| <p><b>Scenario</b><br/>Figure 2-14</p> |  <p><b>Remarks</b> The interface IP addresses are as follows:<br/>                 A: GE0/1 192.168.1.1<br/>                 B: GE0/1 192.168.1.2 GE0/2 172.16.2.1 GE0/3 172.16.3.1<br/>                 C: GE0/2 172.16.2.2 GE0/1 172.16.4.2<br/>                 D: GE0/2 172.16.3.2 GE0/1 172.16.5.2</p> |
| <p><b>Configuration Steps</b></p>      | <ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Summarize routes of area 2 on Router B.</li> </ul>   |
| <p><b>B</b></p>                        | <pre>B# configure terminal B(config)#router ospf 1 B(config-router)#area 2 range 172.16.0.0 255.255.0.0</pre>   |
| <p><b>Verification</b></p>             | <p>On Router A, verify that the entry 172.16.0.0/16 is added to the routing table.</p>  |
| <p><b>A</b></p>                        | <pre>A#show ip route ospf 0 IA 172.16.0.0/16 [110/2] via 192.168.1.2, 00:01:04, GigabitEthernet 0/1</pre>   |

**Common Errors**

- Inter-area route summarization cannot be implemented because the **area range** command is configured on a non-ABR device.

**2.4.6 Configuring Route Filtering**

**Configuration Effect**

- Routes that do not meet filtering conditions cannot be loaded to the routing table, or advertised to neighbors. Network users cannot access specified destination network.

**Notes**

- The OSPF basic functions must be configured.

- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the **area filter-list** or **area range** (containing the **not-advertise** parameter) command on the ABR to prevent generation of black-hole routes.

## Configuration Steps

### ▾ Configuring Inter-Area Route Filtering

- (Optional) This configuration is recommended if users should be restricted from accessing the network in a certain OSPF area.
- Unless otherwise required, this configuration should be performed on an ABR in the area where filtered routes are located.

### ▾ Configuring Redistributed Route Filtering

- (Optional) This configuration is required if external routes introduced by the ASBR need to be filtered.
- Unless otherwise required, this configuration should be performed on an ASBR to which filtered routes are introduced.

### ▾ Configuring Learned Route Filtering

- (Optional) This configuration is required if users should be restricted from accessing a specified destination network.
- Unless otherwise required, this configuration should be performed on a router that requires route filtering.

## Verification

- Run the **show ip route** command to verify that the router is not loaded with routes that have been filtered out.
- Run the **ping** command to verify that the specified destination network cannot be accessed.

## Related Commands

### ▾ Configuring a Passive Interface

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>passive-interface</b> { <b>default</b>   <i>interface-type interface-number</i>   <i>interface-type interface-number ip-address</i> }  |
| <b>Parameter</b>    | <i>interface-type interface-number</i> : Indicates the interface that should be configured as a passive interface.  |
| <b>Description</b>  | <b>default</b> : Indicates that all interface will be configured as passive interfaces.<br><i>interface-type interface-number ip-address</i> : Specifies an address of the interface as the passive address.  |
| <b>Command Mode</b> | OSPF routing process configuration mode   |
| <b>Usage Guide</b>  | To prevent other routers on the network from learning the routing information of the local router, you can configure a specified network interface of the local router as the passive interface, or a specified IP address of a network interface as the passive address. |

### ▾ Configuring the LSA Update Packet Filtering

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>ip ospf database-filter all out</b>  |
| <b>Parameter</b>    | N/A   |
| <b>Description</b>  |   |
| <b>Command Mode</b> | Interface configuration mode  |
| <b>Usage Guide</b>  | Enable this function on an interface to prevent sending the LSA update packet on this interface. After this function is enabled, the local router does not advertise the LSA update packet to neighbors, but still sets up the adjacency with neighbors and receives LSAs from neighbors. |

### ▾ Configuring Inter-Area Route Filtering

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>area <i>area-id</i> filter-list { <i>access-acl-name</i>   prefix <i>prefix-name</i> } { in   out }</b>  |
| <b>Parameter</b>    | <i>area-id</i> : Indicates the area ID.   |
| <b>Description</b>  | <b>access <i>acl-name</i></b> : Indicates the associated ACL.<br><b>prefix <i>prefix-name</i></b> : Indicates the associated prefix list.<br><b>in   out</b> : Filters routes that are received by or sent from the area. |
| <b>Command Mode</b> | OSPF routing process configuration mode   |
| <b>Usage Guide</b>  | This command can be configured only on an ABR.<br>Use this command when it is required to configure filtering conditions for inter-area routes on the ABR.  |

### ▾ Configuring Redistributed Route Filtering

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>distribute-list { [ <i>access-list-number</i>   <i>name</i> ]   prefix <i>prefix-list-name</i> } out [ <b>bgp</b>   <b>connected</b>   <b>isis</b> [<i>area-tag</i>]   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>static</b> ]</b>  |
| <b>Parameter</b>    | <i>access-list-number</i>   <i>name</i> : Uses the ACL for filtering.   |
| <b>Description</b>  | <b>prefix <i>prefix-list-name</i></b> : Uses the prefixlist for filtering.<br><b>bgp   connected   isis [ <i>area-tag</i> ]   ospf <i>process-id</i>   rip   static</b> : Indicates the source of routes to be filtered.  |
| <b>Command Mode</b> | OSPF routing process configuration mode   |
| <b>Usage Guide</b>  | <b>distribute-list out</b> is similar to <b>redistribute route-map</b> , and is used to filter routes that are redistributed from other protocols to OSPF. The <b>distribute-list out</b> command itself does not redistribute routes, and is generally used together with the <b>redistribute</b> command. The ACL and the prefixlist filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes coming from a certain source, the prefixlist cannot be configured to filter the same routes. |

### ▾ Configuring Learned Route Filtering

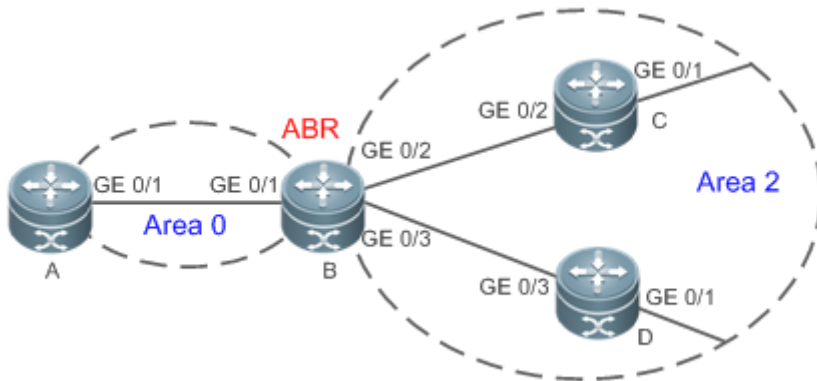

|                    |  |
|--------------------|--|
| <b>Command</b>     | <b>distribute-list { [<i>access-list-number</i>   <i>name</i>]   prefix <i>prefix-list-name</i> [<i>gateway prefix-list-name</i>]   route-map <i>route-map-name</i> } in [<i>interface-type</i> <i>interface-number</i>]</b> |
| <b>Parameter</b>   | <i>access-list-number</i>   <i>name</i> : Uses the ACL for filtering.  |
| <b>Description</b> | <b>gateway <i>prefix-list-name</i></b> : Uses the gateway for filtering.<br><b>prefix <i>prefix-list-name</i></b> : Uses the prefixlist for filtering.   |

|                     |  |
|---------------------|--|
|                     | <p><b>route-map</b> <i>route-map-name</i>: Uses the route map for filtering.</p> <p><i>interface-type interface-number</i>: Specifies the interface for which LSA routes are filtered.</p>   |
| <b>Command Mode</b> | OSPF routing process configuration mode  |
| <b>Usage Guide</b>  | Filter routes that are computed based on received LSAs. Only routes meeting the filtering conditions can be forwarded. The command does not affect the LSDB or the routing tables of neighbors. The ACL, prefix list, and route map filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes of a specified interface, the prefix list or router map cannot be configured for filtering routes of the same interface. |

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

|  |   |
|--|---|
| <p><b>Scenario</b><br/>Figure 2-15</p> |  <p><b>Remarks</b></p> <p>The interface IP addresses are as follows:</p> <p>A: GE0/1 192.168.1.1</p> <p>B: GE0/1 192.168.1.2 GE0/2 172.16.2.1 GE0/3 172.16.3.1</p> <p>C: GE0/2 172.16.2.2 GE0/3 172.16.4.2</p> <p>D: GE0/2 172.16.3.2 GE0/3 172.16.5.2</p> |
| <p><b>Configuration Steps</b></p>      | <ul style="list-style-type: none"> <li>Configure the interface IP addresses on all routers. (Omitted)</li> <li>Configure the OSPF basic functions on all routers. (Omitted)</li> <li>On Router A, configure route filtering.</li> </ul>   |
| <p><b>A</b></p>                        | <pre>A# configure terminal A(config)#access-list 3 permit host 172.16.5.0 A(config)#router ospf 1 A(config-router)#distribute-list 3 in GigabitEthernet 0/1</pre>   |
| <p><b>Verification</b></p>             | <ul style="list-style-type: none"> <li>On Router A, check the routing table. Verify that only the entry 172.16.5.0/24 is loaded.</li> </ul>   |

A

```
A# show ip route ospf
0 172.16.5.0/24 [110/2] via 192.168.1.2, 10:39:40, GigabitEthernet 0/1
```

## Common Errors

- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated.

## 2.4.7 Modifying Route Cost and AD

### Configuration Effect

- Change the OSPF routes to enable the traffic pass through specified nodes or avoid passing through specified nodes.
- Change the sequence that a router selects routes so as to change the priorities of OSPF routes.

### Notes

- The OSPF basic functions must be configured.
- If you run the **ip ospf cost** command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

### Configuration Steps

#### ▾ Configuring the Reference Bandwidth

- Optional.
- A router is connected with lines with different bandwidths. This configuration is recommended if you wish to preferentially select the line with a larger bandwidth.

#### ▾ Configuring the Cost of an Interface

- Optional.
- A router is connected with multiple lines. This configuration is recommended if you wish to manually specify a preferential line.

#### ▾ Configuring the Default Metric for Redistribution

- Optional.
- This configuration is mandatory if the cost of external routes of the OSPF domain should be specified when external routes are introduced to an ASBR.

#### ▾ Configuring the Maximum Metric

- Optional.

- A router may be unstable during the restart process or a period of time after the router is restarted, and users do not want to forward data through this router. In this case, this configuration is recommended.

### ↘ Configuring the AD

- Optional.
- This configuration is mandatory if you wish to change the priorities of OSPF routes on a router that runs multiple unicast routing protocols.

### Verification

- Run the **show ip ospf interface** command to verify that the costs of interfaces are correct.
- Run the **show ip route** command to verify that the costs of external routes introduced to the ASBR are correct.
- Restart the router. Within a specified period of time, data is not forwarded through the restarted router.

### Related Commands

#### ↘ Configuring the Reference Bandwidth

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>auto-costreference-bandwidth</b> <i>ref-bw</i>  |
| <b>Parameter Description</b> | <i>ref-bw</i> : Indicates the reference bandwidth. The unit is Mbps. The value ranges from 1 to 4,294,967.   |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | <p>By default, the cost of an OSPF interface is equal to the reference value of the auto cost divided by the interface bandwidth.</p> <p>Run the <b>auto-cost</b> command to obtain the reference value of the auto cost. The default value is 100 Mbps.</p> <p>Run the <b>bandwidth</b> command to set the interface bandwidth.</p> <p>The costs of OSPF interfaces on several typical lines are as follows:</p> <p>64Kbps serial line: The cost is 1562.</p> <p>E1 line: The cost is 48.</p> <p>10M Ethernet: The cost is 10.</p> <p>100M Ethernet: The cost is 1.</p> <p>If you run the <b>ip ospf cost</b> command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.</p> |

#### ↘ Configuring the Cost of an Interface

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip ospf cost</b> <i>cost</i>   |
| <b>Parameter Description</b> | <i>cost</i> : Indicates the cost of an OSPF interface. The value ranges from 0 to 65,535.                 |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | By default, the cost of an OSPF interface is equal to the reference value of the auto cost divided by the |

|  |  |
|--|--|
|  | <p>interface bandwidth.</p> <p>Run the <b>auto-cost</b> command to obtain the reference value of the auto cost. The default value is 100 Mbps.</p> <p>Run the <b>bandwidth</b> command to set the interface bandwidth.</p> <p>The costs of OSPF interfaces on several typical lines are as follows:</p> <p>64Kbps serial line: The cost is 1562.</p> <p>E1 line: The cost is 48.</p> <p>10M Ethernet: The cost is 10.</p> <p>100M Ethernet: The cost is 1.</p> <p>If you run the <b>ip ospf cost</b> command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.</p> |
|--|--|

### ↘ Configuring the Cost of the Default Route in a Stub or an NSSA Area

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>area</b> <i>area-id</i> <b>default-cost</b> <i>cost</i>  |
| <b>Parameter Description</b> | <i>area-id</i> : Indicates the ID of the stub or NSSA area.<br><i>cost</i> : Indicates the cost of the default summarized route injected to the stub or NSSA area. The value ranges from 0 to 16,777,215.   |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | This command takes effect only on an ABR in a stub area or an ABR/ASBR in an NSSA area. An ABR in a stub area or an ABR/ASBR in an NSSA area is allowed to advertise an LSA indicating the default route in the stub or NSSA area. You can run the <b>area default-cost</b> command to modify the cost of the advertised LSA. |

### ↘ Configuring the Default Metric for Redistribution

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>default-metric</b> <i>metric</i>  |
| <b>Parameter Description</b> | <i>metric</i> : Indicates the default metric of the OSPF redistributed route. The value ranges from 1 to 16,777,214.   |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | The <b>default-metric</b> command must be used together with the <b>redistribute</b> command to modify the initial metrics of all redistributed routes.<br>The <b>default-metric</b> command does not take effect on external routes that are injected to the OSPF routing domain by the <b>default-information originate</b> command. |

### ↘ Configuring the Maximum Metric

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>max-metric</b> <b>router-lsa</b> [ <b>external-lsa</b> [ <i>max-metric-value</i> ]] [ <b>include-stub</b> ] [ <b>on-startup</b> [ <i>seconds</i> ]] [ <b>summary-lsa</b> [ <i>max-metric-value</i> ]]  |
| <b>Parameter Description</b> | <b>router-lsa</b> : Sets the metrics of non-stub links in the Router LSA to the maximum value (0xFFFF).<br><b>external-lsa</b> : Allows a router to replace the metrics of external LSAs (including Type 5 and Type 7 LSAs) with the maximum metric.<br><i>max-metric-value</i> : Indicates the maximum metric of the LSA. The default value is 16711680. The value |

|                     |  |
|---------------------|--|
|                     | <p>ranges from 1 to 16,777,215.</p> <p><b>include-stub:</b> Sets the metrics of stub links in the Router LSA advertised by the router to the maximum value.</p> <p><b>on-startup:</b> Allows a router to advertise the maximum metric when started.</p> <p><i>seconds:</i> Indicates the interval at which the maximum metric is advertised. The default value is 600s. The value ranges from 5 to 86,400.</p> <p><b>summary-lsa:</b> Allows a router to replace the metrics of summary LSAs (including Type 3 and Type 4 LSAs) with the maximum metric.</p>   |
| <b>Command Mode</b> | OSPF routing process configuration mode  |
| <b>Usage Guide</b>  | <p>After the <b>max-metric router-lsa</b> command is executed, the metrics of the non-stub links in the Router LSAs generated by the router will be set to the maximum value (0xFFFF). If you cancel this configuration or the timer expires, the normal metrics of the links are restored.</p> <p>By default, if the <b>max-metric router-lsa</b> command is executed, the stub links still advertise common metrics, that is, the costs of outbound interfaces. If the <b>include-stub</b> parameter is configured, the stub links will advertise the maximum metric.</p> <p>If an ABR does not wish to transfer inter-area traffic, use the <b>summary-lsa</b> parameter to set the metric of the Summary LSA to the maximum metric.</p> <p>If an ASBR does not wish to transfer external traffic, use the <b>external-lsa</b> parameter to set the metric of the external LSA to the maximum metric.</p> <p>The <b>max-metric router-lsa</b> command is generally used in the following scenarios:</p> <p>Restart a device. After the device is restarted, IGP generally converges faster, and other devices attempt to forward traffic through the restarted device. If the current device is still building the BGP routing table and some BGP routes are not learned yet, packets sent these networks will be discarded. In this case, you can use the <b>on-startup</b> parameter to set a delay after which the restarted device acts as the transmission mode.</p> <ul style="list-style-type: none"> <li>● Add a device to the network but the device is not used to transfer traffic. The device is added to the network. If a candidate path exists, the current device is not used to transfer traffic. If a candidate path does not exist, the current device is still used to transfer traffic.</li> <li>● Delete a device gracefully from the network. After the <b>max-metric router-lsa</b> command is executed, the current device advertises the maximum metric among all metrics of routes. In this way, other devices on the network can select the standby path for data transmission before the device is shut down.</li> </ul> <p>In the earlier OSPF version (RFC1247 or earlier), the links with the maximum metric (0xFFFF) in the LSAs do not participate in the SPF computation, that is, no traffic is sent to routers that generate these LSAs.</p> |

### ↘ Configuring RFC1583Compatibility

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>compatible rfc1583</b>               |
| <b>Parameter Description</b> | N/A                                     |
| <b>Command Mode</b>          | OSPF routing process configuration mode |

|                    |  |
|--------------------|--|
| <b>Usage Guide</b> | When there are multiple paths to an ASBR or the forwarding address of an external route, RFC1583 and RFC2328 define different routing rules. If RFC1583 compatibility is configured, a path in the backbone area or an inter-area path is preferentially selected. If RFC1583 compatibility is not configured, a path in a non-backbone area is preferentially selected. |
|--------------------|--|

📌 **Configuring the AD**

|                     |   |
|---------------------|---|
| <b>Command</b>      | <code>distance { distance   ospf { [ intra-area distance ] [ inter-area distance ] [ external distance ] } }</code>   |
| <b>Parameter</b>    | <i>distance</i> : Indicates the AD of a route. The value ranges from 1 to 255.  |
| <b>Description</b>  | <b>intra-area distance</b> : Indicates the AD of an intra-area route. The value ranges from 1 to 255.<br><b>inter-area distance</b> : Indicates the AD of an inter-area route. The value ranges from 1 to 255.<br><b>external distance</b> : Indicates the AD of an external route. The value ranges from 1 to 255. |
| <b>Command Mode</b> | OSPF routing process configuration mode   |
| <b>Usage Guide</b>  | Use this command to specify different ADs for different types of OSPF routes.   |

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

📌 **Configuring the Cost of an Interface**

|                                |  |                |
|--------------------------------|--|----------------|
| <b>Scenario</b><br>Figure 2-16 |  |                |
|                                | <table border="1"> <tr> <td><b>Remarks</b></td> <td>The interface IP addresses are as follows:<br/>A: GE0/1 192.168.1.1    GE0/2 192.168.2.1<br/>B: GE0/1 192.168.1.2    GE0/2 192.168.3.2<br/>C: GE0/1 192.168.4.2    GE0/2 192.168.2.2</td> </tr> </table> | <b>Remarks</b> |
| <b>Remarks</b>                 | The interface IP addresses are as follows:<br>A: GE0/1 192.168.1.1    GE0/2 192.168.2.1<br>B: GE0/1 192.168.1.2    GE0/2 192.168.3.2<br>C: GE0/1 192.168.4.2    GE0/2 192.168.2.2  |                |
| <b>Configuration Steps</b>     | <ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, configure the cost of each interface.</li> </ul>     |                |

|                     |  |
|---------------------|--|
| A                   | <pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip ospf cost 10 A(config)# interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)# ip ospf cost 20</pre> |
|                     |  |
| <b>Verification</b> | On Router A, check the routing table. The next hop of the optimum path to 172.16.1.0/24 is Router B.   |
| A                   | <pre>A# show ip route ospf 0 E2172.16.1.0/0 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1</pre>  |

### Common Errors

- If the cost of an interface is set to 0 in the **ip ospf cost** command, a route computation error may occur. For example, a routing loop is obtained.

## 2.4.8 Enabling Authentication

### Configuration Effect

- All routers connected to the OSPF network must be authenticated to ensure stability of OSPF and protect OSPF against intrusions.

### Notes

- The OSPF basic functions must be configured.
- If authentication is configured for an area, the configuration takes effect on all interfaces that belong to this area.
- If authentication is configured for both an interface and the area to which the interface belongs, the configuration for the interface takes effect preferentially.

### Configuration Steps

#### ↘ Configuring the Authentication Type of an Area

- (Optional) This configuration is recommended if the same authentication type should be used on all interfaces in the same area.
- This configuration is required if a router accesses a network that requires authentication.

#### ↘ Configuring the Authentication Type of an Interface

- (Optional) This configuration is recommended if the different authentication types should be used on different interfaces in the same area.
- This configuration is required if a router accesses a network that requires authentication.

➤ **Configuring a Plain Text Authentication Key for an Interface**

- Optional.
- This configuration is required if a router accesses a network that requires plain text authentication.

➤ **Configuring an MD5 Authentication Key for an Interface**

- (Optional) MD5 authentication features a high security, and therefore is recommended. You must configure either plain text authentication or MD5 authentication.
- This configuration is required if a router accesses a network that requires MD5 authentication.

**Verification**

- If routers are configured with different authentication keys, run the **show ip ospf neighbor** command to verify that there is no OSPF neighbor.
- If routers are configured with the same authentication key, run the **show ip ospf neighbor** command to verify that there are OSPF neighbors.

**Related Commands**

➤ **Configuring the Authentication Type of an Area**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>area <i>area-id</i>authentication [message-digest]</b>  |
| <b>Parameter Description</b> | <i>area-id</i> : Indicates the ID of the area where OSPF authentication is enabled. The area ID can be a decimal integer or an IP address.<br><b>message-digest</b> : Enables MD5 authentication.  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | The RGOS supports three authentication types:<br>(1) Type 0: No authentication is required. If this command is not configured to enable OSPF authentication, the authentication type in the OSPF data packet is 0.<br>(2) Type 1: The authentication type is plain text authentication if this command is configured but does not contain the <b>message-digest</b> parameter.<br>(3) Type 3: The authentication type is MD5 authentication if this command is configured and contains the <b>message-digest</b> parameter.<br>All routers in the same OSPF area must use the same authentication type. If authentication is enabled, the authentication key must be configured on interfaces that are connected to neighbors. You can run the interface configuration command <b>ip ospf authentication-key</b> to configure the plain text authentication key, or <b>ip ospf message-digest-key</b> to configure the MD5 authentication key. |

➤ **Configuring the Authentication Type of an Interface**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip ospfauthentication [ message-digest   null ]</b>   |
| <b>Parameter Description</b> | <b>message-digest</b> : Indicates that MD5 authentication is enabled on the current interface.<br><b>null</b> : Indicates that authentication is disabled. |

|                     |  |
|---------------------|--|
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | If the <b>ip ospf authentication</b> command does not contain any option, it indicates that plain text authentication is enabled. If you use the <b>no</b> form of the command to restore the default authentication mode, whether authentication is enabled is determined by the authentication type that is configured in the area to which the interface belongs. If the authentication type is set to null, authentication is disabled forcibly. When authentication is configured for both an interface and the area to which the interface belongs, the authentication type configured for the interface is used preferentially. |

### ↘ Configuring a Plain Text Authentication Key for an Interface

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip ospf authentication-key</b> [0  7 ] <i>key</i>   |
| <b>Parameter Description</b> | <b>0:</b> Indicates that the key is displayed in plain text.<br><b>7:</b> Indicates that the key is displayed in cipher text.<br><i>key:</i> Indicates the key. The key is a string of up to eight characters.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | The key configured by the <b>ip ospf authentication-key</b> command will be inserted to the headers of all OSPF packets. If the keys are inconsistent, two directly connected devices cannot set up the OSPF adjacency and therefore cannot exchange the routing information.<br>Different keys can be configured for different interface, but all routers connected to the same physical network segment must be configured with the same key.<br>You can enable or disable authentication in an OSPF area by running the <b>area authentication</b> command in OSPF routing process configuration mode.<br>You can also enable authentication on an individual interface by running the <b>ip ospf authentication</b> command in interface configuration mode. When authentication is configured for both an interface and the area to which the interface belongs, the authentication type configured for the interface is used preferentially. |

### ↘ Configuring an MD5 Authentication Key for an Interface

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip ospf message-digest-key</b> <i>key-id</i> <b>md5</b> [0  7 ] <i>key</i>  |
| <b>Parameter Description</b> | <i>key-id:</i> Indicates the key ID. The value ranges from 1 to 255.<br><b>0:</b> Indicates that the key is displayed in plain text.<br><b>7:</b> Indicates that the key is displayed in cipher text.<br><i>key:</i> Indicates the key. The key is a string of up to 16 characters.  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | The key configured by the <b>ip ospf message-digest-key</b> command will be inserted to the headers of all OSPF packets. If the keys are inconsistent, two directly connected devices cannot set up the OSPF adjacency and therefore cannot exchange the routing information.<br>Different keys can be configured for different interface, but all routers connected to the same physical network segment must be configured with the same key. The same key ID on neighbor routers must |

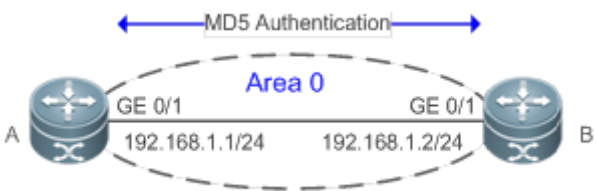

correspond to the same key.

You can enable or disable authentication in an OSPF area by running the **area authentication** command in OSPF routing process configuration mode. You can also enable authentication on an individual interface by running the **ip ospf authentication** command in interface configuration mode. When authentication is configured for both an interface and the area to which the interface belongs, the authentication type configured for the interface is used preferentially.

The RGOS software supports smooth modification of the MD5 authentication key. A new MD5 authentication key must be first added before the old key can be deleted. When an OSPF MD5 authentication key is added to a router, the router determines that other routers do not use the new key yet and therefore uses different keys to send multiple OSPF packets until it confirms that the new key has been configured on neighbors. After configuring the new key all routers, you can delete the old key.

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

|  |  |
|--|--|
| <p><b>Scenario</b><br/>Figure 2-17</p> |    |
| <p><b>Configuration Steps</b></p>      | <ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the authentication type and MD5 authentication key on all routers.</li> </ul> |
| <p><b>A</b></p>                        | <pre>A# configure terminal A(config)#router ospf 1 A(config-router)#area 0 authentication message-digest A(config-router)#exit A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ip ospf message-digest-key 1 md5 hello</pre>                               |

|                     |  |
|---------------------|--|
| <b>B</b>            | <pre>B# configure terminal B(config)#router ospf 1 B(config-router)#area 0 authentication message-digest B(config-router)#exit B(config)#interface GigabitEthernet 0/3 B(config-if-GigabitEthernet 0/3)#ip ospf message-digest-key 1 md5 hello</pre> |
| <b>Verification</b> | On Router A and Router B, verify that the OSPF neighbor status is correct.   |
| <b>A</b>            | <pre>A#show ip ospf neighbor OSPF process 1, 1 Neighbors, 1 is Full: Neighbor ID    Pri  State                Dead Time   Address      Interface 192.168.1.2    1   Full/DR              00:00:32   192.168.1.2  GigabitEthernet 0/1</pre>           |
| <b>B</b>            | <pre>A#show ip ospf neighbor OSPF process 1, 1 Neighbors, 1 is Full: Neighbor ID    Pri  State                Dead Time   Address      Interface 192.168.1.1    1   Full/DR              00:00:32   192.168.1.1  GigabitEthernet 0/1</pre>           |

### Common Errors

- The authentication modes configured on routers are inconsistent.
- The authentication keys configured on routers are inconsistent.

## 2.4.9 Enabling Overflow

### Configuration Effect

- New routes are not loaded to routers when the router memory is insufficient.
- New routes are not loaded to routers when the usage of the database space reaches the upper limit.

### Notes

- The OSPF basic functions must be configured.
- After a router enters the overflow state, you can run the **clear ip ospf process** command, or stop and then restart the OSPF to exit the overflow state.

### Configuration Steps

#### 📌 Configuring the Memory Overflow Function

- Optional.
- This configuration is recommended if a large number of routes exist in the domain and may cause insufficiency of the router memory.

#### ▾ Configuring the Database Overflow Function

- Optional.
- This configuration is recommended if a large number of routes exist in the domain and may cause insufficiency of the router memory.

#### ▾ Configuring the External LSA Database Overflow Function

- Optional.
- This configuration is recommended if the ASBR introduces a large number of external routes and the router memory may be insufficient.

### Verification

- After the memory becomes insufficient, add new routers to the network, and run the **show ip route** command to verify that new routes are not loaded.
- After the usage of the database space reaches the upper limit, add new routers to the network, and run the **show ip route** command to verify that new routes are not loaded.

### Related Commands

#### ▾ Configuring the Memory Overflow Function

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>overflow memory-lack</b>   |
| <b>Parameter</b>    | N/A   |
| <b>Description</b>  |   |
| <b>Command Mode</b> | OSPF routing process configuration mode   |
| <b>Usage Guide</b>  | <p>The OSPF process enters the overflow state to discard newly-learned external routes. This behavior can effectively ensure that the memory usage does not increase.</p> <p>After the overflow function is enabled, the OSPF process enters the overflow state and discards newly-learned external routes, which may cause a routing loop on the entire network. To reduce the occurrence probability of this problem, OSPF generates a default route to the null interface, and this route always exists in the overflow state.</p> <p>You can run the <b>clear ip ospf process</b> command to reset the OSPF process so that the OSPF process can exit the overflow state. You can use the <b>no</b> form of the command to prevent the OSPF process from entering the overflow state when the memory is insufficient. This, however, may lead to over-consumption of the memory resource, after which the OSPF process will stop and delete all the learned routes.</p> |

#### ▾ Configuring the Database Overflow Function

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>overflow database</b> <i>number</i> [ <b>hard</b>   <b>soft</b> ]   |
| <b>Parameter Description</b> | <i>number</i> : Indicates the maximum number of LSAs. The value ranges from 1 to 4,294,967,294.<br><b>hard</b> : Indicates that the OSPF process will be stopped if the number of LSAs exceeds the limit.<br><b>soft</b> : Indicates that a warning will be generated if the number of LSAs exceeds the limit. |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | If the number of LSAs exceeds the limit, use the <b>hard</b> parameter if the OSPF process should be stopped, and use the <b>soft</b> parameter if a warning should be generated without stopping the OSPF process.  |

📌 **Configuring the External LSA Database Overflow Function**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>overflow database external</b> <i>max-dbsize wait-time</i>  |
| <b>Parameter Description</b> | <i>max-dbsize</i> : Indicates the maximum number of external LSAs. This value must be the same on all routers in the same AS. The value ranges from 0 to 2,147,483,647.<br><i>wait-time</i> : Indicates the waiting time after a router in overflow state attempts to restore the normal state. The value ranges from 0 to 2,147,483,647.  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | When the number of external LSAs of a router exceeds the configured <b>max-dbsize</b> , the router enters the overflow state. In this state, the router no longer loads external LSAs and deletes external LSAs that are generated locally. After <i>wait-time</i> elapses, the device restores the normal state, and loads external LSAs again. When using the overflow function, ensure that the same <b>max-dbsize</b> is configured on all routers in the OSPF backbone area and common areas; otherwise, the following problems may occur:<br>Inconsistent LSDBs throughout network are inconsistent, and the failure to achieve the full adjacency<br>Incorrect routes, including routing loops<br>Frequent retransmission of AS external LSAs |

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

📌 **Configuring the External LSA Database Overflow Function**

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router B, configure redistribution and introduce external static routes.</li> <li>● On Router B, configure the maximum number of external LSAs.</li> </ul>  |
| <b>B</b>                   | <pre>B# configure terminal B(config)# router ospf 1 B(config-router)# redistribute static subnets</pre>   |
| <b>A</b>                   | <pre>A# configure terminal A(config)# router ospf 1 A(config-router)# overflow database external 10 3</pre>   |
|                            |   |
| <b>Verification</b>        | <p>On Router B, configure 11 static routes (192.100.1.0/24 to 192.100.11.0/24). On Router A, verify that only 10 static routes are loaded.</p>  |
| <b>A</b>                   | <pre>A# show ip route ospf 0 E2 192.100.1.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.2.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.3.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.4.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.5.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.6.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.7.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.8.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.9.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1 0 E2 192.100.10.0/24 [110/20] via 192.168.1.2, 00:18:03, GigabitEthernet 0/1</pre> |

**Common Errors**

- The OSPF adjacency is abnormal because the maximum number of LSAs is inconsistent on different routers.

**2.4.10 Modifying the Maximum Number of Concurrent Neighbors**

**Configuration Effect**

- Control the maximum number of concurrent neighbors on the OSPF process to ease the pressure on the device.

**Notes**

- The OSPF basic functions must be configured.

### Configuration Steps

#### ↘ Configuring the Maximum Number of Concurrent Neighbors on the OSPF Process

- (Optional) This configuration is recommended if you wish to set up the OSPF adjacency more quickly when a router is connected with a lot of other routers.
- This configuration is performed on a core router.

### Verification

- Run the **show ip ospf neighbor** command to display the number of neighbors that are concurrently interacting with the OSPF process.

### Related Commands

#### ↘ Configuring the Maximum Number of Concurrent Neighbors on the Current Process

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>max-concurrent-dd</b> <i>number</i>   |
| <b>Parameter Description</b> | <i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | When the performance of a router is affected because the router exchanges data with multiple neighbors, you can configure this command to restrict the maximum of neighbors with which one OSPF process can concurrently initiate or accept interaction. |

#### ↘ Configuring the Maximum Number of Concurrent Neighbors on All Processes

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>router ospf max-concurrent-dd</b> <i>number</i>   |
| <b>Parameter Description</b> | <i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | When the performance of a router is affected because the router exchanges data with multiple neighbors, you can configure this command to restrict the maximum of neighbors with which all OSPF processes can concurrently initiate or accept interaction. |

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

#### ↘ Configuring the Maximum Number of Concurrent Neighbors on the OSPF Process

| <p><b>Configuration Steps</b></p>      | <ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On the router Core, set the maximum number of concurrent neighbors to 4.</li> </ul> |
| <p><b>Core</b></p>                     | <pre>Core# configure terminal Core(config)# router ospf max-concurrent-dd 4</pre>  |
| <p><b>Verification</b></p>             | <p>On the router Core, check the neighbor status and verify that at most eight neighbors concurrently interact with the OSPF process.</p>  |

## 2.4.11 Disabling Source Address Verification

### Configuration Effect

- The unicast routing service can be provided even if the interface IP addresses of neighbor routers are not in the same network segment.

### Notes

- The OSPF basic functions must be configured.
- Source address verification cannot be disabled on a broadcast or NBMA network.

### Configuration Steps

#### Disabling Source Address Verification

- (Optional) This configuration is mandatory if an adjacency should be set up between routers with interface IP addresses in different network segments.
- This configuration is performed on routers with interface IP addresses in different network segments.

## Verification

- An adjacency can be set up between routers in different network segments.

## Related Commands

### Disabling Source Address Verification

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>ip ospf source-check-ignore</code>   |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | Generally, the source address of a packet received by OSPF is in the same network segment as the receiving interface. The addresses at both ends of a P2P link are configured separately and are not necessarily in the same network segment. In this scenario, as the peer address information will be notified during the P2P link negotiation process, OSPF checks whether the source address of the packet is the address advertised by the peer during negotiation. If not, OSPF determines that the packet is invalid and discards this packet. In particular, OSPF does not verify the address of an unnumbered interface. In some scenarios, the source address may not meet the preceding requirement, and therefore OSPF address verification fails. For example, the negotiated peer address cannot be obtained on a P2P link. In this scenario, source address verification must be disabled to ensure that the OSPF adjacency can be properly set up. |

## Configuration Example

- i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

## 2.4.12 Disabling MTU Verification

### Configuration Effect

- The unicast routing service can be provided even if the MTUs of interfaces on neighbor routers are different.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Disabling MTU Verification

- (Optional) MTU verification is disabled by default. You are advised to retain the default configuration.
- This configuration is performed on two routers with different interface MTUs.

### Verification

The adjacency can be set up between routers with different MTUs.

### Related Commands

#### ▾ Disabling MTU Verification

|                  |                           |
|------------------|---------------------------|
| <b>Command</b>   | <b>ip ospf mtu-ignore</b> |
| <b>Parameter</b> | N/A                       |

|                     |   |
|---------------------|---|
| <b>Description</b>  |   |
| <b>Command Mode</b> | Interface configuration mode  |
| <b>Usage Guide</b>  | On receiving the database description packet, OSPF checks whether the MTU of the interface on the neighbor is the same as the MTU of its own interface. If the interface MTU specified in the received database description packet is greater than the MTU of the local interface, the adjacency cannot be set up. To resolve this problem, you can disable MTU verification. |

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

## 2.4.13 Enabling Two-Way Maintenance

### Configuration Effect

- Non-Hello packets can also be used to maintain the adjacency.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Enabling Two-Way Maintenance

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- This configuration is performed on all routers.

### Verification

Non-Hello packets can also be used to maintain the adjacency.

### Related Commands

#### ▾ Enabling Two-Way Maintenance

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>two-way-maintain</code>  |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | On a large network, a lot of packets may be sent or received, occupying too much CPU and memory. As a result, some packets are delayed or discarded. If the processing time of Hello packets exceeds the dead interval, the adjacency will be destroyed due to timeout. If the two-way maintenance function is enabled, in addition to the Hello packets, the DD, LSU, LSR, and LSAck packets can also be used to maintain the bidirectional communication between neighbors when a large number of packets exist on the network. This prevents termination of the adjacency caused by delayed or discarded Hello packets. |

### Configuration Example

- The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

|  |  |
|--|--|
| <p><b>Scenario</b><br/>Figure 2-22</p> | <p>The diagram shows two routers, A and B, connected via their GE 0/1 interfaces. They are in the same OSPF Area 0. Router A has IP 192.168.1.1/24 and Router B has IP 192.168.1.2/24.</p> |
|--|--|

## 2.4.14 Enabling GR

### Configuration Effect

- When a distributed router switches services from the active board to the standby board, data forwarding continues and is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and is not interrupted.

### Notes

- The OSPF basic functions must be configured.
- The neighbor router must support the GR helper function.
- The grace period cannot be shorter than the neighbor dead time of the neighbor router.

### Configuration Steps

#### ↘ Configuring the OSPF GR Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- This configuration is performed on all routers.

#### ↘ Configuring the OSPF GR Helper Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- This configuration is performed on all routers.

### Verification

- When a distributed router switches services from the active board to the standby board, data forwarding continues and is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and is not interrupted.

## Related Commands

### ▾ Configuring the OSPF GR Function

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>graceful-restart [ grace-period <i>grace-period</i>   inconsistent-lsa-checking ]</b>  |
| <b>Parameter Description</b> | <p><b>grace-period</b> <i>grace-period</i>: Indicates the grace period, which is the maximum time from occurrence of an OSPF failure to completion of the OSPF GR. The value of the graceperiod varies from 1s to 1800s. The default value is 120s.</p> <p><b>inconsistent-lsa-checking</b>: Enables topological change detection. If any topological change is detected, OSPF exits the GR process to complete convergence. After GR is enabled, topological change detection is enabled by default.</p>   |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | <p>The GR function is configured based on the OSPF process. You can configure different parameters for different OSPF processes based on the actual conditions. This command is used to configure the GR restarter capability of a device. The grace period is the maximum time of the entire GR process, during which link status is rebuilt so that the original state of the OSPF process is restored. After the grace period expires, OSPF exits the GR state and performs common OSPF operations.</p> <p>Run the <b>graceful-restart</b> command to set the grace period to 120s. The <b>graceful-restart grace-period</b> command allows you to modify the grace period explicitly.</p> <p>The precondition for successful execution of GR and uninterrupted forwarding is that the topology remains stable. If the topology changes, OSPF quickly converges without waiting for further execution of GR, thus avoiding long-time forwarding black-hole.</p> <p>Disabling topology detection: If OSPF cannot converge in time when the topology changes during the hot standby process, forwarding black-hole may appear in a long time.</p> <p>Enabling topology detection: Forwarding may be interrupted when topology detection is enabled, but the interruption time is far shorter than that when topology detection is disabled.</p> <p>In most cases, it is recommended that topology detection be enabled. In special scenarios, topology detection can be disabled if the topology changes after the hot standby process, but it can be ensured that the forwarding black-hole will not appear in a long time. This can minimize the forwarding interruption time during the hot standby process.</p> <p>If the Fast Hello function is enabled, the GR function cannot be enabled.</p> |

### ▾ Configuring the OSPF GR Helper Function

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>graceful-restart helper { disable   strict-lsa-checking   internal-lsa-checking }</b>  |
| <b>Parameter Description</b> | <p><b>disable</b>: Prohibits a device from acting as a GR helper for another device.</p> <p><b>strict-lsa-checking</b>: Indicates that changes in Type 1 to Type 5 and Type 7 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network</p> |

|                     |  |
|---------------------|--|
|                     | <p>changes, the device will stop acting as the GR helper.</p> <p><b>internal-lsa-checking:</b> Indicates that changes in Type 1 to Type 3 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p>   |
| <b>Command Mode</b> | OSPF routing process configuration mode  |
| <b>Usage Guide</b>  | <p>This command is used to configure the GR helper capability of a router. When a neighbor router implements GR, it sends a Grace-LSA to notify all neighbor routers. If the GR helper function is enabled on the local router, the local router becomes the GR helper on receiving the Grace-LSA, and helps the neighbor to complete GR. The <b>disable</b> option indicates that GR helper is not provided for any device that implements GR.</p> <p>After a device becomes the GR helper, the network changes are not detected by default. If any change takes place on the network, the network topology converges after GR is completed. If you wish that network changes can be quickly detected during the GR process, you can configure <b>strict-lsa-checking</b> to check Type 1 to 5 and Type 7 LSAs that indicate the network information or <b>internal-lsa-checking</b> to check Type 1 to 3 LSAs that indicate internal routes of the AS domain. When the network scale is large, it is recommended that you disable the LSA checking options (<b>strict-lsa-checking</b> and <b>internal-lsa-checking</b>) because regional network changes may trigger termination of GR and consequently reduce the convergence of the entire network.</p> |

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

|  |   |
|--|---|
| <p><b>Scenario</b></p> <p><b>Figure 2-23</b></p> |   |
| <p><b>Remarks</b></p>                            | <p>The interface IP addresses are as follows:</p> <p>A: GE 0/1 192.168.1.1</p> <p>B: GE 0/1 192.168.1.1    GE 0/2 192.168.2.1    GE 0/3 192.168.3.1</p> <p>C: GE 0/1 192.168.4.2    GE 0/3 192.168.3.2</p> <p>D: GE 0/1 192.168.5.2    GE 0/2 192.168.2.2</p> |

|                                   |   |
|-----------------------------------|---|
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, Router C, and Router D, enable the GR helper function. (This function is enabled by default.)</li> <li>● On Router B, enable the GR function.</li> </ul>                                      |
| <p><b>B</b></p>                   | <pre>B# configure terminal B(config)# router ospf1 B(config-router)# graceful-restart</pre>   |
| <p><b>Verification</b></p>        | <ul style="list-style-type: none"> <li>● Trigger a hot standby switchover on Router B, and verify that the routing tables of destination networks 1 and 2 remain unchanged on Router A during the switchover.</li> <li>● Trigger a hot standby switchover on Router B, ping destination network 1 from Router A, and verify that data forwarding is not interrupted during the switchover.</li> </ul> |

**Common Errors**

- Traffic forwarding is interrupted during the GR process because the configured grace period is shorter than the neighbor dead time of the neighbor router.

**2.4.15 Correlating OSPF with BFD**

**Configuration Effect**

- Once a link is faulty, OSPF can quickly detect the failure of the route. This configuration helps shorten the traffic interruption time.

**Notes**

- The OSPF basic functions must be configured.
- The BFD parameters must be configured for the interface in advance.
- If BFD is configured for both a process and an interface, the configuration for the interface takes effect preferentially.

**Configuration Steps**

📌 **Correlating OSPF with BFD**

- (Optional) This configuration is required if you wish to accelerate OSPF network convergence.
- The configuration must be performed on routers at both ends of the link.

**Verification**

- Run the **show bfd neighbor** command to verify that the BFD neighbors are normal.

**Related Commands**

↘ **Correlating an OSPF Interface with BFD**

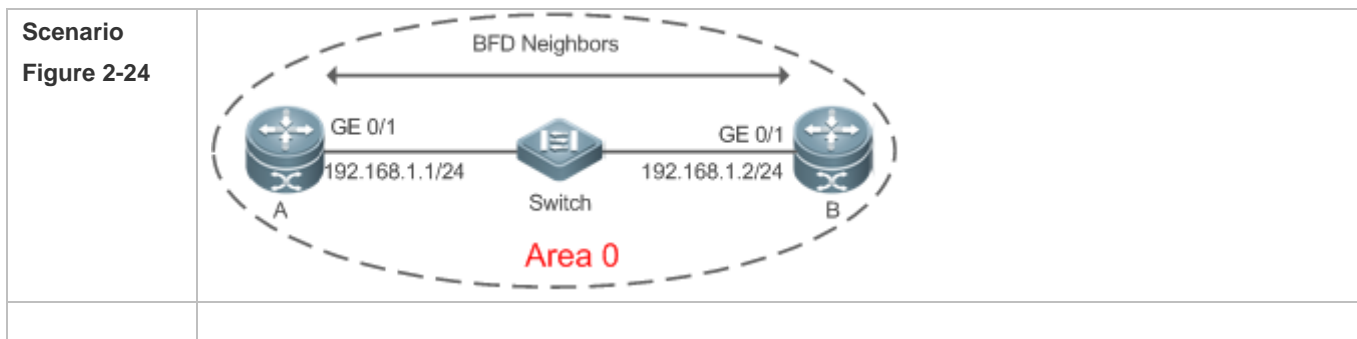

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>ip ospf bfd [ disable ]</b>   |
| <b>Parameter</b>    | <b>disable:</b> Disables BFD for link detection on a specified OSPF-enabled interface.   |
| <b>Description</b>  |  |
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | <p>The interface-based configuration takes precedence over the <b>bfd all-interfaces</b> command used in process configuration mode.</p> <p>Based on the actual environment, you can run the <b>ip ospf bfd</b> command to enable BFD on a specified interface for link detection, or run the <b>bfd all-interfaces</b> command in OSPF process configuration mode to enable BFD on all interface of the OSPF process, or run the <b>ospf bfd disable</b> command to disable BFD on a specified interface.</p> |

↘ **Correlating an OSPF Process with BFD**

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>bfd all-interfaces</b>   |
| <b>Parameter</b>    | N/A   |
| <b>Description</b>  |   |
| <b>Command Mode</b> | OSPF process configuration mode   |
| <b>Usage Guide</b>  | <p>OSPF dynamically discovers neighbors through the Hello packets. After OSPF enables the BFD function, a BFD session will be set up to achieve the full adjacency, and use the BFD mechanism to detect the neighbor status. Once a neighbor failure is detected through BFD, OSPF performs network convergence immediately.</p> <p>You can also run the <b>ip ospf bfd [disable]</b> command in interface configuration mode to enable or disable the BFD function on a specified interface, and this configuration takes precedence over the <b>bfd all-interfaces</b> command used in OSPF process configuration mode.</p> |

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

## 2.4.16 Enabling Fast Reroute

### Configuration Effect

- Once OSPF detects a route failure, the router can immediately switch to the second-best route. This configuration helps shorten the traffic interruption time.

### Notes

- The OSPF basic functions must be configured.

- The LAF configuration for fast reroute is mutually exclusive with the virtual link configuration.
- You must set **carrier-delay** of an interface to 0.

### Configuration Steps

#### ▾ Configuring Fast Reroute

- (Optional) This configuration is required if you wish to increase the OSPF network convergence speed to the millisecond level.
- This configuration is performed on a router that has multiple paths to a destination network.

#### ▾ Preventing an Interface From Becoming a Standby Interface

- (Optional) This configuration is mandatory if you wish that data traffic is not switched over to a specified path after the best path fails. After the best path fails, the traffic will be switched over another second-best path, but a new best path will be selected based on the interface costs after OSPF converges again.
- This configuration is performed on a device where fast reroute is enabled.

### Verification

Run the **show ip route fast-reroute** command to verify that both the best and second-best paths exist.

### Related Commands

#### ▾ Configuring Fast Reroute

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>fast-reroute</b> { <b>ifa</b> [ <b>downstream-paths</b> ]   <b>route-map</b> <i>route-map-name</i> }  |
| <b>Parameter Description</b> | <b>ifa</b> : Enables computation of the loop-free standby path.<br><b>downstream-paths</b> : Enables computation of the downstream path.<br><b>route-map</b> <i>route-map-name</i> : Specifies a standby path through the route map.   |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | If the <b>ifa</b> parameter is configured, computation of the loop-free standby path is enabled. In this case, you can use the interface mode command to specify the path protection mode of the interface.<br>It is recommended that computation of the loop-free standby path be disabled if any of the following case exists on the network:<br>1. Virtual links exist.<br>2. Alternative ABRs exist.<br>3. An ASBR is also an ABR.<br>4. Multiple ASBRs advertise the same external route.<br>If both <b>ifa</b> and <b>downstream-paths</b> are configured, computation of the downstream path is enabled.<br>If <b>route-map</b> is configured, a standby path can be specified for a matched route through the route-map.<br>When the OSPF fast reroute function is used, it is recommended that BFD be enabled at the same time so that the device can quickly detect any link failure and therefore shorten the forwarding interruption time. If the interface is up or down, to shorten the forwarding interruption time during OSPF fast reroute, you can |

|  |  |
|--|--|
|  | configure <b>carrier-delay 0</b> in L3 interface configuration mode to achieve the fastest switchover speed. |
|--|--|

### ↘ Configuring the Interface LFA Protection

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip ospf fast-reroute protection { node   link-node   disable}</b>   |
| <b>Parameter Description</b> | <b>node:</b> Enables the LFA node protection.<br><b>link-node:</b> Enables the LFA link node protection.<br><b>disable:</b> Disables LFA protection.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>If the <b>fast-reroute lfa</b> command is executed in OSPF route process configuration mode, the OSPF fast reroute computation function will be generated, and a standby route will be generated for the active route based on the LFA protection mode specified in interface configuration mode. Link protection is enabled by default for each OSPF interface. Under this protection mode, the failure of the active link does not affect data forwarding on the standby route.</p> <p>Use the <b>node</b> parameter to enable node protection for the interface, that is, data forwarding on the standby route will not be affected by the failure of a neighbor node corresponding to the active link.</p> <p>Use the <b>link-node</b> parameter to protect both the link and neighbor node corresponding to the active link.</p> <p>Use the <b>disable</b> parameter to disable the LFA protection function of the interface, that is, not to generate a standby entry for the route whose next hop is the interface.</p> <p>This command does not take effect if <b>fast-reroute route-map</b> is configured.</p> |

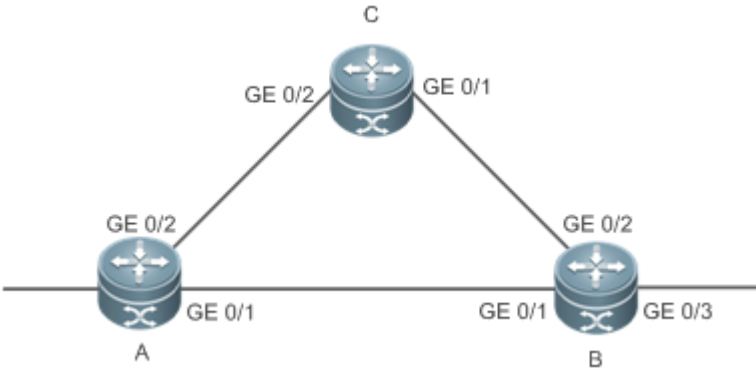

### ↘ Preventing an Interface From Becoming a Standby Interface

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip ospf fast-reroute no-eligible-backup</b>   |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>If the remaining bandwidth of an interface is small or if the interface and its active interface may fail at the same time, the interface cannot be used as a standby interface. Therefore, you need to run this command in interface configuration mode to prevent this interface from becoming a standby interface during OSPF fast reroute computation. After this command is executed, the standby interface is selected from other interface.</p> <p>This command does not take effect if <b>fast-reroute route-map</b> is configured.</p> |

## Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

### ↘ Configuring Fast Reroute

### 2.4.17 Configuring the Network Management Function

#### Configuration Effect

- Use the network management software to manage OSPF parameters and monitor the OSPF running status.

## Notes

- The OSPF basic functions must be configured.
- You must enable the MIB function of the SNMP-Server before enabling the OSPF MIB function.
- You must enable the Trap function of the SNMP-Server before enabling the OSPF Trap function.
- You must enable the logging function of the device before outputting the OSPF logs.

## Configuration Steps

### ↘ Binding the MIB with the OSPF Process

- (Optional) This configuration is required if you want to use the network management software to manage parameters of a specified OSPF process.
- This configuration is performed on all routers.

### ↘ Enabling the Trap Function

- (Optional) This configuration is required if you want to use the network management software to monitor the OSPF running status.
- This configuration is performed on all routers.

### ↘ Configuring the Logging Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration. If you want to reduce the log output, disable this function.
- This configuration is performed on all routers.

## Verification

- Use the network management software to manage the OSPF parameters.
- Use the network management software to monitor the OSPF running status.

