of the costs of individual links along the path. The total cost of a path can be minimized by modifying the costs of individual links along the path. In this way, OSPF selects this path to form a route.

Using configuration commands, you can modify the link costs:

- Cost from an interface to a directly connected network segment and cost from the interface to a neighbor
- Cost from an ABR to the inter-area summarization network segment and cost from the ABR to the default network segment
- Cost from an ASBR to an external network segment and cost from the ASBR to the default network segment

---

 Both the cost and the metric indicate the cost and are not differentiated from each other.

---

### OSPF Administrative Distance

The administrative distance (AD) evaluates reliability of a route, and the value is an integer ranging from 0 to 255. A smaller AD value indicates that the route is more trustworthy. If multiples exist to the same destination, the route preferentially selects a route with a smaller AD value. The route with a greater AD value becomes a floating route, that is, a standby route of the optimum route.

By default, the route coming from one source corresponds to an AD value. The AD value is a local concept. Modifying the AD value affects route selection only on the current router.

Route Source	Directly-Connected Network	Static Route	EBGP Route	OSPF Route	IS-IS Route	RIP Route	IBGP Route	Unreachable Route
Default AD	0	1	20	110	115	120	200	255

## Related Configuration

### ▾ Stub Area and NSSA Area

No stub or NSSA area is configured by default.

Run the **area stub** command to configure a specified area as a stub area.

Run the **area nssa** command to configure a specified area as an NSSA area.

-  The backbone area cannot be configured as a stub or an NSSA area.
-  A transit area (with virtual links going through) cannot be configured as a stub or an NSSA area.
-  An area containing an ASBR cannot be configured as a stub area.

### ▾ Route Redistribution and Default Route Introduction

By default, routes are not redistributed and the default route is not introduced.

Run the **redistribute** command to configure route redistribution.

Run the **default-information originate** command to introduce the default route.

After configuring route redistribution and default route introduction, the route automatically becomes an ASBR.

### ▾ Route Summarization

By default, routes are not summarized. If route summarization is configured, a discard route will be automatically added.

Run the **area range** command to summarize routes distributed between areas (Type 3 LSA) on the ABR.

Run the **summary-address** command to summarize redistributed routes (Type 5 and Type 7 LSAs) on the ASBR.

Run the **discard-route** command to add a discard route to the routing table.

### ▾ Route Filtering

By default, routes are not filtered.

Run the **passive-interface** command to configure a passive interface. Routing information (any LSAs) cannot be exchanged on a passive interface.

Run the **ip ospfdatabase-filter all out** command to prohibit an interface from sending routing information (any LSAs).

Run the **area filter-list** command to filter routing information advertised between areas on the ABR. Only the routing information that meets the filtering conditions can be advertised to another area (Type 3 LSAs).

Use the **route-map** parameter in the **redistribute** command, or use the **distribute-list out** command to filter the external routing information of the AS on the ASBR. Only the routing information that meets the filtering conditions can be redistributed to the OSPF process (Type 5 and Type 7 LSAs).

Run the **distribute-list in** command to filter LSAs received by the router. In the OSPF routing table, only the routes that are computed based on the LSAs meeting the filtering conditions can be advertised.

## ↘ Route Cost

- Cost from the interface to the directly-connected network segment (cost on the interface)  
The default value is the auto cost. Auto cost = Reference bandwidth/Interface bandwidth  
Run the **auto-costreference-bandwidth** command to set the reference bandwidth of auto cost. The default value is 100 Mbps.  
Run the **ip ospf cost** command to manually set the cost of the interface. The configuration priority of this item is higher than that of the auto cost.
- Cost from the interface to a specified neighbor (that is, cost from the local device to a specified neighbor)  
The default value is the auto cost.  
Use the **cost** parameter in the **neighbor** command to modify the cost from the interface to a specified neighbor. The configuration priority of this item is higher than that of the cost of the interface.  
This configuration item is applicable only to P2MP-type interfaces.
- Cost from the ABR to the inter-area summarization network segment (that is, the cost of the summarized inter-area route)  
If OSPF routing is compatible with RFC1583, the default value is the minimum cost among all costs of the summarized links; otherwise, the default value is the maximum cost among all costs of the summarized links.  
Run the **compatible rfc1583** command to make OSPF routing compatible with RFC1583. By default, OSPF routing is compatible with RFC1583.  
Use the **cost** parameter in the **area range** command to modify the cost of inter-area route summarization.
- Cost from the ABR to the default network segment (that is, the cost of the default route that is automatically advertised by the ABR to the stub or NSSA areas)  
The default value is 1.  
Run the **area default-cost** command to modify the cost of the default route that the ABR automatically advertise to the stub or NSSA areas.
- Cost from the ASBR to an external network segment (that is, the metric of an external route)  
By default, the metric of a redistributed BGP route is 1, the metric of other types of redistributed routes is 20, and the route type is Type 2 External.  
Run the **default-metric** command to modify the default metric of the external route.  
Use the **metric**, **metric-type** and **route-map** parameters in the **redistribute** command to modify the metric and route type of the external route.
- Cost from the ASBR to the default network segment (that is, the metric of the default route that is manually introduced)  
By default, the metric is 1, and the route type is Type 2 External.  
Use the **metric**, **metric-type** and **route-map** parameters in the **default-information originate** command to modify the metric and route type of the default route that is manually introduced.  
Use the **metric** and **metric-type** parameters of **default-information originate** in the **area nssa** command to modify the metric and type of the default route that is manually introduced to the NSSA area.

- Run the **max-metric router-lsa** command to set metrics of all routes advertised on the router to the maximum value. In this way, the total cost of any path that passes through this router will become very large, and the path can hardly become the shortest path.

#### ↘ **OSPF Administrative Distance**

By default, the OSPF AD is 110.

Run the **distance** command to set the AD of an OSPF route.

### 4.3.3 Enhanced Security and Reliability

Use functions such as authentication and BFD correlation to enhance security, stability, and reliability of OSPF.

#### Working Principle

##### ↘ **Authentication**

Authentication prevents routers that illegally access the network and hosts that forge OSPF packets from participating in the OSPF process. OSPF packets received on the OSPF interface (or at both ends of the virtual link) are authenticated. If authentication fails, the packets are discarded and the adjacency cannot be set up.

Enabling authentication can avoid learning unauthenticated or invalid routes, thus preventing advertising valid routes to unauthenticated devices. In the broadcast-type network, authentication also prevents unauthenticated devices from becoming designated devices, ensuring stability of the routing system and protecting the routing system against intrusions.

##### ↘ **MTU Verification**

On receiving a DD packet, OSPF checks whether the MTU of the neighbor interface is the same as the MTU of the local interface. If the MTU of the interface specified in the received DD packet is greater than the MTU of the interface that receives the packet, the adjacency cannot be set up. Disabling MTU verification can avoid this problem.

##### ↘ **Source Address Verification**

Generally, the source address of a packet received by OSPF is in the same network segment as the receiving interface. The addresses at both ends of a P2P link are configured separately and are not necessarily in the same network segment. In this scenario, as the peer address information will be notified during the P2P link negotiation process, OSPF checks whether the source address of the packet is the address advertised by the peer during negotiation. If not, OSPF determines that the packet is invalid and discards this packet. In particular, OSPF does not verify the address of an unnumbered interface.

In some scenarios, the source address of a packet received by OSPF may not be in the same network segment as the receiving interface, and therefore OSPF address verification fails. For example, the negotiated peer address cannot be obtained on a P2P link. In this scenario, source address verification must be disabled to ensure that the OSPF adjacency can be properly set up.

##### ↘ **Two-Way Maintenance**

OSPF routers periodically send Hello packets to each other to maintain the adjacency. On a large network, a lot of packets may be sent or received, occupying too much CPU and memory. As a result, some packets are delayed or discarded. If the processing time of Hello packets exceeds the dead interval, the adjacency will be destroyed.

If the two-way maintenance function is enabled, in addition to the Hello packets, the DD, LSU, LSR, and LSAck packets can also be used to maintain the bidirectional communication between neighbors, which makes the adjacency more stable.

### ↘ Concurrent Neighbor Interaction Restriction

When a router simultaneously exchanges data with multiple neighbors, its performance may be affected. If the maximum number of neighbors that concurrently initiate or accept interaction with the OSPF process, the router can interact with neighbors by batches, which ensures data forwarding and other key services.

### ↘ Overflow

OSPF requires that routers in the same area store the same LSDB. The number of routers keeps increasing on the network. Some routers, however, cannot store so much routing information due to the limited system resources. The large amount of routing information may exhaust the system resources of routers, causing failures of the routers.

The overflow function limit the number of external routes in the LSDB to control the size of the LSDB.

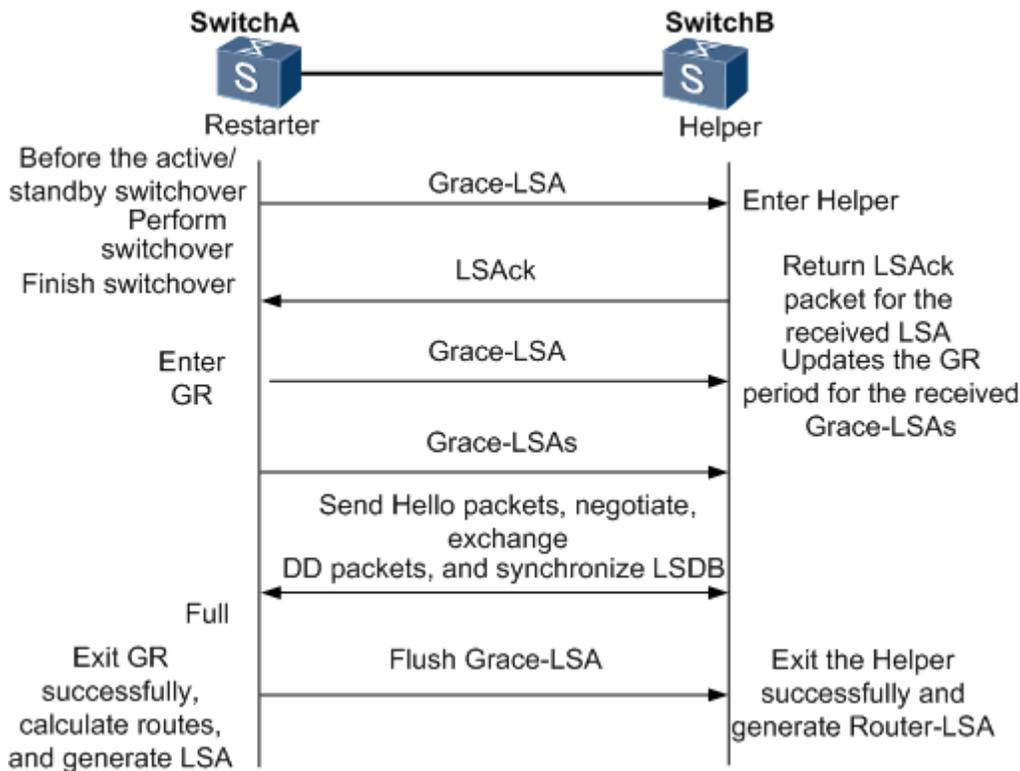

When the number of external routes on a router exceeds the upper limit, the router enters the overflow state. The router deletes the external routes generated by itself from the LSDB, and does not generate new external routes. In addition, the router discards the newly received external routes. After the overflow state timer (5s) expires, if the number of external routes is lower than the upper limit, the normal state is restored.

### ↘ GR

The control and forwarding separated technology is widely used among routers. On a relatively stable network topology, when a GR-enabled router is restarted on the control plane, data forwarding can continue on the forwarding plane. In addition, actions (such as adjacency re-forming and route computation) performed on the control plane do not affect functions of the forwarding plane. In this way, service interruption caused by route flapping can be avoided, thus enhancing reliability of the entire network.

Currently, the GR function is used only during active/standby switchover and system upgrade.

Figure 4-7 Normal OSPF GR Process

- The GR process requires collaboration between the restarter and the helper. The restarter is the router where GR occurs. The helper is a neighbor of the restarter.
- When entering or exiting the GR process, the restarter sends a Grace-LSA to the neighbor, notifying the neighbor to enter or exit the helper state.
- When the adjacency between the restarter and the helper reaches the Full state, the router can exit the GR process successfully.

↳ **NSR**

During nonstop routing (NSR), OSPF-related information is backed up from the active supervisor module of a distributed device to the standby supervisor module. In this way, the device can automatically recover the link state and re-generate routes without the help of the neighbor devices during the active/standby switchover. Information that should be backed up includes the adjacency and link state.

↳ **Fast Hello, BFD Correlation, and Fast Reroute**

After a link fault occurs, OSPF senses the death of the neighbor only after a period of time (about 40s). Then, OSPF advertises the information and re-computes the SPT. During this period, traffic is interrupted.

- After the fast Hello function is enabled (that is, the neighbor dead interval is set to 1s), OSPF can sense the death of a neighbor within 1s once a link is faulty. This greatly accelerates route convergence and prevents traffic interruption.

- BFD is used to test connectivity between devices. A link fault can be detected in as short as 150 ms. After OSPF is correlated with BFD, OSPF can sense the death of a neighbor in as short as 150 ms once a link is faulty. This greatly accelerates route convergence and prevents traffic interruption.
- Fast reroute prepares a standby route for OSPF. Once the OSPF senses the death of a neighbor, the traffic is immediately switched over to the standby route, thus preventing traffic interruption.

### ↳ iSPF

- The OSPF topology is area based. The SPF algorithm is run for independent computation in each area. The standard SPF algorithm re-computes the topology of the entire area each time even if only the leaf nodes change in the area topology.
- When computing the network topology, the incremental SPF (iSPF) corrects only the nodes on the SPT that are affected by the topological changes, and does not re-build the entire SPT. This can effectively ease the pressure on the router processors on a large network, especially when the network is not stable.

## Related Configuration

### ↳ OSPF Packet Authentication

By default, authentication is disabled.

- Run the **area authentication** command to enable the authentication function in the entire area so that the function takes effect on all interfaces in this area. If authentication is enabled in area 0, the function takes effect on the virtual link.
- Run the **ip ospf authentication** command to enable authentication on an interface. This configuration takes precedence over the area-based configuration.
- Run the **ip ospf authentication-key** command to set the text authentication key on an interface.
- Run the **ip ospf message-digest-key** command to set the message digest 5 (MD5) authentication key on an interface.
- Use the **authentication** parameter in the **area virtual-link** command to enable authentication at both ends of a virtual link. This configuration takes precedence over the area-based configuration.
- Use the **authentication-key** parameter in the **area virtual-link** command to set the text authentication key at both ends of a virtual link.
- Use the **message-digest-key** parameter in the **area virtual-link** command to set the MD5 authentication key at both ends of a virtual link.

### ↳ MTU Verification

By default, MTU verification is disabled.

Run the **ip ospf mtu-ignore** command to disable MTU verification on an interface.

### ↳ Source address verification

By default, source address verification is enabled on a P2P interface.

Run the **ip ospf source-check-ignore** command to disable source address verification on an interface.

### ↘ Two-Way Maintenance

By default, bidirectional maintenance is enabled.

Run the **two-way-maintain** command to enable two-way maintenance.

### ↘ Concurrent neighbor Interaction Restriction

Run the **max-concurrent-dd** command to modify the maximum number of neighbors that are concurrently interacting with the current OSPF process. The default value is 5.

Run the **ipv6 router ospf max-concurrent-dd** command to modify the maximum number of neighbors that are concurrently interacting with all OSPF processes on the router. The default value is 10.

### ↘ Overflow

Run the **overflow memory-lack** command to allow the router to enter the overflow state when the memory is insufficient. By default, the router is allowed to enter the overflow state when the memory is insufficient.

Run the **overflow database** command to allow the router to enter the overflow state when the number of LSAs is too large. By default, the router is not allowed to enter the overflow state when the number of LSAs is too large.

Run the **overflow database external** command to allow the router to enter the overflow state when the number of externalLSAs is too large. By default, the router is not allowed to enter the overflow state when the number of external-LSAs is too large.

### ↘ GR

By default, the restarter function is disabled, and the helper function is enabled.

Run the **graceful-restart** command to configure the restarter function.

Run the **graceful-restart helper** command to configure the helper function.

### ↘ NSR

By default, NSR is disabled.

Run the **nsr** command to enable NSR on the current OSPF process.

### ↘ Fast Hello

By default, the neighbor dead interval on the interface is 40s.

Run the **ip ospf dead-intervalminimal hello-multiplier** command to enable the Fast Hello function on an interface, that is, the neighbor dead interval is 1s.

### ↘ Correlating OSPFwith BFD

By default, OSPF is not correlated with BFD.

Run the **bfd interval min\_rx multiplier** command to set the BFD parameters.

Run the **bfd all-interfaces** command to correlate OSPF with BFD on all interfaces.

Run the **ip ospf bfd** command to correlate OSPF with BFD on the current interface.

### Fast Reroute

By default, fast reroute is disabled.

Run the **fast-reroute route-map** command to enable fast reroute on an OSPF process so that the standby route defined in the route map can be used.

Run the **fast-reroute lfa** command to enable fast reroute on an OSPF process so that the standby route can be computed by using the loop-free standby path.

Run the **fast-reroute lfdownstream-paths** command to enable fast reroute on an OSPF process so that the standby route can be computed by using the downstream path.

Run the **set fast-reroute backup-interfacebackup-nextHop** command to define a standby route in the route map.

Run the **ip ospf fast-reroute protection** command to specify the loop-free alternate (LFA) protection mode of an interface.

Run the **ip ospf fast-reroute no-eligible-backup** command to prevent an interface from becoming a standby interface.

### iSPF

By default, iSPF is disabled.

Run the **ispf enable** command to enable iSPF on the OSPF process.

## 4.3.4 Network Management

Use functions such as the MIB and Syslog to facilitate OSPF management.

### Working Principle

#### MIB

MIB is the device status information set maintained by a device. You can use the management program to view and set the MIB node.

Multiple OSPF processes can be simultaneously started on a router, but the OSPF MIB can be bound with only one OSPF process.

#### Trap

A Trap message is a notification generated when the system detects a fault. This message contains the related fault information.

If the Trap function is enabled, the router can proactively send the Trap messages to the network management device.

#### Syslog

The Syslog records the operations (such as command configuration) performed by users on routers and specific events (such as network connection failures).

If the Syslog is allowed to record the adjacency changes, the network administrator can view the logs to learn the entire process that the OSPF adjacency is set up and maintained.

## Related Configuration

### ↳ MIB

By default, the MIB is bound with the OSPF process with the smallest process ID.

Run the **enable mib-binding** command to bind the MIB with the current OSPF process.

### ↳ Trap

By default, all traps are disabled, and the device is not allowed to send OSPF traps.

Run the **enable traps** command to enable a specified trap for an OSPF process.

Run the **snmp-server enable traps ospf** command to allow the device to send OSPF traps.

### ↳ SYSLOG

By default, the Syslog is allowed to record the adjacency changes.

Run the **log-adj-changes** command to allow the Syslog to record the adjacency changes.

## 4.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring OSPF Basic Functions</a>	 (Mandatory) It is used to build an OSPF routing domain.	
	<b>routerospf</b>	Creates an OSPF process.
	<b>router-id</b>	Configures a router ID.
	<b>network area</b>	Enables OSPF on an interface and specifies an area ID.
	<b>area virtual-link</b>	Creates a virtual link.
<a href="#">Setting the Network Type</a>	 (Optional) The configurations are mandatory if the physical network is the X.25, frame relay, or ATM network.	
	<b>ip ospf network</b>	Defines the network type.
	<b>neighbor</b>	Specifies a neighbor.
	<b>ip ospf priority</b>	Configures the DR priority.
<a href="#">Configuring Route Redistribution and Default Route</a>	 (Optional) The configurations are recommended if the OSPF routing domain is connected with an external network.	
	<b>redistribute</b>	Configures route redistribution.
	<b>default-information originate</b>	Introduces a default route.
<a href="#">Configuring Stub Area and NSSA Area</a>	 (Optional) It is used to reduce interaction of routing information and the size of routing table, and enhance stability of routes.	
	<b>areastub</b>	Configures a stub area.

Configuration	Description and Command	
	<b>areanssa</b>	Configures an NSSA area.
	 (Optional) It is used to reduce interaction of routing information and the size of routing table, and enhance stability of routes.	
<a href="#">Configuring Route Summarization</a>	<b>area range</b>	Summarizes routes that are advertised between areas.
	<b>summary-address</b>	Summarizes routes that are introduced through redistribution.
	<b>discard-route</b>	Adds a discard route to the routing table.
<a href="#">Configuring Route Filtering</a>	 (Optional) It is used to manually control interaction of routing information and filter available OSPF routes.	
	<b>passive-interface</b>	Configures a passive interface.
	<b>ip ospfdatabase-filter all out</b>	Prohibits an interface from sending LSAs.
	<b>area filter-list</b>	Filters routes that are advertised between areas..
	<b>distribute-list out</b>	Filters routes that are introduced through redistribution.
	<b>distribute-listin</b>	Filters routes that are calculated based on the received LSAs.
<a href="#">Modifying Route Cost and AD</a>	 (Optional) It is used to manually control the shortest route computed by OSPF and determine whether to select an OSPF route preferentially.	
	<b>auto-costreference-bandwidth</b>	Modifies the reference bandwidth of the auto cost.
	<b>ip ospf cost</b>	Modifies the cost in the outbound direction of an interface.
	<b>areadefault-cost</b>	Modifies the cost of the default route in a stub or an NSSA area.
	<b>default-metric</b>	Modifies the default metric of a redistributed route.
	<b>max-metric router-lsa</b>	Configures the maximum metric.
	<b>compatible rfc1583</b>	Enables the routing rules to be compatible with RFC1583.
	<b>distance</b>	Modifies the OSPF AD.
<a href="#">Enabling Authentication</a>	 (Optional) It is used to prevent routers that illegally access the network and hosts that forge OSPF packets from participating in the OSPF protocol process.	
	<b>areaauthentication</b>	Enables authentication and sets the authentication mode in an area.

Configuration	Description and Command	
	<b>ip ospf authentication</b>	Enables authentication and sets the authentication mode on an interface.
	<b>ip ospf authentication-key</b>	Sets the text authentication key on an interface.
	<b>ip ospfmessage-digest-keymd5</b>	Sets the MD5 authentication key on an interface.
<a href="#">Enabling Overflow</a>	 (Optional) It is used to prevent the problem that OSPF processes stop running due to over-consumption of the memory.	
	<b>overflow memory-lack</b>	Allows the router to enter the overflow state when the memory is insufficient.
	<b>overflow database</b>	Allows the router to enter the overflow state when the number of LSAs exceeds the preset limit.
	<b>overflow database external</b>	Allows the router to enter the overflow state when the number of external LSAs exceeds the preset limit.
<a href="#">Modifying the Maximum Number of Concurrent Neighbors</a>	 (Optional) It is used to prevent the problem of performance deterioration caused by over-consumption of the CPU.	
	<b>max-concurrent-dd</b>	Modifies the maximum number of concurrent neighbors on the current OSPF process.
	<b>router ospf max-concurrent-dd</b>	Modifies the maximum number of concurrent neighbors on all OSPF processes.
<a href="#">Disabling Source Address Verification</a>	 (Optional) It is used to prevent the problem that the adjacency cannot be set up due to the failure to obtain the peer address.	
	<b>ip ospf source-check-ignore</b>	Disables source address verification on an interface.
<a href="#">Disabling MTU Verification</a>	 (Optional) It is used to prevent the problem that the adjacency cannot be set up due to MTU inconsistency on the neighbor interface.	
	<b>ip ospf mtu-ignore</b>	Disables MTU verification on an interface.
<a href="#">Enabling Two-Way Maintenance</a>	 (Optional) It is used to prevent termination of the adjacency due to the delay or loss of Hello packets.	
	<b>two-way-maintain</b>	Enables two-way maintenance.
<a href="#">Enabling GR</a>	 (Optional) It is used to retain OSPF routing forwarding during restart or active/standby switchover of the OSPF processes to prevent traffic interruption.	

Configuration	Description and Command	
	<b>graceful-restart</b>	Configures the restarter function.
	<b>graceful-restart helper</b>	Configures the helper function.
<a href="#">Enabling NSR</a>	 (Optional) It is used to retain OSPF routing forwarding during active/standby switchover of the OSPF processes to prevent traffic interruption.	
	<b>nsr</b>	Enables NSR.
Enabling Fast Hello	 (Optional) It is used to quickly discover the death of a neighbor to prevent traffic interruption when a link is faulty.	
	<b>ip ospf dead-intervalminimal hello-multiplier</b>	Enabling Fast Hello.
<a href="#">Correlating OSPF with BFD</a>	 (Optional) It is used to quickly discover the death of a neighbor to prevent traffic interruption when a link is faulty.	
	<b>bfd interval min_rx multiplier</b>	Sets BFD parameters.
	<b>bfd all-interfaces</b>	Correlates OSPF with BFD on all interfaces.
	<b>ip ospf bfd</b>	Correlates OSPF with BFD on the current interface.
<a href="#">Enabling Fast Reroute</a>	 (Optional) It is used to quickly switch over services to the standby route to prevent traffic interruption.	
	<b>fast-reroute route-map</b>	Enables fast reroute on the OSPF process so that the standby route defined in the route map can be used.
	<b>fast-reroute lfa</b>	Enables fast reroute on an OSPF process so that the standby route can be computed by using the loop-free standby path.
	<b>fast-reroute lfdownstream-paths</b>	Enables fast reroute on an OSPF process so that the standby route can be computed by using the downstream path.
	<b>set fast-reroute backup-interface backup-nexthop</b>	Defines a standby route in the route map.
	<b>ip ospf fast-reroute protection</b>	Specifies the LFA protection mode of an interface.
	<b>ip ospf fast-reroute no-eligible-backup</b>	Prevents an interface from becoming a standby interface.
<a href="#">Enabling iSPF</a>	 (Optional) It is used to enable the incremental topology computation to ease the pressure on the processor.	
	<b>ispf enable</b>	Enables iSPF on an OSPF process.

Configuration	Description and Command	
<a href="#">Configuring the Network Management Function</a>	 (Optional) The configurations enable users to use the SNMP network management software to manage OSPF.	
	<b>enable mib-binding</b>	Binds the MIB with the current OSPF process.
	<b>enable traps</b>	Enables a specified trap for an OSPF process.
	<b>snmp-server enable traps ospf</b>	Allows the device to send OSPF traps.
	<b>log-adj-changes</b>	Allows the Syslog to record the adjacency changes.
<a href="#">Modifying Protocol Control Parameters</a>	 (Optional) You are advised not to modify protocol control parameters unless necessary.	
	<b>ip ospf hello-interval</b>	Modifies the Hello interval.
	<b>ip ospf dead-interval</b>	Modifies the neighbor death interval.
	<b>timers throttle lsa all</b>	Modifies parameters of the exponential backoff algorithm that generates LSAs.
	<b>timers throttle route inter-area</b>	Modifies the inter-area route computation delay.
	<b>timers throttle route ase</b>	Modifies the external route computation delay.
	<b>timers pacing lsa-group</b>	Modifies the LSA group update interval.
	<b>timers pacing lsa-transmit</b>	Modifies the LS-UPD packet sending interval.
	<b>ip ospf transmit-delay</b>	Modifies the LSU packet transmission delay.
	<b>ip ospf retransmit-interval</b>	Modifies the LSU packet retransmission interval.
	<b>timers lsa arrival</b>	Modifies the delay after which the same LSA is received.
<b>timers throttlespf</b>	Modifies the SPT computation timer.	

### 4.4.1 Configuring OSPF Basic Functions

#### Configuration Effect

- Set up an OSPF routing domain on the network to provide IPv4 unicast routing service for users on the network.

#### Notes

- Ensure that the IP unicast routing function is enabled, that is, **ip routing** is not disabled; otherwise, OSPF cannot be enabled.
- It is strongly recommended that you manually configure the router ID.

- After **ip ospf disable all** is configured, the interface neither sends or receives any OSPF packet, nor participates in OSPF computation even if the interface belongs to the network.

## Configuration Steps

### ↳ Creating an OSPF Process

- Mandatory.
- The configuration is mandatory for every router.

### ↳ Configuring a Router ID

- (Optional) It is strongly recommended that you manually configure the router ID.
- If the router ID is not configured, OSPF selects an interface IP address. If the IP address is not configured for any interface, or the configured IP addresses have been used by other OSPF instances, you must manually configure the router ID.

### ↳ Enabling OSPF on an Interface and Specifying an Area ID

- Mandatory.
- The configuration is mandatory for every router.

## Verification

- Run the **show ip route ospf** command to verify that the entries of the OSPF routing table are correctly loaded.
- Run the **ping** command to verify that the IPv4 unicast service is correctly configured.

## Related Commands

### ↳ Creating an OSPF Process

<b>Command</b>	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]
<b>Parameter</b>	<i>process-id</i> : Indicates the OSPF process ID. If the process ID is not specified, the process ID is 1.
<b>Description</b>	<i>vrf-name</i> : Specifies the VPN routing and forwarding (VRF) to which the OSPF process belongs.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Different OSPF processes are independent of each other, and can be treated as different routing protocols that run independently.

### ↳ Configuring a Router ID

<b>Command</b>	<b>router-id</b> <i>router-id</i>
<b>Parameter</b>	<i>router-id</i> : Indicates the router ID to be configured. It is expressed in the IP address.
<b>Description</b>	
<b>Command Mode</b>	OSPF routing process configuration mode

<b>Usage Guide</b>	<p>Different OSPF processes are independent of each other, and can be treated as different routing protocols that run independently.</p> <p>Each OSPF process uses a unique router ID.</p>
--------------------	--

📌 **Enabling OSPF on an Interface and Specifying an Area ID**

<b>Command</b>	<b>network</b> <i>ip-address wildcard area area-id</i>
<b>Parameter</b>	<i>ip-address</i> : Indicates the IP address of the interface.
<b>Description</b>	<p><i>wildcard</i>: Indicates the IP address comparison mode. <b>0</b> indicates accurate matching, and <b>1</b> indicates that no comparison is performed.</p> <p><i>area-id</i>: Indicates the ID of an OSPF area. An OSPF area is always associated with an address range. To facilitate management, you can use a subnet as the ID of an OSPF area.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>By defining <i>ip-address</i> and <i>wildcard</i>, you can use one command to associate multiple interfaces with one OSPF area. To run OSPF on one interface, you must include the primary IP address of the interface in the IP address range defined by <b>network area</b>. If the IP address range defined by <b>network area</b> contains only the secondary IP address of the interface, OSPF does not run on this interface. If the interface address matches the IP address ranges defined in the <b>network</b> commands of multiple OSPF processes, the OSPF process that the interface is associated with is determined based on the best match method.</p>

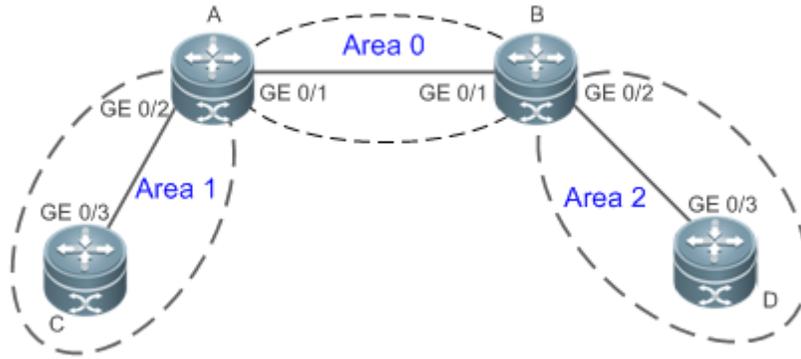

📌 **Creating a Virtual Link**

<b>Command</b>	<b>area</b> <i>area-id</i> <b>virtual-link</b> <i>router-id</i> [ <b>authentication</b> [ <b>message-digest</b>   <b>null</b> ] ] [ <b>dead-interval</b> { <i>seconds</i> / <b>minimal</b> <b>hello-multiplier</b> <i>multiplier</i> } ] [ <b>hello-interval</b> <i>seconds</i> ] [ <b>retransmit-interval</b> <i>seconds</i> ] [ <b>transmit-delay</b> <i>seconds</i> ] [ [ <b>authentication-key</b> [ <b>0</b>   <b>7</b> ] <i>key</i> ]   [ <b>message-digest-key</b> <i>key-id</i> <b>md5</b> [ <b>0</b>   <b>7</b> ] <i>key</i> ] ]
<b>Parameter Description</b>	<p><i>area-id</i>: Indicates the ID of the OSPF transit area. The area ID can be a decimal integer or an IP address.</p> <p><i>router-id</i>: Indicates the ID of a neighbor router on the virtual link.</p> <p><b>dead-interval</b> <i>seconds</i>: Indicates the time that the neighbor is declared lost. The unit is second. The value ranges from 0 to 2,147,483,647. The setting of this parameter must be consistent with that on a neighbor.</p> <p><b>minimal</b>: Indicates that the Fast Hello function is enabled to set the dead interval to 1s.</p> <p><b>hello-multiplier</b>: Indicates the result of the dead interval multiple by the Hello interval in the Fast Hello function.</p> <p><i>multiplier</i>: Indicates the number of Hello packets sent per second in the Fast Hello function. The value ranges from 3 to 20.</p> <p><b>hello-interval</b> <i>seconds</i>: Indicates the interval at which OSPF sends the Hello packet to the virtual link. The unit is second. The value ranges from 1 to 65,535. The setting of this parameter must be consistent with that on a neighbor.</p> <p><b>retransmit-interval</b> <i>seconds</i>: Indicates the OSPF LSA retransmission time. The unit is second. The value ranges from 1 to 65,535.</p> <p><b>transmit-delay</b> <i>seconds</i>: Indicates the delay after which OSPF sends the LSA. The unit is second. The value ranges from 1 to 65,535.</p>

	<p><b>authentication-key [ 0   7 ]key:</b> Defines the key for OSPF plain text authentication.</p> <p><b>message-digest-key key-idmd5 [ 0   7 ]key:</b> Defines the key ID and key for OSPF MD5 authentication.</p> <p><b>authentication:</b> Sets the authentication type to plain text authentication.</p> <p><b>message-digest:</b> Sets the authentication type to MD5 authentication.</p> <p><b>null:</b> Indicates that authentication is disabled.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>In the OSPF routing domain, all areas must be connected to the backbone area. If the backbone area is disconnected, a virtual link must be configured to connect to the backbone area; otherwise, network communication problems will occur. A virtual link must be created between two ABRs, and the area to which both ABRs belong is the transit area. A stub area or an NSSA area cannot be used as a transit area. A virtual link can also be used to connect other non-backbone areas.</p> <p><b>router-id</b> is the ID of an OSPF neighbor router. If you are sure about the value of <b>router-id</b>, run the <b>show ip ospf neighbor</b> command to confirm the value. You can configure the loopback address as the router ID.</p> <p>The <b>area virtual-link</b> command defines only the authentication key of the virtual link. To enable OSPF packet authentication in the areas connected to the virtual link, you must run the <b>area authentication</b> command.</p> <p>OSPF supports the Fast Hello function.</p> <p>After the OSPF Fast Hello function is enabled, OSPF finds neighbors and detects neighbor failures faster. You can enable the OSPF Fast Hello function by specifying the <b>minimal</b> and <b>hello-multiplier</b> keywords and the <b>multiplier</b> parameter. The <b>minimal</b> keyword indicates that the death interval is set to 1s, and <b>hello-multiplier</b> indicates the number of Hello packets sent per second. In this way, the interval at which the Hello packet is sent decreases to less than 1s.</p> <p>If the Fast Hello function is configured for a virtual link, the Hello interval field of the Hello packet advertised on the virtual link is set to 0, and the Hello interval field of the Hello packet received on this virtual link is ignored.</p> <p>No matter whether the Fast Hello function is enabled, the death interval must be consistent and the <b>hello-multiplier</b> values can be inconsistent on routers at both ends of the virtual link. Ensure that at least one Hello packet can be received within the death interval.</p> <p>Run the <b>show ip ospf virtual-links</b> command to monitor the death interval and Fast Hello interval configured for the virtual link.</p> <p>The <b>dead-interval minimal hello-multiplier</b> and <b>hello-interval</b> parameters introduced for the Fast Hello function cannot be configured simultaneously.</p>

## Configuration Example

**Scenario**  
**Figure 4-8**

<b>Remarks</b>	The interface IP addresses are as follows: A: GE 0/1 192.168.1.1    GE 0/2 192.168.2.1 B: GE 0/1 192.168.1.2    GE 0/2 192.168.3.1 C: GE 0/3 192.168.2.2 D: GE 0/3 192.168.3.2
----------------	--

- Configuration Steps**
- Configure the interface IP addresses on all routers.
  - Enable the IPv4 unicast routing function on all routers. (This function is enabled by default.)
  - Configure the OSPF instances and router IDs on all routers.
  - Enable OSPF on the interfaces configured on all routers.

**A**

```
A#configure terminal
A(config)#interface GigabitEthernet 0/1
A(config-if-GigabitEthernet 0/1)#ip address 192.168.1.1 255.255.255.0
A(config-if-GigabitEthernet 0/1)#exit
A(config)#interface GigabitEthernet 0/2
A(config-if-GigabitEthernet 0/2)#ip address 192.168.2.1 255.255.255.0
A(config-if-GigabitEthernet 0/2)#exit
A(config)#router ospf 1
A(config-router)#router-id 192.168.1.1
A(config-router)#network 192.168.1.0 0.0.0.255 area 0
A(config-router)#network 192.168.2.0 0.0.0.255 area 1
```

**B**

```
B#configure terminal
B(config)#interface GigabitEthernet 0/1
B(config-if-GigabitEthernet 0/1)#ip address 192.168.1.2 255.255.255.0
B(config-if-GigabitEthernet 0/1)#exit
B(config)#interface GigabitEthernet 0/2
```

	<pre>B(config-if-GigabitEthernet 0/2)#ip address 192.168.3.1 255.255.255.0 B(config-if-GigabitEthernet 0/2)#exit B(config)#router ospf 1 B(config-router)#router-id192.168.1.2 B(config-router)#network 192.168.1.0 0.0.0.255 area 0 B(config-router)#network 192.168.3.0 0.0.0.255 area 2</pre>
<b>C</b>	<pre>C#configure terminal C(config)#interface GigabitEthernet 0/3 C(config-if-GigabitEthernet 0/3)#ip address 192.168.2.2 255.255.255.0 C(config-if-GigabitEthernet 0/3)#exit C(config)#router ospf 1 C(config-router)#router-id192.168.2.2 C(config-router)#network 192.168.2.0 0.0.0.255 area 1</pre>
<b>D</b>	<pre>D#configure terminal D(config)#interface GigabitEthernet 0/3 D(config-if-GigabitEthernet 0/3)#ip address 192.168.3.2 255.255.255.0 D(config-if-GigabitEthernet 0/3)#exit D(config)#router ospf 1 D(config-router)#router-id192.168.3.2 D(config-router)#network 192.168.3.0 0.0.0.255 area 2</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Verify that the OSPF neighbors are correct on all routers.</li> <li>● Verify that the routing table is correctly loaded on all routers.</li> <li>● On Router D, verify that the IP address 192.168.2.2 can be pinged successfully.</li> </ul>

Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms.</pre>

## Common Errors

- OSPF cannot be enabled because the IP unicast routing function is disabled.
- The network segment configured by the **network** command does not include the interface IP addresses.
- The area IDs enabled on adjacent interfaces are inconsistent.
- The same router ID is configured on multiple routers, resulting in a router ID conflict.
- The same interface IP address is configured on multiple routers, resulting in a running error of the OSPF network.

## 4.4.2 Setting the Network Type

### Configuration Effect

- Run OSPF to provide the IPv4 unicast routing service if the physical network is X.25, frame relay, or ATM.

### Notes

- The OSPF basic functions must be configured.
- The broadcast network sends OSPF packets in multicast mode. Neighbors are automatically discovered, and the DR/BDR election is required.
- The P2P network sends OSPF packets in multicast mode. Neighbors are automatically discovered.
- The NBMA network sends OSPF packets in unicast mode. Neighbors must be manually specified, and the DR/BDR election is required.
- The P2MP network (without the **non-broadcast** parameter) sends OSPF packets in multicast mode. Neighbors are automatically discovered.
- The P2MP network (with the **non-broadcast** parameter) sends OSPF packets in unicast mode. Neighbors must be manually specified.

### Configuration Steps

#### ↘ Configuring the Interface Network Type

- Optional.
- The configuration is required on routers at both ends of the link.

#### ↘ Configuring Neighbors

- (Optional) If the interface network type is set to NBMA or P2MP (with the **non-broadcast** parameter), neighbors must be configured.
- Neighbors are configured on routers at both ends of the NBMA or P2MP (with the **non-broadcast** parameter) network.

#### ↘ Configuring the Interface Priority

- (Optional) You must configure the interface priority if a router must be specified as a DR, or a router cannot be specified as a DR.
- Configure the interface priority on a router that must be specified as a DR, or cannot be specified as a DR.

## Verification

- Run the **show ip ospf interface** command to verify that the network type of each interface is correct.