## Related Commands

### ↘ Binding the MIB with the OSPF Process

|------------------------------|---|
| <b>Command</b>               | <b>enable traps</b> [ error [ IfAuthFailure   IfConfigError   IfRxBadPacket   VirtIfAuthFailure   VirtIfConfigError   VirtIfRxBadPacket]   Isa [ LsdbApproachOverflow   LsdbOverflow   MaxAgeLsa   OriginateLsa]   retransmit [ IfTxRetransmit   VirtIfTxRetransmit]   state-change[ IfStateChange   NbrRestartHelperStatusChange   NbrStateChange   NssaTranslatorStatusChange   RestartStatusChange   VirtIfStateChange   VirtNbrRestartHelperStatusChange   VirtNbrStateChange] ]  |
| <b>Parameter Description</b> | <p><b>IfAuthFailure:</b> Indicates that an interface authentication failure occurs.</p> <p><b>IfConfigError:</b> Indicates that an interface parameter configuration error occurs.</p> <p><b>IfRxBadPacket:</b> Indicates that the interface receives a bad packet.</p> <p><b>IfRxBadPacket:</b> Indicates that the interface receives a bad packet.</p> <p><b>VirtIfAuthFailure:</b> Indicates that a virtual interface authentication failure occurs.</p> <p><b>VirtIfConfigError:</b> Indicates that a virtual interface parameter configuration error occurs.</p> <p><b>VirtIfRxBadPacket:</b> Indicates that the virtual interface receives a bad packet.</p> <p><b>LsdbApproachOverflow:</b> Indicates that the number of external LSAs has reached 90% of the upper limit.</p> <p><b>LsdbOverflow:</b> Indicates that the number of external LSAs has reached the upper limit.</p> <p><b>MaxAgeLsa:</b> Indicates that the LSA aging timer expires.</p> <p><b>OriginateLsa:</b> Indicates that a new LSA is generated.</p> <p><b>IfTxRetransmit:</b> Indicates that a packet is retransmitted on the interface.</p> <p><b>VirtIfTxRetransmit:</b> Indicates that a packet is retransmitted on the virtual interface.</p> <p><b>IfStateChange:</b> Indicates that interface state changes.</p> <p><b>NbrRestartHelperStatusChange:</b>Indicates that the state of the neighbor GR process changes.</p> <p><b>NbrStateChange:</b> Indicates that the neighbor state changes.</p> <p><b>NssaTranslatorStatusChange:</b> Indicates that the NSSA translation state changes.</p> <p><b>RestartStatusChange:</b> Indicates that the GR state of the local device changes.</p> <p><b>VirtIfStateChange:</b> Indicates that the virtual interface state changes.</p> <p><b>VirtNbrRestartHelperStatusChange:</b> Indicates that the GR state of the virtual neighbor changes.</p> <p><b>VirtNbrStateChange:</b> Indicates that the virtual neighbor state changes.</p> |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | <p>The function configured by this command is restricted by the <b>snmp-server</b> command. You can configure <b>snmp-server enable traps ospf</b> and then <b>enable traps</b> command before the corresponding OSPF traps can be correctly sent out.</p> <p>This command is not restricted by the MIB bound with the process. The trap function can be enabled concurrently for different processes.</p>  |

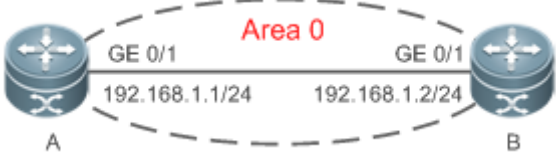

↳ **Configuring the Logging Function**

|                  |   |
|------------------|---|
| <b>Command</b>   | <b>log-adj-changes</b> [ detail]                      |
| <b>Parameter</b> | <b>detail:</b> Records all status change information. |

|                     |   |
|---------------------|---|
| <b>Description</b>  |   |
| <b>Command Mode</b> | OSPF routing process configuration mode |
| <b>Usage Guide</b>  | N/A                                     |

### Configuration Example

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

|                                |  |
|--------------------------------|--|
| <b>Scenario</b><br>Figure 2-26 |   |
| <b>Configuration Steps</b>     | <ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Bind the MIB with the OSPF process on Router A.</li> <li>● Enable the trap function on Router A.</li> </ul> |
| <b>A</b>                       | <pre>A# configure terminal A(config)# snmp-server host 192.168.2.2 traps version 2c public A(config)# snmp-server community public rw A(config)# snmp-server enable traps A(config)# router ospf 10 A(config-router)# enable mib-binding A(config-router)# enable traps</pre>                          |
| <b>Verification</b>            | Use the MIB tool to read and set the OSPF parameters and display the OSPF running status.  |

### Common Errors

Configurations on the SNMP-Server are incorrect. For example, the MIB or trap function is not enabled.

## 2.4.18 Modifying Protocol Control Parameters

### Configuration Effect

Modify protocol control parameters to change the protocol running status.

### Notes

- The OSPF basic functions must be configured.

- The neighbor dead time cannot be shorter than the Hello interval.

## **Configuration Steps**

---

### **↘ Configuring the Hello Interval**

- (Optional) You are advised to retain the default configuration.
- This configuration is performed on routers at both end of a link.

### **↘ Configuring the Dead Interval**

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if you wish to accelerate OSPF convergence when a link fails.
- This configuration is performed on routers at both end of a link.

### **↘ Configuring LSU Retransmission Interval**

- (Optional) You are advised to adjust this configuration if a lot of routes exist in the user environment and network congestion is serious.

### **↘ Configuring the LSA Generation Time**

- (Optional) You are advised to retain the default configuration.

### **↘ Configuring the LSA Group Refresh Time**

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if a lot of routes exist in the user environment.
- This configuration is performed on an ASBR or ABR.

### **↘ Configuring LSA Repeated Receiving Delay**

- (Optional) You are advised to retain the default configuration.

### **↘ Configuring the SPF Computation Delay**

- (Optional) This configuration can be adjusted if network flapping frequently occurs.

### **↘ Configuring the Inter-Area Route Computation Delay**

- (Optional) You are advised to retain the default configuration.
- This configuration is performed on all routers.

### **↘ Configuring the External Route Computation Delay**

- (Optional) You are advised to retain the default configuration.
- This configuration is performed on all routers.

## **Verification**

---

Run the **show ip ospf** and **show ip ospf neighbor** commands to display the protocol running parameters and status.

## Related Commands

### ↘ Configuring the Hello Interval

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip ospf hello-interval</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the interval at which OSPF sends the Hello packet. The unit is second. The value ranges from 1 to 65,535.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | The Hello interval is contained in the Hello packet. A shorter Hello interval indicates that OSPF can detect topological changes more quickly, but the network traffic increases. The Hello interval must be the same on all routers in the same network segment. If you want to manually modify the neighbor dead interval, ensure that the neighbor dead interval is longer than the Hello interval. |

### ↘ Configuring the Dead Interval

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip ospf dead-interval</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the time that the neighbor is declared lost. The unit is second. The value ranges from 0 to 2,147,483,647.  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | The OSPF dead interval is contained in the Hello packet. If OSPF does not receive a Hello packet from a neighbor within the dead interval, it declares that the neighbor is invalid and deletes this neighbor record from the neighbor list. By default, the dead interval is four times the Hello interval. If the Hello interval is modified, the dead interval is modified automatically.<br><br>When using this command to manually modify the dead interval, pay attention to the following issues:<br>1. The dead interval cannot be shorter than the Hello interval.<br>2. The dead interval must be the same on all routers in the same network segment. |

### ↘ Configuring the LSU Transmission Delay

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip ospf transmit-delay</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the LSU transmission delay on the OSPF interface. The unit is second. The value ranges from 0 to 65,535.   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | Before an LSU packet is transmitted, the Age fields in all LSAs in this packet will increase based on the amount specified by the <b>ip ospf transmit-delay</b> command. Considering the transmit and line propagation delays on the interface, you need to set the LSU transmission delay to a greater value for a low-speed line or interface. The LSU transmission delay of a virtual link is defined by the <b>transmit-delay</b> parameter in the <b>area virtual-link</b> command.<br><br>If the value of the Age field of an LSA reaches 3600, the packet will be retransmitted or a retransmission will |

|  |   |
|--|---|
|  | be requested. If the LSA is not updated in time, the expired LSA will be deleted from the LSDB. |
|--|---|

### ↘ Configuring LSU Retransmission Interval

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip ospf retransmit-interval</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the LSU retransmission interval. The unit is second. The value ranges from 1 to 65,535.<br>This interval must be longer than the round-trip transmission delay of data packets between two neighbors.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | After a router finishes sending an LSU packet, this packet is still kept in the transmit buffer queue. If an acknowledgment from the neighbor is not received within the time defined by the <b>ip ospf retransmit-interval</b> command, the router retransmits the LSU packet.<br>The retransmission delay can be set to a greater value on a serial line or virtual link to prevent unnecessary retransmission. The LSU retransmission delay of a virtual link is defined by the <b>retransmit-interval</b> parameter in the <b>area virtual-link</b> command. |

### ↘ Configuring the LSA Generation Time

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>timers throttle lsa all</b> <i>delay-time hold-time max-wait-time</i>  |
| <b>Parameter Description</b> | <i>delay-time</i> : Indicates the minimum delay for LSA generation. The first LSA in the database is always generated instantly. The value ranges from 0 to 600,000. The unit is ms.<br><i>hold-time</i> : Indicates the minimum interval between the first LSA update and the second LSA update. The value ranges from 1 to 600,000. The unit is ms.<br><i>max-wait-time</i> : Indicates the maximum interval between two LSA updates when the LSA is updated continuously. This interval is also used to determine whether the LSA is updated continuously. The value ranges from 1 to 600,000. The unit is ms. |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | If a high convergence requirement is raised when a link changes, you can set <b>delay-time</b> to a smaller value. You can also appropriately increase values of the preceding parameters to reduce the CPU usage.<br>When configuring this command, the value of <b>hold-time</b> cannot be smaller than the value of <b>delay-time</b> , and the value of <b>max-wait-time</b> cannot be smaller than the value of <b>hold-time</b> .   |

### ↘ Configuring the LSA Group Refresh Time

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>timers pacinglsa-group</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the LSA group pacing interval. The value ranges from 10 to 1,800. The unit is second.   |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | Every LSA has a time to live (LSA age). When the LSA age reaches 1800s, a refreshment is needed to prevent LSAs from being cleared because their ages reaching the maximum. If LSA update and aging computation are performed for every LSA, the device will consume a lot of CPU resources. In order to use CPU resources effectively, you can refresh LSAs by group on the device. The interval of group refreshment |

|  |   |
|--|---|
|  | <p>is called group pacing interval. The group refreshment operation is to organize the LSAs generated within a group pacing interval into a group and refresh the group as a whole.</p> <p>If the total number of LSAs does not change, a larger group pacing interval indicates that more LSAs need to be processed after timeout. To maintain the CPU stability, the number of LSAs processes upon each timeout cannot be too large. If the number of LSAs is large, you are advised to reduce the group pacing interval. For example, if there are 1000 LSAs in the database, you can reduce the pacing interval; if there are 40 to 100 LSAs, you can set the pacing interval to 10-20 minutes.</p> |
|--|---|

### ↘ Configuring the LSA Group Refresh Interval

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>timers pacing lsa-transmit</b> <i>transmit-time transmit-count</i>  |
| <b>Parameter Description</b> | <p><i>transmit-time</i>: Indicates the LSA group transmission interval. The value ranges from 10 to 1,000. The unit is ms.</p> <p><i>transmit-count</i>: Indicates the number of LS-UPD packets in a group. The value ranges from 1 to 200.</p>  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | <p>If the number of LSAs is large and the device load is heavy in an environment, properly configuring <b>transmit-time</b> and <b>transmit-count</b> can limit the number of LS-UPD packets flooded on a network.</p> <p>If the CPU usage is not high and the network bandwidth load is not heavy, reducing the value of <b>transmit-time</b> and increasing the value of <b>transmit-count</b> can accelerate the environment convergence.</p> |

### ↘ Configuring LSA Repeated Receiving Delay

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>timers lsa arrival</b> <i>arrival-time</i>   |
| <b>Parameter Description</b> | <p><i>arrival-time</i>: Indicates the delay after which the same LSA is received. The value ranges from 0 to 600,000. The unit is ms.</p> |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | No processing is performed if the same LSA is received within the specified time.   |

### ↘ Configuring the Inter-Area Route Computation Delay

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>timers throttle route inter-area</b> <i>ia-delay</i>   |
| <b>Parameter Description</b> | <p><i>ia-delay</i>: Indicates the inter-area route computation delay. The unit is ms. The value ranges from 0 to 600,000.</p> |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | This delay cannot be modified if strict requirements are raised for the network convergence time.                             |

### ↘ Configuring the External Route Computation Delay

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>timers throttle route ase</b> <i>ase-delay</i>  |
| <b>Parameter Description</b> | <p><i>ase-delay</i>: Indicates the external route computation delay. The unit is ms. The value ranges from 0 to 600,000.</p> |
| <b>Command</b>               | OSPF routing process configuration mode  |

|                    |   |
|--------------------|---|
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | This delay cannot be modified if strict requirements are raised for the network convergence time. |

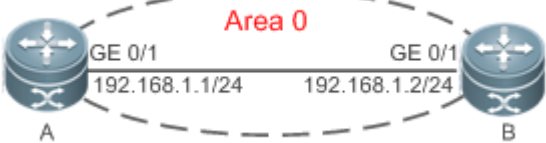

↘ **Configuring the SPF Computation Delay**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>timers throttle spf</b> <i>spf-delay spf-holdtime spf-max-waittime</i>  |
| <b>Parameter Description</b> | <p><i>spf-delay</i>: Indicates the SPF computation delay. The unit is ms. The value ranges from 1 to 600,000. When detecting a topological change, the OSPF routing process triggers the SPF computation at least after <b>spf-delay</b> elapses.</p> <p><i>spf-holdtime</i>: Indicates the minimum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p> <p><i>spf-max-waittime</i>: Indicates the maximum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p> <p><i>number</i>: indicates the metric of the summarized route.</p>  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | <p><b>spf-delay</b> indicates the minimum time between the occurrence of the topological change and the start of SPF computation. <b>spf-holdtime</b> indicates the minimum interval between the first SPF computation and the second SPF computation. After that, the interval between two SPF computations must be at least twice of the previous interval. When the interval reaches <b>spf-max-waittime</b>, the interval cannot increase again. If the interval between two SPF computations already exceeds the required minimum value, the interval is computed by starting from <b>spf-holdtime</b>.</p> <p>You can set <b>spf-delay</b> and <b>spf-holdtime</b> to smaller values to accelerate topology convergence, and set <b>spf-max-waittime</b> to a larger value to reduce SPF computation. Flexible settings can be used based on stability of the network topology.</p> <p>Compared with the <b>timers spf</b> command, this command supports more flexible settings to accelerate the convergence speed of SPF computation and further reduce the system resources consumed by SPF computation when the topology continuously changes. Therefore, you are advised to use the <b>timers throttle spf</b> command for configuration.</p> <ol style="list-style-type: none"> <li>The value of <b>spf-holdtime</b> cannot be smaller than the value of <b>spf-delay</b>; otherwise, <b>spf-holdtime</b> will be automatically set to the value of <b>spf-delay</b>.</li> <li>The value of <b>spf-max-waittime</b> cannot be smaller than the value of <b>spf-holdtime</b>; otherwise, <b>spf-max-waittime</b> will be automatically set to the value of <b>spf-holdtime</b>.</li> <li>The configurations of <b>timers throttle spf</b> and <b>timers spf</b> are mutually overwritten.</li> <li>When both <b>timers throttle spf</b> and <b>timers spf</b> are not configured, the default values of <b>timers throttle spf</b> prevail.</li> </ol> |

**Configuration Example**

**i** The following configuration examples assume that the OSPF basic functions have been configured. For details about the OSPF basic functions, see section 2.4.1 "Configuring OSPF Basic Functions."

↘ **Configuring the Hello Interval and Dead Interval**

|  |  |
|--|--|
| <p><b>Scenario</b><br/>Figure 2-27</p> |   |
| <p><b>Configuration Steps</b></p>      | <ul style="list-style-type: none"> <li>● Configure the interface IP addresses on all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the Hello interval and dead interval on all routers.</li> </ul>   |
| <p><b>A</b></p>                        | <pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ip ospf dead-interval 50</pre>   |
| <p><b>B</b></p>                        | <pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ip ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ip ospf dead-interval 50</pre>   |
|  |  |
| <p><b>Verification</b></p>             | <p>Check the interface parameters on Router A. Verify that the Hello interval is 10s and the dead interval is 50s.</p>   |
| <p><b>A</b></p>                        | <pre>A# show ip ospf interface GigabitEthernet 0/1 is up, line protocol is up   Internet Address 192.168.1.1/24, Ifindex 2, Area 0.0.0.0, MTU 1500   Matching network config: 192.168.1.0/24   Process ID 1, Router ID 192.168.1.2, Network Type POINTOMULTIPOINT, Cost: 1   Transmit Delay is 1 sec, State Point-To-Point   Timer intervals configured, Hello 15, Dead 50, Wait 40, Retransmit 5     Hello due in 00:00:02   Neighbor Count is 1, Adjacent neighbor count is 0   Crypt Sequence Number is 4787   Hello received 465 sent 466, DD received 8 sent 8   LS-Req received 2 sent 2, LS-Upd received 8 sent 21   LS-Ack received 14 sent 7, Discarded 3</pre> |

**Common Errors**

- The configured neighbor dead time is shorter than the Hello interval.

## 2.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

| Description                        | Command   |
|------------------------------------|---|
| Clears and resets an OSPF process. | <b>clear ip ospf</b> [ <i>process-id</i> ] <b>process</b> |

### Displaying

| Description   | Command  |
|---|--|
| Displays the OSPF process configurations.                                     | <b>show ip ospf</b> [ <i>process-id</i> ]  |
| Displays the OSPF internal routing table, including routes to ABRs and ASBRs. | <b>show ip ospf</b> [ <i>process-id</i> ] <b>border-routers</b>  |
| Displays information about the OSPF LSDB.                                     | <b>show ip ospf</b> [ <i>process-id area-id</i> ] <b>database</b> [ { <b>asbr-summary</b>   <b>external</b>   <b>network</b>   <b>nssa-external</b>   <b>opaque-area</b>   <b>opaque-as</b>   <b>opaque-link</b>   <b>router summary</b> } ] [ { <b>adv-router ip-address</b>   <b>self-originate</b> } ] [ <i>link-state-id</i> ] <b>brief</b> [ [ <b>database-summary</b>   <b>max-age</b>   <b>detail</b> ] ] |
| Displays OSPF-enabled interfaces.   | <b>show ip ospf</b> [ <i>process-id</i> ] <b>interface</b> [ <i>interface-type interface-number</i>   <b>brief</b> ]   |
| Displays the OSPF neighbor list.  | <b>show ip ospf</b> [ <i>process-id</i> ] <b>neighbor</b> [ <b>detail</b> ] [ <i>interface-type interface-number</i> ] [ <i>neighbor-id</i> ]  |
| Displays the OSPF routing table.  | <b>show ip ospf</b> [ <i>process-id</i> ] <b>route</b> [ <b>count</b> ]  |
| Displays the number of times SPT is computed in the OSPF area.                | <b>show ip ospf</b> [ <i>process-id</i> ] <b>spf</b>   |
| Displays the summarized route of OSPF redistributed routes.                   | <b>show ip ospf</b> [ <i>process-id</i> ] <b>summary-address</b>   |
| Displays the OSPF network topology information.                               | <b>show ip ospf</b> [ <i>process-id</i> [ <i>area-id</i> ] ] <b>topology</b> [ <b>adv-router</b> <i>adv-router-id</i> [ <i>router-id</i> ]   <b>self-originate</b> [ <i>router-id</i> ] ]  |
| Displays OSPF virtual links.  | <b>show ip ospf</b> [ <i>process-id</i> ] <b>virtual-links</b> [ <i>ip-address</i> ]   |

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description             | Command  |
|-------------------------|--|
| Debugs OSPF events.     | <b>debug ip ospf events</b> [ <b>abr</b>   <b>asbr</b>   <b>lsa</b>   <b>nssa</b>   <b>os</b>   <b>restart</b>   <b>router</b>   <b>slink</b>   <b>vlink</b> ] |
| Debugs OSPF interfaces. | <b>debug ip ospf ifsm</b> [ <b>events</b>   <b>status</b>   <b>timers</b> ]  |
| Debugs OSPF neighbors.  | <b>debug ip ospf nfm</b> [ <b>events</b>   <b>status</b>   <b>timers</b> ]   |

---

|                      |  |
|----------------------|--|
| Debugs the OSPF NSM. | <b>debug ip ospf nsm</b> [interface   redistribute   route]                        |
| Debugs OSPF LSAs.    | <b>debug ip ospf lsa</b> [flooding   generate   install   maxage   refresh]        |
| Debugs OSPF packets. | <b>debug ip ospf packet</b> [dd detail hello ls-ack ls-request ls-update rcv send] |
| Debugs OSPF routes.  | <b>debug ip ospf route</b> [ase   ia   install   spf   time]                       |

## 3 Configuring OSPFv3

### 3.1 Overview

Open Shortest Path First (OSPF) is an Interior Gateway Protocol (IGP) that is used within the Autonomous System (AS) to allow routers to obtain a route to a remote network.

**i** OSPF Version 2 (OSPFv2) is applicable to IPv4, and OSPF Version 3 (OSPFv3) is applicable to IPv6. The protocol running mechanism and most configurations are the same.

OSPF has the following characteristics:

- Wide scope of application: OSPF is applicable to a larger-scale network that supports hundreds of routers.
- Fast convergence: Once the network topology changes, notifications can be quickly sent between routers to update routes.
- No self-loop: Only the link status information is synchronized between routers. Each router computes routes independently, and a self-loop will not occur.
- Area division: A large routing domain is divided into multiple small areas to save system resources and network bandwidth and ensure stability and reliability of routes.
- Route classification: Routes are classified into several types to support flexible control.
- Equivalent routes: OSPF supports equivalent routes.
- Authentication: OSPF supports packet authentication to ensure security of protocol interaction.
- Multicast transmission: Protocol packets are sent using the multicast address to avoid interfering with irrelevant entities and save system resources.

**i** In this chapter, the term "router" refers to any network device that supports the routing function. These network devices can be L3 switches, routers, or firewall.

**i** Unless otherwise specified, "OSPF" in the following descriptions refers to OSPFv3.

#### Protocols and Standards

|   |  |
|---|--|
| <a href="#">RFC2740</a>                                 | This document describes the modifications to OSPF to support version 6 of the Internet Protocol (IPv6).  |
| <a href="#">draft-ietf-ospf-ospfv3-graceful-restart</a> | This document describes the OSPFv3 graceful restart. The OSPFv3 graceful restart is identical to OSPFv2 except for the differences described in this document. These differences include the format of the grace Link State Advertisements (LSA) and other considerations. |
| <a href="#">draft-ietf-ospf-ospfv3-mib-11</a>           | This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in IPv6-based internets. In particular, it defines objects for managing the Open Shortest Path First Routing Protocol for IPv6.                             |

## 3.2 Applications

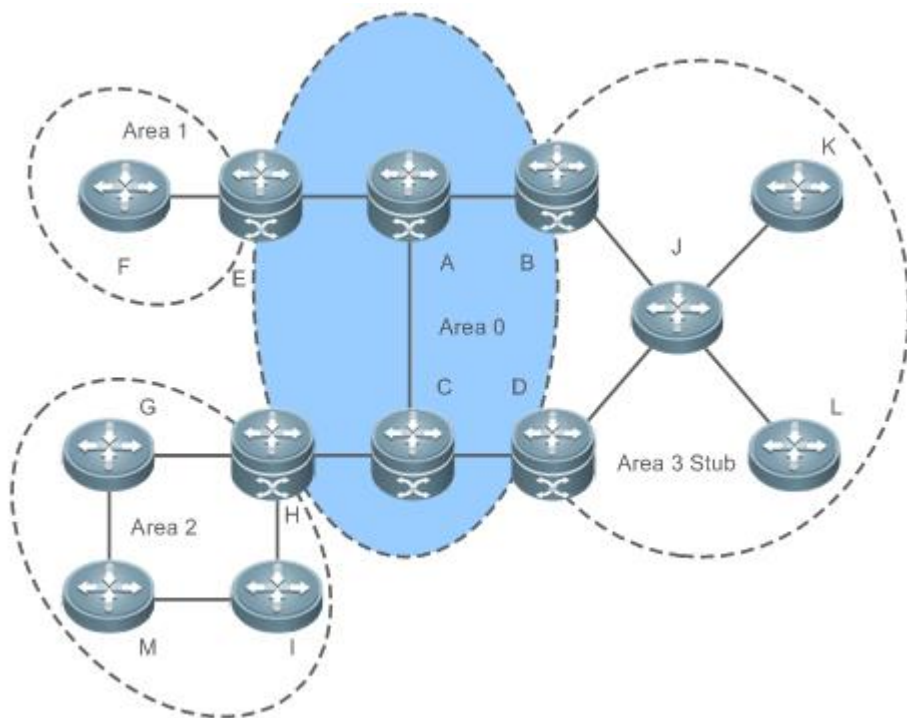

| Application                               | Description   |
|---|---|
| <a href="#">Intra-Domain Interworking</a> | OSPF runs within the AS, which is divided into several areas.                       |
| <a href="#">Inter-Domain Interworking</a> | Several ASs are interconnected. OSPF runs within each AS, and BGP runs between ASs. |

### 3.2.1 Intra-Domain Interworking

#### Scenario

OSPF runs within the AS. If the number of routers exceeds 40, it is recommended that the AS be divided into several areas. Generally, high-end devices featuring reliable performance and fast processing speed are deployed in a backbone area, and low-end or medium-range devices with relatively lower performance can be deployed in a normal area. All normal areas must be connected to the backbone area. It is recommended that a normal area located on the stub be configured as a stub area. As shown in Figure 3-1, the network is divided into four areas. Communication between these areas must go through the backbone area, that is, area 0.

Figure 3-1 Division of the OSPF Areas

|                |  |
|----------------|--|
| <b>Remarks</b> | A, B, C, D, E, and H are located in the backbone area, and are backbone routers.<br>Area 3 is configured as a stub area. |
|----------------|--|

#### Deployment

- OSPF runs on all routers within the AS to implement unicast routing.

### 3.2.2 Inter-Domain Interworking

#### Scenario

Several ASs are interconnected. OSPF runs within each AS, and BGP runs between ASs. Generally, OSPF and BGP learn the routing information from each other.

As shown in Figure 3-2, unicast routing is implemented within AS 100 and AS 200 using OSPF, and between the two ASs using BGP.

Figure 3-2 Interworking Between OSPF and BGP

|                |   |
|----------------|---|
| <b>Remarks</b> | OSPF and BGP run concurrently on Router A and Router D. |
|----------------|---|

#### Deployment

- OSPF runs within AS 100 and AS 200 to implement unicast routing.
- BGP runs between the two ASs to implement unicast routing.

## 3.3 Features

### Basic Concepts

#### Routing Domain

All routers in an AS must be interconnected and use the same routing protocol. Therefore, an AS is also called a routing domain.

An AS on which OSPF runs is also called OSPF routing domain, or OSPF domain for short.

#### OSPF Process

OSPF supports multiple instances, and each instance corresponds to an OSPF process.

One or more OSPF processes can be started on a router. Each OSPF process runs OSPF independently, and the processes are mutually isolated.

An OSPF packet header contains the Instance ID field, and multiple OSPF instances can run concurrently on a single link. The process ID is valid only on the local device.

#### RouterID

The router ID uniquely identifies a router in an OSPF domain. Router IDs of any two routers cannot be the same. If multiple OSPF processes exist on a router, each OSPF process uses one router ID. Router IDs of any two OSPF processes cannot be the same.

## Area

OSPF supports multiple areas. An OSPF domain is divided into multiple areas to ease the computing pressure of a large-scale network.

An area is a logical group of routers, and each group is identified by an area ID. The border between areas is a router. A router may belong to one area or multiple areas. One network segment (link) can belong to only one area, or each OSPF-enabled interface must belong to a specified area.

Area 0 is the backbone area, and other areas are normal areas. Normal areas must be directly connected to the backbone area.

Figure 3-3 Division of the OSPF Areas

## OSPF Router

The following types of routers are defined in OSPF, and assigned with different responsibilities:

- Internal router  
All interface of an interval router belong to the same OSPF area. As shown in Figure 3-3, A, C, F, G, I, M, J, K, and L are internal routers.
- Area border router (ABR)  
An ABR is used to connect the backbone area with a normal area. An ABR belongs to two or more areas, and one of the areas must be the backbone area. As shown in Figure 3-3, B, D, E, and H are ABRs.
- Backbone router  
A backbone router has at least one interface that belongs to the backbone area. All ABRs and all routers in area 0 are backbone routers. As shown in Figure 3-3, A, B, C, D, E, and H are backbone routers.
- AS boundary router (ASBR)

An ASBR is used to exchange routing information with other ASs. An ASBR is not necessarily located on the border of an AS. It may be a router inside an area, or an ABR. As shown in Figure 3-3, A is an ASBR.

Virtual Link

OSPF supports virtual links. A virtual link is a logical link that belongs to the backbone area. It is used to resolve the problems such as a discontinuous backbone area or a failure to directly connect a normal area to the backbone area on the physical network. A virtual link supports traversal of only one normal area, and this area is called transit area. Routers on both ends of a virtual link are ABRs.

Figure 3-4 Discontinuous Backbone Area on the Physical Network

As shown in Figure 3-4, a virtual link is set up between A and B to connect two separated parts of Area 0. Area 1 is a transit area, and A and B are ABRs of Area 1.

Figure 3-5 Failure to Directly Connect a Normal Area to the Backbone Area on the Physical Network

As shown in Figure 3-5, a virtual link is set up between A and B to extend Area 0 to B so that Area 0 can be directly connected to Area 2 on B. Area 1 is a transit area, A is an ABR of Area 1, and B is an ABR of Area 0 and Area 2.

LSA

OSPF describes the routing information by means of Link State Advertisement (LSA).

| LSA Type                     | Description   |
|------------------------------|---|
| Router-LSA(Type1)            | This LSA is originated by every router. It describes the link state and cost of the router, and is advertised only within the area where the originating router is located. |
| Network-LSA(Type2)           | This LSA is originated by a designated router (DR). It describes the state of the current link, and is advertised only within the area where the DR is located.             |
| Inter-Area-Prefix-LSA(Type3) | This LSA is originated by an ABR. It describes a route to another area, and is  |

| LSA Type                     | Description   |
|------------------------------|---|
|                              | advertised to areas except totally stub areas.  |
| Inter-Area-Router-LSA(Type4) | This LSA is originated by an ABR. It describes a route to an ASBR, and is advertised to areas except areas where the ASBR is located.   |
| AS-external-LSA(Type5)       | This LSA is originated by an ABR. It describes a route to a destination outside the AS, and is advertised to all areas except the stub areas.   |
| Link-LSA(Type8)              | This LSA is originated by every router. It describes the link-local address and IPv6 prefix address of each link, and provides the link option that will be set in the Network-LSA. It advertised only on the current link.   |
| Intra-Area-Prefix-LSA(Type9) | Every router or DR generates one or more Intra-Area-Prefix-LSAs, which are advertised in the area to which the router or DR belongs. <ul style="list-style-type: none"> <li>The Intra-Area-Prefix-LSA generated by a router describes the IPv6 prefix address associated with the Route-LSA.</li> <li>The Intra-Area-Prefix-LSA generated by a DR describes the IPv6 prefix address associated with the Network-LSA.</li> </ul> |

 Stub areas and totally stub areas are special forms of normal areas and help reduce the load of routers and enhance reliability of OSPF routes.

## ↳ OSPF Packet

The following table lists the protocol packets used by OSPF. These OSPF packets are encapsulated in IP packets and transmitted in multicast or unicast mode.

| Packet Type                       | Description   |
|-----------------------------------|---|
| Hello                             | Hello packets are sent periodically to discover and maintain OSPF neighbor relationships.   |
| Database Description (DD)         | DD packets carry brief information about the local Link-State Database (LSDB) and are used to synchronize the LSDBs between OSPF neighbors.                     |
| Link State Request (LSR)          | LSR packets are used to request the required LSAs from neighbors. LSR packets are sent only after DD packets are exchanged successfully between OSPF neighbors. |
| Link State Update (LSU)           | LSU packets are used to send the required LSAs to peers.  |
| Link State Acknowledgment (LSAck) | LSAck packets are used to acknowledge the received LSAs.  |

## Overview

| Feature   | Description   |
|---|---|
| <a href="#">Link-State Routing Protocols</a>      | Run OSPF on the router to obtain routes to different destinations on the network.                                 |
| <a href="#">OSPF Route Management</a>             | Properly plan or optimize OSPF routes through manual configuration to implement management of OSPF routes.        |
| <a href="#">Enhanced Security and Reliability</a> | Use functions such as authentication and BFD correlation to enhance security, stability, and reliability of OSPF. |

| Feature                                      | Description   |
|--|---|
| <a href="#">Network Management Functions</a> | Use functions such as the MIB and Syslog to facilitate OSPF management. |

### 3.3.1 Link-State Routing Protocols

OSPF is a type of link-state routing protocols. Its working process is as follows:

- Neighbor discovery → Bidirectional communication  
An OSPF neighbor relationship is set up between adjacent routers, and bidirectional communication is maintained.
- Database synchronization → Full adjacency  
A router uses LSAs to advertise all its link states. LSAs are exchanged between neighbors and the link state database (LSDB) is synchronized to achieve full adjacency.
- Shortest Path Tree (SPT) computation → Formation of a routing table  
The router computes the shortest path to each destination network based on the LSDB and forms an OSPF routing table.

#### Working Principle

##### ↘ Neighbor Discovery → Bidirectional Communication

Routers send Hello packets through all OSPF-enabled interfaces (or virtual links). If Hello packets can be exchanged between two routers, and parameters carried in the Hello packets can be successfully negotiated, the two routers become neighbors. Routers that are mutually neighbors find their own router IDs from Hello packets sent from neighbors, and bidirectional communication is set up.

A Hello packet includes, but is not limited to, the following information:

- Router ID of the originating router
- Area ID of the originating router interface (or virtual link)
- Instance ID of the originating router interface (or virtual link)
- Interface ID of the originating router interface (or virtual link)
- Priority of the originating router interface (used for DR/BDR election)
- Hello interval of the originating router interface (or virtual link)
- Neighbor dead interval of the originating router interface (or virtual link)
- IP addresses of the DR and Backup Designated Router (BDR)
- Router ID of the neighbor of the originating router

##### ↘ Database Synchronization → Full Adjacency

After bidirectional communication is set up between neighbor routers, the DD, LSR, LSU, and LSAck packets are used to exchange LSAs and set up the adjacency. The brief process is as follows:

- A router generates an LSA to describe all link states on the router.

- The LSA is exchanged between neighbors. When a router receives the LSA from its neighbor, it copies the LSA and saves the copy in the local LSDB, and then advertises the LSA to other neighbors.
- When the router and its neighbors obtain the same LSDB, full adjacency is achieved.

**i** OSPF will be very quiet without changes in link costs or network addition or deletion. If any change takes place, the changed link states are advertised to quickly synchronize the LSDB.

### ↘ SPT Computation → Formation of a Routing Table

After the complete LSDB is obtained from the router, the Dijkstra algorithm is run to generate an SPT from the local router to each destination network. The SPT records the destination networks, next-hop addresses, and costs. OSPF generates a routing table based on the SPT.

If changes in link costs or network addition or deletion take place, the LSDB will be updated. The router again runs the Dijkstra algorithm, generates a new SPT, and updates the routing table.

**i** The Dijkstra algorithm is used to find a shortest path from a vertex to other vertices in a weighted directed graph.

### ↘ OSPF Network Types

A router does not necessarily need to exchange LSAs with every neighbor and set up an adjacency with every neighbor. To improve efficiency, OSPF classifies networks that use various link layer protocols into five types so that LSAs are exchanged in different ways to set up an adjacency:

- **Broadcast**  
Neighbors are discovered, and the DR and BDR are elected.  
The DR (or BDR) exchanges LSAs with all other routers to set up an adjacency. Except the DR and BDR, all other routers do not exchange LSAs with each other, and the adjacency is not set up.  
Ethernet and fiber distributed data interface (FDDI) belong to the broadcast network type by default.
- **Non-broadcast multiple access (NBMA)**  
Neighbors are manually configured, and the DR and BDR are elected.  
The DR (or BDR) exchanges LSAs with all other routers to set up an adjacency. Except the DR and BDR, all other routers do not exchange LSAs with each other, and the adjacency is not set up.  
X.25, frame relay, and ATM belong to NBMA networks by default.
- **Point-to-point (P2P)**  
Neighbors are automatically discovered, and the DR or BDR is not elected.  
LSAs are exchanged between routers at both ends of the link, and the adjacency is set up.  
PPP, HDLC, and LAPB belong to the P2P network type by default.
- **Point-to-multipoint(P2MP)**  
Neighbors are automatically discovered, and the DR or BDR is not elected.  
LSAs are exchanged between any two routers, and the adjacency is set up.  
Networks without any link layer protocol belong to the P2MP network type by default.

- P2MP broadcast
  - Neighbors are manually configured, and the DR or BDR is not elected.
  - LSAs are exchanged between any two routers, and the adjacency is set up.
  - Networks without any link layer protocol belong to the P2MP network type by default.

➤ **OSPF Route Types**

Figure 3-6

Display the OSPF routes (marked in red) in the routing table of Router C.

```
C#show ipv6 route ospf
IPv6 routing table name is Default(0) global scope - 7 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
       I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea, IS - ISIS summary
       O - OSPF intra area, OI - OSPF inter area, OE1 - OSPF external type 1, OE2 - OSPF external type 2

       [*] - NOT in hardware forwarding table

L      ::1/128   via Loopback, local host
OI     3001::/64 [110/2] via FE80::21A:A9FF:FE15:4CB9, VLAN 200
C      3001:1::/64   via VLAN 200, directly connected
L      3001:1::2/128 via VLAN 200, local host
L      FE80::/10   via ::1, Null0
C      FE80::/64   via VLAN 200, directly connected
```

```
L FE80::21A:A9FF:FE01:FB1F/128 via VLAN 200, local host
```

A mark is displayed in front of each OSPF route to indicate the type of the route. There are six types of OSPF routes:

- **O:** Intra-area route  
This type of route describes how to arrive at a destination network in the local area. The cost of this type of route is equal to the cost of the route from the local router to the destination network.
- **Ol:** Inter-area route  
This type of route describes how to arrive at a destination network in another area. The cost of this type of route is equal to the cost of the route from the local router to the destination network.
- **OE1:** Type 1 external route  
This type of route describes how to arrive at a destination network outside the AS. The cost of this type of route is equal to the cost of the route from the local router to the ASBR plus the cost of the route from the ASBR to the destination network. This type of route does not exist on routers in the stub area.
- **OE2:** Type 2 external route  
This type of route describes how to arrive at a destination network outside the AS. The cost of this type of route is equal to the cost of the route from the ASBR to the destination network. This type of route does not exist on routers in the stub area.

**i** Reliability of OE2 and ON2 routes is poor. OSPF believes that the cost of the route from the ASBR to a destination outside an AS is far greater than the cost of the route to the ASBR within the AS. Therefore, when the route cost is computed, only the cost of the route from the ASBR to a destination outside an AS is considered.

## Related Configuration

### ↳ Enabling OSPF

OSPF is disabled by default.

Run the **ipv6 router ospf 1** command to create an OSPF process on the router.

Run the **ipv6 ospfarea** command to enable OSPF on an interface and specify the area ID.

Run the **area virtual-link** command to create a virtual link on the router. The virtual link can be treated as a logical interface.

### ↳ Router ID

By default, the OSPF process elects the largest IPv4 address among the IPv4 addresses of all the loopback interfaces as the router ID. If the loopback interfaces configured with IPv4 addresses are not available, the OSPF process elects the largest IPv4 address among the IPv4 addresses of all the physical ports as the router ID.

Alternatively, you can run the **router-id** command to manually specify the router ID.

### ↳ Protocol Control Parameters

Run the **ipv6 ospf hello-interval** command to modify the Hello interval on the interface. The default value is 10s (or 30s for NBMA networks).

Run the **ipv6 ospf dead-interval** command to modify the neighbor dead interval on the interface. The default value is four times the Hello interval.

Use the **poll-interval** parameter in the **ipv6 ospf neighbor** command to modify the neighbor polling interval on the NBMA interface. The default value is 120s.

Run the **ipv6 ospf transmit-delay** command to modify the LSU packet transmission delay on the interface. The default value is 1s.

Run the **ipv6 ospf retransmit-interval** command to modify the LSU packet retransmission interval on the interface. The default value is 5s.

Use the **hello-interval** parameter in the **area virtual-link** command to modify the Hello interval on the virtual link. The default value is 10s.

Use the **dead-interval** parameter in the **area virtual-link** command to modify the neighbor dead interval on the virtual link. The default value is four times the Hello interval.

Use the **transmit-delay** parameter in the **area virtual-link** command to modify the LSU packet transmission delay on the virtual link. The default value is 1s.

Use the **retransmit-interval** parameter in the **area virtual-link** command to modify the LSU packet retransmission interval on the virtual link. The default value is 5s.

Run the **timers throttle lsa all** command to modify parameters of the exponential backoff algorithm that generates LSAs. The default values of these parameters are 0 ms, 5000 ms, and 5000 ms.

Run the **timers pacing lsa-group** command to modify the LSA group update interval. The default value is 30s.

Run the **timers pacing lsa-transmit** command to modify the LS-UPD packet sending interval and the number of sent LS-UPD packets. The default values are 40 ms and 1.

Run the **timers lsa arrival** command to modify the delay after which the same LSA is received. The default value is 1000 ms.

Run the **timers throttle spf** command to modify the SPT computation delay, minimum interval between two SPT computations, and maximum interval between two SPT computations. The default values are 1000 ms, 5000 ms, and 10000 ms.

### 📌 OSPF Network Types

By default, Ethernet and FDDI belong to the broadcast type, X.25, frame relay, and ATM belong to the NBMA type, and PPP, HDLC, and LAPB belong to the P2P type.

Run the **ipv6 ospf network** command to manually specify the network type of an interface.

Run the **ipv6 ospf neighbor** command to manually specify a neighbor. For the NBMA and P2MP non-broadcast types, you must manually specify neighbors.

Run the **ipv6 ospf priority** command to adjust the priorities of interfaces, which are used for DR/BDR election. The DR/BDR election is required for the broadcast and NBMA types. The router with the highest priority wins in the election, and the router with the priority of 0 does not participate in the election. The default value is 1.

## 3.3.2 OSPF Route Management

Properly plan or optimize OSPF routes through manual configuration to implement management of OSPF routes.

### Working Principle

#### 📌 (Totally) Stub Area

The (totally) stub areas help reduce the protocol interaction load and the size of the routing table.

- If an appropriate area is configured as a (totally) stub area, advertisement of a large number of Type 5 and Type 3 LSAs can be avoided within the area.

| Area                    | Type 1 and Type 2 LSAs | Type 3 LSA                             | Type 4 LSA  | Type 5 LSA  | Type 7 LSA  |
|-------------------------|------------------------|--|-------------|-------------|-------------|
| Non (totally) stub area | Allowed                | Allowed                                | Allowed     | Allowed     | Not allowed |
| Stub area               | Allowed                | Allowed (containing one default route) | Not allowed | Not allowed | Not allowed |
| Totally stub area       | Allowed                | Only one default route is allowed.     | Not allowed | Not allowed | Not allowed |

 The ABR uses Type 3 LSAs to advertise a default route to the (totally) stub area.

- If an area is appropriately configured as a (totally) stub area, a large number of OE1, OE2, and OI routes will not be added to the routing table of a router in the area.

| Area                    | Routes Available in the Routing Table of a Router Inside the Area  |
|-------------------------|--|
| Non (totally) stub area | O: a route to a destination network in the local area<br>OI: a route to a destination network in another area<br>OE1 or OE2: a route or default route to a destination network segment outside the AS (via any ASBR in the AS) |
| Stub area               | O: a route to a destination network in the local area<br>OI: a route or a default route to a destination network in another area   |
| Totally stub area       | O: a route to a destination network in the local area<br>OI: a default route   |

### Route Redistribution

Route redistribution refers to the process of introducing routes of other routing protocols, routes of other OSPF processes, static routes, and direct routes that exist on the device to an OSPF process so that these routes can be advertised to neighbors using Type 5 and Type 7 LSAs. A default route cannot be introduced during route redistribution.

Route redistribution is often used for interworking between ASs. You can configure route redistribution on an ASBR to advertise routes outside an AS to the interior of the AS, or routes inside an AS to the exterior of the AS.

### Default Route Introduction

By configuring a command on an ASBR, you can introduce a default route to an OSPF process so that the route can be advertised to neighbors using Type 5 and Type 7 LSAs.

Default route introduction is often used for interworking between ASs. One default route is used to replace all the routes outside an AS.

### Route Summarization

Route summarization is a process of summarizing routing information with the same prefix into one route, and advertising the summarized route (replacing a large number of individual routes) to neighbors. Route summarization helps reduce the protocol interaction load and the size of the routing table.

By default, the ABR advertises inter-area routing information by using Type3 LSAs within a network segment, and advertises redistributed routing information by using Type 5 and Type 7 LSAs. If continuous network segments exist, it is recommended that you configure route summarization.

### Route Filtering

OSPF supports route filtering to ensure security and facilitate control when the routing information is being learned, exchanged, or used.

Using configuration commands, you can configure route filtering for the following items:

- **Interface:** The interface is prevented from sending routing information (any LSAs) or exchanging routing information (any LSAs) with neighbors.
- **Routing information outside an AS:** Only the routing information that meets the filtering conditions can be redistributed to the OSPF process (Type 5 and Type 7 LSAs).
- **LSAs received by a router:** In the OSPF routing table, only the routes that are computed based on the LSAs meeting the filtering conditions can be advertised.

### Route Cost

If redundancy links or devices exist on the network, multiple paths may exist from the local device to the destination network. OSPF selects the path with the minimum total cost to form an OSPF route. The total cost of a path is equal to the sum of the costs of individual links along the path. The total cost of a path can be minimized by modifying the costs of individual links along the path. In this way, OSPF selects this path to form a route.

Using configuration commands, you can modify the following link costs:

- Cost from an interface to a directly connected network segment and cost from the interface to a neighbor
- Cost from an ABR to the default network segment
- Cost from an ASBR to an external network segment and cost from the ASBR to the default network segment

**i** Both the cost and the metric indicate the cost and are not differentiated from each other.

### OSPF Administrative Distance

The administrative distance (AD) evaluates reliability of a route, and the value is an integer ranging from 0 to 255. A smaller AD value indicates that the route is more trustworthy. If multiples exist to the same destination, the route preferentially selects a route with a smaller AD value. The route with a greater AD value becomes a floating route, that is, a standby route of the optimum route.

By default, the route coming from one source corresponds to an AD value. The AD value is a local concept. Modifying the AD value affects route selection only on the current router.

| Route Source | Directly-connected network | Static route | EBGP Route | OSPF Route | IS-IS Route | RIP Route | IBGP Route | Unreachable Route |
|--------------|----------------------------|--------------|------------|------------|-------------|-----------|------------|-------------------|
| Default AD   | 0                          | 1            | 20         | 110        | 115         | 120       | 200        | 255               |

### Related Configuration

## ▾ Stub Area

By default, no stub or NSSA area is configured.

Run the **area stub** command to configure a specified area as a stub area.

- i** A backbone area cannot be configured as a stub.
- i** A transit area (with virtual links going through) cannot be configured as a stub.
- i** An area containing an ASBR cannot be configured as a stub area.

## ▾ Route Redistribution and Default Route Introduction

By default, routes are not redistributed and the default route is not introduced.

Run the **redistribute** command to configure route redistribution.

Run the **default-information originate** command to introduce a default route.

After configuring route redistribution and default route introduction, the router automatically becomes an ASBR.

## ▾ Route Summarization

By default, routes are not summarized. If route summarization is configured, a discard route will be automatically added.

Run the **area range** command to summarize routes (Type 3 LSA) distributed between areas on the ABR.

Run the **summary-prefix** command to summarize redistributed routes (Type 5 and Type 7 LSAs) on the ASBR.

## ▾ Route Filtering

By default, routes are not filtered.

Run the **passive-interface** command to configure a passive interface. Routing information (any LSAs) cannot be exchanged on a passive interface.

Use the **route-map** parameter in the **redistribute** command, or use the **distribute-list out** command to filter the external routing information of the AS on the ASBR. Only the routing information that meets the filtering conditions can be redistributed to the OSPF process (Type 5 LSAs).

Run the **distribute-list in** command to filter LSAs received by the router. In the OSPF routing table, only the routes that are computed based on the LSAs meeting the filtering conditions can be advertised.

## ▾ Route Cost

- Cost from the interface to the directly-connected network segment (cost on the interface)  
The default value is the auto cost. Auto cost = Reference bandwidth/Interface bandwidth  
Run the **auto-cost reference-bandwidth** command to set the reference bandwidth of the auto cost. The default value is 100 Mbps.  
Run the **ipv6 ospf cost** command to manually set the cost of the interface. The configuration priority of this item is higher than that of the auto cost.
- Cost from the interface to a specified neighbor (that is, cost from the local device to a specified neighbor)  
The default value is the auto cost.

Use the **cost** parameter in the **ipv6 ospf neighbor** command to modify the cost from the interface to a specified neighbor. The configuration priority of this item is higher than that of the cost of the interface.

This configuration item is applicable only to P2MP-type interfaces.

- Cost from the ABR to the default network segment (that is, the cost of the default route that is automatically advertised by the ABR to the stub areas)  
The default value is 1.  
Run the **area default-cost** command to modify the cost of the default route that the ABR automatically advertise to the stub areas.
- Cost from the ASBR to an external network segment (that is, the metric of an external route)  
By default, the metric of a redistributed BGP route is 1, the metric of other types of redistributed routes is 20, and the route type is Type 2 External.  
Run the **default-metric** command to modify the default metric of the external route.  
Use the **metric**, **metric-type**, and **route-map** parameters in the **redistribute** command to modify the metric and route type of the external route.
- Cost from the ASBR to the default network segment (that is, the metric of the default route that is manually introduced)  
By default, the metric is 1, and the route type is Type 2 External.  
Use the **metric**, **metric-type**, and **route-map** parameters in the **default-information originate** command to modify the metric and route type of the default route that is manually introduced.

#### ↘ OSPF Administrative Distance

By default, the OSPF AD is 110.

Run the **distance** command to set the AD of an OSPF route.

### 3.3.3 Enhanced Security and Reliability

Use functions such as authentication and BFD correlation to enhance security, stability, and reliability of OSPF.

#### Working Principle

##### ↘ Authentication

OSPFv3 uses the authentication mechanism, that is, IP authentication header (AH) and IP Encapsulating Security Payload (ESP), provided by IPv6 to prevent unauthorized routers that access the network and hosts that forge OSPF packets to participate in OSPF routing. OSPF packets received on the OSPF interface (or at both ends of a virtual link) are authenticated. If authentication fails, the packets are discarded and the adjacency cannot be set up.

Enabling authentication can avoid learning unauthenticated or invalid routes, thus preventing advertising valid routes to unauthenticated devices. In the broadcast-type network, authentication also prevents unauthenticated devices from becoming designated devices, ensuring stability of the routing system and protecting the routing system against intrusions.

##### ↘ MTU Verification

On receiving a DD packet, OSPF checks whether the MTU of the neighbor interface is the same as the MTU of the local interface. If the MTU of the interface specified in the received DD packet is greater than the MTU of the interface that receives the packet, the adjacency cannot be set up. Disabling MTU verification can avoid this problem.

### ↘ Two-Way Maintenance

OSPF routers periodically send Hello packets to each other to maintain the adjacency. On a large network, a lot of packets may be sent or received, occupying too much CPU and memory. As a result, some packets are delayed or discarded. If the processing time of Hello packets exceeds the dead interval, the adjacency will be destroyed.

If the two-way maintenance function is enabled, in addition to the Hello packets, the DD, LSU, LSR, and LSAck packets can also be used to maintain the bidirectional communication between neighbors, which makes the adjacency more stable.

### ↘ Concurrent neighbor Interaction Restriction

When a router simultaneously exchanges data with multiple neighbors, its performance may be affected. If the maximum number of neighbors that concurrently initiate or accept interaction with the OSPF process, the router can interact with neighbors by batches, which ensures data forwarding and other key services.

### ↘ GR

The control and forwarding separated technology is widely used among routers. On a relatively stable network topology, when a GR-enabled router is restarted on the control plane, data forwarding can continue on the forwarding plane. In addition, actions (such as adjacency re-forming and route computation) performed on the control plane do not affect functions of the forwarding plane. In this way, service interruption caused by route flapping can be avoided, thus enhancing reliability of the entire network.

Currently, the GR function is used only during active/standby switchover and system upgrade.

Figure 3-7 Normal OSPF GR Process

- The GR process requires collaboration between the restarter and the helper. The restarter is the router where GR occurs. The helper is a neighbor of the restarter.
- When entering or exiting the GR process, the restarter sends a Grace-LSA to the neighbor, notifying the neighbor to enter or exit the helper state.
- When the adjacency between the restarter and the helper reaches the Full state, the router can exit the GR process successfully.

Fast Hello and BFD Correlation

After a link fault occurs, it takes a period of time (about 40s) before OSPF can sense the death of the neighbor. Then, OSPF advertises the information and re-computes the SPT. During this period, traffic is interrupted.

- After the fast Hello function is enabled (that is, the neighbor dead interval is set to 1s), OSPF can sense the death of a neighbor within 1s once a link is faulty. This greatly accelerates route convergence and prevents traffic interruption.
- BFD is used to test connectivity between devices. A link fault can be detected in as short as 150 ms. After OSPF is correlated with BFD, OSPF can sense the death of a neighbor in as short as 150 ms once a link is faulty. This greatly accelerates route convergence and prevents traffic interruption.

Related Configuration

OSPF Packet Authentication

By default, authentication is disabled.

- Run the **area authentication** command to enable authentication in the entire area so that the authentication function takes effect on all interfaces in this area. If authentication is enabled in area 0, the function also takes effect on the virtual link.
- Run the **area encryption** command to enable encryption and authentication in the entire area so that the encryption and authentication functions take effect on all interfaces in this area. If encryption and authentication are enabled in area 0, the functions also take effect on the virtual link.
- Run the **ipv6 ospf authentication** command to enable authentication on an interface. This configuration takes precedence over the area-based configuration.
- Run the **ipv6 ospf encryption** command to enable encryption and authentication on an interface. This configuration takes precedence over the area-based configuration.
- Use the **authentication** parameter in the **area virtual-link** command to enable authentication at both ends of a virtual link. This configuration takes precedence over the area-based configuration.
- Use the **encryption** parameter in the **area virtual-link** command to enable encryption and authentication at both ends of a virtual link. This configuration takes precedence over the area-based configuration.

#### ↘ MTU Verification

By default, MTU verification is disabled.

Run the **ipv6 ospf mtu-ignore** command to disable MTU verification on an interface.

#### ↘ Two-Way Maintenance

By default, bidirectional maintenance is enabled.

Run the **two-way-maintain** command to enable two-way maintenance.

#### ↘ Concurrent neighbor Interaction Restriction

Run the **max-concurrent-dd** command to modify the maximum number of neighbors that are concurrently interacting with the current OSPF process. The default value is 5.

Run the **ipv6 router ospf max-concurrent-dd** command to modify the maximum number of neighbors that are concurrently interacting with all OSPF processes on the router. The default value is 10.

#### ↘ GR

By default, the restarter function is disabled, and the helper function is enabled.

Run the **graceful-restart** command to configure the restarter function.

Run the **graceful-restart helper** command to configure the helper function.

#### ↘ Fast Hello

By default, the neighbor dead interval on the interface is 40s.

Run the **ipv6 ospf dead-interval minimal hello-multiplier** command to enable the Fast Hello function on an interface, that is, the neighbor dead interval is 1s.

### ↘ Correlating OSPF with BFD

By default, OSPF is not correlated with BFD.

Run the **bfd interval min\_rx multiplier** command to set the BFD parameters.

Run the **bfd all-interfaces** command to correlate OSPF with BFD on all interfaces.

Run the **ipv6 ospf bfd** command to correlate OSPF with BFD on the current interface.

## 3.3.4 Network Management Functions

Use functions such as the MIB and Syslog to facilitate OSPF management.

### Working Principle

#### ↘ MIB

MIB is the device status information set maintained by a device. You can use the management program to view and set the MIB node.

Multiple OSPF processes can be simultaneously started on a router, but the OSPF MIB can be bound with only one OSPF process.

#### ↘ Trap

A trap message is a notification generated when the system detects a fault. This message contains the related fault information.

If the trap function is enabled, the router can proactively send the trap messages to the network management device.

#### ↘ Syslog

The Syslog records the operations (such as command configuration) performed by users on routers and specific events (such as network connection failures).

If the syslog is allowed to record the adjacency changes, the network administrator can view the logs to learn the entire process that the OSPF adjacency is set up and maintained.

### Related Configuration

#### ↘ MIB

By default, the MIB is bound with the OSPF process with the smallest process ID.

Run the **enable mib-binding** command to bind the MIB with the current OSPF process.

#### ↘ Trap

By default, all traps functions are disabled, and the device is not allowed to send OSPF traps.

Run the **snmp-server enable traps ospf** command to allow the device to send OSPF traps.

Run the **enable traps** command to enable a specified trap function for an OSPF process.

➤ **Syslog**

By default, the Syslog is allowed to record the adjacency changes.

Run the **log-adj-changes** command to allow the Syslog to record the adjacency changes.

### 3.4 Configuration

| Configuration  | Description and Command  |   |
|--|--|---|
| <a href="#">Configuring OSPF Basic Functions</a>                   |  (Mandatory) It is used to build an OSPF routing domain.  |   |
|  | <b>ipv6routerospf</b>  | Creates an OSPF process.                                      |
|  | <b>router-id</b>   | Configures a router ID.                                       |
|  | <b>ipv6 ospfarea</b>   | Enables OSPF on an interface and specifies an area ID.        |
| <a href="#">Setting the Network Type</a>                           |  (Optional) The configurations are mandatory if the physical network is the X.25, frame relay, or ATM network.                        |   |
|  | <b>ipv6 ospf network</b>   | Defines the network type.                                     |
|  | <b>ipv6 ospf neighbor</b>  | Specifies a neighbor.   |
|  | <b>ipv6 ospf priority</b>  | Configures the DR priority.                                   |
| <a href="#">Configuring Route Redistribution and Default Route</a> |  (Optional) The configurations are recommended if the OSPF routing domain is connected with an external network.                    |   |
|  | <b>redistribute</b>  | Configures route redistribution.                              |
|  | <b>default-information originate</b>   | Introduces a default route.                                   |
| <a href="#">Configuring the Stub Area</a>                          |  (Optional) It is used to reduce interaction of routing information and the size of routing table, and enhance stability of routes. |   |
|  | <b>area stub</b>   | Configures a stub area.                                       |
| <a href="#">Configuring Route Summarization</a>                    |  (Optional) It is used to reduce interaction of routing information and the size of routing table, and enhance stability of routes. |   |
|  | <b>area range</b>  | Summarizes routes that are advertised between areas.          |
|  | <b>summary-prefix</b>  | Summarizes routes that are introduced through redistribution. |
| <a href="#">Configuring Route Filtering</a>                        |  (Optional) It is used to manually control interaction of routing information and filter available OSPF routes.                     |   |
|  | <b>passive-interface</b>   | Configures a passive interface.                               |
|  | <b>distribute-list out</b>   | Filters routes that are introduced through redistribution.    |
|  | <b>distribute-listin</b>   | Filters received LSAs.  |
| <a href="#">Modifying the Route</a>                                |  (Optional) It is used to manually control the shortest route computed by OSPF and  |   |

| Configuration  | Description and Command   |   |
|--|---|---|
| <a href="#">Cost and AD</a>  | determine whether to select an OSPF route preferentially.   |   |
|  | <b>auto-costreference-bandwidth</b>   | Modifies the reference bandwidth of the auto cost.                                      |
|  | <b>ipv6 ospf cost</b>   | Modifies the cost in the outbound direction of an interface.                            |
|  | <b>area default-cost</b>  | Modifies the cost of the default route in a stub area.                                  |
|  | <b>default-metric</b>   | Modifies the default metric of a redistributed route.                                   |
|  | <b>distance</b>   | Modifies the OSPF AD.   |
| <a href="#">Enabling Authentication</a>                              |  (Optional) It is used to prevent routers that illegally access the network and hosts that forge OSPF packets from participating in the OSPF protocol process. |   |
|  | <b>area authentication</b>  | Enables authentication and sets the authentication mode in an area.                     |
|  | <b>area encryption</b>  | Enables encryption and authentication and sets the authentication mode in an area.      |
|  | <b>ipv6 ospf authentication</b>   | Enables authentication and sets the authentication mode on an interface.                |
|  | <b>ipv6 ospf encryption</b>   | Enables encryption and authentication and sets the authentication mode on an interface. |
| <a href="#">Modifying the Maximum Number of Concurrent Neighbors</a> |  (Optional) It is used to prevent the problem of performance deterioration caused by over-consumption of the CPU.  |   |
|  | <b>max-concurrent-dd</b>  | Modifies the maximum number of concurrent neighbors on the current OSPF process.        |
|  | <b>ipv6 router ospf max-concurrent-dd</b>   | Modifies the maximum number of concurrent neighbors on all OSPF processes.              |
| <a href="#">Disabling MTU Verification</a>                           |  (Optional) It is used to prevent the problem that the adjacency cannot be set up due to MTU inconsistency on the neighbor interface.                        |   |
|  | <b>ipv6 ospf mtu-ignore</b>   | Disables MTU verification on an interface.  |
| <a href="#">Enabling Two-Way Maintenance</a>                         |  (Optional) It is used to prevent termination of the adjacency due to the delay or loss of Hello packets.  |   |
|  | <b>two-way-maintain</b>   | Enables two-way maintenance.  |
| <a href="#">Enabling GR</a>  |  (Optional) It is used to retain OSPF routing forwarding during restart or active/standby switchover of the OSPF processes to prevent traffic interruption.  |   |
|  | <b>graceful-restart</b>   | Enables the restarter function.   |
|  | <b>graceful-restart helper</b>  | Enables the helper function.  |

| Configuration  | Description and Command  |   |
|--|--|---|
| Enabling Fast Hello                                      |  (Optional) It is used to quickly discover the death of a neighbor to prevent traffic interruption when a link is faulty. |   |
|  | <b>ipv6 ospf dead-intervalminimal hello-multiplier</b>   | Enabling the Fast Hello function on an interface.                             |
| <a href="#">Correlating OSPF with BFD</a>                |  (Optional) It is used to quickly discover the death of a neighbor to prevent traffic interruption when a link is faulty. |   |
|  | <b>bfd all-interfaces</b>  | Correlates OSPF with BFD on all interfaces.                                   |
|  | <b>ipv6 ospf bfd</b>   | Correlates OSPF with BFD on the current interface.                            |
| <a href="#">Configuring Network Management Functions</a> |  (Optional) The configurations enable users to use the SNMP network management software to manage OSPF.                   |   |
|  | <b>enable mib-binding</b>  | Bind MIB to the OSPF process.   |
|  | <b>enable traps</b>  | Enables the trap function of the OSPF process.                                |
|  | <b>log-adj-changes</b>   | Allows the syslogs to record the changes in adjacency status.                 |
| <a href="#">Modifying Protocol Control Parameters</a>    |  (Optional) You are advised not to modify protocol control parameters unless necessary.                                  |   |
|  | <b>ipv6 ospf hello-interval</b>  | Modifies the Hello interval on an interface.                                  |
|  | <b>ipv6 ospf dead-interval</b>   | Modifies the neighbor death interval on an interface.                         |
|  | <b>ipv6 ospf transmit-delay</b>  | Modifies the LSU packet transmission delay on an interface.                   |
|  | <b>ipv6 ospf retransmit-interval</b>   | Modifies the LSU packet retransmission interval on an interface.              |
|  | <b>timers throttle lsa all</b>   | Modifies parameters of the exponential backoff algorithm that generates LSAs. |
|  | <b>timers spacing lsa-group</b>  | Modifies the LSA group update interval.                                       |
|  | <b>timers pacing lsa-transmit</b>  | Modifies the LS-UPD packet sending interval.                                  |
|  | <b>timers lsa arrival</b>  | Modifies the delay after which the same LSA is received.                      |
|  | <b>timers throttlespf</b>  | Modifies the SPT computation timer.   |
|  | <b>timers throttle route inter-area</b>  | Modifies the inter-area route computation delay.                              |
| <b>timers throttle route ase</b>                         | Modifies the inter-area route computation delay.   |   |

### 3.4.1 Configuring OSPF Basic Functions

#### Configuration Effect

- Set up an OSPF routing domain on the network to provide IPv6 unicast routing service for users on the network.

#### Notes

- Ensure that the IPv6 routing function is enabled, that is, **ipv6 routing** is not disabled; otherwise, OSPF cannot be enabled.
- IPv6 must be enabled on the interface.
- It is strongly recommended that you manually configure the router ID.

#### Configuration Steps

##### ↳ Creating an OSPF Process

- Mandatory.
- The configuration is mandatory for every router.

##### ↳ Configuring a Router ID

- (Optional) It is strongly recommended that you manually configure the router ID.
- If the router ID is not configured, OSPF selects an interface IP address. If the IP address is not configured for any interface, or the configured IP addresses have been used by other OSPF instances, you must manually configure the router ID.

##### ↳ Enabling OSPF on an Interface and Specifying an Area ID

- Mandatory.
- The configuration is mandatory for every router.

#### Verification

- Run the **show ipv6 route ospf** command to verify that the entries of the OSPF routing table are correctly loaded.
- Run the **ping** command to verify that the IPv6 unicast service is correctly configured.

#### Related Commands

##### ↳ Creating an OSPF Process

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>ipv6 router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]                                       |
| <b>Parameter</b>    | <i>process-id</i> : Indicates the OSPFv3 process ID. If the process ID is not specified, process 1 is enabled. |
| <b>Description</b>  | <i>vrf-name</i> : Specifies the VPN routing and forwarding (VRF) to which the OSPFv3 process belongs.          |
| <b>Command Mode</b> | Global configuration mode  |
| <b>Usage Guide</b>  | After enabling the OSPFv3 process, the device enters the routing process configuration mode.                   |

### ▾ Configuring a Router ID

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>router-id</b> <i>router-id</i>   |
| <b>Parameter</b>    | <i>router-id</i> : Indicates the ID of the device, which is expressed in the IPv4 address.  |
| <b>Description</b>  |   |
| <b>Command Mode</b> | OSPF routing process configuration mode   |
| <b>Usage Guide</b>  | Every device where OSPFv3 run must be identified by using a router ID. You can configure any IPv4 address as the router ID of the device, and ensure that the router ID is unique in an AS. If multiple OSPFv3 processes run on the same device, the router ID of each process must also be unique. After the router ID changes, OSPF performs a lot of internal processing. Therefore, you are advised not to change the router ID unless necessary. When an attempt is made to modify the router ID, a prompt is displayed, requesting you to confirm the modification. After the OSPFv3 process is enabled, you are advised to specify the router ID before configuring other parameters of the process. |

### ▾ Enabling OSPF on an Interface and Specifying an Area ID

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>ipv6 ospf</b> <i>process-id area</i> <i>area-id</i> [ <b>instance</b> <i>instance-id</i> ]   |
| <b>Parameter</b>    | <i>process-id</i> : Indicates the ID of an OSPFv3 process. The value ranges from 1 to 65,535.   |
| <b>Description</b>  | <b>Area</b> <i>area-id</i> : Indicates the ID of the OSPFv3 area in which the interface participates. It can be an integer or an IPv4 prefix.<br><b>Instance</b> <i>instance-id</i> : Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.  |
| <b>Command Mode</b> | Interface configuration mode  |
| <b>Usage Guide</b>  | Run this command in interface configuration mode to enable the interface to participate in OSPFv3, and then run the <b>ipv6 router ospf</b> command to configure the OSPFv3 process. After the OSPFv3 process is configured, the interface will automatically participate in the related process.<br>Run the <b>no ipv6 ospf area</b> command so that the specified interface no longer participates in the OSPFv3 routing process.<br>Run the <b>no ipv6 router ospf</b> command so that all interfaces no longer participate in the OSPFv3 routing process.<br>The adjacency can be set up only between devices with the same <i>instance-id</i> .<br>After this command is configured, all prefix information on the interface will participate in the OSPFv3 process. |

### ▾ Creating a Virtual Link

|                  |  |
|------------------|--|
| <b>Command</b>   | <b>area</b> <i>area-id</i> <b>virtual-link</b> <i>router-id</i> [ <b>hello-interval</b> <i>seconds</i> ] [ <b>dead-interval</b> <i>seconds</i> ] [ <b>retransmit-interval</b> <i>seconds</i> ] [ <b>transmit-delay</b> <i>seconds</i> ] [ <b>instance</b> <i>instance-id</i> ] [ <b>authentication</b> <i>ipsec spi</i> <i>spi</i> [ <b>md5</b> ] <i>sha1</i> ] [0 7] <i>key</i> ] [ <b>encryption ipsec spi</b> <i>spi</i> <b>esp</b> [ <b>null</b> [[ <b>des</b>   <b>3des</b> ] ] [ 0   7 ] <i>des-key</i> ][ <b>md5</b> ] <i>sha1</i> ] [0 7] <i>key</i> ] |
| <b>Parameter</b> | <i>area-id</i> : Indicates the ID of the area where the virtual link is located. It can be an integer or an IPv4   |

|                     |  |
|---------------------|--|
| <b>Description</b>  | <p>prefix.</p> <p><i>router-id</i>: Indicates the router ID of the neighbor connected to the virtual link.</p> <p><b>dead-interval</b><i>seconds</i>: Indicates the time that the local interface of the virtual link detects the failure of the neighbor. The unit is second. The value ranges from 1 to 65,535.</p> <p><b>hello-interval</b> <i>seconds</i>: Indicates the time that the Hello packet is sent on the local interface of the virtual link. The unit is second. The value ranges from 1 to 65,535.</p> <p><b>retransmit-interval</b> <i>seconds</i>: Indicates the interval at which the LSA is retransmitted on the local interface of the virtual link. The unit is second. The value ranges from 1 to 65,535.</p> <p><b>transmit-delay</b> <i>seconds</i>: Indicates the delay after which the LSA is sent on the local interface of the virtual link. The unit is second. The value ranges from 1 to 65,535.</p> <p><b>instance</b><i>instance-id</i>: Indicates the ID of the instance corresponding to the virtual link. The value ranges from 0 to 255. A virtual link cannot be set up between devices with different instance IDs.</p> <p><i>spi</i>: Indicates the security parameter index (SPI). The value ranges from 256 to 4,294,967,295.</p> <p>md5: Enables message digit 5 (MD5) authentication.</p> <p>sha1: Enables Secure Hash Algorithm 1 (SHA1) authentication.</p> <p>0: Indicates that the key is displayed in plain text.</p> <p>7: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p> <p><b>null</b>: Indicates that no encryption mode is used.</p> <p><b>des</b>: Specifies the DES encryption mode.</p> <p><b>3des</b>: Specifies the 3DES encryption mode.</p> <p><i>des-key</i>: Indicates the encryption key.</p> |
| <b>Command Mode</b> | OSPF routing process configuration mode  |
| <b>Usage Guide</b>  | <p>In an OSPFv3 AS, all areas must be connected to the backbone area to properly learn the routing information of the entire OSPFv3 AS. If an area cannot be directly connected to the backbone area, the virtual link can be used to connect this area to the backbone area.</p> <p>The area where the virtual link is located cannot be a stub area.</p> <p>At both ends of neighbors between which the virtual link is set up, settings of <b>hello-interval</b>, <b>dead-interval</b>, and <b>instance</b> must be consistent; otherwise, the adjacency cannot be set up properly.</p>   |

< press Ctrl+C to break >

!!!!

Success rate is 100 percent (5/5), round-trip min/avg/max = 5/9/14 ms.
```

### Common Errors

- IPv6 is disabled on the interface.
- OSPF cannot be enabled because the IPv6 unicast routing function is disabled.
- The area IDs enabled on adjacent interfaces are inconsistent.
- The same router ID is configured on multiple routers, resulting in a router ID conflict.

## 3.4.2 Setting the Network Type

### Configuration Effect

- If the physical network is X.25, Frame Relay, or ATM, OSPF can also run to provide the IPv6 unicast routing service.

### Notes

- The OSPF basic functions must be configured.
- The broadcast network sends multicast OSPF packets, automatically discovers neighbors, and elects a DR and a BDR.
- The P2P network sends multicast OSPF packets and automatically discovers neighbors.
- The NBMA network sends unicast OSPF packets. Neighbors must be manually specified, and a DR and a BDR must be elected.
- The P2MP network (without carrying the **non-broadcast** parameter) sends multicast OSPF packets. Neighbors are automatically discovered.
- The P2MP network (carrying the **non-broadcast** parameter) sends unicast OSPF packets. Neighbors must be manually specified.

### Configuration Steps

#### ↳ Configuring the Interface Network Type

- Optional.
- Perform this configuration on routers at both ends of the link.

↳ **Configuring a Neighbor**

- (Optional)If the interface network type is set to NBMA or P2MP (carrying the **non-broadcast** parameter), neighbors must be configured.
- Neighbors are configured on routers at both ends of the NBMA or P2MP (carrying the **non-broadcast** parameter) network.

↳ **Configuring the Interface Priority**

- (Optional)You must configure the interface priority if a router must be specified as a DR, or a router cannot be specified as a DR.
- Configure the interface priority on a router that must be specified as a DR, or cannot be specified as a DR.

**Verification**

- Run the **show ipv6 ospf interface** command to verify that the network type of each interface is correct.

|------------------------------|--|
| <b>Command</b>               | <b>ipv6 ospf network {broadcast   non-broadcast  point-to-point   point-to-multipoint [non-broadcast]}[instanceinstance-id]</b>  |
| <b>Parameter Description</b> | <p><b>broadcast:</b> Indicates the broadcast network type.</p> <p><b>non-broadcast:</b> Indicates the non-broadcast network type.</p> <p><b>point-to-multipoint:</b> Indicates the point-to-multipoint (P2MP) network type.</p> <p><b>point-to-multipoint non-broadcast:</b> Indicates the P2MP non-broadcast network type.</p> <p><b>point-to-point:</b> Indicates the point-to-point (P2P) network type.</p> <p><b>instanceinstance-id:</b> Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p> |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | You can configure the network type of an interface based on the actual link type and topology.   |

↳ **Configuring a Neighbor**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 ospf neighbor ipv6-address{ [costcost]   [poll-intervalseconds   priorityvalue] }[instanceinstance-id]</b>  |
| <b>Parameter Description</b> | <p><b>ip-address:</b> Indicates the link address of the neighbor interface.</p> <p><b>costcost:</b> Indicates the cost required from the P2MP network to each neighbor. The cost is not defined by default. The cost configured on the interface is used. The value ranges from 1 to 65,535. Only a P2MP network supports this option.</p> <p><b>poll-interval seconds:</b> Indicates the neighbor polling interval. The unit is second. The value ranges from 1 to</p> |

|                     |   |
|---------------------|---|
|                     | <p>2,147,483,647. Only the non-broadcast (NBMA) network supports this option.</p> <p><b>priority value:</b> Indicates the priority value of the non-broadcast network neighbor. The value ranges from 0 to 255. Only the non-broadcast network (NBMA) supports this option.</p> <p><b>instanceinstance-id:</b> Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p> |
| <b>Command Mode</b> | Interface configuration mode  |
| <b>Usage Guide</b>  | You can configure neighbor parameters based on the actual network type.   |

▾ **Configuring the Interface Priority**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 ospf priority number-value[instanceinstance-id]</b>  |
| <b>Parameter Description</b> | <p><b>number-value:</b> Indicates the priority of the interface. The value ranges from 0 to 255.</p> <p><b>instanceinstance-id:</b> Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>On a broadcast network, a DR or BDR must be elected. During the DR/BDR election, the device with a higher priority will be preferentially elected as a DR or BDR. If the priority is the same, the device with a larger router ID will be preferentially elected as a DR or BDR.</p> <p>A device with the priority 0 does not participate in the DR/BDR election.</p> |

## Common Errors

- The network types configured on interfaces at two ends are inconsistent, causing abnormal route learning.
- The network type is set to NBMA or P2MP (non-broadcast), but neighbors are not specified.

### 3.4.3 Configuring Route Redistribution and Default Route

#### Configuration Effect

- Introduce unicast routes for other AS domains to the OSPF domain to provide the unicast routing service to other AS domains for users in the OSPF domain.
- In the OSPF domain, inject a default route to another AS domain so that the unicast routing service to another AS domain can be provided for users in the OSPF domain.

#### Notes

- The OSPF basic functions must be configured.

#### Configuration Steps

##### ↘ Configuring External Route Redistribution

- (Optional) This configuration is mandatory if external routes of the OSPF domain should be introduced to the ASBR.
- Perform this configuration on an ASBR.

##### ↘ Generating a Default Route

- (Optional) Perform this configuration if the default route should be introduced to an ASBR so that other routers in the OSPF domain access other AS domains through this ASBR by default.
- Perform this configuration on an ASBR.

#### Verification

- On a router inside the OSPF domain, run the **show ipv6 route ospf** command to verify that the unicast routes to other AS domains are loaded.
- On a router inside the OSPF domain, run the **show ipv6 route ospf** command to verify that the default route to the ASBR is loaded.
- Run the **ping** command to verify that the IPv6 unicast service to other AS domains is correct.

| <p><b>Usage Guide</b></p>  | <p>When the device supports multiple routing protocols, collaboration between protocols is very important. To run multiple routing protocols concurrently, the device must be able to redistribute routing information of a protocol to another protocol. This applies to all routing protocols.</p> <p>During redistribution of IS-IS routes, <b>level-1</b>, <b>level-2</b>, or <b>level-1-2</b> can be configured to indicate that IS-IS routes of the specified level(s) will be redistributed. By default, IS-IS routes of level 2 are redistributed.</p> <p>During redistribution of OSPFv3 routes, <b>match</b> can be configured to indicate that OSPFv3 routes of the specified sub-type will be redistributed. By default, all types of OSPFv3 routes are redistributed.</p> <p>For the <b>level</b> parameter configured during redistribution of IS-IS routes and the <b>match</b> parameter configured during redistribution of OSPFv3 routes, the routes are matched against the route map only when the sub-type of the routes are correct.</p> <p>During configuration of route redistribution, the <b>match</b> rules configured in route map configuration mode are used based on the original information of routes. The priorities of <b>tag</b>, <b>metric</b> and <b>metric-type</b> in the route redistribution configuration are lower than the priority of the <b>set</b> rules configured in route map configuration mode.</p> <p>The <b>set metric</b> value of the associated route map should fall into the range of 0 to 16,777,214. If the value exceeds this range, routes cannot be introduced.</p> <p>The configuration rules for the <b>no</b> form of the <b>redistribute</b> command are as follows:</p> <ol style="list-style-type: none"> <li>1. If some parameters are specified in the <b>no</b> form of the command, default values of these parameters will be restored.</li> <li>2. If no parameter is specified in the <b>no</b> form of the command, the entire command will be deleted.</li> </ol> <p>For example, if <b>redistribute isis 112 level-2</b> is configured, the <b>no redistribute isis 112 level-2</b> command only restores the default value of <b>level-2</b>. As <b>level-2</b> itself is the default value of the parameter, the configuration saved is still <b>redistribute isis 112 level-2</b> after the preceding <b>no</b> form of the command is executed. To delete the entire command, you need to run the <b>no redistribute isis 112</b> command.</p> |

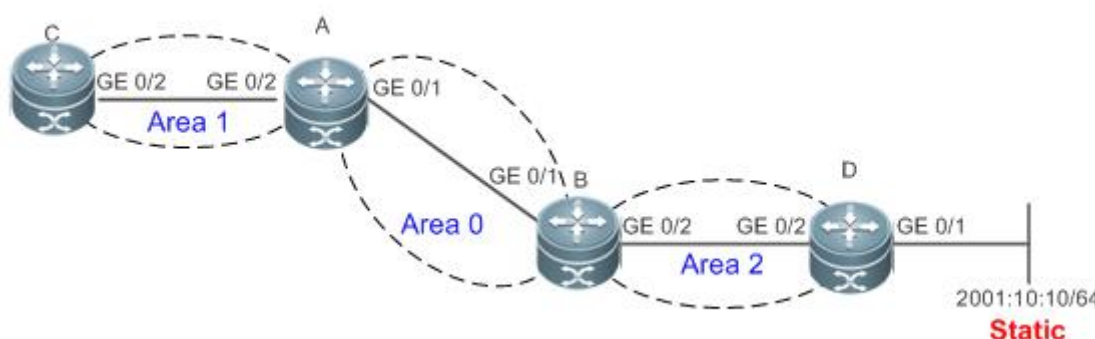

↘ **Introducing a Default Route**

|                       |  |
|-----------------------|--|
| <p><b>Command</b></p> | <p><b>default-information originate</b> [<b>always</b>] [<b>metric <i>metric</i></b>] [<b>metric-type <i>type</i></b>] [<b>route-map <i>map</i></b>]</p> |
|-----------------------|--|

|                                     |  |
|-------------------------------------|--|
| <p><b>Parameter Description</b></p> | <p><b>always:</b> Enables OSPF to generate a default route regardless of whether the local router has a default route.</p> <p><b>metric <i>metric</i>:</b> Indicates the initial metric of the default route. The value ranges from 0 to 16,777,214. By default, the metric of the default route is 1.</p> <p><b>metric-type <i>type</i>:</b> Indicates the type of the default route. OSPF external routes are classified into two types: Type 1: The metric varies with routers; Type 2: The metric is the same for all routers. Type 1 external routes are more trustworthy than Type 2 external routes.</p> <p><b>route-map <i>map-name</i>:</b> Indicates the associated route-map name. By default, no route-map is associated.</p>  |
| <p><b>Command Mode</b></p>          | <p>OSPF routing process configuration mode</p>   |
| <p><b>Usage Guide</b></p>           | <p>When the <b>redistribute</b> or <b>default-information</b> command is executed, the OSPFv3-enabled router automatically becomes an ASBR.</p> <p>The ASBR, however, does not automatically generate or advertise a default route to all routers in the OSPF routing domain. To have the ASBR generate a default route, configure the <b>default-information originate</b> command.</p> <p>If <b>always</b> is specified, the OSPFv3 process advertises an external default route to neighbors no matter whether a default route exists in the core routing table. This default route, however, is not displayed on the local router. To confirm whether the default route is generated, run the <b>show ipv6 ospf database</b> command to display the OSPFv3 link status database. On an OSPFv3 neighbor, you can run the <b>show ipv6 route ospf</b> command to see the default route.</p> <p>The metric of the external default route can only be defined in the <b>default-information originate</b> command, instead of the <b>default-metric</b> command.</p> <p>OSPFv3 has two types of external routes. The metric of the Type 1 external route changes, but the metric of the Type 2 external route is fixed. If two parallel paths to the same destination network have the same route metric, the priority of the Type 1 route is higher than that of the Type 2 route. Therefore, the <b>show ipv6 route ospf</b> command displays only the Type 1 route.</p> <p>A router in a stub area cannot generate an external default route.</p> |

**Configuration Example**

↳ **Configuring Route Redistribution**

|                                   |   |
|-----------------------------------|---|
| <p><b>Scenario</b></p>            |   |
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.</li> <li>● Configure the OSPF basic functions on all routers.</li> <li>● Introduce an external static route to Router D.</li> </ul>  |
| <p><b>D</b></p>                   | <pre>D#configure terminal D(config)#ipv6 router ospf 1 D(config-router)# redistribute static</pre>  |

### Common Errors

- A route loop is formed because the **default-information originate always** command is configured on multiple routers.
- Routes cannot be introduced because route redistribution is configured on a router in the stub area.

### 3.4.4 Configuring the Stub Area

#### Configuration Effect

- Configure an area located on the stub as a stub area to reduce interaction of routing information and the size of routing table, and enhance stability of routes.

#### Notes

- The OSPF basic functions must be configured.
- A backbone or transit area cannot be configured as a stub.
- A router in the stub area cannot introduce external routes.

#### Configuration Steps

##### ▾ Configuring a Stub Area

- (Optional) Perform this configuration if you wish to reduce the size of the routing table on routers in the area.
- Perform this configuration on all routers in the same area.

#### Verification

##### ▾ Verifying the Stub Area

- On a router in the stub area, run the **show ipv6 route ospf** command to verify that the router is not loaded with any external routes.

#### Related Commands

##### ▾ Configuring a Stub Area

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>area area-id stub [ no-summary ]</b>  |
| <b>Parameter Description</b> | <i>area-id</i> : Indicates the ID of the stub area. The value can be an integer or an IPv4 prefix.<br><b>no-summary</b> : This option is valid only on the ABR in a stub area. If this option is specified, the ABR only advertises one Type 3 LSA indicating the default route to the stub area, and does not advertise other Type 3 LSAs.  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | An area located on the stub of a network can be configured as a stub area. You must run the <b>area stub</b> command on all routers in a stub area. Devices in a stub area cannot learn the external routes (Type 5 LSAs) of the AS. In practice, external routes take up a large proportion of the link status database. Therefore, devices in a stub area can learn only a small amount of routing information, which reduces the amount of system resources required to run the OSPFv3 protocol.<br>By default, an ABR in a stub area will generate a Type 3 LSA indicating the default route, and advertise the LSA to the stub area. In this way, devices in the stub area can access devices outside the AS.<br>To configure a totally stub area, add the <b>no-summary</b> keyword when running the <b>area stub</b> command on |

the ABR.

### Configuration Example

#### Configuring a Stub Area

|                                   |   |
|-----------------------------------|---|
| <p><b>Scenario</b></p>            |   |
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Introduce an external static route to Router D.</li> <li>● Configure area 1 as the stub area on Router A and Router C.</li> </ul> |
| <p><b>D</b></p>                   | <pre>D#configure terminal D(config)#ipv6 router ospf 1 D(config-router)#redistribute static</pre>   |
| <p><b>A</b></p>                   | <pre>A# configure terminal A(config)#ipv6 router ospf 1 A(config-router)#area 1 stubno-summary</pre>  |
| <p><b>C</b></p>                   | <pre>C#configure terminal C(config)#ipv6 router ospf 1 C(config-router)#area 1 stub</pre>   |
| <p><b>Verification</b></p>        | <ul style="list-style-type: none"> <li>● On Router C, run the <b>show ipv6 route ospf</b> command to display the routing table. Verify that there is only one default inter-area route, and no external static route is introduced from Router D.</li> </ul>  |

|          |   |
|----------|---|
| <b>C</b> | <pre>C#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries  Codes:  C - Connected, L - Local, S - Static          R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route           E1 - OSPF external type 1, E2 - OSPF external type 2          SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2          IA - Inter area  O IA::/0 [110/3] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/2</pre> |
|----------|---|

### Common Errors

- Configurations of the area type are inconsistent on routers in the same area.
- External routes cannot be introduced because route redistribution is configured on a router in the stub area.

## 3.4.5 Configuring Route Summarization

### Configuration Effect

- Summarize routes to reduce interaction of routing information and the size of routing table, and enhance stability of routes.
- Shield or filter routes.

### Notes

- The OSPF basic functions must be configured.
- The address range of the summarize route may exceed the actual network range in the routing table. If data is sent to a network beyond the summarization range, a routing loop may be formed and the router processing load may increase. To prevent these problems, a discard route must be added to the routing table or shield or filter routes.

### Configuration Steps

#### ↘ **Configuring Inter-Area Route Summarization**

- (Optional) Perform this configuration when routes of the OSPF area need to be summarized.
- Unless otherwise required, perform this configuration on an ABR in the area where routes to be summarized are located.

#### ↘ **Configuring External Route Summarization**

- (Optional) Perform this configuration when routes external to the OSPF domain need to be summarized.
- Unless otherwise required, perform this configuration on an ASBR, to which routes that need to be summarized are introduced.

### Verification

- Run the **show ipv6 route ospf** command to verify that individual routes do not exist and only the summarized route exists.

### Related Commands

#### ▾ Configuring Inter-Area Route Summarization

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>area</b> <i>area-id</i> <b>range</b> <i>ipv6-prefix/prefix-length</i> [ <b>advertise</b>   <b>not-advertise</b> ]   |
| <b>Parameter Description</b> | <i>area-id</i> : Specifies the ID of the OSPF area to which the summarized route should be injected. The value can be an integer or an IPv4 prefix.<br><i>ipv6-prefix/prefix-length</i> : Indicates the range of IP addresses to be summarized.<br><b>advertise</b>   <b>not-advertise</b> : Specifies whether the summarized route should be advertised.  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | This command takes effect only on an ABR, and is used to summarize multiple routes in an area into a route and advertise this route to other areas. Combination of the routing information occurs only on the boundary of an area. Routers inside the area can learn specific routing information, whereas routers in other areas can learn only one summarized route. In addition, you can set <b>advertise</b> or <b>not-advertise</b> to determine whether to advertise the summarized route to shield and filter routes. By default, the summarized route is advertised. You can use the <b>cost</b> parameter to set the metric of the summarized route.<br>You can configure route summarization commands for multiple areas. This simplifies routes in the entire OSPF routing domain, and improves the network forwarding performance, especially for a large-sized network.<br>When multiple route summarization commands are configured and have the inclusive relationship with each other, the area range to be summarized is determined based on the maximum match principle. |

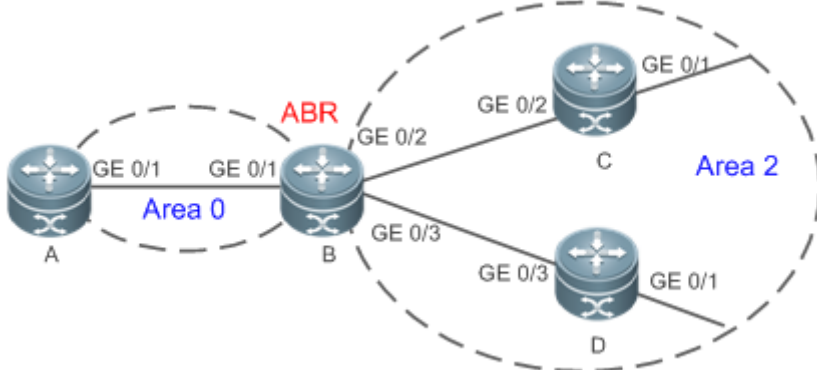

#### ▾ Configuring External Route Summarization

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>summary-prefix</b> <i>ipv6-prefix/prefix-length</i> [ <b>not-advertise</b>   <b>tag number</b> ]   |
| <b>Parameter Description</b> | <i>ipv6-prefix/prefix-length</i> : Indicates the range of IP addresses to be summarized.<br><b>not-advertise</b> : Indicates that the summarized route is not advertised. If this parameter is not specified, the summarized route is advertised.<br><b>tag number</b> : Specifies the tag value of the route that is redistributed into the OSPFv3 routing domain. The value ranges from 0 to 4,294,967,295. |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | When routes are redistributed from other routing processes and injected to the OSPFv3 routing process, each route is advertised to the OSPFv3 routers using an external LSA. If the injected routes are a   |

continuous address space, the ABR can advertise only one summarized route to significantly reduce the size of the routing table.

**area range** summarizes the routes between OSPFv3 areas, whereas **summary-prefix** summarizes external routes of the OSPFv3 routing domain.

### Configuration Example

|                                   |   |                |  |
|-----------------------------------|---|----------------|--|
| <p><b>Configuration Steps</b></p> |  <table border="1" data-bbox="337 898 1474 1066"> <tr> <td><b>Remarks</b></td> <td>The interface IPv6 addresses are as follows:<br/>                 B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64<br/>                 C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64<br/>                 D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64</td> </tr> </table> | <b>Remarks</b> | The interface IPv6 addresses are as follows:<br>B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64<br>C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64<br>D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64 |

| <p><b>B</b></p>                   | <pre>B#configure terminal B(config)#ipv6 router ospf 1 B(config-router)#area 2 range 2001:16::/64</pre>   |                |  |
| <p><b>Verification</b></p>        | <p>On Router A, check the routing table and verify that the entry 2001:16::/64 is generated and other routes do not exist.</p>  |                |  |

|          |   |
|----------|---|
| <b>A</b> | <pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries  Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route          E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  O IA 2001:16::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre> |
|----------|---|

### Common Errors

- Inter-area route summarization cannot be implemented because the **area range** command is configured on a non-ABR device.

## 3.4.6 Configuring Route Filtering

### Configuration Effect

- Routes that do not meet filtering conditions cannot be loaded to the routing table, or advertised to neighbors. Network users cannot access specified destination network.

### Notes

- The OSPF basic functions must be configured.
- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the **area filter-list** or **area range** (containing the **not-advertise** parameter) command on the ABR to prevent generation of black-hole routes.

### Configuration Steps

#### ▾ Configuring Inter-Area Route Filtering

- (Optional) This configuration is recommended if users need to be restricted from accessing the network in a certain OSPF area.
- Unless otherwise required, perform this configuration on an ABR in the area where filtered routes are located.

#### ▾ Configuring Redistributed Route Filtering

- (Optional) Perform this configuration if external routes introduced by the ASBR need to be filtered.
- Unless otherwise required, perform this configuration on an ASBR to which filtered routes are introduced.

### ↘ Configuring Learned Route Filtering

- (Optional) Perform this configuration if users need to be restricted from accessing a specified destination network.
- Unless otherwise required, perform this configuration on a router that requires route filtering.

### Verification

- Run the **show ipv6 route** command to verify that the router is not loaded with routes that have been filtered out.
- Run the **ping** command to verify that the specified destination network cannot be accessed.

### Related Commands

#### ↘ Configuring a Passive Interface

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>passive-interface</b> {default   <i>interface-type</i> <i>interface-number</i> }   |
| <b>Parameter</b>    | <i>interface-type interface-number</i> : Indicates the interface that should be configured as a passive interface.  |
| <b>Description</b>  | <b>default</b> : Indicates that all interfaces will be configured as passive interfaces.  |
| <b>Command Mode</b> | OSPF routing process configuration mode   |
| <b>Usage Guide</b>  | When an interface is configured as a passive interface, it no longer sends or receives Hello packets. This command takes effect only on an OSPFv3-enabled interface, and not on a virtual link. |

#### ↘ Configuring Redistributed Route Filtering

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>distribute-list</b> { <i>name</i>   <b>prefix-list</b> <i>prefix-list-name</i> } <b>out</b> [ <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]   <b>ospf</b> <i>process-id</i> ] <b>rip</b>   <b>static</b> ]   |
| <b>Parameter</b>    | <i>name</i> : Uses the ACL for filtering.   |
| <b>Description</b>  | <b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list for filtering.<br><b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>static</b> : Indicates the source of routes to be filtered.  |
| <b>Command Mode</b> | OSPF routing process configuration mode   |
| <b>Usage Guide</b>  | <b>distribute-list out</b> is similar to <b>redistribute route-map</b> , and is used to filter routes that are redistributed from other protocols to OSPFv3. The <b>distribute-list out</b> command itself does not redistribute routes, and is generally used together with the <b>redistribute</b> command. The ACL and the prefix list filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes coming from a certain source, the prefix list cannot be configured to filter the same routes. |

#### ↘ Configuring Learned Route Filtering

|                    |   |
|--------------------|---|
| <b>Command</b>     | <b>distribute-list</b> { <i>name</i>   <b>prefix-list</b> <i>prefix-list-name</i> } <b>in</b> [ <i>interface-type</i> <i>interface-number</i> ] |
| <b>Parameter</b>   | <i>name</i> : Uses the ACL for filtering.   |
| <b>Description</b> | <b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list for filtering.   |

|                     |  |
|---------------------|--|
|                     | <i>interface-type interface-number</i> : Specifies the interface for which LSA routes are filtered.  |
| <b>Command Mode</b> | OSPF routing process configuration mode  |
| <b>Usage Guide</b>  | Filter routes that are computed based on received LSAs. Only routes meeting the filtering conditions can be forwarded. The command does not affect the LSDB or the routing tables of neighbors. The ACL and the prefix list filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes on a specified interface, the prefix list cannot be configured to filter routes on the same interface. Filtering routes by using the <b>distribute-list in</b> command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the <b>area range</b> (containing the <b>not-advertise</b> parameter) command on the ABR to prevent generation of black-hole routes. |

### Configuration Example

|                            |  |
|----------------------------|--|
| <b>Scenario</b>            |  |
| <b>Remarks</b>             | <p>The interface IPv6 addresses are as follows:</p> <p>B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64</p> <p>C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64</p> <p>D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64</p>              |

**Common Errors**

- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated

and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated.

### 3.4.7 Modifying the Route Cost and AD

#### Configuration Effect

- Change the OSPF routes so that the traffic passes through specified nodes or bypasses specified nodes.
- Change the sequence that a router selects routes so as to change the priorities of OSPF routes.

#### Notes

- The OSPF basic functions must be configured.
- If you run the **ipv6 ospf cost** command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

#### Configuration Steps

##### ▾ Configuring the Reference Bandwidth

- Optional.
- A router is connected with lines with different bandwidths. This configuration is recommended if you wish to preferentially select the line with a larger bandwidth.

##### ▾ Configuring the Cost of an Interface

- Optional.
- A router is connected with multiple lines. This configuration is recommended if you wish to manually specify a preferential line.

##### ▾ Configuring the Default Metric for Redistribution

- Optional.
- This configuration is mandatory if the cost of external routes of the OSPF domain should be specified when external routes are introduced to an ASBR.

##### ▾ Configuring the Maximum Metric

- Optional.
- A router may be unstable during the restart process or a period of time after the router is restarted, and users do not want to forward data through this router. In this case, this configuration is recommended.

##### ▾ Configuring the AD

- Optional.

- Perform this configuration if you wish to change the priorities of OSPF routes on a router that runs multiple unicast routing protocols.

## Verification

- Run the **show ipv6 ospf interface** command to verify that the costs of interfaces are correct.
- Run the **show ipv6 route** command to verify that the costs of external routes introduced by the ASBR are correct.
- Restart the router. Within a specified period of time, data is not forwarded through the restarted router.

## Related Commands

### ↳ Configuring the Reference Bandwidth

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>auto-costreference-bandwidth</b> <i>ref-bw</i>  |
| <b>Parameter Description</b> | <i>ref-bw</i> : Indicates the reference bandwidth. The unit is Mbps. The value ranges from 1 to 4,294,967.   |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | You can run the <b>ipv6 ospf cost</b> command in interface configuration mode to specify the cost of the interface. The priority of this cost is higher than that of the metric computed based on the reference bandwidth. |

### ↳ Configuring the Cost of an Interface

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 ospf cost</b> <i>cost</i> [ <i>instance</i> <i>instance-id</i> ]   |
| <b>Parameter Description</b> | <i>cost</i> : Indicates the cost of an OSPF interface. The value ranges from 0 to 65,535.<br><i>instance</i> <i>instance-id</i> : Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | By default, the cost of an OSPFv3 interface is equal to 100 Mbps/Bandwidth, where Bandwidth is the bandwidth of the interface and configured by the <b>bandwidth</b> command in interface configuration mode.<br>The costs of OSPF interfaces on several typical lines are as follows: <ul style="list-style-type: none"> <li>● 64 Kbps serial line: The cost is 1562.</li> <li>● E1 line: The cost is 48.</li> <li>● 10M Ethernet: The cost is 10.</li> <li>● 100M Ethernet: The cost is 1.</li> </ul> If you run the <b>ipv6 ospf cost</b> command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost. |

### ↳ Configuring the Cost of the Default Route in a Stub Area

|                  |  |
|------------------|--|
| <b>Command</b>   | <b>area</b> <i>area-id</i> <b>default-cost</b> <i>cost</i> |
| <b>Parameter</b> | <i>area-id</i> : Indicates the ID of the stub area.        |

|                     |  |
|---------------------|--|
| <b>Description</b>  | <i>cost</i> : Indicates the cost of the default summarized route injected to the stub area. The value ranges from 0 to 16,777,215. |
| <b>Command Mode</b> | OSPF routing process configuration mode  |
| <b>Usage Guide</b>  | This command takes effect only on an ABR in a stub area.   |

### ↘ Configuring the Default Metric for Redistribution

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>default-metric</b> <i>metric</i>   |
| <b>Parameter Description</b> | <i>metric</i> : Indicates the default metric of the OSPF redistributed route. The value ranges from 1 to 16,777,214.  |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | The <b>default-metric</b> command must be used together with the <b>redistribute</b> command to modify the initial metrics of all redistributed routes. The <b>default-metric</b> command does not take effect on external routes that are injected to the OSPF routing domain by the <b>default-information originate</b> command.<br>The default metric of a redistributed direct route is always 20. |

### ↘ Configuring the AD

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>distance</b> { <i>distance</i>   <b>ospf</b> { [ <b>intra-area</b> <i>distance</i> ] [ <b>inter-area</b> <i>distance</i> ] [ <b>external</b> <i>distance</i> ]} }  |
| <b>Parameter Description</b> | <i>distance</i> : Indicates the AD of a route. The value ranges from 1 to 255.<br><b>intra-area</b> <i>distance</i> : Indicates the AD of an intra-area route. The value ranges from 1 to 255.<br><b>inter-area</b> <i>distance</i> : Indicates the AD of an inter-area route. The value ranges from 1 to 255.<br><b>external</b> <i>distance</i> : Indicates the AD of an external route. The value ranges from 1 to 255.                |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | Use this command to specify different ADs for different types of OSPF routes.<br>The AD allows different routing protocols to compare route priorities. A smaller AD indicates a higher route priority.<br>The priorities of routes generated by different OSPFv3 processes must be compared based on ADs.<br>If the AD of a route entry is set to 255, the route entry is not trustworthy and does not participate in packet forwarding. |

### Configuration Example

|                                   |   |
|-----------------------------------|---|
| <p><b>Scenario</b></p>            |   |
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, configure the cost of each interface.</li> </ul>   |
| <p><b>A</b></p>                   | <pre>A#configure terminal A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ipv6 ospf cost 10 A(config)#interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)#ipv6 ospf cost 20</pre>   |
| <p><b>Verification</b></p>        | <ul style="list-style-type: none"> <li>● On Router A, check the routing table. The next hop of the optimum path to 2001:16:1::/64 is Router B.</li> </ul>   |
| <p><b>A</b></p>                   | <pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries  Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route          E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  O E2 2001:16:1::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre> |

**Common Errors**

- If the cost of an interface is set to 0 in the **ipv6 ospf cost** command, a route computation error may occur. For example, a routing loop is obtained.

### 3.4.8 Enabling Authentication

#### Configuration Effect

- All routers connected to the OSPF network must be authenticated to ensure stability of OSPF and protect OSPF against intrusions.

#### Notes

- The OSPF basic functions must be configured.
- If authentication is configured for an area, the configuration takes effect on all interfaces that belong to this area.
- If authentication is configured for both an interface and the area to which the interface belongs, the configuration for the interface takes effect preferentially.

#### Configuration Steps

##### ▾ Configuring Authentication

- Optional.
- Perform this configuration if a router accesses a network that requires authentication.

##### ▾ Configuring Encryption

- Optional.
- Perform this configuration if a router accesses a network that requires encryption.

##### ▾ Configuring Virtual Link Authentication

- Optional.
- Perform this configuration if a router accesses a network that requires authentication.

##### ▾ Configuring Virtual Link Encryption

- Optional.
- Perform this configuration if a router accesses a network that requires encryption.

#### Verification

- If routers are configured with different authentication keys, run the **show ipv6 ospf neighbor** command to verify that there is no OSPF neighbor.
- If routers are configured with the same authentication key, run the **show ipv6 ospf neighbor** command to verify that there are OSPF neighbors.

### Common Errors

- The configured authentication modes are inconsistent.
- The configured authentication keys are inconsistent.

### 3.4.9 Modifying the Maximum Number of Concurrent Neighbors

#### Configuration Effect

- Control the maximum number of concurrent neighbors on the OSPF process to ease the pressure on the device.

#### Notes

- The OSPF basic functions must be configured.

#### Configuration Steps

##### ▾ Configuring the Maximum Number of Concurrent Neighbors on the OSPF Process

- (Optional) This configuration is recommended if you wish to set up the OSPF adjacency more quickly when a router is connected with a lot of other routers.
- Perform this configuration on a core router.

#### Verification

- Run the **show ipv6 ospf neighbor** command to display the number of neighbors that are concurrently interacting with the OSPF process.

#### Related Commands

##### ▾ Configuring the Maximum Number of Concurrent Neighbors on the Current Process

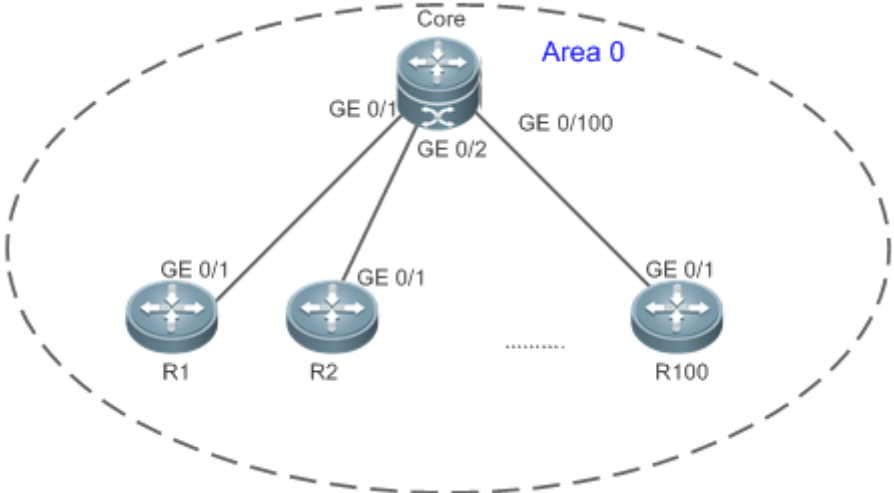

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>max-concurrent-dd</b> <i>number</i>  |
| <b>Parameter Description</b> | <i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.   |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | When the performance of a router is affected because the router exchanges data with multiple neighbors, you can configure this command to restrict the maximum of neighbors with which each OSPF process can concurrently initiate or accept interaction. |

##### ▾ Configuring the Maximum Number of Concurrent Neighbors on All Processes

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 router ospf max-concurrent-dd</b> <i>number</i>   |
| <b>Parameter Description</b> | <i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535. |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | When the performance of a router is affected because the router exchanges data with multiple neighbors,   |

you can configure this command to restrict the maximum of neighbors with which all OSPF processes can concurrently initiate or accept interaction.

### Configuration Example

|                                   |   |
|-----------------------------------|---|
| <p><b>Scenario</b></p>            |   |
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On the Router Core, set the maximum number of concurrent neighbors to 4.</li> </ul> |
| <p><b>Core</b></p>                | <pre>Core# configure terminal Core(config)# ipv6 router ospf max-concurrent-dd 4</pre>  |
| <p><b>Verification</b></p>        | <ul style="list-style-type: none"> <li>● On the Router Core, check the neighbor status and verify that at most eight neighbors concurrently interact with the OSPF process.</li> </ul>  |

### Common Errors

N/A

## 3.4.10 Disabling MTU Verification

### Configuration Effect

- The unicast routing service can be provided even if the MTUs of interfaces on neighbor routers are different.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Disabling MTU Verification

- (Optional) MTU verification is disabled by default. You are advised to retain the default configuration.

- Perform this configuration on two routers with different interface MTUs.

### Verification

- The adjacency can be set up between routers with different MTUs.

### Related Commands

#### Disabling MTU Verification

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>ipv6 ospf mtu-ignore</b>   |
| <b>Parameter</b>    | N/A   |
| <b>Description</b>  |   |
| <b>Command Mode</b> | Interface configuration mode  |
| <b>Usage Guide</b>  | On receiving the database description packet, OSPF checks whether the MTU of the interface on the neighbor is the same as the MTU of its own interface. If the interface MTU specified in the received database description packet is greater than the MTU of the local interface, the adjacency cannot be set up. To resolve this problem, you can disable MTU verification. |

### Configuration Example

|                            |   |
|----------------------------|---|
| <b>Scenario</b>            |   |

## 3.4.11 Enabling Two-Way Maintenance

### Configuration Effect

- Non-Hello packets can also be used to maintain the adjacency.

### Notes

- The OSPF basic functions must be configured.

### Configuration Steps

#### ▾ Enabling Two-Way Maintenance

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on all routers.

### Verification

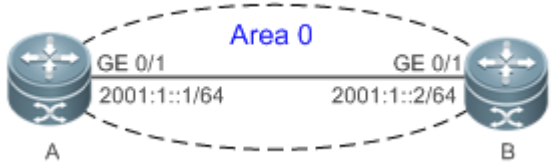

- Non-Hello packets can also be used to maintain the adjacency.

### Related Commands

#### ▾ Enabling Two-Way Maintenance

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>two-way-maintain</b>   |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | On a large network, a lot of packets may be sent or received, occupying too much CPU and memory. As a result, some packets are delayed or discarded. If the processing time of Hello packets exceeds the dead interval, the adjacency will be destroyed due to timeout.If the two-way maintenance function is enabled, in addition to the Hello packets, the DD, LSU, LSR, and LSAck packets can also be used to maintain the bidirectional communication between neighbors when a large number of packets exist on the network. This prevents termination of the adjacency caused by delayed or discarded Hello packets. |

### Configuration Example

### Common Errors

N/A

## 3.4.12 Correlating OSPF with BFD

### Configuration Effect

- Once a link is faulty, OSPF can quickly detect the failure of the route. This configuration helps shorten the traffic interruption time.

### Notes

- The OSPF basic functions must be configured.
- The BFD parameters must be configured for the interface in advance.
- If BFD is configured for both a process and an interface, the interface-based configuration takes effect preferentially.

### Configuration Steps

#### ▾ Correlating OSPF with BFD

- (Optional) Perform this configuration if you wish to accelerate OSPF network convergence.

- Perform this configuration on routers at both ends of the link.

### Verification

- Run the **show bfd neighbor** command to verify that the BFD neighbors are normal.

### Related Commands

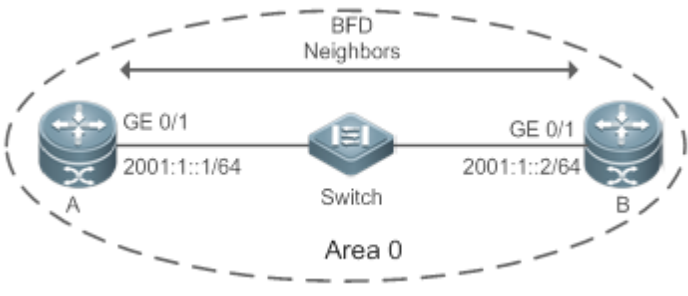

#### ↘ Correlating an OSPF Interface with BFD

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 ospf bfd [ disable ]</b>   |
| <b>Parameter Description</b> | <b>disable:</b> Disables BFD for link detection on a specified OSPF-enabled interface.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | The interface-based configuration takes precedence over the <b>bfd all-interfaces</b> command used in process configuration mode.<br>Based on the actual environment, you can run the <b>ipv6 ospf bfd</b> command to enable BFD on a specified interface for link detection, or run the <b>bfd all-interfaces</b> command in OSPF process configuration mode to enable BFD on all interface of the OSPF process, or run the <b>ipv6 ospf bfd disable</b> command to disable BFD on a specified interface. |

#### ↘ Correlating an OSPF Process with BFD

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>bfd all-interfaces</b>   |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | OSPF process configuration mode   |
| <b>Usage Guide</b>           | OSPF dynamically discovers neighbors through the Hello packets. After OSPF enables the BFD function, a BFD session will be set up to achieve the full adjacency, and use the BFD mechanism to detect the neighbor status. Once a neighbor failure is detected through BFD, OSPF performs network convergence immediately. You can also run the <b>ipv6 ospf bfd [disable]</b> command in interface configuration mode to enable or disable the BFD function on a specified interface, and this configuration takes precedence over the <b>bfd all-interfaces</b> command used in OSPF process configuration mode. |

### Configuration Example

|                                   |   |

### 3.4.13 Enabling GR

#### Configuration Effect

- When a distributed route switches services from the active board to the standby board, traffic forwarding continues and is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and is not interrupted.

#### Notes

- The OSPF basic functions must be configured.
- The neighbor router must support the GR helper function.
- The grace period cannot be shorter than the neighbor dead time of the neighbor router.

#### Configuration Steps

##### ▾ Configuring the OSPF GR Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on routers where hot standby switchover is triggered or the OSPF process is restarted.

##### ▾ Configuring the OSPF GR Helper Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on a router if hot standby switchover is triggered or the OSPF process is restarted on a neighbor of this router.

#### Verification

- When a distributed router switches services from the active board to the standby board, data forwarding continues and the traffic is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and the traffic is not interrupted.

#### Related Commands

##### ▾ Configuring the OSPF GR Function

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>graceful-restart [ grace-period <i>grace-period</i>   inconsistent-lsa-checking ]</b>   |
| <b>Parameter Description</b> | <p><b>grace-period</b> <i>grace-period</i>: Indicates the grace period, which is the maximum time from occurrence of an OSPF failure to completion of the OSPF GR. The value of the grace period varies from 1s to 1800s. The default value is 120s.</p> <p><b>inconsistent-lsa-checking</b>: Enables topological change detection. If any topological change is detected, OSPF exits the GR process to complete convergence. After GR is enabled, topological change detection is enabled by default.</p> |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |

|                    |  |
|--------------------|--|
| <b>Usage Guide</b> | <p>The GR function is configured based on the OSPF process. You can configure different parameters for different OSPF processes based on the actual conditions. This command is used to configure the GR restarter capability of a device. The grace period is the maximum time of the entire GR process, during which link status is rebuilt so that the original state of the OSPF process is restored. After the grace period expires, OSPF exits the GR state and performs common OSPF operations.</p> <p>Run the <b>graceful-restart</b> command to set the grace period to 120s. The <b>graceful-restart grace-period</b> command allows you to modify the grace period explicitly.</p> <p>The precondition for successful execution of GR and uninterrupted forwarding is that the topology remains stable. If the topology changes, OSPF quickly converges without waiting for further execution of GR, thus avoiding long-time forwarding black-hole.</p> <ul style="list-style-type: none"> <li>● Disabling topology detection: If OSPF cannot converge in time when the topology changes during the hot standby process, forwarding black-hole may appear in a long time.</li> <li>● Enabling topology detection: Forwarding may be interrupted when topology detection is enabled, but the interruption time is far shorter than that when topology detection is disabled.</li> </ul> <p>In most cases, it is recommended that topology detection be enabled. In special scenarios, topology detection can be disabled if the topology changes after the hot standby process, but it can be ensured that the forwarding black-hole will not appear in a long time. This can minimize the forwarding interruption time during the hot standby process.</p> <p>If the Fast Hello function is enabled, the GR function cannot be enabled.</p> |
|--------------------|--|

### ▾ Configuring the OSPF GR Helper Function

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>graceful-restart helper { disable [strict-lsa-checking   internal-lsa-checking]}</b>  |
| <b>Parameter Description</b> | <p><b>disable:</b> Prohibits a device from acting as a GR helper for another device.</p> <p><b>strict-lsa-checking:</b> Indicates that changes in Type 1 to Type 5 and Type 7 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p> <p><b>internal-lsa-checking:</b> Indicates that changes in Type 1 to Type 3 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p>  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | <p>This command is used to configure the GR helper capability of a router. When a neighbor router implements GR, it sends a Grace-LSA to notify all neighbor routers. If the GR helper function is enabled on the local router, the local router becomes the GR helper on receiving the Grace-LSA, and helps the neighbor to complete GR. The <b>disable</b> option indicates that GR helper is not provided for any device that implements GR.</p> <p>After a device becomes the GR helper, the network changes are not detected by default. If any change takes place on the network, the network topology converges after GR is completed. If you wish that network changes can be quickly detected during the GR process, you can configure <b>strict-lsa-checking</b> to check Type 1 to 5 and Type 7 LSAs that indicate the network information or <b>internal-lsa-checking</b> to check Type 1 to 3 LSAs that indicate internal routes of the AS domain. When the network scale is large, it is</p> |

recommended that you disable the LSA checking options (**strict-lsa-checking** and **internal-lsa-checking**) because regional network changes may trigger termination of GR and consequently reduce the convergence of the entire network.

### Configuration Example

|                                   |   |
|-----------------------------------|---|
| <p><b>Scenario</b></p>            |   |
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, Router C, and Router D, enable the GR helper function. (This function is enabled by default.)</li> <li>● On Router B, enable the GR function.</li> </ul>   |
| <p><b>B</b></p>                   | <pre>B# configure terminal B(config)# ipv6 router ospf1 B(config-router)# graceful-restart</pre>  |
| <p><b>Verification</b></p>        | <ul style="list-style-type: none"> <li>● Trigger a hot standby switchover on Router B, and verify that the routing tables of destination Network 1 and Network 2 remain unchanged on Router A during the switchover.</li> <li>● Trigger a hot standby switchover on Router B, ping destination Network 1 from Router A, and verify that traffic forwarding is not interrupted during the switchover.</li> </ul> |

### Common Errors

- Traffic forwarding is interrupted during the GR process because the configured grace period is shorter than the neighbor dead time of the neighbor router.

## 3.4.14 Configuring Network Management Functions

### Configuration Effect

- Use the network management software to manage OSPF parameters and monitor the OSPF running status.

### Notes

- The OSPF basic functions must be configured.

- You must enable the MIB function of the SNMP server before enabling the OSPF MIB function.
- You must enable the trap function of the SNMP server before enabling the OSPF trap function.
- You must enable the logging function of the device before outputting the OSPF logs.

## Configuration Steps

### ↘ Binding the MIB with the OSPF Process

- (Optional) This configuration is required if you want to use the network management software to manage parameters of a specified OSPF process.
- Perform this configuration on all routers.

### ↘ Enabling the Trap Function

- (Optional) This configuration is required if you want to use the network management software to monitor the OSPF running status.
- Perform this configuration on all routers.

### ↘ Configuring the Logging Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration. If you want to reduce the log output, disable this function.
- Perform this configuration on all routers.

## Verification

- Use the network management software to manage the OSPF parameters.
- Use the network management software to monitor the OSPF running status.

## Related Commands

### ↘ Binding the MIB with the OSPF Process

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>enable mib-binding</b>   |
| <b>Parameter</b>    | N/A   |
| <b>Description</b>  |   |
| <b>Command Mode</b> | OSPF routing process configuration mode   |
| <b>Usage Guide</b>  | The OSPFv2 MIB does not have the OSPFv3 process information. Therefore, you can perform operations only on a single OSPFv2 process through SNMP. By default, the OSPFv3 MIB is bound with the OSPFv3 process with the smallest process ID, and all user operations take effect on this process.<br>If you wish to perform operations on a specified OSPFv3 process through SNMP, run this command to bind the MIB with the process. |

### ↘ Enabling the Trap Function

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>enable traps[error [IfConfigError   IfRxBadPacket   VirtIfConfigError   VirtIfRxBadPacket]   state-change[IfStateChange   NbrStateChange   VirtIfStateChange   VirtNbrStateChange   RestartStatusChange   NbrRestartHelperStatusChange   VirtNbrRestartHelperStatusChange] ]</code>  |
| <b>Parameter Description</b> | <p><b>IfConfigError:</b> Indicates that an interface parameter configuration error occurs.</p> <p><b>IfRxBadPacket:</b> Indicates that the interface receives a bad packet.</p> <p><b>VirtIfConfigError:</b> Indicates that a virtual interface parameter configuration error occurs.</p> <p><b>VirtIfRxBadPacket:</b> Indicates that the virtual interface receives a bad packet.</p> <p><b>IfStateChange:</b> Indicates that interface state changes.</p> <p><b>NbrStateChange:</b> Indicates that the neighbor state changes.</p> <p><b>VirtIfStateChange:</b> Indicates that the virtual interface state changes.</p> <p><b>VirtNbrStateChange:</b> Indicates that the virtual neighbor state changes.</p> <p><b>RestartStatusChange:</b> Indicates that the GR state of the local device changes.</p> <p><b>NbrRestartHelperStatusChange:</b> Indicates that the state of the neighbor GR process changes.</p> <p><b>VirtNbrRestartHelperStatusChange:</b> Indicates that the GR state of the virtual neighbor changes.</p> |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | <p>The function configured by this command is restricted by the <code>snmp-server enable traps ospf</code> and then <code>enable traps</code> command before the corresponding OSPF traps can be correctly sent out.</p> <p>This command is not restricted by the MIB bound with the process. The trap function can be enabled concurrently for different processes.</p>   |

## 3.4.15 Modifying Protocol Control Parameters

### Configuration Effect

- Modify protocol control parameters to change the protocol running status.

### Notes

- The OSPF basic functions must be configured.
- The neighbor dead time cannot be shorter than the Hello interval.

### Configuration Steps

#### ▾ Configuring the Hello Interval

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on routers at both end of a link.

#### ▾ Configuring the Dead Interval

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if you wish to accelerate OSPF convergence when a link fails.
- Perform this configuration on routers at both end of a link.

#### ▾ Configuring the LSU Retransmission Interval

- (Optional) You are advised to adjust this configuration if a lot of routes exist in the user environment and network congestion is serious.

#### ▾ Configuring the LSA Generation Time

- (Optional) You are advised to retain the default configuration.

#### ↘ Configuring the LSA Group Refresh Time

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if a lot of routes exist in the user environment.
- Perform this configuration on an ASBR or ABR.

#### ↘ Configuring LSA Repeated Receiving Delay

- (Optional) You are advised to retain the default configuration.

#### ↘ Configuring the SPF Computation Delay

- (Optional) This configuration can be adjusted if network flapping frequently occurs.

#### ↘ Configuring the Inter-Area Route Computation Delay

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on all routers.

#### ↘ Configuring the Inter-Area Route Computation Delay

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on all routers.

### Verification

- Run the **show ipv6 ospf** and **show ipv6 ospf neighbor** commands to display the protocol running parameters and status.

### Related Commands

#### ↘ Configuring the Hello Interval

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 ospf hello-interval</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the interval at which OSPF sends the Hello packet. The unit is second. The value ranges from 1 to 65,535.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | The Hello interval is contained in the Hello packet. A shorter Hello interval indicates that OSPF can detect topological changes more quickly, but the network traffic increases. The Hello interval must be the same on all routers in the same network segment. If you want to manually modify the neighbor dead interval, ensure that the neighbor dead interval is longer than the Hello interval. |

#### ↘ Configuring the Dead Interval

|                |   |
|----------------|---|
| <b>Command</b> | <b>ipv6 ospf dead-interval</b> <i>seconds</i> |
|----------------|---|

|                              |  |
|------------------------------|--|
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the time that the neighbor is declared lost. The unit is second. The value ranges from 1 to 65,535.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>The OSPF dead interval is contained in the Hello packet. If OSPF does not receive a Hello packet from a neighbor within the dead interval, it declares that the neighbor is invalid and deletes this neighbor record from the neighbor list. By default, the dead interval is four times the Hello interval. If the Hello interval is modified, the dead interval is modified automatically.</p> <p>When using this command to manually modify the dead interval, pay attention to the following issues:</p> <ol style="list-style-type: none"> <li>1. The dead interval cannot be shorter than the Hello interval.</li> <li>2. The dead interval must be the same on all routers in the same network segment.</li> </ol> |

### ↘ Configuring the LSU Transmission Delay

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 ospf transmit-delay</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the LSU transmission delay on the OSPF interface. The unit is second. The value ranges from 0 to 65,535.   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | <p>Before an LSU packet is transmitted, the Age fields in all LSAs in this packet will increase based on the amount specified by the <b>ip ospf transmit-delay</b> command. Considering the transmission delay and line propagation delay on the interface, you need to set the LSU transmission delay to a greater value for a low-speed line or interface. The LSU transmission delay of a virtual link is defined by the <b>transmit-delay</b> parameter in the <b>area virtual-link</b> command.</p> <p>If the value of the Age field of an LSA reaches 3600, the packet will be retransmitted or a retransmission will be requested. If the LSA is not updated in time, the expired LSA will be deleted from the LSDB.</p> |

### ↘ Configuring the LSU Retransmission Interval

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 ospf retransmit-interval</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the LSU retransmission interval. The unit is second. The value ranges from 0 to 65,535. This interval must be longer than the round-trip transmission delay of data packets between two neighbors.   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | <p>After a router finishes sending an LSU packet, this packet is still kept in the transmit buffer queue. If an acknowledgment from the neighbor is not received within the time defined by the <b>ip ospf retransmit-interval</b> command, the router retransmits the LSU packet.</p> <p>The retransmission delay can be set to a greater value on a serial line or virtual link to prevent unnecessary retransmission. The LSU retransmission delay of a virtual link is defined by the <b>retransmit-interval</b> parameter in the <b>area virtual-link</b> command.</p> |

### ↘ Configuring the LSA Generation Time

|                |  |
|----------------|--|
| <b>Command</b> | <b>timers throttle lsa all</b> <i>delay-time hold-time max-wait-time</i> |
|----------------|--|

|                              |   |
|------------------------------|---|
| <b>Parameter Description</b> | <p><i>delay-time</i>: Indicates the minimum delay for LSA generation. The first LSA in the database is always generated instantly. The value ranges from 0 to 600,000. The unit is ms.</p> <p><i>hold-time</i>: Indicates the minimum interval between the first LSA update and the second LSA update. The value ranges from 1 to 600,000. The unit is ms.</p> <p><i>max-wait-time</i>: Indicates the maximum interval between two LSA updates when the LSA is updated continuously. This interval is also used to determine whether the LSA is updated continuously. The value ranges from 1 to 600,000. The unit is ms.</p> |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | <p>If a high convergence requirement is raised when a link changes, you can set <b>delay-time</b> to a smaller value. You can also appropriately increase values of the preceding parameters to reduce the CPU usage.</p> <p>When configuring this command, the value of <b>hold-time</b> cannot be smaller than the value of <b>delay-time</b>, and the value of <b>max-wait-time</b> cannot be smaller than the value of <b>hold-time</b>.</p>  |

### 📌 Configuring the LSA Group Refresh Time

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>timers pacinglsa-group</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the LSA group pacing interval. The value ranges from 10 to 1,800. The unit is second.   |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | <p>Every LSA has a time to live (LSA age). When the LSA age reaches 1800s, a refreshment is needed to prevent LSAs from being cleared because their ages reaching the maximum. If LSA update and aging computation are performed for every LSA, the device will consume a lot of CPU resources. In order to use CPU resources effectively, you can refresh LSAs by group on the device. The interval of group refreshment is called group pacing interval. The group refreshment operation is to organize the LSAs generated within a group pacing interval into a group and refresh the group as a whole.</p> <p>If the total number of LSAs does not change, a larger group pacing interval indicates that more LSAs need to be processed after timeout. To maintain the CPU stability, the number of LSAs processes upon each timeout cannot be too large. If the number of LSAs is large, you are advised to reduce the group pacing interval. For example, if there are 1000 LSAs in the database, you can reduce the pacing interval; if there are 40 to 100 LSAs, you can set the pacing interval to 10-20 minutes.</p> |

### 📌 Configuring the LSA Group Refresh Interval

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>timers pacing lsa-transmit</b> <i>transmit-time transmit-count</i>   |
| <b>Parameter Description</b> | <p><i>transmit-time</i>: Indicates the LSA group transmission interval. The value ranges from 10 to 600,000. The unit is ms.</p> <p><i>transmit-count</i>: Indicates the number of LS-UPD packets in a group. The value ranges from 1 to 200.</p> |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | If the number of LSAs is large and the device load is heavy in an environment, properly configuring <b>transimit-time</b> and <b>transimit-count</b> can limit the number of LS-UPD packets flooded on a network.                                 |

|  |  |
|--|--|
|  | If the CPU usage is not high and the network bandwidth load is not heavy, reducing the value of <b>transimit-time</b> and increasing the value of <b>transimit-count</b> can accelerate the environment convergence. |
|--|--|

↘ **Configuring LSA Repeated Receiving Delay**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>timers lsa arrival</b> <i>arrival-time</i>   |
| <b>Parameter Description</b> | <i>arrival-time</i> : Indicates the delay after which the same LSA is received. The value ranges from 0 to 600,000. The unit is ms. |
| <b>Command Mode</b>          | OSPF routing process configuration mode   |
| <b>Usage Guide</b>           | No processing is performed if the same LSA is received within the specified time.   |

↘ **Configuring the SPF Computation Delay**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>timers throttle spf</b> <i>spf-delay spf-holdtime spf-max-waittime</i>  |
| <b>Parameter Description</b> | <p><i>spf-delay</i>: Indicates the SPF computation delay. The unit is ms. The value ranges from 1 to 600,000. When detecting a topological change, the OSPF routing process triggers the SPF computation at least after <b>spf-delay</b> elapses.</p> <p><i>spf-holdtime</i>: Indicates the minimum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p> <p><i>spf-max-waittime</i>: Indicates the maximum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p> <p><i>number</i>: Indicates the metric of the summarized route.</p>  |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | <p><b>spf-delay</b> indicates the minimum time between the occurrence of the topological change and the start of SPF computation. <b>spf-holdtime</b> indicates the minimum interval between the first SPF computation and the second SPF computation. After that, the interval between two SPF computations must be at least twice of the previous interval. When the interval reaches <b>spf-max-waittime</b>, the interval cannot increase again. If the interval between two SPF computations already exceeds the required minimum value, the interval is computed by starting from <b>spf-holdtime</b>.</p> <p>You can set <b>spf-delay</b> and <b>spf-holdtime</b> to smaller values to accelerate topology convergence, and set <b>spf-max-waittime</b> to a larger value to reduce SPF computation. Flexible settings can be used based on stability of the network topology.</p> <p>Compared with the <b>timers spf</b> command, this command supports more flexible settings to accelerate the convergence speed of SPF computation and further reduce the system resources consumed by SPF computation when the topology continuously changes. Therefore, you are advised to use the <b>timers throttle spf</b> command for configuration.</p> <ol style="list-style-type: none"> <li>The value of <b>spf-holdtime</b> cannot be smaller than the value of <b>spf-delay</b>; otherwise, <b>spf-holdtime</b> will be automatically set to the value of <b>spf-delay</b>.</li> <li>The value of <b>spf-max-waittime</b> cannot be smaller than the value of <b>spf-holdtime</b>; otherwise, <b>spf-max-waittime</b> will be automatically set to the value of <b>spf-holdtime</b>.</li> <li>The configurations of <b>timers throttle spf</b> and <b>timers spf</b> are mutually overwritten.</li> </ol> |

|  |   |
|--|---|
|  | 4. When both <b>timers throttle spf</b> and <b>timers spf</b> are not configured, the default values of <b>timers throttle spf</b> prevail. |
|--|---|

↘ **Configuring the Computation Delays of Inter-Area Routes and External Routes**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>timers throttle route</b> {inter-area <i>ia-delay</i>  asease-delay}  |
| <b>Parameter Description</b> | <b>inter-area</b> <i>ia-delay</i> : Indicates the inter-area route computation delay. The unit is ms. The value ranges from 0 to 600,000.<br><b>asease-delay</b> : Indicates the external route computation delay. The unit is ms. The value ranges from 0 to 600,000.         |
| <b>Command Mode</b>          | OSPF routing process configuration mode  |
| <b>Usage Guide</b>           | If a strict requirement is raised for the network convergence time, use the default value.<br>If a lot of inter-area or external routes exist on the network and the network is not stable, adjust the delays and optimize route computation to reduce the load on the device. |

**Configuration Example**

↘ **Configuring the Hello Interval and Dead Interval**

|                            |   |
|----------------------------|---|
| <b>Scenario</b>            |   |
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the Hello interval and dead interval on all routers.</li> </ul>                    |
| <b>A</b>                   | <pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ipv6 ospf dead-interval 50</pre>  |
| <b>B</b>                   | <pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ipv6 ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ipv6 ospf dead-interval 50</pre>  |
| <b>Verification</b>        | <ul style="list-style-type: none"> <li>● Check the interface parameters on Router A and Router B. Verify that the Hello interval is 10s and the dead interval is 50s.</li> <li>● On Router A and Router B, verify that the OSPF neighbor information is correct.</li> </ul> |

A