## Related Commands

### ↘ Configuring the Interface Network Type

<b>Command</b>	<b>ip ospf network { broadcast  non-broadcast  point-to-multipoint[ non-broadcast]   point-to-point}</b>
<b>Parameter Description</b>	<p><b>broadcast:</b> Sets the interface network type to broadcast.</p> <p><b>non-broadcast:</b> Sets the interface network type to non-broadcast.</p> <p><b>point-to-multipoint [ non-broadcast ]:</b> Sets the interface network type to P2MP. If the interface does not have the broadcast capability, the <b>non-broadcast</b> parameter must be available.</p> <p><b>point-to-point:</b> Sets the interface network type to P2P.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>The broadcast type requires that the interface must have the broadcast capability.</p> <p>The P2P type requires that the interfaces are interconnected in one-to-one manner.</p> <p>The NBMA type requires full-meshed connections, and all interconnected routers can directly communicate with each other.</p> <p>The P2MP type does not raise any requirement.</p>

### ↘ Configuring Neighbors

<b>Command</b>	<b>neighbor ip-address [ poll-intervalseconds ] [ prioritypriority ] [ cost cost ]</b>
<b>Parameter Description</b>	<p><b>ip-address:</b> Indicates the IP address of the neighbor interface.</p> <p><b>poll-intervalseconds:</b> Indicates the neighbor polling interval. The unit is second. The value ranges from 0 to 2,147,483,647. This parameter is applicable only to the NBMA interface.</p> <p><b>prioritypriority:</b> Indicates the neighbor priority. The value ranges from 0 to 255. This parameter is applicable only to the NBMA interface.</p> <p><b>costcost:</b> Indicates the cost required to reach each neighbor. There is no default value. The value ranges from 0 to 65,535. This parameter is applicable only to the P2MP interface.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>Neighbors must be specified for the NBMA or P2MP (non-broadcast) interfaces. The neighbor IP address must be the primary IP address of this neighbor interface.</p> <p>If a neighbor router becomes inactive on the NBMA network, OSPF still sends Hello packets to this neighbor even if no Hello packet is received within the router death time. The interval at which the Hello packet is sent is called polling interval. When running for the first time, OSPF sends Hello packets only to neighbors whose priorities are not 0. In this way, neighbors with priorities set to 0 do not participate in the DR/BDR election. After a DR/BDR is elected, the DR/BDR sends the Hello packets to all neighbors to set up the adjacency.</p> <p>The P2MP (non-broadcast) network cannot dynamically discover neighbors because it does not have the broadcast capability. Therefore, you must use this command to manually configure neighbors for the P2MP (non-broadcast) network. In addition, you can use the <b>cost</b> parameter to specify the cost to reach each</p>

	neighbor on the P2MP network.
--	-------------------------------

▾ **Configuring the Interface Priority**

<b>Command</b>	<b>ip ospf priority</b> <i>priority</i>
<b>Parameter</b>	<i>priority</i> : Indicates the OSPF priority of an interface. The value ranges from 0 to 255.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>The OSPF interface priority is contained in the Hello packet. When the DR/BDR election occurs on the OSPF broadcast network, the router with the highest priority becomes the DR or BDR. If the priorities are the same, the router with the largest router ID becomes the DR or BDR. A router with the priority set to 0 does not participate in the DR/BDR election.</p> <p>This command is applicable only to the OSPF broadcast and NBMA interfaces.</p>

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

▾ **Setting the Interface Network Type to P2MP**

<p><b>Scenario</b> Figure 4-9</p>			
	<table border="1" style="width: 100%;"> <tr> <td style="width: 15%;"><b>Remarks</b></td> <td>The interface IP addresses are as follows: A: S1/0 192.168.1.2 B: S1/0 192.168.1.3 C: S1/0 192.168.1.4</td> </tr> </table>	<b>Remarks</b>	The interface IP addresses are as follows: A: S1/0 192.168.1.2 B: S1/0 192.168.1.3 C: S1/0 192.168.1.4
<b>Remarks</b>	The interface IP addresses are as follows: A: S1/0 192.168.1.2 B: S1/0 192.168.1.3 C: S1/0 192.168.1.4		
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Set the interface network type to P2MP on all routers.</li> </ul>		

<b>A</b>	<pre>A#configure terminal A(config)# interface Serial1/0 A(config-Serial1/0)# encapsulation frame-relay A(config-Serial1/0)# ip ospf network point-to-multipoint</pre>
<b>B</b>	<pre>B#configure terminal B(config)# interface Serial1/0 B(config-Serial1/0)# encapsulation frame-relay B(config-Serial1/0)# ip ospf network point-to-multipoint</pre>
<b>C</b>	<pre>C#configure terminal C(config)# interface Serial1/0 C(config-Serial1/0)# encapsulation frame-relay C(config-Serial1/0)# ip ospf network point-to-multipoint</pre>
<b>Verification</b>	<p>Verify that the interface network type is P2MP.</p> <pre>A# show ip ospf interface Serial1/0 Serial1/0 is up, line protocol is up   Internet Address 192.168.1.2/24, Ifindex 2, Area 0.0.0.1, MTU 1500   Matching network config: 192.168.1.0/24   Process ID 1, Router ID 192.168.1.2, Network Type POINTOMULTIPOINT, Cost: 1   Transmit Delay is 1 sec, State Point-To-Point   Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5   Hello due in 00:00:02   Neighbor Count is 1, Adjacent neighbor count is 0   Crypt Sequence Number is 4787   Hello received 465 sent 466, DD received 8 sent 8   LS-Req received 2 sent 2, LS-Upd received 8 sent 21   LS-Ack received 14 sent 7, Discarded 3</pre>

## Common Errors

- The network types configured on interfaces at two ends are inconsistent, causing abnormal route learning.
- The network type is set to NBMA or P2MP (with the **non-broadcast** parameter), but neighbors are not specified.

### 4.4.3 Configuring Route Redistribution and Default Route

#### Configuration Effect

- In the OSPF domain, introduce a unicast route to other AS domains so that the unicast routing service to other AS domains can be provided for users in the OSPF domain.
- In the OSPF domain, inject a default route to other AS domains so that the unicast routing service to other AS domains can be provided for users in the OSPF domain.

#### Notes

- The OSPF basic functions must be configured.

#### Configuration Steps

##### ↘ Configuring External Route Redistribution

- (Optional) This configuration is required if external routes of the OSPF domain should be introduced to an ASBR.
- This configuration is performed on an ASBR.

##### ↘ Generating a Default Route

- (Optional) This configuration is required if the default route should be introduced to an ASBR so that other routers in the OSPF domain access other AS domains through this ASBR by default.
- This configuration is performed on an ASBR.

#### Verification

- On a router inside the OSPF domain, run the **show ip route** command to verify that the unicast routes to other AS domains are loaded.
- On a router inside the OSPF domain, run the **show ip route** command to verify that the default route to the ASBR is loaded.
- Run the **ping** command to verify that the IPv4 unicast service to other AS domains is correct.

#### Related Commands

##### ↘ Configuring External Route Redistribution

<b>Command</b>	<b>redistribute</b> { <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>arp-host</b>   <b>static</b> } [ { <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> } ] [ <b>match</b> { <b>internal</b>   <b>external</b> [ <b>1 2</b> ]   <b>nssa-external</b> [ <b>1 2</b> ] } ] [ <b>metric</b> <i>metric-value</i> ] [ <b>metric-type</b> { <b>1 2</b> } ] [ <b>route-map</b> <i>route-map-name</i> ] [ <b>subnets</b> ] [ <b>tag</b> <i>tag-value</i> ]
<b>Parameter Description</b>	<p><b>bgp</b>: Indicates redistribution from BGP.</p> <p><b>connected</b>: Indicates redistribution from direct routes.</p> <p><b>isis</b> [ <i>area-tag</i> ]: Indicates redistribution from IS-IS. <i>area-tag</i> specifies the IS-IS instance.</p> <p><b>ospf</b> <i>process-id</i>: Indicates redistribution from OSPF. <i>process-id</i> specifies an OSPF process. The value ranges from 1 to 65,535.</p>

	<p><b>rip:</b> Indicates redistribution from RIP.</p> <p><b>static:</b> Indicates redistribution from static routes.</p> <p><b>arp-host:</b> Indicates redistribution from arp routes.</p> <p><b>level-1   level-1-2   level-2:</b> Used only when IS-IS routes are redistributed. Only the routes of the specified level are redistributed. By default, only level-2 IS-IS routes can be redistributed.</p> <p><b>match:</b> Used only when OSPF routes are redistributed. Only the routes meeting the filtering conditions are redistributed. By default, all OSPF routes can be redistributed.</p> <p><b>metric <i>metric-value</i>:</b> Specifies the metric of the OSPF external LSA. <i>metric-value</i> specifies the size of the metric. The value ranges from 0 to 16,777,214.</p> <p><b>metric-type { 1   2 }:</b> Sets the external route type, which can be E-1 or E-2.</p> <p><b>route-map <i>route-map-name</i>:</b> Sets the redistribution filtering rules.</p> <p><b>subnets:</b> Specifies the non-standard networks for redistribution.</p> <p><b>tag <i>tag-value</i>:</b> Specifies the tag value of the route that is redistributed into the OSPF routing domain. The value ranges from 0 to 4,294,967,295.</p>
<p><b>Command Mode</b></p>	<p>OSPF routing process configuration mode</p>
<p><b>Usage Guide</b></p>	<p>After this command is configured, the router becomes an ASBR, imports related routing information to the OSPF domain, and advertises the routing information as Type 5 LSAs to other OSPF routers in the domain. If you configure redistribution of IS-IS routes without specifying the <b>level</b> parameter, only level-2 routes can be redistributed by default. If you specify the <b>level</b> parameter during initial configuration of redistribution, routes of the specified level can be redistributed. If both <b>level-1</b> and <b>level-2</b> are configured, the two levels are combined and saved as <b>level-1-2</b>. For details, see the configuration example.</p> <p>If you configure redistribution of OSPF routes without specifying the <b>match</b> parameter, OSPF routes of all sub-types can be distributed by default. The latest setting of the <b>match</b> parameter is used as the initial <b>match</b> parameter. Only routes that match the sub-types can be redistributed. You can use the <b>no</b> form of the command to restore the default value of <b>match</b>. For details, see the configuration example.</p> <p>If <b>route-map</b> is specified, the filtering rules specified in <b>route-map</b> are applicable to original parameters of redistribution. For redistribution of OSPF or IS-IS routes, the routemap is used for filtering only when the redistributed routes meet criteria specified by <b>match</b> or <b>level</b>.</p> <p>The <b>set metric</b> value associated with <b>route-map</b> should fall into the range of 0 to 16,777,214. If the value exceeds this range, routes cannot be introduced.</p> <p>The configuration rules for the <b>no</b> form of the <b>redistribute</b> command are as follows:</p> <ol style="list-style-type: none"> <li>1. If some parameters are specified in the <b>no</b> form of the command, default values of these parameters will be restored.</li> <li>2. If no parameter is specified in the <b>no</b> form of the command, the entire command will be deleted.</li> </ol> <p>For example, if <b>redistribute isis 112 level-2</b> is configured, you can run the <b>no redistribute isis 112 level-2</b> command to restore the default value of <b>level-2</b>.</p> <p>As level-2 itself is the default value of the parameter, the configuration saved is still <b>redistribute isis 112 level-2</b> after the preceding <b>no</b> form of the command is executed. To delete the entire command, run the <b>no redistribute isis 112</b> command.</p>

<b>Command</b>	<b>default-information originate</b> [ <b>always</b> ] [ <b>metric</b> <i>metric</i> ] [ <b>metric-type</b> <i>type</i> ] [ <b>route-map</b> <i>map-name</i> ]
<b>Parameter Description</b>	<p><b>always</b>: Enables OSPF to generate a default route regardless of whether the local router has a default route.</p> <p><b>metric</b> <i>metric</i>: Indicates the initial metric of the default route. The value ranges from 0 to 16,777,214.</p> <p><b>metric-type</b> <i>type</i>: Indicates the type of the default route. OSPF external routes are classified into two types: Type 1: The metric varies with routers; Type 2: The metric is the same for all routers. Type 1 external routes are more trustworthy than Type 2 external routes.</p> <p><b>route-map</b> <i>map-name</i>: Indicates the associated route-map name. By default, no route-map is associated.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>When the <b>redistribute</b> or <b>default-information</b> command is executed, the OSPF router automatically becomes an ASBR. The ASBR, however, does not automatically generate or advertise a default route to all routers in the OSPF routing domain. To have the ASBR generate a default route, configure the <b>default-information originate</b> command.</p> <p>If <b>always</b> is specified, the OSPF routing process advertises an external default route to neighbors regardless of whether a default route exists. This default route, however, is not displayed on the local router. To confirm whether the default route is generated, run the <b>show ip ospf database</b> command to display the OSPF link status database. The external link with the ID 0.0.0.0 describes the default route. On an OSPF neighbor, you can run the <b>show ip route</b> command to see the default route.</p> <p>The metric of the external default route can only be defined in the <b>default-information originate</b> command, instead of the <b>default-metric</b> command.</p> <p>OSPF has two types of external routes. The metric of the Type 1 external route changes, but the metric of the Type 2 external route is fixed. If two parallel paths to the same destination have the same route metric, the priority of the Type 1 route is higher than that of the Type 2 route. Therefore, the <b>show ip route</b> command displays only the Type 1 route.</p> <p>A router in the stub area cannot generate an external default route.</p> <p>The <b>set metric</b> value associated with <b>route-map</b> should fall into the range of 0 to 16,777,214. If the value exceeds this range, routes cannot be introduced.</p>

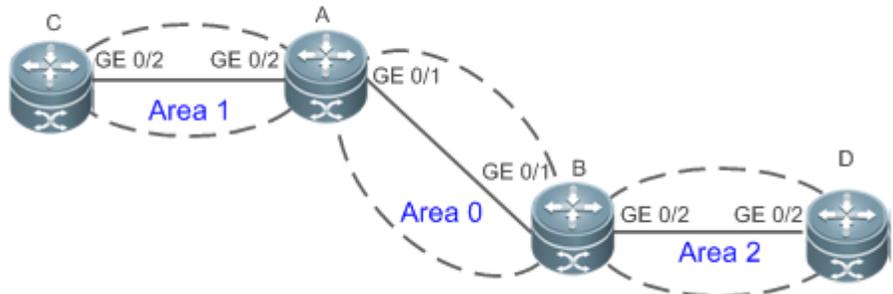

## Configuration Example

 The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

### [Configuring Static Route Redistribution](#)

<p><b>Scenario</b> Figure 4-10</p>	<p><b>Remarks</b></p> <p>The interface IP addresses are as follows:</p> <p>A: GE 0/1 192.168.1.1    GE 0/2 192.168.2.1          B: GE 0/1 192.168.1.2    GE 0/2 192.168.3.1          C: GE 0/2 192.168.2.2          D: GE 0/1 192.168.6.2    GE 0/2 192.168.3.2</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Introduce an external static route to Router D.</li> </ul>
<p><b>D</b></p>	<pre>D# configure terminal D(config)# ip route 172.10.10.0 255.255.255.0 192.168.6.3 D(config)#router ospf 1 D(config-router)# redistribute staticsubnets</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router D, run the <b>show ip ospf database external brief</b> command to verify that an LSA corresponding to an external route is generated.</li> <li>● On Router C, run the <b>show ip route ospf</b> command to verify that the external static route has been introduced.</li> </ul>
<p><b>D</b></p>	<pre>D# show ip ospf database external brief           OSPF Router with ID (192.168.22.30) (Process ID 1)           AS External Link States  Link ID      ADV Router    Age  Seq#       CkSum  Route          Tag ----- 172.10.10.0  192.168.22.30  11  0x80000001  0xa4bb E2 172.10.10.0/24  0</pre>
<p><b>C</b></p>	<pre>C# show ip route ospf 0 E2 172.10.10.0/24 [110/20] via 192.168.2.1, 00:18:03, GigabitEthernet 0/2</pre>

➤ **Configuring the Default Route**

<p><b>Scenario</b> Figure 4-11</p>	 <p><b>Remarks</b></p> <p>The interface IP addresses are as follows:          A: GE 0/1 192.168.1.1    GE 0/2 192.168.2.1          B: GE 0/1 192.168.1.2    GE 0/2 192.168.3.1          C: GE 0/2 192.168.2.2          D: GE 0/2 192.168.3.2</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the default route on Router D.</li> </ul>
<p><b>D</b></p>	<pre>D# configure terminal D(config)#router ospf 1 D(config-router)#default-information originate always</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router D, run the <b>show ip ospf database external brief</b> command to verify that an LSA corresponding to the default route is generated.</li> <li>● On Router C, run the <b>show ip route ospf</b> command to verify that the OSPF default route exists.</li> </ul>
<p><b>D</b></p>	<pre>D#show ip ospf database external brief        OSPF Router with ID (192.168.22.30) (Process ID 1)        AS External Link States  Link ID      ADV Router   Age  Seq#       CkSum  Route          Tag ----- 0.0.0.0      192.168.22.30 565  0x80000002 0xa190 E2 0.0.0.0/0      1</pre>
<p><b>C</b></p>	<pre>C# show ip route ospf  0 E20.0.0.0/0 [110/20] via 192.168.2.1, 00:18:03, GigabitEthernet 0/2</pre>

**Common Errors**

- The subnet route is not introduced because the **subnets** parameter in the **redistribute** command is not configured.
- A routing loop is formed because the **default-information originate always** command is configured on multiple routers.
- Routes cannot be introduced because route redistribution is configured on a router in the stub area.

#### 4.4.4 Configuring Stub Area and NSSA Area

##### Configuration Effect

- Configure an area located on the stub as a stub area to reduce interaction of routing information and the size of routing table, and enhance stability of routes.

##### Notes

- The OSPF basic functions must be configured.
- A backbone or transit area cannot be configured as a stub or an NSSA area.
- A router in the stub area cannot introduce external routes, but a router in the NSSA area can introduce external routes.

##### Configuration Steps

###### ↘ Configuring a Stub Area

- (Optional) This configuration is required if you wish to reduce the size of the routing table on routers in the area.
- The area must be configured as a stub area on all routers in this area.

###### ↘ Configuring an NSSA Area

- (Optional) This configuration is required if you wish to reduce the size of the routing table on routers in the area and introduce OSPF external routes to the area.
- The area must be configured as an NSSA area on all routers in this area.

##### Verification

###### ↘ Verifying the Stub Area

- On a router in the stub area, run the **show ip route** command to verify that the router is not loaded with any external routes.

###### ↘ Verifying the NSSA Area

- On a router in the NSSA area, run the **show ip ospf database** command to verify that the introduced external route generates Type 7 LSAs.
- On a router in the backbone area, run the **show ip route** command to verify that the router is loaded with external routes introduced from the NSSA area.

##### Related Commands

↳ **Configuring a Stub Area**

<b>Command</b>	<b>area <i>area-id</i> stub [ no-summary ]</b>
<b>Parameter</b>	<i>area-id</i> : Indicates the ID of the stub area.
<b>Description</b>	<b>no-summary</b> : Prohibits the ABR from sending network summary LSAs. At this time, the stub can be called totally stub area. This parameter is configured only when the router is an ABR.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>You must run the <b>area stub</b> command on all routers in the OSPF stub area. The ABR sends only three types of LSAs to the stub area: (1) Type 1: Router LSA; (2) Type 2: Network LSA; (3) Type 3: Network Summary LSA. From the routing table point of view, a router in the stub area can learn only the internal routes of the OSPF routing domain, including the internal default route generated by an ABR. A router in the stub area cannot learn external routes of the OSPF routing domain.</p> <p>To configure a totally stub area, add the <b>no-summary</b> keyword when running the <b>area stub</b> command on the ABR. A router in the totally stub area can learn only the internal routes of the local area, including the internal default route generated by an ABR.</p> <p>You can run either the <b>area stub</b> or <b>area default-cost</b> command to configure an OSPF area as a stub area. If <b>area stub</b> is used, you must configure this command on all routers connected to the stub area. If <b>area default-cost</b> is used, run this command only on the ABR in the stub area. The <b>area default-cost</b> command defines the initial cost (metric) of the internal default route.</p>

↳ **Configuring an NSSA Area**

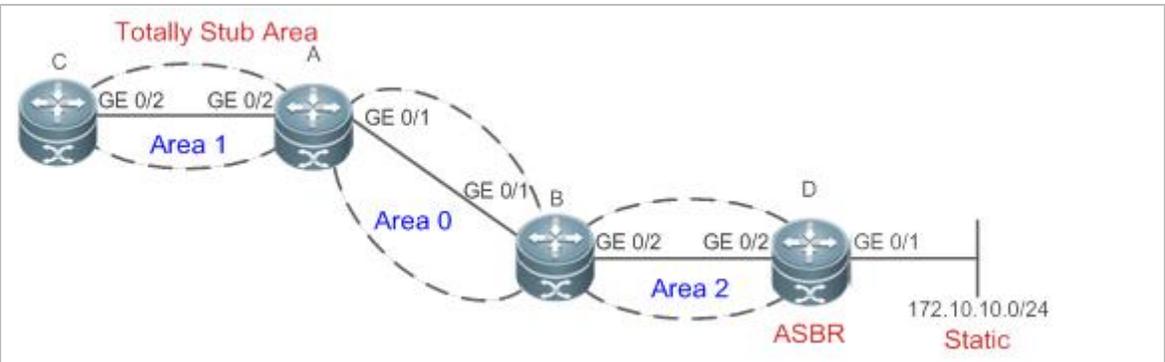

<b>Command</b>	<b>area <i>area-id</i> nssa [ no-redistribution ] [ default-information-originate [ <i>metric value</i> ] [ <i>metric-type type</i> ] ] [ no-summary ] [ translator [ <i>stability-interval seconds</i>   always ] ]</b>
<b>Parameter</b>	<i>area-id</i> : Indicates the ID of the NSSA area.
<b>Description</b>	<p><b>no-redistribution</b>: Select this option if the router is an NSSA ABR and you want to use only the <b>redistribute</b> command to introduce the routing information into a common area instead of an NSSA area.</p> <p><b>default-information-originate</b>: Indicates that a default Type 7 LSA is generated and introduced to the NSSA area. This option takes effect only on an NSSA ABR or ASBR.</p> <p><b>metric value</b>: Specifies the metric of the generated default LSA. The value ranges from 0 to 16,777,214. The default value is 1.</p> <p><b>metric-type type</b>: Specifies the route type of the generated default LSA. The values include 1 and 2. <b>1</b> represents N-1, and <b>2</b> represents N-2. The default value is 2.</p> <p><b>no-summary</b>: Prohibits the ABR in the NSSA area from sending summary LSAs (Type-3 LSA).</p> <p><b>translator</b>: Indicates that the NSSA ABR is a translator.</p> <p><b>stability-interval seconds</b>: Indicates the stability interval after the NSSA ABR is changed from a translator to a non-translator. The unit is second. The default value is 40. The value ranges from 0 to 2,147,483,647.</p> <p><b>always</b>: Indicates that the current NSSA ABR always acts as a translator. The default value is the standby translator.</p>
<b>Command</b>	OSPF routing process configuration mode

Mode	
<b>Usage Guide</b>	<p>The <b>default-information-originate</b> parameter is used to generate a default Type 7 LSA. This parameter has different functions on the ABR and the ASBR in the NSSA area. On the ABR, a Type 7 LSA default route is generated regardless of whether the default route exists in the routing table. On the ASBR (not an ABR), a Type 7 LSA default route is generated only when the default route exists in the routing table.</p> <p>If the <b>no-redistribution</b> parameter is configured on the ASBR, other external routes introduced by OSPF through the <b>redistribute</b> command cannot be advertised to the NSSA area. This parameter is generally used when a router in the NSSA area acts both as the ASBR and the ABR. It prevents external routing information from entering the NSSA area.</p> <p>To further reduce the number of LSAs sent to the NSSA area, you can configure the <b>no-summary</b> parameter on the ABR to prevent the ABR from sending the summary LSAs (Type 3 LSA) to the NSSA area.</p> <p><b>area default-cost</b> is used on an ABR or ASBR connected to the NSSA area. This command configures the cost of the default route sent from the ABR/ASBR to the NSSA area. By default, the cost of the default route sent to the NSSA area is 1.</p> <p>If an NSSA area has two or more ABRs, the ABR with the largest router ID is elected by default as the translator for converting Type 7 LSAs into Type 5 LSAs. If the current device is always the translator ABR for converting Type 7 LSAs into Type 5 LSAs, use the <b>translator always</b> parameter.</p> <p>If the translator role of the current device is replaced by another ABR, the conversion capability is retained during the time specified by <b>stability-interval</b>. If the router does not become a translator again during <b>stability-interval</b>, LSAs that are converted from Type 7 to Type 5 will be deleted from the AS after <b>stability-interval</b> expires.</p> <p>To prevent a routing loop, LSAs that are converted from Type 7 to Type 5 will be deleted from the AS immediately after the current device loses the translator role even if <b>stability-interval</b> does not expire.</p> <p>In the same NSSA area, it is recommended that <b>translator always</b> be configured on only one ABR.</p>

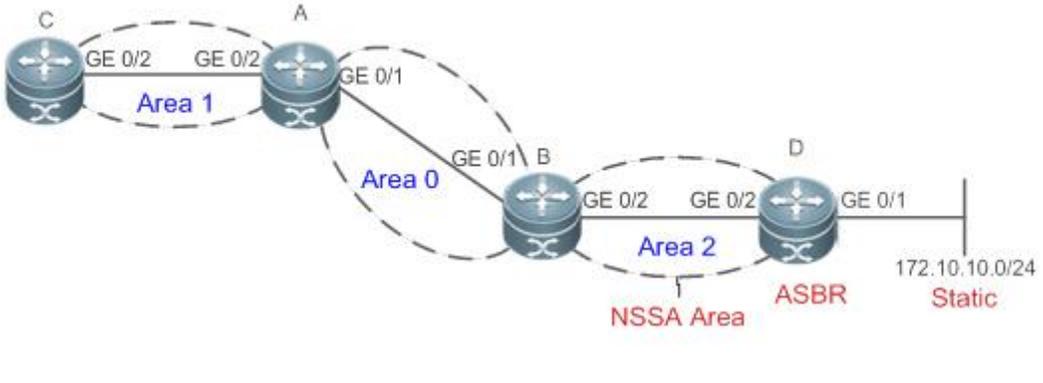

## Configuration Example

 The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

### Configuring a Stub Area

<p><b>Scenario</b> Figure 4-12</p>	 <p><b>Remarks</b> The interface IP addresses are as follows:          A: GE 0/1 192.168.1.1    GE 0/2 192.168.2.1          B: GE 0/1 192.168.1.2    GE 0/2 192.168.3.1          C: GE 0/2 192.168.2.2          D: GE 0/1 192.168.6.2    GE 0/2 192.168.3.2</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Introduce an external static route to Router D.</li> <li>● Configure area 1 as the stub area on Router A and Router C.</li> </ul>
<p><b>D</b></p>	<pre>D# configure terminal D(config)#router ospf 1 D(config-router)# redistribute staticsubnets</pre>
<p><b>A</b></p>	<pre>A# configure terminal A(config)#router ospf 1 A(config-router)#area 1 stubno-summary</pre>
<p><b>C</b></p>	<pre>C# configure terminal C(config)#router ospf 1 C(config-router)#area 1 stub</pre>
<p><b>Verification</b></p>	<p>On Router C, run the <b>show ip route ospf</b> command to display the routing table. Verify that there is only one default inter-area route, and no external static route is introduced from Router D.</p>
	<pre>C#show ip route ospf 0*IA 0.0.0.0/0 [110/2] via 192.168.2.1, 00:30:53, GigabitEthernet 0/2</pre>

➤ **Configuring an NSSA Area**

<p><b>Scenario</b> Figure 4-13</p>	 <p><b>Remarks</b></p> <p>The interface IP addresses are as follows:</p> <p>A: GE 0/1 192.168.1.1    GE 0/2 192.168.2.1          B: GE 0/1 192.168.1.2    GE 0/2 192.168.3.1          C: GE 0/2 192.168.2.2          D: GE 0/1 192.168.6.2    GE 0/2 192.168.3.2</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Introduce an external static route to Router D.</li> <li>● Configure area 2 as the NSSA area on Router B and Router D.</li> </ul>
<p><b>B</b></p>	<pre>B# configure terminal B(config)#router ospf 1 B(config-router)#area 2 nssa</pre>
<p><b>D</b></p>	<pre>D# configure terminal D(config)#ip route 172.10.10.0 255.255.255.0 192.168.6.2 D(config)#router ospf 1 D(config-router)#redistribute static subnets D(config-router)#area 2 nssa</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router D, verify that the Type 7 LSA, 172.10.10.0/24, is generated.</li> <li>● On Router B, verify that Type 5 and Type 7 LSAs coexist on 172.10.10.0/24.</li> <li>● On Router B, verify that the N-2 route of 172.10.10.0/24 is generated.</li> </ul>
<p><b>D</b></p>	<pre>D# show ip ospf database nssa-external          OSPF Router with ID (192.168.6.2) (Process ID 1)          NSSA-external Link States (Area 0.0.0.1 [NSSA])  LS age: 61</pre>

```
Options: 0x8 (-|-|-|-|N/P|-|-|-)

```

## Common Errors

- Configurations of the area type are inconsistent on routers in the same area.
- External routes cannot be introduced because route redistribution is configured on a router in the stub area.

## 4.4.5 Configuring Route Summarization

### Configuration Effect

- Summarize routes to reduce interaction of routing information and the size of routing table, and enhance stability of routes.
- Shield or filter routes.

### Notes

- The OSPF basic functions must be configured.

- The address range of summarized routes may exceed the actual network range in the routing table. If data is sent to a network beyond the summarization range, a routing loop may be formed and the router processing load may increase. To prevent these problems, a discard route must be added to the routing table or shield or filter routes.

## Configuration Steps

### ▾ Configuring Inter-Area Route Summarization

- (Optional) This configuration is required when routes of the OSPF area need to be summarized.
- Unless otherwise required, this configuration should be performed on an ABR in the area where routes to be summarized are located.

### ▾ Configuring External Route Summarization

- (Optional) This configuration is required when routes external to the OSPF domain need to be summarized.
- Unless otherwise required, this configuration should be performed on an ASBR to which routes to be summarized are introduced.

## Verification

Run the **show ip route ospf** command to verify that individual routes do not exist and only the summarized route exists.

## Related Commands

### ▾ Configuring Inter-Area Route Summarization

<b>Command</b>	<b>area</b> <i>area-id</i> range <i>ip-address net-mask</i> [ <b>advertise</b>   <b>not-advertise</b> ] [ <b>cost</b> <i>cost</i> ]
<b>Parameter Description</b>	<p><i>area-id</i>: Specifies the ID of the OSPF area to which the summarized route should be injected. The area ID can be a decimal integer or an IP address.</p> <p><i>ip-address net-mask</i>: Defines the network segment of the summarized route.</p> <p><b>advertise</b>   <b>not-advertise</b>: Specifies whether the summarized route should be advertised.</p> <p><b>cost</b> <i>cost</i>: Indicates the metric of the summarized route. The value ranges from 0 to 16777215.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>This command can be executed only on the ABR. It is used to combine or summarize multiple routes of an area into one route, and advertise the route to other areas. Combination of the routing information occurs only on the boundary of an area. Routers inside the area can learn specific routing information, whereas routers in other areas can learn only one summarized route. In addition, you can set <b>advertise</b> or <b>not-advertise</b> to determine whether to advertise the summarized route to shield and filter routes. By default, the summarized route is advertised. You can use the <b>cost</b> parameter to set the metric of the summarized route.</p> <p>You can configure route summarization commands for multiple areas. This simplifies routes in the entire OSPF routing domain, and improve the network forwarding performance, especially for a large-sized network.</p> <p>When multiple route summarization commands are configured and have the inclusive relationship with each</p>

	other, the area range to be summarized is determined based on the maximum match principle.
--	--

↘ **Configuring External Route Summarization**

<b>Command</b>	<b>summary-address</b> <i>ip-address net-mask</i> [ <b>not-advertise</b>   <b>tag value</b> ]
<b>Parameter Description</b>	<p><i>ip-address</i>: Indicates the IP address of the summarized route.</p> <p><i>net-mask</i>: Indicates the subnet mask of the summarized route.</p> <p><b>not-advertise</b>: Indicates that the summarized route is not advertised. If this parameter is not specified, the summarized route is advertised.</p> <p><b>tag value</b>: Indicates the tag of the summarized route. The value ranges from 0 to 4,294,967,295.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>When routes are redistributed from other routing processes and injected to the OSPF routing process, each route is advertised to the OSPF routers using an external LSA. If the injected routes are a continuous address space, the ABR can advertised only one summarized route to significantly reduce the size of the routing table.</p> <p><b>area range</b> summarizes the routes between OSPF routes, whereas <b>summary-address</b> summarizes external routes of the OSPF routing domain.</p> <p>When configured on the NSSA ABR translator, <b>summary-address</b> summarizes redistributed routes and routes obtained based on the LSAs that are converted from Type 7 to Type 5. When configured on the ASBR (not an NSSA ABR translator), <b>summary-address</b> summarizes only redistributed routes.</p>

↘ **Configuring a Discard Route**

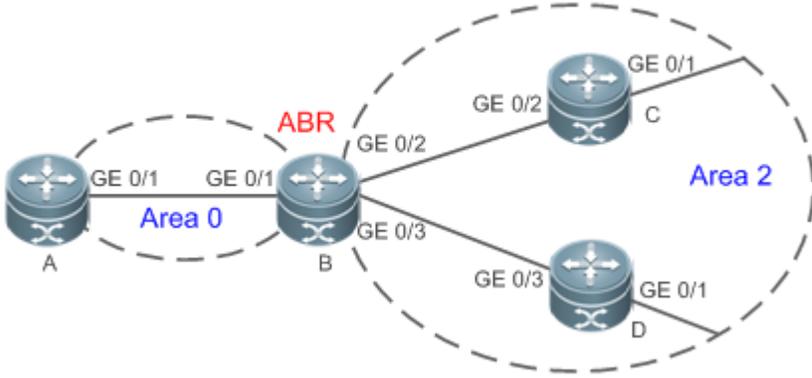

<b>Command</b>	<b>discard-route</b> { <b>internal</b>   <b>external</b> }
<b>Parameter Description</b>	<p><b>internal</b>: Indicates that the discard route generated by the <b>area range</b> command can be added.</p> <p><b>external</b>: Indicates that the discard route generated by the <b>summary-address</b> command can be added.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The address range of summarized routes may exceed the actual network range in the routing table. If data is sent to a network beyond the summarization range, a routing loop may be formed and the router processing load may increase. To prevent these problems, a discard route must be added to the routing table on the ABR or ASBR. This route is automatically generated, and is not advertised.</p>

**Configuration Example**

---

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

---

<p><b>Scenario</b> Figure 4-14</p>	 <p><b>Remarks</b> The interface IP addresses are as follows:                  A: GE0/1 192.168.1.1                  B: GE0/1 192.168.1.2 GE0/2 172.16.2.1 GE0/3 172.16.3.1                  C: GE0/2 172.16.2.2 GE0/1 172.16.4.2                  D: GE0/2 172.16.3.2 GE0/1 172.16.5.2</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Summarize routes of area 2 on Router B.</li> </ul>
<p><b>B</b></p>	<pre>B# configure terminal B(config)#router ospf 1 B(config-router)#area 2 range 172.16.0.0 255.255.0.0</pre>
<p><b>Verification</b></p>	<p>On Router A, verify that the entry 172.16.0.0/16 is added to the routing table.</p>
<p><b>A</b></p>	<pre>A#show ip route ospf 0 IA 172.16.0.0/16 [110/2] via 192.168.1.2, 00:01:04, GigabitEthernet 0/1</pre>

**Common Errors**

- Inter-area route summarization cannot be implemented because the **area range** command is configured on a non-ABR device.

**4.4.6 Configuring Route Filtering**

**Configuration Effect**

- Routes that do not meet filtering conditions cannot be loaded to the routing table, or advertised to neighbors. Network users cannot access specified destination network.

**Notes**

- The OSPF basic functions must be configured.

- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the **area filter-list** or **area range** (containing the **not-advertise** parameter) command on the ABR to prevent generation of black-hole routes.

## Configuration Steps

### ▾ Configuring Inter-Area Route Filtering

- (Optional) This configuration is recommended if users should be restricted from accessing the network in a certain OSPF area.
- Unless otherwise required, this configuration should be performed on an ABR in the area where filtered routes are located.

### ▾ Configuring Redistributed Route Filtering

- (Optional) This configuration is required if external routes introduced by the ASBR need to be filtered.
- Unless otherwise required, this configuration should be performed on an ASBR to which filtered routes are introduced.

### ▾ Configuring Learned Route Filtering

- (Optional) This configuration is required if users should be restricted from accessing a specified destination network.
- Unless otherwise required, this configuration should be performed on a router that requires route filtering.

## Verification

- Run the **show ip route** command to verify that the router is not loaded with routes that have been filtered out.
- Run the **ping** command to verify that the specified destination network cannot be accessed.

## Related Commands

### ▾ Configuring a Passive Interface

<b>Command</b>	<b>passive-interface</b> { <b>default</b>   <i>interface-type interface-number</i>   <i>interface-type interface-number ip-address</i> }
<b>Parameter</b>	<i>interface-type interface-number</i> : Indicates the interface that should be configured as a passive interface.
<b>Description</b>	<b>default</b> : Indicates that all interface will be configured as passive interfaces. <i>interface-type interface-number ip-address</i> : Specifies an address of the interface as the passive address.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	To prevent other routers on the network from learning the routing information of the local router, you can configure a specified network interface of the local router as the passive interface, or a specified IP address of a network interface as the passive address.

### ▾ Configuring the LSA Update Packet Filtering

<b>Command</b>	<b>ip ospf database-filter all out</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Enable this function on an interface to prevent sending the LSA update packet on this interface. After this function is enabled, the local router does not advertise the LSA update packet to neighbors, but still sets up the adjacency with neighbors and receives LSAs from neighbors.

### ↘ Configuring Inter-Area Route Filtering

<b>Command</b>	<b>area <i>area-id</i> filter-list {<i>access-acl-name</i>   prefix <i>prefix-name</i>} {in   out}</b>
<b>Parameter</b>	<i>area-id</i> : Indicates the area ID.
<b>Description</b>	<b>access <i>acl-name</i></b> : Indicates the associated ACL. <b>prefix <i>prefix-name</i></b> : Indicates the associated prefix list. <b>in   out</b> : Filters routes that are received by or sent from the area.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	This command can be configured only on an ABR. Use this command when it is required to configure filtering conditions for inter-area routes on the ABR.

### ↘ Configuring Redistributed Route Filtering

<b>Command</b>	<b>distribute-list { [ <i>access-list-number</i>   <i>name</i> ]   prefix <i>prefix-list-name</i> } out [bgp   connected   isis [<i>area-tag</i>]   ospf <i>process-id</i>   rip   arp-host   static]</b>
<b>Parameter</b>	<i>access-list-number</i>   <i>name</i> : Uses the ACL for filtering.
<b>Description</b>	<b>prefix <i>prefix-list-name</i></b> : Uses the prefixlist for filtering. <b>bgp   connected   isis [ <i>area-tag</i> ]   ospf <i>process-id</i>   rip   arp-host   static</b> : Indicates the source of routes to be filtered.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<b>distribute-list out</b> is similar to <b>redistribute route-map</b> , and is used to filter routes that are redistributed from other protocols to OSPF. The <b>distribute-list out</b> command itself does not redistribute routes, and is generally used together with the <b>redistribute</b> command. The ACL and the prefixlist filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes coming from a certain source, the prefixlist cannot be configured to filter the same routes.

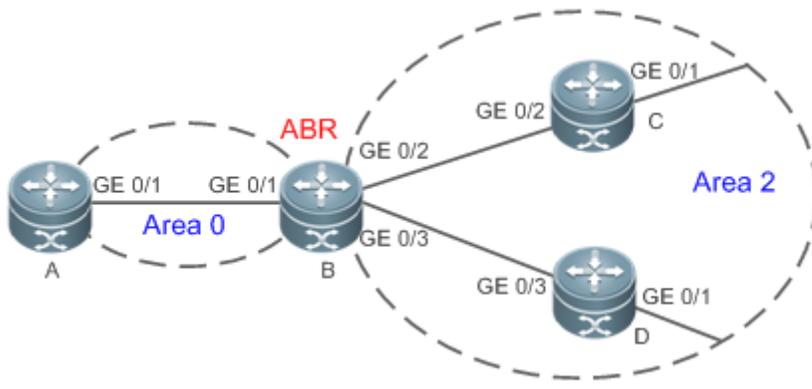

### ↘ Configuring Learned Route Filtering

<b>Command</b>	<b>distribute-list {[<i>access-list-number</i>   <i>name</i>]   prefix <i>prefix-list-name</i> [<i>gateway prefix-list-name</i>]   route-map <i>route-map-name</i> } in [<i>interface-type</i> <i>interface-number</i>]</b>
<b>Parameter</b>	<i>access-list-number</i>   <i>name</i> : Uses the ACL for filtering.
<b>Description</b>	<b>gateway <i>prefix-list-name</i></b> : Uses the gateway for filtering. <b>prefix <i>prefix-list-name</i></b> : Uses the prefixlist for filtering.

	<p><b>route-map</b> <i>route-map-name</i>: Uses the route map for filtering.</p> <p><i>interface-type interface-number</i>: Specifies the interface for which LSA routes are filtered.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	Filter routes that are computed based on received LSAs. Only routes meeting the filtering conditions can be forwarded. The command does not affect the LSDB or the routing tables of neighbors. The ACL, prefix list, and route map filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes of a specified interface, the prefix list or router map cannot be configured for filtering routes of the same interface.

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

<p><b>Scenario</b> Figure 4-15</p>	 <table border="1" data-bbox="341 1165 1469 1375"> <tr> <td><b>Remarks</b></td> <td>The interface IP addresses are as follows: A: GE0/1 192.168.1.1 B: GE0/1 192.168.1.2 GE0/2 172.16.2.1 GE0/3 172.16.3.1 C: GE0/2 172.16.2.2 GE0/3 172.16.4.2 D: GE0/2 172.16.3.2 GE0/3 172.16.5.2</td> </tr> </table>	<b>Remarks</b>	The interface IP addresses are as follows: A: GE0/1 192.168.1.1 B: GE0/1 192.168.1.2 GE0/2 172.16.2.1 GE0/3 172.16.3.1 C: GE0/2 172.16.2.2 GE0/3 172.16.4.2 D: GE0/2 172.16.3.2 GE0/3 172.16.5.2
<b>Remarks</b>	The interface IP addresses are as follows: A: GE0/1 192.168.1.1 B: GE0/1 192.168.1.2 GE0/2 172.16.2.1 GE0/3 172.16.3.1 C: GE0/2 172.16.2.2 GE0/3 172.16.4.2 D: GE0/2 172.16.3.2 GE0/3 172.16.5.2		
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>Configure the interface IP addresses on all routers. (Omitted)</li> <li>Configure the OSPF basic functions on all routers. (Omitted)</li> <li>On Router A, configure route filtering.</li> </ul>		
<p><b>A</b></p>	<pre>A# configure terminal A(config)#access-list 3 permit host 172.16.5.0 A(config)#router ospf 1 A(config-router)#distribute-list 3 in GigabitEthernet 0/1</pre>		
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>On Router A, check the routing table. Verify that only the entry 172.16.5.0/24 is loaded.</li> </ul>		
<p><b>A</b></p>	<pre>A# show ip route ospf</pre>		

```
0 172.16.5.0/24 [110/2] via 192.168.1.2, 10:39:40, GigabitEthernet 0/1
```

## Common Errors

- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated.

## 4.4.7 Modifying Route Cost and AD

### Configuration Effect

- Change the OSPF routes to enable the traffic pass through specified nodes or avoid passing through specified nodes.
- Change the sequence that a router selects routes so as to change the priorities of OSPF routes.

### Notes

- The OSPF basic functions must be configured.
- If you run the **ip ospf cost** command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

### Configuration Steps

#### ▾ Configuring the Reference Bandwidth

- Optional.
- A router is connected with lines with different bandwidths. This configuration is recommended if you wish to preferentially select the line with a larger bandwidth.

#### ▾ Configuring the Cost of an Interface

- Optional.
- A router is connected with multiple lines. This configuration is recommended if you wish to manually specify a preferential line.

#### ▾ Configuring the Default Metric for Redistribution

- Optional.
- This configuration is mandatory if the cost of external routes of the OSPF domain should be specified when external routes are introduced to an ASBR.

#### ▾ Configuring the Maximum Metric

- Optional.

- A router may be unstable during the restart process or a period of time after the router is restarted, and users do not want to forward data through this router. In this case, this configuration is recommended.

### ↘ Configuring the AD

- Optional.
- This configuration is mandatory if you wish to change the priorities of OSPF routes on a router that runs multiple unicast routing protocols.

### Verification

- Run the **show ip ospf interface** command to verify that the costs of interfaces are correct.
- Run the **show ip route** command to verify that the costs of external routes introduced to the ASBR are correct.
- Restart the router. Within a specified period of time, data is not forwarded through the restarted router.