```
A# show ipv6 ospf interface
GigabitEthernet 0/1 is up, line protocol is up

  LS-Ack received 3 sent 4, Discarded 1

B# show ipv6 ospf neighbor

OSPFv3 Process (1), 1 Neighbors, 1 is Full:

Neighbor ID    Pri   State           Dead Time   Instance ID  Interface
1.1.1.11      Full/DR    00:00:38     0           GigabitEthernet 0/1
    
```

### Common Errors

- The configured neighbor dead time is shorter than the Hello interval.

## 3.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

| Description                        | Command   |
|------------------------------------|---|
| Clears and resets an OSPF process. | <b>clear ipv6 ospf</b> [ <i>process-id</i> ] <b>process</b> |

### Displaying

| Description                               | Command                                     |
|---|---|
| Displays the OSPF process configurations. | <b>show ipv6 ospf</b> [ <i>process-id</i> ] |

| Description   | Command   |
|---|---|
| Displays information about the OSPF LSDB.                   | <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>lsa-type</i> [ <b>adv-router</b> <i>router-id</i> ] ]  |
| Displays OSPF-enabled interfaces.                           | <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>interface</b> [ <i>interface-type interface-number</i>   <b>brief</b> ]  |
| Displays the OSPF neighbor list.                            | <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>neighbor</b> [ <i>interface-type interface-number</i> [ <b>detail</b> ]]<br><i>neighbor-id</i> [ <b>detail</b> ] |
| Displays the OSPF routing table.                            | <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>route</b> [ <i>count</i> ]   |
| Displays the summarized route of OSPF redistributed routes. | <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>summary-prefix</b>   |
| Displays the OSPF network topology information.             | <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>topology</b> [ <i>area</i> <i>area-id</i> ]  |
| Displays OSPF virtual links.                                | <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>virtual-links</b>  |

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description             | Command  |
|-------------------------|--|
| Debugs OSPF events.     | <b>debug ipv6 ospf events</b> [ <i>abr</i>   <i>asbr</i>   <i>os</i> ] <b>router</b>   <b>vlink</b> ]  |
| Debugs OSPF interfaces. | <b>debug ipv6 ospf ifsm</b> [ <i>events</i>   <i>status</i>   <i>timers</i> ]  |
| Debugs OSPF neighbors.  | <b>debug ipv6 ospf nfm</b> [ <i>events</i>   <i>status</i>   <i>timers</i> ]   |
| Debugs the OSPF NSM.    | <b>debug ipv6 ospf nsm</b> [ <i>interface</i>   <i>redistribute</i>   <i>route</i> ]   |
| Debugs OSPF LSAs.       | <b>debug ipv6 ospf lsa</b> [ <i>flooding</i>   <i>generate</i>   <i>install</i>   <i>maxage</i>   <i>refresh</i> ]   |
| Debugs OSPF packets.    | <b>debug ipv6 ospf packet</b> [ <i>dd</i>   <i>detail</i> ]  <i>hello</i>   <i>ls-ack</i>   <i>ls-request</i>   <i>ls-update</i>   <i>recv</i>   <i>send</i> ] |
| Debugs OSPF routes.     | <b>debug ipv6 ospf route</b> [ <i>ase</i>   <i>ia</i>   <i>install</i>   <i>spf</i>   <i>time</i> ]  |

## 4 Configuring IS-IS

### 4.1 Overview

Intermediate System to Intermediate System (IS-IS) is an extensible, robust, and easy-to-use Interior Gateway Protocol (IGP) for route selection and applicable to an IP-ISO CLNS dual environment network (ISO CLNS is short for International Organization for Standardization Connectionless Network Service).

IS-IS has the common characteristics of a link state protocol. It sends Hello packets to discover and maintain neighbor relationships, and sends Link State Protocol Data Units (LSPs) to neighbors to advertise its link state. IS-IS supports Level-1 routing and Level-2 routing. All devices at the same Level maintain the same Link State Database (LSDB), which stores the LSPs generated by the devices to notify each other of the Level's network topology. Each device uses the Dijkstra Shortest Path First (SPF) algorithm to perform best-route calculation, path selection, and fast convergence.

#### Protocols and Standards

- RFC1142: OSI IS-IS Intra-domain Routing Protocol
- RFC1195: Use of OSI IS-IS for routing in TCP/IP and dual environments
- RFC3786: Extending the Number of Intermediate System to Intermediate System (IS-IS) Link State PDU (LSP) Fragments Beyond the 256 Limit
- RFC3373: Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies
- RFC3358: Optional Checksums in Intermediate System to Intermediate System (ISIS)
- RFC3784: Intermediate System to Intermediate System (IS-IS) Extensions for Traffic Engineering (TE)
- RFC2763: Dynamic Hostname Exchange Mechanism for IS-IS
- RFC6119(draft-ietf-isis-ipv6-te-00): IPv6 Traffic Engineering in IS-IS
- RFC 2966: Domain-wide Prefix Distribution with Two-Level IS-IS

### 4.2 Applications

| Application                           | Description   |
|---------------------------------------|---|
| <a href="#">Planar Topology</a>       | A planar topology is applicable to a small-scale network. At the initial stage of large-scale network construction, core devices are deployed to form an area based on a planar topology. |
| <a href="#">Hierarchical Topology</a> | A hierarchical topology is applicable to a large-scale network with frequent link flapping.   |

#### 4.2.1 Planar Topology

##### Scenario

A planar topology is formed by devices in the same area. See Figure 4-1.

Figure 4-1 Planar Topology

### Deployment

- To facilitate future extension and reduce device burden, configure the devices in a planar topology as Level-2 devices.

## 4.2.2 Hierarchical Topology

### Scenario

A hierarchical topology divides the network into the core layer, convergence layer, and access layer. See Figure 4-2.

- Route summarization at the convergence layer is facilitated by address planning.
- When primary and secondary routes exist, devices at the convergence layer leak Level-2 routes to Level-1 areas.

Figure 4-2 Hierarchical Topology

|                |  |
|----------------|--|
| <b>Remarks</b> | Devices at the core layer must be connected consecutively. |
|----------------|--|

### Deployment

- Design the network topology starting from the core layer.

- Configure devices at the core layer as Level-2 devices.
- Configure devices at the convergence layer as Level-1/Level-2 devices.
- Configure devices at the access layer as Level-1 devices.

## 4.3 Features

### Basic Concepts

---

#### ↘ End System (ES)

An ES is a non-router device, for example, a host.

#### ↘ Intermediate System (IS)

An IS is a router, which is the basic unit used to transmit routing information and generate routes in IS-IS.

#### ↘ End System to Intermediate System Routing Exchange Protocol (ES-IS)

ES-IS is the protocol used for communication between ESs and ISs in Open System Interconnection (OSI) to dynamically discover Level-2 neighbor relationships.

#### ↘ Domain

A set of ISs in the same routing domain (RD) use the same routing protocol to exchange routing information.

#### ↘ Area

An RD can be divided into multiple areas.

#### ↘ Complete Serial Number PDU (CSNP)

CSNPs are sent by a Designated Intermediate System (DIS) every 10s to synchronize link states in a broadcast network.

#### ↘ Partial Sequence Number PDU (PSNP)

PSNPs are sent by a point-to-point (P2P) link to confirm LSPs, or request LSPs in a broadcast network.

#### ↘ Connectionless Network Protocol (CLNP)

CLNP is an OSI protocol used to transmit data and error messages at the network layer. It is similar to the IP protocol.

#### ↘ Connectionless Network Service (CLNS)

The CLNS is a type of unreliable connection and requires no circuit setup before data transmission.

#### ↘ Designated Intermediate System (DIS)

Similar to a DIS router (DR) in Open Shortest Path First (OSPF), a DIS propagates LSPs to other machines in a Local Area Network (LAN). Neighbor relationships are established not only between DISs and other machines but also between those machines. This characteristic is not possessed by OSPF.

### ↳ Hello Packet

Hello packets are used to establish and maintain neighbor relationships.

### ↳ LSP

LSPs describe link states, similar to link-state advertisement (LSA) in OSPF, but the former do not depend on TCP/IP information. LSPs are classified into Level-1 LSPs and Level-2 LSPs, depending on different route types.

### ↳ Network Selector (NSEL)

An NSEL (sometimes referred to as SEL) specifies the target network-layer protocol service. It is similar to the TCP/UDP port for the Upper Layer Service in the IP protocol. In IS-IS, SEL is typically set to 00 to indicate a device.

### ↳ Network Service Access Point (NSAP)

An NSAP is the CLNS complete address, including the OSI address and high-layer processes. It consists of an area ID, a system ID, and SEL. When SEL is set to 00, the NSAP is a Network Entity Title (NET), similar to an IP address plus a protocol number.

### ↳ Sub-Network Point of Attachment (SNPA)

An SNPA provides physical connections and network-layer services. It is similar to a MAC address used in the IP protocol, a Data Link Connection Identifier (DLCI) used by frame relay (FR), or High-Level Data Link Control (HDLC) in a wide area network (WAN).

### ↳ Level-1 Route

A Level-1 route is an intra-area route that only receives relevant information within the area. To reach other areas, you need to store in Level-1 a default route destined for the closest Level-2.

### ↳ Level-2 Route

A Level-2 route is an inter-area backbone route. Level-1 and Level-2 cannot be connected directly.

### ↳ Level-1/Level-2 Route

A Level-1/Level-2 route is a border route connecting a Level-1 route and a Level-2 route. It maintains two databases for the Level-1 and Level-2 routes respectively. It is similar to an area border router (ABR) in OSPF.

### ↳ Pseudonode

A pseudonode identifies a broadcast subnet (LAN) and allows a broadcast medium to work as a virtual device, which has a route as its interface. The route-pseudonode relationship is managed by a DIS.

### ↳ Network Entity Title (NET)

A NET is part of an OSI address and describes the area ID and system ID, but it does not define the NSEL, which is contained in the NSAP of the specified system.

### ↳ Circuit

Circuit is an interface-related term used in IS-IS. Whereas NSAP and NET indicate whole devices, a circuit indicates an interface. The circuit ID of a P2P interface is one byte long. For example, the circuit ID of HDLC is 0x00. In a broadcast network (for example, a LAN), the circuit ID is seven bytes long, including the system ID, for example, 1921.6800.0001.01.

 For details about terms related to IS-IS, see ISO 10589 and RFC1195.

## Overview

| Feature                                   | Description  |

### 4.3.1 IS-IS Network Hierarchy

An IS-IS network is divided into Level-1 and Level-2. The nodes on which devices exchange information in the same area form one Level (Level-1).

#### Working Principle

All devices in an area know the area's network topology and exchange data within the area. A Level-1/Level-2 device is a border device that belongs to different areas and provides inter-area connections. Areas are connected by Level-2 devices. The border devices in various areas form a Level-2 backbone network for inter-area data exchange.

Level-1 devices are only interested in the local area's topology, including all nodes in the local area and the next-hop devices destined for the nodes. Level-1 devices access other areas through Level-2 devices and forward packets from a target network outside of the local area to the closest Level-2 device.

Figure 4-3 IS-IS Network Topology

## Related Configuration

### Setting the Circuit Type of an IS-IS Interface

By default, **circuit-type** is set to Level-1/Level-2.

Run the **isis circuit-type** command to change the Level of an interface.

If **circuit-type** is set to Level-1 or Level-2-only, IS-IS will only send PDUs of the corresponding Level.

### Specifying the IS-IS Level

By default, **is-type** is set to Level-1/Level-2 if no IS-IS instance runs at Level-2 (including Level-1/Level-2). **is-type** is set to Level-1 if there are IS-IS instances running at Level-2 (including Level-1/Level-2).

Run the **is-type** command to specify the Level at which IS-IS will run.

Changing the **is-type** value will enable or disable the routes of a certain Level. A device can have only one instance running at Level-2 (including Level-1/Level-2).

## 4.3.2 IS-IS Address Coding Mode

An IS-IS address is called a NET, which consists of an area ID, a system ID, and an NSAP identifier, ranging from eight to 20 bytes.

## Working Principle

Figure 4-4 NET Address Format

- The area ID identifies the RD length in an area and is fixed relative to the RD. It ranges from one to 13 bytes.
- The system ID is unique in an autonomous system (AS).
- The NSAP is a network selector and sometimes called SEL. In IS-IS, SEL is typically set to 00 to indicate a device.

### Related Configuration

#### Configuring a NET Address in IS-IS

By default, no NET address is configured in IS-IS.

Run the **net** command to configure a NET address in IS-IS.

The command configures an area ID and a system ID in IS-IS. Different NET addresses must have the same system ID.

### 4.3.3 IS-IS Packet Types

There are three types of IS-IS packets:

- LSP
- IIH PDU
- SNP (classified into CSNP and PSNP)

#### Working Principle

There are three types of IS-IS packets:

- LSP

LSPs are used to transmit link state records within an area and are classified into Level-1 LSPs and Level-2 LSPs. LSPs are only flooded to the corresponding Level.

- IIH PDU

IIH PDUs are used to maintain neighbor relationships. They carry multicast MAC addresses used to determine whether other systems run IS-IS.

- SNP (classified into CSNP and PSNP)

CSNPs are used for LSDB synchronization. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established.

PSNPs are also used for LSDB synchronization.

## Related Configuration

### ▾ Configuring the LSP Interval on an IS-IS Interface

By default, the LSP interval is 33 ms. If no Level is specified, the interval takes effect for Level-1 and Level-2 LSPs.

Run the **isis lsp-interval** command to configure the LSP interval on an IS-IS interface, in the unit of seconds.

The command changes the LSP interval.

### ▾ Configuring the Hello Packet Interval on an IS-IS Interface

By default, the Hello packet interval is 10s for Level-1 and Level-2.

Run the **isis hello-interval** command to configure the Hello packet interval on an IS-IS interface, in the unit of seconds.

The command changes the Hello packet interval. A DIS sends Hello packets at a frequency three times that by non-DIS devices in a broadcast network. If an IS is elected as the DIS on the interface, by default, the interface sends a Hello packet every 3.3s.

### ▾ Configuring the Minimum PSNP Interval

By default, the minimum PSNP interval is not configured, and the default interval 2s takes effect for Level-1 and Level-2 PSNPs.

Run the **isis psnp-interval** command to configure the minimum PSNP interval, in the unit of seconds.

PSNPs are mainly used to request LSPs that are absent locally or respond to received LSPs (in a P2P network). The PSNP interval should be minimized. If many LSPs exist and the device performance is low, you can increase the PSNP interval and LSP retransmission interval to reduce the device burden.

### ▾ Configuring the CSNP Broadcast Interval on an IS-IS Interface

By default, CSNPs are sent at 10s intervals in a broadcast network. No CSNPs are sent in a P2P network. When you configure a new CSNP interval without Level-1 or Level-2 specified, the interval takes effect for Level-1 and Level-2 CSNPs.

Run the **isis csnp-interval** command to specify the CSNP broadcast interval on an IS-IS interface, in the unit of seconds.

The command changes the CSNP interval. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to **mesh-groups** can be configured to periodically send CSNPs. No CSNPs are sent if the CSNP interval is set to 0.

## 4.3.4 DIS Election

A DIS is a designated device in a broadcast network and works like a DR in OSPF.

A pseudonode is generated by a DIS and sets up a relationship with each device in the local network.

### Working Principle

A DIS simulates multiple access links as a pseudonode and generates LSPs for the pseudonode. The pseudonode sets up a relationship with each device in the local network and forbids direct communication between the devices. A broadcast subnet and a non-broadcast multiple access (NBMA) network are considered as pseudonodes externally. Non-DIS devices report their link states to the DIS in the same network, and the DIS maintains the link states reported by all ISs in the network. Like DR election in OSPF, a DIS is elected to reduce unnecessary neighbor relationships and route information exchanges.

DIS election in IS-IS is preemptive. The election result can be manually controlled through interface priority configuration. The device with a higher interface priority is more likely to be elected as the DIS.

### Related Configuration

#### ▾ Configuring the Priority for DIS Election in a LAN

By default, Priority 64 takes effect for Level-1 and Level-2.

Run the **isis priority** command to configure the priority for DIS election in a LAN.

The command changes the priority carried in Hello packets in a LAN. The device with a lower priority is less likely to be elected as the DIS.

The command is invalid on a P2P network interface. The **no isis priority** command, with or without parameters, restores the priority to its default value. To change the configured priority, run the **isis priority** command with the priority specified to overwrite the existing configuration, or you can first restore the priority to its default value and then configure a new priority.

## 4.3.5 IS-IS Supported TLV Types

IS-IS supports 26 types of TLV.

### Working Principle

The following table lists the IS-IS supported TLV types:

| TLV Code   | Description                          |
|------------|--------------------------------------|
| Code = 1   | Area ID                              |
| Code = 2   | Priority of an IS neighbor           |
| Code = 3   | ES neighbor                          |
| Code = 6   | MAC address of an IS neighbor        |
| Code = 8   | Filling field                        |
| Code = 9   | LSP entity                           |
| Code = 10  | Verification field                   |
| Code = 14  | Size of the source LSP buffer        |
| Code = 22  | Extended IS reachability             |
| Code = 128 | IP internal reachability information |
| Code = 129 | Supported protocol                   |

| TLV Code   | Description                               |
|------------|---|
| Code = 130 | IP external reachability information      |
| Code = 131 | Inter-domain routing protocol information |
| Code = 132 | IP interface address                      |
| Code = 133 | Verification information                  |
| Code = 135 | Extended IP reachability TLV              |
| Code = 137 | Dynamic host name                         |
| Code = 222 | Multi-Topology (MT) IS reachability       |
| Code = 229 | MT TLV                                    |
| Code = 211 | GR  |
| Code=232   | IPv6 interface                            |
| Code = 235 | IPv4 MT IP reachability TLV               |
| Code =236  | IPv6 IP reachability TLV                  |
| Code = 237 | IPv6 MT IP reachability TLV               |
| Code = 240 | P2P three-way handshake TLV               |

## Related Configuration

### ↘ Configuring the Neighbor Detection Protocol Carried in Hello Packets

By default, neighbor detection is enabled.

Run the **adjacency-check** command to configure the neighbor detection protocol carried in Hello packets.

## 4.3.6 LSP Fragment Extension

IS-IS floods LSPs to advertise link states. The size of an LSP is limited by the MTU size of the link. When the content to be advertised exceeds one LSP, IS-IS will create LSP fragments to carry new link state information. According to ISO standards, an LSP fragment is identified by a one-byte LSP number. An IS-IS device can generate up to 256 LSP fragments.

### Working Principle

The 256 LSP fragments are insufficient in any of the following situations:

1. New applications (such as traffic engineering [TE]) extend new TLV or Sub-TLV.
2. The network is expanded continuously.
3. Routes with reduced granularity are advertised, or other routes are redistributed to IS-IS.

After LSP fragments are used up, new routing information and neighbor information will be discarded, causing network exceptions such as routing black holes or loops. LSP fragments must be extended to carry more link state information, thus ensuring normal network operation.

You can configure an additional system ID and enable fragment extension to allow IS-IS to advertise more link state information in extended LSP fragments. Each virtual system can be considered as a virtual device that establishes a

neighbor relationship (with the path value being 0) with the originating system. Extended LSPs are published by the neighbor of the originating system, that is, the virtual system.

The following terms are related to fragment extension:

#### ↳ Normal System ID

The system ID defined by ISO is used to establish neighbor relationships and learn routes. It is further defined as the normal system ID in order to be distinguished from the additional system ID introduced to fragment extension.

#### ↳ Additional System ID

The additional system ID is configured by an administrator to generate extended LSPs. The additional system ID shares the usage rules of the normal system ID (for example, the additional system ID must be unique in the entire area), except that the additional system ID is not carried in Hello packets for neighbor relationship establishment.

#### ↳ Originating System

An originating system is an IS-IS-enabled device and maps a virtual system identified by the additional system ID.

#### ↳ Virtual System (Virtual IS)

A virtual system is identified by the additional system ID and used to generate extended LSPs. The virtual system concept is proposed by RFC for distinguishing from the originating system concept. Each virtual system can generate up to 256 LSP fragments. The administrator can configure multiple additional system IDs (virtual systems) to generate more LSP fragments.

#### ↳ Original LSP

An original LSP is the LSP whose system ID contained in the LSP ID is a normal system ID. Original LSPs are generated by an originating system.

#### ↳ Extended LSP

An extended LSP is the LSP whose system ID contained in the LSP ID is an additional system ID. Extended LSPs are generated by a virtual system.

### Related Configuration

#### ↳ Enabling Fragment Extension

By default, fragment extension is disabled. If you do not specify a Level when enabling fragment extension, it will take effect for Level-1 and Level-2 LSPs.

Run the **isp-fragments-extend** command to enable fragment extension.

There are up to 256 LSP fragments. When the fragments are used up, subsequent link state information, including neighbor information and IP route information, will be discarded, causing a network exception. To solve this problem, enable fragment extension at the specified Level and configure an additional system ID by using the **virtual-system** command.

### 4.3.7 IS-IS VRF

VRF is mainly used for local routing and packet separation. It avoids route conflict caused by use of the same prefix by multiple VPNs. IPv4 VPN and IPv6 VPN combine Multiprotocol Label Switching (MPLS) advantages in terms of Quality of Service (QoS) and security assurance, and are the primary solutions for interconnecting the geographically different office branches of an enterprise or industry user.

#### Working Principle

Figure 4-5 Separation of Different VPNs by VRF Tables Configured on Provider Edge (PE) Devices

In Figure 4-5, the following configuration requirements exist: Configure the two sites (CE1 and CE3) in VPN1 to access each other and the two sites (CE2 and CE4) in VPN2 to access each other, and forbid access between the sites in VPN1 and those in VPN2, because VPN1 and VPN2 belong to different customers or departments and may have identical IP addresses.

The customer edge (CE) devices connect the customer network to the PEs to exchange VPN routing information with the PEs, that is, advertise local routes to the PEs and learn remote routes from the PEs.

Each PE learns routes from directly connected CEs and exchanges the learned VPN routes with the other PE through the Border Gateway Protocol (BGP). The PEs provide access to the VPN service.

The Provider (P) device in the Service Provider (SP) network is not directly connected to the CEs. The P device only needs the MPLS forwarding capability and does not maintain VPN information.

The IS-IS protocol running between the PEs and CEs requires the VRF capability to separate routing information between VPN1 and VPN2. That is, IS-IS only learns routes through VRF.

#### Related Configuration

##### ↘ Binding an IS-IS Instance with a VRF Table

By default, an IS-IS instance is not bound with any VRF table.

Run the **VRF** command to bind an IS-IS instance with a VRF table.

Note the following constraints or conventions for the binding operation:

- The IS-IS instances bound with the same non-default VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same system ID.
- One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.
- When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the **ip** (or **ipv6**) **router isis** [ *tag* ] interface configuration and the redistribution configuration in routing process mode will be deleted.

### 4.3.8 IS-IS MTR

IS-IS MTR is an extended feature used to separate IPv4 unicast route calculation and IPv6 unicast route calculation based on topologies. It complies with the specification of IS-IS MT extension defined in RFC 5120. New TLV types are introduced to IIH PDUs and LSPs to transmit IPv6 unicast topology information. One physical network can be divided into an IPv4 unicast logical topology and an IPv6 unicast logical topology. The two topologies perform SPF calculation separately and maintain independent IPv4 and IPv6 unicast routing tables respectively. In this way, IPv4 unicast service traffic and IPv6 unicast service traffic are forwarded by different paths. The IS-IS MTR technique helps users deploy IPv6 unicast networks without the constraint on consistency between IPv4 and IPv6 unicast topology information.

IS-IS MTR is derived from IS-IS MT, which is used to separate IPv4 and IPv6 unicast topologies, unicast and multicast topologies, and topologies using different protocol stacks (such as IPv4 and Pv6). IS-IS MTR separates IPv4 and IPv6 unicast topologies based on IS-IS MT.

#### Working Principle

Figure 4-6 shows a typical networking application. The following implementation requirements exist: Deploy an IPv6 unicast topology in incremental mode, and upgrade some devices to support IPv4 and IPv6 dual protocol stacks while keeping other IPv4-enabled devices unchanged.

Figure 4-6 Physical Topology for IPv4-IPv6 Hybrid Deployment

In Figure 4-6, each link is marked by a number indicating its metric. RB only supports the IPv4 protocol stack, whereas other devices support IPv4 and IPv6 dual protocol stacks.

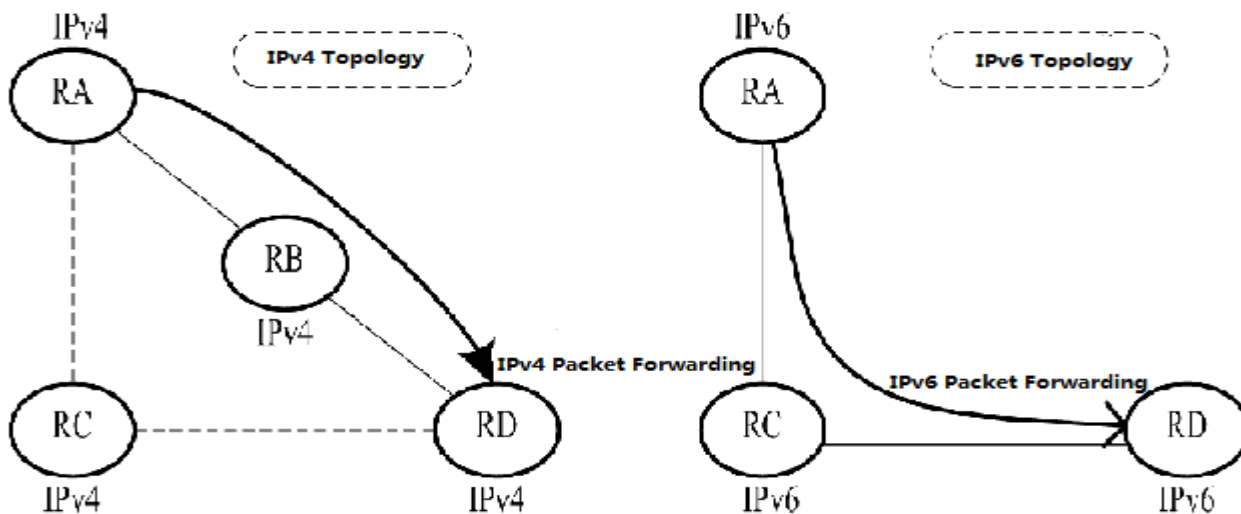

The networking constraint on consistency between IPv4 and IPv6 unicast topologies must be canceled to retain the use of RB; otherwise, RB cannot establish a neighbor relationship with RA or RD, which will cause new problems.

Figure 4-7 IPv4-IPv6 Hybrid Topology

In Figure 4-7, without IS-IS MTR support, the SPF calculations performed by RA, RB, RC, and RD only take into account the single hybrid topology. The calculated shortest path is RA -> RB -> RD, with the overhead being 20. RB will discard IPv6 packets because it does not support IPv6.

Figure 4-8 Separation of IPv4 and IPv6 Topologies

In Figure 4-8, the IS-IS MTR technique is used to separate IPv4 and IPv6 unicast topologies. RA, RB, RC, and RD establish neighbor relationships based on the IPv4 unicast topology and IPv6 unicast topology respectively. The left part shows the IPv4 topology formed by IPv4-enabled routers. The calculated IPv4 shortest path is RA -> RB -> RC, which realizes IPv4 packet forwarding. The right part shows the IPv6 topology formed by IPv6-enabled routers. The calculated IPv6 shortest path is RA -> RC -> RD, which realizes IPv6 packet forwarding.

IS-IS MTR must be deployed to avoid routing black holes when some devices support only one protocol. IS-IS MTR is not required when all devices support IPv4 and IPv6 dual protocol stacks.

- Deployment of a new network: IS-IS MTR is not required when devices only support the IPv4 protocol stack. For devices that only support the IPv6 protocol stack or devices that support IPv4 and IPv6 dual protocol stacks, enable the MT mode of IS-IS MTR. You are advised not to enable Multi-Topology Transition (MTT); otherwise, loops may occur.
- Reconstruction of an existing network with devices supporting only one protocol stack: Enable the MTT mode of IS-IS MTR on devices that support IPv4 and IPv6 dual protocol stacks in sequence (starting from the device closest to a device supporting only one protocol stack in the network topology). After the MTT mode is enabled on all new devices, switch the MTT mode to the MT mode on these devices in sequence (starting from the device farthest from a device supporting only one protocol stack in the network topology).

## Related Configuration

### ↳ Enabling MTR for IS-IS Instances

By default, IS-IS instances are not enabled with MTR.

Run the **multi-topology** command to configure IS-IS to support IPv6 unicast topologies. After that, IPv4 and IPv6 unicast routes in IS-IS will be calculated based on different topologies.

Note the following constraints or conventions when you use the **multi-topology** command:

1. Set **metric-style** to **Wide** or **Transition** before you run the command.
2. The MTR feature will be disabled if **metric-style** is set to **Narrow** or only one Level is configured to support the Wide or Transition mode.

### 4.3.9 IS-IS Neighbor

When IS-IS MTR is not configured, the following conditions must be met for two routing devices to establish a neighbor relationship:

- The interface addresses on both routing devices are in the same network segment.
- The interface Levels on both routing devices match.
- The routing devices are authenticated by each other.
- The routing devices support the same protocol.

When IS-IS MTR is configured, the following conditions must be met for routing devices to establish a neighbor relationship:

- The interface addresses on both routing devices are in the same network segments.
- The interface Levels on both routing devices match.
- The routing devices are authenticated by each other.
- The routing devices have at least one consistent MT ID when P2P links are configured.
- There are no constraints on the MT IDs that the routing devices support when LAN links are configured.

## 4.4 Configuration

| Configuration                                   | Description and Command  |  |
|---|--|--|
| <a href="#">Enabling IS-IS</a>                  |  (Mandatory) It is used to enable IS-IS on specified interfaces. You need to create an IS-IS routing process in advance.  |  |
|   | <b>router isis</b> [ tag ]   | Starts an IS-IS routing process. <i>tag</i> indicates the process name.  |
|   | <b>net</b> <i>areaAddress.SystemId.00</i>  | Configures a NET address in IS-IS.   |
|   | <b>ip router isis</b> [ tag ]  | Enables IS-IS on an interface. <i>tag</i> indicates the name of the IS-IS routing process.                                       |
| <a href="#">Configuring IS-IS Hello Packets</a> |  (Optional) It is used to configure the IS-IS Hello packet holdtime.  |  |
|   | <b>isis hello-interval</b> { <i>interval</i>   <b>minimal</b> }<br>[ <b>level-1</b>   <b>level-2</b> ]   | Configures the Hello packet interval on an interface. The value range is 1 to 65,535, in the unit of seconds.                    |
|   | <b>isis hello-multiplier</b> <i>multiplier-number</i><br>[ <b>level-1</b>   <b>level-2</b> ]   | Configures the Hello packet holdtime multiplier on an IS-IS interface. The value range is 2 to 100.<br>The default value is 3.   |
| <a href="#">Configuring IS-IS LSPs</a>          |  (Optional) It is used to perform time-related LSP configuration, determine whether to ignore LSP checksum errors, and enable/disable LSP fragment extension. |  |
|   | <b>isis lsp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]   | Configures the minimum LSP interval on an interface. The value range is 1 to 4,294,967,295, in the unit of milliseconds.         |
|   | <b>isis retransmit-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]  | Configures the LSP retransmission interval by P2P links on an interface. The value range is 0 to 65,535, in the unit of seconds. |

| Configuration   | Description and Command   |  |
|---|---|--|
|   | <p><b>lsp-gen-interval</b> [ level-1   level-2 ]<br/><i>maximum-interval</i></p>  | <p>Configures LSP generation cycle.<br/><i>maximum-interval</i>: Indicates the maximum interval for generating two consecutive LSP packets. The value range is <b>1</b> to <b>65535</b> (in seconds). The default value is <b>5</b>.<br/><i>initial-interval</i>: Indicates the waiting time for generating an LSP packet for the first time. The value range is <b>0</b> to <b>60000</b> (in milliseconds). The default value is <b>50</b>.<br/><i>hold-interval</i>: Indicates the minimum interval for generating an LSP packet for the second time. The value range is <b>10</b> to <b>60000</b> (in milliseconds). The default value is <b>200</b>.</p> |
|   | <p><b>lsp-refresh-interval</b> <i>interval</i></p>  | <p>Configures the LSP refresh interval. The value range is 1 to 65,535, in the unit of seconds.</p>  |

| Configuration | Description and Command  |   |
|---------------|--|---|
|               | <p><b>isis password</b> [ 0   7 ] <i>password</i> [ <b>send-only</b> ] [ level-1   level-2 ]</p> | <p>Configures the password for plaintext authentication of Hello packets on an interface.</p> <p>When <b>send-only</b> is included, the authentication password is only used to authenticate sent Hello packets. Received Hello packets are not authenticated.</p> <p>If no Level is specified, the configured authentication and password take effect for all Levels.</p> <p>This command does not take effect if the <b>isis authentication mode</b> command is executed. Both commands are used to configure IS-IS interface authentication, but the <b>isis password</b> command has a lower priority. Before you run the <b>isis password</b> command, delete the <b>isis authentication mode</b> command configuration.</p> |
|               | <p><b>isis authentication mode</b> { text   md5 } [ level-1   level-2 ]</p>                      | <p>Specifies authentication as plaintext or MD5. If no Level is specified, the authentication mode takes effect for all Levels.</p> <p>If you use this command after the <b>isis password</b> <i>password</i> [ level-1   level-2 ] command is executed, the previous command configuration will be overwritten. Both commands are used to configure IS-IS interface authentication, but the <b>isis authentication mode</b> command has a higher priority.</p>   |
|               | <p><b>isis authentication key-chain</b> <i>name-of-chain</i> [ level-1   level-2 ]</p>           | <p>Configures the password for interface authentication.</p> <p>If no Level is specified, the configured key chain takes effect for all Levels.</p> <p>This command must be used with the <b>isis authentication mode</b> command to configure IS-IS interface authentication.</p>  |

| Configuration | Description and Command   |  |
|---------------|---|--|
|               | <p><b>isis authentication send-only [ level-1   level-2 ]</b></p> | <p>(Optional) Specifies that interface authentication is performed only on sent packets. Received packets are not authenticated.</p> <p>If no Level is specified, the send-only authentication mode takes effect for all Levels.</p> <p>This command is used to avoid network flapping caused by a temporary authentication failure when IS-IS authentication is configured. Before you deploy IS-IS authentication in the entire network, run the <b>isis authentication mode { text   md5 } [ level-1   level-2 ]</b> and <b>isis authentication key-chain name-of-chain [ level-1   level-2 ]</b> commands on each device. After that, run the <b>no isis authentication send-only</b> command to restore the authentication of received packets. This realizes smooth authentication deployment and avoids network flapping.</p> |
|               | <p><b>area-password [ 0   7 ] password [ send-only ]</b></p>      | <p>Configures the password for area (Level-1) plaintext authentication.</p> <p>When <b>send-only</b> is included, the authentication password is only used to authenticate sent packets. Received packets are not authenticated.</p> <p>This command does not take effect if the <b>authentication mode</b> command is executed. Both commands are used to configure IS-IS area authentication, but the <b>area-password</b> command has a lower priority. Before you run the <b>area-password</b> command, delete the <b>authentication mode</b> command configuration.</p>   |

| Configuration | Description and Command                                      |   |

| <a href="#">Configuring IS-IS VRF</a>   |  (Optional) It is used to bind an IS-IS instance with a VRF table.   |  |
|   | <b>vrf</b> <i>vrf-name</i>  | Binds an IS-IS instance with a VRF table.  |
| <a href="#">Configuring IS-IS MTR</a>   |  (Optional) It is used to calculate IPv4 and IPv6 unicast routes in IS-IS based on different topologies.   |  |
|   | <b>multi-topology</b> [ <b>transition</b> ]   | Configures IS-IS to support IPv6 unicast topologies.   |
| <a href="#">Configuring Simple Network Management Protocol (SNMP) for IS-IS</a> |  (Optional) It is used to allow the SNMP software to perform Management Information Base (MIB) operations on IS-IS instances.  |  |
|   | <b>enable mib-binding</b>   | Performs MIB operations on the instance bound with Tag 1.  |
|   | <b>configure terminal</b>   | Enters global configuration mode.  |
|   | <b>snmp-server enable traps isis</b>  | Enables IS-IS trap globally.   |
|   | <b>snmp-server host</b> { <i>host-addr</i>   <b>ipv6</b> <i>ipv6-addr</i> } [ <b>vrf</b> <i>vrfname</i> ] [ <b>traps</b> ] [ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> { <b>auth</b>   <b>noauth</b>   <b>priv</b> } ] <i>community-string</i> [ <b>udp-port</b> <i>port-num</i> ] | Configures an SNMP host in global configuration mode to receive IS-IS trap messages.                             |
|   | <b>router isis</b>  | Enters IS-IS routing process configuration mode.   |
|   | <b>enable traps all</b>   | Allows the sending of all IS-IS trap messages to the host with the IP address 10.1.1.1.                          |
| <a href="#">.Configuring Other IS-IS Parameters</a>                             |  Optional.   |  |
|   | <b>maximum-paths</b> <i>maximum</i>   | Configures the maximum number of IS-IS IPv4/IPv6 equal-cost paths.   |
|   | <b>lsp-length</b> <i>receive size</i>   | Configures the maximum length allowed for received LSPs.   |
|   | <b>lsp-length originate</b> <i>size</i> [ <b>level-1</b>   <b>level-2</b> ]   | Configures the maximum length allowed for sent LSPs.   |
|   | <b>passive-interface</b> [ <b>default</b> ] { <i>interface-type</i> <i>interface-number</i> }   | Configures a passive interface.  |
|   | <b>isis metric</b> <i>metric</i> [ <b>level-1</b>   <b>level-2</b> ]  | Configures the interface metric, which is valid only when <b>metric-style</b> is set to <b>Narrow</b> .          |
|   | <b>isis wide-metric</b> <i>metric</i> [ <b>level-1</b>   <b>level-2</b> ]   | Configures the interface wide-metric value, which is valid only when <b>metric-style</b> is set to <b>Wide</b> . |

| Configuration | Description and Command  |  |
|---------------|--|--|
|               | <b>isis priority</b> <i>value</i> [ <b>level-1</b>   <b>level-2</b> ]  | Configures the priority for DIS election on an interface.  |
|               | <b>default-information originate</b> [ <b>route-map</b> <i>map-name</i> ]  | Generates a Level-2 default route, which will be advertised through LSPs. When the command includes the <b>route-map</b> option, a default route is generated only if the criteria in route-map are met. |
|               | <b>summary-address</b> <i>ip-address net-mask</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ] [ <b>metric</b> <i>number</i> ] | Configures an IPv4 summary route.  |
|               | <b>summary-prefix</b> <i>ipv6-prefix/prefix-length</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ]                            | Configures an IPv6 summary route.  |
|               | <b>ignore-lsp-errors</b>   | Configures to ignore LSP checksum errors.  |
|               | <b>log-adjacency-changes</b>   | Activates logging of IS-IS neighbor relationship changes.  |
|               | <b>redistribute</b>  | Configures route redistribution.   |

## 4.4.1 Enabling IS-IS

### Configuration Effect

- Before you run IS-IS, create an IS-IS routing process in global configuration mode. You can set the **tag** parameter after the **router isis** command to name the process. You can add different tags to configure different IS-IS routing processes. The setting of the **tag** parameter is optional.
- A system ID uniquely identifies an IS in a routing AS; therefore, the system ID must be unique across the AS. In IS-IS, each area may contain one or multiple area IDs. Normally, you only need to configure one area ID. You can configure multiple area IDs to realize area division. If an IS is configured with multiple area IDs, the system IDs must be the same.
- After an interface is added to the specified IS-IS routing process, the interface will establish a neighbor relationship.

### Notes

- The Level-1 IS devices in an area must be configured with the same area ID.
- The core routing table does not distinguish the routing entries generated by different IS-IS routing processes.
- The IP addresses of interfaces connected between neighbors must be in the same network segment.
- If the two IP addresses are in different network segments, a neighbor relationship cannot be established.
- If you need to add an interface to the specified IS-IS routing process, set the **tag** parameter after the **ip router isis** command to indicate the process name.

- If you run the **no ip routing** command in global configuration mode, IS-IS will disable IPv4 routing on all interfaces. That is, the **no ip router isis [ tag ]** command is automatically executed on all interfaces. Other IS-IS settings remain unchanged.
- By default, CPU protection is enabled on devices. For packets mapped to the destination group addresses (AllISSystems, AllL1ISSystems, and AllL2ISSystems) in IS-IS, there is a default limit (for example, 400 pps) on the number of packets sent to the CPU. If a device has many neighbor relationships or sends Hello packets at short intervals, the IS-IS packets that the device receives may exceed the default limit, causing frequent flapping of neighbor relationships. To solve the problem, you can use the CPU protection command in global configuration mode to increase the limit.

## Configuration Steps

### ▾ Starting an IS-IS Routing Process

- Mandatory.
- Perform this configuration in global configuration mode on each device, unless otherwise specified.

### ▾ Configuring a NET Address in IS-IS

- Mandatory.
- Perform this configuration in IS-IS routing process configuration mode on each device, unless otherwise specified.

### ▾ Enabling IS-IS on an Interfaces

- Mandatory.
- Perform this configuration in interface configuration mode on each device, unless otherwise specified.

## Verification

- Check whether devices send Hello packets.
- Check whether devices establish neighbor relationships.
- Check whether devices exchange LSPs.

## Related Commands

### ▾ Starting an IS-IS Routing Process

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>router isis [ tag ]</b>  |
| <b>Parameter Description</b> | <i>tag</i> : Indicates the name of an IS-IS instance.   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | Use this command to initialize an IS-IS instance and enter IS-IS routing process configuration mode. An IS-IS instance will start running after a NET address is configured.<br>If you set the <b>tag</b> parameter when you start an IS-IS routing process, you need to add the <b>tag</b> parameter |

when closing the IS-IS routing process.

By default, CPU protection is enabled on devices. For packets mapped to the destination group addresses (AllISSystems, AllL1ISSystems, and AllL2ISSystems) in IS-IS, there is a default limit (for example, 400 pps) on the number of packets sent to the CPU. If a device has many neighbor relationships or sends Hello packets at short intervals, the IS-IS packets that the device receives may exceed the default limit, causing frequent flapping of neighbor relationships. To solve the problem, you can use the CPU protection command in global configuration mode to increase the limit.

↘ **Configuring a NET Address in IS-IS**

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>net</b> <i>net-address</i>   |
| <b>Parameter</b>    | <i>net-address</i> :  |
| <b>Description</b>  | The NET address is in the format of XX.XXXX.YYYY.YYYY.YYYY.00. XX.XXXX indicates the area ID, and YYYY.YYYY.YYYY indicates the system ID. |
| <b>Command Mode</b> | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>  | Use this command to configure an area ID and a system ID in IS-IS. Different NET addresses must have the same system ID.                  |

↘ **Enabling IS-IS on an Interface**

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>ip router isis</b> [ <i>tag</i> ]   |
| <b>Parameter</b>    | <i>tag</i> : Indicates the name of an IS-IS instance.  |
| <b>Description</b>  |  |
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | Use this command to enable an interface to participate in IS-IS IPv4 routing. Use the <b>no</b> form of this command to disable the IS-IS routing process on the interface.<br><br>If you run the <b>no ip routing</b> command in global configuration mode, IS-IS will disable IPv4 routing on all interfaces. That is, the <b>no ip router isis</b> [ <i>tag</i> ] command is automatically executed on all interfaces. Other IS-IS settings remain unchanged. |

**Configuration Example**

↘ **Establishing a Neighbor Relationship on an IS-IS P2P Link**

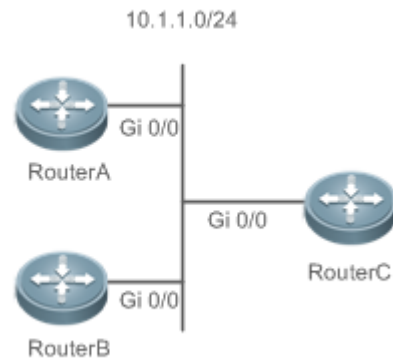

|                                     |   |
|-------------------------------------|---|
| <b>Scenario</b>                     | Router A and Router B are connected in P2P mode.  |
| <b>Figure 4-9 P2P Link Topology</b> | <p>The diagram shows two routers connected via a point-to-point link. The link is labeled with the IP address range 192.168.1.0/30. Both routers have their S1/0 interfaces connected to the link. The network is identified as Area 49.0001.</p> |
|                                     |   |

|                            |  |
|----------------------------|--|

## Common Errors

- The IP addresses of the interfaces connected between neighbors are not in the same network segment.
- The **ip router isis** command is not executed on interfaces.
- No NET address is configured, or different NET addresses exist at Level-1.
- **max-area-addresses** is configured differently on both sides.
- **metric-style** is configured differently on both sides.
- The interface Levels on both sides are different. One side is Level-1, whereas the other side is Level-2.
- One side is configured with the P2P mode, whereas the other side is configured with the broadcast mode.
- One side is enabled with authentication, whereas the other side is not.

## 4.4.2 Configuring IS-IS Hello Packets

### Configuration Effect

- Configure the Hello packet interval on an interface. The value range is 1 to 65,535, in the unit of seconds.
- Configure the Hello packet holdtime multiplier on an IS-IS interface.

### Notes

- You can change the Hello packet holdtime by using the **isis hello-multiplier** command or **isis hello-interval** command or both.
- By default, CPU protection is enabled on devices. For packets mapped to the destination group addresses (AllISSystems, AllL1ISSystems, and AllL2ISSystems) in IS-IS, there is a default limit (for example, 400 pps) on the number of packets sent to the CPU. If a device has many neighbor relationships or sends Hello packets at short interval, the IS-IS packets that the device receives may exceed the default limit, causing frequent flapping of neighbor relationships. To solve the problem, you can use the CPU protection command in global mode to increase the limit.

### Configuration Steps

#### ↘ Configuring the Hello Packet Interval on an Interface

- Perform this configuration based on requirements.
- Run the **isis hello-interval** command in interface configuration mode on the desired device, unless otherwise specified.

#### ↘ Configuring the Hello Packet Holdtime Multiplier on an Interface

- Perform this configuration based on requirements.
- Run the **isis hello-multiplier** command in interface configuration mode on the desired device, unless otherwise specified.

## Verification

- Enable Router A to send Hello packets to Router B and Router C, and capture packets to check the packet interval.
- Make Router B or Router C down. After the holdtime has elapsed, check whether the corresponding neighbor relationship on Router A is invalid.

## Related Commands

### ↘ Configuring the Hello Packet Interval on an Interface

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>isis hello-interval</b> { <i>interval</i>   <b>minimal</b> } [ <b>level-1</b>   <b>level-2</b> ]   |
| <b>Parameter Description</b> | <p><i>interval</i>: Indicates the Hello packet interval. The value range is 1 to 65,535, in the unit of seconds. The default value is 10.</p> <p><b>minimal</b>: Indicates the minimum value of the holdtime, which is 1.</p> <p><b>level-1</b>: Applies the setting to Level-1 Hello packets.</p> <p><b>level-2</b>: Applies the setting to Level-2 Hello packets.</p>   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | <p>Use this command to change the Hello packet interval. The default interval is 10s. A DIS sends Hello packets at a frequency three times that by non-DIS devices in a broadcast network. If an IS is elected as the DIS on the interface, by default, the interface sends a Hello packet every 3.3s.</p> <p>If the keyword <b>minimal</b> is used, the Hello packet holdtime is set to 1. The Hello packet interval will be calculated based on the holdtime multiplier. If the holdtime multiplier is set to 4 and the <b>isis hello-interval minimal</b> command is executed, the Hello packet interval is equal to 1s divided by 4. The default Hello packet holdtime multiplier on an IS-IS interface is 3. The holdtime is equal to the holdtime multiplier multiplied by the packet interval. If the keyword <b>minimal</b> is used, the holdtime is set to 1. The packet interval is equal to 1 divided by the holdtime multiplier. If the holdtime multiplier is set to 4 and the <b>isis hello-interval minimal</b> command is executed, the packet interval is equal to 1 divided by 4s, which is 250 ms.</p> |

### ↘ Configuring Hello Packet Holdtime Multiplier on an Interface

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>isis hello-multiplier</b> <i>multiplier-number</i> [ <b>level-1</b>   <b>level-2</b> ]                                       |
| <b>Parameter Description</b> | <i>multiplier-number</i> : Indicates the Hello packet holdtime multiplier. The value range is 2 to 100. The default value is 3. |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | The Hello packet holdtime is equal to the Hello packet interval multiplied by the holdtime multiplier.                          |

## 4.4.3 Configuring IS-IS LSPs

### Configuration Effect

- **isis lsp-interval:** Configures the LSP interval on an IS-IS interface.
- **isis retransmit-interval:** After a device at one end of a P2P link sends an LSP packet, if the device receives no response within a period of time, it determines that the LSP packet is lost or dropped due to an error. The device will resend the LSP packet.
- **lsp-gen-interval:** Indicates the exponential backoff algorithm of LSP packet generation. Any update to related information forming the LSP packet leads to LSP packet generation. During network flapping, LSP packets are frequently generated, which increases system resource consumption. An appropriate value can be set by running the **lsp-gen-interval** command. In this way, LSP packets are generated and advertised in time when the network is stable. When the network becomes unstable, less LSP packets are generated as the flapping continues, reducing the device consumption.
- **lsp-refresh-interval:** All current LSPs are periodically retransmitted to enable each network node to maintain the latest LSPs. The retransmission period is called the LSP refresh interval, which aims to update and synchronize LSPs in the entire area.
- **max-lsp-lifetime:** An LSP contains a field to indicate its lifetime. When a device generates an LSP, the field is set to the maximum lifetime of the LSP. After the LSP is received by the peer device, its lifetime will decrease with time. The peer device will replace the old LSP with the newly received one. If the device receives no new LSP until the existing LSP's lifetime decreases to 0, the existing LSP is still maintained in the LSDB for another 60s. If the device still receives no new LSP during this period, the existing LSP will be deleted from the LSDB. This mechanism updates and synchronizes LSPs in the entire area.

- **ignore-lsp-errors:** After receiving an LSP, the local IS-IS neighbor calculates its checksum and compares it with the checksum contained in the LSP. By default, if the two checksums are inconsistent, the LSP will be discarded. If you run the **ignore-lsp-errors** command to configure to ignore checksum errors, the LSP will be processed normally despite checksum inconsistency.
- **lsp-fragments-extend:** Enables LSP fragment extension, which is used to generate an extended LSP when the 256 fragments of the original LSP are used up.

## Notes

- The LSP refresh interval must be smaller than the maximum LSP lifetime.
- The maximum LSP lifetime must be greater than the LSP refresh interval.
- The value of **initial-interval** cannot be greater than that of **maximum-interval**. Otherwise, the value of **initial-interval** will be used as the value of **maximum-interval**.
- The value of **hold-interval** cannot be greater than that of **maximum-interval**. Otherwise, the value of **hold-interval** will be used as the value of **maximum-interval**.
- The value of **initial-interval** cannot be greater than that of **hold-interval**. Otherwise, the value of **initial-interval** will be used as the value of **hold-interval**.

## Configuration Steps

### ↘ Configuring the Minimum LSP Interval

- Perform this configuration based on requirements.
- Run the **isis lsp-interval** command in interface configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the LSP Retransmission Interval

- Perform this configuration based on requirements.
- Run the **isis retransmit-interval** command in interface configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring LSP Packet Generation Cycle

- Perform this configuration based on requirements.
- Run the **lsp-gen-interval** command in interface configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the LSP Refresh Interval

- Perform this configuration based on requirements.
- Run the **lsp-refresh-interval** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the LSP Lifetime

- Perform this configuration based on requirements.

- Run the **max-lsp-lifetime** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

↘ **Configuring to Ignore LSP Checksum Errors**

- Perform this configuration based on requirements.
- Run the **ignore-lsp-errors** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

↘ **Configuring LSP Fragment Extension**

- Perform this configuration based on requirements.
- Run the **lsp-fragment-extend** and **virtual-system** commands in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

Verification

- Update LSPs continuously and capture LSPs to check the minimum LSP interval.
- Disable neighboring routes and capture LSPs to check the LSP retransmission interval.
- Capture LSPs to check the refresh interval.
- Check the LSP lifetime.
- Send an LSP with an incorrect checksum and check whether the LSP is discarded.
- Reduce the **lsp-length originate** command value, add routing information, and capture LSPs to check whether more than 256 LSP fragments are generated.

Related Commands

| <b>Parameter Description</b> | <b>milliseconds</b> : Indicates the LSP interval. The value range is 1 to 4,294,967,295, in the unit of milliseconds.<br><b>level-1</b> : Applies the setting only to Level-1 LSPs.<br><b>level-2</b> : Applies the setting only to Level-2 LSPs. |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | N/A   |

↘ **Configuring the LSP Retransmission Interval**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>isis retransmit-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]   |
| <b>Parameter Description</b> | <b>seconds</b> : Indicates the LSP retransmission interval. The value range is 0 to 65,535, in the unit of seconds.<br><b>level-1</b> : Applies the setting only to Level-1 LSPs.<br><b>level-2</b> : Applies the setting only to Level-2 LSPs. |
| <b>Command</b>               | Interface configuration mode  |

|                    |  |
|--------------------|--|
| <b>Mode</b>        |  |
| <b>Usage Guide</b> | Use this command to configure the LSP retransmission interval. In a P2P network, after a device sends an LSP, if the device receives no PSNP response within the time specified by this command, it will resend the LSP. If the retransmission interval is set to 0, the LSP will not be resent, |

### 📌 Configuring LSP Packet Generation Cycle

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>lsp-gen-interval</b> [ <b>level-1</b>   <b>level-2</b> ] <i>maximum-interval</i>   |
| <b>Parameter Description</b> | <b>level-1</b> : Applies the configuration only to Level-1.<br><b>level-2</b> : Applies the configuration only to Level-2.<br><i>maximum-interval</i> : Indicates the maximum interval for generating two consecutive LSP packets. The value range is 1 to 65535 (in seconds). The default value is 5.  |
| <b>Configuration Mode</b>    | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | <p>The LSP packet generation interval refers to the interval for generating two different LSP packets. A smaller generation interval indicates faster network convergence, which, however, will be accompanied by frequent flooding on the network.</p> <p>The waiting time for generating an LSP packet for the first time is the initial interval. If the network becomes unstable, the LSP packet regeneration interval is changed to be less than the maximum interval, and the interval for generating an LSP packet for the second time becomes the hold interval. A corresponding penalty will be added to this interval: The next interval for regenerating a LSP packet doubles the previous interval for generating the same LSP packet, until the regeneration interval reaches the maximum interval. Subsequent LSP packets will be generated at the maximum interval. When the network becomes stable, the LSP packet regeneration interval becomes greater than the maximum interval, and the waiting time for LSP packet generation is restored to the initial interval.</p> <p>Link changes have high requirements for convergence. The initial interval can be set to a small value. The preceding parameters can also be adjusted to larger values to reduce CPU consumption.</p> <p>The value of <b>initial-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>hold-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>hold-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>initial-interval</b> cannot be greater than that of <b>hold-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>hold-interval</b>.</p> |

### 📌 Configuring the LSP Refresh Interval

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>lsp-refresh-interval</b> <i>interval</i>   |
| <b>Parameter Description</b> | <i>interval</i> : Indicates the LSP refresh interval. The value range is 1 to 65,535, in the unit of seconds. The default value is 900. |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | After an LSP has remained stable for a period specified by this command, it will be refreshed and updated                               |

|  |  |
|--|--|
|  | before being published.<br>The LSP refresh interval must be smaller than the maximum LSP lifetime. |
|--|--|

### ↘ Configuring the LSP Lifetime

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>max-lsp-lifetime</b> <i>value</i>  |
| <b>Parameter Description</b> | <i>value</i> : Indicates the maximum time that LSPs keep alive. The value range is 1 to 65,535, in the unit of seconds. The default value is 1,200. |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | The maximum LSP lifetime must be greater than LSP refresh interval.   |

### ↘ Configuring to Ignore LSP Checksum Errors

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ignore-lsp-errors</b>  |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | After receiving an LSP, the local IS-IS neighbor calculates its checksum and compares it with the checksum contained in the LSP. By default, if the two checksums are inconsistent, the LSP will be discarded. If you run the <b>ignore-lsp-errors</b> command to configure to ignore checksum errors, the LSP will be processed normally despite checksum inconsistency. |

### ↘ Configuring LSP Fragment Extension

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>lsp-fragments-extend</b> [ <b>level-1</b>   <b>level-2</b> ] [ <b>compatible rfc3786</b> ]   |
| <b>Parameter Description</b> | <b>level-1</b> : Applies the setting only to Level-1 LSPs.<br><b>level-2</b> : Applies the setting only to Level-2 LSPs.<br><b>compatible</b> : Indicates compatibility with the RFC version of extended LSPs.<br><b>rfc3786</b> : Extends the LSP old version. |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | Use this command to enable LSP fragment extension.  |

### ↘ Configuring an Additional System ID

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>virtual-system</b> <i>system-id</i>  |
| <b>Parameter Description</b> | <i>system-id</i> : Indicates an additional system ID (6-byte).  |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | Use this command to configure the additional system ID of an IS-IS routing process, which is used by the extended LSP that is generated after the 256 fragments of the original LSP are used up. To enable fragment |

|  |   |
|--|---|
|  | extension, run the <b>lsp-fragments-extend</b> command. |
|--|---|

### Configuration Example

#### Configuring the Minimum LSP Interval

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>Configure IS-IS neighbors. (Omitted)</li> <li>Configure the minimum LSP interval.</li> </ul> |
|                            | <pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis lsp-interval 100 level-2</pre>                                     |
| <b>Verification</b>        | Run the <b>clear isis *</b> command to update LSPs continuously and capture LSPs to check the minimum LSP interval.                 |

#### Configuring the Maximum Number of LSP Packets Sent at a Time

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>Configure IS-IS neighbors. (Omitted)</li> <li>Configure the maximum number of LSP packets sent at a time.</li> </ul> |
| <b>Verification</b>        | Run <b>show isis interface</b> command to check the maximum number of LSP packets sent at a time.   |

#### Configuring the LSP Retransmission Interval

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>Configure IS-IS neighbors in P2P mode. (Omitted)</li> <li>Configure the LSP retransmission interval.</li> </ul> |
|                            | <pre>A(config)# interface serial 0/1 A(config-if)# isis retransmit-interval 10 level-2</pre>   |
| <b>Verification</b>        | Disable neighboring routes and capture LSPs to check the LSP retransmission interval.  |

#### Configuring LSP Packet Generation Cycle

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>Configure IS-IS neighbors. (Omitted)</li> <li>Configure the LSP packet generation cycle.</li> </ul> |
|                            | <pre>A(config)# router isis A(config-router)# lsp-gen-interval 5 50 100</pre>  |

|                     |  |
|---------------------|--|
| <b>Verification</b> | Generate LSP packet frequently to see whether the exponential backoff algorithm is used. |
|---------------------|--|

### ↘ Configuring the LSP Refresh Interval

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the LSP refresh interval.</li> </ul> |
|                            | <pre>A(config)# router isis A(config-router)# lsp-refresh-interval 600</pre>  |
| <b>Verification</b>        | Capture LSPs to check the refresh interval.   |

### ↘ Configuring the LSP Lifetime

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the LSP lifetime.</li> </ul> |
|                            | <pre>A(config)# router isis A(config-router)# max-lsp-lifetime 1500</pre>   |
| <b>Verification</b>        | Check the LSP lifetime ( <b>LSP Holdtime</b> field).  |
|                            | <pre>A# show isis database</pre>  |

### ↘ Configuring to Ignore LSP Checksum Errors

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure to ignore LSP checksum errors.</li> </ul> |
|                            | <pre>A(config)# router isis A(config-router)# ignore-lsp-errors</pre>  |
| <b>Verification</b>        | Send an LSP with an incorrect checksum and check whether the LSP is discarded.   |

### ↘ Configuring LSP Fragment Extension

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure LSP fragment extension.</li> <li>● Configure the additional system ID of the IS-IS routing process.</li> </ul> |
|----------------------------|---|

|                     |   |
|---------------------|---|
|                     | <pre>A(config)# router isis A(config-router)# lsp-fragments-extend A(config-router)# virtual-system 0000.0000.0034</pre>                                    |
| <b>Verification</b> | Reduce the <b>lsp-length originate</b> command value, add routing information, and capture LSPs to check whether more than 256 LSP fragments are generated. |

### 4.4.4 Configuring IS-IS SNPs

#### Configuration Effect

- CSNPs are periodically broadcast by the DIS in a broadcast network for LSDB synchronization. In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to **mesh-groups** can be configured to periodically send CSNPs.
- When you need to set **mesh-group** on an IS-IS interface, run the **isis csnp-interval** command to configure the non-0 CSNP interval to ensure complete LSP synchronization between neighbors in the network. After that, CNSPs will be periodically sent to synchronize LSPs.

#### Configuration Steps

- Perform this configuration based on requirements.
- Run the **isis csnp-interval interval [ level-1 | level-2 ]** command in interface configuration mode on the desired device, unless otherwise specified.

#### Verification

Capture CSNPs in the broadcast network to check the CSNP interval.

#### Related Commands

##### 📌 Configuring Source Registration Filter

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>isis csnp-interval interval [ level-1   level-2 ]</b>  |
| <b>Parameter</b>    | <i>interval</i> : Indicates the CSNP interval. The value range is 0 to 65,535, in the unit of seconds.  |
| <b>Description</b>  | <b>level-1</b> : Applies the setting only to Level-1 CSNPs.<br><b>level-2</b> : Applies the setting only to Level-2 CSNPs.  |
| <b>Command Mode</b> | Interface configuration mode  |
| <b>Usage Guide</b>  | Use this command to change the CSNP interval. By default, a DIS sends a CSNP every 10s in a broadcast network.<br>In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to <b>mesh-groups</b> can be configured to periodically send CSNPs.<br>No CSNPs are sent if the CSNP interval is set to 0. |

## Configuration Example

### Configuring the CSNP Broadcast Interval

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the CSNP broadcast interval.</li> </ul> |
|                            | <pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis csnp-interval 20</pre>  |
| <b>Verification</b>        | Capture packets to check the CSNP interval.  |

## 4.4.5 Configuring the IS-IS Level Type

### Configuration Effect

- IS-IS supports a two-Level system to realize routing management and extensible route selection in a large network. Each Level is only concerned about maintaining the topology of the corresponding area.
- You can run the **is-type** command in IS-IS routing process configuration mode to configure an IS-IS Level, or run the **isis circuit-type** command in interface configuration mode to configure the IS-IS Level of an interface. The default Levels specified by the **is-type** and **isis circuit-type** commands are Level-1/Level-2. If you run both commands, the interface only sends the PDUs of the same Level specified by the two commands.

### Notes

- If Level-1 or Level-2-only is configured using the **circuit-type** command, IS-IS will only send PDUs of the corresponding Level.
- If an interface is set to **external**, the interface will work as an external domain interface and IS-IS will not send PDUs of the corresponding Level.
- A device can have only one instance running at Level-2 (including Level-1/Level-2).

### Configuration Steps

#### Configuring the System Type

- Perform this configuration based on requirements.
- Run the **is-type** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### Configuring the Interface Circuit Type

- Perform this configuration based on requirements.
- Run the **isis circuit-type** command in interface configuration mode on the desired device, unless otherwise specified.

## Verification

- Check whether only the instances of the Level specified by the **is-type** command are processed, and neighbors of the corresponding Level are created.
- Check whether the interface only sends the PDUs of the same Level specified by the **is-type** and **circuit-type** commands.

| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | If the circuit type is set to Level-1 or Level-2-only, IS-IS will only send PDUs of the corresponding Level.<br>If the system type is set to Level-1 or Level-2-only, IS-IS only processes the instances of the corresponding Level, and the interface only sends the PDUs of the same Level specified by the <b>is-type</b> and <b>circuit-type</b> commands.<br>If the interface is set to <b>external</b> , the interface will work as an external domain interface and IS-IS will not send PDUs of the corresponding Level. |

## Configuration Example

### ▾ Configuring IS-IS Levels

|                                   |  |
|-----------------------------------|--|
| <b>Configuration Requirements</b> | Router A is connected to Router B and Router C by P2P serial links. Router B and Router C are connected by the Ethernet, and Router D and Router E are also connected by the Ethernet. On Router A, configure IS-IS area route summarization. Note that area route summarization can be configured only on border devices. |
|-----------------------------------|--|

**Figure 4-12**  
IS-IS Level  
Configuration

**Configuration Steps**

- Configure IS-IS.
- Configure Ethernet interfaces.
- Configure the IS-IS Level structure.

**A**

Configure IS-IS.

```
A(config)# router isis
A(config-router)# net 50.0001.0000.0000.0001.00
A(config-router)# is-type level-2-only
```

Configure two serial link ports.

```
A(config)# interface Serial 1/0
A(config-if)# ip address 192.168.1.1 255.255.255.252
A(config-if)# ip router isis
A(config)# interface Serial 1/1
A(config-if)# ip address 192.168.2.1 255.255.255.252
A(config-if)# ip router isis
```

**B**

Configure IS-IS.

```
B(config)# router isis
B(config-router)# net 49.0001.0000.0000.0002.00
```

## 4.4.6 Configuring IS-IS Authentication

### Configuration Effect

- Interface authentication is intended for establishing and maintaining neighbor relationships. A neighbor relationship cannot be established between two IS-IS devices with different interface authentication passwords. This prevents unauthorized or unauthenticated IS-IS devices from joining an IS-IS network that requires authentication. Interface authentication passwords are encapsulated in Hello packets before being sent.
- Area authentication and RD authentication in IS-IS are performed to verify LSPs, CSNPs, and PSNPs to prevent unauthorized or unauthenticated routing information from being injected into the LSDB. Authentication passwords are encapsulated in LSPs, CSNPs, and PSNPs before being sent.

### Notes

- An interface authentication password is encapsulated in a Hello packet before being sent by an interface. When an interface receives a Hello packet, it checks the password in the packet against the existing one.
- Area authentication passwords are encapsulated in Level-1 LSPs, CSNPs, and PSNPs. When an interface receives an LSP, CSNP, or PSNP, it checks the password in the packet against the existing one.
- RD authentication passwords are encapsulated in Level-2 LSPs, CSNPs, and PSNPs. When an interface receives an LSP, CSNP, or PSNP, it checks the password in the packet against the existing one.

## Configuration Steps

### ▾ Configuring Interface Authentication

- Perform this configuration based on requirements.
- Configure **isis password** in interface configuration mode on the desired device, unless otherwise specified.

### ▾ Configuring Area Authentication

- Perform this configuration based on requirements.
- Run the **area-password** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ▾ Configuring RD Authentication

- Perform this configuration based on requirements.
- Run the **domain-password** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

- IS-IS plaintext authentication provides only limited security because the password transferred through a packet is visible.
- IS-IS MD5 authentication provides higher security because the password transferred through a packet is encrypted using the MD5 algorithm.

### ▾ Configuring the Password for Plaintext Authentication of Hello Packets on an Interface

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>isis password [ 0   7 ] password [ send-only ] [ level-1   level-2 ]</b>   |
| <b>Parameter Description</b> | <p><b>0:</b> Indicates that the key is displayed in plaintext.</p> <p><b>7:</b> Indicates that the key is displayed in ciphertext.</p> <p><b>password-string:</b> Indicates the password string for plaintext authentication. The string can contain up to 126 characters.</p> <p><b>send-only:</b> Indicates that the plaintext authentication password is only used to authenticate sent packets. Received packets are not authenticated.</p> <p><b>level-1:</b> Applies the setting to the Level-1 circuit type.</p> |

|                     |  |
|---------------------|--|
|                     | <b>level-2:</b> Applies the setting to the Level-2 circuit type.   |
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | <p>Use this command to configure the password for Hello packet authentication on an interface. Use the <b>no</b> form of this command to clear the password.</p> <p>If no Level is specified, by default, the password takes effect for Level-1 and Level-2 circuit types.</p> <p>This command does not take effect if the <b>isis authentication mode</b> command is executed. You need to first delete the previous command configuration.</p> <p>If you include the <b>send-only</b> parameter when deleting the <b>isis authentication mode</b> command configuration, only the parameter setting is canceled.</p> |

### ▾ Specifying Interface Authentication as Plaintext or MD5

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>isis authentication mode</b> { <b>md5</b>   <b>text</b> } [ <b>level-1</b>   <b>level-2</b> ]  |
| <b>Parameter Description</b> | <p><b>md5:</b> Uses MD5 authentication.</p> <p><b>text:</b> Uses plaintext authentication.</p> <p><b>level-1:</b> Applies the setting to the Level-1 circuit type.</p> <p><b>level-2:</b> Applies the setting to the Level-2 circuit type.</p>  |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | <p>Use this command to specify the authentication mode before you can make the key chain configured using the <b>isis authentication key-chain</b> command take effect.</p> <p>If no Level is specified, the authentication mode will take effect for Level-1 and Level-2 circuit types.</p> <p>If you use the <b>isis authentication mode</b> command after the <b>isis password</b> command is executed to configure plaintext authentication, the previous command configuration will be overwritten.</p> <p>The <b>isis password</b> command does not take effect if the <b>isis authentication mode</b> command is executed.</p> <p>To run the <b>isis password</b> command, delete the <b>isis authentication mode</b> command configuration first.</p> |

### ▾ Configuring the Password for Interface Authentication

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>isis authentication key-chain</b> <i>name-of-chain</i> [ <b>level-1</b>   <b>level-2</b> ]   |
| <b>Parameter Description</b> | <p><i>name-of-chain:</i> Indicates the name of a key chain. The maximum length is 255.</p> <p><b>level-1:</b> Indicates that the authentication key chain takes effect for Level-1.</p> <p><b>level-2:</b> Indicates that the authentication key chain takes effect for Level-2.</p>  |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | <p>Authentication is not performed if no key chain is configured using the <b>key chain</b> command. In addition to the <b>key chain</b> command, you also need to run the <b>isis authentication mode</b> command to make IS-IS key chain authentication take effect.</p> <p>The key chain is applicable to plaintext authentication and MD5 authentication. Which authentication mode to use can be determined using the <b>isis authentication mode</b> command.</p> <p>For plaintext authentication, the key-string in the key chain cannot exceed 80 characters; otherwise, the key chain will be invalid.</p> |

|  |  |
|--|--|
|  | <p>Only one key chain can be used at a time. After you configure a new key chain, it will replace the original one.</p> <p>If no Level is specified, the key chain takes effect for Level-1 and Level-2.</p> <p>The key chain is applicable to Hello packets. IS-IS will send or receive passwords that belong to the key chain.</p> <p>A key chain may contain multiple passwords. A password with a smaller SN is preferentially used for sending a packet. When the packet arrives at the peer device, the device will receive the packet if the packet-carried password is consistent with a password in the key chain.</p> <p>The authentication commands (for example, <b>authentication key-chain</b>) executed in IS-IS routing process configuration mode are intended for LSPs and SNPs. They do not take effect for IS-IS interfaces.</p> |
|--|--|

#### 📌 (Optional) Applying Interface Authentication Only to Sent Packets (Received Packets Are Not Authenticated)

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>isis authentication send-only [ level-1   level-2 ]</b>   |
| <b>Parameter Description</b> | <b>level-1:</b> Sets <b>send-only</b> for Level-1 on an interface.<br><b>level-2:</b> Sets <b>send-only</b> for Level-2 on an interface.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>Use this command to enable IS-IS to set an authentication password in the Hello packet sent by an interface. However, IS-IS does not authenticate the Hello packet received by the interface. You can use this command before you deploy IS-IS interface authentication on all devices in the network or before you change the authentication password or authentication mode. After you run the <b>isis authentication send-only</b> command, the devices will not authenticate received Hello packets to avoid network flapping when IS-IS interface authentication is deployed. After authentication is deployed in the entire network, run the <b>no isis authentication send-only</b> command to cancel the <b>send-only</b> setting.</p> <p>The <b>isis authentication send-only</b> command is applicable to plaintext authentication and MD5 authentication. You can run the <b>isis authentication mode</b> command to specify the authentication mode for an IS-IS interface.</p> <p>If no Level is specified, the authentication mode will take effect for Level-1 and Level-2 on the interface.</p> |

#### 📌 Configuring the Password for Area (Level-1) Plaintext Authentication

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>area-password [ 0   7 ] password [ send-only ]</b>   |
| <b>Parameter Description</b> | <p><b>0:</b> Indicates that the key is displayed in plaintext.</p> <p><b>7:</b> Indicates that the key is displayed in ciphertext.</p> <p><b>password-string:</b> Indicates the password string for plaintext authentication. The string can contain up to 126 characters.</p> <p><b>send-only:</b> Indicates that the plaintext authentication password is only used to authenticate sent Hello packets in Level-1 areas. Received Hello packets are not authenticate.</p> |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | Run this command to enable authentication of received LSPs, CSNPs, and PSNPs in Level-1 areas and include authentication information in these packets before they are sent. All IS-IS devices in an area must be  |

|  |   |
|--|---|
|  | <p>configured with the same password.</p> <p>This command does not take effect if the <b>authentication mode</b> command is executed. You need to first delete the previous command configuration.</p> <p>To delete the password, run the <b>no area-password</b> command. If you run the <b>no area-password send-only</b> command, only the <b>send-only</b> setting is canceled. If you run the <b>area-password psw send-only</b> and <b>no area-password send-only</b> commands in sequence, the configuration is changed to <b>area-password psw</b>.</p> |
|--|---|

📌 **Configuring the Password for RD (Level-2) Plaintext Authentication**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>domain-password [ 0   7 ] password [ send-only ]</b>   |
| <b>Parameter Description</b> | <p><b>0:</b> Indicates that the key is displayed in plaintext.</p> <p><b>7:</b> Indicates that the key is displayed in ciphertext.</p> <p><b>password-string:</b> Indicates the password string for plaintext authentication. The string can contain up to 126 characters.</p> <p><b>send-only:</b> Indicates that the plaintext authentication password is only used to authenticate sent Hello packets in Level-1 areas. Received Hello packets are not authenticated.</p>  |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | <p>Run this command to enable authentication of received LSPs, CSNPs, and PSNPs in Level-2 domains and include authentication information in these packets before they are sent. All IS-IS devices in a Level-2 domain must be configured with the same password.</p> <p>This command does not take effect if the <b>authentication mode</b> command is executed. You need to first delete the previous command configuration.</p> <p>To delete the password, run the <b>no domain-password</b> command. If you run the <b>no domain-password send-only</b> command, only the <b>send-only</b> setting is canceled. If you run the <b>domain-password psw send-only</b> and <b>no domain-password send-only</b> commands in sequence, the configuration is changed to <b>domain-password psw</b>.</p> |

📌 **Specifying the IS-IS RD Authentication Mode**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>authentication mode { md5   text } [ level-1   level-2 ]</b>   |
| <b>Parameter Description</b> | <p><b>md5:</b> Uses MD5 authentication.</p> <p><b>text:</b> Uses plaintext authentication.</p> <p><b>level-1:</b> Indicates that the authentication mode takes effect for Level-1.</p> <p><b>level-2:</b> Indicates that the authentication mode takes effect for Level-2.</p>  |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | <p>Use this command to specify the authentication mode before you can make the key chain configured using the <b>authentication key-chain</b> command take effect.</p> <p>If no Level is specified, the authentication mode will take effect for Level-1 and Level-2.</p> <p>If you use the <b>authentication mode</b> command after the <b>area-password</b> or <b>domain-password</b> command is executed to configure plaintext authentication, the previous command configuration will be overwritten.</p> <p>The <b>area-password</b> or <b>domain-password</b> command does not take effect if the <b>authentication mode</b></p> |

|  |  |
|--|--|
|  | command is executed. To run the <b>area-password</b> or <b>domain-password</b> command, delete the <b>authentication mode</b> command configuration first. |
|--|--|

➤ **Specifying the Key Chain for IS-IS Authentication**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>authentication key-chain</b> <i>name-of-chain</i> [ <b>level-1</b>   <b>level-2</b> ]   |
| <b>Parameter Description</b> | <i>name-of-chain</i> : Indicates the name of a key chain. The maximum length is 255.<br><b>level-1</b> : Indicates that the authentication key chain takes effect for Level-1.<br><b>level-2</b> : Indicates that the authentication key chain takes effect for Level-2.   |
| <b>Command Mode</b>          | IS-IS routing process configuration mode   |
| <b>Usage Guide</b>           | <p>Authentication is not performed if no key chain is configured using the <b>key chain</b> command. In addition to the <b>key chain</b> command, you also need to run the <b>authentication mode</b> command to make IS-IS key chain authentication take effect.</p> <p>The key chain is applicable to plaintext authentication and MD5 authentication. Which authentication mode to use can be determined using the <b>authentication mode</b> command.</p> <p>For plaintext authentication, the key-string in the key chain cannot exceed 80 characters; otherwise, the key chain will be invalid.</p> <p>Only one key chain can be used at a time. After you configure a new key chain, it will replace the original one.</p> <p>If no Level is specified, the key chain takes effect for Level-1 and Level-2.</p> <p>The key chain is applicable to LSPs, CSNPs, and PSNPs. IS-IS will send or receive passwords that belong to the key chain.</p> <p>A key chain may contain multiple passwords. A password with a SN is preferentially used for sending a packet. When the packet arrives at the peer device, the device will receive the packet if the packet-carried password is consistent with a password in the key chain.</p> |

➤ **Applying IS-IS Authentication Only to Sent Packets**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>authentication send-only</b> [ <b>level-1</b>   <b>level-2</b> ]   |
| <b>Parameter Description</b> | <b>level-1</b> : Applies the <b>send-only</b> setting to Level-1.<br><b>level-2</b> : Applies the <b>send-only</b> setting to Level-2.  |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | <p>Use this command to enable IS-IS to set an authentication password in the Hello packet to be sent. However, IS-IS does not authenticate received Hello packets. You can use this command before you deploy IS-IS authentication on all devices in the network or before you change the authentication password or authentication mode. After you run the <b>authentication send-only</b> command, the devices will not authenticate received packets to avoid network flapping when authentication passwords are deployed. After authentication is deployed in the entire network, run the <b>no isis authentication send-only</b> command to cancel the <b>send-only</b> setting.</p> <p>The <b>authentication send-only</b> command is applicable to plaintext authentication and MD5 authentication. You can run the <b>authentication mode</b> command to specify the authentication mode.</p> |

If no Level is specified, the authentication mode will take effect for Level-1 and Level-2.

### Configuration Example

#### Configuring IS-IS Authentication

|   |   |
|---|---|
| <p><b>Configuration Requirements</b></p>                | <p>Router A, Router B, and Router C are connected through the Ethernet and run IS-IS. Router A is a Level-1 device, Router B is a Level-1/Level-2 device, and Router C is a Level-2 device. The following configuration requirements exist: Apply plaintext authentication to the Hello packets between Router A and Router B, as well as Level-1 LSPs and SNPs. Apply MD5 authentication to the Hello packets between Router B and Router C, as well as Level-2 LSPs and SNPs.</p> |
| <p><b>Figure 4-13 IS-IS Authentication Topology</b></p> |   |
| <p><b>Configuration Steps</b></p>                       | <ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> <li>● Configure the password for IS-IS authentication.</li> </ul>  |

### Common Errors

- Different authentication passwords are configured between neighbors.
- Different authentication modes are configured between neighbors.

## 4.4.7 Configuring IS-IS GR

### Configuration Effect

- IS-IS GR helps improve system reliability. On devices that separate the control plane from the forwarding plane, GR ensures that data forwarding is not interrupted during routing protocol restart.

### IS-IS GR Working Mechanism

For GR to be successful, the following two conditions must be met: (1) The network topology is stable; (2) The device can ensure uninterrupted forwarding when it restarts IS-IS.

Two roles exist during the GR process: Restarter and Helper. Accordingly, IS-IS GR is divided into the IS-IS GR Restart capability and IS-IS GR Help capability. A device with the GR Restart capability can send a GR request and execute GR. A device with the GR Help capability can receive a GR request and help its neighbor with GR implementation. The GR process

starts when the Restarter sends a GR request. After receiving the GR request, the neighboring device enters Help mode to help the Restarter reestablish its LSDB while maintaining the neighbor relationship with the Restarter. The main GR working mechanism is as follows:

When an IS-IS device needs to perform GR, it instructs its neighbor to maintain their neighbor relationship so that other devices in the network cannot sense the change in the topological relationship and the neighbor will not recalculate the route and update its forwarding table. The IS-IS device synchronizes and restores the LSDB to its pre-GR state with the help of the neighbor to ensure that the route and forwarding table remain unchanged before and after GR implementation and data forwarding is not interrupted.

The Restarter performs the following operations during the GR process:

1. The GR Restarter notifies the GR Helpers that it will be restarted.

Figure 4-14 Restart Notification by the GR Restarter

Switch A is a GR Restarter, and Switch B and Switch C are the GR Helpers for Switch A. Switch A sends a GR request instructing all its neighbors not to delete the neighbor relationships with Switch A when it is restarted. After receiving the GR request, the neighbors send GR responses to the GR Restarter, and will maintain their neighbor relationships with the GR Restarter during the GR time (specified by **GR grace-period**) notified by the GR Restarter.

2. The GR Restarter is restarted.

Figure 4-15 Restart Performed by the GR Restarter

When the GR Restarter is restarted, its IS-IS interface goes from Down to Up. Because the GR Helpers know that the GR Restarter is in IS-IS restart state, they maintain their neighbor relationships with the GR Restarter during the GR time and retain the routes from the GR Restarter.

- 3. The GR Restarter synchronizes topology and routing information from the GR Helpers.

Figure 4-16 LSDB Synchronization

After IS-IS restart, the GR Restarter synchronizes topology or routing information from the GR Helpers and recalculates its routing table. During this process, any change in the routing table is not updated to the forwarding table.

- 4. GR is completed when the GR Restarter finishes LSDB synchronization. Then all devices enter IS-IS interaction state.

Figure 4-17 GR Completion

After the GR Restarter synchronizes all required data, all devices enter IS-IS interaction state. The GR Restarter's routing table is updated to the forwarding table and invalid entries are cleared. Because the GR Restarter is completely restored to the pre-restart state under stable network conditions, its routing table and forwarding table remain unchanged before and after GR.

## Notes

- IS-IS GR is implemented based on RFC5306: Restart Signaling for IS-IS.

✔ All products support the IS-IS GR Helper capability.

## Configuration Steps

### ▾ Enabling the IS-IS GR Restart Capability

- Perform this configuration based on requirements.
- Run the **graceful-restart** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ▾ Configuring the Maximum GR Time

- Perform this configuration based on requirements.
- Run the **graceful-restart grace-period** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ▾ Enabling the IS-IS GR Help Capability

- Perform this configuration based on requirements.
- Run the **graceful-restart helper** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

- Check whether the routing table and forwarding table remain unchanged before and after GR.

## Related Commands

### 4.4.8 Configuring BFD Support for IS-IS

#### Configuration Effect

- IS-IS dynamically discovers neighbors through Hello packets. After IS-IS enables the BFD function, a BFD session will be set up with the neighbor in Up state. The BFD mechanism is used to detect the neighbor state. Once a neighbor

failure is detected through BFD, IS-IS performs network convergence immediately. The convergence time can be reduced from 30s to less than 1s. By default, IS-IS Hello packets are sent at an interval of 10s in a P2P network, and the time required to detect a neighbor failure is three times the packet interval, that is 30s.

### Notes

- You must set BFD session parameters before you enable BFD support for IS-IS.
- When you run the **bfd up-dampening** command on an interface with BFD support for IS-IS, you need to run the **bfd all-interfaces** command with the *[anti-congestion]* option selected.
- When you run the **bfd all-interfaces** command with the *[anti-congestion]* option selected, run the **bfd up-dampening** command on the interface.
- IP routing may cause a neighbor's interface for BFD session setup to be inconsistent with the interface for outgoing BFD packets. If this happens, the BFD session cannot be set up.
- If a neighbor's interface for BFD session setup is inconsistent with the interface for outgoing BFD packets, the BFD session cannot be set up.

### Configuration Steps

#### ↳ Enabling BFD Support for IS-IS on All Interfaces

- Perform this configuration based on requirements.
- Run the **bfd all-interfaces** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↳ Enabling BFD Support for IS-IS on the Current Interface

- Perform this configuration based on requirements.
- Run the **isis bfd** command in interface configuration mode on the desired device, unless otherwise specified.

### Verification

- Build a topology with two parallel lines. Typically, IS-IS selects one line as the master line and the other as the backup line. Enable BFD on the master line.
- Make the master line fail. Check whether IS-IS performs route convergence based on the BFD monitoring state and starts the backup line.

### ↘ Enabling BFD Support for IS-IS on the Current Interface

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>isis bfd [ disable   anti-congestion ]</b>  |
| <b>Parameter</b>    | <i>disable</i> : Disables BFD support for IS-IS on the current interface.  |
| <b>Description</b>  | <i>anti-congestion</i> : Indicates the IS-IS BFD anti-congestion option.   |
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | <p>You can enable or disable BFD on an IS-IS interface by using any of the following two methods:</p> <p>Method 1: Run the [ <b>no</b> ] <b>bfd all-interfaces [anti-congestion]</b> command in IS-IS routing process configuration mode to enable or disable BFD on all IS-IS interfaces.</p> <p>Method 2: Run the <b>isis bfd [disable   anti-congestion]</b> command in interface configuration mode to enable or disable BFD on the specified interface.</p> <p>Normally, BFD sends detection packets at millisecond intervals to detect the link state. When a link exception (such as a disconnected link) occurs, BFD can quickly detect it and instruct IS-IS to delete the neighbor relationship and the neighbor reachability information in LSPs. Then IS-IS recalculates and generates a new route to bypass the abnormal link, thus realizing fast convergence. With the introduction of new techniques such as the Multi-Service Transport Platform (MSTP), link congestion tends to occur during peak hours of data communication. BFD quickly detects the link exception and instructs IS-IS to delete the neighbor relationship and the neighbor reachability information in LSPs. Link switch is performed to bypass the congested link. A Hello packet for IS-IS neighbor detection is sent every 10s and its expiration time is 30s. The Hello packet can still be received normally when BFD detects an exception, and therefore an IS-IS neighbor relationship is reestablished quickly, causing the route to be restored to the congested link. Then BFD detects the abnormal link and link switch is performed again. This process is repeated, which makes the route be switched between the congested link and other links, causing repetitive flapping.</p> <p>The <b>anti-congestion</b> option is used to avoid routing flapping in case of link congestion. After the option is configured, the IS-IS neighbor state is still kept alive when link congestion occurs, but the neighbor reachability information in LSPs is deleted. The route is switched to a normal link. When the congested link is restored, the neighbor reachability information in LSPs is recovered and the route is switched back, which avoids route flapping.</p> <p>When you run the <b>bfd all-interfaces [anti-congestion]</b> command, run the <b>bfd up-dampening</b> command on the interface. The two commands must be used together. If you run only one command, the route flap dampening feature may not take effect or other network exceptions may occur.</p> |

### Configuration Example

➤ **Enabling BFD Support for IS-IS on the Current Interface**

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Set BFD session parameters. (Omitted)</li> <li>● Enable BFD support for IS-IS on the current interface.</li> </ul>   |
|                            | <pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis bfd</pre>  |
| <b>Verification</b>        | <p>Enable S1 (192.168.1.10) and S2 (192.168.2.10) to send packets to G1 (229.1.1.1) and G2 (229.1.2.1). Add User to the G1 and G2 groups.</p> <ul style="list-style-type: none"> <li>● Check the multicast packet that User receives. User should only receive the (S1, G1) packet.</li> <li>● Check that the PIM-SM routing table does not have the (S1, G2), (S2, G1), and (S2, G2) entries.</li> </ul> |
|                            | <pre>A# show bfd neighbors detail</pre>   |

**Common Errors**

- BFD support for IS-IS is not enabled on neighbors.

**4.4.9 Setting the IS-IS Overload Bit**

**Configuration Effect**

The overload bit is used in the following three situations:

- Device overload

The local IS-IS node has overload issues, such as insufficient memory or full CPU load; as a result, its routing table has incomplete routes or does not have resource forwarding data. You can set the overload bit in an LSP to instruct the neighbor not to use the local node as a forwarding device.

To set the overload bit, run the **set-overload-bit** command without the **on-startup** keyword. The overload bit can be configured or canceled manually. When the local IS-IS node is restored, manually cancel the command configuration; otherwise, the node is always in overload state.

- Instantaneous black hole

In the scenario described by RFC3277, the IS-IS convergence speed is faster than the BGP speed; as a result, after an IS-IS node is restarted, a route may be instantaneously unreachable, which is called an instantaneous black hole. You can set the overload bit in an LSP to instruct the neighbor not to use the local node as a forwarding device until the specified time has elapsed.

To set the overload bit, run the **set-overload-bit** command with the **on-startup** keyword. The overload bit can be configured or canceled automatically by the IS-IS node based on the configuration. If the **on-startup** keyword is selected, the IS-IS node

automatically enters instantaneous black hole state after restart. When a neighbor relationship is established, the IS-IS node sends an LSP with the overload bit to notify the neighbor that the local node enters instantaneous black hole (or overload) state and instruct the neighbor not to use the local node as a forwarding device. After the specified time has elapsed, the IS-IS node immediately sends an LSP with the overload bit canceled to notify the neighbor that the local node has exited instantaneous black hole (or overload) state and can work as a forwarding device.

- Disabling real data forwarding on the local IS-IS node

If you only need to connect the local IS-IS node to a production network for testing or to meet other functional requirements, but does not require the node to forward real data in the network, you can set the overload bit in an LSP to instruct the neighbor not to use the local node as a forwarding device.

To set the overload bit, run the **set-overload-bit** command without the **on-startup** keyword. The overload bit can be configured or canceled manually. You can set the **suppress** keyword based on requirements to limit the routing information carried in an LSP in case of overload. For example, internal and external routes can be suppressed, and only the local direct route is advertised.

### Notes

- At the same Level, the configuration with the **on-startup** keyword is mutually exclusive with the configuration without the **on-startup** keyword.

### Configuration Steps

- Perform this configuration based on requirements.
- Run the **set-overload-bit** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### Verification

- Capture packets and check that the neighbor does not forward LSPs from the local node.

| <b>Verification</b>        | <p>Capture packets to check LSPs. Verify that the LSPs carry the overload bit and only advertise local direct routes.</p>  |
|                            | <pre>A# show isis neighbors</pre>  |

## 4.4.10 Configuring IS-IS VRF

### Configuration Effect

- Each VRF table can be seen as a virtual device or a dedicated PE device.
- The virtual device contains the following elements: an independent routing table, as well as an independent address space; a set of interfaces that belong to the VRF table; a set of routing protocols applicable only to the VRF table.
- Each device can maintain one or more VRF tables and a public-network routing table (also called a global routing table). Multiple VRF instances are separated from each other.

### Notes

- Note the following constraints or conventions when you bind IS-IS instances and VRF tables:
- The IS-IS instances bound with the same VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same system ID.
- One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.
- When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the **ip router isis [tag]** interface configuration and the redistribution configuration in routing process configuration mode will be deleted.

### Configuration Steps

- Perform this configuration based on requirements.
- Run the **vrf** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### Verification

- Check whether the local device establishes neighbor relationships with other devices specified in the VRF table.

| <b>Command Mode</b> | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>  | <p>Before you bind an IS-IS instance to a VRF table, ensure that the VRF table has been configured. If you need to establish an IS-ISv6 neighbor relationship, enable IPv6 and ensure that the table to be bound is a multiprotocol VRF table.</p> <p>Note the following constraints or conventions when you bind IS-IS instances and VRF tables:</p> <ul style="list-style-type: none"> <li>● The IS-IS instances bound with the same non-default VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same</li> </ul> |

|  |   |
|--|---|
|  | <p>system ID.</p> <ul style="list-style-type: none"> <li>● One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.</li> <li>● When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the <b>ip</b> (or <b>ipv6</b>) <b>router isis</b> [ tag ] interface configuration and the redistribution configuration in routing process configuration mode will be deleted.</li> </ul> |
|--|---|

### Configuration Example

#### Configuring IS-IS VRF

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Bind an IS-IS instance to a VRF table.</li> <li>● Add interfaces to the VRF table and IS-IS instance. (Omitted)</li> </ul> |
|                            | <pre>A(config)#vrf definition vrf_1 A(config-vrf)#address-family ipv4 A(config-vrf-af)#exit-address-family A(config)# router isis A(config-router)# vrf vrf_1</pre> |
| <b>Verification</b>        | Check whether the local device establishes neighbor relationships with other devices specified in the VRF table.  |
|                            | <pre>A# show isis neighbors</pre>   |

### Common Errors

- Interfaces are not added to the VRF table.
- The IP addresses of the interfaces connected between neighbors are not in the same network segment.
- The **ip router isis** command is not executed on interfaces.
- No NET address is configured, or different NET addresses exist at Level-1.
- **max-area-addresses** is configured differently on both sides.
- **metric-style** is configured differently on both sides.
- The interface Levels on both sides are different. One side is Level-1, whereas the other side is Level-2.
- One side is configured with the P2P mode, whereas the other side is configured with the broadcast mode.
- One side is enabled with authentication, whereas the other side is not.

#### 4.4.11 Configuring IS-IS MTR

### Configuration Effect

- If the **multi-topology** command is not executed, IPv4 and IPv6 share one IS-IS physical topology, also called the default topology. If the **multi-topology** command is executed without the **transition** parameter, routing devices run in MT mode. IS-ISv4 runs in the default topology, and IS-ISv6 runs in the IPv6 unicast topology. If the **multi-topology** command is executed with the **transition** parameter, routing devices run in MTT mode. IS-ISv6 runs in the default topology and IPv6 unicast topology. The three configurations are mutually exclusive. The routing devices in MTT mode can transfer the MT TLV or the default topology TLV. The MTT mode is applicable to incremental deployment to ensure smooth network migration. The MTT mode can cause route leaking between the default topology and IPv6 unicast topology. If the MTT mode is configured improperly, network failures such as routing black holes and loops may occur.

### Notes

Note the following constraints or conventions when you configure the IS-IS MTR feature:

- Set **metric-style** to **Wide** or **Transition** before you run the **multi-topology** command.
- The MTR feature will be disabled if **metric-style** is set to **Narrow** or only one Level is configured to support the Wide or Transition mode.

### Configuration Steps

- Perform this configuration based on requirements.
- Configure the MTR feature in IS-IS address-family ipv6 configuration mode on the desired device, unless otherwise specified.

### Verification

- Check whether the local device establishes neighbor relationships with other devices.

### Configuration Example

➤ **Configuring IS-IS MTR**

**Configuration Requirements**

The typical application scenario of MTR is to retain devices that only support IPv4 services in a network where IPv6 service extension will be performed.

In Figure 4-19, Router 2 only supports the IPv4 protocol stack but does not support the MTR feature; therefore, it can only run IPv4 services. The network capacity needs to be scaled to support IPv6 services in order to meet service extension requirements. (Router 1, Router 3, and Router 4 that support the MTR feature will be added.) The device (Router 2) that supports only one protocol stack must be replaced to maintain the stability of the network running IPv4 and IPv6 dual protocol stacks; otherwise, IPv6 routing black holes may occur.

If you need to retain Router 2, you can configure the MTR feature on Router 1, Router 3, and Router 4. The MTR feature enables Router 2 to continue to run IPv4 services without interference on the IPv4 and IPv6 services on Router 1, Router 3, and Router 4. The MTR feature improves networking flexibility, indirectly prolongs the service life of old devices, and meets service extension requirements while maximizing the values of old devices.

The configuration requirements are as follows:

- Retain Router 2, which only supports IPv4 services.
- Add devices that support IPv4 and IPv6 dual topologies, and separate IPv4 route calculation and IPv6 route calculation based on different topologies.

**Figure 4-19**  
**IS-IS MTR**  
**Topology**

**Router 1**

Configure IS-IS and Ethernet interfaces.

Configure IS-IS:

```

Ruijie(config)# router isis
Ruijie(config-router)# net 49.0001. 0000.0000.0001.00
Ruijie(config-router)# is-type level-1
Ruijie(config-router)# metric-style wide
    
```

```

## Common Errors

- **metric-style** is not set to **Wide** or **Transition**.
- The protocol types used by two neighbors do not match; therefore, a neighbor relationship cannot be established.
- The IP addresses of the interfaces connected between neighbors are not in the same network segment.
- The **ip router isis** command is not executed on interfaces.
- No NET address is configured, or different NET addresses exist at Level 1.
- **max-area-addresses** is configured differently on both sides.
- **metric-style** is configured differently on both sides.
- The interface Levels on both sides are different. One side is Level-1, whereas the other side is Level-2.
- One side is configured with the P2P mode, whereas the other side is configured with the broadcast mode.
- One side is enabled with authentication, whereas the other side is not.

## 4.4.12 Configuring SNMP for IS-IS

### Configuration Effect

- By default, the SNMP software can perform the MIB operation on the first IS-IS instance. To perform the MIB operation on other instances, you need to manually specify these instances.

### Notes

- By default, the SNMP software can perform the MIB operation on the first displayed IS-IS instance.

### Configuration Steps

#### ↘ Binding the Instances on Which the IS-IS MIB Operation Will Be Performed

- Perform this configuration based on requirements.
- Run the **enable mib-binding** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ Enabling IS-IS Trap Globally

- Perform this configuration based on requirements.
- Run the **snmp-server enable traps isis** command in global configuration mode on the desired device, unless otherwise specified.

#### ↘ Configuring an SNMP Host Globally

- Perform this configuration based on requirements.
- Run the **snmp-server host** command in global configuration mode on the desired device, unless otherwise specified.

#### ↘ Allowing the Sending of all IS-IS Trap Messages to the SNMP Host

- Perform this configuration based on requirements.
- Run the **enable traps all** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### Verification

- Use the MIB tool to read and write IS-IS settings.

### Related Commands

#### ↘ Binding the Instances on Which the IS-IS MIB Operation Will Be Performed

|                    |  |
|--------------------|--|
| <b>Command</b>     | <b>enable mib-binding</b>                |
| <b>Parameter</b>   | N/A                                      |
| <b>Description</b> |  |
| <b>Command</b>     | IS-IS routing process configuration mode |

|                    |  |
|--------------------|--|
| <b>Mode</b>        |  |
| <b>Usage Guide</b> | The latest standards stipulate that the MIB operation can be performed on a single instance. By default, the MIB operation is performed on the first displayed IS-IS instance. Because multiple IS-IS instances can be configured, the administrator can use this command to specify the instances on which the MIB operation will be performed. |

### ↳ Enabling IS-IS Trap Globally

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>snmp-server enable traps</b> [ <i>isis</i> ]  |
| <b>Parameter Description</b> | <i>isis</i> : Enables IS-IS event trap.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | This command must be used with the <b>snmp-server host</b> command in global configuration mode so that trap messages can be sent. |

### ↳ Configuring an SNMP Host Globally

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>snmp-server host</b> { <i>host-addr</i>   <b>ipv6</b> <i>ipv6-addr</i> } [ <b>vrf</b> <i>vrfname</i> ] [ <b>traps</b> ] [ <b>version</b> { <b>1</b>   <b>2c</b>   <b>3</b> { <b>auth</b>   <b>noauth</b>   <b>priv</b> } ] <i>community-string</i> [ <b>udp-port</b> <i>port-num</i> ] [ <i>notification-type</i> ]  |
| <b>Parameter Description</b> | <p><i>host-addr</i>: Indicates the address of the SNMP host.</p> <p><i>ipv6-addr</i>: Indicates the IPv6 address of the SNMP host.</p> <p><i>vrfname</i>: Indicates the name of a VRF table.</p> <p><b>version</b>: Indicates the SNMP version, which can be set to <b>V1</b>, <b>V2C</b>, or <b>V3</b></p> <p><b>auth</b>   <b>noauth</b>   <b>priv</b>: Indicates the security level of V3 users.</p> <p><i>community-string</i>: Indicates the community string or user name (V3 version).</p> <p><i>port-num</i>: Indicates the port number of the SNMP host.</p> <p><i>notification-type</i>: Indicates the type of trap messages that are actively sent, for example, snmp.</p> |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | This command is used with the <b>snmp-server enable traps</b> command to actively send trap messages to a Network Management System (NMS). You can configure different SNMP hosts to receive trap messages. A host supports different trap types, ports, and VRF tables. For the same host (with the same port configuration and VRF configuration), the last configuration is combined with the previous configurations. That is, to send different trap messages to the same host, configure a type of trap messages each time. These configurations are finally combined.  |

### ↳ Allowing the Sending of Trap Messages

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>enable traps</b> { <b>all</b>   <i>traps set</i> }  |
| <b>Parameter Description</b> | <p><b>all</b>: Indicates all trap messages.</p> <p><i>traps set</i>: Indicates a trap message type in any set.</p> |

|                     |   |
|---------------------|---|
| <b>Command Mode</b> | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>  | IS-IS packets are classified into 18 types of trap messages, which are grouped into several sets, with each set containing several trap message types. To enable the sending of IS-IS trap messages, run the <b>snmp-server enable traps isis</b> command in global configuration mode and specify the recipient host and the type of trap messages that can be sent. |

### Configuration Example

#### Configuring IS-IS SNMP

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Bind the instances on which the IS-IS MIB operation will be performed.</li> <li>● Complete trap message-related settings.</li> </ul>   |
|                            | <pre>A(config)# router isis A(config-router)# enable mib-binding A# configure terminal A(config)#snmp-server enable traps isis A(config)#snmp-server host 10.1.1.1 traps version 2c public A(config)#router isis A(config-router)# enable traps all</pre> |
| <b>Verification</b>        | Run the MIB tool to read and write IS-IS settings.  |
|                            | <pre>A# show running-config</pre>   |

### 4.4.13 Configuring Other IS-IS Parameters

#### Configuration Effect

- **maximum-paths:** Configures the maximum number of IS-IS equal-cost paths to be installed to a routing table.
- **isp-length receive:** Configures the maximum length allowed for received LSPs.
- **isp-length originate:** Configures the maximum length allowed for sent LSPs.
- **passive-interface:** Prevents passive interfaces from receiving and sending IS-IS packets. That is, IS-IS neighbor relationships will not be established on passive interfaces. The IP addresses of passive interfaces are flooded through other interfaces.
- **isis metric:** Stores the metric, which is used in SPF calculation, in the IP reachability information TLV. The greater the metric, the greater the routing consumption of the interface and the longer the path obtained by SPF calculation.

- **isis priority:** In a broadcast network, IS-IS needs to elect a DIS among all devices. The DIS will generate a pseudonode and related LSPs. The device with the highest priority is elected as the DIS. You can configure different priorities for different Levels.
- **default-information originate:** Generates a Level-2 default route, which will be advertised through LSPs.
- **spf-interval:** Configures the exponential backoff algorithm of SPF.
- **summary-address** and **summary-prefix:** Creates a summary route to represent a group of routes in a routing table. A summary route can include multiple routes of the specified Level. The interface metric of the summary route follows the smallest interface metric among all routes.
- **log-adjacency-changes:** Enables neighbor relationship event output to log IS-IS neighbor relationship changes.
- **redistribute:** Redistributes other routes to IS-IS; redistributes Level-1 routes to Level-2; redistributes Level-2 routes to Level-1.

## Configuration Steps

### ↘ Configuring the Maximum Number of Equal-Cost Paths

- Perform this configuration based on requirements.
- Run the **maximum-paths** command in IS-IS routing process configuration mode or IS-IS address-family ipv6 configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the Maximum Length Allowed for Received LSPs

- Perform this configuration based on requirements.
- Run the **isp-length receive** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the Maximum Length Allowed for Sent LSPs

- Perform this configuration based on requirements.
- Run the **isp-length originate** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring a Passive Interface

- Perform this configuration based on requirements.
- Run the **passive-interface** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the IS-IS Interface Metric

- Perform this configuration based on requirements.
- Run the **isis metric** command in interface configuration mode on the desired device, unless otherwise specified.

### ↘ Configuring the Priority of the DIS

- Perform this configuration based on requirements.
- Run the **isis priority** command in interface configuration mode on the desired device, unless otherwise specified.

### ↘ **Configuring the SPF Calculation Cycle**

- Perform this configuration based on requirements.
- Run the **spf-interval** command in interface configuration mode on the desired device, unless otherwise specified.

### ↘ **Generating a Default Route**

- Perform this configuration based on requirements.
- Run the **default-information originate** command in IS-IS routing process configuration mode or IS-IS address-family ipv6 configuration mode on the desired device, unless otherwise specified.

### ↘ **Configure a Summary Route**

- Perform this configuration based on requirements.
- Run the **summary-address** and **summary-prefix** commands in IS-IS routing process configuration mode or IS-IS address-family ipv6 configuration mode on the desired device, unless otherwise specified.

### ↘ **Enabling Neighbor Relationship Event Output**

- Perform this configuration based on requirements.
- Run the **log-adjacency-changes** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ↘ **Configuring Route Redistribution**

- Perform this configuration based on requirements.
- Run the **redistribute** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

- **maximum-paths:** Check whether the maximum number of equal-cost paths displayed by routing entries is the same as the configuration.
- **lsp-length receive:** Capture packets to check the length of LSPs.
- **lsp-length originate:** Capture packets to check the length of LSPs.
- **passive-interface:** Capture packets to check whether the interface receives and sends IS-IS packets.
- **isis metric:** Check the database details of IS-IS.
- **isis priority:** Check whether the device with the changed priority setting is elected as the DIS.
- **default-information originate:** Check whether a default route is generated.
- **spf-interval:** Check whether the SPF calculation cycle works.

- **summary-address and summary-prefix:** Capture packets to check whether the summary route instead of detailed routes is advertised through LSPs.
- **log-adjacency-changes:** Change the neighbor state and verify that the change is recorded when debugging is disabled.
- **redistribute:** Check IS-IS routing entries.

## Related Commands

### ▾ Configuring the Maximum Number of Equal-Cost Paths

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>maximum-paths</b> <i>maximum</i>  |
| <b>Parameter Description</b> | <i>maximum</i> : Indicates the maximum number of IS-IS equal-cost routes to be installed to a routing table. The value range is 1 to 32.   |
| <b>Command Mode</b>          | IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode  |
| <b>Usage Guide</b>           | This command is used by IS-IS to control the number of IS-IS equal-cost paths to be installed to a routing table. The routing table also has a command used to control the number of equal-cost paths. The number of effective equal-cost paths is determined by either of the two command values, whichever is smaller. |

### ▾ Configuring the Maximum Length Allowed for Received LSPs

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>lsp-length receive</b> <i>size</i>   |
| <b>Parameter Description</b> | <i>size</i> : Indicates the maximum length allowed for received LSPs. According to RFC, the value range is 1,492 to 16,000, in the unit of bytes.   |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | Use this command to control the maximum length allowed for LSPs received by the local device. Intermediate nodes with sufficient memory are required to receive LSPs whose maximum length is equal to the interface MTU in order to avoid a route convergence failure. From this perspective, the command is meaningless. The maximum length allowed for received LSPs cannot be smaller than that allowed for sent LSPs; otherwise, the former will be automatically adjusted to be equal to the latter. |

### ▾ Configuring the Maximum Length Allowed for Sent LSPs

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>lsp-length originate</b> <i>size</i> [ <b>level-1</b>   <b>level-2</b> ]   |
| <b>Parameter Description</b> | <i>size</i> : Indicates the maximum length allowed for sent LSPs. The value range is 512 to 16,000, in the unit of bytes.<br><b>level-1</b> : Applies the setting only to Level-1 LSPs.<br><b>level-2</b> : Applies the setting only to Level-2 LSPs. |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | In principle, the maximum length of LSPs and SNPs cannot be greater than the interface MTU; otherwise, the packets will be discarded when being sent.   |

### ↘ Configuring a Passive Interface

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>passive-interface</b> [ <b>default</b> ] { <i>interface-type interface-number</i> }  |
| <b>Parameter</b>    | <b>default</b> : Configures all IS-IS interfaces that are not enabled as passive interfaces.  |
| <b>Description</b>  | <i>interface-type</i> : Indicates the interface type.<br><i>interface-number</i> : Indicates the interface number.  |
| <b>Command Mode</b> | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>  | This command prevents the specified interface from receiving and sending IS-IS packets, but the IP address of the interface will be flooded by other interfaces.<br><br>If the <b>default</b> option is selected and there are more than 255 IS-IS interfaces not enabled, only the first 255 interfaces will be configured as passive interfaces. The remaining interfaces are non-passive interfaces. |

### ↘ Configuring the IS-IS Interface Metric

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>isis metric</b> <i>metric</i> [ <b>level-1</b>   <b>level-2</b> ]  |
| <b>Parameter</b>    | <i>metric</i> : Indicates the metric value. The value range is 1 to 63. The default value is 10.  |
| <b>Description</b>  | <b>level-1</b> : Applies the setting to Level-1 circuits.<br><b>level-2</b> : Applies the setting to Level-2 circuits.  |
| <b>Command Mode</b> | Interface configuration mode  |
| <b>Usage Guide</b>  | The metric, which is used in SPF calculation, is stored in the IP reachability information TLV. The greater the metric, the greater the routing consumption of the interface and the longer the path obtained by SPF calculation.<br><br>The metric belongs to the narrow type and is valid only when <b>metric-style</b> is set to <b>Narrow</b> . |

### ↘ Configuring the Wide Metric of an Interface

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>isis wide-metric</b> <i>metric</i> [ <b>level-1</b>   <b>level-2</b> ]  |
| <b>Parameter</b>    | <i>metric</i> : Indicates the metric value. The value range is 1 to 16,777,214. The default value is 10.   |
| <b>Description</b>  | <b>level-1</b> : Applies the setting to Level-1 circuits.<br><b>level-2</b> : Applies the setting to Level-2 circuits.   |
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | The metric, which is used in SPF calculation, is stored in the IP reachability information TLV. The greater the metric, the greater the routing consumption of the interface and the longer the path obtained by SPF calculation.<br><br>The metric is valid only when <b>metric-style</b> is set to <b>Wide</b> . |

### ↘ Configuring the Priority of the DIS

|                    |  |
|--------------------|--|
| <b>Command</b>     | <b>isis priority</b> <i>value</i> [ <b>level-1</b>   <b>level-2</b> ]                        |
| <b>Parameter</b>   | <i>value</i> : Indicates the priority. The value range is 0 to 127. The default value is 64. |
| <b>Description</b> | <b>level-1</b> : Applies the setting to Level-1 circuits.                                    |

|                     |   |
|---------------------|---|
|                     | <b>level-2:</b> Applies the setting to Level-2 circuits.  |
| <b>Command Mode</b> | Interface configuration mode  |
| <b>Usage Guide</b>  | <p>Use this command to change the priority carried in Hello packets in a LAN.</p> <p>The device with a lower priority is less likely to be elected as the DIS.</p> <p>The command is invalid on a P2P network interface.</p> <p>The <b>no isis priority</b> command, with or without parameters, restores the priority to its default value. To change the configured priority, run the <b>isis priority</b> command with the priority specified to overwrite the existing configuration, or you can first restore the priority to its default value and then configure a new priority.</p> |

### ↘ Generating a Default Route

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>default-information originate [ route-map <i>map-name</i> ]</b>  |
| <b>Parameter Description</b> | <b>route-map <i>map-name</i>:</b> Associates with a route map.  |
| <b>Command Mode</b>          | IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode                                       |
| <b>Usage Guide</b>           | Because Level-2 domains do not generate any default route, use this command to allow a default route to enter a Level-2 domain. |

### ↘ Configuring SPF Calculation Cycle

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>spf-interval [ level-1   level-2 ] <i>maximum-interval</i></b>   |
| <b>Parameter Description</b> | <p><b>level-1:</b> Applies the configuration only to Level-1.</p> <p><b>level-2:</b> Applies the configuration only to Level-2.</p> <p><i>maximum-interval:</i> Indicates the maximum interval for performing two consecutive SPF calculations. The value range is <b>1</b> to <b>120</b> (in seconds). The default value is <b>10</b>.</p>   |
| <b>Command Mode</b>          | IS-IS routing process configuration mode  |
| <b>Usage Guide</b>           | <p>Increasing the maximum interval for performing SPF calculations can avoid frequent SPF calculations and waste of CPU resources. However, a larger minimum interval also leads to slower responses to route changes.</p> <p>The waiting time for performing the SPF calculation for the first time is the initial interval. If the network becomes unstable, the SPF calculation interval is less than the maximum interval, and the interval for performing the SPF calculation for the second time becomes the hold interval. A corresponding penalty is added to this interval: The next interval for the SPF calculation doubles the previous interval for the same SPF calculation, until the SPF calculation interval reaches the maximum interval. Subsequent SPF calculations are performed at the maximum interval. When the network becomes stable, the interval for performing the SPF calculation becomes greater than the maximum interval, and the waiting time for performing the SPF calculation is restored to the initial interval.</p> <p>Link changes have high requirements for convergence. The initial interval can be set to a small value. The preceding parameters can also be adjusted to larger values to reduce CPU consumption.</p> |

|  |   |
|--|---|
|  | <p>The value of <b>initial-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>hold-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>hold-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>initial-interval</b> cannot be greater than that of <b>hold-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>hold-interval</b>.</p> |
|--|---|

### ▾ Configuring an IPv4 Summary Route

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>summary-address</b> <i>ip-address net-mask</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ] [ <i>metric number</i> ]  |
| <b>Parameter Description</b> | <p><i>ip-address</i>: Indicates the IP address of the summary route.</p> <p><i>net-mask</i>: Indicates the subnet mask of the summary route.</p> <p><b>level-1</b>: Applies the setting only to Level-1.</p> <p><b>level-2</b>: Applies the setting only to Level-2. By default, the setting takes effect for Level-2.</p> <p><b>level-1-2</b>: Applies the setting to Level-1 and Level-2.</p> <p><i>number</i>: Indicates the metric of the summary route.</p> |
| <b>Command Mode</b>          | IS-IS routing process configuration mode   |
| <b>Usage Guide</b>           | If the configured summary route contains routing information about a reachable address or network segment, the summary route, instead of detailed routes, is advertised externally.  |

### ▾ Configuring an IPv6 Summary Route

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>summary-prefix</b> <i>ipv6-prefix/prefix-length</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ]  |
| <b>Parameter Description</b> | <p><i>ipv6-prefix/prefix-length</i>: Indicates the network address of the summary route and its IPv6 prefix length. The address format is X:X:X:X:/&lt;0-128&gt;.</p> <p><b>level-1</b>: Applies the setting only to Level-1.</p> <p><b>level-2</b>: Applies the setting only to Level-2. By default, the setting takes effect for Level-2.</p> <p><b>level-1-2</b>: Applies the setting to Level-1 and Level-2.</p> |
| <b>Command Mode</b>          | IS-IS address-family ipv6 configuration mode   |
| <b>Usage Guide</b>           | If the configured summary route contains routing information about a reachable address or network segment, the summary route, instead of detailed routes, is advertised externally.  |

### ▾ Enabling Neighbor Relationship Event Output

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>log-adjacency-changes</b>   |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | IS-IS routing process configuration mode   |
| <b>Usage Guide</b>           | You can also use the <b>debug</b> command to record IS neighbor state changes, but the command consumes many system resources. |

## ↘ Redistributing Other Routes to IS-IS

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>redistribute</b> { <b>bgp</b>   <b>ospf</b> <i>process-id</i> [ <b>match</b> { <b>internal</b> [ <b>external</b> [ 1   2 ] ] [ <b>nssa-external</b> [ 1   2 ] ]   <b>external</b> [ 1   2 ] [ <b>internal</b> ] [ <b>nssa-external</b> [ 1   2 ] ]   <b>nssa-external</b> [ 1   2 ] [ <b>internal</b> ] [ <b>external</b> [ 1   2 ] ] } ]   <b>rip</b>   <b>connected</b>   <b>static</b> } [ <b>metric</b> <i>metric-value</i> ] [ <b>metric-type</b> <i>type-value</i> ] [ <b>route-map</b> <i>map-tag</i> ] [ <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> ]   |
| <b>Parameter Description</b> | <p><i>process-id</i>: Indicates the OSPF process ID. The range is 1 to 65,535.</p> <p><b>match</b> { <b>internal</b>   <b>external</b> [ 1   2 ]   <b>nssa-external</b> [ 1   2 ] }: When OSPF routes are redistributed, the routes are filtered by subtype. If the <b>match</b> option is not selected, routes of all OSPF types will be received. If <b>match external</b> is not followed by the number 1 or 2, OSPF routes specified by <b>external 1</b> and <b>external 2</b> will be redistributed. If <b>match nssa-external</b> is not followed by the number 1 or 2, OSPF routes specified by <b>nssa-external 1</b> and <b>nssa-external 2</b> will be redistributed.</p> <p><b>metric</b> <i>metric-value</i>: Indicates the metric of redistributed routes. The value range is 0 to 4,261,412,864. The metric of external routes is used when the <b>metric</b> option is not specified.</p> <p><b>metric-type</b> { <b>internal</b>   <b>external</b> }: Indicates the metric type of redistributed routes. <b>internal</b>: Indicates that the metric belongs to the internal type. <b>external</b>: Indicates that the metric belongs to the external type. If <b>metric-type</b> is not specified, the metric belongs to the internal type.</p> <p><b>route-map</b> <i>map-tag</i>: Indicates the route map used for external route redistribution. It is used to filter redistributed routes or configure the attributes of redistributed routes. The value of <i>map-tag</i> cannot exceed 32 characters. By default, <b>route-map</b> is not configured.</p> <p><b>level-1</b>   <b>level-1-2</b>   <b>level-2</b>: Indicates the Level of redistributed routes received by IS-IS. If no Level is specified, routes are redistributed to Level-2. <b>level-1</b>: Redistributes routes to Level-1. <b>level-1-2</b>: Redistributes routes to Level-1 and Level-2. <b>level-2</b>: Redistributes routes to Level-2.</p> |
| <b>Command Mode</b>          | IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode  |
| <b>Usage Guide</b>           | <p>The <b>no redistribute</b> { <b>bgp</b>   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>connected</b>   <b>static</b> } command is used to cancel the redistribution of routes mapped to the specified protocol. If <b>no redistribute</b> is followed by other parameters, the command will restore the default parameter settings, rather than cancel route redistribution. For example, <b>no redistribute bgp</b> cancels BGP route redistribution, whereas <b>no redistribute bgp route-map aa</b> cancels the route map named <b>aa</b> used for BGP route redistribution.</p> <p>When external routes are redistributed in IPv4 mode, the routing information is stored in LSPs' IP External Reachability Information TLV.</p> <p>When external routes are redistributed in IPv6 mode, the routing information is stored in LSPs' IPv6 Reachable TLV.</p> <p>In the old versions of some vendors, if <b>metric-type</b> is set to <b>external</b>, the metric of redistributed routes is added by 64 during route calculation and used to determine routing. This practice does not comply with the related protocol. In the actual application, external routes may be preferred over internal routes. If this happens during interworking with old versions of some vendors, you can modify the related setting (such as <b>metric</b> or <b>metric-type</b>) of each device to ensure that internal routes are preferred over external routes.</p>  |

## ↘ Redistributing the Level-1 Reachable Routing Information of the Specified IS-IS Instance to Level-2 of the Current Instance

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>redistribute isis</b> [ <i>tag</i> ] <b>level-1 into level-2</b> [ <b>route-map</b> <i>route-map-name</i>   <b>distribute-list</b> <i>access-list-name</i> ]   |
| <b>Parameter Description</b> | <p><i>tag</i>: Indicates the name of the IS-IS instance whose routing information will be redistributed.</p> <p><b>route-map</b> <i>route-map-name</i>: Indicates the route map used for route redistribution. It is used to filter redistributed routes or configure the attributes of redistributed routes. The value of <i>route-map-name</i> cannot exceed 32 characters. By default, <b>route-map</b> is not configured.</p> <p><b>distribute-list</b> <i>access-list-name</i>: Filters redistributed routes by using <b>distribute-list</b>. <i>access-list-name</i> indicates the associated prefix list, which can be a standard prefix list, an extended prefix list, or a name prefix list. It is in the format of {&lt;1-99&gt;   &lt;100-199&gt;   &lt;1300-1999&gt;   &lt;2000-2699&gt;   <i>acl-name</i> }. When the IS-IS address-family ipv6 configuration mode is applied, only the name prefix list can be used, in the format of <i>acl-name</i>.</p>  |
| <b>Command Mode</b>          | IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode   |
| <b>Usage Guide</b>           | <p>You can use the <b>route-map</b> or <b>distribute-list</b> parameter to filter the specified instance's Level-1 routes to be redistributed. Only the routes that meet specific criteria can be redistributed to Level-2 of the current instance. The <b>route-map</b> and <b>distribute-list</b> parameters cannot be used at the same time.</p> <p>The <b>no redistribute isis</b> [<i>tag</i>] <b>level-2 into level-1</b> command is used to cancel the redistribution of the specified instance's routes. If <b>no redistribute</b> is followed by other parameters, the command will restore the default parameter settings, rather than cancel route redistribution.</p> <p>For example, <b>no redistribute isis</b> <i>tag1</i> <b>level-1 into level-2</b> cancels the redistribution of the routes of the IS-IS instance name <i>tag1</i>. <b>no redistribute isis</b> <i>tag1</i> <b>level-1 into level-2 route-map</b> <i>aa</i> cancels the use of the route map named <i>aa</i> to filter redistributed routes.</p> |

↘ **Redistributing the Level-2 Reachable Routing Information of the Specified IS-IS Instance to Level-1 of the Current Instance**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>redistribute isis</b> [ <i>tag</i> ] <b>level-2 into level-1</b> [ <b>route-map</b> <i>route-map-name</i>   <b>distribute-list</b> <i>access-list-name</i>   ( <b>prefix</b> <i>ip-address net-mask</i>   <b>ipv6-prefix</b> <i>ipv6-address/length</i> ) ]   |
| <b>Parameter Description</b> | <p><i>tag</i>: Indicates the name of the IS-IS instance whose routing information will be redistributed.</p> <p><b>route-map</b> <i>route-map-name</i>: Indicates the route map used for route redistribution. It is used to filter redistributed routes or configure the attributes of redistributed routes. The value of <i>route-map-name</i> cannot exceed 32 characters. By default, <b>route-map</b> is not configured.</p> <p><b>Distribute-list</b> <i>access-list-name</i>: Filters redistributed routes by using <b>distribute-list</b>. <i>access-list-name</i> indicates the associated prefix list, which can be a standard prefix list, an extended prefix list, or a name prefix list. It is in the format of {&lt;1-99&gt;   &lt;100-199&gt;   &lt;1300-1999&gt;   &lt;2000-2699&gt;   <i>acl-name</i> }. When the IS-IS address-family ipv6 configuration mode is applied, only the name prefix list can be used, in the format of <i>acl-name</i>.</p> <p><b>prefix</b> <i>ip-address net-mask</i>: Determines the routes to be redistributed by address and prefix length.</p> <p><b>ipv6-prefix</b> <i>ipv6-address/length</i>: Determines the IPv6 routes to be redistributed by address and prefix length.</p> |
| <b>Command Mode</b>          | IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode  |

|                    |  |
|--------------------|--|
| <b>Usage Guide</b> | <p>You can use the <b>route-map</b>, <b>distribute-list</b>, or <b>prefix</b> parameter to filter the specified instance's Level-2 routes to be redistributed. Only the routes that meet specific criteria can be redistributed to Level-1 of the current instance.</p> <p>The <b>no redistribue isis [ tag ] level-2 into level-1</b> command is used to cancel the redistribution of the specified instance's routes. If <b>no redistribute</b> is followed by other parameters, the command will restore the default parameter settings, rather than cancel route redistribution.</p> <p>For example:</p> <p><b>no redistribue isis tag1 level-2 into level-1</b> cancels the redistribution of the routes of the IS-IS instance name <b>tag1</b>. <b>no redistribue isis tag1 level-2 into level-1 route-map aa</b> cancels the use of the route map named <b>aa</b> to filter redistributed routes.</p> |
|--------------------|--|

### Configuration Example

#### Configuring the Maximum Number of Equal-Cost Paths

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>Configure IS-IS neighbors. (Omitted)</li> <li>Configure the maximum number of equal-cost paths.</li> </ul>                     |
|                            | <pre>A(config)# router isis A(config-router)# maximum-paths 5</pre>   |
| <b>Verification</b>        | <ul style="list-style-type: none"> <li>Check whether the maximum number of equal-cost paths displayed by routing entries is the same as the configuration.</li> </ul> |
|                            | <pre>A# show ip route isis</pre>  |

#### Configuring the Maximum Length Allowed for Received LSPs

|                      |   |
|----------------------|---|
| <b>Configuration</b> | <ul style="list-style-type: none"> <li>Configure IS-IS neighbors. (Omitted)</li> <li>Configure the maximum length allowed for received LSPs.</li> </ul> |
|                      | <pre>A(config)# router isis A(config-router)# lsp-length receive 512</pre>  |
| <b>Verification</b>  | <p>Capture packets to check the length of received LSPs.</p>  |

#### Configuring the Maximum Length Allowed for Sent LSPs

|                       |   |
|-----------------------|---|
| <b>Configurations</b> | <ul style="list-style-type: none"> <li>Configure IS-IS neighbors. (Omitted)</li> <li>Configure the maximum length allowed for sent LSPs.</li> </ul> |
|-----------------------|---|

|                     |  |
|---------------------|--|
|                     | <pre>A# configure terminal A(config)# router isis 1 A(config-router)# lsp-length originate 512 level-2</pre> |
| <b>Verification</b> | Capture packets to check the length of sent LSPs.  |

### ↘ Configuring a Passive Interface

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure a passive interface.</li> </ul> |
|                            | <pre>A# configure terminal A(config)# router isis 1 A(config-router)# passive-interface GigabitEthernet 0/0</pre>                  |
| <b>Verification</b>        | Capture packets to check whether the interface receives and sends IS-IS packets.   |

### ↘ Configuring the Metric of an IS-IS Interface

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure metric of the IS-IS interface.</li> </ul> |
|                            | <pre>A(config)# interface GigabitEthernet 0/1 A(config-if)#isis metric 1</pre>   |
| <b>Verification</b>        | Check the database details of IS-IS.   |
|                            | <pre>A# show isis database detail</pre>  |

### ↘ Configuring the Priority of the DIS

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the priority of the DIS.</li> </ul> |
|                            | <pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis priority 127 level-1</pre>  |
| <b>Verification</b>        | Check whether the device with the changed priority setting is elected as the DIS.  |
|                            | <pre>A# show isis database detail</pre>  |

➤ **Generating a Default Route**

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Generate a default route.</li> </ul> |
|                            | <pre>A(config)# router isis A(config-router)# default-information originate</pre>   |
| <b>Verification</b>        | Capture packets to check whether the sent LSP contains a default route.   |

➤ **Configuring SPF Calculation Cycle**

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configuring SPF calculation cycle.</li> </ul> |
|                            | <pre>A(config)# router isis A(config-router)# spf-interval 5 100 200</pre>   |
| <b>Verification</b>        | Check whether the SPF calculation cycle works.   |

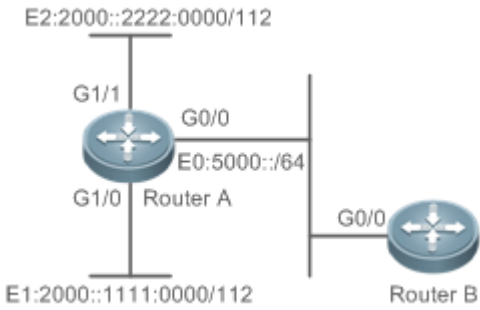

➤ **Configuring an IS-IS Summary Route**

|   |   |
|---|---|
| <b>Configuration Requirements</b>               | Router A and Router B are connected through the Ethernet and run IS-IS. Configure Router A to advertise only the 172.16.0.0/22 route instead of the 172.16.1.0/24 and 172.16.2.0/24 routes. |
| <b>Figure 4-20 IS-IS Route Summary Topology</b> |   |
| <b>Configuration Steps</b>                      | <ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> <li>● Configure the password for IS-IS authentication.</li> </ul>                  |
| <b>A</b>  | Configure IS-IS.  |
|   | <pre>A(config)# router isis</pre>   |

|                     |   |
|---------------------|---|
|                     | <pre>A(config-router)# net 49.0001.0000.0000.0001.00 A(config-router)# summary-address 172.16.0.0/16 level-1-2</pre>  |
|                     | <p><b>Configure Ethernet interfaces.</b></p> <pre>A(config)# interface GigabitEthernet 0/0 A(config-if)# ip address 192.168.20.1 255.255.255.0 A(config-if)# ip router isis A(config)# interface GigabitEthernet 1/0 A(config-if)# ip address 172.16.1.1 255.255.255.0 A(config-if)# ip router isis A(config)# interface GigabitEthernet 1/1 A(config-if)# ip address 172.16.2.1 255.255.255.0 A(config-if)# ip router isis</pre> |
| <b>B</b>            | <p><b>Configure IS-IS.</b></p> <pre>B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00</pre>  |
|                     | <p><b>Configure an Ethernet interface.</b></p> <pre>B(config)# interface GigabitEthernet 0/0 B(config-if)# ip address 192.168.20.2 255.255.255.0 B(config-if)# ip router isis</pre>   |
|                     |   |
| <b>Verification</b> | <p>Run the <b>show ip route</b> command on Router B to check whether only one summary route exists.</p>   |
| <b>B</b>            | <pre>B(config)# show ip route i L1    172.16.0.0/16 [115/20] via 192.168.20.1, FastEthernet0/0</pre>  |

↘ **Configuring an IS-ISv6 Summary Route**

|   |   |
|---|---|
|   | <p>Router A and Router B are connected through the Ethernet and run IS-ISv6. Configure Router A to advertise only the 2000::/96 route instead of the 2000::1111:0/112 and 2000::2222::0/112 routes.</p> |
| <b>Figure 4-21<br/>IS-ISv6 Route<br/>Summary<br/>Topology</b> |   |

|                                   |  |
|-----------------------------------|--|
|                                   |   |
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> <li>● Configure the password for IS-IS authentication.</li> </ul>   |
| <p><b>A</b></p>                   | <p>Configure IS-IS.</p>  |
|                                   | <pre>A(config)# ipv6 unicast-routing A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config-router)# address-family ipv6 unicast A (config-router-af)# summary-prefix 2000::/96 level-1-2 A (config-router-af)# exit-address-family</pre>   |
|                                   | <p>Configure Ethernet interfaces.</p> <pre>A(config)# interface GigabitEthernet 0/0 A(config-if)# ipv6 address 5000::1/64 A(config-if)# ipv6 router isis A(config)# interface GigabitEthernet 1/0 A(config-if)# ipv6 address 2000::1111:0001/112 A(config-if)# ipv6 router isis A(config)# interface GigabitEthernet 1/1 A(config-if)# ipv6 address 2000::2222:0001/112 A(config-if)# ipv6 router isis</pre> |
| <p><b>B</b></p>                   | <p>Configure IS-IS.</p>  |
|                                   | <pre>B(config)# ipv6 unicast-routing B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00</pre>  |
|                                   | <p>Configure an Ethernet interface.</p>  |

|                     |  |
|---------------------|--|
|                     | <pre>B(config)# interface GigabitEthernet 0/0 B(config-if)# ipv6 address 5000::2/64 B(config-if)# ipv6 router isis</pre> |
| <b>Verification</b> | Run the <b>show ipv6 route</b> command on Router B to check whether only one summary route exists.                       |
| <b>B</b>            | <pre>B(config)# show ipv6 route I1 2000::/96 [115/20] via FE80::C800:1BFF:FEF8:1C, FastEthernet1/0</pre>                 |

📌 **Enabling Neighbor Relationship Event Output**

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Enable neighbor relationship event output.</li> </ul> |
|                            | <pre>A(config-router)# log-adjacency-changes</pre>   |
| <b>Verification</b>        | Change the neighbor state and verify that the change is recorded when debugging is disabled.   |

📌 **Configuring Route Redistribution**

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure OSPF routes. (Omitted)</li> <li>● Configure route redistribution</li> </ul> |
|                            | <pre>A(config)# router isis A(config-router)# redistribute ospf 1 metric 10 level-1</pre>  |
| <b>Verification</b>        | Check whether routing entries with redistributed routes exist.   |
|                            | <pre>A# show ip route isis</pre>   |

## 4.5 Monitoring

### Clearing

⚠️ Running the **clear** commands may lose vital information and thus interrupt services.

| Description                                    | Command                     |
|--|-----------------------------|
| Clears all IS-IS neighbor relationship tables. | <b>clear clns neighbors</b> |

|                                   |                                   |
|-----------------------------------|-----------------------------------|
| Clears all IS-IS data structures. | <b>clear isis *</b>               |
| Clears all IS-IS counters.        | <b>clear isis [ tag ] counter</b> |

## Displaying

| Description   | Command  |
|---|--|
| Displays all IS neighbors and inter-device neighbor relationships.  | <b>show clns [ tag ] is-neighbors [ interface-type interface-number ] [ detail ]</b> |
| Displays all IS neighbors and provides device information and information about the neighbor relationship with ESs. | <b>show clns [ tag ] neighbors [ interface-type interface-number ] [ detail ]</b>    |
| Displays all IS-IS counters.  | <b>show isis [ tag ] counter</b>   |
| Displays the LSDB information.  | <b>show isis [ tag ] database [ FLAGS ] [ LEVEL ] [ LSPID ]</b>                      |
| Displays the state information related to IS-IS GR.   | <b>show isis [ tag ] graceful-restart</b>  |
| Displays the relationship between the device name and system ID.  | <b>show isis [ tag ] hostname</b>  |
| Displays the details of an IS-IS interface.   | <b>show isis [ tag ] interface [ interface-type interface-number ] [ counter ]</b>   |
| Displays the mesh group configuration of all interfaces.  | <b>show isis [ tag ] mesh-groups</b>   |
| Displays IS-IS neighbor information.  | <b>show isis [ tag ] neighbors [ detail ]</b>  |
| Displays the neighbor information of virtual systems in IS-IS.  | <b>show isis [ tag ] virtual-neighbors</b>   |
| Displays IS-IS information.   | <b>show isis [ tag ] protocol</b>  |
| Displays the topology of IS-IS device connection.   | <b>show isis [ tag ] topology [ I1   I2   level-1   level-2 ]</b>                    |
| Displays information of an IS-IS IPv6 unicast topology.   | <b>show isis [ tag ] ipv6 topology [ I1   I2   level-1   level-2 ]</b>               |

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description              | Command  |
|--------------------------|--|
| Enables IS-IS debugging. | <b>debug isis { all   auth   events   gr   ifsm   lsp   mtr   n fsm   nsm   pdu   spf   warn }</b> |

## 5 Configuring BGP

### 5.1 Overview

The Border Gateway Protocol (BGP) is an Exterior Gateway Protocol (EGP) used for communication between routers in different autonomous systems (ASs). BGP is used to exchange network accessibility information between different ASs and eliminate routing loops by using its own mechanism.

BGP uses TCP as the transmission protocol. The reliable transmission mechanism of TCP is used to ensure the transmission reliability of BGP.

Routers running BGP are called BGP speakers. BGP speakers between which a BGP session is established are called BGP peers.

Two modes can be used to establish peers between BGP speakers: Internal BGP (IBGP) and External BGP (EBGP).

- IBGP refers to a BGP connection established within an AS and completes transition of routing information within the AS.
- EBGP refers to a BGP connection established between different ASs and completes exchange of routing information between different ASs.

Rules for BGP to select an optimum route:

5. Invalid routing table entries are not involved in optimum route selection.

---

 Invalid entries include entries of inaccessible next hops and flapping entries.

---

6. Otherwise, select a route with a large value of **LOCAL\_PREF**.

7. Otherwise, select a route generated by a BGP speaker.

---

 Routes generated by a BGP speaker include routes generated by the **network**, **redistribute** and **aggregate** commands.

---

8. Otherwise, select a route with the shortest AS length.

9. Otherwise, select a route with a smaller value of **ORIGIN**.

10. Otherwise, select a route with the smallest value of **MED**.

11. Otherwise, EBGP routes have higher priorities than IBGP routes and routes in the AS alliance, and the IBGP routes have the same priorities as the routes in the AS alliance.

12. Otherwise, select a route with the smallest IGP metric value to the next hop.

13. Otherwise, select an EBGP route that is received first.

14. Otherwise, select a route advertised by a BGP speaker with a smaller router ID.

15. Otherwise, select a route with a large cluster length.

16. Otherwise, select a route with a large neighbor address.

**i** The preceding shows the route selection process under the default configurations. By using CLI commands, you can change the route selection process. For example, you can run the **bgp bestpath as-path ignore** command to make step 4 of the route selection process lose effect or run the **bgp bestpath compare-routerid** command to make step 9 lose effect.

### Protocols and Standards

- RFC4271: A Border Gateway Protocol 4 (BGP-4)
- RFC4273: Definitions of Managed Objects for BGP-4
- RFC4360: Proposed Standard: BGP Extended Communities Attribute
- RFC4364: Proposed Standard: BGP/MPLS IP Virtual Private Networks (VPNs)
- RFC4486: Proposed Standard: Subcodes for BGP Cease Notification Message
- RFC4724: Proposed Standard: Graceful Restart Mechanism for BGP
- RFC4760: Draft Standard: Multiprotocol Extensions for BGP-4
- RFC5492: Draft Standard: Capabilities Advertisement with BGP-4
- RFC7432: Proposed Standard: BGP MPLS-based Ethernet VPN

## 5.2 Applications

| Application                                  | Description  |
|--|--|
| <a href="#">Inter-AS Route Advertisement</a> | Implement inter-AS route advertisement by using BGP.                       |
| <a href="#">Intra-AS Route Reflection</a>    | Set up a route reflection topology within an AS to reduce BGP connections. |

### 5.2.1 Inter-AS Route Advertisement

#### Scenario

BGP implements route advertisement and maintenance across different ASs.

As shown in Figure 5-1, BGP transfers the route of AS 65536 to AS 65538 through AS 65537.

Figure 5-1

|                |  |
|----------------|--|
| <b>Remarks</b> | R1 is a device at the network edge of AS 65536.<br>R2 and R3 are devices at the network edge of AS 65537.<br>R4 is a device at the network edge of AS 65538. |
|----------------|--|

## Deployment

- Establish the EBGP neighborship between R1 and R2 to implement inter-AS route advertisement.
- Establish the IBGP neighborship between R2 and R3 to implement intra-AS route advertisement.
- The Internet runs OSPF to ensure network accessibility between R2 and R3.
- Establish the EBGP neighborship between R3 and R4 to implement inter-AS route advertisement.

### 5.2.2 Intra-AS Route Reflection

#### Scenario

According to the BGP route advertisement principles, routes learned by an IBGP neighbor will not be advertised to the next IBGP neighbor by default. Therefore within an AS, a device running BGP must implement full-mesh. When there are many BGP devices within the AS, implementing full-mesh may cause large difficulties for network deployment. In this case, route reflection can be used to solve this problem.

As shown in Figure 5-2, route reflection is deployed to implement BGP full-mesh among R1 to R4 and RR.

Figure 5-2

|                |  |
|----------------|--|
| <b>Remarks</b> | RR is a route reflector.<br>R1 to R4 are route reflection clients. |
|----------------|--|

## Deployment

- Establish IBGP neighborships between R1 to R4 and RR respectively.
- Configure R1 to R4 as the route reflection clients of RR.

## 5.3 Features

### Basic Concept

### ↘ BGP Speaker and AS Number

A router enabled with BGP is called a BGP speaker.

After a router is enabled with BGP, a local AS number must be specified for the router. An AS number is a globally unique number allocated by IANA, ranging from 1 to 4294967295.

### ↘ BGP Neighbor and Peer

Before a route is advertised between BGP speakers, a neighborhood must be established in advance. You need to manually configure BGP neighbors on both BGP speakers. That is, configure the peer as a neighbor on the two BGP speakers respectively. Therefore, BGP neighbors are also called BGP peers.

### ↘ Neighbor Type and Route Type

BGP neighborhoods are classified into the following types:

- IBGP neighborhood: The neighborhood between BGP speakers within an AS is called IBGP neighborhood. Routes learned from IBGP neighbors are called IBGP routes.
- EBGP neighborhood: The neighborhood between BGP speakers in different ASs is called EBGP neighborhood. Routes learned from EBGP neighbors are called EBGP routes.

### ↘ BGP route attribute

When a BGP speaker advertises routes to its neighbors, the BGP speaker also advertises the attributes carried by the routes. Common BGP attributes are as follows:

- ORIGIN: Specifies the origin of a BGP route and can be set to **IGP**, **EGP**, or **INCOMPLETE**.
- AS-PATH: Lists the ASs passed by a route in a reverse order. The last AS is placed at the beginning of the list.
- NEXT-HOP: Specifies the IP address of the next hop to be reached by a BGP route.
- MULTI-EXIT-DISC: Distinguishes multiple output/input interfaces for reaching the same neighbor AS. A smaller value means a higher priority.
- LOCAL-PREF: Distinguishes the priorities of IBGP routes in an AS. A larger value means a higher priority.