### Related Commands

#### ↘ Configuring the Reference Bandwidth

<b>Command</b>	<b>auto-costreference-bandwidth</b> <i>ref-bw</i>
<b>Parameter Description</b>	<i>ref-bw</i> : Indicates the reference bandwidth. The unit is Mbps. The value ranges from 1 to 4,294,967.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>By default, the cost of an OSPF interface is equal to the reference value of the auto cost divided by the interface bandwidth.</p> <p>Run the <b>auto-cost</b> command to obtain the reference value of the auto cost. The default value is 100 Mbps.</p> <p>Run the <b>bandwidth</b> command to set the interface bandwidth.</p> <p>The costs of OSPF interfaces on several typical lines are as follows:</p> <p>64Kbps serial line: The cost is 1562.</p> <p>E1 line: The cost is 48.</p> <p>10M Ethernet: The cost is 10.</p> <p>100M Ethernet: The cost is 1.</p> <p>If you run the <b>ip ospf cost</b> command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.</p>

#### ↘ Configuring the Cost of an Interface

<b>Command</b>	<b>ip ospf cost</b> <i>cost</i>
<b>Parameter Description</b>	<i>cost</i> : Indicates the cost of an OSPF interface. The value ranges from 0 to 65,535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, the cost of an OSPF interface is equal to the reference value of the auto cost divided by the

	<p>interface bandwidth.</p> <p>Run the <b>auto-cost</b> command to obtain the reference value of the auto cost. The default value is 100 Mbps.</p> <p>Run the <b>bandwidth</b> command to set the interface bandwidth.</p> <p>The costs of OSPF interfaces on several typical lines are as follows:</p> <p>64Kbps serial line: The cost is 1562.</p> <p>E1 line: The cost is 48.</p> <p>10M Ethernet: The cost is 10.</p> <p>100M Ethernet: The cost is 1.</p> <p>If you run the <b>ip ospf cost</b> command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.</p>
--	--

↘ **Configuring the Cost of the Default Route in a Stub or an NSSA Area**

<b>Command</b>	<b>area</b> <i>area-id</i> <b>default-cost</b> <i>cost</i>
<b>Parameter Description</b>	<i>area-id</i> : Indicates the ID of the stub or NSSA area. <i>cost</i> : Indicates the cost of the default summarized route injected to the stub or NSSA area. The value ranges from 0 to 16,777,215.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	This command takes effect only on an ABR in a stub area or an ABR/ASBR in an NSSA area. An ABR in a stub area or an ABR/ASBR in an NSSA area is allowed to advertise an LSA indicating the default route in the stub or NSSA area. You can run the <b>area default-cost</b> command to modify the cost of the advertised LSA.

↘ **Configuring the Default Metric for Redistribution**

<b>Command</b>	<b>default-metric</b> <i>metric</i>
<b>Parameter Description</b>	<i>metric</i> : Indicates the default metric of the OSPF redistributed route. The value ranges from 1 to 16,777,214.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	The <b>default-metric</b> command must be used together with the <b>redistribute</b> command to modify the initial metrics of all redistributed routes. The <b>default-metric</b> command does not take effect on external routes that are injected to the OSPF routing domain by the <b>default-information originate</b> command.

↘ **Configuring the Maximum Metric**

<b>Command</b>	<b>max-metric</b> <b>router-lsa</b> [ <b>external-lsa</b> [ <i>max-metric-value</i> ]] [ <b>include-stub</b> ] [ <b>on-startup</b> [ <i>seconds</i> ]] [ <b>summary-lsa</b> [ <i>max-metric-value</i> ]]
<b>Parameter Description</b>	<b>router-lsa</b> : Sets the metrics of non-stub links in the Router LSA to the maximum value (0xFFFF). <b>external-lsa</b> : Allows a router to replace the metrics of external LSAs (including Type 5 and Type 7 LSAs) with the maximum metric. <i>max-metric-value</i> : Indicates the maximum metric of the LSA. The default value is 16711680. The value

	<p>ranges from 1 to 16,777,215.</p> <p><b>include-stub:</b> Sets the metrics of stub links in the Router LSA advertised by the router to the maximum value.</p> <p><b>on-startup:</b> Allows a router to advertise the maximum metric when started.</p> <p><i>seconds:</i> Indicates the interval at which the maximum metric is advertised. The default value is 600s. The value ranges from 5 to 86,400.</p> <p><b>summary-lsa:</b> Allows a router to replace the metrics of summary LSAs (including Type 3 and Type 4 LSAs) with the maximum metric.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>After the <b>max-metric router-lsa</b> command is executed, the metrics of the non-stub links in the Router LSAs generated by the router will be set to the maximum value (0xFFFF). If you cancel this configuration or the timer expires, the normal metrics of the links are restored.</p> <p>By default, if the <b>max-metric router-lsa</b> command is executed, the stub links still advertise common metrics, that is, the costs of outbound interfaces. If the <b>include-stub</b> parameter is configured, the stub links will advertise the maximum metric.</p> <p>If an ABR does not wish to transfer inter-area traffic, use the <b>summary-lsa</b> parameter to set the metric of the Summary LSA to the maximum metric.</p> <p>If an ASBR does not wish to transfer external traffic, use the <b>external-lsa</b> parameter to set the metric of the external LSA to the maximum metric.</p> <p>The <b>max-metric router-lsa</b> command is generally used in the following scenarios:</p> <p>Restart a device. After the device is restarted, IGP generally converges faster, and other devices attempt to forward traffic through the restarted device. If the current device is still building the BGP routing table and some BGP routes are not learned yet, packets sent these networks will be discarded. In this case, you can use the <b>on-startup</b> parameter to set a delay after which the restarted device acts as the transmission mode.</p> <ul style="list-style-type: none"> <li>● Add a device to the network but the device is not used to transfer traffic. The device is added to the network. If a candidate path exists, the current device is not used to transfer traffic. If a candidate path does not exist, the current device is still used to transfer traffic.</li> <li>● Delete a device gracefully from the network. After the <b>max-metric router-lsa</b> command is executed, the current device advertises the maximum metric among all metrics of routes. In this way, other devices on the network can select the standby path for data transmission before the device is shut down.</li> </ul> <p>In the earlier OSPF version (RFC1247 or earlier), the links with the maximum metric (0xFFFF) in the LSAs do not participate in the SPF computation, that is, no traffic is sent to routers that generate these LSAs.</p>

↘ **Configuring RFC1583Compatibility**

<b>Command</b>	<b>compatible rfc1583</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	OSPF routing process configuration mode

<b>Usage Guide</b>	When there are multiple paths to an ASBR or the forwarding address of an external route, RFC1583 and RFC2328 define different routing rules. If RFC1583 compatibility is configured, a path in the backbone area or an inter-area path is preferentially selected. If RFC1583 compatibility is not configured, a path in a non-backbone area is preferentially selected.
--------------------	--

↘ **Configuring the AD**

<b>Command</b>	<code>distance { distance [ route-map map-name ]   ospf { intra-area distance [ route-map map-name ]   inter-area distance [ route-map map-name ]   external distance [ route-map map-name ] } }</code>
<b>Parameter Description</b>	<p><i>distance</i>: Indicates the AD of a route. The value ranges from 1 to 255.</p> <p><b>intra-area distance</b>: Indicates the AD of an intra-area route. The value ranges from 1 to 255.</p> <p><b>inter-area distance</b>: Indicates the AD of an inter-area route. The value ranges from 1 to 255.</p> <p><b>external distance</b>: Indicates the AD of an external route. The value ranges from 1 to 255.</p> <p>route-map map-name: Indicates the AD of a specified route by policy.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>Use this command to specify different ADs for different types of OSPF routes.</p> <p>Configure the <b>route-map</b> parameter to set the AD for a specified route by policy. If <b>route-map</b> has configured <b>set distance</b>,</p> <p>through matched route: AD is set by <b>set distance</b></p> <p>through unmatched route: AD is set by the <b>distance</b> command</p>

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

↘ **Configuring the Cost of an Interface**

<p><b>Scenario</b> Figure 4-16</p>	
<b>Remarks</b>	<p>The interface IP addresses are as follows:</p> <p>A: GE0/1 192.168.1.1    GE0/2 192.168.2.1</p> <p>B: GE0/1 192.168.1.2    GE0/2 192.168.3.2</p> <p>C: GE0/1 192.168.4.2    GE0/2 192.168.2.2</p>

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, configure the cost of each interface.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip ospf cost 10 A(config)# interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)# ip ospf cost 20</pre>
<b>Verification</b>	On Router A, check the routing table. The next hop of the optimum path to 172.16.1.0/24 is Router B.
<b>A</b>	<pre>A# show ip route ospf 0 E2172.16.1.0/0 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1</pre>

### Common Errors

- If the cost of an interface is set to 0 in the **ip ospf cost** command, a route computation error may occur. For example, a routing loop is obtained.

## 4.4.8 Enabling Authentication

### Configuration Effect

- All routers connected to the OSPF network must be authenticated to ensure stability of OSPF and protect OSPF against intrusions.

### Notes

- The OSPF basic functions must be configured.
- If authentication is configured for an area, the configuration takes effect on all interfaces that belong to this area.
- If authentication is configured for both an interface and the area to which the interface belongs, the configuration for the interface takes effect preferentially.

### Configuration Steps

#### ↘ Configuring the Authentication Type of an Area

- (Optional) This configuration is recommended if the same authentication type should be used on all interfaces in the same area.
- This configuration is required if a router accesses a network that requires authentication.

#### ↘ Configuring the Authentication Type of an Interface

- (Optional) This configuration is recommended if the different authentication types should be used on different interfaces in the same area.
- This configuration is required if a router accesses a network that requires authentication.

↘ **Configuring a Plain Text Authentication Key for an Interface**

- Optional.
- This configuration is required if a router accesses a network that requires plain text authentication.

↘ **Configuring an MD5 Authentication Key for an Interface**

- (Optional) MD5 authentication features a high security, and therefore is recommended. You must configure either plain text authentication or MD5 authentication.
- This configuration is required if a router accesses a network that requires MD5 authentication.

**Verification**

- If routers are configured with different authentication keys, run the **show ip ospf neighbor** command to verify that there is no OSPF neighbor.
- If routers are configured with the same authentication key, run the **show ip ospf neighbor** command to verify that there are OSPF neighbors.

**Related Commands**

↘ **Configuring the Authentication Type of an Area**

<b>Command</b>	<b>area <i>area-id</i> authentication [message-digest]</b>
<b>Parameter Description</b>	<i>area-id</i> : Indicates the ID of the area where OSPF authentication is enabled. The area ID can be a decimal integer or an IP address. <b>message-digest</b> : Enables MD5 authentication.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	The RGOS supports three authentication types: (1) Type 0: No authentication is required. If this command is not configured to enable OSPF authentication, the authentication type in the OSPF data packet is 0. (2) Type 1: The authentication type is plain text authentication if this command is configured but does not contain the <b>message-digest</b> parameter. (3) Type 3: The authentication type is MD5 authentication if this command is configured and contains the <b>message-digest</b> parameter. All routers in the same OSPF area must use the same authentication type. If authentication is enabled, the authentication key must be configured on interfaces that are connected to neighbors. You can run the interface configuration command <b>ip ospf authentication-key</b> to configure the plain text authentication key, or <b>ip ospf message-digest-key</b> to configure the MD5 authentication key.

↘ **Configuring the Authentication Type of an Interface**

<b>Command</b>	<b>ip ospfauthentication [ message-digest   null ]</b>
<b>Parameter</b>	<b>message-digest:</b> Indicates that MD5 authentication is enabled on the current interface.
<b>Description</b>	<b>null:</b> Indicates that authentication is disabled.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If the <b>ip ospfauthentication</b> command does not contain any option, it indicates that plain text authentication is enabled. If you use the <b>no</b> form of the command to restore the default authentication mode, whether authentication is enabled is determined by the authentication type that is configured in the area to which the interface belongs. If the authentication type is set to null, authentication is disabled forcibly. When authentication is configured for both an interface and the area to which the interface belongs, the authentication type configured for the interface is used preferentially.

### 📌 Configuring a Plain Text Authentication Key for an Interface

<b>Command</b>	<b>ip ospf authentication-key[0  7 ]key</b>
<b>Parameter</b>	<b>0:</b> Indicates that the key is displayed in plain text.
<b>Description</b>	<b>7:</b> Indicates that the key is displayed in cipher text. <i>key:</i> Indicates the key. The key is a string of up to eight characters.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The key configured by the <b>ip ospf authentication-key</b> command will be inserted to the headers of all OSPF packets. If the keys are inconsistent, two directly connected devices cannot set up the OSPF adjacency and therefore cannot exchange the routing information.  Different keys can be configured for different interface, but all routers connected to the same physical network segment must be configured with the same key.  You can enable or disable authentication in an OSPF area by running the <b>areaauthentication</b> command in OSPF routing process configuration mode.  You can also enable authentication on an individual interface by running the <b>ip ospf authentication</b> command in interface configuration mode. When authentication is configured for both an interface and the area to which the interface belongs, the authentication type configured for the interface is used preferentially.

### 📌 Configuring an MD5 Authentication Key for an Interface

<b>Command</b>	<b>ip ospf message-digest-key <i>key-id</i> md5[0  7 ]key</b>
<b>Parameter</b>	<i>key-id:</i> Indicates the key ID. The value ranges from 1 to 255.
<b>Description</b>	<b>0:</b> Indicates that the key is displayed in plain text. <b>7:</b> Indicates that the key is displayed in cipher text. <i>key:</i> Indicates the key. The key is a string of up to 16 characters.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The key configured by the <b>ip ospf message-digest-key</b> command will be inserted to the headers of all OSPF packets. If the keys are inconsistent, two directly connected devices cannot set up the OSPF adjacency and therefore cannot exchange the routing information.

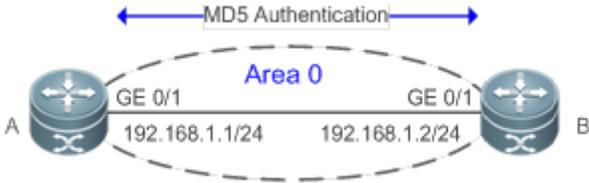

Different keys can be configured for different interface, but all routers connected to the same physical network segment must be configured with the same key. The same key ID on neighbor routers must correspond to the same key.

You can enable or disable authentication in an OSPF area by running the **area authentication** command in OSPF routing process configuration mode. You can also enable authentication on an individual interface by running the **ip ospf authentication** command in interface configuration mode. When authentication is configured for both an interface and the area to which the interface belongs, the authentication type configured for the interface is used preferentially.

The RGOS software supports smooth modification of the MD5 authentication key. A new MD5 authentication key must be first added before the old key can be deleted. When an OSPF MD5 authentication key is added to a router, the router determines that other routers do not use the new key yet and therefore uses different keys to send multiple OSPF packets until it confirms that the new key has been configured on neighbors. After configuring the new key all routers, you can delete the old key.

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

<p><b>Scenario</b> Figure 4-17</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the authentication type and MD5 authentication key on all routers.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)#router ospf 1 A(config-router)#area 0 authentication message-digest A(config-router)#exit A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ip ospf message-digest-key 1 md5 hello</pre>

<b>B</b>	<pre> B# configure terminal B(config)#router ospf 1 B(config-router)#area 0 authentication message-digest B(config-router)#exit B(config)#interface GigabitEthernet 0/3 B(config-if-GigabitEthernet 0/3)#ip ospf message-digest-key 1 md5 hello                 </pre>
<b>Verification</b>	On Router A and Router B, verify that the OSPF neighbor status is correct.
<b>A</b>	<pre> A#show ip ospf neighbor OSPF process 1, 1 Neighbors, 1 is Full: Neighbor ID    Pri   State           Dead Time   Address        Interface 192.168.1.2    1    Full/DR         00:00:32   192.168.1.2   GigabitEthernet 0/1                 </pre>
<b>B</b>	<pre> A#show ip ospf neighbor OSPF process 1, 1 Neighbors, 1 is Full: Neighbor ID    Pri   State           Dead Time   Address        Interface 192.168.1.1    1    Full/DR         00:00:32   192.168.1.1   GigabitEthernet 0/1                 </pre>

### Common Errors

- The authentication modes configured on routers are inconsistent.
- The authentication keys configured on routers are inconsistent.

## 4.4.9 Enabling Overflow

### Configuration Effect

- New routes are not loaded to routers when the router memory is insufficient.
- New routes are not loaded to routers when the usage of the database space reaches the upper limit.

### Notes

- The OSPF basic functions must be configured.
- After a router enters the overflow state, you can run the **clear ip ospf process** command, or stop and then restart the OSPF to exit the overflow state.

### Configuration Steps

#### 📌 Configuring the Memory Overflow Function

- Optional.
- This configuration is recommended if a large number of routes exist in the domain and may cause insufficiency of the router memory.

#### ↘ Configuring the Database Overflow Function

- Optional.
- This configuration is recommended if a large number of routes exist in the domain and may cause insufficiency of the router memory.

#### ↘ Configuring the External LSA Database Overflow Function

- Optional.
- This configuration is recommended if the ASBR introduces a large number of external routes and the router memory may be insufficient.

### Verification

- After the memory becomes insufficient, add new routers to the network, and run the **show ip route** command to verify that new routes are not loaded.
- After the usage of the database space reaches the upper limit, add new routers to the network, and run the **show ip route** command to verify that new routes are not loaded.

### Related Commands

#### ↘ Configuring the Memory Overflow Function

<b>Command</b>	<b>overflow memory-lack</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The OSPF process enters the overflow state to discard newly-learned external routes. This behavior can effectively ensure that the memory usage does not increase.</p> <p>After the overflow function is enabled, the OSPF process enters the overflow state and discards newly-learned external routes, which may cause a routing loop on the entire network. To reduce the occurrence probability of this problem, OSPF generates a default route to the null interface, and this route always exists in the overflow state.</p> <p>You can run the <b>clear ip ospf process</b> command to reset the OSPF process so that the OSPF process can exit the overflow state. You can use the <b>no</b> form of the command to prevent the OSPF process from entering the overflow state when the memory is insufficient. This, however, may lead to over-consumption of the memory resource, after which the OSPF process will stop and delete all the learned routes.</p>

#### ↘ Configuring the Database Overflow Function

<b>Command</b>	<b>overflow database</b> <i>number</i> [ <b>hard</b>   <b>soft</b> ]
<b>Parameter</b>	<i>number</i> : Indicates the maximum number of LSAs. The value ranges from 1 to 4,294,967,294.
<b>Description</b>	<b>hard</b> : Indicates that the OSPF process will be stopped if the number of LSAs exceeds the limit. <b>soft</b> : Indicates that a warning will be generated if the number of LSAs exceeds the limit.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	If the number of LSAs exceeds the limit, use the <b>hard</b> parameter if the OSPF process should be stopped, and use the <b>soft</b> parameter if a warning should be generated without stopping the OSPF process.

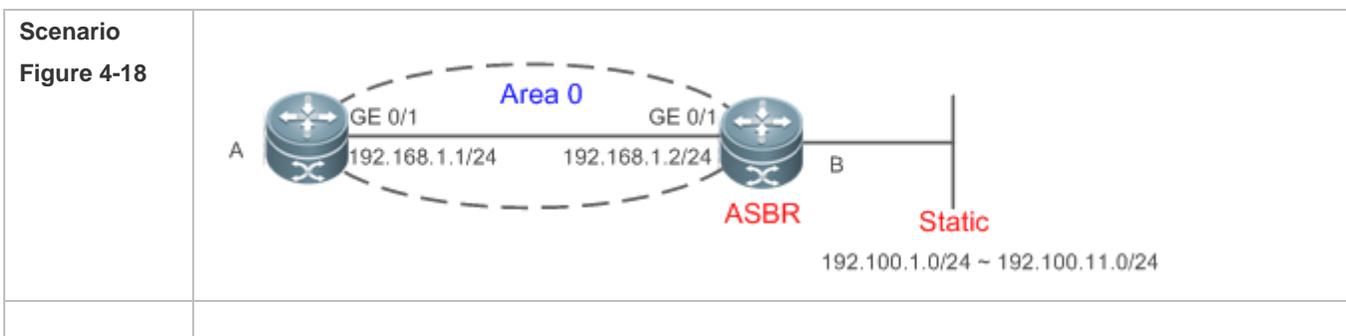

📌 **Configuring the External LSA Database Overflow Function**

<b>Command</b>	<b>overflow database external</b> <i>max-dbsize wait-time</i>
<b>Parameter</b>	<i>max-dbsize</i> : Indicates the maximum number of external LSAs. This value must be the same on all routers in the same AS. The value ranges from 0 to 2,147,483,647.
<b>Description</b>	<i>wait-time</i> : Indicates the waiting time after a router in overflow state attempts to restore the normal state. The value ranges from 0 to 2,147,483,647.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	When the number of external LSAs of a router exceeds the configured <b>max-dbsize</b> , the router enters the overflow state. In this state, the router no longer loads external LSAs and deletes external LSAs that are generated locally. After <i>wait-time</i> elapses, the device restores the normal state, and loads external LSAs again. When using the overflow function, ensure that the same <b>max-dbsize</b> is configured on all routers in the OSPF backbone area and common areas; otherwise, the following problems may occur: Inconsistent LSDBs throughout network are inconsistent, and the failure to achieve the full adjacency Incorrect routes, including routing loops Frequent retransmission of AS external LSAs

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

📌 **Configuring the External LSA Database Overflow Function**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router B, configure redistribution and introduce external static routes.</li> <li>● On Router B, configure the maximum number of external LSAs.</li> </ul>
<b>B</b>	<pre>B# configure terminal B(config)# router ospf 1 B(config-router)# redistribute static subnets</pre>
<b>A</b>	<pre>A# configure terminal A(config)# router ospf 1 A(config-router)# overflow database external 10 3</pre>
<b>Verification</b>	<p>On Router B, configure 11 static routes (192.100.1.0/24 to 192.100.11.0/24). On Router A, verify that only 10 static routes are loaded.</p>
<b>A</b>	<pre>A# show ip route ospf 0 E2 192.100.1.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.2.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.3.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.4.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.5.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.6.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.7.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.8.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.9.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.10.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1</pre>

### Common Errors

- The OSPF adjacency is abnormal because the maximum number of LSAs is inconsistent on different routers.

## 4.4.10 Modifying the Maximum Number of Concurrent Neighbors

### Configuration Effect

- Control the maximum number of concurrent neighbors on the OSPF process to ease the pressure on the device.

### Notes

- The OSPF basic functions must be configured.

## Configuration Steps

### ↘ Configuring the Maximum Number of Concurrent Neighbors on the OSPF Process

- (Optional) This configuration is recommended if you wish to set up the OSPF adjacency more quickly when a router is connected with a lot of other routers.
- This configuration is performed on a core router.

## Verification

- Run the **show ip ospf neighbor** command to display the number of neighbors that are concurrently interacting with the OSPF process.

## Related Commands

### ↘ Configuring the Maximum Number of Concurrent Neighbors on the Current Process

<b>Command</b>	<b>max-concurrent-dd</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	When the performance of a router is affected because the router exchanges data with multiple neighbors, you can configure this command to restrict the maximum of neighbors with which one OSPF process can concurrently initiate or accept interaction.

### ↘ Configuring the Maximum Number of Concurrent Neighbors on All Processes

<b>Command</b>	<b>router ospf max-concurrent-dd</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When the performance of a router is affected because the router exchanges data with multiple neighbors, you can configure this command to restrict the maximum of neighbors with which all OSPF processes can concurrently initiate or accept interaction.

## Configuration Example

- i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

### ↘ Configuring the Maximum Number of Concurrent Neighbors on the OSPF Process

<p><b>Scenario</b> Figure 4-19</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On the router Core, set the maximum number of concurrent neighbors to 4.</li> </ul>
<p><b>Core</b></p>	<pre>Core# configure terminal Core(config)# router ospf max-concurrent-dd 4</pre>
<p><b>Verification</b></p>	<p>On the router Core, check the neighbor status and verify that at most eight neighbors concurrently interact with the OSPF process.</p>

### 4.4.11 Disabling Source Address Verification

#### Configuration Effect

- The unicast routing service can be provided even if the interface IP addresses of neighbor routers are not in the same network segment.

#### Notes

- The OSPF basic functions must be configured.
- Source address verification cannot be disabled on a broadcast or NBMA network.

#### Configuration Steps

##### Disabling Source Address Verification

- (Optional) This configuration is mandatory if an adjacency should be set up between routers with interface IP addresses in different network segments.
- This configuration is performed on routers with interface IP addresses in different network segments.

## Verification

- An adjacency can be set up between routers in different network segments.

## Related Commands

### Disabling Source Address Verification

<b>Command</b>	<code>ip ospf source-check-ignore</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Generally, the source address of a packet received by OSPF is in the same network segment as the receiving interface. The addresses at both ends of a P2P link are configured separately and are not necessarily in the same network segment. In this scenario, as the peer address information will be notified during the P2P link negotiation process, OSPF checks whether the source address of the packet is the address advertised by the peer during negotiation. If not, OSPF determines that the packet is invalid and discards this packet. In particular, OSPF does not verify the address of an unnumbered interface. In some scenarios, the source address may not meet the preceding requirement, and therefore OSPF address verification fails. For example, the negotiated peer address cannot be obtained on a P2P link. In this scenario, source address verification must be disabled to ensure that the OSPF adjacency can be properly set up.

## Configuration Example

- i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

### Disabling Source Address Verification

<b>Scenario</b> Figure 4-20	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>• Configure the interface IP addresses on all routers. (Omitted)</li> <li>• Configure the OSPF basic functions on all routers. (Omitted)</li> <li>• Set the network types of interfaces on all routers to P2P.</li> <li>• Disable source address verification on all routers.</li> </ul>

<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip ospf network point-to-point A(config-if-GigabitEthernet 0/1)# ip ospf source-check-ignore</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ip ospf network point-to-point B(config-if-GigabitEthernet 0/1)# ip ospf source-check-ignore</pre>
<b>Verification</b>	On Router A, verify that the OSPF neighbor information is correct.
<b>A</b>	<pre>A# show ip ospfneighbor  OSPF process 1, 1 Neighbors, 1 is Full:  Neighbor ID      Pri   State           Dead Time   Address        Interface 192.100.2.2      1    Full/-          00:00:34   192.100.2.2   GigabitEthernet 0/1</pre>

## 4.4.12 Disabling MTU Verification

### Configuration Effect

- The unicast routing service can be provided even if the MTUs of interfaces on neighbor routers are different.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Disabling MTU Verification

- (Optional) MTU verification is disabled by default. You are advised to retain the default configuration.
- This configuration is performed on two routers with different interface MTUs.

### Verification

The adjacency can be set up between routers with different MTUs.

### Related Commands

#### ▾ Disabling MTU Verification

<b>Command</b>	<b>ip ospf mtu-ignore</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	On receiving the database description packet, OSPF checks whether the MTU of the interface on the neighbor is the same as the MTU of its own interface. If the interface MTU specified in the received database description packet is greater than the MTU of the local interface, the adjacency cannot be set up. To resolve this problem, you can disable MTU verification.

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

<b>Scenario</b> <b>Figure 4-21</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure different MTUs for interfaces on two routers.</li> <li>● Disable MTU verification on all routers. (By default, the function of disabling MTU verification is enabled.)</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip mtu 1400 A(config-if-GigabitEthernet 0/1)# ip ospf mtu-ignore</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip mtu 1600 B(config-if-GigabitEthernet 0/1)# ip ospf mtu-ignore</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router A, verify that the OSPF neighbor information is correct.</li> </ul>
<b>A</b>	<pre>A# show ip ospfneighbor  OSPF process 1, 1 Neighbors, 1 is Full:  Neighbor ID      Pri   State           Dead Time   Address        Interface 192.168.1.2      1    Full/DR         00:00:34   192.168.1.2   GigabitEthernet 0/1</pre>

### 4.4.13 Enabling Two-Way Maintenance

#### Configuration Effect

- Non-Hello packets can also be used to maintain the adjacency.

#### Notes

- The OSPF basic functions must be configured.

#### Configuration Steps

##### ▾ Enabling Two-Way Maintenance

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- This configuration is performed on all routers.

#### Verification

Non-Hello packets can also be used to maintain the adjacency.

#### Related Commands

##### ▾ Enabling Two-Way Maintenance

<b>Command</b>	<code>two-way-maintain</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	On a large network, a lot of packets may be sent or received, occupying too much CPU and memory. As a result, some packets are delayed or discarded. If the processing time of Hello packets exceeds the dead interval, the adjacency will be destroyed due to timeout. If the two-way maintenance function is enabled, in addition to the Hello packets, the DD, LSU, LSR, and LSAck packets can also be used to maintain the bidirectional communication between neighbors when a large number of packets exist on the network. This prevents termination of the adjacency caused by delayed or discarded Hello packets.

#### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

<p><b>Scenario</b> Figure 4-22</p>	

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, enable the two-way maintenance function. (This function is enabled by default.)</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)#routerospf 1 A(config-router)#two-way-maintain</pre>
<b>Verification</b>	When the adjacency is being set up, Router A checks the neighbor dead interval and updates the dead interval without waiting for Router B to send a Hello packet.
<b>A</b>	<pre>A# show ip ospfneighbor  OSPF process 1, 1 Neighbors, 1 is Full:  Neighbor ID    Pri   State           Dead Time   Address        Interface 192.168.1.2    1     Full/BDR        00:00:40   192.168.1.2   GigabitEthernet 0/1</pre>

## 4.4.14 Enabling GR

### Configuration Effect

- When a distributed router switches services from the active board to the standby board, data forwarding continues and is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and is not interrupted.

### Notes

- The OSPF basic functions must be configured.
- The neighbor router must support the GR helper function.
- The grace period cannot be shorter than the neighbor dead time of the neighbor router.

### Configuration Steps

#### ▾ Configuring the OSPF GR Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- This configuration is performed on all routers.

#### ▾ Configuring the OSPF GR Helper Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- This configuration is performed on all routers.

### Verification

- When a distributed router switches services from the active board to the standby board, data forwarding continues and is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and is not interrupted.

## Related Commands

### ▾ Configuring the OSPF GR Function

<b>Command</b>	<b>graceful-restart [ grace-period <i>grace-period</i>   inconsistent-lsa-checking ]</b>
<b>Parameter Description</b>	<p><b>grace-period</b> <i>grace-period</i>: Indicates the grace period, which is the maximum time from occurrence of an OSPF failure to completion of the OSPF GR. The value of the graceperiod varies from 1s to 1800s. The default value is 120s.</p> <p><b>inconsistent-lsa-checking</b>: Enables topological change detection. If any topological change is detected, OSPF exits the GR process to complete convergence. After GR is enabled, topological change detection is enabled by default.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The GR function is configured based on the OSPF process. You can configure different parameters for different OSPF processes based on the actual conditions. This command is used to configure the GR restarter capability of a device. The grace period is the maximum time of the entire GR process, during which link status is rebuilt so that the original state of the OSPF process is restored. After the grace period expires, OSPF exits the GR state and performs common OSPF operations.</p> <p>Run the <b>graceful-restart</b> command to set the grace period to 120s. The <b>graceful-restart grace-period</b> command allows you to modify the grace period explicitly.</p> <p>The precondition for successful execution of GR and uninterrupted forwarding is that the topology remains stable. If the topology changes, OSPF quickly converges without waiting for further execution of GR, thus avoiding long-time forwarding black-hole.</p> <p>Disabling topology detection: If OSPF cannot converge in time when the topology changes during the hot standby process, forwarding black-hole may appear in a long time.</p> <p>Enabling topology detection: Forwarding may be interrupted when topology detection is enabled, but the interruption time is far shorter than that when topology detection is disabled.</p> <p>In most cases, it is recommended that topology detection be enabled. In special scenarios, topology detection can be disabled if the topology changes after the hot standby process, but it can be ensured that the forwarding black-hole will not appear in a long time. This can minimize the forwarding interruption time during the hot standby process.</p> <p>If the Fast Hello function is enabled, the GR function cannot be enabled.</p>

### ▾ Configuring the OSPF GR Helper Function

<b>Command</b>	<b>graceful-restart helper { disable   strict-lsa-checking   internal-lsa-checking }</b>
<b>Parameter Description</b>	<p><b>disable</b>: Prohibits a device from acting as a GR helper for another device.</p> <p><b>strict-lsa-checking</b>: Indicates that changes in Type 1 to Type 5 and Type 7 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network</p>

	<p>changes, the device will stop acting as the GR helper.</p> <p><b>internal-lsa-checking:</b> Indicates that changes in Type 1 to Type 3 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>This command is used to configure the GR helper capability of a router. When a neighbor router implements GR, it sends a Grace-LSA to notify all neighbor routers. If the GR helper function is enabled on the local router, the local router becomes the GR helper on receiving the Grace-LSA, and helps the neighbor to complete GR. The <b>disable</b> option indicates that GR helper is not provided for any device that implements GR.</p> <p>After a device becomes the GR helper, the network changes are not detected by default. If any change takes place on the network, the network topology converges after GR is completed. If you wish that network changes can be quickly detected during the GR process, you can configure <b>strict-lsa-checking</b> to check Type 1 to 5 and Type 7 LSAs that indicate the network information or <b>internal-lsa-checking</b> to check Type 1 to 3 LSAs that indicate internal routes of the AS domain. When the network scale is large, it is recommended that you disable the LSA checking options (<b>strict-lsa-checking</b> and <b>internal-lsa-checking</b>) because regional network changes may trigger termination of GR and consequently reduce the convergence of the entire network.</p>

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

<p><b>Scenario</b></p> <p><b>Figure 4-23</b></p>	
<p><b>Remarks</b></p>	<p>The interface IP addresses are as follows:</p> <p>A: GE 0/1 192.168.1.1</p> <p>B: GE 0/1 192.168.1.1    GE 0/2 192.168.2.1    GE 0/3 192.168.3.1</p> <p>C: GE 0/1 192.168.4.2    GE 0/3 192.168.3.2</p> <p>D: GE 0/1 192.168.5.2    GE 0/2 192.168.2.2</p>

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, Router C, and Router D, enable the GR helper function. (This function is enabled by default.)</li> <li>● On Router B, enable the GR function.</li> </ul>
<b>B</b>	<pre>B# configure terminal B(config)# router ospf1 B(config-router)# graceful-restart</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Trigger a hot standby switchover on Router B, and verify that the routing tables of destination networks 1 and 2 remain unchanged on Router A during the switchover.</li> <li>● Trigger a hot standby switchover on Router B, ping destination network 1 from Router A, and verify that data forwarding is not interrupted during the switchover.</li> </ul>

### Common Errors

- Traffic forwarding is interrupted during the GR process because the configured grace period is shorter than the neighbor dead time of the neighbor router.

## 4.4.15 Enabling NSR

### Configuration Effect

- During the active/standby switchover of a distributed router, data forwarding continues and is not interrupted.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ↳ Enabling the OSPF NSR Function

- (Optional) This function is disabled by default and enabled only when the function needs to be used.

### Verification

- During the active/standby switchover of a distributed router, data forwarding continues and is not interrupted.

### Related Commands

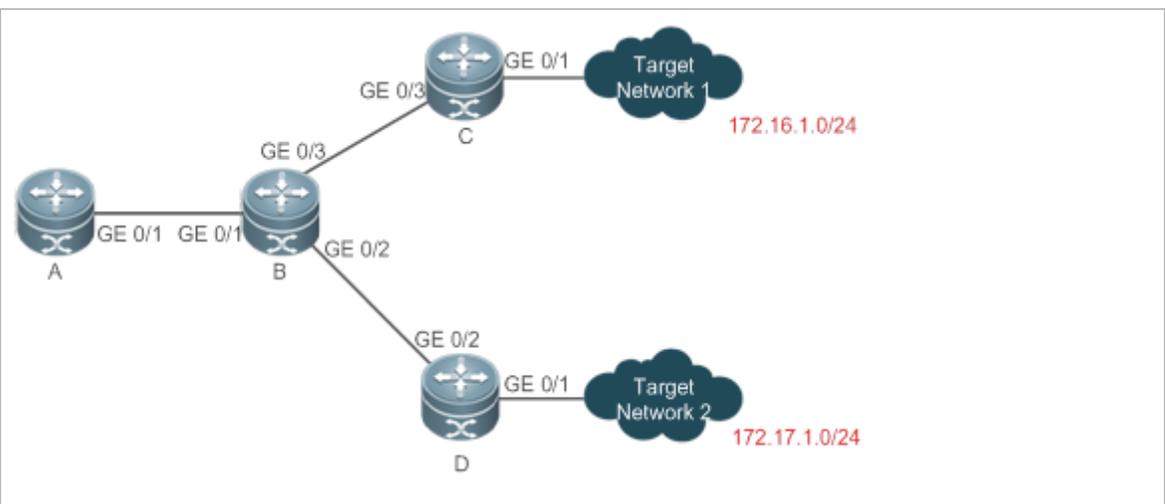

#### ↳ Enabling NSR

<b>Command</b>	nsr
<b>Parameter</b>	N/A
<b>Description</b>	

<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>This command is used to enable the NSR function. Enable either NSR or GR for the same OSPF process. That is, when GR is enabled, NSR is automatically disabled. When NSR is enabled, GR is automatically disabled, but the GR helper capability is not affected.</p> <p>The switchover of a distributed router takes some time. If the OSPF neighbor dead time is shorter than the switchover time, the OSPF adjacency will be destroyed, causing service interruption during the switchover. Therefore, when enabling the NSR function, you are advised to configure an OSPF neighbor dead time that is equal to or greater than the default value. When the Fast Hello function is enabled, the OSPF neighbor dead time is shorter than 1s, and therefore it is recommended that the NSR function be disabled.</p>

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

<p>Scenario Figure 4-24</p>	 <table border="1" data-bbox="324 1291 1489 1501"> <tr> <td><b>Remarks</b></td> <td> <p>The interface IP addresses are as follows:</p> <p>A: GE 0/1 192.168.1.1</p> <p>B: GE 0/1 192.168.1.2    GE 0/2 192.168.2.1    GE 0/3 192.168.3.1</p> <p>C: GE 0/1 192.168.4.2    GE 0/3 192.168.3.2</p> <p>D: GE 0/1 192.168.5.2    GE 0/2 192.168.2.2</p> </td> </tr> </table>	<b>Remarks</b>	<p>The interface IP addresses are as follows:</p> <p>A: GE 0/1 192.168.1.1</p> <p>B: GE 0/1 192.168.1.2    GE 0/2 192.168.2.1    GE 0/3 192.168.3.1</p> <p>C: GE 0/1 192.168.4.2    GE 0/3 192.168.3.2</p> <p>D: GE 0/1 192.168.5.2    GE 0/2 192.168.2.2</p>
<b>Remarks</b>	<p>The interface IP addresses are as follows:</p> <p>A: GE 0/1 192.168.1.1</p> <p>B: GE 0/1 192.168.1.2    GE 0/2 192.168.2.1    GE 0/3 192.168.3.1</p> <p>C: GE 0/1 192.168.4.2    GE 0/3 192.168.3.2</p> <p>D: GE 0/1 192.168.5.2    GE 0/2 192.168.2.2</p>		
<p>Configuration Steps</p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router B, enable the NSR function.</li> </ul>		
<p>B</p>	<pre>B# configure terminal B(config)# router ospf1 B(config-router)# nsr</pre>		

Verification	<ul style="list-style-type: none"> <li>● Trigger a hot standby switchover on Router B, and verify that the routing tables of destination networks 1 and 2 remain unchanged on Router A during the switchover.</li> <li>● Trigger a hot standby switchover on Router B, ping destination network 1 from Router A, and verify that data forwarding is not interrupted during the switchover.</li> </ul>
--------------	---

### Common Errors

- The configured OSPF neighbor dead interval is too short. If the Fast Hello function is enabled, the OSPF adjacency will be destroyed during the switchover, causing interruption of data forwarding.

## 4.4.16 Correlating OSPF with BFD

### Configuration Effect

- Once a link is faulty, OSPF can quickly detect the failure of the route. This configuration helps shorten the traffic interruption time.

### Notes

- The OSPF basic functions must be configured.
- The BFD parameters must be configured for the interface in advance.
- If BFD is configured for both a process and an interface, the configuration for the interface takes effect preferentially.

### Configuration Steps

#### ↘ Correlating OSPF with BFD

- (Optional) This configuration is required if you wish to accelerate OSPF network convergence.
- The configuration must be performed on routers at both ends of the link.

### Verification

- Run the **show bfd neighbor** command to verify that the BFD neighbors are normal.

### Related Commands

#### ↘ Correlating an OSPF Interface with BFD

<b>Command</b>	<b>ip ospf bfd [ disable ]</b>
<b>Parameter Description</b>	<b>disable:</b> Disables BFD for link detection on a specified OSPF-enabled interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The interface-based configuration takes precedence over the <b>bfd all-interfaces</b> command used in process configuration mode. Based on the actual environment, you can run the <b>ip ospf bfd</b> command to enable BFD on a specified

	interface for link detection, or run the <b>bfd all-interfaces</b> command in OSPF process configuration mode to enable BFD on all interface of the OSPF process, or run the <b>ospf bfd disable</b> command to disable BFD on a specified interface.
--	---

↘ **Correlatingan OSPF Process with BFD**

<b>Command</b>	<b>bfd all-interfaces</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	OSPF process configuration mode
<b>Usage Guide</b>	OSPF dynamically discovers neighbors through the Hello packets. After OSPF enables the BFD function, a BFD session will be set up to achieve the full adjacency, and use the BFD mechanism to detect the neighbor status. Once a neighbor failure is detected through BFD, OSPF performs network convergence immediately. You can also run the <b>ip ospf bfd [disable]</b> command in interface configuration mode to enable or disable the BFD function on a specified interface, and this configuration takes precedence over the <b>bfd all-interfaces</b> command used in OSPF process configuration mode.

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

<b>Scenario</b> Figure 4-25	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the BFD parameters for interfaces of all routers.</li> <li>● Correlate OSPF with BFD on all routers.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#bfd interval 200 min_rx 200 multiplier 5 A(config)# router ospf 1 A(config-router)#bfd all-interfaces</pre>

<b>B</b>	<pre>B(config)# interface GigabitEthernet 0/1  B(config-if-GigabitEthernet 2/1)#bfd interval 200 min_rx 200 multiplier 5  B(config)# router ospf 1  B(config-router)#bfd all-interfaces</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router A and Router B, verify that the BFD state is Up.</li> <li>● Disconnect Router A from the switch. On Router A, verify that a neighbor is found disconnected during BFD, and the corresponding OSPF route is deleted.</li> </ul>
<b>A</b>	<pre>A# show ip ospf neighbor  OSPF process 1, 1 Neighbors, 1 is Full:  Neighbor ID    Pri  State           BFD State  Dead Time  Address      Interface 192.168.1.2    1    Full/BDR        Up          00:00:40   192.168.1.2 GigabitEthernet 0/1</pre>
<b>B</b>	<pre>B# show ip ospf neighbor  OSPF process 1, 1 Neighbors, 1 is Full:  Neighbor ID    Pri  State           BFD State  Dead Time  Address      Interface 192.168.1.1    1    Full/BDR        Up          00:00:40   192.168.1.1 GigabitEthernet 0/1</pre>

## 4.4.17 Enabling Fast Reroute

### Configuration Effect

- Once OSPF detects a route failure, the router can immediately switch to the second-best route. This configuration helps shorten the traffic interruption time.

### Notes

- The OSPF basic functions must be configured.
- The LAF configuration for fast reroute is mutually exclusive with the virtual link configuration.
- You must set **carrier-delay** of an interface to 0.

### Configuration Steps

#### 📄 Configuring Fast Reroute

- (Optional) This configuration is required if you wish to increase the OSPF network convergence speed to the millisecond level.
- This configuration is performed on a router that has multiple paths to a destination network.

#### 📄 Preventing an Interface From Becoming a Standby Interface

- (Optional) This configuration is mandatory if you wish that data traffic is not switched over to a specified path after the best path fails. After the best path fails, the traffic will be switched over another second-best path, but a new best path will be selected based on the interface costs after OSPF converges again.
- This configuration is performed on a device where fast reroute is enabled.

## Verification

Run the **show ip route fast-reroute** command to verify that both the best and second-best paths exist.

## Related Commands

### ↳ Configuring Fast Reroute

<b>Command</b>	<b>fast-reroute</b> { <b>ifa</b> [downstream-paths]   <b>route-map</b> <i>route-map-name</i> }
<b>Parameter Description</b>	<b>ifa</b> : Enables computation of the loop-free standby path. <b>downstream-paths</b> : Enables computation of the downstream path. <b>route-map</b> <i>route-map-name</i> : Specifies a standby path through the route map.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>If the <b>ifa</b> parameter is configured, computation of the loop-free standby path is enabled. In this case, you can use the interface mode command to specify the path protection mode of the interface.</p> <p>It is recommended that computation of the loop-free standby path be disabled if any of the following case exists on the network:</p> <ol style="list-style-type: none"> <li>1. Virtual links exist.</li> <li>2. Alternative ABRs exist.</li> <li>3. An ASBR is also an ABR.</li> <li>4. Multiple ASBRs advertise the same external route.</li> </ol> <p>If both <b>ifa</b> and <b>downstream-paths</b> are configured, computation of the downstream path is enabled.</p> <p>If <b>route-map</b> is configured, a standby path can be specified for a matched route through the route-map.</p> <p>When the OSPF fast reroute function is used, it is recommended that BFD be enabled at the same time so that the device can quickly detect any link failure and therefore shorten the forwarding interruption time. If the interface is up or down, to shorten the forwarding interruption time during OSPF fast reroute, you can configure <b>carrier-delay 0</b> in L3 interface configuration mode to achieve the fastest switchover speed.</p>

### ↳ Configuring the Interface LFA Protection

<b>Command</b>	<b>ip ospf fast-reroute protection</b> { <b>node</b>   <b>link-node</b>   <b>disable</b> }
<b>Parameter Description</b>	<b>node</b> : Enables the LFA node protection. <b>link-node</b> : Enables the LFA link node protection. <b>disable</b> : Disables LFA protection.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If the <b>fast-rerouteifa</b> command is executed in OSPF route process configuration mode, the OSPF fast reroute computation function will be generated, and a standby route will be generated for the active route

	<p>based on the LFA protection mode specified in interface configuration mode. Link protection is enabled by default for each OSPF interface. Under this protection mode, the failure of the active link does not affect data forwarding on the standby route.</p> <p>Use the <b>node</b> parameter to enable node protection for the interface, that is, data forwarding on the standby route will not be affected by the failure of a neighbor node corresponding to the active link.</p> <p>Use the <b>link-node</b> parameter to protect both the link and neighbor node corresponding to the active link.</p> <p>Use the <b>disable</b> parameter to disable the LFA protection function of the interface, that is, not to generate a standby entry for the route whose next hop is the interface.</p> <p>This command does not take effect if <b>fast-rotate route-map</b> is configured.</p>
--	---

📌 Preventing an Interface From Becoming a Standby Interface

<b>Command</b>	<b>ip ospf fast-reroute no-eligible-backup</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>If the remaining bandwidth of an interface is small or if the interface and its active interface may fail at the same time, the interface cannot be used as a standby interface. Therefore, you need to run this command in interface configuration mode to prevent this interface from becoming a standby interface during OSPF fast reroute computation. After this command is executed, the standby interface is selected from other interface.</p> <p>This command does not take effect if <b>fast-rotate route-map</b> is configured.</p>

Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

📌 Configuring Fast Reroute

<p><b>Scenario</b> Figure 4-26</p>	
<p><b>Remarks</b></p>	<p>The interface IP addresses are as follows:</p> <p>A: GE0/1 192.168.1.1    GE0/2 192.168.2.1</p> <p>B: GE0/1 192.168.1.2    GE0/2 192.168.3.1    GE0/3 192.168.4.1</p> <p>C: GE0/1 192.168.3.2    GE 0/2 192.168.2.2</p>
<p><b>Configuration</b></p>	<ul style="list-style-type: none"> <li>Configure the interface IP addresses on all routers. (Omitted)</li> </ul>

<b>Steps</b>	<ul style="list-style-type: none"> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure fast reroute on Router A.</li> <li>● Configure <b>carrier-delay 0</b> for the interface on Router A.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# router ospf 1 A(config-router)# fast-reroute lfa A(config-router)# exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#carrier-delay 0 A(config-if-GigabitEthernet 0/1)# exit A(config)# interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)#carrier-delay 0</pre>
<b>Verification</b>	On Router A, check the routing table and verify that a standby route exists for the entry 192.168.4.0/24.
	<pre>A# show ip route fast-reroute   begin 192.168.4.0 0 192.168.4.0/24 [ma] via 192.168.1.2, 00:39:28, GigabitEthernet 0/1 [b] via 192.168.2.2, 00:39:28, GigabitEthernet 0/2</pre>

## 4.4.18 Enabling iSPF

### Configuration Effect

- OSPF adopts the iSPF algorithm to compute the network topology.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ↘ Configuring iSPF

- (Optional) This configuration is recommended if you wish to accelerate route convergence in a single area with more than 100 routers.
- This configuration is performed on all routers in the area.

### Verification

Run the **show ip ospf** command to verify that iSPF is enabled.

### Related Commands

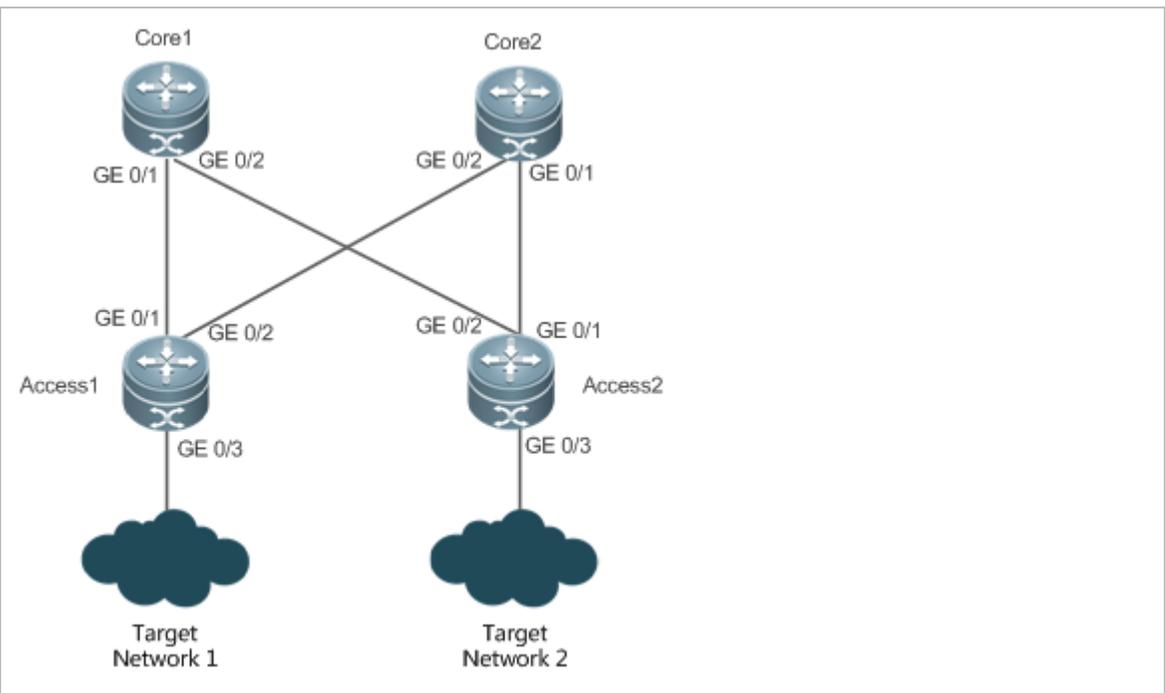

➤ **Configuring iSPF**

<b>Command</b>	<b>ispf enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>After iSPF is enabled, OSPF will use the iSPF algorithm to compute the network topology. That is, after the network topology changes, OSPF corrects only the nodes affected by the topological change, instead of re-building the entire SPT.</p> <p>The iSPF function is generally used on a large-sized network to ease the pressure on router processors.</p>

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

➤ **Configuring iSPF**

## 4.4.19 Configuring the Network Management Function

### Configuration Effect

- Use the network management software to manage OSPF parameters and monitor the OSPF running status.

### Notes

- The OSPF basic functions must be configured.
- You must enable the MIB function of the SNMP-Server before enabling the OSPF MIB function.
- You must enable the Trap function of the SNMP-Server before enabling the OSPF Trap function.
- You must enable the logging function of the device before outputting the OSPF logs.

## Configuration Steps

### ↘ Binding the MIB with the OSPF Process

- (Optional) This configuration is required if you want to use the network management software to manage parameters of a specified OSPF process.
- This configuration is performed on all routers.

### ↘ Enabling the Trap Function

- (Optional) This configuration is required if you want to use the network management software to monitor the OSPF running status.
- This configuration is performed on all routers.

### ↘ Configuring the Logging Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration. If you want to reduce the log output, disable this function.
- This configuration is performed on all routers.

## Verification

- Use the network management software to manage the OSPF parameters.
- Use the network management software to monitor the OSPF running status.

## Related Commands

### ↘ Binding the MIB with the OSPF Process

<b>Command</b>	<b>enable mib-binding</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The OSPFv2 MIB does not have the OSPFv2 process information. Therefore, you must perform operations on a single OSPFv2 process through SNMP. By default, the OSPFv2 MIB is bound with the OSPFv2 process with the smallest process ID, and all user operations take effect on this process.</p> <p>If you wish to perform operations on a specified OSPFv2 through SNMP, run this command to bind the MIB with the process.</p>

↳ **Enabling the Trap Function**

<b>Command</b>	<code>enable traps[ error [ IfAuthFailure   IfConfigError   IfRxBadPacket   VirtIfAuthFailure   VirtIfConfigError   VirtIfRxBadPacket]   Isa [ LsdbApproachOverflow   LsdbOverflow   MaxAgeLsa   OriginateLsa]   retransmit [ IfTxRetransmit   VirtIfTxRetransmit]   state-change[ IfStateChange   NbrRestartHelperStatusChange   NbrStateChange   NssaTranslatorStatusChange   RestartStatusChange   VirtIfStateChange   VirtNbrRestartHelperStatusChange  VirtNbrStateChange] ]</code>
<b>Parameter Description</b>	<p><b>IfAuthFailure:</b> Indicates that an interface authentication failure occurs.</p> <p><b>IfConfigError:</b> Indicates that an interface parameter configuration error occurs.</p> <p><b>IfRxBadPacket:</b> Indicates that the interface receives a bad packet.</p> <p><b>IfRxBadPacket:</b> Indicates that the interface receives a bad packet.</p> <p><b>VirtIfAuthFailure:</b> Indicates that a virtual interface authentication failure occurs.</p> <p><b>VirtIfConfigError:</b> Indicates that a virtual interface parameter configuration error occurs.</p> <p><b>VirtIfRxBadPacket:</b> Indicates that the virtual interface receives a bad packet.</p> <p><b>LsdbApproachOverflow:</b> Indicates that the number of external LSAs has reached 90% of the upper limit.</p> <p><b>LsdbOverflow:</b> Indicates that the number of external LSAs has reached the upper limit.</p> <p><b>MaxAgeLsa:</b> Indicates that the LSA aging timer expires.</p> <p><b>OriginateLsa:</b> Indicates that a new LSA is generated.</p> <p><b>IfTxRetransmit:</b> Indicates that a packet is retransmitted on the interface.</p> <p><b>VirtIfTxRetransmit:</b> Indicates that a packet is retransmitted on the virtual interface.</p> <p><b>IfStateChange:</b> Indicates that interface state changes.</p> <p><b>NbrRestartHelperStatusChange:</b>Indicates that the state of the neighbor GR process changes.</p> <p><b>NbrStateChange:</b> Indicates that the neighbor state changes.</p> <p><b>NssaTranslatorStatusChange:</b> Indicates that the NSSA translation state changes.</p> <p><b>RestartStatusChange:</b> Indicates that the GR state of the local device changes.</p> <p><b>VirtIfStateChange:</b> Indicates that the virtual interface state changes.</p> <p><b>VirtNbrRestartHelperStatusChange:</b> Indicates that the GR state of the virtual neighbor changes.</p> <p><b>VirtNbrStateChange:</b> Indicates that the virtual neighbor state changes.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The function configured by this command is restricted by the <b>snmp-server</b> command. You can configure <b>snmp-server enable traps ospf</b> and then <b>enable traps</b> command before the corresponding OSPF traps can be correctly sent out.</p> <p>This command is not restricted by the MIB bound with the process. The trap function can be enabled concurrently for different processes.</p>

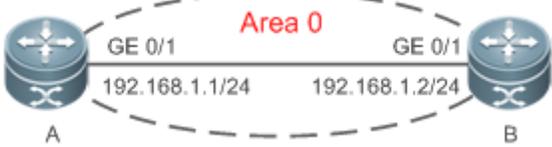

↳ **Configuring the Logging Function**

<b>Command</b>	<code>log-adj-changes[ detail]</code>
<b>Parameter Description</b>	<b>detail:</b> Records all status change information.
<b>Command</b>	OSPF routing process configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	N/A

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

<p><b>Scenario</b> Figure 4-28</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Bind the MIB with the OSPF process on Router A.</li> <li>● Enable the trap function on Router A.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# snmp-server host 192.168.2.2 traps version 2c public A(config)# snmp-server community public rw A(config)# snmp-server enable traps A(config)# router ospf 10 A(config-router)# enable mib-binding A(config-router)# enable traps</pre>
<p><b>Verification</b></p>	<p>Use the MIB tool to read and set the OSPF parameters and display the OSPF running status.</p>

### Common Errors

Configurations on the SNMP-Server are incorrect. For example, the MIB or trap function is not enabled.

## 4.4.20 Modifying Protocol Control Parameters

### Configuration Effect

Modify protocol control parameters to change the protocol running status.

### Notes

- The OSPF basic functions must be configured.
- The neighbor dead time cannot be shorter than the Hello interval.

## Configuration Steps

---

### ↘ Configuring the Hello Interval

- (Optional) You are advised to retain the default configuration.
- This configuration is performed on routers at both end of a link.

### ↘ Configuring the Dead Interval

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if you wish to accelerate OSPF convergence when a link fails.
- This configuration is performed on routers at both end of a link.

### ↘ Configuring LSU Retransmission Interval

- (Optional) You are advised to adjust this configuration if a lot of routes exist in the user environment and network congestion is serious.

### ↘ Configuring the LSA Generation Time

- (Optional) You are advised to retain the default configuration.

### ↘ Configuring the LSA Group Refresh Time

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if a lot of routes exist in the user environment.
- This configuration is performed on an ASBR or ABR.

### ↘ Configuring LSA Repeated Receiving Delay

- (Optional) You are advised to retain the default configuration.

### ↘ Configuring the SPF Computation Delay

- (Optional) This configuration can be adjusted if network flapping frequently occurs.

### ↘ Configuring the Inter-Area Route Computation Delay

- (Optional) You are advised to retain the default configuration.
- This configuration is performed on all routers.

### ↘ Configuring the External Route Computation Delay

- (Optional) You are advised to retain the default configuration.
- This configuration is performed on all routers.

## Verification

---

Run the **show ip ospf** and **show ip ospf neighbor** commands to display the protocol running parameters and status.

## Related Commands

### ↘ Configuring the Hello Interval

<b>Command</b>	<b>ip ospf hello-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the interval at which OSPF sends the Hello packet. The unit is second. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The Hello interval is contained in the Hello packet. A shorter Hello interval indicates that OSPF can detect topological changes more quickly, but the network traffic increases. The Hello interval must be the same on all routers in the same network segment. If you want to manually modify the neighbor dead interval, ensure that the neighbor dead interval is longer than the Hello interval.

### ↘ Configuring the Dead Interval

<b>Command</b>	<b>ip ospf dead-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the time that the neighbor is declared lost. The unit is second. The value ranges from 0 to 2,147,483,647.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>The OSPF dead interval is contained in the Hello packet. If OSPF does not receive a Hello packet from a neighbor within the dead interval, it declares that the neighbor is invalid and deletes this neighbor record from the neighbor list. By default, the dead interval is four times the Hello interval. If the Hello interval is modified, the dead interval is modified automatically.</p> <p>When using this command to manually modify the dead interval, pay attention to the following issues:</p> <ol style="list-style-type: none"> <li>1. The dead interval cannot be shorter than the Hello interval.</li> <li>2. The dead interval must be the same on all routers in the same network segment.</li> </ol>

### ↘ Configuring the LSU Transmission Delay

<b>Command</b>	<b>ip ospf transmit-delay</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSU transmission delay on the OSPF interface. The unit is second. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Before an LSU packet is transmitted, the Age fields in all LSAs in this packet will increase based on the amount specified by the <b>ip ospf transmit-delay</b> command. Considering the transmit and line propagation delays on the interface, you need to set the LSU transmission delay to a greater value for a low-speed line or interface. The LSU transmission delay of a virtual link is defined by the <b>transmit-delay</b> parameter in the <b>area virtual-link</b> command.</p> <p>If the value of the Age field of an LSA reaches 3600, the packet will be retransmitted or a retransmission will be requested. If the LSA is not updated in time, the expired LSA will be deleted from the LSDB.</p>

### ↘ Configuring LSU Retransmission Interval

<b>Command</b>	<b>ip ospf retransmit-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSU retransmission interval. The unit is second. The value ranges from 0 to 65,535. This interval must be longer than the round-trip transmission delay of data packets between two neighbors.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After a router finishes sending an LSU packet, this packet is still kept in the transmit buffer queue. If an acknowledgment from the neighbor is not received within the time defined by the <b>ip ospf retransmit-interval</b> command, the router retransmits the LSU packet. The retransmission delay can be set to a greater value on a serial line or virtual link to prevent unnecessary retransmission. The LSU retransmission delay of a virtual link is defined by the <b>retransmit-interval</b> parameter in the <b>area virtual-link</b> command.

### ↘ Configuring the LSA Generation Time

<b>Command</b>	<b>timers throttle lsa all</b> <i>delay-time hold-time max-wait-time</i>
<b>Parameter Description</b>	<i>delay-time</i> : Indicates the minimum delay for LSA generation. The first LSA in the database is always generated instantly. The value ranges from 0 to 600,000. The unit is ms. <i>hold-time</i> : Indicates the minimum interval between the first LSA update and the second LSA update. The value ranges from 1 to 600,000. The unit is ms. <i>max-wait-time</i> : Indicates the maximum interval between two LSA updates when the LSA is updated continuously. This interval is also used to determine whether the LSA is updated continuously. The value ranges from 1 to 600,000. The unit is ms.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	If a high convergence requirement is raised when a link changes, you can set <b>delay-time</b> to a smaller value. You can also appropriately increase values of the preceding parameters to reduce the CPU usage. When configuring this command, the value of <b>hold-time</b> cannot be smaller than the value of <b>delay-time</b> , and the value of <b>max-wait-time</b> cannot be smaller than the value of <b>hold-time</b> .

### ↘ Configuring the LSA Group Refresh Time

<b>Command</b>	<b>timers pacinglsa-group</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSA group pacing interval. The value ranges from 10 to 1,800. The unit is second.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	Every LSA has a time to live (LSA age). When the LSA age reaches 1800s, a refreshment is needed to prevent LSAs from being cleared because their ages reaching the maximum. If LSA update and aging computation are performed for every LSA, the device will consume a lot of CPU resources. In order to use CPU resources effectively, you can refresh LSAs by group on the device. The interval of group refreshment is called group pacing interval. The group refreshment operation is to organize the LSAs generated within a

	<p>group pacing interval into a group and refresh the group as a whole.</p> <p>If the total number of LSAs does not change, a larger group pacing interval indicates that more LSAs need to be processed after timeout. To maintain the CPU stability, the number of LSAs processes upon each timeout cannot be too large. If the number of LSAs is large, you are advised to reduce the group pacing interval. For example, if there are 1000 LSAs in the database, you can reduce the pacing interval; if there are 40 to 100 LSAs, you can set the pacing interval to 10-20 minutes.</p>
--	---

### ↘ Configuring the LSA Group Refresh Interval

<b>Command</b>	<b>timers pacing lsa-transmit</b> <i>transmit-time transmit-count</i>
<b>Parameter Description</b>	<p><i>transmit-time</i>: Indicates the LSA group transmission interval. The value ranges from 10 to 1,000. The unit is ms.</p> <p><i>transmit-count</i>: Indicates the number of LS-UPD packets in a group. The value ranges from 1 to 200.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>If the number of LSAs is large and the device load is heavy in an environment, properly configuring <b>transmit-time</b> and <b>transmit-count</b> can limit the number of LS-UPD packets flooded on a network.</p> <p>If the CPU usage is not high and the network bandwidth load is not heavy, reducing the value of <b>transmit-time</b> and increasing the value of <b>transmit-count</b> can accelerate the environment convergence.</p>

### ↘ Configuring LSA Repeated Receiving Delay

<b>Command</b>	<b>timers lsa arrival</b> <i>arrival-time</i>
<b>Parameter Description</b>	<p><i>arrival-time</i>: Indicates the delay after which the same LSA is received. The value ranges from 0 to 600,000. The unit is ms.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	No processing is performed if the same LSA is received within the specified time.

### ↘ Configuring the Inter-Area Route Computation Delay

<b>Command</b>	<b>timers throttle route inter-area</b> <i>ia-delay</i>
<b>Parameter Description</b>	<p><i>ia-delay</i>: Indicates the inter-area route computation delay. The unit is ms. The value ranges from 0 to 600,000.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	This delay cannot be modified if strict requirements are raised for the network convergence time.

### ↘ Configuring the External Route Computation Delay

<b>Command</b>	<b>timers throttle route ase</b> <i>ase-delay</i>
<b>Parameter Description</b>	<p><i>ase-delay</i>: Indicates the external route computation delay. The unit is ms. The value ranges from 0 to 600,000.</p>
<b>Command Mode</b>	OSPF routing process configuration mode

<b>Usage Guide</b>	This delay cannot be modified if strict requirements are raised for the network convergence time.
--------------------	---

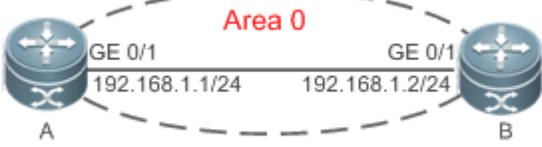

📄 **Configuring the SPF Computation Delay**

<b>Command</b>	<code>timers throttle spf spf-delay spf-holdtime spf-max-waittime</code>
<b>Parameter Description</b>	<p><i>spf-delay</i>: Indicates the SPF computation delay. The unit is ms. The value ranges from 1 to 600,000. When detecting a topological change, the OSPF routing process triggers the SPF computation at least after <b>spf-delay</b> elapses.</p> <p><i>spf-holdtime</i>: Indicates the minimum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p> <p><i>spf-max-waittime</i>: Indicates the maximum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p> <p><i>number</i>: indicates the metric of the summarized route.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p><b>spf-delay</b> indicates the minimum time between the occurrence of the topological change and the start of SPF computation. <b>spf-holdtime</b> indicates the minimum interval between the first SPF computation and the second SPF computation. After that, the interval between two SPF computations must be at least twice of the previous interval. When the interval reaches <b>spf-max-waittime</b>, the interval cannot increase again. If the interval between two SPF computations already exceeds the required minimum value, the interval is computed by starting from <b>spf-holdtime</b>.</p> <p>You can set <b>spf-delay</b> and <b>spf-holdtime</b> to smaller values to accelerate topology convergence, and set <b>spf-max-waittime</b> to a larger value to reduce SPF computation. Flexible settings can be used based on stability of the network topology.</p> <p>Compared with the <b>timers spf</b> command, this command supports more flexible settings to accelerate the convergence speed of SPF computation and further reduce the system resources consumed by SPF computation when the topology continuously changes. Therefore, you are advised to use the <b>timers throttle spf</b> command for configuration.</p> <ol style="list-style-type: none"> <li>The value of <b>spf-holdtime</b> cannot be smaller than the value of <b>spf-delay</b>; otherwise, <b>spf-holdtime</b> will be automatically set to the value of <b>spf-delay</b>.</li> <li>The value of <b>spf-max-waittime</b> cannot be smaller than the value of <b>spf-holdtime</b>; otherwise, <b>spf-max-waittime</b> will be automatically set to the value of <b>spf-holdtime</b>.</li> <li>The configurations of <b>timers throttle spf</b> and <b>timers spf</b> are mutually overwritten.</li> <li>When both <b>timers throttle spf</b> and <b>timers spf</b> are not configured, the default values of <b>timers throttle spf</b> prevail.</li> </ol>

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 4.4.1 "Configuring OSPF Basic Functions."

📄 **Configuring the Hello Interval and Dead Interval**

<p><b>Scenario</b> Figure 4-29</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the Hello interval and dead interval on all routers.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ip ospf dead-interval 50</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ip ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ip ospf dead-interval 50</pre>
<p><b>Verification</b></p>	<p>Check the interface parameters on Router A. Verify that the Hello interval is 10s and the dead interval is 50s.</p>
<p><b>A</b></p>	<pre>A# show ip ospf interface GigabitEthernet 0/1 is up, line protocol is up   Internet Address 192.168.1.1/24, Ifindex 2, Area 0.0.0.0, MTU 1500   Matching network config: 192.168.1.0/24   Process ID 1, Router ID 192.168.1.2, Network Type POINTOMULTIPOINT, Cost: 1   Transmit Delay is 1 sec, State Point-To-Point   Timer intervals configured, Hello 15, Dead 50, Wait 40, Retransmit 5     Hello due in 00:00:02   Neighbor Count is 1, Adjacent neighbor count is 0   Crypt Sequence Number is 4787   Hello received 465 sent 466, DD received 8 sent 8   LS-Req received 2 sent 2, LS-Upd received 8 sent 21   LS-Ack received 14 sent 7, Discarded 3</pre>

**Common Errors**

- The configured neighbor dead time is shorter than the Hello interval.

## 4.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears and resets an OSPF process.	<b>clear ip ospf</b> [ <i>process-id</i> ] <b>process</b>

### Displaying

Description	Command
Displays the OSPF process configurations.	<b>show ip ospf</b> [ <i>process-id</i> ]
Displays the OSPF internal routing table, including routes to ABRs and ASBRs.	<b>show ip ospf</b> [ <i>process-id</i> ] <b>border-routers</b>
Displays information about the OSPF LSDB.	<b>show ip ospf</b> [ <i>process-id area-id</i> ] <b>database</b> [ { <b>asbr-summary</b>   <b>external</b>   <b>network</b>   <b>nssa-external</b>   <b>opaque-area</b>   <b>opaque-as</b>   <b>opaque-link</b>   <b>router summary</b> } ] [ { <b>adv-router</b> <i>ip-address</i>   <b>self-originate</b> } ] [ <i>link-state-id</i> ] <b>brief</b> [ [ <b>database-summary</b>   <b>max-age</b>   <b>detail</b> ] ]
Displays OSPF-enabled interfaces.	<b>show ip ospf</b> [ <i>process-id</i> ] <b>interface</b> [ <i>interface-type interface-number</i>   <b>brief</b> ]
Displays the OSPF neighbor list.	<b>show ip ospf</b> [ <i>process-id</i> ] <b>neighbor</b> [ <b>detail</b> ] [ <i>interface-type interface-number</i> ] [ <i>neighbor-id</i> ]
Displays the OSPF routing table.	<b>show ip ospf</b> [ <i>process-id</i> ] <b>route</b> [ <b>count</b> ]
Displays the number of times SPT is computed in the OSPF area.	<b>show ip ospf</b> [ <i>process-id</i> ] <b>spf</b>
Displays the summarized route of OSPF redistributed routes.	<b>show ip ospf</b> [ <i>process-id</i> ] <b>summary-address</b>
Displays the OSPF network topology information.	<b>show ip ospf</b> [ <i>process-id</i> [ <i>area-id</i> ] ] <b>topology</b> [ <b>adv-router</b> <i>adv-router-id</i> [ <i>router-id</i> ]   <b>self-originate</b> [ <i>router-id</i> ] ]
Displays OSPF virtual links.	<b>show ip ospf</b> [ <i>process-id</i> ] <b>virtual-links</b> [ <i>ip-address</i> ]

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs OSPF events.	<b>debug ip ospf events</b> [ <b>abr</b>   <b>asbr</b>   <b>lsa</b>   <b>nssa</b>   <b>os</b>   <b>restart</b>   <b>router</b>   <b>slink</b>   <b>vlink</b> ]
Debugs OSPF interfaces.	<b>debug ip ospf ifsm</b> [ <b>events</b>   <b>status</b>   <b>timers</b> ]
Debugs OSPF neighbors.	<b>debug ip ospf nfm</b> [ <b>events</b>   <b>status</b>   <b>timers</b> ]

Debugs the OSPF NSM.	<b>debug ip ospf nsm</b> [interface   redistribute   route]
Debugs OSPF LSAs.	<b>debug ip ospf lsa</b> [flooding   generate   install   maxage   refresh]
Debugs OSPF packets.	<b>debug ip ospf packet</b> [dd detail hello ls-ack ls-request ls-update recv send]
Debugs OSPF routes.	<b>debug ip ospf route</b> [ase   ia   install   spf   time]

## 5 Configuring OSPFv3

### 5.1 Overview

Open Shortest Path First (OSPF) is an Interior Gateway Protocol (IGP) that is used within the Autonomous System (AS) to allow routers to obtain a route to a remote network.

**i** OSPF Version 2 (OSPFv2) is applicable to IPv4, and OSPF Version 3 (OSPFv3) is applicable to IPv6. The protocol running mechanism and most configurations are the same.

OSPF has the following characteristics:

- Wide scope of application: OSPF is applicable to a larger-scale network that supports hundreds of routers.
- Fast convergence: Once the network topology changes, notifications can be quickly sent between routers to update routes.
- No self-loop: Only the link status information is synchronized between routers. Each router computes routes independently, and a self-loop will not occur.
- Area division: A large routing domain is divided into multiple small areas to save system resources and network bandwidth and ensure stability and reliability of routes.
- Route classification: Routes are classified into several types to support flexible control.
- Equivalent routes: OSPF supports equivalent routes.
- Authentication: OSPF supports packet authentication to ensure security of protocol interaction.
- Multicast transmission: Protocol packets are sent using the multicast address to avoid interfering with irrelevant entities and save system resources.

**i** In this chapter, the term "router" refers to any network device that supports the routing function. These network devices can be L3 switches, routers, or firewall.

**i** Unless otherwise specified, "OSPF" in the following descriptions refers to OSPFv3.

#### Protocols and Standards

<a href="#">RFC2740</a>	This document describes the modifications to OSPF to support version 6 of the Internet Protocol (IPv6).
<a href="#">draft-ietf-ospf-ospfv3-graceful-restart</a>	This document describes the OSPFv3 graceful restart. The OSPFv3 graceful restart is identical to OSPFv2 except for the differences described in this document. These differences include the format of the grace Link State Advertisements (LSA) and other considerations.
<a href="#">draft-ietf-ospf-ospfv3-mib-11</a>	This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in IPv6-based internets. In particular, it defines objects for managing the Open Shortest Path First Routing Protocol for IPv6.

## 5.2 Applications

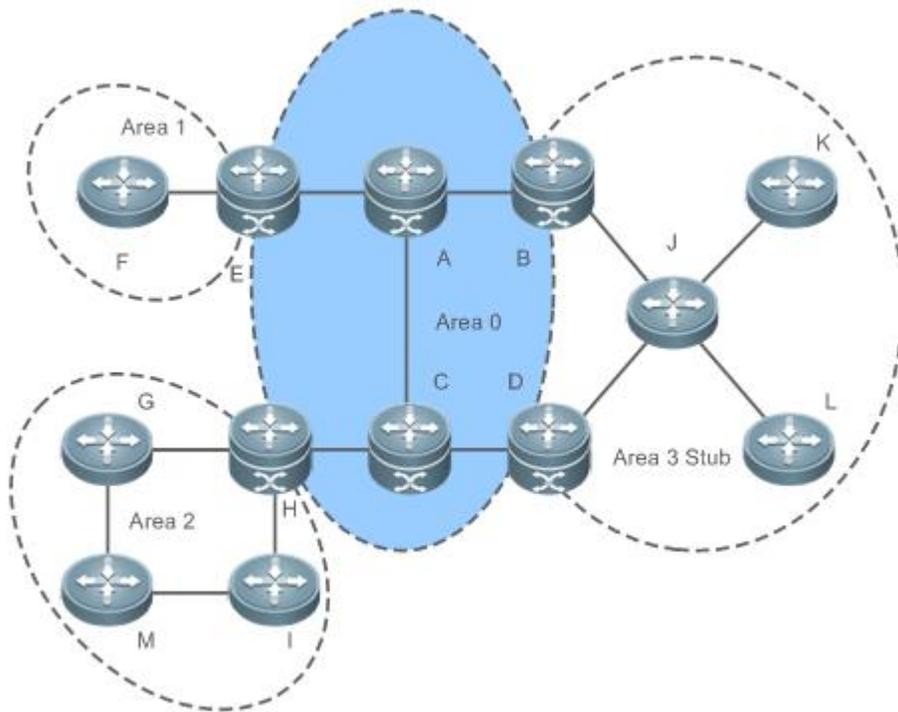

Application	Description
<a href="#">Intra-Domain Interworking</a>	OSPF runs within the AS, which is divided into several areas.
<a href="#">Inter-Domain Interworking</a>	Several ASs are interconnected. OSPF runs within each AS, and BGP runs between ASs.

### 5.2.1 Intra-Domain Interworking

#### Scenario

OSPF runs within the AS. If the number of routers exceeds 40, it is recommended that the AS be divided into several areas. Generally, high-end devices featuring reliable performance and fast processing speed are deployed in a backbone area, and low-end or medium-range devices with relatively lower performance can be deployed in a normal area. All normal areas must be connected to the backbone area. It is recommended that a normal area located on the stub be configured as a stub area. As shown in Figure 5-1, the network is divided into four areas. Communication between these areas must go through the backbone area, that is, area 0.

Figure 5-1 Division of the OSPF Areas

<b>Remarks</b>	A, B, C, D, E, and H are located in the backbone area, and are backbone routers. Area 3 is configured as a stub area.
----------------	--

#### Deployment

- OSPF runs on all routers within the AS to implement unicast routing.

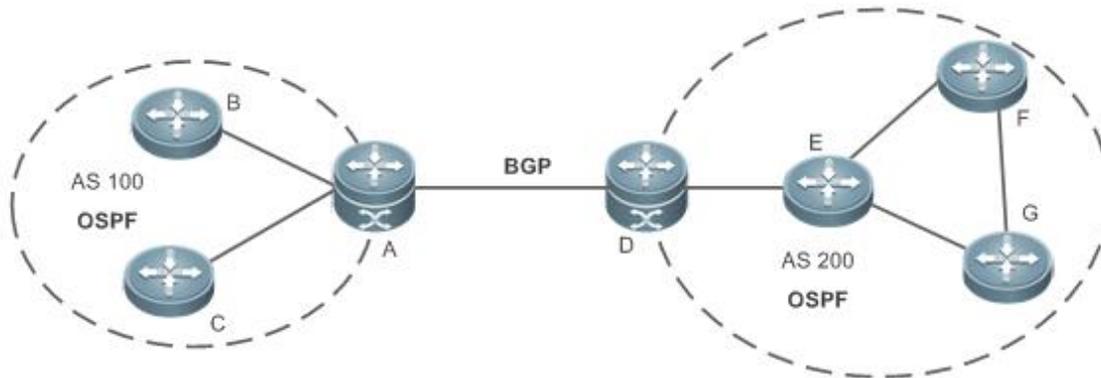

## 5.2.2 Inter-Domain Interworking

### Scenario

Several ASs are interconnected. OSPF runs within each AS, and BGP runs between ASs. Generally, OSPF and BGP learn the routing information from each other.

As shown in Figure 5-2, unicast routing is implemented within AS 100 and AS 200 using OSPF, and between the two ASs using BGP.

Figure 5-2 Interworking Between OSPF and BGP

<b>Remarks</b>	OSPF and BGP run concurrently on Router A and Router D.
----------------	---

### Deployment

- OSPF runs within AS 100 and AS 200 to implement unicast routing.
- BGP runs between the two ASs to implement unicast routing.

## 5.3 Features

### Basic Concepts

#### Routing Domain

All routers in an AS must be interconnected and use the same routing protocol. Therefore, an AS is also called a routing domain.

An AS on which OSPF runs is also called OSPF routing domain, or OSPF domain for short.

#### OSPF Process

OSPF supports multiple instances, and each instance corresponds to an OSPF process.

One or more OSPF processes can be started on a router. Each OSPF process runs OSPF independently, and the processes are mutually isolated.

An OSPF packet header contains the Instance ID field, and multiple OSPF instances can run concurrently on a single link. The process ID is valid only on the local device.

## RouterID

The router ID uniquely identifies a router in an OSPF domain. Router IDs of any two routers cannot be the same. If multiple OSPF processes exist on a router, each OSPF process uses one router ID. Router IDs of any two OSPF processes cannot be the same.

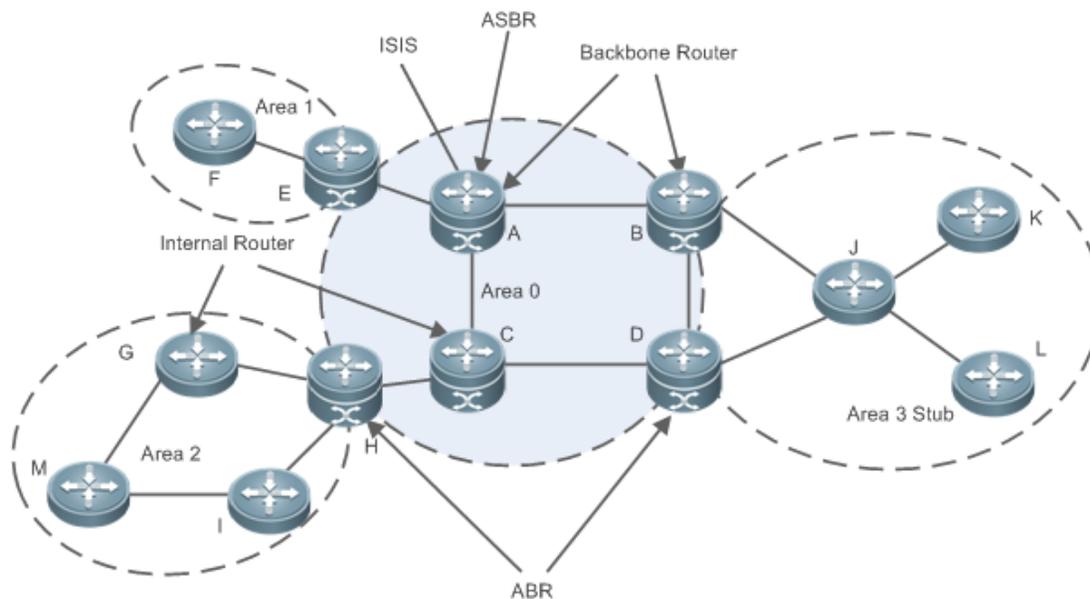

## Area

OSPF supports multiple areas. An OSPF domain is divided into multiple areas to ease the computing pressure of a large-scale network.

An area is a logical group of routers, and each group is identified by an area ID. The border between areas is a router. A router may belong to one area or multiple areas. One network segment (link) can belong to only one area, or each OSPF-enabled interface must belong to a specified area.

Area 0 is the backbone area, and other areas are normal areas. Normal areas must be directly connected to the backbone area.

Figure 5-3 Division of the OSPF Areas

## OSPF Router

The following types of routers are defined in OSPF, and assigned with different responsibilities:

- Internal router
 

All interface of an interval router belong to the same OSPF area. As shown in Figure 5-3, A, C, F, G, I, M, J, K, and L are internal routers.
- Area border router (ABR)
 

An ABR is used to connect the backbone area with a normal area. An ABR belongs to two or more areas, and one of the areas must be the backbone area. As shown in Figure 5-3, B, D, E, and H are ABRs.
- Backbone router

A backbone router has at least one interface that belongs to the backbone area. All ABRs and all routers in area 0 are backbone routers. As shown in Figure 5-3, A, B, C, D, E, and H are backbone routers.

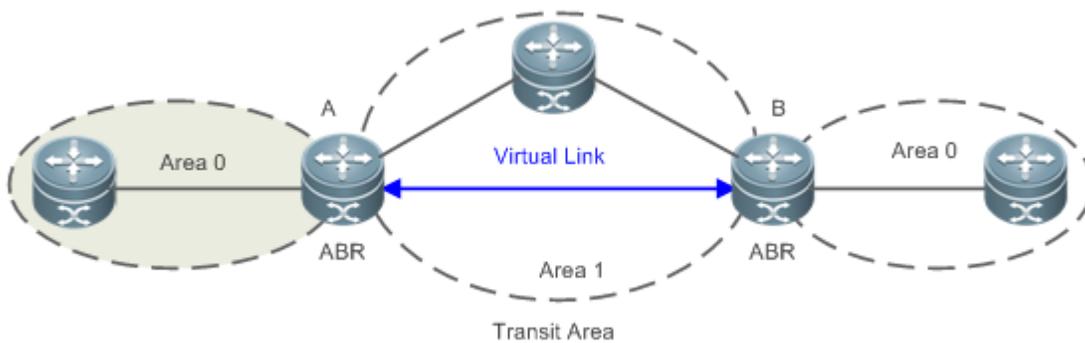

- AS boundary router (ASBR)

An ASBR is used to exchange routing information with other ASs. An ASBR is not necessarily located on the border of an AS. It may be a router inside an area, or an ABR. As shown in Figure 5-3, A is an ASBR.