## Overview

| Feature   | Description  |
|---|--|
| <a href="#">Creating a BGP Neighbor</a>                             | Create a BGP neighbor.   |
| <a href="#">Configuring a BGP Route Reflector</a>                   | Set up a BGP route reflection topology to simplify network deployment for BGP neighbor full-mesh.                          |
| <a href="#">Configuring a BGP Alliance</a>                          | Configure a BGP alliance to simplify network deployment for BGP neighbor full-mesh.  |
| <a href="#">Re-distributing Local AS Network Information to BGP</a> | Re-distribute routing information to BGP and advertise local routes through BGP.   |
| <a href="#">Controlling Route Exchange Between BGP Peers</a>        | Configure the route exchange policy for a BGP peer and control routes to be received by and to be advertised to this peer. |

| Feature  | Description   |
|--|---|
| <a href="#">Obtaining Accessible Networks of Other ASs from BGP</a>        | Re-distribute routing information in BGP into a core routing table or IGP.  |
| <a href="#">Configuring Synchronization Between BGP and IGP</a>            | Configure BGP to check whether BGP routes are synchronized with IGP routes.   |
| <a href="#">Configuring BGP Soft Reset</a>                                 | After a routing policy changes, use soft reset to apply a new policy.   |

| <a href="#">Configuring BGP Route Dampening</a>                            | Reduce the impacts of route flapping on a network topology.   |
| <a href="#">Configuring the Management Distance of BGP</a>                 | Change the priorities of BGP routes.  |
| <a href="#">Configuring Multi-path Load Balancing of BGP</a>               | Configure multi-path load balancing for BGP to enhance the network reliability and increase the network bandwidth.  |
| <a href="#">Configuring BGP FRR</a>  | Configure fast rerouting for BGP to enhance the network reliability.  |
| <a href="#">Configuring BGP Timers</a>                                     | Modify the internal timer time of BGP.  |
| <a href="#">Configuring BGP Route Update Mechanisms</a>                    | Disable/Enable regular scanning for BGP routes and configure the route scanning interval.   |
| <a href="#">Configuring the Next-Hop Triggering Update Function of BGP</a> | Configure the next hop triggering update function of BGP.   |
| <a href="#">Configuring BGP LOCAL AS</a>                                   | Configure the LOCAL AS for a BGP neighbor.  |
| <a href="#">Configuring BGP Capacity Protection</a>                        | Avoid non-predictable running status caused by consumption of device capacity.  |
| <a href="#">Configuring BGP GR</a>   | Configure the BGP GR function to enhance the network reliability.   |
| <a href="#">Configuring 4-Byte AS Numbers of BGP</a>                       | Configure the display mode of a 4-byte AS number.   |
| <a href="#">Configuring a Regular Expression</a>                           | Use a regular expression to filter routing information.   |
| <a href="#">Configuring BGP Session Retention</a>                          | Configure BGP to ensure that after an address family with incorrect routing attributes is detected for a neighbor, other address family routes advertised by the neighbor will not be affected. |

| Feature   | Description   |
|---|---|
| <a href="#">Configuring BGP Delayed Advertisement upon System Restart</a> | Configure BGP to delay route advertisement to a neighbor within a period after the system is restarted. |
| <a href="#">Other Related Configurations</a>                              | Configure extended BGP functions.   |

### 5.3.1 Creating a BGP Neighbor

A BGP neighbor is manually configured by a user. Two connection modes are supported: IBGP and EBGP. You can identify the connection mode between BGP speakers based on the AS where the BGP peer resides and the AS where the BGP speaker resides.

- i** Generally, BGP speakers between which an EBGP connection is established are directly connected whereas BGP speakers between which an IBGP connection is established can be at any location within an AS.

#### Working Principle

A BGP speaker can initiate a TCP connection request to a BGP peer specified by a user. After the TCP connection is successfully created, the peers will exchange BGP packets to negotiate about connection parameters. The BGP neighborhood is successfully established after the negotiation succeeds.

#### ↳ Creating a TCP Connection

A BGP speaker initiates a TCP connection request to a neighbor. The destination IP address is the peer IP address specified by the user and the port number is fixed to 179.

The BGP speaker also listens on the port number 179 of the local TCP connection to receive connection requests from its peer.

#### ↳ Negotiating about Protocol Parameters

After the TCP connection is successfully created, the BGP speakers exchange OPEN packets to negotiate about BGP connection parameters. The parameters for negotiation include:

- **Version:** Indicates the BGP version number. At present, only version 4 is supported.
- **Neighbor AS number:** Determines whether the AS number of the neighbor is consistent with the local AS number. If not, the connection request will be denied.
- **Hold Time:** Negotiates about the timeout duration for the BGP connection. The default value is 180 seconds.
- **Neighbor capability:** Negotiates about various extended capabilities supported by the neighbor, including the address family, dynamic route update, and GR functions.

#### ↳ Maintaining Neighborhood

The Keepalive message is periodically sent between BGP speakers. If a new Keepalive packet is not received from the BGP neighbor after the Hold Time expires, the BGP speaker considers that the neighbor is not accessible, disconnects the TCP connection from the neighbor, and attempts to reconnect to it. The interval for a BGP speaker to send the Keepalive message is one third of the Hold Time determined through negotiation and is 60 seconds by default.

## Related Configuration

### ↘ Creating a BGP Neighbor

By default, a BGP speaker does not specify any neighbor. You can manually configure a BGP neighbor.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **remote-as** *as-number* command to manually create a BGP neighbor and specify the AS number of the neighbor.

### ↘ Setting the Neighbor TTL

By default, The TTL field in a TCP packet sent by an IBGP neighbor is set to the maximum value (255). It is set to 1 by an EBGP neighbor.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **ebgp-multihop** [ *tll* ] command to set the TTL field of a TCP packet sent by a BGP neighbor.

A larger value of TTL means a longer distance between BGP neighbors. When TTL is 1, the BGP neighbor devices must be directly connected.

### ↘ Setting the Source Address of TCP

By default, BGP automatically selects the source IP address of a TCP connection based on the IP address of the neighbor. Generally, the IP address of a local packet output interface is used.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **update-source** { *interface-type interface-number* | *address* } command to adjust the source IP address of the neighbor's TCP connection.

### ↘ Setting MD5 Encryption

By default, a BGP connection is not encrypted through MD5.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **password** [ **0** | **7** ] *string* command to set encryption for a BGP neighbor's TCP connection.

### ↘ Activating the Address Family Capability of a Neighbor

By default, a neighbor created in the BGP configuration mode activates only the IPv4 Unicast address family capability.

You can run the **address-family** command to enter a corresponding address family mode, and then run the **neighbor** { *peer-address* | *peer-group-name* } **activate** command to activate the address family capability for the BGP neighbor.

## 5.3.2 Configuring a BGP Route Reflector

According to the principle of BGP route advertisement, full mesh must be established for all BGP speakers within an AS (neighborships need to be established between each two BGP speakers). Too many BGP speakers within an AS will increase the resource overhead of the BGP speakers, increase the network administrator's workload and complexity of configuration and decrease the network expansion capability.

Using a route reflector is a method for reducing IBGP peer connections within an AS.

- 
- i** The methods for reducing the IBGP peer connections within an AS include using a route reflector and using an AS alliance.
- 

## Working Principle

---

Configure a BGP speaker as a route reflector which classifies IBGP peers in an AS into two types: clients and non-clients.

The rules for implementing a route reflector within an AS are as follows:

- Configure a route reflector and specify clients for the route reflector. The route reflector and its clients form a cluster. The route reflector will connect to its clients.
- The clients of a route reflector in a cluster cannot connect to other BGP speakers out of the cluster.
- Within an AS, full mesh is established among IBGP peers of non-clients. The IBGP peers of non-clients include the following situations: Multiple route reflectors in a cluster; a route reflector in a cluster and BGP speakers (generally not supporting the route reflector function) not involved in the route reflector function out of the cluster; a route reflector in a cluster and route reflectors in other clusters.

The rules for processing a route received by a route reflector are as follows:

- A route update message received by an EBGP speaker will be sent to all clients and non-clients.
- A route update message received by a client will be sent to other clients and all non-clients.
- A route update message received by an IBGP speaker will be sent to all the other clients.

- 
- i** Generally, only one route reflector is configured in a cluster. In this case, the Router ID of the route reflector can be used to identify this cluster. To increase the redundancy, you can set multiple route reflectors in a cluster. In this case, you must configure the cluster ID so that a route reflector can identify the route update messages from other route reflectors in the cluster.
  - i** If multiple route reflectors are configured for a cluster, you must configure a cluster ID for the cluster.
  - i** Generally, it is unnecessary to create connections between the clients of a route reflector in a cluster because the route reflector will reflect the routes between the clients. However, if full mesh has been established among all clients, you can cancel the client route reflection function of the route reflector.
- 

## Related Configuration

---

### ↘ Configuring a BGP Route Reflector and Reflected Clients

By default, BGP is not configured with route reflection.

You can run the **neighbor peer-address route-reflector-client** command to configure a device as a route reflector and its neighbor devices as reflected clients.

### ↘ Configuring BGP Client-Client Reflection

By default, BGP client-client route reflection is enabled, which means that routes received from a reflected client can be advertised to other clients.

You can run the **bgp client-to-client reflection** command to enable or disable (using the **no** form of this command) client-client reflection.

#### ▾ [Configuring a BGP Reflection Cluster ID](#)

By default, a BGP reflection cluster ID is the Router-ID of BGP. If multiple reflection clusters are deployed within an AS, different reflection cluster IDs must be configured for these reflection clusters.

You can run the **bgp cluster-id** *cluster-id* command to manually configure the cluster ID of a route reflector.

### 5.3.3 Configuring a BGP Alliance

An alliance is another method for reducing the IBGP peer connections within an AS.

#### Working Principle

Divide an AS into multiple sub ASs and configure a unified alliance ID (namely, the alliance AS NUMBER) for these sub ASs to form an alliance. Outside the alliance, the entire alliance is still considered as an AS and only the AS number of the alliance is visible. Inside the alliance, full mesh of IBGP peers can be established for BGP speakers within a sub AS, and EBGP connections can be established for BGP speakers in different sub ASs. Though EBGP connections are established between BGP speakers within a sub AS, when information is exchanged, NEXT\_HOP, MED, LOCAL\_PREF and other path attributes keep unchanged.

#### Related Configuration

#### ▾ [Configuring a BGP Alliance ID](#)

By default, no alliance ID is configured for a BGP speaker.

You can run the **bgp confederation identifier** *as-number* command to configure a BGP alliance ID. After the configuration is successful, the local AS (specified by the **router bgp** *as-number* command) of BGP becomes the private AS inside the alliance and is invisible to other ASs.

#### ▾ [Configuring a BGP Alliance Neighbor](#)

By default, no alliance neighbor is configured for BGP.

You can run the **bgp confederation peers** *as-number* [... *as-number*] command to configure a BGP alliance neighbor. After the configuration succeeds, the AS specified by this command and the local AS belong to the same alliance.

### 5.3.4 Re-distributing Local AS Network Information to BGP

BGP cannot automatically discover or learn accessible networks. The accessible network information of a local AS must be re-distributed to BGP. Then, BGP can advertise the information to neighbors.

#### Working Principle

Two methods can be used to re-distribute local AS network information to BGP:

- Manual static configuration: re-distribute the accessible network information within a specified range to BGP.

- Configuring route re-distribution: re-distribute accessible IGP network information to BGP.

 In addition, you can also re-distribute local AS network information to BGP routes by configuring route aggregation.

## Related Configuration

### ▾ Configuring a BGP Network

By default, no network is configured for BGP.

You can run the **network** *network-number* [ **mask** *mask* ] [ **route-map** *map-tag* ] [ **backdoor** ] command to configure a BGP network to re-distribute specified accessible network information to BGP. The prerequisite for successfully re-distributing routing information to BGP is that a route is available in the core routing table and this route can be an IGP, directly-connected or static route.

### ▾ Configuring BGP Route Re-distribution

By default, BGP is not configured with route re-distribution.

You can run the **redistribute** *protocol-type* command to re-distribute the routing information of other protocols to BGP, including OSPF, RIP, ISIS, static and directly-connected routes.

## 5.3.5 Controlling Route Exchange Between BGP Peers

BGP provides powerful route management functions. You can actively control the route exchange between BGP peers.

### Working Principle

Configure the route exchange policy for a BGP peer and control routes to be received by and to be advertised to this peer.

## Related Configuration

### ▾ Configuring the Default Route to Be Advertised to a Peer

By default, BGP does not advertise the default route.

You can run the **neighbor** { *address* | *peer-group-name* } **default-originate** [ **route-map** *map-tag* ] command to advertise the default route to a peer (or a peer group).

### ▾ Configuring Next-Hop-Self for a Peer

By default, BGP does not change the next hop of a route when it advertises the route to an IBGP neighbor and sets the next hop to the local BGP speaker when it advertises the route to an EBGP neighbor.

You can run the **neighbor** { *address* | *peer-group-name* } **next-hop-self** command to configure the next hop of a route to the local BGP speaker when distributing the route to a specified BGP peer (group).

### ▾ Configuring Remove-Private-AS for a Peer

By default, BGP does not delete the private AS in the AS-PATH attribute when it advertises routing information to a peer.

You can run the **neighbor** { *address* | *peer-group-name* } **remove-private-as** command to require that the private AS number recorded in the AS path attribute should be deleted when routing information is distributed to an EBGp peer (group). This command does not apply to an IBGP neighbor.

### ↘ Configuring Send-Community for a Peer

By default, BGP does not send the community attribute when it advertises routing information to a peer.

You can run the **neighbor** { *address* | *peer-group-name* } **send-community** command to specify that the community attribute can be sent to a specified BGP peer (group).

### ↘ Configuring Maximum-Prefix for a Peer

By default, BGP does not restrict the records of routing information that can be received by a peer.

You can run the **neighbor** { *address* | *peer-group-name* } **maximum-prefix** *maximum* [ **warning-only** ] command to specify the records of routing information received from a specified peer (group).

### ↘ Configuring Route Filtering for a BGP Neighbor

By default, a BGP neighbor is not enabled with any filtering policy and receives all legal routing information advertised by a neighbor.

BGP supports multiple methods of configuring the route filtering policies for a neighbor, including:

- **neighbor** { *peer-address* | *peer-group-name* } **distribute-list** { *access-list-number* | *access-list-name* } { **in** | **out** }  
Use an ACL to filter routes in the input and output directions of the neighbor.
- **neighbor** { *peer-address* | *peer-group-name* } **filter-list** *access-list-number* { **in** | **out** }  
Use an AS-PATH list to filter routes in the input and output directions of the neighbor.
- **neighbor** { *peer-address* | *peer-group-name* } **prefix-list** *prefix-list-name* { **in** | **out** }  
Use a prefix-list to filter routes in the input and output directions of the neighbor.
- **neighbor** { *peer-address* | *peer-group-name* } **route-map** *map-tag* { **in** | **out** }  
Use a route map to filter routes in the input and output directions of the neighbor.
- **neighbor** { *address* | *peer-group-name* } **unsuppress-map** *map-tag*  
Allow for advertising certain routing information previously suppressed by the **aggregate-address** command when distributing routing information to a specified peer.

## 5.3.6 Obtaining Accessible Networks of Other ASs from BGP

Send routing information of other ASs exchanged by BGP to the routing table of a device so that the device can forward packets to other ASs.

Send routing information of other ASs exchanged by BGP to the routing table of a device so that the device can forward packets to other ASs.

### Working Principle

### ↘ BGP Sends Routing Information to a Core Routing Table

BGP controls routing information sent to the core routing table by using **table-map**. **table-map** can modify the attributes of routing information sent to the core routing table. If the route is matched, BGP modifies the attribute of the routing information and sends the route. If the route is not matched or route matching is denied, BGP does not modify the attribute of the routing information but sends the route.

Changes of **table-map** are not reflected in the core routing table immediately, but reflected a moment later. To update the application of **table-map** immediately, you can run the **clear ip bgp [ vrf vrf-name ] table-map** command to update the routing information in the core routing table immediately. This command does not clear the existing routes in the core routing table, but directly applies **table-map** to send the updated routing information, thereby not causing forwarding flapping.

### ↘ Re-distributing BGP Routes to IGP

Re-distribute BGP routes on a BGP speaker to IGP to ensure that routers within an AS can obtain routes to other ASs.

## Related Configuration

### ↘ Configuring table-map

By default, BGP is not configured with a table-map and allows for sending all routes without modifying the attributes of the routes.

You can run the **table-map route-map-name** command to set a table-map and control the routing information to be sent to the core routing table. *route-map-name* specifies a route-map to be associated.

- 
- Run the **table-map** command in the BGP configuration mode or in the IPv4 address family mode.

The Match and Set statements supported in the table-map are as follows:

Match statements: as-path, community, ip address, ip next-hop, metric, origin and route-type

Set statements: metric, tag and next-hop

- You can run the **no table-map** command to delete the table-map configurations.
- 

### ↘ Configuring BGP Route Re-distribution by IGP

By default, IGP does not re-distribute BGP routes.

You can run the **redistribute bgp [ route-map map-tag ] [ metric metric-value ]** command to re-distribute BGP routes to IGP (RIP\OSPF\ISIS).

The **bgp redistribute-internal** command controls only whether to re-distribute routes learned from IBGP to IGP. By default, routes learned from IBGP can be re-distributed to IGP.

- 
- You can run the **bgp redistribute-internal** command in the BGP configuration mode, IPv4/IPv6 address family mode or the IPv4 VRF address family mode.

- You can run the **no bgp redistribute-internal** command to delete the configuration.
-

### 5.3.7 Configuring Synchronization Between BGP and IGP

Generally, BGP speakers working as mutual IBGP neighbors are not directly connected. IGP devices between the BGP speakers may fail to learn routing information same as that learned by the BGP speakers. When a BGP speaker at the border of an AS forwards packets received from other domains to the next-hop IBGP neighbor, the packets pass an IGP device in the middle. In this case, the packets may be lost due to no routing information on the IGP device.

#### Working Principle

To keep synchronization between BGP and IGP, you must ensure that all routers within an AS can learn routing information to be sent to another AS before the routing information is advertised to this AS.

Synchronization between BGP and IGP is not required only in the following cases:

- Routing information passing through an AS is not available. For example, the AS is an end AS.
- All routers within an AS run BPG. Full mesh is established among all BGP speakers (neighborship is established between each two BGP speakers).

#### Related Configuration

##### 📄 Configuring BGP Route Synchronization

By default, synchronization between BGP and IBGP routes is disabled.

You can run the **synchronization** command to enable synchronization between BGP and IGP.

---

You can run the **no synchronization** command to disable synchronization between BGP and IGP.

---

### 5.3.8 Configuring BGP Soft Reset

If routing policies (including **neighbor distribute-list**, **neighbor route-map**, **neighbor prefix-list** and **neighbor filter-list**) change, an effective method must be provided to implement new routing policies. A traditional method is to terminate a BGP connection and then create a new BGP connection. By configuring BGP Soft Reset, you can execute a new routing policy without terminating a BGP session connection.

#### Working Principle

- 📘 Routing policies that affect inbound routing information are called inbound routing policies (such as In-route-map and In-dist-list) and routing policies that affect outbound routing information are called outbound routing policies (such as Out-route-map and Out-dist-list).

When outbound routing policies change, BGP soft reset will re-advertise all routing information of a BGP speaker to its neighbors.

If inbound routing policies change, the operation is more complex than that when outbound routing policies change. This is because outbound routing policies are executed in the routing table of the local BGP speaker whereas inbound routing policies are executed for routing information received from the BGP peer. To reduce cost, the local BGP speaker does not store the original routing information received from the BGP peer.

If inbound routing policies change and a neighbor device supports route update, you can configure soft reset to send a route update request to the neighbor device. After receiving the request, the neighbor device re-advertises all routing information. You can also perform configuration to ensure that each BGP peer stores original routing information on the local BGP speaker and provides original routing information basis for modifying inbound routing policies subsequently.

- 
- i** The "route update capability" allows for modifying and executing routing policies without storing original routing information. This product supports the route update capability. You can run the **show ip bgp neighbors** command to check whether a BGP peer supports route update. If yes, you do not need to run the **neighbor soft-reconfiguration inbound** command when inbound routing policies change.
- 

## Related Configuration

### ↳ Configuring BGP Soft Reset

Run the **clear ip bgp** { \* | *peer-address* | **peer-group** *peer-group-name* | **external** } **soft out** command to soft reset a BGP connection. You can activate execution of a routing policy without restarting the BGP session.

### ↳ Saving Original Routing Information of Neighbors

By default, BGP does not save original routing information of neighbors.

Run the **neighbor** { *address* | *peer-group-name* } **soft-reconfiguration inbound** command to save unmodified routing information sent by a BGP peer (group).

## 5.3.9 Configuring the Route Attributes of BGP

BGP provides various control policies for route attributes. You can apply the policies based on actual conditions.

### Working Principle

#### ↳ AS\_PATH Attribute

BGP can control distribution of routing information in three modes:

- IP address. You can run the **neighbor distribute-list** and **neighbor prefix-list** commands for implementation.
- AS\_PATH attribute. See the description in this section.
- COMMUNITY attribute. See the related configuration of the COMMUNITY attribute.

You can use an AS path-based access control list (ACL) to control the distribution of routing information. Where, the AS path-based ACL uses a regular expression to parse the AS path.

Based on the standard (RFC1771), BGP does not consider the AS path length when selecting the optimum path. Generally, a shorter AS path length means a higher path priority; therefore, Ruijie considers the AS path length when selecting the optimum path. You can determine whether to consider the AS path length when selecting the optimum path based on the actual conditions.

- 
- i** Within an AS, whether to consider the AS path should be consistent for all BGP speakers when the optimum path is selected; otherwise, the optimum paths selected by the BGP speakers may be different.
-

### ➤ MULTI\_EXIT\_DISC Attribute

BGP uses the MED value as the basis for comparing priorities of paths learned from EBGP peers. A smaller MED value means a higher path priority.

- By default, the MED value is compared only for paths of peers from the same AS when the optimum path is selected.
- By default, the MED value is not compared for paths of peers from other sub ASs within an AS alliance.
- By default, if a path not configured with the MED attribute is received, it is considered that the MED value of this path is 0. Since a smaller MED value means a higher path priority, this path has the highest priority.
- By default, the MED value is not compared with paths from different ASs; instead, the sequence of receiving the paths is compared.

### ➤ LOCAL\_PREF Attribute

When sending routes received from EBGP peers to IBGP peers, a BGP speaker adds the LOCAL\_PREF attribute. BGP uses the LOCAL\_PREF attribute as the basis for comparing priorities of paths learned from IBGP peers. A larger value of LOCAL\_PREF means a higher path priority.

You can also run the **set local-preference** command of a route map to modify the LOCAL\_PREF attribute of the specified path.

### ➤ COMMUNITY Attribute

The COMMUNITY attribute is another mode for controlling distribution of routing information.

A community is a set of destination addresses. The COMMUNITY attribute is intended to facilitate execution of a routing policy based on a community and thereby simplify the configuration of routing information distribution control on BGP speakers. Each destination address may belong to multiple communities. An AS administrator can define the communities, to which a destination address belongs.

By default, all destination addresses belong to the Internet community and are carried in the community attribute of the path.

At present, four common community attribute values are pre-defined:

- Internet: Indicates the Internet community. All paths belong to this community.
- no-export: Indicates that the path is not advertised to EBGP peers.
- no-advertise: Indicates that the path is not advertised to any BGP peer.
- local-as: Indicates that a path is not advertised to other ASs. When an AS alliance is configured, the path is not advertised to other ASs or sub ASs.

By using the community attribute, you can control the receiving, prioritization and distribution of routing information. BGP speakers can set, add or modify the community attribute when learning, advertising or re-distributing routes. An aggregation path will contain the community attribute values of all aggregated paths.

- 
- **i** BGP supports up to 32 COMMUNITY attributes for each route and allows for up to 32 COMMUNITY attributes when match and set COMMUNITY of a route map are configured.
- 

### ➤ Others

During selection of the optimum path, if two paths with the same path attributes are received from different EBGPs, the optimum path is selected based on the receiving sequence by default. You can disable comparison of the receiving sequence but use the path with a smaller router ID as the optimum path.

## Related Configuration

### Configuring AS\_PATH Attribute

- **ip as-path access-list** *path-list-name* { **permit** | **deny** } *as-regular-expression*

Defines an AS path list.

- **neighbor** { *address* | *peer-group-name* } **filter-list** *path-list-name* { **in** | **out** }

By default, no filtering policy is configured for BGP peers.

The configuration is the same as that for routing information receiving and sending for a specified BGP peer (group). Routing policies are executed based on the AS path list to advertise or receive only routes that match the policies.

- **neighbor** { *address* | *peer-group-name* } **route-map** *map-tag* { **in** | **out** }

By default, no filtering policy is configured for BGP peers.

The configuration is the same as when receiving and sending routing information for a specified BGP peer (group). Routing policies are executed based on a route map or the set rules in the route map are used to modify routing attributes.

---

**i** In the route-map configuration mode, you can run the **match as-path** command to modify AS path attributes by using an AS path list or directly run the **set as-path** command to modify AS attribute values.

---

- **bgp bestpath as-path ignore**

Allows BGP not to consider the AS path length when selecting the optimum path. The AS path length is compared by default.

By default, a smaller AS path length means a higher path priority.

### Configuring MULTI\_EXIT\_DISC Attribute

- **bgp always-compare-med**

Allows for comparing the MED values of paths from different ASs, which is disabled by default.

- **bgp bestpath med confed**

Allows for comparing the MED values of paths of peers from other sub ASs in the same AS alliance, which is disabled by default.

- **bgp bestpath med missing-as-worst**

Sets a path not configured with the MED attribute to the lowest priority, which is disabled by default.

- **bgp deterministic-med**

Allows for comparing the paths of peers within the same AS, which is disabled by default.

### Configuring LOCAL\_PREF Attribute

- **bgp default local-preference** *value*

Changes the default local preference value, ranging from 0 to 4,294,967,295. A larger value means a higher priority. The default value is 100.

### ↘ Configuring COMMUNITY Attribute

- **ip community-list standard** *community-list-name* { **permit** | **deny** } *community-number*

Creates a community list. **community-list-name** indicates the name of the community list.

**i** *community-number*: Indicates a value (0 to 4,294,967,295) specified by a user or a known community attribute (internet, local-AS, no-advertise or no-export).

- **neighbor** { *address* | *peer-group-name* } **send-community**

Allows for sending the community attribute to a specified BGP peer (group), which is not configured by default.

- **neighbor** { *address* | *peer-group-name* } **route-map** *map-tag* { **in** | **out** }

The configuration is the same as that for routing information receiving and sending for a specified BGP peer (group). Routing policies are executed based on a route map. No filtering policy is configured for peers by default.

**i** In the route-map configuration mode, you can run the **match community-list [exact]** and **set community-list delete** commands to modify the community attribute by using a community list or directly run the **set community** command to modify the community value.

### ↘ Others

- **bgp bestpath compare-routerid**

Allows BGP to compare the router ID when selecting the optimum path, which is disabled by default.

## 5.3.10 Configuring BGP Route Aggregation

BGP-4 supports CIDR and therefore allows for creating aggregation entries to reduce the size of a BGP routing table. BGP aggregation entries can be added to a BGP routing table only when valid paths are available within the aggregation range.

### Working Principle

Aggregate one or more detailed BGP routes into a BGP route with a shorter network mask.

**i** By default, BGP advertises all path information before and after aggregation. If you hope that only aggregated path information is advertised, you can run the **aggregate-address summary-only** command.

**i** When the **aggregate-address** command is used to configure an aggregated route, the aggregated route takes effect immediately as long as there are routes in the configured address range.

### Related Configuration

#### ↘ Configuring BGP Route Aggregation

- **aggregate-address** *address mask*

Configures BGP route aggregation. By default, BGP does not create any aggregated routing entry.

- **aggregate-address** *address mask as-set*

Configures an aggregation address and stores the AS path information within the aggregation address range. By default, BGP does not store AS path information.

- **aggregate-address** *address mask summary-only*

Configures an aggregation address and advertises only an aggregated path. By default, BGP advertises all path information within the aggregation range.

- **aggregate-address** *address mask as-set summary-only*

Configures an aggregation address, stores the AS path information within the aggregation address range and advertises only aggregated paths.

### 5.3.11 Configuring BGP Route Dampening

If a route changes between being valid and invalid, route flapping occurs.

Route flapping often causes transmission of unstable routes in a network, and thereby causes network instability. BGP route dampening is a method for reducing route flapping. It reduces possible route flapping by monitoring routing information from EBGp peers.

#### Working Principle

Terms used in BGP route dampening are as follows:

- **Route Flap:** A route changes between being valid and invalid.
- **Penalty:** Once route flapping occurs, a BGP speaker enabled with route dampening adds a value to the penalty for this route. The penalty is accumulated until the Suppress Limit is reached.
- **Suppress Limit:** When the penalty of a route is greater than this value, the route will be suppressed.
- **Half-life-time:** The time used for the penalty to be halved.
- **Reuse Limit:** When the penalty value of a route is smaller than this value, route suppression will be canceled.
- **Max-suppress-time:** The longest time that a route can be suppressed.

A brief description of route dampening processing: BGP speaker punishes a route once (adds to the penalty) route flapping occurs. When the penalty reaches the Suppress Limit, the route will be suppressed. When the Half-life-time reaches, the penalty is halved. When the penalty is reduced to the Reuse Limit, the route is activated again. The Max-suppress-time indicates the longest time that the route can be suppressed.

#### Related Configuration

##### ▾ [Configuring BGP Route Dampening](#)

- **bgp dampening**

Enables BGP dampening, which is disabled by default.

- **bgp dampening** *half-life-time reuse suppress max-suppress-time*

Configures the parameters of route dampening.

*half-life-time* (1~45minutes): The default value is 15 minutes. A larger value means a longer flapping suppression and dampening period.

*reuse* (1~10000): The default value is 750. A smaller value means longer time for continuous stabilization before a flapping route is enabled again.

*suppress* (1~20000): The default value is 2,000. A smaller value means more flapping times allowed before suppression.

*max-suppress-time* (1~255minutes): The default value is 4\**half-life-time*. A larger value means longer maximum suppression time.

#### ▾ **Displaying BGP Route Dampening**

- **show ip bgp dampening flap-statistics**

Displays the flapping statistics about all routes.

- **show ip bgp dampening dampened-paths**

Displays the statistics about suppressed routes.

#### ▾ **Resetting BGP Route Dampening**

- **clear ip bgp flap-statistics**

Clears the flapping statistics about all routes that are not suppressed.

- **clear ip bgp flap-statistics** *address mask*

Clears the flapping statistics about specified routes (excluding suppressed routes).

- **clear ip bgp dampening** [ *address* [ *mask* ] ]

Clears the flapping statistics about all routes, including routes whose suppression is cancelled.

## 5.3.12 Configuring the Management Distance of BGP

The management distance is used to evaluate the reliability of various route sources. A smaller management distance means a better route.

### Working Principle

#### ▾ **Management Distance of BGP**

The management distance indicates the reliability of a route source, ranging from 1 to 255. A larger value means lower reliability. BGP sets different management distances for routing information learned from different sources, including External-distance, Internal-distance and Local-distance.

- **External-distance:** Indicates the management distance of routes learned from EBGP peers.
- **Internal-distance:** Indicates the management distance of routes learned from IBGP peers.
- **Local-distance:** Indicates the management distance for routes learned from peers but it is considered that better routes can be learned from IGP. Generally, these routes can be indicated by the **Network Backdoor** command.

**i** You are not advised to change the management distance of BGP. If you really need to change the management distance of BGP, please remember:  
The external-distance should be shorter than the management distances of other IGP routing protocols (OSPF and RIP).  
The internal-distance and local-distance should be longer than the management distances of other IGP routing protocols.

### ↘ Backdoor Route

If you prefer an IGP route but do not use an EBGP route, you can set the EBGP route as the backdoor route. By default, the management distance for routes learned from a BGP speaker for which an EBGP connection is established is 20. You can run the **network backdoor** command to set the management distance of the network information to 200 so that the same network information learned from IGP has the highest priority. The networks learned from IGP are considered backdoor networks and are not advertised.

## Related Configuration

### ↘ Configuring the Management Distance of BGP

You can run the **distance bgp** *external-distance internal-distance local-distance* command to configure the management distance of BGP. The value ranges from 1 to 255.

The default value of *external-distance* is 20; the default value of *internal-distance* is 200; the default value of *local-distance* is 200.

A longer management distance means a lower route priority.

### ↘ Configuring a Backdoor Route

Run the **network** *network-number mask network-mask* **backdoor** command to configure a backdoor route. By default, no backdoor route is configured.

## 5.3.13 Configuring Multi-path Load Balancing of BGP

Multi-path load balancing means that there are multiple paths to the same network and data packets are evenly forwarded by these paths. In a routing table, one route has multiple next hops.

According to the types of equivalent routes, multi-path load balancing of BGP is classified into the following types:

- **EBGP load balancing:** implement load balancing for routes learned from EBGP neighbors.
- **IBGP load balancing:** implement load balancing for routes learned from IBGP neighbors.

**i** Both the IPv4 and IPv6 protocol stacks support multi-path load balancing.

 Load balancing cannot be implemented between IBGP and EBGP routes (including EBGP routes in an alliance).

## Working Principle

If a BGP routing table has multiple paths to the same network, BGP calculates the route with the highest priority by default. If there are optimum multiple routes with the same priorities, BGP still selects a unique route by using comparison rules, notifies the route to the forwarding plane and controls the forwarding of data streams. After multi-path load balancing is enabled, BGP calculates a unique optimum route and also lists paths with the same priorities as equivalent routes. Then, BGP notifies the optimum route and the equivalent routes to the forwarding plane to implement load balancing.

Equivalent routes have the same basic attributes and priorities. That is, according to the optimum path selection rules of BGP, the paths have the same priorities before router-IDs are compared.

### AS\_PATH Loose Comparison

By default, equivalent routes must have the same AS-PATH attributes. Under such strict conditions, load balancing cannot be implemented in certain environments. In this case, you are advertised to enable the AS-PATH loose comparison mode. In the AS-PATH loose comparison mode, when other conditions for equivalent routes are met, as long as the AS-PATH lengths of routes and the AS-PATH lengths of routes from an alliance are the same respectively, it is considered that the conditions for equivalent routes are met.

 When the next hops of multiple BGP equivalent paths recur to the same IGP output interface, load balancing cannot be implemented.

## Related Configuration

### Configuring Multi-path Load Balancing of BGP

- **maximum-paths ebgp** *number*

Enables the multi-path load balancing function of EBGP.

*number* indicates the number of equivalent next hops, ranging from 1 to 32. The default value is 1. A larger value means more equivalent next hops allowed.

- **maximum-paths ibgp** *number*

Enables the multi-path load balancing function of IBGP.

*number* indicates the number of equivalent next hops, ranging from 1 to 32. The default value is 1. A larger value means more equivalent next hops allowed.

### Configuring AS\_PATH Loose Comparison

- **bgp bestpath as-path multipath-relax**

Enables the BGP AS-PATH loose comparison mode.

### 5.3.14 Configuring BGP FRR

With high-speed development of IP technologies and application of various complex services, the requirements for network security and stability become increasingly higher. Especially, certain real-time services (audios and videos) are sensitive to network running status and may be largely affected by unstable networks. Therefore, more and more focus and importance are attached to network reliability. With these requirements, the IP FRR function comes into being. It is intended to use a backup link to maintain data forwarding during route platform convergence after a faulty link is detected, in order to achieve the ideal targets of "zero delay" and "zero loss" in packet forwarding.

BGP FRR is shorted for Fast Reroute.

#### Working Principle

If a BGP routing table has multiple paths to the same network, BGP calculates the route with the highest priority by default. After the BGP FRR function is used, BGP selects a backup route for each optimum route. After BFD FRR detects that the master link is faulty, it switches the data to the originally calculated backup link for forwarding. After route convergence is completed, data is switched to the optimum route re-calculated for forwarding. In this way, BGP FRR can avoid route disconnection due to a link fault before BGP route convergence is completed.

-  BGP FRR is supported only in the IPv4 Unicast and IPv4 VRF address families of BGP.
-  Only one backup route can be generated and the next hop of the backup route cannot be the same as that of the preferred route.
-  A backup next hop cannot be generated for an Equal-Cost Multi-Path Routing (ECMP) route.
-  In the BGP IPv4 VRF configuration mode, BGP FRR has a lower priority than VPN FRR. That is, if VPN FRR is enabled in the VRF mode, BGP FRR takes effect only when VPN FRR fails to calculate a backup route.

#### Related Configuration

##### Configuring BGP FRR

Run the **bgp fast-reroute** command to enable the BGP FRR function, which is disabled by default.

##### Configuring a BFD Session to a BGP Neighbor

Run the **neighbor peer-address fall-over bfd** command to configure a BFD session to a BGP neighbor, which is not configured by default.

### 5.3.15 Configuring BGP Timers

You can manually configure various timers within BGP to meet the neighbor keepalive and route management requirements in different network environments.

#### Working Principle

##### BGP Neighbor Keepalive Timer

BGP uses the Keepalive timer to maintain a valid connection with a peer and uses the Holdtime timer to identify whether a peer is valid. By default, the value of the Keepalive timer is 60 seconds and the value of the Holdtime timer is 180 seconds. When a BGP connection is established between two BGP speakers, the two BGP speakers negotiate about the Holdtime timer value and select a smaller value. 1/3 of the negotiated Holdtime timer value and the configured Keepalive timer value are compared and the smaller value is used as the Keepalive timer value.

### ↘ Neighbor Reconnection Timer

To reduce the impacts of frequent BGP reconnection to a neighbor on the network bandwidth, after a BGP speaker detects failure of a neighbor connection, the BGP speaker attempts to reconnect the neighbor after the connect-retry timer expires. By default, the value of the connect-retry timer is 15s.

### ↘ Route Advertisement Timer

To reduce the impacts of route update packets on the network bandwidth, after a BGP speaker detects a network topology change, the BGP speaker does not advertise the route update to its neighbors immediately. Instead, the BGP speaker uses a regular update mechanism to advertise all changed routing information to its neighbors.

## Related Configuration

### ↘ Configuring the BGP Neighbor Keepalive Timer

- **timers bgp *keepalive holdtime***

Adjusts the BGP *keepalive* and *holdtime* values for all peers.

The *keepalive* value ranges from 0 to 65,535. The default value is 60 seconds.

The *holdtime* value ranges from 0 to 65,535. The default value is 180 seconds.

- **neighbor { *address* | *peer-group-name* } timers *keepalive holdtime***

Configures the *keepalive* and *holdtime* values used for connecting to a specified BGP peer (group).

The *keepalive* value ranges from 0 to 65,535. The default value is 60 seconds.

The *holdtime* value ranges from 0 to 65,535. The default value is 180 seconds.

### ↘ Configuring the Neighbor Re-connection Timer

- **neighbor { *address* | *peer-group-name* } timers connect *connect-retry***

Configures the *connect-retry* value used for reconnecting to a specified BGP peer (group).

The value of *connect-retry* ranges from 1 to 65,535. The default value is 15 seconds.

### ↘ Configuring the Route Advertisement Timer

- **neighbor { *address* | *peer-group-name* } advertisement-interval *seconds***

Configures the minimum interval for sending route updates to a specified BGP peer (group). The value of *advertisement-interval* ranges from 0 to 600 seconds. The default value for IBGP peers is 0 seconds and the default value for EBGP peers is 30 seconds.

- **neighbor** { *address* | *peer-group-name* } **as-origination-interval** *seconds*

Configures the minimum interval for sending local initial route updates to a specified BGP peer (group). The value of `As-origination-interval` ranges from 1 to 65,535. The default value is 1 second.

### 5.3.16 Configuring BGP Route Update Mechanisms

#### Working Principle

BGP provides two route update mechanisms: regular-scanning update and event-triggering update. Regular-scanning update indicates that BGP uses an internal timer to start scanning regularly and update the routing table. Event-triggering update indicates that BGP starts scanning and updates the routing table when the BGP configuration commands are changed due to user configuration or the next hop of a BGP route changes.

- ❗ This function is configured based on address families and can be configured in the IPv4, IPv6, VPNv4, VPNv6, IPv4 vrf and IPv6 VRF address family modes.
- ❗ If you set the BGP route update mechanism to event-triggering update (by running the **bgp scan-rib disable** command), you must disable synchronization (by running the **no synchronization** command) and enable the BGP next-hop triggering update function (by running the **bgp nexthop trigger enable** command). On the other hand, if you enable synchronization or disable the BGP next-hop triggering update function, the BGP routing table must be updated in the regular scanning mode.

#### Related Configuration

##### ▾ Configuring Route Update Mechanisms

- **bgp scan-rib disable**

Sets the BGP route update mechanism to event-triggering update. Regular-scanning update is used by default.

- **bgp scan-time** *scan-time*

Configures the regular update interval of BGP. The value of *scan-time* ranges from 5 to 60 seconds. The default value is 60 seconds.

### 5.3.17 Configuring the Next-Hop Triggering Update Function of BGP

The next-hop triggering update function of BGP is a method for reducing the BGP convergence time. This function is used to optimize the method for monitoring the next hop of a route to ensure that BGP can increase the BGP route convergence speed when the network topology is stable.

#### Working Principle

When BGP connects to a neighbor, BGP automatically monitors the next hop of the BGP route learned from the neighbor. When the next hop changes in the core routing table, BGP receives an advertisement about the next hop change and updates the BGP routing table. This optimization measure improves the BGP route convergence performance by reducing the time for detecting next-hop changes.

If this function is disabled, BGP next hop update will be discovered through regular scanning specified by scan-timer.

-  This function is configured based on address families and can be configured in the IPv4, IPv6, VPNv4, and IPv4 vrf address family modes.
-  **bgp nexthop trigger delay** and **bgp scan-time** control the same timer. When bgp scan is enabled (it is enabled by default and can be disabled by the **bgp scan-rib disable** command), if the value of **bgp nexthop trigger delay** is larger than 60s, bgp scan does not take effect because the scan timer is always triggered before the delay.
-  If the network environment is unstable (with frequent next-hop changes), especially with many routes, this function performs unnecessary route calculations, which consumes more CPU resources. Therefore, you are advised to disable this function in this environment.

## Related Configuration

### Configuring the Next-Hop Triggering Update Function of BGP

- **bgp nexthop trigger enable**  
Enables the BGP next-hop triggering function, which is enabled by default.
- **bgp nexthop trigger delay** *delay-time*  
Configures the delay of BGP next-hop triggering update. The value of *delay-time* ranges from 0 to 100 seconds. The default value is 5 seconds.

## 5.3.18 Configuring BGP LOCAL AS

The Local AS function of BGP is used to configure a local AS different from a router BGP AS for a specific peer. This is similar to deploying a new virtual AS between the peer devices. When the local router BGP AS changes, you can establish a BGP connection without changing the BGP configurations on the peer device. This function is mainly used for AS migration and merging of large networks and ensures that the device configurations in other interconnected ASs are not affected.

### Working Principle

In BGP, when a local device connects to a peer, the local device advertises the local AS number to the peer by using an Open message. The peer checks whether the BGP AS number advertised is the same as the local AS number. If the AS numbers are different, the peer will deny the BGP connection. By default, the local AS in the BGP connection is a route BGP AS. However, if a local AS is configured for the peer, the configured local AS will replace the route BGP AS when a BGP connection is established between the local device and the peer.

-  The **neighbor peer-address local-as as-num** command for configuring the BGP Local AS function can be followed by more options. For details, see the Command Reference.
-  The BGP Local AS function is applied only to EBGP peers, but is not applied to IBGP peers and alliance EBGP peers. In addition, the BGP Local AS function has the following restrictions:
  - 1) The configured local AS cannot be the same as the remote AS of a peer.
  - 2) The local AS cannot be configured independently for a member of a peer group.
  - 3) The configured local AS cannot be the same as the route BGP AS.
  - 4) If a device is a member of an AS alliance, the local AS cannot be the same as the AS alliance number.

## Related Configuration

### Configuring BGP LOCAL AS

- **neighbor** { *address* | *peer-group-name* } **local-as** *as-number*

Configures a local AS for a peer. By default, no local AS is configured for any peer. The local AS of a peer is the route BGP AS.

## 5.3.19 Configuring BGP Capacity Protection

There are often a large number of BGP routes, which may cause overload of a device, especially for a device with small memory. Protecting BGP capacity helps avoid non-predictable running status caused by consumption of device capacity.

### Working Principle

#### Restricting the Number of BGP Routes

Restrict the number of BGP routes by setting the maximum number of routes in a BGP address family and the maximum number of routes that can be learned by a BGP neighbor.

#### Entering the OVERFLOW State in case of Insufficient Memory

If the memory is insufficient, BGP can enter the OVERFLOW state. In the OVERFLOW state, BGP generates a default route pointing to a NULL interface. If a newly learned route is not a refined route other than the default route in the current routing table, the route is discarded. In other words, general newly learned routes are discarded to ensure that the system memory is stable. The purpose of not discarding all routes is to avoid route loops in the entire network. Therefore, it is safe for BGP to enter the OVERFLOW state. BGP is allowed to enter the OVERFLOW state by default.

- ❗ By default, BGP enters the OVERFLOW state in case of insufficient memory. If you do not want BGP to enter the OVERFLOW state, you can run the **no overflow memory-lack** command to disable this function.
- ❗ In the OVERFLOW state, BGP supports only the **clear bgp** { *addressfamily* | **all** } \* command at present. You can also exit from the OVERFLOW state by disabling and enabling BGP again. When the memory becomes sufficient again, BGP can also automatically exit from the OVERFLOW state.

## Related Configuration

### Restricting the Number of BGP Routes

- **neighbor** { *address* | *peer-group-name* } **maximum-prefix** *maximum* [ **threshold** ] [ **warning-only** ]

Restricts the maximum number of routes that can be learned from a BGP neighbor, which is not restricted by default.

- **maximum-prefix** *maximum*

Restricts the maximum number of routes in a BGP address family. The default maximum number of routes for the BGP IPv4 VRF, IPv6 VRF and IPv4 MDT address families are 10,000 and is not configured for other address families.

### Configuring BGP OVERFLOW

- **overflow memory-lack**

Enable BGP to enter the OVERFLOW state in case of insufficient memory, which is enabled by default.

### 5.3.20 Configuring BGP GR

Graceful Restart (GR) is intended to implement uninterrupted data forwarding during restart of BGP. During active/standby switching of the management boards, the GR function keeps the network topology stable, maintains the forwarding table and ensures that key services are not interrupted.

#### Working Principle

- 
- **i** Comply with RFC4724: Graceful Restart Mechanism for BGP. [BGP GR] is used in the following description to indicate the RFC.
- 

BGP GR is not an independent process, but is jointly completed by the Restarter and Helper.

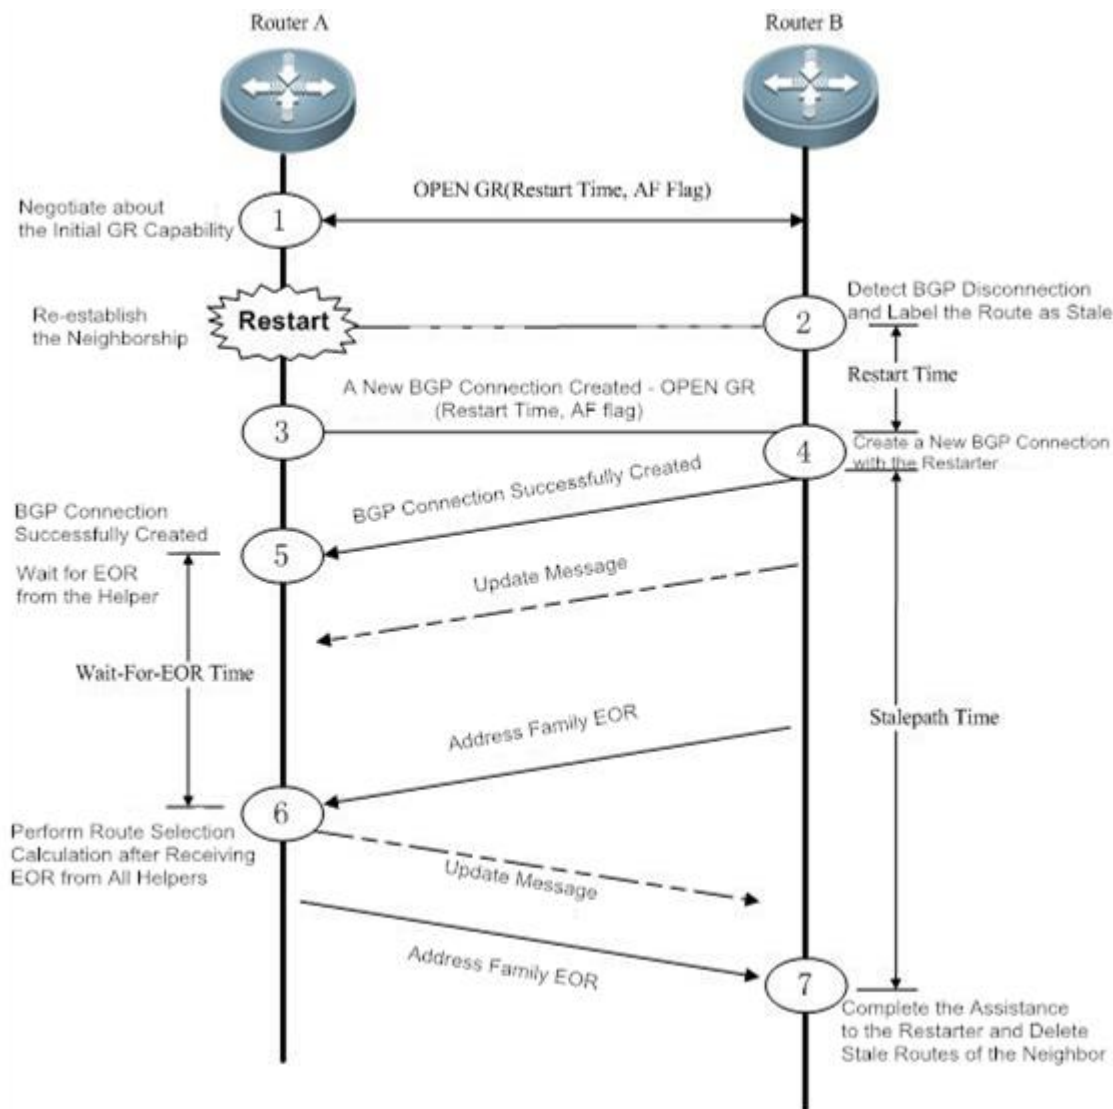

- The Restarter performs restart and maintains the working capability of the route forwarding plane when the route control plane is faulty.
- The Helper is the BGP neighbor of the Restarter and helps the Restarter to complete GR.

A capability indicating GR is added to the OPEN message of BGP, which is called "Graceful Restart Capability". This capability is used by BGP to tell its neighbor it supports the graceful restart capability. During initialization of a BGP connection, two neighbors negotiate about the GR capability.

The route update end flag (End-of-RIB, shorted as EOR) is added to the Update packet of BGP, which indicates that the routing information update to the neighbor is completed.

Figure 5-3 BGP GR Interaction Process

5. ① When BGP establishes neighborhood at the beginning, BGP uses the GR capability field in the OPEN message to negotiate about the GR capabilities of the two neighbors.
6. ② At a moment, the Restarter starts restart, and the BGP session is disconnected. The Helper detects the disconnection, keeps the route of the Restarter valid but adds the "Stale (aged but not updated)" flag to the route.
7. ③ and ④ The Restarter completes restart and connects to the Helper again.
8. ⑤ The Restarter waits for the route update message and EOR flag from the Helper.
9. ⑥ After receiving the EOR flag from all neighbors, the Restarter performs route calculation, update routing entries and then sends updated routes to the Helper.
10. ⑦ After receiving the updated routes, the Helper cancels the "Stale" flag of the routes. After receiving the EOR flag from the Restarter, the Helper deletes routes with the "Stale" flag (these routes are not updated), performs route calculation, and updates the routing entries. The entire GR process is completed.

BGP GR defines several extended and important timers:

- **Restart-Timer:** The GR Restarter advertises the time value to the GR Helper, which indicates the maximum waiting time that the GR Restarter hopes the Helper to wait before a new connection is established between them. You can run the **bgp graceful-restart restart-time** command to modify the time value.
- **Wait-For-EOR Timer:** Indicates the maximum time that the GR Restarter waits for the EOR flag from all GR Helpers. After receiving the EOR flag from all GR Helpers or after the Wait-For-EOR timer expires, the GR Restarter calculates the preferred route and updates the routing entries. You can run the **bgp update-delay** command to modify the time value.
- **StalePath Timer:** Indicates the maximum time that the GR-Helper waits for the EOR flag from the GR Restarter after a new connection is established between them. Within this period, the Helper keeps the original route of the Restarter valid. After receiving the EOR flag or after the StalePath timer expires, the Helper clears the routing entries still with the "Stale" tag. You can run the **bgp graceful-restart stalepath-time** command to modify the time value.

## Related Configuration

### ↳ Configuring BGP GR

- **bgp graceful-restart**  
Enables the Restarter capability, which is enabled by default.
- **bgp graceful-restart restart-time** *time*  
Sets the Restart Timer. The default value is 120 seconds.
- **bgp update-delay** *delay*  
Sets the Wait-For-EOR Timer. The default value is 120 seconds.
- **bgp graceful-restart stalepath-time** *time*  
Sets the StalePath Timer. The default value is 360 seconds.
- **bgp graceful-restart disable**  
Disables the address family GR capability. The address family GR capability is enabled by default. After the global BGP GR is enabled, the GR capability is automatically enabled for all address families.

**i** When BGP GR is implemented, all BGP peers must enable the BGP GR capability. If certain peers do not support or enable GR, BGP GR may fail to be implemented. GR failure may cause a short route black-hole or route loop, which may affect the network. Therefore, you are advised to verify that all neighbors are enabled with the BGP GR capability. You can run the **show ip bgp neighbors** command to display the capabilities successfully negotiated between BGP peers and verify that the GR capability negotiation is successful. In the BGP route configuration mode, run the **bgp graceful-restart** command to enable the BGP GR capability.

**i** The **bgp graceful-restart** command will not be applied to a successfully established BGP connection immediately. That is, when the BGP connection is in the Established state, the BGP peers will not re-negotiate about the GR capability immediately. To enable the BGP peers of the BGP connection to negotiate about the GR capability immediately, you need to forcibly restart the BGP peers to re-negotiate about the GR capability by running the **clear ip**

**bgp 192.168.195.64** command (for example). To make GR enabling or disabling take effect immediately, you must restart the neighborhood for capability negotiation, which may cause network flapping and affect normal use of users. Therefore, you can explicitly control whether to restart the neighborhood.