➤ Virtual Link

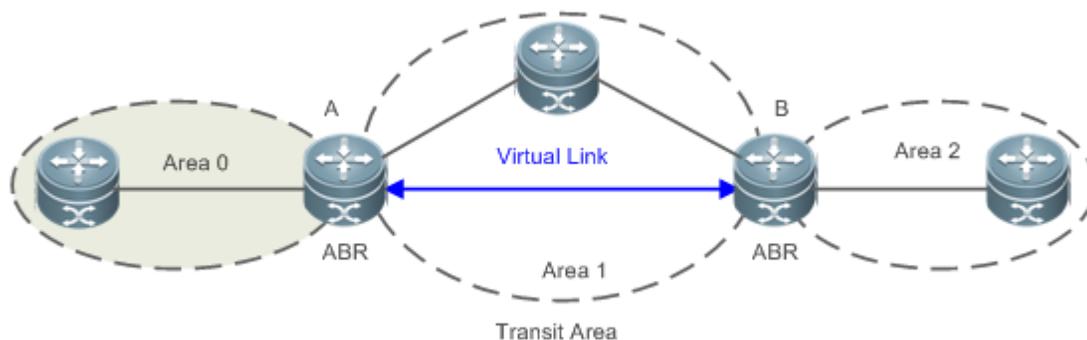

OSPF supports virtual links. A virtual link is a logical link that belongs to the backbone area. It is used to resolve the problems such as a discontinuous backbone area or a failure to directly connect a normal area to the backbone area on the physical network. A virtual link supports traversal of only one normal area, and this area is called transit area. Routers on both ends of a virtual link are ABRs.

Figure 5-4 Discontinuous Backbone Area on the Physical Network

As shown in Figure 5-4, a virtual link is set up between A and B to connect two separated parts of Area 0. Area 1 is a transit area, and A and B are ABRs of Area 1.

Figure 5-5 Failure to Directly Connect a Normal Area to the Backbone Area on the Physical Network

As shown in Figure 5-5, a virtual link is set up between A and B to extend Area 0 to B so that Area 0 can be directly connected to Area 2 on B. Area 1 is a transit area, A is an ABR of Area 1, and B is an ABR of Area 0 and Area 2.

➤ LSA

OSPF describes the routing information by means of Link State Advertisement (LSA).

LSA Type	Description
Router-LSA(Type1)	This LSA is originated by every router. It describes the link state and cost of the router,

LSA Type	Description
	and is advertised only within the area where the originating router is located.
Network-LSA(Type2)	This LSA is originated by a designated router (DR). It describes the state of the current link, and is advertised only within the area where the DR is located.
Inter-Area-Prefix-LSA(Type3)	This LSA is originated by an ABR. It describes a route to another area, and is advertised to areas except totally stub areas or Not-So-Stubby Area (NSSA) areas.
Inter-Area-Router-LSA(Type4)	This LSA is originated by an ABR. It describes a route to an ASBR, and is advertised to areas except areas where the ASBR is located.
AS-external-LSA(Type5)	This LSA is originated by an ABR. It describes a route to a destination outside the AS, and is advertised to all areas except the stub and NSSA areas.
NSSA LSA(Type7)	This LSA is originated by an ABR. It describes a route to a destination outside the AS, and is advertised only within the NASSA areas.
Link-LSA(Type8)	This LSA is originated by every router. It describes the link-local address and IPv6 prefix address of each link, and provides the link option that will be set in the Network-LSA. It advertised only on the current link.
Intra-Area-Prefix-LSA(Type9)	Every router or DR generates one or more Intra-Area-Prefix-LSAs, which are advertised in the area to which the router or DR belongs. <ul style="list-style-type: none"> <li>● The Intra-Area-Prefix-LSA generated by a router describes the IPv6 prefix address associated with the Route-LSA.</li> <li>● The Intra-Area-Prefix-LSA generated by a DR describes the IPv6 prefix address associated with the Network-LSA.</li> </ul>

 Stub areas, NSSA areas, totally stub areas, and totally NSSA areas are special forms of normal areas and help reduce the load of routers and enhance reliability of OSPF routes.

## OSPF Packet

The following table lists the protocol packets used by OSPF. These OSPF packets are encapsulated in IP packets and transmitted in multicast or unicast mode.

Packet Type	Description
Hello	Hello packets are sent periodically to discover and maintain OSPF neighbor relationships.
Database Description (DD)	DD packets carry brief information about the local Link-State Database (LSDB) and are used to synchronize the LSDBs between OSPF neighbors.
Link State Request (LSR)	LSR packets are used to request the required LSAs from neighbors. LSR packets are sent only after DD packets are exchanged successfully between OSPF neighbors.
Link State Update (LSU)	LSU packets are used to send the required LSAs to peers.
Link State Acknowledgment (LSAck)	LSAck packets are used to acknowledge the received LSAs.

## Overview

Feature	Description
---------	-------------

Feature	Description
<a href="#">Link-State Routing Protocols</a>	Run OSPF on the router to obtain routes to different destinations on the network.
<a href="#">OSPF Route Management</a>	Properly plan or optimize OSPF routes through manual configuration to implement management of OSPF routes.
<a href="#">Enhanced Security and Reliability</a>	Use functions such as authentication and BFD correlation to enhance security, stability, and reliability of OSPF.
<a href="#">Network Management Functions</a>	Use functions such as the MIB and Syslog to facilitate OSPF management.

### 5.3.1 Link-State Routing Protocols

OSPF is a type of link-state routing protocols. Its working process is as follows:

- Neighbor discovery → Bidirectional communication  
An OSPF neighbor relationship is set up between adjacent routers, and bidirectional communication is maintained.
- Database synchronization → Full adjacency  
A router uses LSAs to advertise all its link states. LSAs are exchanged between neighbors and the link state database (LSDB) is synchronized to achieve full adjacency.
- Shortest Path Tree (SPT) computation → Formation of a routing table  
The router computes the shortest path to each destination network based on the LSDB and forms an OSPF routing table.

#### Working Principle

##### ↘ Neighbor Discovery → Bidirectional Communication

Routers send Hello packets through all OSPF-enabled interfaces (or virtual links). If Hello packets can be exchanged between two routers, and parameters carried in the Hello packets can be successfully negotiated, the two routers become neighbors. Routers that are mutually neighbors find their own router IDs from Hello packets sent from neighbors, and bidirectional communication is set up.

A Hello packet includes, but is not limited to, the following information:

- Router ID of the originating router
- Area ID of the originating router interface (or virtual link)
- Instance ID of the originating router interface (or virtual link)
- Interface ID of the originating router interface (or virtual link)
- Priority of the originating router interface (used for DR/BDR election)
- Hello interval of the originating router interface (or virtual link)
- Neighbor dead interval of the originating router interface (or virtual link)
- IP addresses of the DR and Backup Designated Router (BDR)

- Router ID of the neighbor of the originating router

### Database Synchronization → Full Adjacency

After bidirectional communication is set up between neighbor routers, the DD, LSR, LSU, and LSack packets are used to exchange LSAs and set up the adjacency. The brief process is as follows:

- A router generates an LSA to describe all link states on the router.
- The LSA is exchanged between neighbors. When a router receives the LSA from its neighbor, it copies the LSA and saves the copy in the local LSDB, and then advertises the LSA to other neighbors.
- When the router and its neighbors obtain the same LSDB, full adjacency is achieved.

**i** OSPF will be very quiet without changes in link costs or network addition or deletion. If any change takes place, the changed link states are advertised to quickly synchronize the LSDB.

### SPT Computation → Formation of a Routing Table

After the complete LSDB is obtained from the router, the Dijkstra algorithm is run to generate an SPT from the local router to each destination network. The SPT records the destination networks, next-hop addresses, and costs. OSPF generates a routing table based on the SPT.

If changes in link costs or network addition or deletion take place, the LSDB will be updated. The router again runs the Dijkstra algorithm, generates a new SPT, and updates the routing table.

**i** The Dijkstra algorithm is used to find a shortest path from a vertex to other vertices in a weighted directed graph.

### OSPF Network Types

A router does not necessarily need to exchange LSAs with every neighbor and set up an adjacency with every neighbor. To improve efficiency, OSPF classifies networks that use various link layer protocols into five types so that LSAs are exchanged in different ways to set up an adjacency:

- Broadcast

Neighbors are discovered, and the DR and BDR are elected.

The DR (or BDR) exchanges LSAs with all other routers to set up an adjacency. Except the DR and BDR, all other routers do not exchange LSAs with each other, and the adjacency is not set up.

Ethernet and fiber distributed data interface (FDDI) belong to the broadcast network type by default.

- Non-broadcast multiple access (NBMA)

Neighbors are manually configured, and the DR and BDR are elected.

The DR (or BDR) exchanges LSAs with all other routers to set up an adjacency. Except the DR and BDR, all other routers do not exchange LSAs with each other, and the adjacency is not set up.

X.25, frame relay, and ATM belong to NBMA networks by default.

- Point-to-point (P2P)

Neighbors are automatically discovered, and the DR or BDR is not elected.

LSAs are exchanged between routers at both ends of the link, and the adjacency is set up.

PPP, HDLC, and LAPB belong to the P2P network type by default.

- Point-to-multipoint(P2MP)

Neighbors are automatically discovered, and the DR or BDR is not elected.

LSAs are exchanged between any two routers, and the adjacency is set up.

Networks without any link layer protocol belong to the P2MP network type by default.

- P2MP broadcast

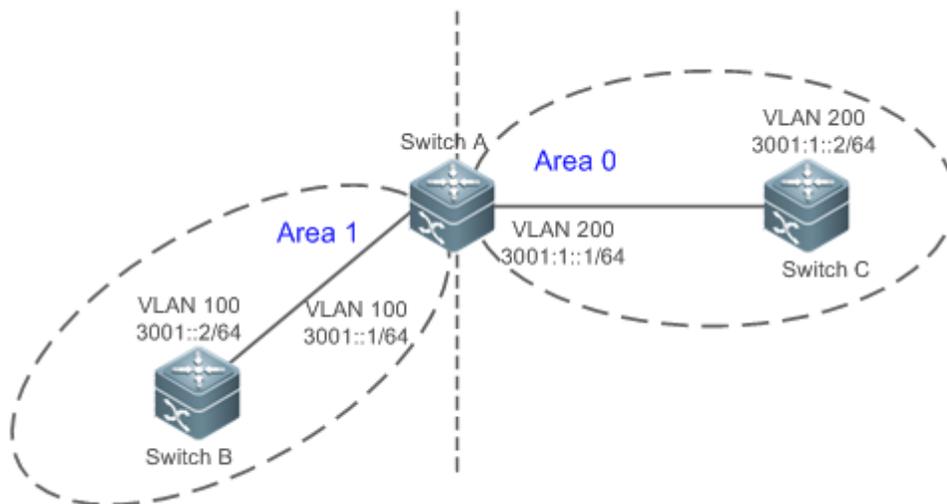

Neighbors are manually configured, and the DR or BDR is not elected.

LSAs are exchanged between any two routers, and the adjacency is set up.

Networks without any link layer protocol belong to the P2MP network type by default.

➤ **OSPF Route Types**

Figure 5-6

Display the OSPF routes (marked in red) in the routing table of Router C.

```
C#show ipv6 route ospf
IPv6 routing table name is Default(0) global scope - 7 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
       I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea, IS - ISIS summary
       O - OSPF intra area, OI - OSPF inter area, OE1 - OSPF external type 1, OE2 - OSPF external type 2
       ON1 - OSPF NSSA external type 1, ON2 - OSPF NSSA external type 2
       [*] - NOT in hardware forwarding table
```

```
L    ::1/128 via Loopback, local host
OI   3001::/64 [110/2] via FE80::21A:A9FF:FE15:4CB9, VLAN 200
C    3001:1::/64 via VLAN 200, directly connected
L    3001:1::2/128 via VLAN 200, local host
L    FE80::/10 via ::1, Null0
C    FE80::/64 via VLAN 200, directly connected
L    FE80::21A:A9FF:FE01:FB1F/128 via VLAN 200, local host
```

A mark is displayed in front of each OSPF route to indicate the type of the route. There are six types of OSPF routes:

- **O:** Intra-area route

This type of route describes how to arrive at a destination network in the local area. The cost of this type of route is equal to the cost of the route from the local router to the destination network.

- **OI:** Inter-area route

This type of route describes how to arrive at a destination network in another area. The cost of this type of route is equal to the cost of the route from the local router to the destination network.

- **OE1:** Type 1 external route

This type of route describes how to arrive at a destination network outside the AS. The cost of this type of route is equal to the cost of the route from the local router to the ASBR plus the cost of the route from the ASBR to the destination network. This type of route does not exist on routers in the stub or NSSA area.

- **OE2:** Type 2 external route

This type of route describes how to arrive at a destination network outside the AS. The cost of this type of route is equal to the cost of the route from the ASBR to the destination network. This type of route does not exist on routers in the stub or NSSA area.

- **ON1:** Type 1 external route of the NSSA area

This type of route describes how to arrive at a destination network outside the AS through the ASBR in the NSSA area. The cost of this type of route is equal to the cost of the route from the local router to the ASBR plus the cost of the route from the ASBR to the destination network. This type of route exists only on routers in the NSSA area.

- **ON2:** Type 2 external route of the NSSA area

This type of route describes how to arrive at a destination network outside the AS through the ASBR in the NSSA area. The cost of this type of route is equal to the cost of the route from the ASBR to the destination network. This type of route exists only on routers in the NSSA area.

---

 Reliability of OE2 and ON2 routes is poor. OSPF believes that the cost of the route from the ASBR to a destination outside an AS is far greater than the cost of the route to the ASBR within the AS. Therefore, when the route cost is computed, only the cost of the route from the ASBR to a destination outside an AS is considered.

---

## [Related Configuration](#)

## ↳ Enabling OSPF

OSPF is disabled by default.

Run the **ipv6 router ospf 1** command to create an OSPF process on the router.

Run the **ipv6 ospfarea** command to enable OSPF on an interface and specify the area ID.

Run the **area virtual-link** command to create a virtual link on the router. The virtual link can be treated as a logical interface.

## ↳ Router ID

By default, the OSPF process elects the largest IPv4 address among the IPv4 addresses of all the loopback interfaces as the router ID. If the loopback interfaces configured with IPv4 addresses are not available, the OSPF process elects the largest IPv4 address among the IPv4 addresses of all the physical ports as the router ID.

Alternatively, you can run the **router-id** command to manually specify the router ID.

## ↳ Protocol Control Parameters

Run the **ipv6 ospf hello-interval** command to modify the Hello interval on the interface. The default value is 10s (or 30s for NBMA networks).

Run the **ipv6 ospf dead-interval** command to modify the neighbor dead interval on the interface. The default value is four times the Hello interval.

Use the **poll-interval** parameter in the **ipv6 ospf neighbor** command to modify the neighbor polling interval on the NBMA interface. The default value is 120s.

Run the **ipv6 ospf transmit-delay** command to modify the LSU packet transmission delay on the interface. The default value is 1s.

Run the **ipv6 ospf retransmit-interval** command to modify the LSU packet retransmission interval on the interface. The default value is 5s.

Use the **hello-interval** parameter in the **area virtual-link** command to modify the Hello interval on the virtual link. The default value is 10s.

Use the **dead-interval** parameter in the **area virtual-link** command to modify the neighbor dead interval on the virtual link. The default value is four times the Hello interval.

Use the **transmit-delay** parameter in the **area virtual-link** command to modify the LSU packet transmission delay on the virtual link. The default value is 1s.

Use the **retransmit-interval** parameter in the **area virtual-link** command to modify the LSU packet retransmission interval on the virtual link. The default value is 5s.

Run the **timers throttle lsa all** command to modify parameters of the exponential backoff algorithm that generates LSAs. The default values of these parameters are 0 ms, 5000 ms, and 5000 ms.

Run the **timers pacing lsa-group** command to modify the LSA group update interval. The default value is 30s.

Run the **timers pacing lsa-transmit** command to modify the LS-UPD packet sending interval and the number of sent LS-UPD packets. The default values are 40 ms and 1.

Run the **timers lsa arrival** command to modify the delay after which the same LSA is received. The default value is 1000 ms.

Run the **timers throttle spf** command to modify the SPT computation delay, minimum interval between two SPT computations, and maximum interval between two SPT computations. The default values are 1000 ms, 5000 ms, and 10000 ms.

### 📌 OSPF Network Types

By default, Ethernet and FDDI belong to the broadcast type, X.25, frame relay, and ATM belong to the NBMA type, and PPP, HDLC, and LAPB belong to the P2P type.

Run the **ipv6 ospf network** command to manually specify the network type of an interface.

Run the **ipv6 ospf neighbor** command to manually specify a neighbor. For the NBMA and P2MP non-broadcast types, you must manually specify neighbors.

Run the **ipv6 ospf priority** command to adjust the priorities of interfaces, which are used for DR/BDR election. The DR/BDR election is required for the broadcast and NBMA types. The router with the highest priority wins in the election, and the router with the priority of 0 does not participate in the election. The default value is 1.

## 5.3.2 OSPF Route Management

Properly plan or optimize OSPF routes through manual configuration to implement management of OSPF routes.

### Working Principle

#### 📌 (Totally) Stub Area and (Totally) NSSA Area

The (totally) stub and (totally) NSSA areas help reduce the protocol interaction load and the size of the routing table.

- If an appropriate area is configured as a (totally) stub or NSSA area, advertisement of a large number of Type 5 and Type 3 LSAs can be avoided within the area.

Area	Type 1 and Type 2 LSAs	Type 3 LSA	Type 4 LSA	Type 5 LSA	Type 7 LSA
Non (totally) stub area and NSSA area	Allowed	Allowed	Allowed	Allowed	Not allowed
Stub area	Allowed	Allowed (containing one default route)	Not allowed	Not allowed	Not allowed
Totally stub area	Allowed	Only one default route is allowed.	Not allowed	Not allowed	Not allowed
NSSA area	Allowed	Allowed (containing one default route)	Allowed	Not allowed	Allowed
Totally NSSA area	Allowed	Only one default route is allowed.	Allowed	Not allowed	Allowed

- **i** The ABR uses Type 3 LSAs to advertise a default route to the (totally) stub or NSSA area.
- **i** The ABR converts Type 7 LSAs in the totally NSSA area to Type 5 LSAs, and advertise Type 5 LSAs to the backbone area.
- If an area is appropriately configured as a (totally) stub area or an NSSA area, a large number of OE1, OE2, and OI routes will not be added to the routing table of a router in the area.

Area	Routes Available in the Routing Table of a Router Inside the Area
Non (totally) stub area and NSSA area	O: a route to a destination network in the local area OI: a route to a destination network in another area OE1 or OE2: a route or default route to a destination network segment outside the AS (via any ASBR in the AS)
Stub area	O: a route to a destination network in the local area OI: a route or a default route to a destination network in another area
Totally stub area	O: a route to a destination network in the local area OI: a default route
NSSA area	O: a route to a destination network in the local area OI: a route or a default route to a destination network in another area ON1 or ON2: a route or default route to a destination network segment outside the AS (via an ASBR in the local area)
Totally NSSA area	O: a route to a destination network in the local area OI: a default route ON1 or ON2: a route or default route to a destination network segment outside the AS (via an ASBR in the local area)

### Route Redistribution

Route redistribution refers to the process of introducing routes of other routing protocols, routes of other OSPF processes, static routes, and direct routes that exist on the device to an OSPF process so that these routes can be advertised to neighbors using Type 5 and Type 7 LSAs. A default route cannot be introduced during route redistribution.

Route redistribution is often used for interworking between ASs. You can configure route redistribution on an ASBR to advertise routes outside an AS to the interior of the AS, or routes inside an AS to the exterior of the AS.

### Default Route Introduction

By configuring a command on an ASBR, you can introduce a default route to an OSPF process so that the route can be advertised to neighbors using Type 5 and Type 7 LSAs.

Default route introduction is often used for interworking between ASs. One default route is used to replace all the routes outside an AS.

### Route Summarization

Route summarization is a process of summarizing routing information with the same prefix into one route, and advertising the summarized route (replacing a large number of individual routes) to neighbors. Route summarization helps reduce the protocol interaction load and the size of the routing table.

By default, the ABR advertises inter-area routing information by using Type3 LSAs within a network segment, and advertises redistributed routing information by using Type 5 and Type 7 LSAs. If continuous network segments exist, it is recommended that you configure route summarization.

### Route Filtering

OSPF supports route filtering to ensure security and facilitate control when the routing information is being learned, exchanged, or used.

Using configuration commands, you can configure route filtering for the following items:

- **Interface:** The interface is prevented from sending routing information (any LSAs) or exchanging routing information (any LSAs) with neighbors.
- **Routing information outside an AS:** Only the routing information that meets the filtering conditions can be redistributed to the OSPF process (Type 5 and Type 7 LSAs).
- **LSAs received by a router:** In the OSPF routing table, only the routes that are computed based on the LSAs meeting the filtering conditions can be advertised.

### Route Cost

If redundancy links or devices exist on the network, multiple paths may exist from the local device to the destination network. OSPF selects the path with the minimum total cost to form an OSPF route. The total cost of a path is equal to the sum of the costs of individual links along the path. The total cost of a path can be minimized by modifying the costs of individual links along the path. In this way, OSPF selects this path to form a route.

Using configuration commands, you can modify the following link costs:

- Cost from an interface to a directly connected network segment and cost from the interface to a neighbor
- Cost from an ABR to the default network segment
- Cost from an ASBR to an external network segment and cost from the ASBR to the default network segment

**i** Both the cost and the metric indicate the cost and are not differentiated from each other.

### OSPF Administrative Distance

The administrative distance (AD) evaluates reliability of a route, and the value is an integer ranging from 0 to 255. A smaller AD value indicates that the route is more trustworthy. If multiples exist to the same destination, the route preferentially selects a route with a smaller AD value. The route with a greater AD value becomes a floating route, that is, a standby route of the optimum route.

By default, the route coming from one source corresponds to an AD value. The AD value is a local concept. Modifying the AD value affects route selection only on the current router.

Route Source	Directly-connected network	Static route	EBGP Route	OSPF Route	IS-IS Route	RIP Route	IBGP Route	Unreachable Route
Default AD	0	1	20	110	115	120	200	255

## Related Configuration

### Stub/NSSA Area

By default, no stub or nssa area is configured.

Run the **area stub** command to configure a specified area as a stub area.

Run the **area nssa** command to configure a specified area as a nssa area.

-  A backbone area cannot be configured as a stub or nssa area.
-  A transit area (with virtual links going through) cannot be configured as a stub or nssa area.
-  An area containing an ASBR cannot be configured as a stub area.

### Route Redistribution and Default Route Introduction

By default, routes are not redistributed and the default route is not introduced.

Run the **redistribute** command to configure route redistribution.

Run the **default-information originate** command to introduce a default route.

After configuring route redistribution and default route introduction, the router automatically becomes an ASBR.

### Route Summarization

By default, routes are not summarized. If route summarization is configured, a discard route will be automatically added.

Run the **area range** command to summarize routes (Type 3 LSA) distributed between areas on the ABR.

Run the **summary-prefix** command to summarize redistributed routes (Type 5 and Type 7 LSAs) on the ASBR.

### Route Filtering

By default, routes are not filtered.

Run the **passive-interface** command to configure a passive interface. Routing information (any LSAs) cannot be exchanged on a passive interface.

Use the **route-map** parameter in the **redistribute** command, or use the **distribute-list out** command to filter the external routing information of the AS on the ASBR. Only the routing information that meets the filtering conditions can be redistributed to the OSPF process (Type 5 LSAs).

Run the **distribute-list in** command to filter LSAs received by the router. In the OSPF routing table, only the routes that are computed based on the LSAs meeting the filtering conditions can be advertised.

### Route Cost

- Cost from the interface to the directly-connected network segment (cost on the interface)  
The default value is the auto cost. Auto cost = Reference bandwidth/Interface bandwidth  
Run the **auto-cost reference-bandwidth** command to set the reference bandwidth of the auto cost. The default value is 100 Mbps.  
Run the **ipv6 ospf cost** command to manually set the cost of the interface. The configuration priority of this item is higher than that of the auto cost.
- Cost from the interface to a specified neighbor (that is, cost from the local device to a specified neighbor)  
The default value is the auto cost.  
Use the **cost** parameter in the **ipv6 ospf neighbor** command to modify the cost from the interface to a specified neighbor. The configuration priority of this item is higher than that of the cost of the interface.  
This configuration item is applicable only to P2MP-type interfaces.

- Cost from the ABR to the default network segment (that is, the cost of the default route that is automatically advertised by the ABR to the stub area)  
The default value is 1.  
Run the **area default-cost** command to modify the cost of the default route that the ABR automatically advertise to the stub or nssa areas.
- Cost from the ASBR to an external network segment (that is, the metric of an external route)  
By default, the metric of a redistributed BGP route is 1, the metric of other types of redistributed routes is 20, and the route type is Type 2 External.  
Run the **default-metric** command to modify the default metric of the external route.  
Use the **metric**, **metric-type**, and **route-map** parameters in the **redistribute** command to modify the metric and route type of the external route.
- Cost from the ASBR to the default network segment (that is, the metric of the default route that is manually introduced)  
By default, the metric is 1, and the route type is Type 2 External.  
Use the **metric**, **metric-type**, and **route-map** parameters in the **default-information originate** command to modify the metric and route type of the default route that is manually introduced.
- Use the **metric** and **metric-type** parameters of **default-information originate** in the **area nssa** command to modify the metric and type of the default route that is manually introduced to the NSSA area.

#### ↘ OSPF Administrative Distance

By default, the OSPF AD is 110.

Run the **distance** command to set the AD of an OSPF route.

### 5.3.3 Enhanced Security and Reliability

Use functions such as authentication and BFD correlation to enhance security, stability, and reliability of OSPF.

#### Working Principle

##### ↘ Authentication

OSPFv3 uses the authentication mechanism, that is, IP authentication header (AH) and IP Encapsulating Security Payload (ESP), provided by IPv6 to prevent unauthorized routers that access the network and hosts that forge OSPF packets to participate in OSPF routing. OSPF packets received on the OSPF interface (or at both ends of a virtual link) are authenticated. If authentication fails, the packets are discarded and the adjacency cannot be set up.

Enabling authentication can avoid learning unauthenticated or invalid routes, thus preventing advertising valid routes to unauthenticated devices. In the broadcast-type network, authentication also prevents unauthenticated devices from becoming designated devices, ensuring stability of the routing system and protecting the routing system against intrusions.

##### ↘ MTU Verification

On receiving a DD packet, OSPF checks whether the MTU of the neighbor interface is the same as the MTU of the local interface. If the MTU of the interface specified in the received DD packet is greater than the MTU of the interface that receives the packet, the adjacency cannot be set up. Disabling MTU verification can avoid this problem.

Two-Way Maintenance

OSPF routers periodically send Hello packets to each other to maintain the adjacency. On a large network, a lot of packets may be sent or received, occupying too much CPU and memory. As a result, some packets are delayed or discarded. If the processing time of Hello packets exceeds the dead interval, the adjacency will be destroyed.

If the two-way maintenance function is enabled, in addition to the Hello packets, the DD, LSU, LSR, and LSAck packets can also be used to maintain the bidirectional communication between neighbors, which makes the adjacency more stable.

Concurrent neighbor Interaction Restriction

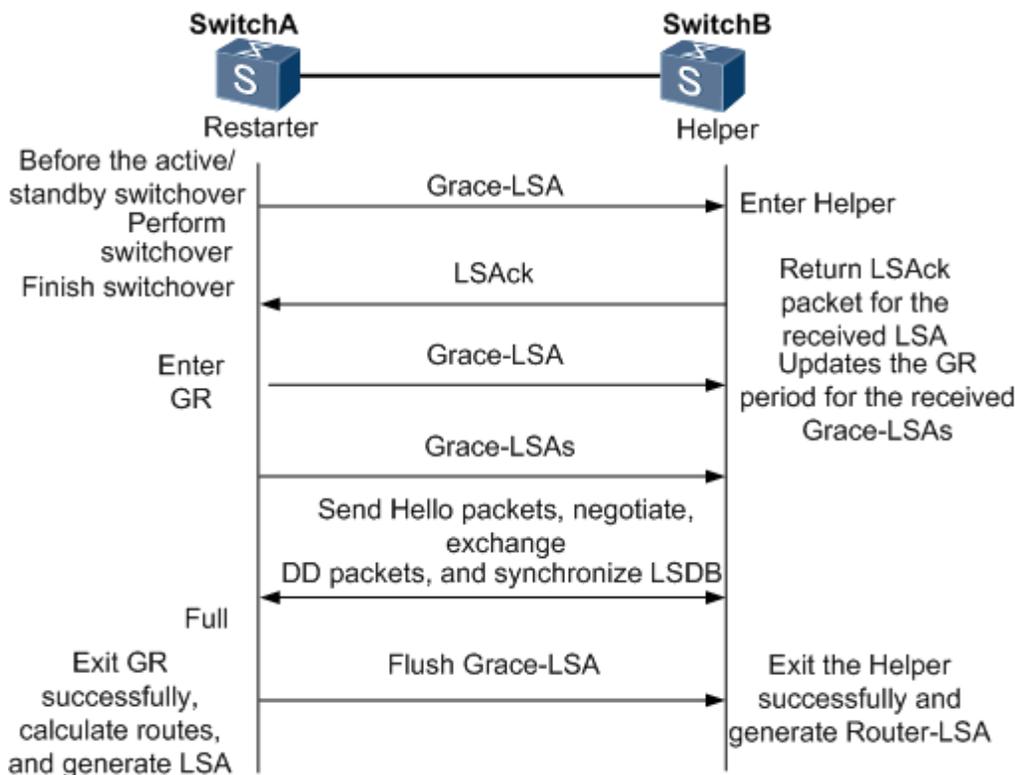

When a router simultaneously exchanges data with multiple neighbors, its performance may be affected. If the maximum number of neighbors that concurrently initiate or accept interaction with the OSPF process, the router can interact with neighbors by batches, which ensures data forwarding and other key services.

GR

The control and forwarding separated technology is widely used among routers. On a relatively stable network topology, when a GR-enabled router is restarted on the control plane, data forwarding can continue on the forwarding plane. In addition, actions (such as adjacency re-forming and route computation) performed on the control plane do not affect functions of the forwarding plane. In this way, service interruption caused by route flapping can be avoided, thus enhancing reliability of the entire network.

Currently, the GR function is used only during active/standby switchover and system upgrade.

Figure 5-7 Normal OSPF GR Process

- The GR process requires collaboration between the restarter and the helper. The restarter is the router where GR occurs. The helper is a neighbor of the restarter.
- When entering or exiting the GR process, the restarter sends a Grace-LSA to the neighbor, notifying the neighbor to enter or exit the helper state.
- When the adjacency between the restarter and the helper reaches the Full state, the router can exit the GR process successfully.

### ↘ Fast Hello and BFD Correlation

After a link fault occurs, it takes a period of time (about 40s) before OSPF can sense the death of the neighbor. Then, OSPF advertises the information and re-computes the SPT. During this period, traffic is interrupted.

- After the fast Hello function is enabled (that is, the neighbor dead interval is set to 1s), OSPF can sense the death of a neighbor within 1s once a link is faulty. This greatly accelerates route convergence and prevents traffic interruption.
- BFD is used to test connectivity between devices. A link fault can be detected in as short as 150 ms. After OSPF is correlated with BFD, OSPF can sense the death of a neighbor in as short as 150 ms once a link is faulty. This greatly accelerates route convergence and prevents traffic interruption.

## Related Configuration

### ↘ OSPF Packet Authentication

By default, authentication is disabled.

- Run the **area authentication** command to enable authentication in the entire area so that the authentication function takes effect on all interfaces in this area. If authentication is enabled in area 0, the function also takes effect on the virtual link.
- Run the **area encryption** command to enable encryption and authentication in the entire area so that the encryption and authentication functions take effect on all interfaces in this area. If encryption and authentication are enabled in area 0, the functions also take effect on the virtual link.
- Run the **ipv6 ospf authentication** command to enable authentication on an interface. This configuration takes precedence over the area-based configuration.
- Run the **ipv6 ospf encryption** command to enable encryption and authentication on an interface. This configuration takes precedence over the area-based configuration.
- Use the **authentication** parameter in the **area virtual-link** command to enable authentication at both ends of a virtual link. This configuration takes precedence over the area-based configuration.
- Use the **encryption** parameter in the **area virtual-link** command to enable encryption and authentication at both ends of a virtual link. This configuration takes precedence over the area-based configuration.

### ↘ MTU Verification

By default, MTU verification is disabled.

Run the **ipv6 ospf mtu-ignore** command to disable MTU verification on an interface.

### ↘ Two-Way Maintenance

By default, bidirectional maintenance is enabled.

Run the **two-way-maintain** command to enable two-way maintenance.

### ↘ Concurrent neighbor Interaction Restriction

Run the **max-concurrent-dd** command to modify the maximum number of neighbors that are concurrently interacting with the current OSPF process. The default value is 5.

Run the **ipv6 router ospf max-concurrent-dd** command to modify the maximum number of neighbors that are concurrently interacting with all OSPF processes on the router. The default value is 10.

### ↘ GR

By default, the restarter function is disabled, and the helper function is enabled.

Run the **graceful-restart** command to configure the restarter function.

Run the **graceful-restart helper** command to configure the helper function.

### ↘ Fast Hello

By default, the neighbor dead interval on the interface is 40s.

Run the **ipv6 ospf dead-interval minimal hello-multiplier** command to enable the Fast Hello function on an interface, that is, the neighbor dead interval is 1s.

### ↘ Correlating OSPF with BFD

By default, OSPF is not correlated with BFD.

Run the **bfd interval min\_rx multiplier** command to set the BFD parameters.

Run the **bfd all-interfaces** command to correlate OSPF with BFD on all interfaces.

Run the **ipv6 ospf bfd** command to correlate OSPF with BFD on the current interface.

## 5.3.4 Network Management Functions

Use functions such as the MIB and Syslog to facilitate OSPF management.

### Working Principle

#### ↘ MIB

MIB is the device status information set maintained by a device. You can use the management program to view and set the MIB node.

Multiple OSPF processes can be simultaneously started on a router, but the OSPF MIB can be bound with only one OSPF process.

#### ↘ Trap

A trap message is a notification generated when the system detects a fault. This message contains the related fault information.

If the trap function is enabled, the router can proactively send the trap messages to the network management device.

### ↳ Syslog

The Syslog records the operations (such as command configuration) performed by users on routers and specific events (such as network connection failures).

If the syslog is allowed to record the adjacency changes, the network administrator can view the logs to learn the entire process that the OSPF adjacency is set up and maintained.

## Related Configuration

### ↳ MIB

By default, the MIB is bound with the OSPF process with the smallest process ID.

Run the **enable mib-binding** command to bind the MIB with the current OSPF process.

### ↳ Trap

By default, all traps functions are disabled, and the device is not allowed to send OSPF traps.

Run the **snmp-server enable traps ospf** command to allow the device to send OSPF traps.

Run the **enable traps** command to enable a specified trap function for an OSPF process.

### ↳ Syslog

By default, the Syslog is allowed to record the adjacency changes.

Run the **log-adj-changes** command to allow the Syslog to record the adjacency changes.

## 5.4 Configuration

Configuration	Description and Command	
<a href="#">Configuring OSPF Basic Functions</a>	 (Mandatory) It is used to build an OSPF routing domain.	
	<b>ipv6routerospf</b>	Creates an OSPF process.
	<b>router-id</b>	Configures a router ID.
	<b>ipv6 ospfarea</b>	Enables OSPF on an interface and specifies an area ID.
<a href="#">Setting the Network Type</a>	 (Optional) The configurations are mandatory if the physical network is the X.25, frame relay, or ATM network.	
	<b>ipv6 ospf network</b>	Defines the network type.
	<b>ipv6 ospf neighbor</b>	Specifies a neighbor.
	<b>area virtual-link</b>	Creates a virtual link.

Configuration	Description and Command	
	<b>ipv6 ospf priority</b>	Configures the DR priority.
<a href="#">Configuring Route Redistribution and Default Route</a>	 (Optional) The configurations are recommended if the OSPF routing domain is connected with an external network.	
	<b>redistribute</b>	Configures route redistribution.
	<b>default-information originate</b>	Introduces a default route.
<a href="#">Configuring the Stub/NSSA Area</a>	 (Optional) It is used to reduce interaction of routing information and the size of routing table, and enhance stability of routes.	
	<b>Area stub</b>	Configures a stub area.
	<b>Area nssa</b>	Configures a nssa area.
<a href="#">Configuring Route Summarization</a>	 (Optional) It is used to reduce interaction of routing information and the size of routing table, and enhance stability of routes.	
	<b>arearange</b>	Summarizes routes that are advertised between areas.
	<b>summary-prefix</b>	Summarizes routes that are introduced through redistribution.
<a href="#">Configuring Route Filtering</a>	 (Optional) It is used to manually control interaction of routing information and filter available OSPF routes.	
	<b>passive-interface</b>	Configures a passive interface.
	<b>distribute-list out</b>	Filters routes that are introduced through redistribution.
	<b>distribute-listin</b>	Filters received LSAs.
<a href="#">Modifying the Route Cost and AD</a>	 (Optional) It is used to manually control the shortest route computed by OSPF and determine whether to select an OSPF route preferentially.	
	<b>auto-costreference-bandwidth</b>	Modifies the reference bandwidth of the auto cost.
	<b>ipv6 ospf cost</b>	Modifies the cost in the outbound direction of an interface.
	<b>areadefault-cost</b>	Modifies the cost of the default route in a stub/nssa area.
	<b>default-metric</b>	Modifies the default metric of a redistributed route.
	<b>distance</b>	Modifies the OSPF AD.
<a href="#">Enabling Authentication</a>	 (Optional) It is used to prevent routers that illegally access the network and hosts that forge OSPF packets from participating in the OSPF protocol process.	
	<b>areaauthentication</b>	Enables authentication and sets the authentication mode in an area.

Configuration	Description and Command	
	<b>areaencryption</b>	Enables encryption and authentication and sets the authentication mode in an area.
	<b>ipv6 ospf authentication</b>	Enables authentication and sets the authentication mode on an interface.
	<b>ipv6 ospf encryption</b>	Enables encryption and authentication and sets the authentication mode on an interface.
<a href="#">Modifying the Maximum Number of Concurrent Neighbors</a>	 (Optional) It is used to prevent the problem of performance deterioration caused by over-consumption of the CPU.	
	<b>max-concurrent-dd</b>	Modifies the maximum number of concurrent neighbors on the current OSPF process.
	<b>ipv6 router ospf max-concurrent-dd</b>	Modifies the maximum number of concurrent neighbors on all OSPF processes.
<a href="#">Disabling MTU Verification</a>	 (Optional) It is used to prevent the problem that the adjacency cannot be set up due to MTU inconsistency on the neighbor interface.	
	<b>ipv6 ospf mtu-ignore</b>	Disables MTU verification on an interface.
<a href="#">Enabling Two-Way Maintenance</a>	 (Optional) It is used to prevent termination of the adjacency due to the delay or loss of Hello packets.	
	<b>two-way-maintain</b>	Enables two-way maintenance.
<a href="#">Enabling GR</a>	 (Optional) It is used to retain OSPF routing forwarding during restart or active/standby switchover of the OSPF processes to prevent traffic interruption.	
	<b>graceful-restart</b>	Enables the restarter function.
	<b>graceful-restart helper</b>	Enables the helper function.
Enabling Fast Hello	 (Optional) It is used to quickly discover the death of a neighbor to prevent traffic interruption when a link is faulty.	
	<b>ipv6 ospf dead-intervalminimal hello-multiplier</b>	Enabling the Fast Hello function on an interface.
<a href="#">Enabling GR</a>	 (Optional) It is used to retain OSPF routing forwarding during restart or active/standby switchover of the OSPF processes to prevent traffic interruption.	
	<b>graceful-restart</b>	Enables the restarter function.
	<b>graceful-restart helper</b>	Enables the helper function.
<a href="#">Correlating OSPF with BFD</a>	 (Optional) It is used to quickly discover the death of a neighbor to prevent traffic interruption when a link is faulty.	
	<b>bfd all-interfaces</b>	Correlates OSPF with BFD on all interfaces.

Configuration	Description and Command	
	<b>ipv6 ospf bfd</b>	Correlates OSPF with BFD on the current interface.
<a href="#">Configuring Network Management Functions</a>	 (Optional) The configurations enable users to use the SNMP network management software to manage OSPF.	
	<b>enable mib-binding</b>	Bind MIB to the OSPF process.
	<b>enable traps</b>	Enables the trap function of the OSPF process.
	<b>log-adj-changes</b>	Allows the syslogs to record the changes in adjacency status.
<a href="#">Modifying Protocol Control Parameters</a>	 (Optional) You are advised not to modify protocol control parameters unless necessary.	
	<b>ipv6 ospf hello-interval</b>	Modifies the Hello interval on an interface.
	<b>ipv6 ospf dead-interval</b>	Modifies the neighbor death interval on an interface.
	<b>ipv6 ospf transmit-delay</b>	Modifies the LSU packet transmission delay on an interface.
	<b>ipv6 ospf retransmit-interval</b>	Modifies the LSU packet retransmission interval on an interface.
	<b>timers throttle lsa all</b>	Modifies parameters of the exponential backoff algorithm that generates LSAs.
	<b>timers pacing lsa-group</b>	Modifies the LSA group update interval.
	<b>timers pacing lsa-transmit</b>	Modifies the LS-UPD packet sending interval.
	<b>timers lsa arrival</b>	Modifies the delay after which the same LSA is received.
	<b>timers throttle spf</b>	Modifies the SPT computation timer.
	<b>timers throttle route inter-area</b>	Modifies the inter-area route computation delay.
<b>timers throttle route ase</b>	Modifies the inter-area route computation delay.	

## 5.4.1 Configuring OSPF Basic Functions

### Configuration Effect

- Set up an OSPF routing domain on the network to provide IPv6 unicast routing service for users on the network.

### Notes

- Ensure that the IPv6 routing function is enabled, that is, **ipv6 routing** is not disabled; otherwise, OSPF cannot be enabled.
- IPv6 must be enabled on the interface.

- It is strongly recommended that you manually configure the router ID.

### Configuration Steps

#### ↳ Creating an OSPF Process

- Mandatory.
- The configuration is mandatory for every router.

#### ↳ Configuring a Router ID

- (Optional) It is strongly recommended that you manually configure the router ID.
- If the router ID is not configured, OSPF selects an interface IP address. If the IP address is not configured for any interface, or the configured IP addresses have been used by other OSPF instances, you must manually configure the router ID.

#### ↳ Enabling OSPF on an Interface and Specifying an Area ID

- Mandatory.
- The configuration is mandatory for every router.

### Verification

- Run the **show ipv6 route ospf** command to verify that the entries of the OSPF routing table are correctly loaded.
- Run the **ping** command to verify that the IPv6 unicast service is correctly configured.

### Related Commands

#### ↳ Creating an OSPF Process

<b>Command</b>	<b>ipv6 router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]
<b>Parameter</b>	<i>process-id</i> : Indicates the OSPFv3 process ID. If the process ID is not specified, process 1 is enabled.
<b>Description</b>	<i>vrf-name</i> : Specifies the VPN routing and forwarding (VRF) to which the OSPFv3 process belongs.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After enabling the OSPFv3 process, the device enters the routing process configuration mode.

#### ↳ Configuring a Router ID

<b>Command</b>	<b>router-id</b> <i>router-id</i>
<b>Parameter Description</b>	<i>router-id</i> : Indicates the ID of the device, which is expressed in the IPv4 address.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	Every device where OSPFv3 run must be identified by using a router ID. You can configure any IPv4 address as the router ID of the device, and ensure that the router ID is unique in an AS. If multiple OSPFv3

processes run on the same device, the router ID of each process must also be unique. After the router ID changes, OSPF performs a lot of internal processing. Therefore, you are advised not to change the router ID unless necessary. When an attempt is made to modify the router ID, a prompt is displayed, requesting you to confirm the modification. After the OSPFv3 process is enabled, you are advised to specify the router ID before configuring other parameters of the process.

↳ **Enabling OSPF on an Interface and Specifying an Area ID**

<b>Command</b>	<code>ipv6 ospf process-id area area-id [instance instance-id]</code>
<b>Parameter Description</b>	<p><i>process-id</i>: Indicates the ID of an OSPFv3 process. The value ranges from 1 to 65,535.</p> <p><b>Area</b> <i>area-id</i>: Indicates the ID of the OSPFv3 area in which the interface participates. It can be an integer or an IPv4 prefix.</p> <p><b>Instance</b> <i>instance-id</i>: Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Run this command in interface configuration mode to enable the interface to participate in OSPFv3, and then run the <b>ipv6 router ospf</b> command to configure the OSPFv3 process. After the OSPFv3 process is configured, the interface will automatically participate in the related process.</p> <p>Run the <b>no ipv6 ospf area</b> command so that the specified interface no longer participates in the OSPFv3 routing process.</p> <p>Run the <b>no ipv6 router ospf</b> command so that all interfaces no longer participate in the OSPFv3 routing process.</p> <p>The adjacency can be set up only between devices with the same <i>instance-id</i>.</p> <p>After this command is configured, all prefix information on the interface will participate in the OSPFv3 process.</p>

↳ **Creating a Virtual Link**

<b>Command</b>	<code>area area-id virtual-link router-id [hello-interval seconds] [dead-interval seconds] [retransmit-interval seconds] [transmit-delay seconds] [instance instance-id] [ authentication ipsec spi spi [md5 sha1] [0 7] key] [ encryption ipsec spi spi esp null [md5 sha1] [0 7] key]</code>
<b>Parameter Description</b>	<p><i>area-id</i>: Indicates the ID of the area where the virtual link is located. It can be an integer or an IPv4 prefix.</p> <p><i>router-id</i>: Indicates the router ID of the neighbor connected to the virtual link.</p> <p><b>dead-interval</b> <i>seconds</i>: Indicates the time that the local interface of the virtual link detects the failure of the neighbor. The unit is second. The value ranges from 1 to 65,535.</p> <p><b>hello-interval</b> <i>seconds</i>: Indicates the time that the Hello packet is sent on the local interface of the virtual link. The unit is second. The value ranges from 1 to 65,535.</p> <p><b>retransmit-interval</b> <i>seconds</i>: Indicates the interval at which the LSA is retransmitted on the local interface of the virtual link. The unit is second. The value ranges from 1 to 65,535.</p> <p><b>transmit-delay</b> <i>seconds</i>: Indicates the delay after which the LSA is sent on the local interface of the virtual link. The unit is second. The value ranges from 1 to 65,535.</p> <p><b>instance</b> <i>instance-id</i>: Indicates the ID of the instance corresponding to the virtual link. The value ranges from</p>

	<p>0 to 255. A virtual link cannot be set up between devices with different instance IDs.</p> <p><i>spi</i>: Indicates the security parameter index (SPI). The value ranges from 256 to 4,294,967,295.</p> <p><i>md5</i>: Enables message digit 5 (MD5) authentication.</p> <p><i>sha1</i>: Enables Secure Hash Algorithm 1 (SHA1) authentication.</p> <p>0: Indicates that the key is displayed in plain text.</p> <p>7: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p> <p><b>null</b>: Indicates that no encryption mode is used.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>In an OSPFv3 AS, all areas must be connected to the backbone area to properly learn the routing information of the entire OSPFv3 AS. If an area cannot be directly connected to the backbone area, the virtual link can be used to connect this area to the backbone area.</p> <p>The area where the virtual link is located cannot be a stub or nssa area.</p> <p>At both ends of neighbors between which the virtual link is set up, settings of <b>hello-interval</b>, <b>dead-interval</b>, and <b>instance</b> must be consistent; otherwise, the adjacency cannot be set up properly.</p>

### Configuration Example

<p><b>Scenario</b></p> <p>Figure 5-8</p>	
	<p><b>Remarks</b></p> <p>The interface IP addresses are as follows:</p> <p>A: GE 0/1 2001:1::1/64    GE 0/2 2001:2::1/64</p> <p>B: GE 0/1 2001:1::2/64    GE 0/2 2001:3::1/64</p> <p>C: GE 0/3 2001:2::2/64</p> <p>D: GE 0/3 2001:3::2/64</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers.</li> <li>● Enable the IPv4 unicast routing function on all routers. (This function is enabled by default.)</li> <li>● Configure the OSPF instances and router IDs on all routers.</li> <li>● Enable OSPF on the interfaces configured on all routers.</li> </ul>
<b>A</b>	<pre>A#configure terminal A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ipv6 enable</pre>

Success rate is 100 percent (5/5), round-trip min/avg/max = 5/9/14 ms.
```

## Common Errors

- IPv6 is disabled on the interface.
- OSPF cannot be enabled because the IPv6 unicast routing function is disabled.
- The area IDs enabled on adjacent interfaces are inconsistent.
- The same router ID is configured on multiple routers, resulting in a router ID conflict.

## 5.4.2 Setting the Network Type

### Configuration Effect

- If the physical network is X.25, Frame Relay, or ATM, OSPF can also run to provide the IPv6 unicast routing service.

## Notes

- The OSPF basic functions must be configured.
- The broadcast network sends multicast OSPF packets, automatically discovers neighbors, and elects a DR and a BDR.
- The P2P network sends multicast OSPF packets and automatically discovers neighbors.
- The NBMA network sends unicast OSPF packets. Neighbors must be manually specified, and a DR and a BDR must be elected.
- The P2MP network (without carrying the **non-broadcast** parameter) sends multicast OSPF packets. Neighbors are automatically discovered.
- The P2MP network (carrying the **non-broadcast** parameter) sends unicast OSPF packets. Neighbors must be manually specified.

## Configuration Steps

### ▾ Configuring the Interface Network Type

- Optional.
- Perform this configuration on routers at both ends of the link.

### ▾ Configuring a Neighbor

- (Optional) If the interface network type is set to NBMA or P2MP (carrying the **non-broadcast** parameter), neighbors must be configured.
- Neighbors are configured on routers at both ends of the NBMA or P2MP (carrying the **non-broadcast** parameter) network.

### ▾ Configuring the Interface Priority

- (Optional) You must configure the interface priority if a router must be specified as a DR, or a router cannot be specified as a DR.
- Configure the interface priority on a router that must be specified as a DR, or cannot be specified as a DR.

## Verification

- Run the **show ipv6 ospf interface** command to verify that the network type of each interface is correct.

## Related Commands

### ▾ Configuring the Interface Network Type

Command	<code>ipv6 ospf network {broadcast   non-broadcast   point-to-point   point-to-multipoint[non-broadcast]}[instance <i>instance-id</i>]</code>
Parameter	<b>broadcast</b> : Indicates the broadcast network type.

<b>Description</b>	<p><b>non-broadcast:</b> Indicates the non-broadcast network type.</p> <p><b>point-to-multipoint:</b> Indicates the point-to-multipoint (P2MP) network type.</p> <p><b>point-to-multipoint non-broadcast:</b> Indicates the P2MP non-broadcast network type.</p> <p><b>point-to-point:</b> Indicates the point-to-point (P2P) network type.</p> <p><b>instance</b><i>instance-id</i>: Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	You can configure the network type of an interface based on the actual link type and topology.

### ↘ Configuring a Neighbor

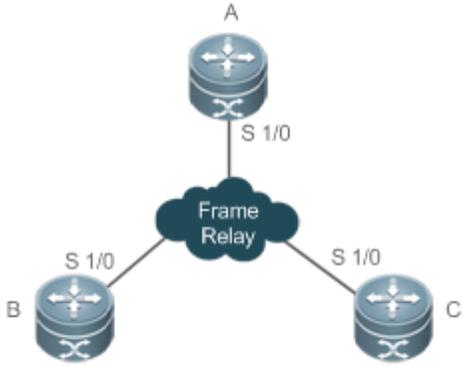

<b>Command</b>	<b>ipv6 ospf neighbor</b> <i>ipv6-address</i> [ <b>cost</b> <i>cost</i> ]   [ <b>poll-interval</b> <i>seconds</i>   <b>priority</b> <i>value</i> ] [ <b>instance</b> <i>instance-id</i> ]
<b>Parameter Description</b>	<p><i>ip-address</i>: Indicates the link address of the neighbor interface.</p> <p><b>cost</b><i>cost</i>: Indicates the cost required from the P2MP network to each neighbor. The cost is not defined by default. The cost configured on the interface is used. The value ranges from 1 to 65,535. Only a P2MP network supports this option.</p> <p><b>poll-interval</b> <i>seconds</i>: Indicates the neighbor polling interval. The unit is second. The value ranges from 1 to 2,147,483,647. Only the non-broadcast (NBMA) network supports this option.</p> <p><b>priority</b> <i>value</i>: Indicates the priority value of the non-broadcast network neighbor. The value ranges from 0 to 255. Only the non-broadcast network (NBMA) supports this option.</p> <p><b>instance</b><i>instance-id</i>: Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	You can configure neighbor parameters based on the actual network type.

### ↘ Configuring the Interface Priority

<b>Command</b>	<b>ipv6 ospf priority</b> <i>number-value</i> [ <b>instance</b> <i>instance-id</i> ]
<b>Parameter Description</b>	<p><i>number-value</i>: Indicates the priority of the interface. The value ranges from 0 to 255.</p> <p><b>instance</b><i>instance-id</i>: Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>On a broadcast network, a DR or BDR must be elected. During the DR/BDR election, the device with a higher priority will be preferentially elected as a DR or BDR. If the priority is the same, the device with a larger router ID will be preferentially elected as a DR or BDR.</p> <p>A device with the priority 0 does not participate in the DR/BDR election.</p>

## Configuration Example

### ↘ Configuring the Interface Network Type

<p><b>Scenario</b> <b>Figure 5-9</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.</li> <li>● Configure the OSPF basic functions on all routers.</li> <li>● Set the interface network type to P2MP on all routers.</li> </ul>
<p><b>A</b></p>	<pre>A#configure terminal A(config)# interface Serial1/0 A(config-Serial1/0)# encapsulation frame-relay A(config-Serial1/0)# ipv6 ospf network point-to-multipoint</pre>
<p><b>B</b></p>	<pre>B#configure terminal B(config)# interface Serial1/0 B(config-Serial1/0)# encapsulation frame-relay B(config-Serial1/0)# ipv6 ospf network point-to-multipoint</pre>
<p><b>C</b></p>	<pre>C#configure terminal C(config)# interface Serial1/0 C(config-Serial1/0)# encapsulation frame-relay C(config-Serial1/0)# ipv6 ospf network point-to-multipoint</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Verify that the interface network type is P2MP.</li> </ul>

A	<pre>A#show ipv6 ospf interface Serial1/0  Serial1/0 is up, line protocol is up  Interface ID 2  IPv6 Prefixes      fe80::2d0:f8ff:fe22:3346/64 (Link-Local Address)  OSPFv3 Process (1), Area 0.0.0.1, Instance ID 0  Router ID 192.168.22.30, Network Type POINTOMULTIPOINT, Cost: 1  Transmit Delay is 1 sec, State Point-To-Point, Priority 1  Timer interval configured, Hello 30, Dead 120, Wait 40, Retransmit 10      Hello due in 00:00:06  Neighbor Count is 1, Adjacent neighbor count is 1  Hello received 40 sent 40, DD received 17 sent 9  LS-Req received 1 sent 3, LS-Upd received 6 sent 5  LS-Ack received 3 sent 4, Discarded 1</pre>
---	---

### Common Errors

- The network types configured on interfaces at two ends are inconsistent, causing abnormal route learning.
- The network type is set to NBMA or P2MP (non-broadcast), but neighbors are not specified.

## 5.4.3 Configuring Route Redistribution and Default Route

### Configuration Effect

- Introduce unicast routes for other AS domains to the OSPF domain to provide the unicast routing service to other AS domains for users in the OSPF domain.
- In the OSPF domain, inject a default route to another AS domain so that the unicast routing service to another AS domain can be provided for users in the OSPF domain.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ↘ Configuring External Route Redistribution

- (Optional) This configuration is mandatory if external routes of the OSPF domain should be introduced to the ASBR.
- Perform this configuration on an ASBR.

➤ **Generating a Default Route**

- (Optional) Perform this configuration if the default route should be introduced to an ASBR so that other routers in the OSPF domain access other AS domains through this ASBR by default.
- Perform this configuration on an ASBR.

**Verification**

- On a router inside the OSPF domain, run the **show ipv6 route ospf** command to verify that the unicast routes to other AS domains are loaded.
- On a router inside the OSPF domain, run the **show ipv6 route ospf** command to verify that the default route to the ASBR is loaded.
- Run the **ping** command to verify that the IPv6 unicast service to other AS domains is correct.

**Related Commands**

➤ **Configuring Route Redistribution**

<b>Command</b>	<b>redistribute</b> { <b>bgp</b>   <b>connected</b> [ <i>isis</i> [ <i>area-tag</i> ]   <i>ospf</i> <i>process-id</i> ]   <b>rip</b>   <b>static</b> }{ <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> }   <b>match</b> { <b>internal</b>   <b>external</b> [1 2]   <b>nssa-external</b> [ 1   2 ]}   <b>metric</b> <i>metric-value</i>   <b>metric-type</b> {1 2}   <b>route-map</b> <i>route-map-name</i> [ <b>tag</b> <i>tag-value</i> ]
<b>Parameter Description</b>	<p><b>bgp</b>: Indicates redistribution from BGP.</p> <p><b>connected</b>: Indicates redistribution from direct routes.</p> <p><b>isis</b> [<i>area-tag</i>]: Indicates redistribution from IS-IS. <b>area-tag</b> specifies the IS-IS instance.</p> <p><b>ospf</b><i>process-id</i>: Indicates redistribution from OSPF. <b>process-id</b> specifies an OSPF instance. The value ranges from 1 to 65535. 1-65535</p> <p><b>rip</b>: Indicates redistribution from RIP.</p> <p><b>static</b>: Indicates redistribution from static routes.</p> <p><b>level-1</b>   <b>level-1-2</b>   <b>level-2</b>: Used only when IS-IS routes are redistributed. Only the routes of the specified level are redistributed. By default, only level-2 IS-IS routes can be redistributed.</p> <p><b>match</b>: Used only when OSPF routes are redistributed. Only the routes that match the specified criteria are redistributed. By default, all OSPF routes can be redistributed.</p> <p><b>metric</b><i>metric-value</i>: Indicates the metric of the OSPF external LSA. <i>metric-value</i> specifies the size of the metric. The value ranges from 0 to 16,777,214.</p> <p><b>metric-type</b> {1 2}: Indicates the external route type, which can be E-1 or E-2.</p> <p><b>route-map</b><i>route-map-name</i>: Sets the redistribution filtering rules.</p> <p><b>tag</b><i>tag-value</i>: Specifies the tag value of the route that is redistributed into the OSPF routing domain. The value ranges from 0 to 4294967295.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	When the device supports multiple routing protocols, collaboration between protocols is very important. To run multiple routing protocols concurrently, the device must be able to redistribute routing information of a protocol to another protocol. This applies to all routing protocols.

	<p>During redistribution of IS-IS routes, <b>level-1</b>, <b>level-2</b>, or <b>level-1-2</b> can be configured to indicate that IS-IS routes of the specified level(s) will be redistributed. By default, IS-IS routes of level 2 are redistributed.</p> <p>During redistribution of OSPFv3 routes, <b>match</b> can be configured to indicate that OSPFv3 routes of the specified sub-type will be redistributed. By default, all types of OSPFv3 routes are redistributed.</p> <p>For the <b>level</b> parameter configured during redistribution of IS-IS routes and the <b>match</b> parameter configured during redistribution of OSPFv3 routes, the routes are matched against the route map only when the sub-type of the routes are correct.</p> <p>During configuration of route redistribution, the <b>match</b> rules configured in route map configuration mode are used based on the original information of routes. The priorities of <b>tag</b>, <b>metric</b> and <b>metric-type</b> in the route redistribution configuration are lower than the priority of the <b>set</b> rules configured in route map configuration mode.</p> <p>The <b>set metric</b> value of the associated route map should fall into the range of 0 to 16,777,214. If the value exceeds this range, routes cannot be introduced.</p> <p>The configuration rules for the <b>no</b> form of the <b>redistribute</b> command are as follows:</p> <ol style="list-style-type: none"> <li>1. If some parameters are specified in the <b>no</b> form of the command, default values of these parameters will be restored.</li> <li>2. If no parameter is specified in the <b>no</b> form of the command, the entire command will be deleted.</li> </ol> <p>For example, if <b>redistribute isis 112 level-2</b> is configured, the <b>no redistribute isis 112 level-2</b> command only restores the default value of <b>level-2</b>. As <b>level-2</b> itself is the default value of the parameter, the configuration saved is still <b>redistribute isis 112 level-2</b> after the preceding <b>no</b> form of the command is executed. To delete the entire command, you need to run the <b>no redistribute isis 112</b> command.</p>
--	--

↘ Introducing a Default Route

<b>Command</b>	<b>default-information originate</b> [ <i>always</i> ] [ <i>metric metric</i> ] [ <i>metric-type type</i> ] [ <i>route-map map</i> ]
<b>Parameter Description</b>	<p><b>always</b>: Enables OSPF to generate a default route regardless of whether the local router has a default route.</p> <p><b>metric</b> <i>metric</i>: Indicates the initial metric of the default route. The value ranges from 0 to 16,777,214. By default, the metric of the default route is 1.</p> <p><b>metric-type</b> <i>type</i>: Indicates the type of the default route. OSPF external routes are classified into two types: Type 1: The metric varies with routers; Type 2: The metric is the same for all routers. Type 1 external routes are more trustworthy than Type 2 external routes.</p> <p><b>route-map</b> <i>map-name</i>: Indicates the associated route-map name. By default, no route-map is associated.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>When the <b>redistribute</b> or <b>default-information</b> command is executed, the OSPFv3-enabled router automatically becomes an ASBR.</p> <p>The ASBR, however, does not automatically generate or advertise a default route to all routers in the OSPF routing domain. To have the ASBR generate a default route, configure the <b>default-information originate</b> command.</p> <p>If <b>always</b> is specified, the OSPFv3 process advertises an external default route to neighbors no matter whether a default route exists in the core routing table. This default route, however, is not displayed on the</p>

local router. To confirm whether the default route is generated, run the **show ipv6 ospf database** command to display the OSPFv3 link status database. On an OSPFv3 neighbor, you can run the **show ipv6 route ospf** command to see the default route.

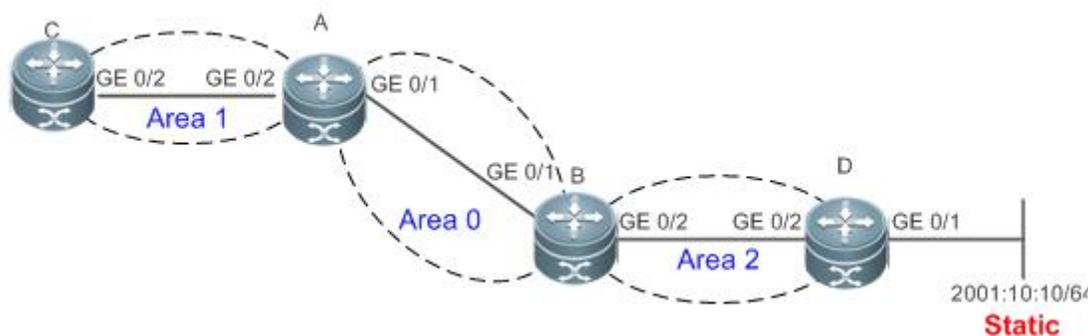

The metric of the external default route can only be defined in the **default-information originate** command, instead of the **default-metric** command.

OSPFv3 has two types of external routes. The metric of the Type 1 external route changes, but the metric of the Type 2 external route is fixed. If two parallel paths to the same destination network have the same route metric, the priority of the Type 1 route is higher than that of the Type 2 route. Therefore, the **show ipv6 route ospf** command displays only the Type 1 route.

A router in a stub area cannot generate an external default route.

### Configuration Example

#### Configuring Route Redistribution

<p><b>Scenario</b> Figure 5-10</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.</li> <li>● Configure the OSPF basic functions on all routers.</li> <li>● Introduce an external static route to Router D.</li> </ul>
<p><b>D</b></p>	<pre>D#configure terminal D(config)#ipv6 router ospf 1 D(config-router)# redistribute static</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router D, run the <b>show ipv6ospf database external brief</b> command to verify that an LSA corresponding to an external route is generated.</li> <li>● On Router C, run the <b>show ipv6 route ospf</b> command to verify that the external static route has been introduced.</li> </ul>

<b>D</b>	<pre>D#show ipv6 ospf database external        OSPFv3 Router with ID (4.4.4.4) (Process 1)        AS-external-LSA  LS age: 7  LS Type: AS-External-LSA  Link State ID: 0.0.0.6  Advertising Router: 4.4.4.4  LS Seq Number: 0x80000001  Checksum: 0x9C1F  Length: 36    Metric Type: 2 (Larger than any link state path)    Metric: 20    Prefix: 2001:10:10::/64    Prefix Options: 0 (- - - -)</pre>
<b>C</b>	<pre>C#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries  Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area  0 E2 2001:10:10::/64 [110/20] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/2</pre>

## ➤ Configuring the Default Route

<p><b>Scenario</b> Figure 5-11</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.</li> <li>● Configure the OSPF basic functions on all routers.</li> <li>● Configure the default route on Router D.</li> </ul>
<p><b>D</b></p>	<pre>D#configure terminal D(config)#ipv6 router ospf 1 D(config-router)#default-information originate always</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router D, run the <b>show ipv6ospf database external brief</b> command to verify that an LSA corresponding to the default route is generated.</li> <li>● On Router C, run the <b>show ipv6 route ospf</b> command to verify that the OSPF default route exists.</li> </ul>
<p><b>D</b></p>	<pre>D#show ipv6 ospf database external OSPFv3 Router with ID (4.4.4.4) (Process 1) AS-external-LSA LS age: 3 LS Type: AS-External-LSA Link State ID: 0.0.0.7 Advertising Router: 4.4.4.4 LS Seq Number: 0x80000001 Checksum: 0x1839 Length: 32 Metric Type: 2 (Larger than any link state path) Metric: 1 Prefix: ::/0 Prefix Options: 0 (- - - -) External Route Tag: 1</pre>

----------	---

### Common Errors

- A route loop is formed because the **default-information originate always** command is configured on multiple routers.
- Routes cannot be introduced because route redistribution is configured on a router in the stub area.

## 5.4.4 Configuring the Stub Area and NSSA Area

### Configuration Effect

- Configure an area located on the stub as a stub area to reduce interaction of routing information and the size of routing table, and enhance stability of routes.

### Notes

- The OSPF basic functions must be configured.
- A backbone or transit area cannot be configured as a stub or an NSSA area.
- A router in the stub area cannot introduce external routes, but a router in the NSSA area can introduce external routes.

### Configuration Steps

#### ↘ **Configuring a Stub Area**

- (Optional) Perform this configuration if you wish to reduce the size of the routing table on routers in the area.
- Perform this configuration on all routers in the same area.

#### ↘ **Configuring an NSSA Area**

- (Optional) Perform this configuration if you wish to reduce the size of the routing table on routers in the area and introduce OSPF external routes to the area.

- The area must be configured as an NSSA area on all routers in this area.

## Verification

### ↘ Verifying the Stub Area

- On a router in the stub area, run the **show ipv6 route** command to verify that the router is not loaded with any external routes.

### ↘ Verifying the NSSA Area

- On a router in the NSSA area, run the **show ipv6 ospf database** command to verify that the introduced external route generates Type 7 LSAs.
- On a router in the backbone area, run the **show ipv6 route** command to verify that the router is loaded with external routes introduced from the NSSA area.

## Related Commands

### ↘ Configuring a Stub Area

<b>Command</b>	<b>area</b> <i>area-id</i> <b>stub</b> [ <b>no-summary</b> ]
<b>Parameter Description</b>	<i>area-id</i> : Indicates the ID of the stub area. The value can be an integer or an IPv4 prefix. <b>no-summary</b> : This option is valid only on the ABR in a stub area. If this option is specified, the ABR only advertises one Type 3 LSA indicating the default route to the stub area, and does not advertise other Type 3 LSAs.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	An area located on the stub of a network can be configured as a stub area. You must run the <b>area stub</b> command on all routers in a stub area. Devices in a stub area cannot learn the external routes (Type 5 LSAs) of the AS. In practice, external routes take up a large proportion of the link status database. Therefore, devices in a stub area can learn only a small amount of routing information, which reduces the amount of system resources required to run the OSPFv3 protocol. By default, an ABR in a stub area will generate a Type 3 LSA indicating the default route, and advertise the LSA to the stub area. In this way, devices in the stub area can access devices outside the AS. To configure a totally stub area, add the <b>no-summary</b> keyword when running the <b>area stub</b> command on the ABR.

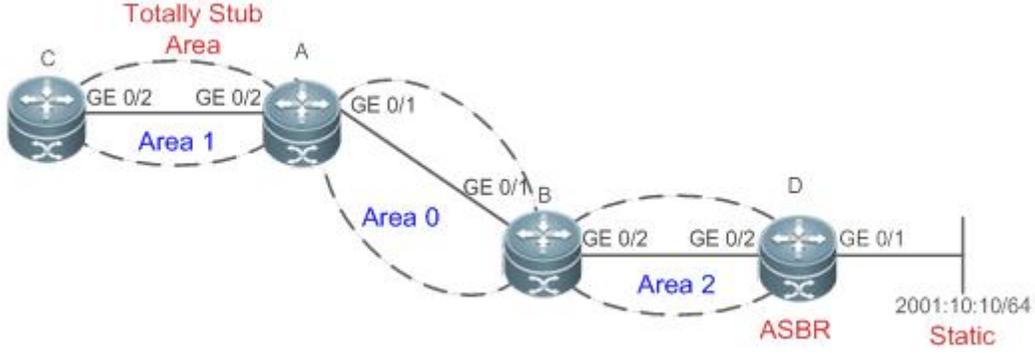

### ↘ Configuring an NSSA Area

<b>Command</b>	<b>area</b> <i>area-id</i> <b>nssa</b> [ <b>no-redistribution</b> ] [ <b>default-information-originate</b> [ <i>metric</i> <i>value</i> ] [ <b>metric-type</b> <i>type</i> ] ] [ <b>no-summary</b> ] [ <b>translator</b> [ <b>stability-interval</b> <i>seconds</i>   <b>always</b> ] ] [ <b>translate type7 suppress-fa</b> ]
<b>Parameter Description</b>	<i>area-id</i> : Indicates the ID of the NSSA area. <b>no-redistribution</b> : Select this option if the router is an NSSA ABR and you want to use only the <b>redistribute</b> command to introduce the routing information into a common area instead of an NSSA area. <b>default-information-originate</b> : Indicates that a default Type 7 LSA is generated and introduced to the

	<p>NSSA area. This option takes effect only on an NSSA ABR or ASBR.</p> <p><b>metric value:</b> Specifies the metric of the generated default LSA. The value ranges from 0 to 16,777,214. The default value is 1.</p> <p><b>metric-type type:</b> Specifies the route type of the generated default LSA. The values include 1 and 2. <b>1</b> represents N-1, and <b>2</b> represents N-2. The default value is 2.</p> <p><b>no-summary:</b> Prohibits the ABR in the NSSA area from sending summary LSAs (Type-3 LSA).</p> <p><b>translator:</b> Indicates that the NSSA ABR is a translator.</p> <p><b>stability-interval seconds:</b> Indicates the stability interval after the NSSA ABR is changed from a translator to a non-translator. The unit is second. The default value is 40. The value ranges from 0 to 2,147,483,647.</p> <p><b>always:</b> Indicates that the current NSSA ABR always acts as a translator. The default value is the standby translator.</p> <p><b>translate type7 suppress-fa:</b> Indicates that the Type 5 LSA does not carry the forwarding address (FA) when the Type 7 LSA is converted to the Type 5 LSA.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The <b>default-information-originate</b> parameter is used to generate a default Type 7 LSA. This parameter has different functions on the ABR and the ASBR in the NSSA area. On the ABR, a Type 7 LSA default route is generated regardless of whether the default route exists in the routing table. On the ASBR (not an ABR), a Type 7 LSA default route is generated only when the default route exists in the routing table.</p> <p>If the <b>no-redistribution</b> parameter is configured on the ASBR, other external routes introduced by OSPF through the <b>redistribute</b> command cannot be advertised to the NSSA area. This parameter is generally used when a router in the NSSA area acts both as the ASBR and the ABR. It prevents external routing information from entering the NSSA area.</p> <p>To further reduce the number of LSAs sent to the NSSA area, you can configure the <b>no-summary</b> parameter on the ABR to prevent the ABR from sending the summary LSAs (Type 3 LSA) to the NSSA area.</p> <p><b>area default-cost</b> is used on an ABR or ASBR connected to the NSSA area. This command configures the cost of the default route sent from the ABR/ASBR to the NSSA area. By default, the cost of the default route sent to the NSSA area is 1.</p> <p>If an NSSA area has two or more ABRs, the ABR with the largest router ID is elected by default as the translator for converting Type 7 LSAs into Type 5 LSAs. If the current device is always the translator ABR for converting Type 7 LSAs into Type 5 LSAs, use the <b>translator always</b> parameter.</p> <p>If the translator role of the current device is replaced by another ABR, the conversion capability is retained during the time specified by <b>stability-interval</b>. If the router does not become a translator again during <b>stability-interval</b>, LSAs that are converted from Type 7 to Type 5 will be deleted from the AS after <b>stability-interval</b> expires.</p> <p>To prevent a routing loop, LSAs that are converted from Type 7 to Type 5 will be deleted from the AS immediately after the current device loses the translator role even if <b>stability-interval</b> does not expire. In the same NSSA area, it is recommended that <b>translator always</b> be configured on only one ABR.</p>

## Configuration Example

### ↳ Configuring a Stub Area

<p><b>Scenario</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. ## Common Errors

- Configurations of the area type are inconsistent on routers in the same area.

- External routes cannot be introduced because route redistribution is configured on a router in the stub area.

## 5.4.5 Configuring Route Summarization

### Configuration Effect

- Summarize routes to reduce interaction of routing information and the size of routing table, and enhance stability of routes.
- Shield or filter routes.

### Notes

- The OSPF basic functions must be configured.
- The address range of the summarize route may exceed the actual network range in the routing table. If data is sent to a network beyond the summarization range, a routing loop may be formed and the router processing load may increase. To prevent these problems, a discard route must be added to the routing table or shield or filter routes.

### Configuration Steps

#### ↘ Configuring Inter-Area Route Summarization

- (Optional) Perform this configuration when routes of the OSPF area need to be summarized.
- Unless otherwise required, perform this configuration on an ABR in the area where routes to be summarized are located.

#### ↘ Configuring External Route Summarization

- (Optional) Perform this configuration when routes external to the OSPF domain need to be summarized.
- Unless otherwise required, perform this configuration on an ASBR, to which routes that need to be summarized are introduced.

### Verification

- Run the **show ipv6 route ospf** command to verify that individual routes do not exist and only the summarized route exists.

### Related Commands

#### ↘ Configuring Inter-Area Route Summarization

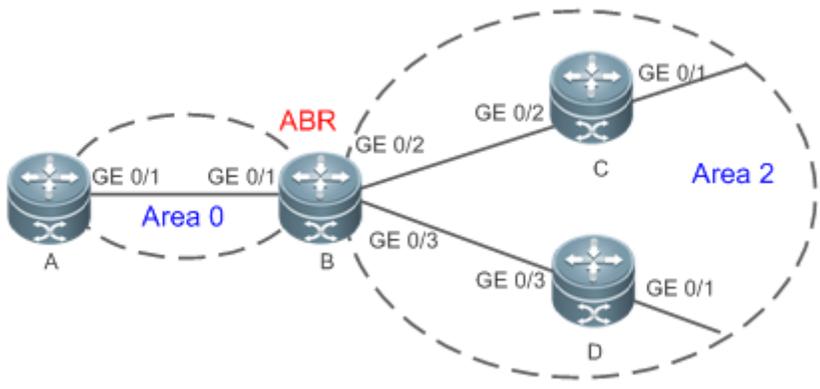

<b>Command</b>	<code>area area-id range ipv6-prefix/prefix-length [advertise not-advertise]</code>
<b>Parameter Description</b>	<p><i>area-id</i>: Specifies the ID of the OSPF area to which the summarized route should be injected. The value can be an integer or an IPv4 prefix.</p> <p><i>ipv6-prefix/prefix-length</i>: Indicates the range of IP addresses to be summarized.</p> <p><b>advertise</b>   <b>not-advertise</b>: Specifies whether the summarized route should be advertised.</p>
<b>Command</b>	OSPF routing process configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>This command takes effect only on an ABR, and is used to summarize multiple routes in an area into a route and advertise this route to other areas. Combination of the routing information occurs only on the boundary of an area. Routers inside the area can learn specific routing information, whereas routers in other areas can learn only one summarized route. In addition, you can set <b>advertise</b> or <b>not-advertise</b> to determine whether to advertise the summarized route to shield and filter routes. By default, the summarized route is advertised. You can use the <b>cost</b> parameter to set the metric of the summarized route.</p> <p>You can configure route summarization commands for multiple areas. This simplifies routes in the entire OSPF routing domain, and improves the network forwarding performance, especially for a large-sized network.</p> <p>When multiple route summarization commands are configured and have the inclusive relationship with each other, the area range to be summarized is determined based on the maximum match principle.</p>

### ↘ Configuring External Route Summarization

<b>Command</b>	<b>summary-prefix</b> <i>ipv6-prefix/prefix-length</i> [ <b>not-advertise</b>   <b>tag number</b> ]
<b>Parameter Description</b>	<p><i>ipv6-prefix/prefix-length</i>: Indicates the range of IP addresses to be summarized.</p> <p><b>not-advertise</b>: Indicates that the summarized route is not advertised. If this parameter is not specified, the summarized route is advertised.</p> <p><b>tag number</b>: Specifies the tag value of the route that is redistributed into the OSPFv3 routing domain. The value ranges from 0 to 4,294,967,295.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>When routes are redistributed from other routing processes and injected to the OSPFv3 routing process, each route is advertised to the OSPFv3 routers using an external LSA. If the injected routes are a continuous address space, the ABR can advertise only one summarized route to significantly reduce the size of the routing table.</p> <p><b>area range</b> summarizes the routes between OSPFv3 areas, whereas <b>summary-prefix</b> summarizes external routes of the OSPFv3 routing domain.</p> <p>When configured on the NSSA ABR translator, <b>summary-prefix</b> summarizes redistributed routes and routes obtained based on the LSAs that are converted from Type 7 to Type 5. When configured on the ASBR (not an NSSA ABR translator), <b>summary-prefix</b> summarizes only redistributed routes.</p>

### Configuration Example

<p><b>Configuration Steps</b> Figure 5-13</p>	 <p><b>Remarks</b> The interface IPv6 addresses are as follows:          B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64          C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64          D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Summarize routes of area 2 on Router B.</li> </ul>
<p><b>B</b></p>	<pre>B#configure terminal B(config)#ipv6 router ospf 1 B(config-router)#area 2 range 2001:16::/64</pre>
<p><b>Verification</b></p>	<p>On Router A, check the routing table and verify that the entry 2001:16::/64 is generated and other routes do not exist.</p>
<p><b>A</b></p>	<pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries Codes: C - Connected, L - Local, S - Static  R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2 E1 - OSPF external type 1, E2 - OSPF external type 2 SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2 IA - Inter area  0 IA 2001:16::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre>

**Common Errors**

- Inter-area route summarization cannot be implemented because the **area range** command is configured on a non-ABR device.

## 5.4.6 Configuring Route Filtering

### Configuration Effect

- Routes that do not meet filtering conditions cannot be loaded to the routing table, or advertised to neighbors. Network users cannot access specified destination network.

### Notes

- The OSPF basic functions must be configured.
- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the **area filter-list** or **area range** (containing the **not-advertise** parameter) command on the ABR to prevent generation of black-hole routes.

### Configuration Steps

#### ▾ Configuring Inter-Area Route Filtering

- (Optional) This configuration is recommended if users need to be restricted from accessing the network in a certain OSPF area.
- Unless otherwise required, perform this configuration on an ABR in the area where filtered routes are located.

#### ▾ Configuring Redistributed Route Filtering

- (Optional) Perform this configuration if external routes introduced by the ASBR need to be filtered.
- Unless otherwise required, perform this configuration on an ASBR to which filtered routes are introduced.

#### ▾ Configuring Learned Route Filtering

- (Optional) Perform this configuration if users need to be restricted from accessing a specified destination network.
- Unless otherwise required, perform this configuration on a router that requires route filtering.

### Verification

- Run the **show ipv6 route** command to verify that the router is not loaded with routes that have been filtered out.
- Run the **ping** command to verify that the specified destination network cannot be accessed.

### Related Commands

#### ▾ Configuring a Passive Interface

Command	<code>passive-interface {default   interface-type interface-number }</code>
---------	---

<b>Parameter</b>	<i>interface-type interface-number</i> : Indicates the interface that should be configured as a passive interface.
<b>Description</b>	<b>default</b> : Indicates that all interfaces will be configured as passive interfaces.
<b>Command</b>	OSPF routing process configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	When an interface is configured as a passive interface, it no longer sends or receives Hello packets. This command takes effect only on an OSPFv3-enabled interface, and not on a virtual link.

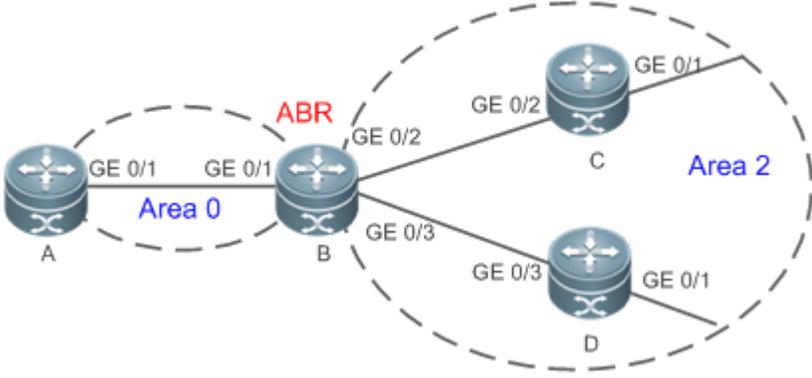

### ↘ Configuring Redistributed Route Filtering

<b>Command</b>	<b>distribute-list</b> { <i>name</i>   <b>prefix-list</b> <i>prefix-list-name</i> } <b>out</b> [ <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]   <b>ospf</b> <i>process-id</i> ] <b>rip</b>   <b>static</b> ]
<b>Parameter</b>	<i>name</i> : Uses the ACL for filtering.
<b>Description</b>	<b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list for filtering. <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>static</b> : Indicates the source of routes to be filtered.
<b>Command</b>	OSPF routing process configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	<b>distribute-list out</b> is similar to <b>redistribute route-map</b> , and is used to filter routes that are redistributed from other protocols to OSPFv3. The <b>distribute-list out</b> command itself does not redistribute routes, and is generally used together with the <b>redistribute</b> command. The ACL and the prefix list filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes coming from a certain source, the prefix list cannot be configured to filter the same routes.

### ↘ Configuring Learned Route Filtering

<b>Command</b>	<b>distribute-list</b> { <i>name</i>   <b>prefix-list</b> <i>prefix-list-name</i> } <b>in</b> [ <i>interface-type</i> <i>interface-number</i> ]
<b>Parameter</b>	<i>name</i> : Uses the ACL for filtering.
<b>Description</b>	<b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list for filtering. <i>interface-type interface-number</i> : Specifies the interface for which LSA routes are filtered.
<b>Command</b>	OSPF routing process configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Filter routes that are computed based on received LSAs. Only routes meeting the filtering conditions can be forwarded. The command does not affect the LSDB or the routing tables of neighbors. The ACL and the prefix list filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes on a specified interface, the prefix list cannot be configured to filter routes on the same interface. Filtering routes by using the <b>distribute-list in</b> command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the <b>area range</b> (containing the <b>not-advertise</b> parameter) command on the ABR to prevent generation of black-hole routes.

### Configuration Example

<p><b>Scenario</b> Figure 5-14</p>	 <table border="1" data-bbox="341 604 1469 770"> <tr> <td><b>Remarks</b></td> <td>The interface IPv6 addresses are as follows: B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64 C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64 D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64</td> </tr> </table>	<b>Remarks</b>	The interface IPv6 addresses are as follows: B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64 C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64 D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64
<b>Remarks</b>	The interface IPv6 addresses are as follows: B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64 C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64 D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64		
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, configure route filtering.</li> </ul>		
<p><b>A</b></p>	<pre>A#configure terminal A(config)#ipv6 access-list test A (config-ipv6-acl)#permit ipv6 2001:16:5::/64 any A(config)#ipv6 router ospf 1 A(config-router)#distribute-list test in GigabitEthernet0/1</pre>		
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A, check the routing table. Verify that only the entry 2001:16:5::/64 is loaded.</li> </ul>		
<p><b>A</b></p>	<pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  0 IA 2001:16:5::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre>		

**Common Errors**

- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated.

## 5.4.7 Modifying the Route Cost and AD

### Configuration Effect

- Change the OSPF routes so that the traffic passes through specified nodes or bypasses specified nodes.
- Change the sequence that a router selects routes so as to change the priorities of OSPF routes.

### Notes

- The OSPF basic functions must be configured.
- If you run the **ipv6 ospf cost** command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

### Configuration Steps

#### ▾ Configuring the Reference Bandwidth

- Optional.
- A router is connected with lines with different bandwidths. This configuration is recommended if you wish to preferentially select the line with a larger bandwidth.

#### ▾ Configuring the Cost of an Interface

- Optional.
- A router is connected with multiple lines. This configuration is recommended if you wish to manually specify a preferential line.

#### ▾ Configuring the Default Metric for Redistribution

- Optional.
- This configuration is mandatory if the cost of external routes of the OSPF domain should be specified when external routes are introduced to an ASBR.

#### ▾ Configuring the Maximum Metric

- Optional.
- A router may be unstable during the restart process or a period of time after the router is restarted, and users do not want to forward data through this router. In this case, this configuration is recommended.

#### ▾ Configuring the AD

- Optional.

- Perform this configuration if you wish to change the priorities of OSPF routes on a router that runs multiple unicast routing protocols.

## Verification

- Run the **show ipv6 ospf interface** command to verify that the costs of interfaces are correct.
- Run the **show ipv6 route** command to verify that the costs of external routes introduced by the ASBR are correct.
- Restart the router. Within a specified period of time, data is not forwarded through the restarted router.

## Related Commands

### ▾ Configuring the Reference Bandwidth

<b>Command</b>	<b>auto-cost reference-bandwidth</b> <i>ref-bw</i>
<b>Parameter Description</b>	<i>ref-bw</i> : Indicates the reference bandwidth. The unit is Mbps. The value ranges from 1 to 4, 294, 967.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	You can run the <b>ipv6 ospf cost</b> command in interface configuration mode to specify the cost of the interface. The priority of this cost is higher than that of the metric computed based on the reference bandwidth.

### ▾ Configuring the Cost of an Interface

<b>Command</b>	<b>ipv6 ospf cost</b> <i>cost</i> [ <b>instance</b> <i>instance-id</i> ]
<b>Parameter Description</b>	<i>cost</i> : Indicates the cost of an OSPF interface. The value ranges from 0 to 65,535. <b>instance</b> <i>instance-id</i> : Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, the cost of an OSPFv3 interface is equal to 100 Mbps/Bandwidth, where Bandwidth is the bandwidth of the interface and configured by the <b>bandwidth</b> command in interface configuration mode. The costs of OSPF interfaces on several typical lines are as follows: <ul style="list-style-type: none"> <li>● 64 Kbps serial line: The cost is 1562.</li> <li>● E1 line: The cost is 48.</li> <li>● 10M Ethernet: The cost is 10.</li> <li>● 100M Ethernet: The cost is 1.</li> </ul> If you run the <b>ipv6 ospf cost</b> command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

### ▾ Configuring the Cost of the Default Route in a Stub/NSSA Area

<b>Command</b>	<b>area</b> <i>area-id</i> <b>default-cost</b> <i>cost</i>
<b>Parameter Description</b>	<i>area-id</i> : Indicates the ID of the stub/nssa area. <i>cost</i> : Indicates the cost of the default summarized route injected to the stub/nssa area. The value ranges

	from 0 to 16, 777, 215.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	This command takes effect only on an ABR in a stub/nssa area.

### ↘ Configuring the Default Metric for Redistribution

<b>Command</b>	<b>default-metric</b> <i>metric</i>
<b>Parameter Description</b>	<i>metric</i> : Indicates the default metric of the OSPF redistributed route. The value ranges from 1 to 16,777,214.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	The <b>default-metric</b> command must be used together with the <b>redistribute</b> command to modify the initial metrics of all redistributed routes. The <b>default-metric</b> command does not take effect on external routes that are injected to the OSPF routing domain by the <b>default-information originate</b> command. The default metric of a redistributed direct route is always 20.

### ↘ Configuring the AD

<b>Command</b>	<b>distance</b> { <i>distance</i>   <b>ospf</b> { [ <b>intra-area</b> <i>distance</i> ] [ <b>inter-area</b> <i>distance</i> ] [ <b>external</b> <i>distance</i> ]} }
<b>Parameter Description</b>	<i>distance</i> : Indicates the AD of a route. The value ranges from 1 to 255. <b>intra-area</b> <i>distance</i> : Indicates the AD of an intra-area route. The value ranges from 1 to 255. <b>inter-area</b> <i>distance</i> : Indicates the AD of an inter-area route. The value ranges from 1 to 255. <b>external</b> <i>distance</i> : Indicates the AD of an external route. The value ranges from 1 to 255.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	Use this command to specify different ADs for different types of OSPF routes. The AD allows different routing protocols to compare route priorities. A smaller AD indicates a higher route priority. The priorities of routes generated by different OSPFv3 processes must be compared based on ADs. If the AD of a route entry is set to 255, the route entry is not trustworthy and does not participate in packet forwarding.

### Configuration Example

<p><b>Scenario</b> Figure 5-15</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, configure the cost of each interface.</li> </ul>
<p><b>A</b></p>	<pre>A#configure terminal A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ipv6 ospf cost 10 A(config)#interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)#ipv6 ospf cost 20</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A, check the routing table. The next hop of the optimum path to 2001:16:1::/64 is Router B.</li> </ul>
<p><b>A</b></p>	<pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  0 E2 2001:16:1::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre>

**Common Errors**

- If the cost of an interface is set to 0 in the **ipv6 ospf cost** command, a route computation error may occur. For example, a routing loop is obtained.

## 5.4.8 Enabling Authentication

### Configuration Effect

- All routers connected to the OSPF network must be authenticated to ensure stability of OSPF and protect OSPF against intrusions.

### Notes

- The OSPF basic functions must be configured.
- If authentication is configured for an area, the configuration takes effect on all interfaces that belong to this area.
- If authentication is configured for both an interface and the area to which the interface belongs, the configuration for the interface takes effect preferentially.

### Configuration Steps

#### ▾ Configuring Authentication

- Optional.
- Perform this configuration if a router accesses a network that requires authentication.

#### ▾ Configuring Encryption

- Optional.
- Perform this configuration if a router accesses a network that requires encryption.

#### ▾ Configuring Virtual Link Authentication

- Optional.
- Perform this configuration if a router accesses a network that requires authentication.

#### ▾ Configuring Virtual Link Encryption

- Optional.
- Perform this configuration if a router accesses a network that requires encryption.

### Verification

- If routers are configured with different authentication keys, run the **show ipv6 ospf neighbor** command to verify that there is no OSPF neighbor.
- If routers are configured with the same authentication key, run the **show ipv6 ospf neighbor** command to verify that there are OSPF neighbors.

### Related Commands

#### ▾ Configuring Area-based Authentication

Command	<code>area <i>area-id</i> authentication ipsec spi <i>spi</i> [md5 sha1] [0   7 ] key</code>
---------	--

<b>Parameter Description</b>	<p><i>area-id</i>: Indicates the area ID. The value can be an integer or an IPv4 prefix.</p> <p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p> <p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The RGOS supports three authentication types:</p> <ul style="list-style-type: none"> <li>● No authentication</li> <li>● MD5 authentication</li> <li>● SHA1 authentication</li> </ul> <p>Configuration of area-based authentication for OSPFv3 takes effect on all interfaces (except virtual links) in the area, but the interface-based authentication configuration takes precedence over the area-based configuration.</p>

📌 **Configuring Area-based Encryption and Authentication**

<b>Command</b>	<code>area <i>area-id</i> encryption ipsec spi <i>spi</i> esp [ null   [ des   3des ] [ 0   7 ] <i>des-key</i>] [md5 sha1] [0 7] <i>key</i></code>
<b>Parameter Description</b>	<p><i>area-id</i>: Indicates the area ID. The value can be an integer or an IPv4 prefix.</p> <p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>null</b>: Indicates that no encryption mode is used.</p> <p><b>des</b>: Indicates that the Data Encryption Standard (DES) mode is used.</p> <p><b>3des</b>: Indicates that the Triple DES (3DES) mode is used.</p> <p><i>des-key</i>: Indicates the encryption key.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p> <p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The RGOS supports two encryption modes and two authentication modes.</p> <p>The two encryption modes are as follows:</p> <ul style="list-style-type: none"> <li>● DES</li> <li>● 3DES</li> </ul> <p>The two authentication modes are as follows:</p> <ul style="list-style-type: none"> <li>● MD5</li> <li>● SHA1</li> </ul> <p>Configuration of area-based encryption and authentication for OSPFv3 takes effect on all interfaces (except virtual links) in the area, but the interface-based encryption and authentication configuration takes</p>

	precedence over the area-based configuration.
--	---

↘ **Configuring Interface-based Authentication**

<b>Command</b>	<code>ipv6 ospfauthentication[ null   ipsec spi spi [md5 sha1] [0 7]key][instance instance-id]</code>
<b>Parameter Description</b>	<p><i>area-id</i>: Indicates the area ID. The value can be an integer or an IPv4 prefix.</p> <p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p> <p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p> <p><b>instance instance-id</b>: Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The RGOS supports three authentication types:</p> <ul style="list-style-type: none"> <li>● No authentication</li> <li>● MD5 authentication</li> <li>● SHA1 authentication</li> </ul> <p>OSPFv3 authentication parameters configured on interconnected interfaces must be consistent.</p>

↘ **Configuring Interface-based Encryption and Authentication**

<b>Command</b>	<code>ipv6 ospfencryption ipsec spi spi esp[ null [ des   3des ]][ 0   7 ] des-key][md5 sha1] [0 7]key][instance instance-id]</code>
<b>Parameter Description</b>	<p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>null</b>: Indicates that no encryption mode is used.</p> <p><b>des</b>: Indicates that the DES mode is used.</p> <p><b>3des</b>: Indicates that the 3DES mode is used.</p> <p><i>des-key</i>: Indicates the encryption key.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p> <p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p> <p><b>instance instance-id</b>: Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The RGOS supports two encryption modes and two authentication modes.</p> <p>The two encryption modes are as follows:</p> <ul style="list-style-type: none"> <li>● DES</li> </ul>

	<ul style="list-style-type: none"> <li>● 3DES</li> </ul> <p>The two authentication modes are as follows:</p> <ul style="list-style-type: none"> <li>● MD5</li> <li>● SHA1</li> </ul> <p>OSPFv3 encryption and authentication parameters configured on the local interface must be consistent with those configured on the interconnected interfaces.</p>
--	--

### Configuration Example

<p><b>Scenario</b> Figure 5-16</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure MD5 authentication for interfaces of all routers.</li> </ul>
<p><b>A</b></p>	<pre>A#configure terminal A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ipv6 ospf authentication ipsec spi 256 md5 01234567890123456789012345678912</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)#interface GigabitEthernet 0/3 B(config-if-GigabitEthernet 0/3)#ipv6 ospf authentication ipsec spi 256 md5 01234567890123456789012345678912</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A and Router B, verify that the OSPF neighbor status is correct.</li> </ul>
<p><b>A</b></p>	<pre>A# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri   State           Dead Time   Instance ID  Interface 2.2.2.2        1    Full/DR         00:00:38   0            GigabitEthernet 0/1</pre>
<p><b>B</b></p>	<pre>B# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri   State           Dead Time   Instance ID  Interface 1.1.1.1        1    Full/BDR        00:00:38   0            GigabitEthernet 0/1</pre>

### Common Errors

- The configured authentication modes are inconsistent.
- The configured authentication keys are inconsistent.

## 5.4.9 Modifying the Maximum Number of Concurrent Neighbors

### Configuration Effect

- Control the maximum number of concurrent neighbors on the OSPF process to ease the pressure on the device.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Configuring the Maximum Number of Concurrent Neighbors on the OSPF Process

- (Optional) This configuration is recommended if you wish to set up the OSPF adjacency more quickly when a router is connected with a lot of other routers.
- Perform this configuration on a core router.

### Verification

- Run the **show ipv6 ospf neighbor** command to display the number of neighbors that are concurrently interacting with the OSPF process.

### Related Commands

#### ▾ Configuring the Maximum Number of Concurrent Neighbors on the Current Process

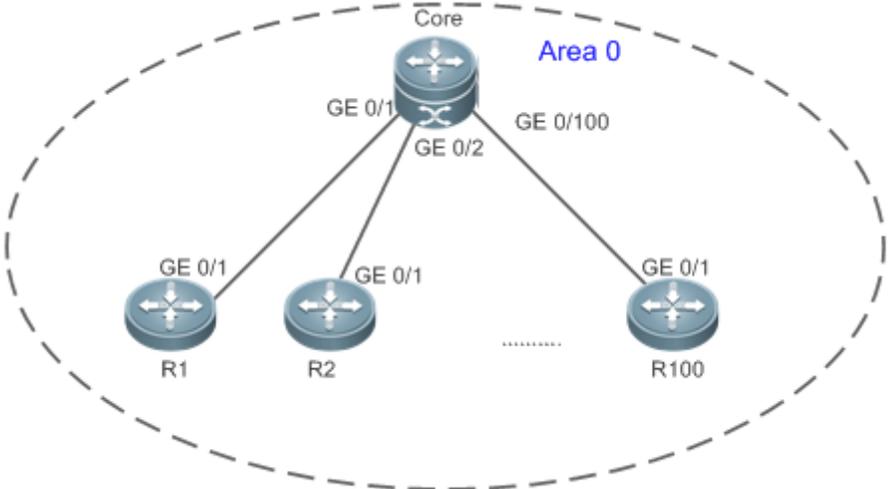

<b>Command</b>	<b>max-concurrent-dd</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	When the performance of a router is affected because the router exchanges data with multiple neighbors, you can configure this command to restrict the maximum of neighbors with which each OSPF process can concurrently initiate or accept interaction.

#### ▾ Configuring the Maximum Number of Concurrent Neighbors on All Processes

<b>Command</b>	<b>ipv6 router ospf max-concurrent-dd</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When the performance of a router is affected because the router exchanges data with multiple neighbors,

you can configure this command to restrict the maximum of neighbors with which all OSPF processes can concurrently initiate or accept interaction.

### Configuration Example

<p><b>Scenario</b> Figure 5-17</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On the Router Core, set the maximum number of concurrent neighbors to 4.</li> </ul>
<p><b>Core</b></p>	<pre>Core# configure terminal Core(config)# ipv6 router ospf max-concurrent-dd 4</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On the Router Core, check the neighbor status and verify that at most eight neighbors concurrently interact with the OSPF process.</li> </ul>

### Common Errors

N/A

## 5.4.10 Disabling MTU Verification

### Configuration Effect

- The unicast routing service can be provided even if the MTUs of interfaces on neighbor routers are different.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### Disabling MTU Verification

- (Optional) MTU verification is disabled by default. You are advised to retain the default configuration.

- Perform this configuration on two routers with different interface MTUs.

### Verification

- The adjacency can be set up between routers with different MTUs.

### Related Commands

#### Disabling MTU Verification

<b>Command</b>	<b>ipv6 ospf mtu-ignore</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	On receiving the database description packet, OSPF checks whether the MTU of the interface on the neighbor is the same as the MTU of its own interface. If the interface MTU specified in the received database description packet is greater than the MTU of the local interface, the adjacency cannot be set up. To resolve this problem, you can disable MTU verification.

### Configuration Example

<b>Scenario</b> Figure 5-18	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure different MTUs for interfaces on two routers.</li> <li>● Disable MTU verification on all routers. (By default, the function of disabling MTU verification is enabled.)</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 mtu 1400 A(config-if-GigabitEthernet 0/1)#ipv6 ospf mtu-ignore</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 mtu 1600 B(config-if-GigabitEthernet 0/1)# ipv6 ospf mtu-ignore</pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>On Router A, verify that the OSPF neighbor information is correct.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospf neighbor  OSPFv3 Process (1), 1 Neighbors, 1 is Full:  Neighbor ID    Pri   State           Dead Time   Instance ID  Interface 2.2.2.2        1    Full/DR         00:00:38   0            GigabitEthernet 0/1</pre>

### Common Errors

N/A

## 5.4.11 Enabling Two-Way Maintenance

### Configuration Effect

- Non-Hello packets can also be used to maintain the adjacency.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Enabling Two-Way Maintenance

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on all routers.

### Verification

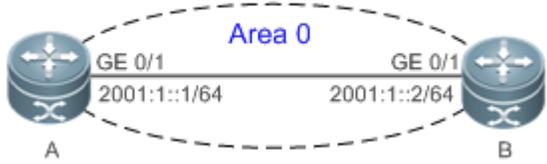

- Non-Hello packets can also be used to maintain the adjacency.

### Related Commands

#### ▾ Enabling Two-Way Maintenance

<b>Command</b>	<b>two-way-maintain</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	On a large network, a lot of packets may be sent or received, occupying too much CPU and memory. As a result, some packets are delayed or discarded. If the processing time of Hello packets exceeds the dead interval, the adjacency will be destroyed due to timeout. If the two-way maintenance function is enabled, in addition to the Hello packets, the DD, LSU, LSR, and LSack packets can also be used to maintain the bidirectional communication between neighbors when a large number of packets exist on the network. This prevents termination of the adjacency caused by delayed or discarded Hello packets.

### Configuration Example

<p><b>Scenario</b> Figure 5-19</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, enable the two-way maintenance function. (This function is enabled by default.)</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ipv6 routerospf 1 A(config-router)#two-way-maintain</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● When the adjacency is being set up, Router A checks the neighbor dead interval and updates the dead interval without waiting for Router B to send a Hello packet.</li> </ul>
<p><b>A</b></p>	<pre>A# show ipv6 ospfneighbor  OSPFv3 Process (1), 1 Neighbors, 1 is Full:  Neighbor ID    Pri  State           Dead Time   Instance ID  Interface ----- 2.2.2.2        1    Full/DR         00:00:38   0            GigabitEthernet 0/1</pre>

### Common Errors

N/A

## 5.4.12 Correlating OSPF with BFD

### Configuration Effect

- Once a link is faulty, OSPF can quickly detect the failure of the route. This configuration helps shorten the traffic interruption time.

### Notes

- The OSPF basic functions must be configured.
- The BFD parameters must be configured for the interface in advance.
- If BFD is configured for both a process and an interface, the interface-based configuration takes effect preferentially.

### Configuration Steps

#### ➤ Correlating OSPF with BFD

- (Optional) Perform this configuration if you wish to accelerate OSPF network convergence.

- Perform this configuration on routers at both ends of the link.

## Verification

- Run the **show bfd neighbor** command to verify that the BFD neighbors are normal.

## Related Commands

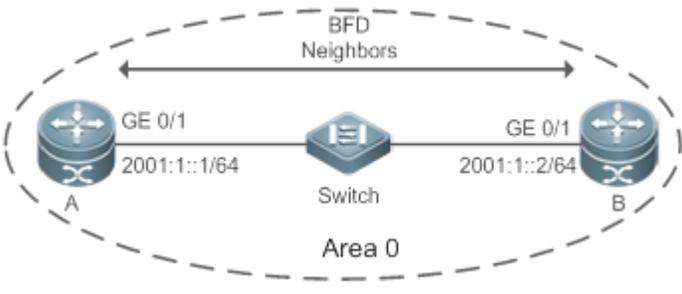

### ↘ Correlating an OSPF Interface with BFD

<b>Command</b>	<b>ipv6 ospf bfd [ disable ]</b>
<b>Parameter Description</b>	<b>disable:</b> Disables BFD for link detection on a specified OSPF-enabled interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The interface-based configuration takes precedence over the <b>bfd all-interfaces</b> command used in process configuration mode. Based on the actual environment, you can run the <b>ipv6 ospf bfd</b> command to enable BFD on a specified interface for link detection, or run the <b>bfd all-interfaces</b> command in OSPF process configuration mode to enable BFD on all interface of the OSPF process, or run the <b>ipv6 ospf bfd disable</b> command to disable BFD on a specified interface.

### ↘ Correlating an OSPF Process with BFD

<b>Command</b>	<b>bfd all-interfaces</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	OSPF process configuration mode
<b>Usage Guide</b>	OSPF dynamically discovers neighbors through the Hello packets. After OSPF enables the BFD function, a BFD session will be set up to achieve the full adjacency, and use the BFD mechanism to detect the neighbor status. Once a neighbor failure is detected through BFD, OSPF performs network convergence immediately. You can also run the <b>ipv6 ospf bfd [disable]</b> command in interface configuration mode to enable or disable the BFD function on a specified interface, and this configuration takes precedence over the <b>bfd all-interfaces</b> command used in OSPF process configuration mode.

## Configuration Example

<p><b>Scenario</b> Figure 5-20</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the BFD parameters for interfaces of all routers.</li> <li>● Correlate OSPF with BFD on all routers.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)#bfd interval 200 min_rx 200 multiplier 5 A(config)# ipv6 router ospf 1 A(config-router)#bfd all-interfaces</pre>
<p><b>B</b></p>	<pre>B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 2/1)#bfd interval 200 min_rx 200 multiplier 5 B(config)# ipv6 router ospf 1 B(config-router)#bfd all-interfaces</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A and Router B, verify that the BFD state is Up.</li> <li>● Disconnect Router B from the switch. On Router A, verify that a neighbor is found disconnected during BFD, and the corresponding OSPF route is deleted.</li> </ul>
<p><b>A</b></p>	<pre>A# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri  State      BFD State  Dead Time  Instance ID  Interface 2.2.2.2        1   Full/BDR   Up          00:00:35   0            GigabitEthernet 0/1</pre>
<p><b>B</b></p>	<pre>B# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri  State      BFD State  Dead Time  Instance ID  Interface 1.1.1.1        1   Full/DR    Up          00:00:35   0            GigabitEthernet 0/1</pre>

**Common Errors**

### 5.4.13 Enabling GR

#### Configuration Effect

- When a distributed route switches services from the active board to the standby board, traffic forwarding continues and is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and is not interrupted.

#### Notes

- The OSPF basic functions must be configured.
- The neighbor router must support the GR helper function.
- The grace period cannot be shorter than the neighbor dead time of the neighbor router.

#### Configuration Steps

##### ▾ Configuring the OSPF GR Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on routers where hot standby switchover is triggered or the OSPF process is restarted.

##### ▾ Configuring the OSPF GR Helper Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on a router if hot standby switchover is triggered or the OSPF process is restarted on a neighbor of this router.

#### Verification

- When a distributed router switches services from the active board to the standby board, data forwarding continues and the traffic is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and the traffic is not interrupted.

#### Related Commands

##### ▾ Configuring the OSPF GR Function

<b>Command</b>	<b>graceful-restart [ <b>grace-period</b><i>grace-period</i><b>inconsistent-lsa-checking</b> ]</b>
<b>Parameter Description</b>	<b>grace-period</b> <i>grace-period</i> : Indicates the grace period, which is the maximum time from occurrence of an OSPF failure to completion of the OSPF GR. The value of the grace period varies from 1s to 1800s. The default value is 120s. <b>inconsistent-lsa-checking</b> : Enables topological change detection. If any topological change is detected, OSPF exits the GR process to complete convergence. After GR is enabled, topological change detection is enabled by default.
<b>Command Mode</b>	OSPF routing process configuration mode

<p><b>Usage Guide</b></p>	<p>The GR function is configured based on the OSPF process. You can configure different parameters for different OSPF processes based on the actual conditions. This command is used to configure the GR restarter capability of a device. The grace period is the maximum time of the entire GR process, during which link status is rebuilt so that the original state of the OSPF process is restored. After the grace period expires, OSPF exits the GR state and performs common OSPF operations.</p> <p>Run the <b>graceful-restart</b> command to set the grace period to 120s. The <b>graceful-restart grace-period</b> command allows you to modify the grace period explicitly.</p> <p>The precondition for successful execution of GR and uninterrupted forwarding is that the topology remains stable. If the topology changes, OSPF quickly converges without waiting for further execution of GR, thus avoiding long-time forwarding black-hole.</p> <ul style="list-style-type: none"> <li>● Disabling topology detection: If OSPF cannot converge in time when the topology changes during the hot standby process, forwarding black-hole may appear in a long time.</li> <li>● Enabling topology detection: Forwarding may be interrupted when topology detection is enabled, but the interruption time is far shorter than that when topology detection is disabled.</li> </ul> <p>In most cases, it is recommended that topology detection be enabled. In special scenarios, topology detection can be disabled if the topology changes after the hot standby process, but it can be ensured that the forwarding black-hole will not appear in a long time. This can minimize the forwarding interruption time during the hot standby process.</p> <p>If the Fast Hello function is enabled, the GR function cannot be enabled.</p>
---------------------------	--

↘ **Configuring the OSPF GR Helper Function**

<p><b>Command</b></p>	<p><b>graceful-restart helper { disable  strict-lsa-checking   internal-lsa-checking}</b></p>
<p><b>Parameter Description</b></p>	<p><b>disable:</b> Prohibits a device from acting as a GR helper for another device.</p> <p><b>strict-lsa-checking:</b> Indicates that changes in Type 1 to Type 5 and Type 7 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p> <p><b>internal-lsa-checking:</b> Indicates that changes in Type 1 to Type 3 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p>
<p><b>Command Mode</b></p>	<p>OSPF routing process configuration mode</p>
<p><b>Usage Guide</b></p>	<p>This command is used to configure the GR helper capability of a router. When a neighbor router implements GR, it sends a Grace-LSA to notify all neighbor routers. If the GR helper function is enabled on the local router, the local router becomes the GR helper on receiving the Grace-LSA, and helps the neighbor to complete GR. The <b>disable</b> option indicates that GR helper is not provided for any device that implements GR.</p> <p>After a device becomes the GR helper, the network changes are not detected by default. If any change takes place on the network, the network topology converges after GR is completed. If you wish that network changes can be quickly detected during the GR process, you can configure <b>strict-lsa-checking</b> to check Type 1 to 5 and Type 7 LSAs that indicate the network information or <b>internal-lsa-checking</b> to check Type 1 to 3 LSAs that indicate internal routes of the AS domain. When the network scale is large, it is recommended</p>

that you disable the LSA checking options (**strict-lsa-checking** and **internal-lsa-checking**) because regional network changes may trigger termination of GR and consequently reduce the convergence of the entire network.

### Configuration Example

<p><b>Scenario</b> Figure 5-21</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, Router C, and Router D, enable the GR helper function. (This function is enabled by default.)</li> <li>● On Router B, enable the GR function.</li> </ul>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# ipv6 router ospf1 B(config-router)# graceful-restart</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Trigger a hot standby switchover on Router B, and verify that the routing tables of destination Network 1 and Network 2 remain unchanged on Router A during the switchover.</li> <li>● Trigger a hot standby switchover on Router B, ping destination Network 1 from Router A, and verify that traffic forwarding is not interrupted during the switchover.</li> </ul>

### Common Errors

- Traffic forwarding is interrupted during the GR process because the configured grace period is shorter than the neighbor dead time of the neighbor router.

## 5.4.14 Configuring Network Management Functions

### Configuration Effect

- Use the network management software to manage OSPF parameters and monitor the OSPF running status.

### Notes

- The OSPF basic functions must be configured.

- You must enable the MIB function of the SNMP server before enabling the OSPF MIB function.
- You must enable the trap function of the SNMP server before enabling the OSPF trap function.
- You must enable the logging function of the device before outputting the OSPF logs.

## Configuration Steps

### ↘ Binding the MIB with the OSPF Process

- (Optional) This configuration is required if you want to use the network management software to manage parameters of a specified OSPF process.
- Perform this configuration on all routers.

### ↘ Enabling the Trap Function

- (Optional) This configuration is required if you want to use the network management software to monitor the OSPF running status.
- Perform this configuration on all routers.

### ↘ Configuring the Logging Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration. If you want to reduce the log output, disable this function.
- Perform this configuration on all routers.

## Verification

- Use the network management software to manage the OSPF parameters.
- Use the network management software to monitor the OSPF running status.

## Related Commands

### ↘ Binding the MIB with the OSPF Process

<b>Command</b>	<b>enable mib-binding</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	The OSPFv2 MIB does not have the OSPFv3 process information. Therefore, you can perform operations only on a single OSPFv2 process through SNMP. By default, the OSPFv3 MIB is bound with the OSPFv3 process with the smallest process ID, and all user operations take effect on this process. If you wish to perform operations on a specified OSPFv3 process through SNMP, run this command to bind the MIB with the process.

### ↘ Enabling the Trap Function

<b>Command</b>	<code>enable traps[error [IfConfigError   IfRxBadPacket   VirtIfConfigError   VirtIfRxBadPacket]   state-change[IfStateChange   NbrStateChange   NssaTranslatorStatusChange   VirtIfStateChange   VirtNbrStateChange   RestartStatusChange   NbrRestartHelperStatusChange   VirtNbrRestartHelperStatusChange] ]</code>
<b>Parameter Description</b>	<p><b>IfConfigError:</b> Indicates that an interface parameter configuration error occurs.</p> <p><b>IfRxBadPacket:</b> Indicates that the interface receives a bad packet.</p> <p><b>VirtIfConfigError:</b> Indicates that a virtual interface parameter configuration error occurs.</p> <p><b>VirtIfRxBadPacket:</b> Indicates that the virtual interface receives a bad packet.</p> <p><b>IfStateChange:</b> Indicates that interface state changes.</p> <p><b>NbrStateChange:</b> Indicates that the neighbor state changes.</p> <p><b>NssaTranslatorStatusChange:</b> Indicates that the NSSA state changes.</p> <p><b>VirtIfStateChange:</b> Indicates that the virtual interface state changes.</p> <p><b>VirtNbrStateChange:</b> Indicates that the virtual neighbor state changes.</p> <p><b>RestartStatusChange:</b> Indicates that the GR state of the local device changes.</p> <p><b>NbrRestartHelperStatusChange:</b> Indicates that the state of the neighbor GR process changes.</p> <p><b>VirtNbrRestartHelperStatusChange:</b> Indicates that the GR state of the virtual neighbor changes.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The function configured by this command is restricted by the <code>snmp-server</code> command. You can configure <code>snmp-server enable traps ospf</code> and then <code>enable traps</code> command before the corresponding OSPF traps can be correctly sent out.</p> <p>This command is not restricted by the MIB bound with the process. The trap function can be enabled concurrently for different processes.</p>

↘ **Configuring the Logging Function**

<b>Command</b>	<code>log-adj-changes[ detail]</code>
<b>Parameter Description</b>	<b>detail:</b> Records all status change information.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

<b>Scenario</b> Figure 5-22	<p>The diagram illustrates a network topology with two routers, A and B, connected via their GE 0/1 interfaces. Both routers are part of OSPF Area 0. Router A is assigned the IPv6 address 2001:1::1/64, and Router B is assigned 2001:1::2/64. The connection is shown as a horizontal line between the two routers, with the area name 'Area 0' written above it in a dashed oval.</p>
--------------------------------	---

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Bind the MIB with the OSPF process on Router A.</li> <li>● Enable the trap function on Router A.</li> </ul>
<b>A</b>	<pre style="background-color: #f0f0f0; padding: 10px;"> A# configure terminal A(config)#snmp-server host 192.168.2.2 traps version 2c public A(config)#snmp-server community public rw A(config)#snmp-server enable traps A(config)# A(config)# ipv6 routerospf 10 A(config-router)# enable mib-binding A(config-router)# enable traps                     </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Use the MIB tool to read and set the OSPF parameters and display the OSPF running status.</li> </ul>

### Common Errors

N/A

## 5.4.15 Modifying Protocol Control Parameters

### Configuration Effect

- Modify protocol control parameters to change the protocol running status.

### Notes

- The OSPF basic functions must be configured.
- The neighbor dead time cannot be shorter than the Hello interval.

### Configuration Steps

#### ⌵ Configuring the Hello Interval

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on routers at both end of a link.

#### ⌵ Configuring the Dead Interval

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if you wish to accelerate OSPF convergence when a link fails.
- Perform this configuration on routers at both end of a link.

#### ⌵ Configuring the LSU Retransmission Interval

- (Optional) You are advised to adjust this configuration if a lot of routes exist in the user environment and network congestion is serious.

#### ↘ Configuring the LSA Generation Time

- (Optional) You are advised to retain the default configuration.

#### ↘ Configuring the LSA Group Refresh Time

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if a lot of routes exist in the user environment.
- Perform this configuration on an ASBR or ABR.

#### ↘ Configuring LSA Repeated Receiving Delay

- (Optional) You are advised to retain the default configuration.

#### ↘ Configuring the SPF Computation Delay

- (Optional) This configuration can be adjusted if network flapping frequently occurs.

#### ↘ Configuring the Inter-Area Route Computation Delay

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on all routers.

#### ↘ Configuring the Inter-Area Route Computation Delay

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on all routers.

## Verification

- Run the **show ipv6 ospf** and **show ipv6 ospf neighbor** commands to display the protocol running parameters and status.

## Related Commands

### ↘ Configuring the Hello Interval

<b>Command</b>	<b>ipv6ospf hello-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the interval at which OSPF sends the Hello packet. The unit is second. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The Hello interval is contained in the Hello packet. A shorter Hello interval indicates that OSPF can detect topological changes more quickly, but the network traffic increases. The Hello interval must be the same on all routers in the same network segment. If you want to manually modify the neighbor dead interval, ensure

	that the neighbor dead interval is longer than the Hello interval.
--	--

### ↘ Configuring the Dead Interval

<b>Command</b>	<b>ipv6ospf dead-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the time that the neighbor is declared lost. The unit is second. The value ranges from 2 to 65535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>The OSPF dead interval is contained in the Hello packet. If OSPF does not receive a Hello packet from a neighbor within the dead interval, it declares that the neighbor is invalid and deletes this neighbor record from the neighbor list. By default, the dead interval is four times the Hello interval. If the Hello interval is modified, the dead interval is modified automatically.</p> <p>When using this command to manually modify the dead interval, pay attention to the following issues:</p> <ol style="list-style-type: none"> <li>1. The dead interval cannot be shorter than the Hello interval.</li> <li>2. The dead interval must be the same on all routers in the same network segment.</li> </ol>

### ↘ Configuring the LSU Transmission Delay

<b>Command</b>	<b>ipv6ospf transmit-delay</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSU transmission delay on the OSPF interface. The unit is second. The value ranges from 0 to 65,535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Before an LSU packet is transmitted, the Age fields in all LSAs in this packet will increase based on the amount specified by the <b>ip ospf transmit-delay</b> command. Considering the transmission delay and line propagation delay on the interface, you need to set the LSU transmission delay to a greater value for a low-speed line or interface. The LSU transmission delay of a virtual link is defined by the <b>transmit-delay</b> parameter in the <b>area virtual-link</b> command.</p> <p>If the value of the Age field of an LSA reaches 3600, the packet will be retransmitted or a retransmission will be requested. If the LSA is not updated in time, the expired LSA will be deleted from the LSDB.</p>

### ↘ Configuring the LSU Retransmission Interval

<b>Command</b>	<b>ipv6ospf retransmit-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSU retransmission interval. The unit is second. The value ranges from 0 to 65,535. This interval must be longer than the round-trip transmission delay of data packets between two neighbors.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>After a router finishes sending an LSU packet, this packet is still kept in the transmit buffer queue. If an acknowledgment from the neighbor is not received within the time defined by the <b>ip ospf retransmit-interval</b> command, the router retransmits the LSU packet.</p> <p>The retransmission delay can be set to a greater value on a serial line or virtual link to prevent unnecessary retransmission. The LSU retransmission delay of a virtual link is defined by the</p>

	retransmit-interval parameter in the <b>area virtual-link</b> command.
--	--

↘ **Configuring the LSA Generation Time**

<b>Command</b>	<b>timers throttle lsa all</b> <i>delay-time hold-time max-wait-time</i>
<b>Parameter Description</b>	<p><i>delay-time</i>: Indicates the minimum delay for LSA generation. The first LSA in the database is always generated instantly. The value ranges from 0 to 600,000. The unit is ms.</p> <p><i>hold-time</i>: Indicates the minimum interval between the first LSA update and the second LSA update. The value ranges from 1 to 600,000. The unit is ms.</p> <p><i>max-wait-time</i>: Indicates the maximum interval between two LSA updates when the LSA is updated continuously. This interval is also used to determine whether the LSA is updated continuously. The value ranges from 1 to 600,000. The unit is ms.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>If a high convergence requirement is raised when a link changes, you can set <b>delay-time</b> to a smaller value. You can also appropriately increase values of the preceding parameters to reduce the CPU usage.</p> <p>When configuring this command, the value of <b>hold-time</b> cannot be smaller than the value of <b>delay-time</b>, and the value of <b>max-wait-time</b> cannot be smaller than the value of <b>hold-time</b>.</p>

↘ **Configuring the LSA Group Refresh Time**

<b>Command</b>	<b>timers pacing lsa-group</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSA group pacing interval. The value ranges from 10 to 1,800. The unit is second.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>Every LSA has a time to live (LSA age). When the LSA age reaches 1800s, a refreshment is needed to prevent LSAs from being cleared because their ages reaching the maximum. If LSA update and aging computation are performed for every LSA, the device will consume a lot of CPU resources. In order to use CPU resources effectively, you can refresh LSAs by group on the device. The interval of group refreshment is called group pacing interval. The group refreshment operation is to organize the LSAs generated within a group pacing interval into a group and refresh the group as a whole.</p> <p>If the total number of LSAs does not change, a larger group pacing interval indicates that more LSAs need to be processed after timeout. To maintain the CPU stability, the number of LSAs processes upon each timeout cannot be too large. If the number of LSAs is large, you are advised to reduce the group pacing interval. For example, if there are 1000 LSAs in the database, you can reduce the pacing interval; if there are 40 to 100 LSAs, you can set the pacing interval to 10-20 minutes.</p>

↘ **Configuring the LSA Group Refresh Interval**

<b>Command</b>	<b>timers pacing lsa-transmit</b> <i>transmit-time transmit-count</i>
<b>Parameter Description</b>	<p><i>transmit-time</i>: Indicates the LSA group transmission interval. The value ranges from 10 to 600,000. The unit is ms.</p> <p><i>transmit-count</i>: Indicates the number of LS-UPD packets in a group. The value ranges from 1 to 200.</p>

<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	If the number of LSAs is large and the device load is heavy in an environment, properly configuring <b>transimit-time</b> and <b>transimit-count</b> can limit the number of LS-UPD packets flooded on a network. If the CPU usage is not high and the network bandwidth load is not heavy, reducing the value of <b>transimit-time</b> and increasing the value of <b>transimit-count</b> can accelerate the environment convergence.

↘ **Configuring LSA Repeated Receiving Delay**

<b>Command</b>	<b>timers lsa arrival</b> <i>arrival-time</i>
<b>Parameter Description</b>	<i>arrival-time</i> : Indicates the delay after which the same LSA is received. The value ranges from 0 to 600,000. The unit is ms.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	No processing is performed if the same LSA is received within the specified time.

↘ **Configuring the SPF Computation Delay**

<b>Command</b>	<b>timers throttle spf</b> <i>spf-delay spf-holdtime spf-max-waittime</i>
<b>Parameter Description</b>	<i>spf-delay</i> : Indicates the SPF computation delay. The unit is ms. The value ranges from 1 to 600,000. When detecting a topological change, the OSPF routing process triggers the SPF computation at least after <b>spf-delay</b> elapses. <i>spf-holdtime</i> : Indicates the minimum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000. <i>spf-max-waittime</i> : Indicates the maximum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000. <i>number</i> : Indicates the metric of the summarized route.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<b>spf-delay</b> indicates the minimum time between the occurrence of the topological change and the start of SPF computation. <b>spf-holdtime</b> indicates the minimum interval between the first SPF computation and the second SPF computation. After that, the interval between two SPF computations must be at least twice of the previous interval. When the interval reaches <b>spf-max-waittime</b> , the interval cannot increase again. If the interval between two SPF computations already exceeds the required minimum value, the interval is computed by starting from <b>spf-holdtime</b> . You can set <b>spf-delay</b> and <b>spf-holdtime</b> to smaller values to accelerate topology convergence, and set <b>spf-max-waittime</b> to a larger value to reduce SPF computation. Flexible settings can be used based on stability of the network topology. Compared with the <b>timers spf</b> command, this command supports more flexible settings to accelerate the convergence speed of SPF computation and further reduce the system resources consumed by SPF computation when the topology continuously changes. Therefore, you are advised to use the <b>timers throttle spf</b> command for configuration. 1. The value of <b>spf-holdtime</b> cannot be smaller than the value of <b>spf-delay</b> ; otherwise, <b>spf-holdtime</b> will

	<p>be automatically set to the value of <b>spf-delay</b>.</p> <ol style="list-style-type: none"> <li>The value of <b>spf-max-waittime</b> cannot be smaller than the value of <b>spf-holdtime</b>; otherwise, <b>spf-max-waittime</b> will be automatically set to the value of <b>spf-holdtime</b>.</li> <li>The configurations of <b>timers throttle spf</b> and <b>timers spf</b> are mutually overwritten.</li> <li>When both <b>timers throttle spf</b> and <b>timers spf</b> are not configured, the default values of <b>timers throttle spf</b> prevail.</li> </ol>
--	---

📌 **Configuring the Computation Delays of Inter-Area Routes and External Routes**

<b>Command</b>	<b>timers throttle route</b> {inter-area <i>ia-delay</i>  ase <i>ase-delay</i> }
<b>Parameter Description</b>	<b>inter-area</b> <i>ia-delay</i> : Indicates the inter-area route computation delay. The unit is ms. The value ranges from 0 to 600,000. <b>ase</b> <i>ase-delay</i> : Indicates the external route computation delay. The unit is ms. The value ranges from 0 to 600,000.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	If a strict requirement is raised for the network convergence time, use the default value. If a lot of inter-area or external routes exist on the network and the network is not stable, adjust the delays and optimize route computation to reduce the load on the device.

**Configuration Example**

📌 **Configuring the Hello Interval and Dead Interval**

<b>Scenario</b> Figure 5-23	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>Configure the OSPF basic functions on all routers. (Omitted)</li> <li>Configure the Hello interval and dead interval on all routers.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ipv6 ospf dead-interval 50</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ipv6 ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ipv6 ospf dead-interval 50</pre>

<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Check the interface parameters on Router A and Router B. Verify that the Hello interval is 10s and the dead interval is 50s.</li> <li>● On Router A and Router B, verify that the OSPF neighbor information is correct.</li> </ul>
<p><b>A</b></p>	<pre> A# show ipv6 ospf interface GigabitEthernet 0/1 is up, line protocol is up  Interface ID 2  IPv6 Prefixes      fe80::2d0:f8ff:fe22:3346/64 (Link-Local Address)  OSPFv3 Process (1), Area 0.0.0.0, Instance ID 0  Router ID 1.1.1.1, Network Type BROADCAST, Cost: 1  Transmit Delay is 1 sec, State DR, Priority 1  Timer interval configured, Hello 15, Dead 50, Wait 40, Retransmit 10      Hello due in 00:00:06  Neighbor Count is 1, Adjacent neighbor count is 1  Hello received 40 sent 40, DD received 17 sent 9  LS-Req received 1 sent 3, LS-Upd received 6 sent 5  LS-Ack received 3 sent 4, Discarded 1  A# show ipv6 ospf neighbor  OSPFv3 Process (1), 1 Neighbors, 1 is Full:  Neighbor ID    Pri  State           Dead Time   Instance ID  Interface 2.2.2.21     Full/BDR      00:00:30    0           GigabitEthernet 0/1                 </pre>

```

B
B# show ipv6 ospf interface

GigabitEthernet 0/1 is up, line protocol is up

  Interface ID 2

```

**Common Errors**

- The configured neighbor dead time is shorter than the Hello interval.

**5.5 Monitoring**

**Clearing**

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears and resets an OSPF process.	<b>clear ipv6 ospf [ process-id]process</b>

**Displaying**

Description	Command
Displays the OSPF process configurations.	<b>show ipv6 ospf</b> [ <i>process-id</i> ]
Displays information about the OSPF LSDB.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>lsa-type</i> [ <b>adv-router</b> <i>router-id</i> ] ]
Displays OSPF-enabled interfaces.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>interface</b> [ <i>interface-type interface-number</i>   <b>brief</b> ]
Displays the OSPF neighbor list.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>neighbor</b> [ <i>interface-type interface-number</i> [ <b>detail</b> ]] <i>neighbor-id</i> [ <b>detail</b> ]
Displays the OSPF routing table.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>route</b> [ <i>count</i> ]
Displays the summarized route of OSPF redistributed routes.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>summary-prefix</b>
Displays the OSPF network topology information.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>topology</b> [ <i>area-area-id</i> ]
Displays OSPF virtual links.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>virtual-links</b>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs OSPF events.	<b>debug ipv6 ospf events</b> [ <b>abr</b>   <b>asbr</b>   <b>os</b>   <b>router</b>   <b>vlink</b> ]
Debugs OSPF interfaces.	<b>debug ipv6 ospf ifsm</b> [ <b>events</b>   <b>status</b>   <b>timers</b> ]
Debugs OSPF neighbors.	<b>debug ipv6 ospf nfm</b> [ <b>events</b>   <b>status</b>   <b>timers</b> ]
Debugs the OSPF NSM.	<b>debug ipv6 ospf nsm</b> [ <b>interface</b>   <b>redistribute</b>   <b>route</b> ]
Debugs OSPF LSAs.	<b>debug ipv6 ospf lsa</b> [ <b>flooding</b>   <b>generate</b>   <b>install</b>   <b>maxage</b>   <b>refresh</b> ]
Debugs OSPF packets.	<b>debug ipv6 ospf packet</b> [ <b>dd</b>   <b>detail</b>   <b>hello</b>   <b>ls-ack</b>   <b>ls-request</b>   <b>ls-update</b>   <b>rcv</b>   <b>send</b> ]
Debugs OSPF routes.	<b>debug ipv6 ospf route</b> [ <b>ase</b>   <b>ia</b>   <b>install</b>   <b>spf</b>   <b>time</b> ]

## 6 Configuring IS-IS

### 6.1 Overview

Intermediate System to Intermediate System (IS-IS) is an extensible, robust, and easy-to-use Interior Gateway Protocol (IGP) for route selection and applicable to an IP-ISO CLNS dual environment network (ISO CLNS is short for International Organization for Standardization Connectionless Network Service).

IS-IS has the common characteristics of a link state protocol. It sends Hello packets to discover and maintain neighbor relationships, and sends Link State Protocol Data Units (LSPs) to neighbors to advertise its link state. IS-IS supports Level-1 routing and Level-2 routing. All devices at the same Level maintain the same Link State Database (LSDB), which stores the LSPs generated by the devices to notify each other of the Level's network topology. Each device uses the Dijkstra Shortest Path First (SPF) algorithm to perform best-route calculation, path selection, and fast convergence.

#### Protocols and Standards

- RFC1142: OSI IS-IS Intra-domain Routing Protocol
- RFC1195: Use of OSI IS-IS for routing in TCP/IP and dual environments
- RFC3786: Extending the Number of Intermediate System to Intermediate System (IS-IS) Link State PDU (LSP) Fragments Beyond the 256 Limit
- RFC3373: Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies
- RFC3358: Optional Checksums in Intermediate System to Intermediate System (ISIS)
- RFC3784: Intermediate System to Intermediate System (IS-IS) Extensions for Traffic Engineering (TE)
- RFC2763: Dynamic Hostname Exchange Mechanism for IS-IS
- RFC6119(draft-ietf-isis-ipv6-te-00): IPv6 Traffic Engineering in IS-IS
- RFC 2966: Domain-wide Prefix Distribution with Two-Level IS-IS

### 6.2 Applications

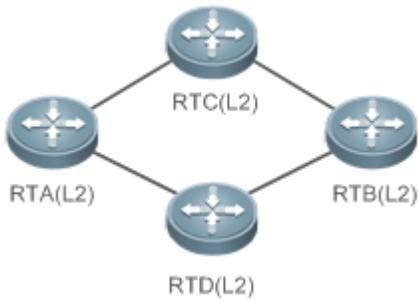

Application	Description
<a href="#">Planar Topology</a>	A planar topology is applicable to a small-scale network. At the initial stage of large-scale network construction, core devices are deployed to form an area based on a planar topology.
<a href="#">Hierarchical Topology</a>	A hierarchical topology is applicable to a large-scale network with frequent link flapping.

#### 6.2.1 Planar Topology

##### Scenario

A planar topology is formed by devices in the same area. See Figure 6-1.

Figure 6-1 Planar Topology

### Deployment

- To facilitate future extension and reduce device burden, configure the devices in a planar topology as Level-2 devices.

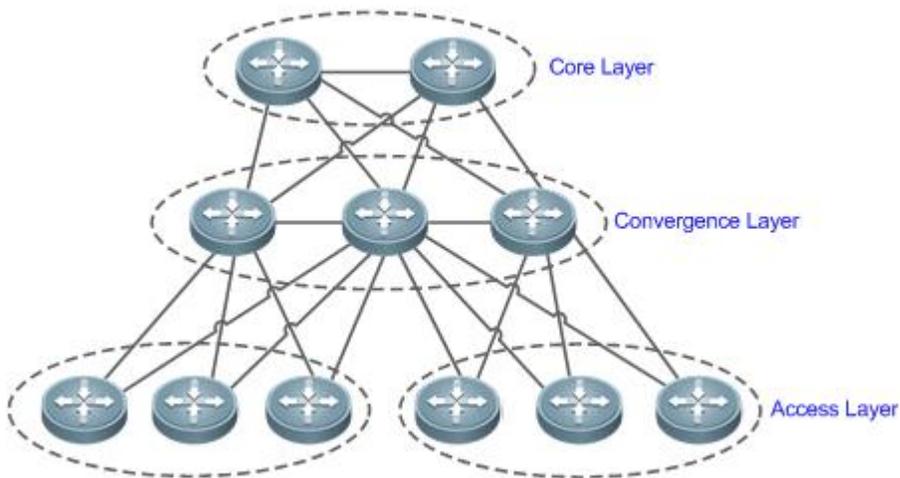

## 6.2.2 Hierarchical Topology

### Scenario

A hierarchical topology divides the network into the core layer, convergence layer, and access layer. See Figure 6-2.

- Route summarization at the convergence layer is facilitated by address planning.
- When primary and secondary routes exist, devices at the convergence layer leak Level-2 routes to Level-1 areas.

Figure 6-2 Hierarchical Topology

<b>Remarks</b>	Devices at the core layer must be connected consecutively.
----------------	--

### Deployment

- Design the network topology starting from the core layer.

- Configure devices at the core layer as Level-2 devices.
- Configure devices at the convergence layer as Level-1/Level-2 devices.
- Configure devices at the access layer as Level-1 devices.

## 6.3 Features

### Basic Concepts

---

#### ↘ End System (ES)

An ES is a non-router device, for example, a host.

#### ↘ Intermediate System (IS)

An IS is a router, which is the basic unit used to transmit routing information and generate routes in IS-IS.

#### ↘ End System to Intermediate System Routing Exchange Protocol (ES-IS)

ES-IS is the protocol used for communication between ESs and ISs in Open System Interconnection (OSI) to dynamically discover Level-2 neighbor relationships.

#### ↘ Domain

A set of ISs in the same routing domain (RD) use the same routing protocol to exchange routing information.

#### ↘ Area

An RD can be divided into multiple areas.

#### ↘ Complete Serial Number PDU (CSNP)

CSNPs are sent by a Designated Intermediate System (DIS) every 10s to synchronize link states in a broadcast network.

#### ↘ Partial Sequence Number PDU (PSNP)

PSNPs are sent by a point-to-point (P2P) link to confirm LSPs, or request LSPs in a broadcast network.

#### ↘ Connectionless Network Protocol (CLNP)

CLNP is an OSI protocol used to transmit data and error messages at the network layer. It is similar to the IP protocol.

#### ↘ Connectionless Network Service (CLNS)

The CLNS is a type of unreliable connection and requires no circuit setup before data transmission.

#### ↘ Designated Intermediate System (DIS)

Similar to a DIS router (DR) in Open Shortest Path First (OSPF), a DIS propagates LSPs to other machines in a Local Area Network (LAN). Neighbor relationships are established not only between DISs and other machines but also between those machines. This characteristic is not possessed by OSPF.

### ↳ Hello Packet

Hello packets are used to establish and maintain neighbor relationships.

### ↳ LSP

LSPs describe link states, similar to link-state advertisement (LSA) in OSPF, but the former do not depend on TCP/IP information. LSPs are classified into Level-1 LSPs and Level-2 LSPs, depending on different route types.

### ↳ Network Selector (NSEL)

An NSEL (sometimes referred to as SEL) specifies the target network-layer protocol service. It is similar to the TCP/UDP port for the Upper Layer Service in the IP protocol. In IS-IS, SEL is typically set to 00 to indicate a device.

### ↳ Network Service Access Point (NSAP)

An NSAP is the CLNS complete address, including the OSI address and high-layer processes. It consists of an area ID, a system ID, and SEL. When SEL is set to 00, the NSAP is a Network Entity Title (NET), similar to an IP address plus a protocol number.

### ↳ Sub-Network Point of Attachment (SNPA)

An SNPA provides physical connections and network-layer services. It is similar to a MAC address used in the IP protocol, a Data Link Connection Identifier (DLCI) used by frame relay (FR), or High-Level Data Link Control (HDLC) in a wide area network (WAN).

### ↳ Level-1 Route

A Level-1 route is an intra-area route that only receives relevant information within the area. To reach other areas, you need to store in Level-1 a default route destined for the closest Level-2.

### ↳ Level-2 Route

A Level-2 route is an inter-area backbone route. Level-1 and Level-2 cannot be connected directly.

### ↳ Level-1/Level-2 Route

A Level-1/Level-2 route is a border route connecting a Level-1 route and a Level-2 route. It maintains two databases for the Level-1 and Level-2 routes respectively. It is similar to an area border router (ABR) in OSPF.

### ↳ Pseudonode

A pseudonode identifies a broadcast subnet (LAN) and allows a broadcast medium to work as a virtual device, which has a route as its interface. The route-pseudonode relationship is managed by a DIS.

### ↳ Network Entity Title (NET)

A NET is part of an OSI address and describes the area ID and system ID, but it does not define the NSEL, which is contained in the NSAP of the specified system.

### ↳ Circuit

Circuit is an interface-related term used in IS-IS. Whereas NSAP and NET indicate whole devices, a circuit indicates an interface. The circuit ID of a P2P interface is one byte long. For example, the circuit ID of HDLC is 0x00. In a broadcast network (for example, a LAN), the circuit ID is seven bytes long, including the system ID, for example, 1921.6800.0001.01.

 For details about terms related to IS-IS, see ISO 10589 and RFC1195.

## Overview

Feature	Description
<a href="#">IS-IS Network Hierarchy</a>	An IS-IS network is divided into Level-1 and Level-2. The nodes on which devices exchange information in the same area form one Level (Level-1).
<a href="#">IS-IS Address Coding Mode</a>	An IS-IS address is called a NET, which consists of an area ID, a system ID, and an NSAP identifier.
<a href="#">IS-IS Packet Types</a>	There are three types of IS-IS packets: LSP, IS-IS Hello packet (IIH PDU), and serial number packet (SNP) classified into CSNP and PSNP.
<a href="#">DIS Election</a>	A DIS simulates multiple access links as a pseudonode and generates LSPs for the pseudonode. The pseudonode sets up a relationship with each device in the local network and forbids direct communication between the devices.
<a href="#">IS-IS Supported TLV Types</a>	IS-IS supports 21 types of Type-Length-Value (TLV).
<a href="#">LSP Fragment Extension</a>	IS-IS floods LSPs to advertise link states. The size of an LSP is limited by the Maximum Transmission Unit (MTU) size of the link. When the content to be advertised exceeds one LSP, IS-IS will create LSP fragments to carry new link state information.
<a href="#">IS-IS VRF</a>	VPN Routing and Forwarding (VRF) is mainly used for local routing and packet separation. It avoids route conflict caused by use of the same prefix by multiple VPNs.
<a href="#">IS-IS MTR</a>	Multi-Topology Routing (MTR) is mainly used to calculate IPv4 and IPv6 unicast routes in IS-IS based on different topologies.

### 6.3.1 IS-IS Network Hierarchy

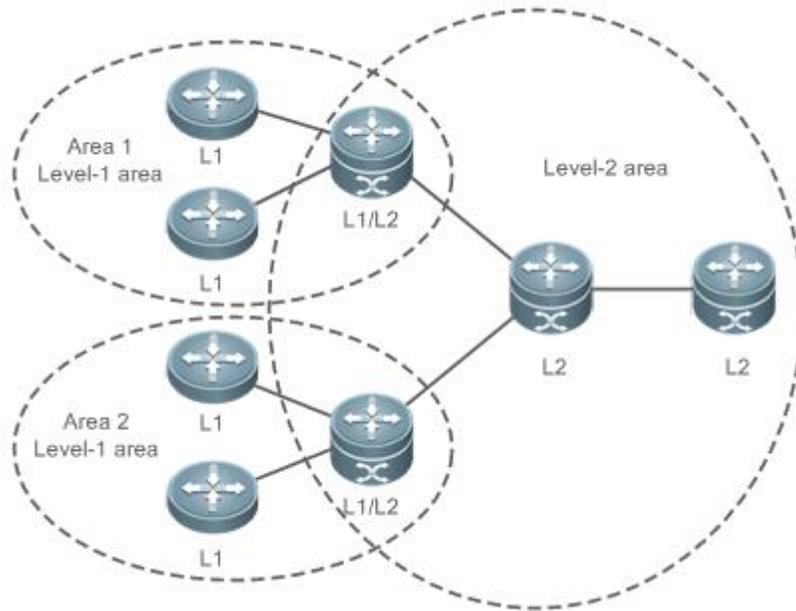

An IS-IS network is divided into Level-1 and Level-2. The nodes on which devices exchange information in the same area form one Level (Level-1).

#### Working Principle

All devices in an area know the area's network topology and exchange data within the area. A Level-1/Level-2 device is a border device that belongs to different areas and provides inter-area connections. Areas are connected by Level-2 devices. The border devices in various areas form a Level-2 backbone network for inter-area data exchange.

Level-1 devices are only interested in the local area's topology, including all nodes in the local area and the next-hop devices destined for the nodes. Level-1 devices access other areas through Level-2 devices and forward packets from a target network outside of the local area to the closest Level-2 device.

Figure 6-3 IS-IS Network Topology

## Related Configuration

### Setting the Circuit Type of an IS-IS Interface

By default, **circuit-type** is set to Level-1/Level-2.

Run the **isis circuit-type** command to change the Level of an interface.

If **circuit-type** is set to Level-1 or Level-2-only, IS-IS will only send PDUs of the corresponding Level.

### Specifying the IS-IS Level

By default, **is-type** is set to Level-1/Level-2 if no IS-IS instance runs at Level-2 (including Level-1/Level-2). **is-type** is set to Level-1 if there are IS-IS instances running at Level-2 (including Level-1/Level-2).

Run the **is-type** command to specify the Level at which IS-IS will run.

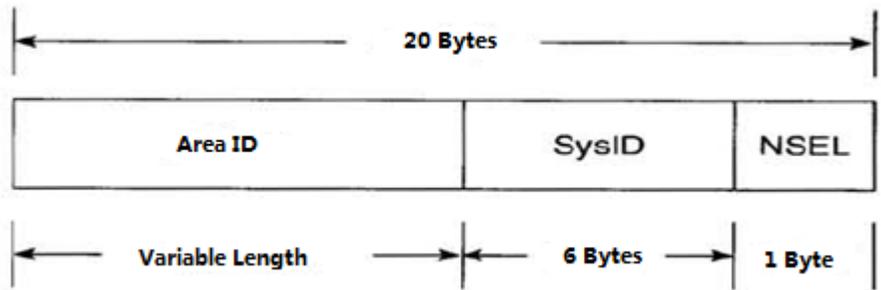

Changing the **is-type** value will enable or disable the routes of a certain Level. A device can have only one instance running at Level-2 (including Level-1/Level-2).

## 6.3.2 IS-IS Address Coding Mode

An IS-IS address is called a NET, which consists of an area ID, a system ID, and an NSAP identifier, ranging from eight to 20 bytes.

## Working Principle

Figure 6-4 NET Address Format

- The area ID identifies the RD length in an area and is fixed relative to the RD. It ranges from one to 13 bytes.
- The system ID is unique in an autonomous system (AS).
- The NSAP is a network selector and sometimes called SEL. In IS-IS, SEL is typically set to 00 to indicate a device.

### Related Configuration

#### Configuring a NET Address in IS-IS

By default, no NET address is configured in IS-IS.

Run the **net** command to configure a NET address in IS-IS.

The command configures an area ID and a system ID in IS-IS. Different NET addresses must have the same system ID.

### 6.3.3 IS-IS Packet Types

There are three types of IS-IS packets:

- LSP
- IIH PDU
- SNP (classified into CSNP and PSNP)

#### Working Principle

There are three types of IS-IS packets:

- LSP

LSPs are used to transmit link state records within an area and are classified into Level-1 LSPs and Level-2 LSPs. LSPs are only flooded to the corresponding Level.

- IIH PDU

IIH PDUs are used to maintain neighbor relationships. They carry multicast MAC addresses used to determine whether other systems run IS-IS.

- SNP (classified into CSNP and PSNP)

CSNPs are used for LSDB synchronization. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established.

PSNPs are also used for LSDB synchronization.

## Related Configuration

### ▾ Configuring the LSP Interval on an IS-IS Interface

By default, the LSP interval is 33 ms. If no Level is specified, the interval takes effect for Level-1 and Level-2 LSPs.

Run the **isis lsp-interval** command to configure the LSP interval on an IS-IS interface, in the unit of seconds.

The command changes the LSP interval.

### ▾ Configuring the Maximum Number of LSP PDUs Sent by IS-IS Interface at a Time

The default value is 5. If no particular level is designated, the default level is set to **level-1-2**, that is, the configuration of the maximum number takes effect at Level-1 and Level-2 concurrently.

Run the **isis lsp-flood** command to set the number of LSP PDUs sent by the IS-IS interface at a time.

You can use this command to change the maximum number of LSP PDUs sent by the interface at a time.

### ▾ Configuring the Interval for Receiving Duplicate LSP Packets

By default, this command is not configured and the function of setting the interval for receiving LSP packets is not supported. If no particular level is designated, the default level is set to **level-1-2**, that is, the interval configuration takes effect at Level-1 and Level-2 concurrently.

Run the **min-lsp-arrival** command to set the interval for receiving duplicate LSP packets.

During network flapping, LSP packets are frequently duplicated and the LSP packet sequence number constantly increases. If the device processes the duplicate LSP packets, more system resources are consumed. Therefore, setting the interval for receiving duplicate LSP packets can relieve device load.

### ▾ Configuring the Hello Packet Interval on an IS-IS Interface

By default, the Hello packet interval is 10s for Level-1 and Level-2.

Run the **isis hello-interval** command to configure the Hello packet interval on an IS-IS interface, in the unit of seconds.

The command changes the Hello packet interval. A DIS sends Hello packets at a frequency three times that by non-DIS devices in a broadcast network. If an IS is elected as the DIS on the interface, by default, the interface sends a Hello packet every 3.3s.

### ▾ Configuring the Minimum PSNP Interval

By default, the minimum PSNP interval is not configured, and the default interval 2s takes effect for Level-1 and Level-2 PSNPs.

Run the **isis psnp-interval** command to configure the minimum PSNP interval, in the unit of seconds.

PSNPs are mainly used to request LSPs that are absent locally or respond to received LSPs (in a P2P network). The PSNP interval should be minimized. If many LSPs exist and the device performance is low, you can increase the PSNP interval and LSP retransmission interval to reduce the device burden.

### 📌 Configuring the CSNP Broadcast Interval on an IS-IS Interface

By default, CSNPs are sent at 10s intervals in a broadcast network. No CSNPs are sent in a P2P network. When you configure a new CSNP interval without Level-1 or Level-2 specified, the interval takes effect for Level-1 and Level-2 CSNPs.

Run the **isis csnp-interval** command to specify the CSNP broadcast interval on an IS-IS interface, in the unit of seconds.

The command changes the CSNP interval. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to **mesh-groups** can be configured to periodically send CSNPs. No CSNPs are sent if the CSNP interval is set to 0.

## 6.3.4 DIS Election

A DIS is a designated device in a broadcast network and works like a DR in OSPF.

A pseudonode is generated by a DIS and sets up a relationship with each device in the local network.

### Working Principle

A DIS simulates multiple access links as a pseudonode and generates LSPs for the pseudonode. The pseudonode sets up a relationship with each device in the local network and forbids direct communication between the devices. A broadcast subnet and a non-broadcast multiple access (NBMA) network are considered as pseudonodes externally. Non-DIS devices report their link states to the DIS in the same network, and the DIS maintains the link states reported by all ISs in the network. Like DR election in OSPF, a DIS is elected to reduce unnecessary neighbor relationships and route information exchanges.

DIS election in IS-IS is preemptive. The election result can be manually controlled through interface priority configuration.

The device with a higher interface priority is more likely to be elected as the DIS.

### Related Configuration

#### 📌 Configuring the Priority for DIS Election in a LAN

By default, Priority 64 takes effect for Level-1 and Level-2.

Run the **isis priority** command to configure the priority for DIS election in a LAN.

The command changes the priority carried in Hello packets in a LAN. The device with a lower priority is less likely to be elected as the DIS.

The command is invalid on a P2P network interface. The **no isis priority** command, with or without parameters, restores the priority to its default value. To change the configured priority, run the **isis priority** command with the priority specified to overwrite the existing configuration, or you can first restore the priority to its default value and then configure a new priority.

## 6.3.5 IS-IS Supported TLV Types

IS-IS supports 26 types of TLV.

## Working Principle

The following table lists the IS-IS supported TLV types:

TLV Code	Description
Code = 1	Area ID
Code = 2	Priority of an IS neighbor
Code = 3	ES neighbor
Code = 6	MAC address of an IS neighbor
Code = 8	Filling field
Code = 9	LSP entity
Code = 10	Verification field
Code = 14	Size of the source LSP buffer
Code = 22	Extended IS reachability
Code = 128	IP internal reachability information
Code = 129	Supported protocol
Code = 130	IP external reachability information
Code = 131	Inter-domain routing protocol information
Code = 132	IP interface address
Code = 133	Verification information
Code = 135	Extended IP reachability TLV
Code = 137	Dynamic host name
Code = 211	Graceful Restart (GR)
Code = 222	Multi-Topology (MT) IS reachability
Code = 229	MT TLV
Code = 211	GR
Code=232	IPv6 interface
Code = 235	IPv4 MT IP reachability TLV
Code =236	IPv6 IP reachability TLV
Code = 237	IPv6 MT IP reachability TLV
Code = 240	P2P three-way handshake TLV

## Related Configuration

### 📄 [Configuring the Neighbor Detection Protocol Carried in Hello Packets](#)

By default, neighbor detection is enabled.

Run the **adjacency-check** command to configure the neighbor detection protocol carried in Hello packets.

### 6.3.6 LSP Fragment Extension

IS-IS floods LSPs to advertise link states. The size of an LSP is limited by the MTU size of the link. When the content to be advertised exceeds one LSP, IS-IS will create LSP fragments to carry new link state information. According to ISO standards, an LSP fragment is identified by a one-byte LSP number. An IS-IS device can generate up to 256 LSP fragments.

#### Working Principle

The 256 LSP fragments are insufficient in any of the following situations:

1. New applications (such as traffic engineering [TE]) extend new TLV or Sub-TLV.
2. The network is expanded continuously.
3. Routes with reduced granularity are advertised, or other routes are redistributed to IS-IS.

After LSP fragments are used up, new routing information and neighbor information will be discarded, causing network exceptions such as routing black holes or loops. LSP fragments must be extended to carry more link state information, thus ensuring normal network operation.

You can configure an additional system ID and enable fragment extension to allow IS-IS to advertise more link state information in extended LSP fragments. Each virtual system can be considered as a virtual device that establishes a neighbor relationship (with the path value being 0) with the originating system. Extended LSPs are published by the neighbor of the originating system, that is, the virtual system.

The following terms are related to fragment extension:

#### ↳ Normal System ID

The system ID defined by ISO is used to establish neighbor relationships and learn routes. It is further defined as the normal system ID in order to be distinguished from the additional system ID introduced to fragment extension.

#### ↳ Additional System ID

The additional system ID is configured by an administrator to generate extended LSPs. The additional system ID shares the usage rules of the normal system ID (for example, the additional system ID must be unique in the entire area), except that the additional system ID is not carried in Hello packets for neighbor relationship establishment.

#### ↳ Originating System

An originating system is an IS-IS-enabled device and maps a virtual system identified by the additional system ID.

#### ↳ Virtual System (Virtual IS)

A virtual system is identified by the additional system ID and used to generate extended LSPs. The virtual system concept is proposed by RFC for distinguishing from the originating system concept. Each virtual system can generate up to 256 LSP fragments. The administrator can configure multiple additional system IDs (virtual systems) to generate more LSP fragments.

#### ↳ Original LSP

An original LSP is the LSP whose system ID contained in the LSP ID is a normal system ID. Original LSPs are generated by an originating system.

#### Extended LSP

An extended LSP is the LSP whose system ID contained in the LSP ID is an additional system ID. Extended LSPs are generated by a virtual system.

### Related Configuration

#### Enabling Fragment Extension

By default, fragment extension is disabled. If you do not specify a Level when enabling fragment extension, it will take effect for Level-1 and Level-2 LSPs.

Run the **lsp-fragments-extend** command to enable fragment extension.

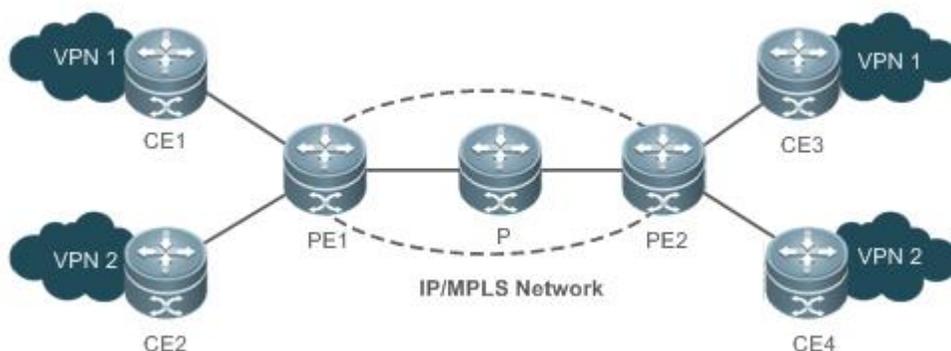

There are up to 256 LSP fragments. When the fragments are used up, subsequent link state information, including neighbor information and IP route information, will be discarded, causing a network exception. To solve this problem, enable fragment extension at the specified Level and configure an additional system ID by using the **virtual-system** command.

## 6.3.7 IS-IS VRF

VRF is mainly used for local routing and packet separation. It avoids route conflict caused by use of the same prefix by multiple VPNs. IPv4 VPN and IPv6 VPN combine Multiprotocol Label Switching (MPLS) advantages in terms of Quality of Service (QoS) and security assurance, and are the primary solutions for interconnecting the geographically different office branches of an enterprise or industry user.

### Working Principle

Figure 6-5 Separation of Different VPNs by VRF Tables Configured on Provider Edge (PE) Devices

In Figure 6-5, the following configuration requirements exist: Configure the two sites (CE1 and CE3) in VPN1 to access each other and the two sites (CE2 and CE4) in VPN2 to access each other, and forbid access between the sites in VPN1 and those in VPN2, because VPN1 and VPN2 belong to different customers or departments and may have identical IP addresses.

The customer edge (CE) devices connect the customer network to the PEs to exchange VPN routing information with the PEs, that is, advertise local routes to the PEs and learn remote routes from the PEs.

Each PE learns routes from directly connected CEs and exchanges the learned VPN routes with the other PE through the Border Gateway Protocol (BGP). The PEs provide access to the VPN service.

The Provider (P) device in the Service Provider (SP) network is not directly connected to the CEs. The P device only needs the MPLS forwarding capability and does not maintain VPN information.

The IS-IS protocol running between the PEs and CEs requires the VRF capability to separate routing information between VPN1 and VPN2. That is, IS-IS only learns routes through VRF.

## Related Configuration

### ↘ Binding an IS-IS Instance with a VRF Table

By default, an IS-IS instance is not bound with any VRF table.

Run the **VRF** command to bind an IS-IS instance with a VRF table.

Note the following constraints or conventions for the binding operation:

- The IS-IS instances bound with the same non-default VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same system ID.
- One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.
- When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the **ip** (or **ipv6**) **router isis** [ *tag* ] interface configuration and the redistribution configuration in routing process mode will be deleted.

## 6.3.8 IS-IS MTR

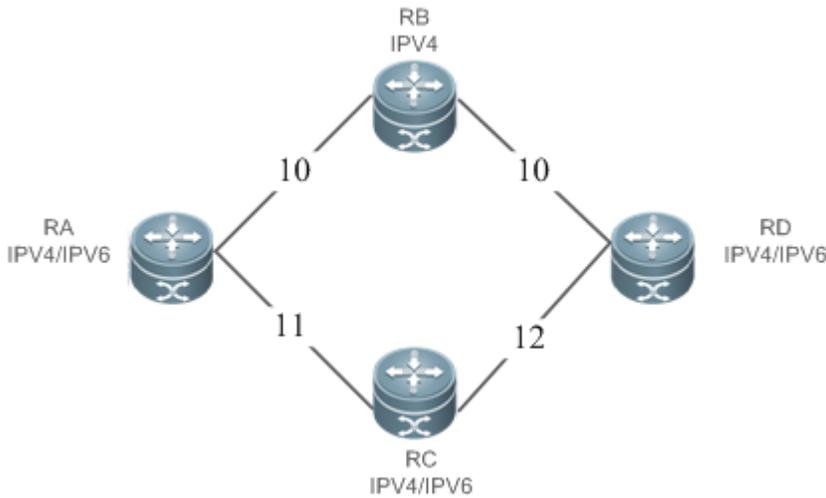

IS-IS MTR is an extended feature used to separate IPv4 unicast route calculation and IPv6 unicast route calculation based on topologies. It complies with the specification of IS-IS MT extension defined in RFC 5120. New TLV types are introduced to IIH PDUs and LSPs to transmit IPv6 unicast topology information. One physical network can be divided into an IPv4 unicast logical topology and an IPv6 unicast logical topology. The two topologies perform SPF calculation separately and maintain independent IPv4 and IPv6 unicast routing tables respectively. In this way, IPv4 unicast service traffic and IPv6 unicast service traffic are forwarded by different paths. The IS-IS MTR technique helps users deploy IPv6 unicast networks without the constraint on consistency between IPv4 and IPv6 unicast topology information.

IS-IS MTR is derived from IS-IS MT, which is used to separate IPv4 and IPv6 unicast topologies, unicast and multicast topologies, and topologies using different protocol stacks (such as IPv4 and Pv6). IS-IS MTR separates IPv4 and IPv6 unicast topologies based on IS-IS MT.

## Working Principle

Figure 6-6 shows a typical networking application. The following implementation requirements exist: Deploy an IPv6 unicast topology in incremental mode, and upgrade some devices to support IPv4 and IPv6 dual protocol stacks while keeping other IPv4-enabled devices unchanged.

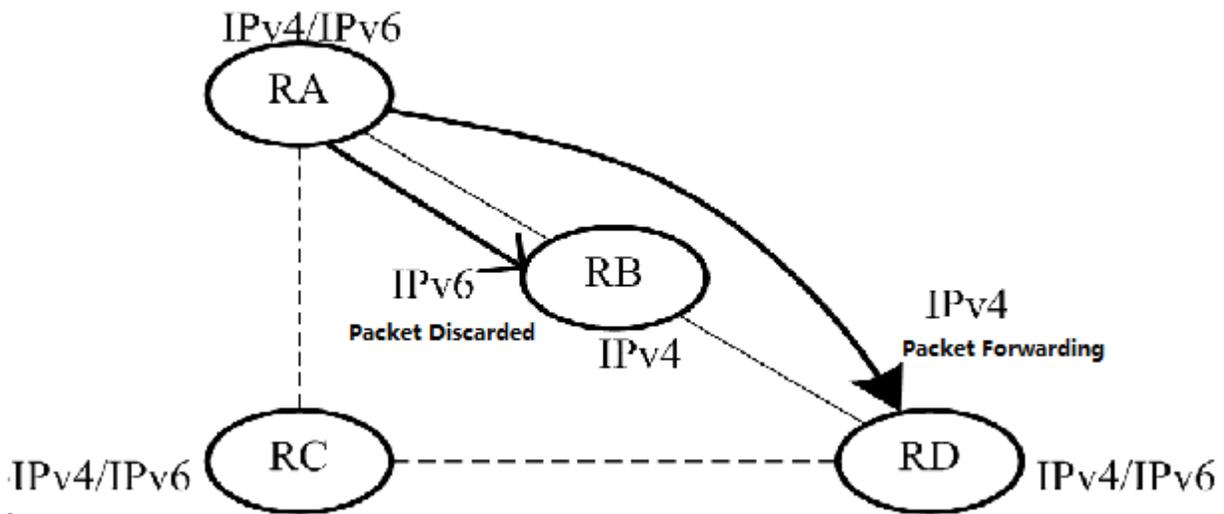

Figure 6-6 Physical Topology for IPv4-IPv6 Hybrid Deployment

In Figure 6-6, each link is marked by a number indicating its metric. RB only supports the IPv4 protocol stack, whereas other devices support IPv4 and IPv6 dual protocol stacks.

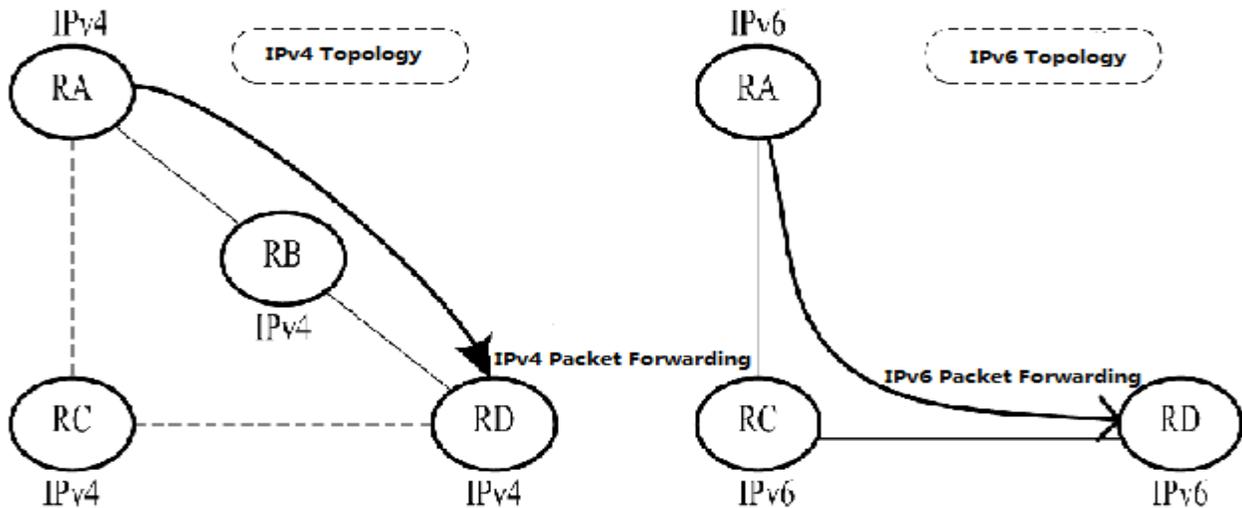

The networking constraint on consistency between IPv4 and IPv6 unicast topologies must be canceled to retain the use of RB; otherwise, RB cannot establish a neighbor relationship with RA or RD, which will cause new problems.

Figure 6-7 IPv4-IPv6 Hybrid Topology

In Figure 6-7, without IS-IS MTR support, the SPF calculations performed by RA, RB, RC, and RD only take into account the single hybrid topology. The calculated shortest path is RA -> RB -> RD, with the overhead being 20. RB will discard IPv6 packets because it does not support IPv6.

Figure 6-8 Separation of IPv4 and IPv6 Topologies

In Figure 6-8, the IS-IS MTR technique is used to separate IPv4 and IPv6 unicast topologies. RA, RB, RC, and RD establish neighbor relationships based on the IPv4 unicast topology and IPv6 unicast topology respectively. The left part shows the IPv4 topology formed by IPv4-enabled routers. The calculated IPv4 shortest path is RA -> RB -> RC, which realizes IPv4 packet forwarding. The right part shows the IPv6 topology formed by IPv6-enabled routers. The calculated IPv6 shortest path is RA -> RC -> RD, which realizes IPv6 packet forwarding.

IS-IS MTR must be deployed to avoid routing black holes when some devices support only one protocol. IS-IS MTR is not required when all devices support IPv4 and IPv6 dual protocol stacks.

- Deployment of a new network: IS-IS MTR is not required when devices only support the IPv4 protocol stack. For devices that only support the IPv6 protocol stack or devices that support IPv4 and IPv6 dual protocol stacks, enable the MT mode of IS-IS MTR. You are advised not to enable Multi-Topology Transition (MTT); otherwise, loops may occur.
- Reconstruction of an existing network with devices supporting only one protocol stack: Enable the MTT mode of IS-IS MTR on devices that support IPv4 and IPv6 dual protocol stacks in sequence (starting from the device closest to a device supporting only one protocol stack in the network topology). After the MTT mode is enabled on all new devices, switch the MTT mode to the MT mode on these devices in sequence (starting from the device farthest from a device supporting only one protocol stack in the network topology).

## Related Configuration

### ▾ Enabling MTR for IS-IS Instances

By default, IS-IS instances are not enabled with MTR.

Run the **multi-topology** command to configure IS-IS to support IPv6 unicast topologies. After that, IPv4 and IPv6 unicast routes in IS-IS will be calculated based on different topologies.

Note the following constraints or conventions when you use the **multi-topology** command:

1. Set **metric-style** to **Wide** or **Transition** before you run the command.
2. The MTR feature will be disabled if **metric-style** is set to **Narrow** or only one Level is configured to support the Wide or Transition mode.

### 6.3.9 IS-IS Neighbor

The following conditions must be met for two routing devices to establish a neighbor relationship when IS-IS MTR is not configured:

- The interface addresses on both routing devices are in the same network segment.
- The interface Levels on both routing devices match.
- The routing devices are authenticated by each other.
- The routing devices support the same protocol.

The following conditions must be met for routing devices to establish a neighbor relationship when IS-IS MTR is configured:

- The interface addresses on both routing devices are in the same network segments.
- The interface Levels on both routing devices match.
- The routing devices are authenticated by each other.
- The routing devices have at least one consistent MT ID when P2P links are configured.
- There are no constraints on the MT IDs that the routing devices support when LAN links are configured.

## 6.4 Configuration

Configuration	Description and Command	
<a href="#">Enabling IS-IS</a>	 (Mandatory) It is used to enable IS-IS on specified interfaces. You need to create an IS-IS routing process in advance.	
	<b>router isis</b> [ tag ]	Starts an IS-IS routing process. <i>tag</i> indicates the process name.
	<b>net</b> areaAddress.SystemId.00	Configures a NET address in IS-IS.
	<b>ip router isis</b> [ tag ]	Enables IS-IS on an interface. <i>tag</i> indicates the name of the IS-IS routing process.
<a href="#">Configuring IS-IS Hello Packets</a>	 (Optional) It is used to configure the IS-IS Hello packet holdtime.	
	<b>isis hello-interval</b> { interval   minimal } [ level-1   level-2 ]	Configures the Hello packet interval on an interface. The value range is 1 to 65,535, in the unit of seconds.
	<b>isis hello-multiplier</b> multiplier-number [ level-1   level-2 ]	Configures the Hello packet holdtime multiplier on an IS-IS interface. The value range is 2 to 100. The default value is 3.
<a href="#">Configuring IS-IS LSPs</a>	 (Optional) It is used to perform time-related LSP configuration, determine whether to ignore LSP checksum errors, and enable/disable LSP fragment extension.	

Configuration	Description and Command	
	<b>isis lsp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]	Configures the minimum LSP interval on an interface. The value range is 1 to 4,294,967,295, in the unit of milliseconds.
	<b>isis lsp-flood</b> <i>lsp-number</i> [ <b>level-1</b>   <b>level-2</b> ]	Indicates the maximum number of LSP packets sent by the IS-IS interface at a time. The value range is <b>1</b> to <b>1000</b> . The default value is <b>5</b> .
	<b>isis retransmit-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]	Configures the LSP retransmission interval by P2P links on an interface. The value range is 0 to 65,535, in the unit of seconds.
	<b>lsp-gen-interval</b> [ <b>level-1</b>   <b>level-2</b> ] <i>maximum-interval</i> [ <i>initial-interval</i> <i>hold-interval</i> ]	Configures LSP generation cycle. <i>maximum-interval</i> : Indicates the maximum interval for generating two consecutive LSP packets. The value range is <b>1</b> to <b>65535</b> (in seconds). The default value is <b>5</b> . <i>initial-interval</i> : Indicates the waiting time for generating an LSP packet for the first time. The value range is <b>0</b> to <b>60000</b> (in milliseconds). The default value is <b>50</b> . <i>hold-interval</i> : Indicates the minimum interval for generating an LSP packet for the second time. The value range is <b>10</b> to <b>60000</b> (in milliseconds). The default value is <b>200</b> .
	<b>ignore-lsp-errors</b>	Configures to ignore LSP checksum errors.
	<b>lsp-fragments-extend</b> [ <b>level-1</b>   <b>level-2</b> ] <b>[compatible rfc3786]</b>	Enables fragment extension.
	<b>virtual-system</b> <i>system-id</i>	Configures an additional system ID.
<a href="#">Configuring IS-IS SNPs</a>	 (Optional) It is used to configure the CSNP broadcast interval.	
	<b>isis csnp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]	Configures the CSNP interval on an interface. The value range is 0 to 65,535, in the unit of seconds. The default value is 10s. No CSNPs are sent if the CSNP interval is set to 0.
<a href="#">Configuring the IS-IS Level Type</a>	 (Optional) It is used to configure the system type or interface circuit type in IS-IS.	
	<b>is-type</b> { <b>level-1</b>   <b>level-1-2</b>   <b>level-2-only</b> }	Configures the system type.
	<b>isis circuit-type</b> { <b>level-1</b>   <b>level-1-2</b>   <b>level-2-only</b> [ <b>external</b> ] }	Configures the interface circuit type.

Configuration	Description and Command
<a href="#">Configuring IS-IS Authentication</a>	<p> (Optional) It is used to configure interface authentication, area authentication, and RD authentication.</p>
	<p><b>isis password</b> [ 0   7 ] <i>password</i> [ <b>send-only</b> ] [ level-1   level-2 ]</p> <p>Configures the password for plaintext authentication of Hello packets on an interface.</p> <p>When <b>send-only</b> is included, the authentication password is only used to authenticate sent Hello packets. Received Hello packets are not authenticated.</p> <p>If no Level is specified, the configured authentication and password take effect for all Levels.</p> <p>This command does not take effect if the <b>isis authentication mode</b> command is executed. Both commands are used to configure IS-IS interface authentication, but the <b>isis password</b> command has a lower priority. Before you run the <b>isis password</b> command, delete the <b>isis authentication mode</b> command configuration.</p>