- i** Supporting BGP GR does not mean that a device can be used as the Restarter to implement BGP GR. Whether to implement BGP GR also depends on the hardware capabilities of the device. Ruijie devices must support the dual-engine hot backup when being used as the GR Restarter.
- i** The restart period configured by the **bgp graceful-restart restart-time** command should not be longer than the Hold Time of the BGP peers; otherwise, the Hold Time will be used as the restart time to be advertised to the BGP peers during GR capability negotiation.
- i** The **bgp graceful-restart disable** command is used to disable the GR capability in an address family in the address family configuration mode, which is not configured by default.

---

### 5.3.21 Configuring 4-Byte AS Numbers of BGP

A traditional AS number consists of 2 bytes, ranging from 1 to 65,535. A newly defined AS number consists of 4 bytes, ranging from 1 to 4,294,967,295. Newly defined AS numbers are used to cope with exhaustion of AS number resources.

#### Working Principle

4-byte AS numbers support two expression modes: the decimal mode and dot mode. The decimal mode is the same as the original expression mode, that is, expressing the 4 bytes of an AS number as decimal digits. The dot mode is expressed as ([higher 2 bytes.]lower 2 bytes). If the higher 2 bytes are 0, they will not be displayed.

For example, an AS number is 65534 in the decimal mode and is 65,534 in the dot mode (the 0 at the beginning is not displayed).

For example, an AS number is 65,536 in the decimal mode, and is 1.0 in the dot mode.

For example, an AS number is 65,538 in the decimal mode, and is 1.2 in the dot mode.

- 
- i** Related protocols are as follows: RFC 4893 and RFC 5396.

#### Configuring the Display Mode of a 4-Byte AS Number

A 4-byte AS number is displayed in the decimal mode by default. You can manually set the display mode to the dot mode. After the setting, a regular expression will use the dot mode for matching 4-byte AS numbers.

#### Compatibility with Devices Supporting Only 2-Byte AS Numbers

With introduction of 4-byte AS numbers, BGP connections may be established between old BGP speakers supporting only 2-byte AS numbers and new BGP speakers supporting 4-byte AS numbers. If the AS where a new BGP speaker resides has a 4-byte AS number, when an old BGP speaker creates neighborhood with the new BGP speaker, the old BGP speaker uses the reserved AS number 23,456 to replace the 4-byte AS number of the new BGP speaker. In the OPEN packets sent by the new BGP speaker to the old BGP speaker, the 4-byte AS number in the **My Autonomous System** field will be replaced by 23,456. In addition, in UPDATE packets sent to the old BGP speaker, the 4-byte AS number in the AS-PATH and AGGREGATOR attributes will also be replaced by 23,456. In addition, new optional transfer attributes AS4-PATH and AS4-

AGGREGATOR will be used to record the real 4-byte AS number so that the real AS-PATH and AGGREGATOR attributes can be restored when the route reaches a next new BGP speaker.

In other cases, the real AS number of the remote end is used to create neighborship.

## Related Configuration

### ↘ Configuring the Display Mode of a 4-Byte AS Number

- **bgp asnotation dot**

Displays a 4-byte AS number in the dot mode. The decimal mode is used by default.

## 5.3.22 Configuring a Regular Expression

A regular expression is a formula that matches strings based on a template.

The formula is used to assess text data and return True or False to indicate whether the expression can correctly describe the data.

### Working Principle

Regular expressions are used in BGP path attributes. The following table describes the usages of special characters in a regular expression.

| Character       | Symbol | Special Meaning   |
|-----------------|--------|---|
| Period          | .      | Matches any single character.                                     |
| Asterisk        | *      | Matches zero or any sequence in a string.                         |
| Plus sign       | +      | Matches one or any sequence in a string.                          |
| Question mark   | ?      | Matches zero or one symbol in a string.                           |
| Caret           | ^      | Matches the start of a string.                                    |
| Dollar sign     | \$     | Matches the end of a string.                                      |
| Underline       | _      | Matches the start, end and space of commas, brackets and strings. |
| Square brackets | [ ]    | Matches a single character within a range.                        |

## Related Configuration

### ↘ Using a Regular Expression in a show Command

- **show ip bgp regexp *regexp***

Displays the BGP routing information in a specified regular expression matched by the AS-PATH attribute.

- **show ip bgp quote-regexp *regexp***

Displays the BGP routing information in a regular expression within the specified double quotation marks matched by the AS-PATH attribute.

### 5.3.23 Configuring BGP Session Retention

By default, when an UPDATE packet is received from a neighbor, a BGP session will be disconnected if an error is detected on the multi-protocol routing attribute. This will cause flapping of the routes in all address families of this neighbor. That is, the routing error in an address family will affect the route stability in other address families.

#### Working Principle

After the BGP session retention function is enabled, if an error occurs in the routing attribute of an address family, only the routing information in this address family related to the neighbor is deleted. In addition, the BGP session and other address families are not affected, which enhances the stability of BGP.

**recovery-time** is used to configure the time for waiting for automatic route recovery, which requires that a neighbor should support the route-refresh capability. After the recovery-time, BGP sends the route-refresh message of the address family to the neighbor and re-advertises all routing information in the address family to this neighbor.

---

 In the session retention state, you can manually reset the neighbor to exit from the session retention state.

---

#### Related Configuration

##### ▾ Configuring BGP Session Retention

- **bgp mp-error-handle session-retain [ recovery-time *time* ]**

Enables the BGP session retention function, which is disabled by default.

**recovery-time** *time* configures the time for waiting for automatic route recovery, ranging from 10 to 4,294,967,296 seconds. The default value is 120.

### 5.3.24 Configuring BGP Delayed Advertisement upon System Restart

By default, after the neighborhood is established after system restart, a BGP peer can advertise route information to its neighbors. This is normal in most cases. However, in certain cases, for example, there are many neighbors or routes during startup but writing entries into the hardware is slow. In this case, the neighbors have learned the routes and started forwarding traffic, but the hardware has not completed writing of entries at the local end, which causes failure of traffic forwarding.

#### Working Principle

The BGP delayed advertisement upon system restart ensures that routes are not advertised to neighbors immediately after the neighborhood is established upon system restart and that the routes are advertised after a period. This function has no effect on other behaviors such as route receiving performed by the neighbors. If part of the routes is not affected by the delay, configure prefix-list policy to match this part of routes so that route advertisement can be more flexible.

**delay-time** is used to configure the waiting time before routes are advertised to the neighbors. **startup-time** is used to configure the startup time. Within the startup-time, BGP sends routing information to the neighbors at the interval specified by **delay-time**.

---

 After the startup-time ends, the default route advertisement behavior recovers.

---

## Related Configuration

### ↳ Configuring BGP Delayed Advertisement upon System Restart

- **bgp initial-advertise-delay** *delay-time* [ *startup-time* ] [ **wait-for-controller** ]

Enables BGP delayed advertisement upon system restart, which is disabled by default.

*delay-time* configures the delay time for advertising routes after the BGP neighborhood is established upon system restart, ranging from 1 to 600 seconds. The default value is 1s.

*startup-time* configures the time range for system restart, ranging from 5 to 58,400 seconds. The delayed route advertisement mechanism is used within this range. The default value is 600s.

Configure the **wait-for-controller** command to ensure that routes are advertised only after the controller delivers configuration messages and receives EOR messages from the neighbors. If no EOR message is received within the time specified by *startup-time*, routes will be advertised forcibly.

- **bgp initial-advertise-delay prefix-list** *prefix-list-name*

By default, the BGP delayed advertisement upon system restart is disabled. If enable it, the route will be immediately sent after the prefix-list policy is matched.

*prefix-list-name*: indicates the name of prefix-list policy.

### 5.3.25 Configuring BGP Delayed Advertisement for First Routes

By default, after the neighborhood is established, a BGP peer can advertise route information to its neighbors. However, neighbors with the neighborhood newly established will send out the route information after a delayed period of time.

#### Working Principle

After BGP starts, BGP peers negotiate to establish the neighborhood before sending route information (update packets). An optimum route is calculated on the local end and sent to the peer end. By default, routes are advertised directly. After a neighbor receives a better route, it updates the route information to the peer. As a result, extra route advertisement occurs. **update-delay** can be configured to shorten the route information update time.

In addition, after **update-delay** is configured on the local end, a specific neighbor sends route information to the local end, the local end selects an optimum route, and then sends out the route information immediately to other neighbors by default. In this case, extra advertisement also occurs. Therefore, the value of **update-delay** includes two parts: delay of route advertisement from the local end to a specific neighbor and delay of route advertisement from the local end to other neighbors after the specific neighbor advertises the route information to the local end.

- ❗ If BGP delayed advertisement upon system restart and BGP delayed advertisement for first routes are enabled at the same time, BGP delayed advertisement upon system restart takes precedence over BGP delayed advertisement for first routes.
- ❗ BGP GR is not affected by either BGP delayed advertisement upon system restart or BGP delayed advertisement for first routes, that is, the BGP GR route advertisement is not affected by the delay time.

## Related Configuration

### ↘ Creating a BGP Neighbor

By default, no neighbor is specified on a BGP speaker. You need to manually configure a BGP neighbor.

Run the **neighbor** { *peer-address* | *peer-group-name* } **remote-as** *as-number* command to manually create a BGP neighbor and specify the AS number of the neighbor.

### ↘ Configuring BGP Delayed Advertisement for First Routes

By default, BGP delayed advertisement for first routes is disabled for neighbors.

Run the **neighbor** { *peer-address* | *peer-group-name* } **update-delay** *delay-time* command to enable BGP delayed advertisement for first routes.

## 5.3.26 Other Related Configurations

-  For configuration and application of BGP MCE, see section "VRF Configuration Guide".
-  For configuration and application of BGP/MPLS VPN, see section "BGP/MPLS VPN Configuration Guide".

## 5.4 Configuration

| Configuration  | Description and Command   |   |
|--|---|---|
| <a href="#">Configuring a BGP Peer (Group)</a>               | (Mandatory) It is used to create a BGP neighbor.  |   |
|  | <b>router bgp</b>   | Enables BGP.                                    |
|  | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> }<br><b>remote-as</b> <i>as-number</i>       | Creates a BGP neighbor.                         |
| <a href="#">Configuring MD5 Authentication</a>               | (Optional) It is used to perform encrypted authentication for the BGP neighbor.                             |   |
|  | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> }<br><b>password</b> [ 0   7 ] <i>string</i> | Configures the password for encryption.         |
| <a href="#">Configuring a Route Reflector</a>                | (Optional) It is used to reduce the number of BGP neighbor connections.                                     |   |
|  | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> }<br><b>route-reflector-client</b>           | Specifies a peer (group) as a reflector client. |
| <a href="#">Configuring an AS Alliance</a>                   | (Optional) It is used to reduce the number of BGP neighbor connections.                                     |   |
|  | <b>bgp confederation identifier</b> <i>as-number</i>  | Configures the BGP alliance ID.                 |
|  | <b>bgp confederation peers</b> <i>as-number</i> [...<br><i>as-number</i> ]                                  | Configures a BGP alliance neighbor.             |
| <a href="#">Configuring Multi-path Load Balancing of BGP</a> | (Optional) It is used to implement multi-path load balancing.   |   |
|  | <b>maximum-paths ibgp</b> <i>number</i>   | Configures IBGP load balancing.                 |
|  | <b>maximum-paths ebgp</b> <i>number</i>   | Configures EBGP load balancing.                 |
|  | <b>bgp bestpath as-path multipath-relax</b>   | Enables the BGP AS-PATH loose comparison mode.  |
| <a href="#">Configuring EBGP FRR</a>                         | (Optional) It is used to increase the convergence speed when a network fault occurs.                        |   |
|  | <b>bgp fast-reroute</b>   | Configures BGP FRR.                             |

| Configuration  | Description and Command   |  |
|--|---|--|
|  | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> }<br><b>fall-over bfd</b>  | Configures a BFD session to a BGP neighbor.  |
| <a href="#">Configuring FRR in an IBGP Route Reflection Environment</a>                    | (Optional) It is used to increase the convergence speed when a network fault occurs.  |  |
|  | <b>bgp fast-reroute</b>   | Configures BGP FRR.  |
| <a href="#">Configuring Local ASs</a>  | (Optional) It is used for transitional deployment during network migration.   |  |
|  | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> }<br><b>local-as</b> <i>as-number</i> [ <b>no-prepend</b> [ <b>replace-as</b> [ <b>dual-as</b> ] ] ] | Configures the local AS for a BGP neighbor.  |
| <a href="#">Configuring BGP GR</a>   | (Recommended) It is used to improve the network reliability.  |  |
|  | <b>bgp graceful-restart</b>   | Enables the BGP GR capability.   |
|  | <b>bgp graceful-restart restart-time</b> <i>restart-time</i>  | Configures the maximum time for BGP GR.  |
|  | <b>bgp graceful-restart stalepath-time</b> <i>time</i>  | Configures the maximum retention time for BGP stable route.                                  |
| <a href="#">Configuring a BGP IPv6 Address Family</a>                                      | (Optional) It is used to deploy an IPv6 network by using BGP.   |  |
|  | <b>address-family ipv6 unicast</b>  | Enters the BGP IPv6 unicast configuration mode.  |
|  | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> }<br><b>activate</b>   | Activates the address family capability of a BGP neighbor in the current configuration mode. |
| <a href="#">Configuring Interconnection with Devices Supporting Only 2-Byte AS Numbers</a> | Optional. It is used for interconnecting with an old device that supports only 2-byte AS numbers.   |  |
|  | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> }<br><b>remote-as</b> <i>as-number</i>   | Creates a BGP neighbor.  |

## 5.4.1 Configuring a BGP Peer (Group)

### Configuration Effect

- Configure BGP and create IBGP and EBGP neighbors.

### Notes

- If an IBGP neighbor is not directly connected, you need to configure IGP or a static routing protocol to implement interconnection.
- If an EBGP neighbor is not directly connected, you need to configure the **ebgp-multihop** parameter for the neighbor.

### Configuration Steps

#### ▾ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↘ Configuring a Source Interface for a BGP Neighbor

- (Optional) Perform this configuration in the BGP configuration mode. By default, BGP automatically selects a local interface that reaches the destination IP address of a peer as the source interface.

**i** For an IBGP neighbor, you are advised to use a Loopback interface as the source interface.

### Verification

- Run the **show** command to display the neighbor status.

### Related Commands

#### ↘ Enabling BGP

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>router bgp</b> <i>as-number</i>   |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | -  |

#### ↘ Creating a BGP Neighbor

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>  |
| <b>Parameter Description</b> | <i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.<br><i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.<br><i>as-number</i> : Indicates the AS number of a BGP peer (group). |
| <b>Command Mode</b>          | BGP configuration mode  |
| <b>Usage Guide</b>           | The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.   |

#### ↘ Creating a Source Interface for a BGP Neighbor

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>update-source</b> { <i>interface-type interface-number</i>   <i>address</i> }  |
| <b>Parameter Description</b> | <i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.<br><i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.<br><i>interface-type interface-number</i> : Indicates an interface name.<br><i>address</i> : Directly specifies the network interface address used for creating a BGP connection. |
| <b>Command Mode</b>          | BGP configuration mode   |
| <b>Usage Guide</b>           | The source interface of a neighbor must be a local valid interface or address.   |

## Common Errors

- IGP is not enabled and the interconnection between the local loopback address and the loopback address on the IBGP neighbor fails, which causes that the neighbor fails to be created.
- `ebgp-multihop` is not configured when an EBGP is not directly connected, which causes that a TCP connection fails to be created.

## 5.4.2 Configuring MD5 Authentication

### Configuration Effect

- Configure MD5 for encrypted authentication between EBGP and IBGP neighbors.

### Notes

- If an IBGP neighbor is not directly connected, you need to configure IGP or a static routing protocol to implement interconnection.
- If an EBGP neighbor is not directly connected, you need to configure the **`ebgp-multihop`** parameter for the neighbor.

### Configuration Steps

#### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display the neighbor status.

| <b>Command</b>               | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>  |
| <b>Parameter Description</b> | <i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.<br><i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.<br><i>as-number</i> : Indicates the AS number of a BGP peer (group). |
| <b>Command Mode</b>          | BGP configuration mode  |
| <b>Usage Guide</b>           | The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.   |

#### ↘ Configuring an MD5 Password for a BGP Neighbor

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>password</b> [ <b>0</b>   <b>7</b> ] <i>string</i>   |
| <b>Parameter Description</b> | <i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.<br><i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.<br><b>0</b> : Displays a password not encrypted.<br><b>7</b> : Displays a password encrypted.<br><i>string</i> : Indicates a password for TCP MD5 authentication, consisting of a maximum of 80 characters. |
| <b>Command Mode</b>          | BGP configuration mode   |
| <b>Usage Guide</b>           | The same passwords must be configured on the two ends of a BGP neighborhood.   |

### Configuration Example

#### ↘ Configuring BGP MD5 Authentication

|  |  |
|--|--|
| <p><b>Scenario</b><br/><b>Figure 5-5</b></p> |    |
| <p><b>Configuration Steps</b></p>            | <ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 5-5.</li> <li>● Configure a loopback interface on B and C and create an IBGP neighbor based on the loopback interface.</li> <li>● Create an EBGP neighborship by using the directly connected interfaces on A and B.</li> <li>● Configure the passwords on A, B and C for their neighbors.</li> </ul>   |
| <p><b>A</b></p>                              | <pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip address 192.168.1.1 255.255.255.0 A(config-if-GigabitEthernet 0/1)# exit A(config)# router bgp 65537 A(config-router)# neighbor 192.168.1.2 remote-as 65536 A(config-router)# neighbor 192.168.1.2 password 7 ebgpneighbor</pre>  |
| <p><b>B</b></p>                              | <pre>B# configure terminal B(config)# interface loopback 0 B(config-if-Loopback 0)# ip address 10.1.1.1 255.255.255.255 B(config-if-Loopback 0)# exit B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ip address 192.168.1.2 255.255.255.0 B(config-if-GigabitEthernet 0/1)# exit B(config)# interface GigabitEthernet 0/2 B(config-if-GigabitEthernet 0/2)# ip address 192.168.2.2 255.255.255.0 B(config-if-GigabitEthernet 0/2)# exit B(config)# router bgp 65536 B(config-router)# neighbor 10.1.1.2 remote-as 65536 B(config-router)# neighbor 10.1.1.2 update-source loopback 0</pre> |

|                     |   |
|---------------------|---|

## Common Errors

- The passwords for MD5 encrypted authentication at the two ends of a BGP neighborhood are different.

### 5.4.3 Configuring a Route Reflector

#### Configuration Effect

- Configure a route reflector in the IBGP environment to reduce the number of BGP neighbor connections.

#### Notes

- If an IBGP neighbor is not directly connected, you need to configure IGP or a static routing protocol to implement interconnection.

## Configuration Steps

### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Creating a BGP Reflector

- (Mandatory) Perform this configuration in the BGP configuration mode.

## Verification

- Run the **show** command to display the neighbor status.

## Related Commands

### ↳ Enabling BGP

## 5.4.4 Configuring an AS Alliance

### Configuration Effect

- Configure a BGP alliance to reduce the number of BGP neighbor connections.

### Notes

- It is advised to use private AS numbers for sub ASs (also called member ASs) within an alliance. Private AS numbers range from 64,512 to 65,535.
- Within a sub AS of an alliance, full mesh must be established for all BGP speakers (route reflectors can be further configured within the sub AS).
- An EBGP neighborhood must be established between sub ASs of an alliance.
- All BGP speakers within an alliance must belong to a sub AS within the alliance.

### Configuration Steps

#### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↳ Configuring a BGP Alliance ID

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↳ Configuring a BGP Alliance Member

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↳ Configuring Multiple Hops for an EBGP Neighbor

- Perform this configuration in the BGP configuration mode. It is mandatory when an EBGP neighbor is not directly connected.

### ↘ Configuring BGP Route Re-distribution to a Network

- (Optional) Perform this configuration in the BGP configuration mode. Perform this configuration when a local route needs to be advertised. You can also configure an alternative network by means of re-distribution.

### Verification

- Run the **show** command to display the BGP neighbor status.
- Run the **show** command to display the BGP routing table information.

### Related Commands

#### ↘ Enabling BGP

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>router bgp</b> <i>as-number</i>   |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | -  |

#### ↘ Enabling a BGP Alliance ID

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>bgp confederation identifier</b> <i>as-number</i>   |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | BGP configuration mode   |
| <b>Usage Guide</b>           | -  |

#### ↘ Configuring a BGP Alliance Member

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>bgp confederation peers</b> <i>as-number</i> [... <i>as-number</i> ]  |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | BGP configuration mode   |
| <b>Usage Guide</b>           | All member ASs of a local EBGP alliance must be identified.  |

#### ↘ Creating a BGP Neighbor

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>   |
| <b>Parameter Description</b> | <i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.<br><i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. |

|                     |   |
|---------------------|---|
|                     | <i>as-number</i> : Indicates the AS number of a BGP peer (group).   |
| <b>Command Mode</b> | BGP configuration mode  |
| <b>Usage Guide</b>  | The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end. |

➤ **Configuring Multiple Hops for an EBGP Neighbor**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>ebgp-multihop</b> [ <i>ttl</i> ]   |
| <b>Parameter Description</b> | <i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.<br><i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.<br><i>ttl</i> : Indicates the maximum number of hops that are allowed, ranging from 1 to 255. |
| <b>Command Mode</b>          | BGP configuration mode   |
| <b>Usage Guide</b>           | The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.  |

➤ **Configuring BGP Route Re-distribution to a Network**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>network</b> <i>network-number</i> [ <b>mask</b> <i>mask</i> ] [ <b>route-map</b> <i>map-tag</i> ] [ <b>backdoor</b> ]   |
| <b>Parameter Description</b> | <i>network-number</i> : Indicates the network address.<br><i>mask</i> : Indicates the subnet mask.<br><i>map-tag</i> : Indicates the name of a route map, consisting of no more than 32 characters.<br><b>backdoor</b> : Indicates that the route is a backdoor route. |
| <b>Command Mode</b>          | BGP configuration mode   |
| <b>Usage Guide</b>           | The core routing table must contain same IGP (or static and directly connected) routes.  |

**Configuration Example**

➤ **Configuring a BGP Alliance**

|                               |  |
|-------------------------------|--|
| <b>Scenario</b><br>Figure 5-7 | <p>The diagram illustrates a BGP alliance. On the left, AS 100 is a confederation of three member ASes: AS 65536 (routers A and B), AS 65537 (routers C and D), and AS 65538 (routers E and ASBR1). On the right, AS 200 (ASBR2) is connected to AS 100 via ASBR1. Connections between AS 100 member ASes are labeled 'Confed EBGP', and the connection between AS 100 and AS 200 is labeled 'EBGP'. Physical interfaces are shown as GE0/1, GE0/2, and GE0/3.</p> |
| <b>Configuration</b>          | <ul style="list-style-type: none"> <li>Configure BGP on A and B, set the AS number to 65,536 and configure an IBGP neighborship.</li> </ul>  |

|              |  |
|--------------|--|
| <b>Steps</b> | <ul style="list-style-type: none"> <li>● Configure BGP on C and D, set the AS number to 65,537 and configure an IBGP neighborship.</li> <li>● Configure BGP on ASBR1 and E, set the AS number to 65,538 and configure an IBGP neighborship.</li> <li>● Configure an alliance ID 100 on A, B, C, D, E and ASBR1.</li> <li>● Configure the alliance member 65,537 on A, configure C as an EBGP neighbor, and set the peer AS number to 65,537.</li> <li>● Configure the alliance members 65,536 and 65,538 on C, configure A as an EBGP neighbor and set the peer AS number to 65,536, configure ASBR1 as an EBGP neighbor and set the peer AS number to 65,538.</li> <li>● Configure the alliance members 65,537 on ASBR1, configure C as an EBGP neighbor and set the peer AS number to 65,537, configure ASBR2 as an EBGP neighbor and set the peer AS number to 200.</li> <li>● Configure BGP on ASBR2 and set the AS number to 200; configure ASBR1 as an EBGP neighbor and set the peer AS number to 100.</li> </ul> |

**Common Errors**

- No BGP alliance neighbor is configured.
- Full mesh is not established within sub ASs of an alliance.

## 5.4.5 Configuring Multi-path Load Balancing of BGP

### Configuration Effect

- Implement multi-path load balancing for IBGP routes.
- Support AS-PATH loose comparison.

### Notes

- Routes learned from an IBGP neighbor must have the same priority (the router-ID does not need to be compared).

### Configuration Steps

#### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↘ Configuring BGP Load Balancing

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↘ Configuring AS-PATH Loose Comparison

- (Optional) Perform this configuration in the BGP configuration mode. Perform this configuration when load balancing needs to be implemented for routes learned from different ASs.

### Verification

- Run the **show** command to display BGP routing information.
- Run the **show** command to display the core routing table information.

### Related Commands

#### ↘ Enabling BGP

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>router bgp</b> <i>as-number</i>   |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | -  |

#### ↘ Creating a BGP Neighbor

|                  |  |
|------------------|--|
| <b>Command</b>   | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>             |
| <b>Parameter</b> | <i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. |

|                     |   |
|---------------------|---|
| <b>Description</b>  | <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.<br><i>as-number</i> : Indicates the AS number of a BGP peer (group). |
| <b>Command Mode</b> | BGP configuration mode  |
| <b>Usage Guide</b>  | The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.   |

### ↘ [Configuring BGP Load Balancing](#)

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>maximum-paths ibgp</b> <i>number</i>  |
| <b>Parameter Description</b> | <i>number</i> : Indicates the maximum number of equivalent paths, ranging from 1 to 32. If the value is 1, multi-path load balancing of IBGP will be disabled. |
| <b>Command Mode</b>          | BGP configuration mode   |
| <b>Usage Guide</b>           | -  |

### ↘ [Configuring AS-PATH Loose Comparison](#)

|                              |   |

      [200/0] via 10.4.1.1, 00:27:56

```

## Common Errors

- The priorities of multi-hop BGP routes are different, which causes load balancing failure.

## 5.4.6 Configuring EBGPFRR

### Configuration Effect

- Implement EBGPFRR.

### Notes

- (Optional) Configure a neighbor BFD session to implement fast link fault detection.

### Configuration Steps

#### ▾ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ▾ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ▾ Configuring BGP FRR

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ▾ Configuring a Neighbor BFD Session

- (Optional) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display routing information.

## Common Errors

- No BFD session is configured for BGP neighbors.

## 5.4.7 Configuring Local ASs

### Configuration Effect

- Smoothly migrate the network configurations of router A from AS 23 to AS 3600.

### Notes

N/A

### Configuration Steps

#### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↘ Configuring the Local AS for a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display the information.

## 5.4.8 Configuring BGP GR

### Configuration Effect

- Configure BGP GR to implement network deployment with high reliability.

### Notes

- To successfully deploy the BGP GR function, you need to use a neighbor device as the GR Helper.
- In an BGP environment, you also need to configure IGP GR.
- After BGP GR is enabled, you need to reset a BGP neighbor connection to make it take effect.

### Configuration Steps

#### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↘ Configuring BGP GR

- Perform this configuration in the BGP configuration mode, which is configured by default.

#### ↘ Configuring a BGP GR Timer

- (Optional) Perform this configuration in the BGP configuration mode.

#### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display the neighbor status.

| <b>Parameter Description</b> | <i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.<br><i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.<br><i>as-number</i> : Indicates the AS number of a BGP peer (group). |
| <b>Command Mode</b>          | BGP configuration mode  |
| <b>Usage Guide</b>           | The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer  |

end.

### Configuration Example

#### Configuring BGP GR

|  |  |
|--|--|
| <p><b>Scenario</b><br/>Figure 5-11</p> | <p>The diagram illustrates two Autonomous Systems (ASes). AS 200 consists of a single router R1. AS 100 consists of three routers: R2, R3, and R4. R1 is connected to R2 via a solid line, representing an EBGP neighborship. R2, R3, and R4 are interconnected with each other via dashed lines, representing an IBGP neighborship. A legend indicates that solid lines represent EBGP and dashed lines represent IBGP.</p> |
| <p><b>Configuration Steps</b></p>      | <ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 5-11.</li> <li>● Configure a loopback interface on R2, R3, and R4 and create an IBGP neighborship based on the loopback interface.</li> <li>● Create an EBGP neighborship by using the directly connected interfaces on R1 and R2.</li> <li>● Enable BGP GR on R1, R2, R3, and R4.</li> </ul>                   |
| <p><b>R1</b></p>                       | <pre>R1# configure terminal R1(config-router)# exit R1(config)# router bgp 100 R1(config-router)# bgp graceful-restart</pre>   |
| <p><b>R2</b></p>                       | <pre>R2# configure terminal R2(config)# router ospf 1 R2(config-router)# graceful-restart R2(config-router)# exit R2(config)# router bgp 100 R2(config-router)# bgp graceful-restart</pre>   |
| <p><b>R3</b></p>                       | <pre>R3# configure terminal</pre>  |

|                     |   |
|---------------------|---|
|                     | <pre> R3(config)# router ospf 1 R3(config-router)# graceful-restart R3(config-router)# exit R3(config)# router bgp 100 R3(config-router)# bgp graceful-restart </pre>   |
| <b>R4</b>           | <pre> R4# configure terminal R4(config)# router ospf 1 R4(config-router)# graceful-restart R4(config-router)# exit R4(config)# router bgp 100 R4(config-router)# bgp graceful-restart </pre>  |
| <b>Verification</b> | Run the <b>show</b> command to display the BGP neighbor status.   |
| <b>R2</b>           | <pre> R2# show ip ospf Routing Process "ospf 1" with ID 10.0.0.2 Process uptime is 4 minutes Process bound to VRF default Conforms to RFC2328, and RFC1583Compatibility flag is enabled Supports only single TOS(TOS0) routes Supports opaque LSA This router is an ASBR (injecting external routing information) SPF schedule delay 5 secs, Hold time between two SPFs 10 secs LsaGroupPacing: 240 secs Number of incoming current DD exchange neighbors 0/5 Number of outgoing current DD exchange neighbors 0/5 Number of external LSA 4. ```

### Common Errors

- GR is not enabled for IGP.
- GR is not enabled for a BGP neighbor device.

## 5.4.9 Configuring a BGP IPv6 Address Family

### Configuration Effect

- Configure BGP IPv6 routes to implement IPv6 network access in different ASs.

### Notes

- Generally, BGP uses IPv6 addresses to create neighborships and implement exchange of IPv6 routes.

- In special scenarios (such as the 6PE function, see the MPLS-L3VPN-SCG.doc), BGP supports exchange of IPv6 routes on the neighbors with IPv4 addresses.
- Configurations related to BGP IPv6 services must be configured in the BGP IPv6 address family mode.

### Configuration Steps

#### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↳ Configuring the BGP IPv4 Address Family Mode

- (Optional) Perform this configuration in the BGP configuration mode.

#### ↳ Disabling the IPv4 Address Family Capability for a BGP Neighbor

- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

#### ↳ Configuring the BGP IPv6 Address Family Mode

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↳ Configuring the IPv6 Address Family Capability for a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP IPv6 configuration mode.

#### ↳ Configuring IPv6 Route Advertisement in BGP

- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

### Verification

- Run the **show** command to display the neighbor status.
- Run the **show** command to display the routing status.

### Related Commands

#### ↳ Enabling BGP

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>router bgp</b> <i>as-number</i>   |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | -  |

#### ↳ Creating a BGP Neighbor

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>  |
| <b>Parameter</b>    | <i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address.  |
| <b>Description</b>  | <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.<br><i>as-number</i> : Indicates the AS number of a BGP peer (group). |
| <b>Command Mode</b> | BGP configuration mode  |
| <b>Usage Guide</b>  | The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.   |

#### ↘ Configuring the BGP IPv4 Address Family Mode

|                     |                                    |
|---------------------|------------------------------------|
| <b>Command</b>      | <b>address-family ipv4 unicast</b> |
| <b>Parameter</b>    | -                                  |
| <b>Description</b>  |                                    |
| <b>Command Mode</b> | BGP configuration mode             |
| <b>Usage Guide</b>  | -                                  |

#### ↘ Disabling the IPv4 Address Family Capability for a BGP Neighbor

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>no neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>activate</b>   |
| <b>Parameter</b>    | <i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address.  |
| <b>Description</b>  | <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.  |
| <b>Command Mode</b> | BGP IPv4 address family mode  |
| <b>Usage Guide</b>  | Neighbors with IPv6 addresses are used to exchange IPv6 routes. However, when a neighbor is configured in the BGP mode, BGP automatically activates the IPv4 unicast address family capability for the neighbor. Therefore, you are advised to manually disable the IPv4 unicast address family capability. |

#### ↘ Configuring the BGP IPv6 Address Family Mode

|                     |                                    |
|---------------------|------------------------------------|
| <b>Command</b>      | <b>address-family ipv6 unicast</b> |
| <b>Parameter</b>    | -                                  |
| <b>Description</b>  |                                    |
| <b>Command Mode</b> | BGP configuration mode             |
| <b>Usage Guide</b>  | -                                  |

#### ↘ Configuring the IPv6 Address Family Capability for a BGP Neighbor

|                    |  |
|--------------------|--|
| <b>Command</b>     | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>activate</b>                       |
| <b>Parameter</b>   | <i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address.               |
| <b>Description</b> | <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. |
| <b>Command</b>     | BGP IPv6 address family mode   |

|                    |   |
|--------------------|---|

Configuration Example

↘ **Configuring BGP to Implement IPv6 Route Exchange in Different ASs**

|                                |  |
|--------------------------------|--|
| <b>Scenario</b><br>Figure 5-12 | <p>The diagram shows two routers, Router A and Router B, connected by a line. Router A is on the left and is associated with AS 65530. Router B is on the right and is associated with AS 65531. Each router is represented by a blue cube with a white cross on its top face, and a cloud-like shape is attached to its left and right sides respectively.</p>  |
| <b>Configuration Steps</b>     | <ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 5-12.</li> <li>● Configure a BGP neighbor, disable the IPv4 address family capability for the neighbor and activate the IPv6 address family capability.</li> <li>● Configure IPv6 route advertisement in BGP.</li> </ul>  |
| <b>A</b>                       | <pre> A# configure terminal A(config)# int loopback 0 A(config-if-Loopback)# ipv6 address 30::1/128 A(config-if-Loopback)# exit A(config)# router bgp 65530 A(config-router)# neighbor 100::1 remote-as 65531 A(config-router)# address-family ipv4 A(config-router-af)# no neighbor 100::1 activate A(config-router-af)# exit-address-family A(config-router)# address-family ipv6 A(config-router-af)# neighbor 100::1 activate                     </pre> |

|                            | <pre>A(config-router-af)# network 30::1/128</pre>   |          |          |         |         |         |        |              |              |         |              |        |         |       |   |   |   |   |   |          |   |
|----------------------------|---|----------|----------|---------|---------|---------|--------|--------------|--------------|---------|--------------|--------|---------|-------|---|---|---|---|---|----------|---|
| <p><b>B</b></p>            | <pre>B# configure terminal B(config)# router bgp 65531 B(config-router)# neighbor 100::2 remote-as 65530 B(config-router)# address-family ipv4 B(config-router-af)# no neighbor 100::2 activate B(config-router-af)# exit-address-family B(config-router)# address-family ipv6 B(config-router-af)# neighbor 100::2 activate</pre>  |          |          |         |         |         |        |              |              |         |              |        |         |       |   |   |   |   |   |          |   |
| <p><b>Verification</b></p> | <p>Run the <b>show</b> command to display the BGP neighbor status.</p>  |          |          |         |         |         |        |              |              |         |              |        |         |       |   |   |   |   |   |          |   |
| <p><b>A</b></p>            | <pre>A# show bgp ipv6 unicast summary BGP router identifier 1.1.1.1, local AS number 65530 BGP table version is 1 1 BGP AS-PATH entries 0 BGP Community entries 1 BGP Prefix entries (Maximum-prefix:4294967295)</pre> <table border="1" data-bbox="326 1121 1477 1209"> <thead> <tr> <th>Neighbor</th> <th>V</th> <th>AS</th> <th>MsgRcvd</th> <th>MsgSent</th> <th>TblVer</th> <th>InQ</th> <th>OutQ</th> <th>Up/Down</th> <th>State/PfxRcd</th> </tr> </thead> <tbody> <tr> <td>100::1</td> <td>4</td> <td>65531</td> <td>4</td> <td>6</td> <td>1</td> <td>0</td> <td>0</td> <td>00:01:49</td> <td>0</td> </tr> </tbody> </table> <pre>Total number of neighbors 1</pre> | Neighbor | V        | AS      | MsgRcvd | MsgSent | TblVer | InQ          | OutQ         | Up/Down | State/PfxRcd | 100::1 | 4       | 65531 | 4 | 6 | 1 | 0 | 0 | 00:01:49 | 0 |

|--|----------------------------|

## Common Errors

- The IPv6 address family capability is not activated for BGP neighbors.
- In non-6PE scenarios, IPv4 addresses are used to establish IPv6 routes for exchange between neighbors.

## 5.4.10 Configuring Interconnection with Devices Supporting Only 2-Byte AS Numbers

### Configuration Effect

- Successfully interconnect devices supporting 4-byte AS numbers with devices supporting only 2-byte AS numbers.

### Configuration Steps

#### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### ↳ Configuring the Display Mode of a 4-Byte AS Number

- (Optional) Perform this configuration in the BGP configuration mode. By default, a 4-byte AS number is displayed as decimal digits.

### Verification

- Run the **show** command to display the neighbor status.

### Related Commands

#### ↳ Enabling BGP

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>router bgp</b> <i>as-number</i>   |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | -  |

#### ↳ Creating a BGP Neighbor

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>  |
| <b>Parameter Description</b> | <i>peer-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.<br><i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters.<br><i>as-number</i> : Indicates the AS number of a BGP peer (group). |

|                     |   |
|---------------------|---|
| <b>Command Mode</b> | BGP configuration mode  |
| <b>Usage Guide</b>  | The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end. |

**Common Errors**

N/A

**5.4.11 Using Local IPv6 Link Addresses to Establish BGP Neighborships**

**Configuration Effect**

- Use local IPv6 link addresses to establish BGP neighborships.

## Notes

---

- Generally, global IPv4 addresses need to be used for establishing BGP neighborships.
- Local IPv6 link addresses can be used for establishing only single-hop BGP neighborships.
- When local IPv6 link addresses are used for establishing neighborships, using local IPv6 link addresses as information sources must be specified on the peer end.
- When local IPv6 link addresses are used for establishing neighborships, local IPv6 link addresses must be configured on both ends.

## Configuration Steps

---

### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↘ Specifying the Message Source for a BGP Neighbor

- Perform this configuration in the BGP configuration mode. If local IPv6 link addresses are configured for a neighbor, this configuration is mandatory; otherwise, this configuration is optional.

### ↘ Configuring the BGP IPv4 Address Family Mode

- (Optional) Perform this configuration in the BGP configuration mode.

### ↘ Disabling the IPv4 Address Family Capability for a BGP Neighbor

- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

### ↘ Configuring the BGP IPv6 Address Family Mode

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↘ Configuring the IPv6 Address Family Capability for a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP IPv6 configuration mode.

### ↘ Configuring IPv6 Route Advertisement in BGP

- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

## Verification

---

- Run the **show** command to display the neighbor status.
- Run the **show** command to display the routing status.

## Related Commands

### ↳ Enabling BGP

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>router bgp</b> <i>as-number</i>   |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | -  |

### ↳ Creating a BGP Neighbor

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>neighbor</b> <i>peer-address</i> <b>remote-as</b> <i>as-number</i>   |
| <b>Parameter Description</b> | <i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address.<br><i>as-number</i> : Indicates the AS number of a BGP peer (group). |
| <b>Command Mode</b>          | BGP configuration mode  |
| <b>Usage Guide</b>           | The AS specified for a peer must be the same as the BGP AS number of a BGP speaker at the peer end.   |

### ↳ Specifying the Message Source for a BGP Neighbor

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>neighbor</b> <i>peer-address</i> <b>update-source</b> <i>interface-type interface-number</i>  |
| <b>Parameter Description</b> | <i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address.<br><i>interface-type interface-number</i> : Indicates an interface name.  |
| <b>Command Mode</b>          | BGP configuration mode   |
| <b>Usage Guide</b>           | If the local IPv6 link address of a local interface is used when a BGP neighborhood is established with a neighbor device, this interface must be specified as the message source of the neighborhood when the BGP neighborhood is configured on the local device. |

### ↳ Configuring the BGP IPv4 Address Family Mode

|                  |                                    |
|------------------|------------------------------------|
| <b>Command</b>   | <b>address-family ipv4 unicast</b> |
| <b>Parameter</b> | -                                  |

|                     |                        |
|---------------------|------------------------|
| <b>Description</b>  |                        |
| <b>Command Mode</b> | BGP configuration mode |
| <b>Usage Guide</b>  | -                      |

#### ↘ Disabling the IPv4 Address Family Capability for a BGP Neighbor

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>no neighbor <i>peer-address</i> activate</b>   |
| <b>Parameter Description</b> | <i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address.  |
| <b>Command Mode</b>          | BGP IPv4 address family mode  |
| <b>Usage Guide</b>           | Neighbors with IPv6 addresses are used to exchange IPv6 routes. However, when a neighbor is configured in the BGP mode, BGP automatically activates the IPv4 unicast address family capability for the neighbor. Therefore, you are advised to manually disable the IPv4 unicast address family capability. |

#### ↘ Configuring the BGP IPv6 Address Family Mode

|                              |                                    |
|------------------------------|------------------------------------|
| <b>Command</b>               | <b>address-family ipv6 unicast</b> |
| <b>Parameter Description</b> | -                                  |
| <b>Command Mode</b>          | BGP configuration mode             |
| <b>Usage Guide</b>           | -                                  |

#### ↘ Configuring the IPv6 Address Family Capability for a BGP Neighbor

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>neighbor <i>peer-address</i> activate</b>   |
| <b>Parameter Description</b> | <i>peer-address</i> : Indicates the address of a peer, which is usually an IPv6 address. |
| <b>Command Mode</b>          | BGP IPv6 address family mode   |
| <b>Usage Guide</b>           | -  |

#### ↘ Configuring IPv6 Route Advertisement in BGP

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>network</b> <i>network-number</i> [ <b>mask</b> <i>mask</i> ] [ <b>route-map</b> <i>map-tag</i> ] [ <b>backdoor</b> ]   |
| <b>Parameter Description</b> | <p><i>network-number</i>: Indicates the network number.</p> <p><i>mask</i>: Indicates the subnet mask.</p> <p><i>map-tag</i>: Indicates the name of a route map, consisting of no more than 32 characters.</p> <p><b>backdoor</b>: Indicates that the route is a backdoor route.</p> |
| <b>Command Mode</b>          | BGP IPv6 address family mode   |
| <b>Usage Guide</b>           | -  |

### Configuration Example

#### Using a Local IPv6 Link Address for Configuring a BGP Neighborhood to Implement IPv6 Route Exchange in Different ASs

|   |  |
|---|--|
| <p><b>Scenario</b></p> <p>Figure 5-14</p> | <p>The diagram shows two routers, Router A and Router B, connected by a line. Router A is on the left and is associated with AS 65530. Router B is on the right and is associated with AS 65531. Each router is connected to a cloud representing a network.</p>   |
| <p><b>Configuration Steps</b></p>         | <ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 5-14.</li> <li>● Configure a BGP neighbor, specify the update-source, disable the IPv4 address family capability for the neighbor and activate the IPv6 address family capability.</li> <li>● Configure IPv6 route advertisement in BGP.</li> </ul> |
| <p><b>A</b></p>                           | <pre>A# configure terminal A(config)# int loopback 0 A(config-if-Loopback)# ipv6 address 30::1/128 A(config-if-Loopback)# exit A(config)# int GigabitEthernet 0/1 A(config-if-Loopback)# ipv6 address fe80:100::2/64 A(config-if-Loopback)# exit A(config)# router bgp 65530</pre>   |

| Network      | Next Hop  | Metric  | LocPrf   | Weight Path |        |             |              |             |   |  |           |
| *> 30::1/128 | FE80:100::2   | 0       |          | 0 65530 i   |        |             |              |             |   |  |           |

### Common Errors

- When a neighborhood is configured, a local IPv6 link address is used to specify the neighborhood; however, no update source is specified as the interface for this local IPv6 link address during local configuration.
- Only one end uses a local IPv6 link address for establishing a neighborhood.

## 5.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

| Description                     | Command  |
|---------------------------------|--|
| Clears BGP IPv4 unicast routes. | <b>clear ip bgp [ vrf vrf-name ] { *   as-number   peer-address } [ soft ] [ in   out ]</b><br><b>clear bgp ipv4 unicast [ vrf vrf-name ] { *   as-number   peer-address } [ soft ] [ in   out ]</b> |
| Clears BGP IPv6 unicast routes. | <b>clear bgp ipv6 unicast [ vrf vrf-name ] { *   as-number   peer-address } [ soft ] [ in   out ]</b>  |

### Displaying

| Description                       | Command  |
|-----------------------------------|--|
| Displays BGP IPv4 unicast routes. | <b>show ip bgp</b><br><b>show bgp ipv4 unicast</b> |
| Displays BGP IPv6 unicast routes. | <b>show bgp ipv6 unicast</b>                       |

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description                       | Command                        |
|-----------------------------------|--------------------------------|
| Enables all BGP debugging.        | <b>debug ip bgp all</b>        |
| Debugs BGP route flapping.        | <b>debug ip bgp dampening</b>  |
| Debugs BGP event processing.      | <b>debug ip bgp event</b>      |
| Debugs BGP route filtering.       | <b>debug ip bgp filter</b>     |
| Debugs BGP status machine.        | <b>debug ip bgp fsm</b>        |
| Debugs BGP neighbor keepalive.    | <b>debug ip bgp keepalives</b> |
| Debugs BGP MPLS processing.       | <b>debug ip bgp mpls</b>       |
| Debugs BGP core route processing. | <b>debug ip bgp nsm</b>        |
| Debugs BGP UPDATE packets.        | <b>debug ip bgp update</b>     |

## 6 Configuring PBR

### 6.1 Overview

Policy-based routing (PBR) is implemented by applying a route map including policies to interfaces and devices.

Similar to static routing, PBR is also manually configured and cannot automatically update with network changes. In addition, PBR is effective only for packets sent from local interfaces and devices. As compared with static and dynamic routing, PBR is more flexible. Static and dynamic routing can forward packets only based on destination addresses. PBR can forward packets based on source and destination addresses, packet length and input interface.

### 6.2 Applications

| Application  | Description  |
|--|--|
| <a href="#">Selecting an ISP by Using PBR</a>                    | Specify preferential output interfaces for packets from different subnets. |
| <a href="#">Implementing Traffic Classification by Using PBR</a> | Specify QoS values for packets from different subnets.                     |

#### 6.2.1 Selecting an ISP by Using PBR

An existing user network often uses resources of multiple internet server providers (ISPs). PBR needs to be used since different bandwidths may be requested from different ISPs or the network resources for key users need to be protected. By controlling forwarding of certain data packets, you can make full use ISP resources as well as meet the requirements of flexible and diversified applications.

#### Scenario

Figure 6-1

A LAN has two output interfaces for connecting the Internet. PBR is configured on the layer-3 device DEV1 to enable the two output interfaces to implement load sharing and mutual backup.

The specific requirements are as follows:

- Data streams from subnet 1 are sent from GE 0/1.
- Data streams from subnet 2 are sent from GE 0/2.
- If the GE 0/1 link is disconnected, the data streams on GE 0/1 are switched to GE 0/2. Vice versa.

## Deployment

- Configure two different ACLs on the layer-3 device DEV1:  
ACL1: source addresses belong to subnet 1.  
ACL2: source addresses belong to subnet 2.
- Configure two policies in the route map on the layer-3 device DEV1:  
Policy 1: sets the next hops for packets matching ACL1 to GE0/1 and GE0/2 (Based on the configuration sequence, GE0/1 takes effect first and GE0/2 works in the backup mode).  
Policy 2: sets the next hops for packets matching ACL2 to GE0/2 and GE0/1 (Based on the configuration sequence, GE0/2 takes effect first and GE0/1 works in the backup mode).
- Configure PBR on GE0/3 (by using a route map). Then, packets received on this interface are forwarded based on the policies.

## 6.2.2 Implementing Traffic Classification by Using PBR

### Scenario

Networks of medium- and small-sized enterprises have simple structures. Different branch nodes are interconnected to the central nodes through carrier dedicated lines or the Internet VPN mode. Enterprise networks often need to implement

three-in-one integration (of audio, video and data) to maximize the utilization of existing IP networks and save costs. Since all traffic is output from a single output interface, it is necessary to adjust the QoS policies for the output interface, in order to provide preferential communication quality for bandwidth- and delay-sensitive applications.

Figure 6-2

A LAN has an output interface for connecting the Internet. PBR is configured on the layer-3 device DEV1 to change the QoS values for packets from different networks.

The specific requirements are as follows:

- For data streams from subnet 1, representing audio streams, set the DSCP value to 56.
- For data streams from subnet 2, representing video streams, set the DSCP value to 40.
- For data streams from subnet 3, representing data streams, set the DSCP value to 24.

## Deployment

- Configure three different ACLs on the layer-3 device DEV1:
  - ACL1: source addresses belong to subnet 1.
  - ACL2: source addresses belong to subnet 2.
  - ACL3: source addresses belong to subnet 3.
- Configure three policies in the route map on the layer-3 device DEV1:
  - Policy 1: sets the DSCP value for packets matching ACL1 to 56.
  - Policy 2: sets the DSCP value for packets matching ACL2 to 40.
  - Policy 3: sets the DSCP value for packets matching ACL3 to 24.
- Configure PBR on GE0/3 (by using a route map). Then, the DSCP values for packets received on this interface are changed based on the policies.

## 6.3 Features

| Feature                              | Description  |
|--------------------------------------|--|
| <a href="#">Configuring a Policy</a> | Before configuring PBR, configure policies in a route map.                       |
| <a href="#">Configuring PBR</a>      | Apply a route map including policies to interfaces and devices to implement PBR. |

### 6.3.1 Configuring a Policy

A policy is a "match ..., set..." statement, which indicates that "if certain conditions are matched, perform certain processing actions".

 For detailed introduction to the policies, see the section "Route Map".

#### Executing Policies

In the global configuration mode, you can run the **route-map** *route-map-name* [ **permit** | **deny** ] [ *sequence-number* ] command to create a policy in a route map.

A route map may contain multiple policies. Each policy has a corresponding sequence number. A smaller sequence number means a higher priority. Policies are executed based on their sequence numbers. Once the matching condition of a policy is met, the processing action for this policy needs to be executed and the route map exits. If no matching condition of any policy is met, no processing action will be performed.

Policies have two working modes:

- **permit**: When the matching condition of a policy is met, perform the processing action for this policy and exit the route map.
- **deny**: When the matching condition of a policy is met, do not perform the processing action for this policy and exit the route map.

#### Matching conditions of policies

The matching conditions of a policy may contain 0, 1 or more matching rules.

- If 0 matching rule is contained, no packet will be matched.
- If one or more match rules are contained, all match rules must be matched at the same time to meet the matching conditions of the policy.

In the route map mode, run the **match** command to configure match rules. One **match** command is mapped to one match rule.

PBR supports the following **match** commands:

| Command | Description |
|---------|-------------|
|---------|-------------|

|          |                           |   |
|----------|---------------------------|---|
|          | <b>match ip address</b>   | The source IPv4 address (and the destination IPv4 address) is used as the matching condition.<br><br> Multiple <b>match ip address</b> commands can be configured in a policy. |
| IPv6 PBR | <b>match ipv6 address</b> | The source IPv6 address (and the destination IPv6 address) is used as the matching condition.<br><br> Only one <b>match ipv6 policy</b> command can be configured in a policy. |

-  IPv4 PBR defines the source IP address (and destination IP address) ranges of packets by using the IP standard or extended ACLs. IPv6 PBR defines the source IPv6 address (and destination IPv6 address) ranges of packets by using the IPv6 extended ACLs.
-  On a switch, packet forwarding based on policies of IPv4 PBR interfaces supports expert-level and MAC name ACLs. Packet forwarding based on local policies does not support expert-level and MAC name ACLs.
-  When PBR uses an ACL that is unavailable, the route sub-map will not be matched and the next route sub-map will be matched instead. If no route sub-map is matched, a common route will be selected for forwarding. If only ACLs are configured but no ACE is configured, the PBR forwarding behavior is the same as that in a scenario where an ACL is unavailable.
-  On a non-switch device, packet forwarding based on policies of IPv4 PBR interfaces and local policies do not support expert-level and MAC name ACLs.
-  On a switch, if a route sub-map uses multiple ACLs in PBR, only the first ACL is matched.

### Processing action for a policy

The processing action of a policy may contain 0, 1 or more set rules.

- If 0 set rule is contained, no processing action will be performed and the route map will directly exit.
- If one or more set rules are contained, all processing actions will be performed and the route map will exit.

 If set rules have different priorities, the set rule with the highest priority will take effect.

In the route map mode, run the **set** command to configure set rules. One **set** command is mapped to one set rule.

PBR supports the following **set** commands:

|          | Command                  | Description  |
|----------|--------------------------|--|
| IPv4 PBR | <b>set ip tos</b>        | Modifies the <b>tos</b> field of an IPv4 packet.<br><br> This command cannot work with the <b>set ip dscp</b> command.        |
|          | <b>set ip precedence</b> | Modifies the <b>precedence</b> field of an IPv4 packet.<br><br> This command cannot work with the <b>set ip dscp</b> command. |

|             | Command                          | Description  |
|-------------|----------------------------------|--|
|             | <b>set ip dscp</b>               | <p>Modifies the <b>dscp</b> field of an IPv4 packet.</p> <p> This command cannot work with the <b>set ip tos</b> and <b>set ip precedence</b> commands.</p>   |
|             | <b>set ip next-hop</b>           | <p>Configures the next hop of IPv4 packet forwarding. The next hop must be directly connected; otherwise, this command is invalid.</p> <p>A packet matching the match rules will be forwarded to the next hop specified by <b>set ip next-hop first</b>, no matter whether the route selected for the packet in the routing table is consistent with the next hop specified by PBR.</p> <p> On a switch, the output interfaces for next hops supported by PBR include the SVI, routing and layer-3 AP interfaces.</p>   |
|             | <b>set ip next-hop recursive</b> | <p>Configures the recursive next hop of IPv4 packet forwarding. The next hop can be directly connected or not directly connected. A non-directly-connected next hop will recur to a static or dynamic route in the routing table.</p> <p>This command supports recursion to multiple ECMP next hops of a static or dynamic route. A maximum of 32 next hops are supported. If a recursive route is a static route, only one next hop is supported for the static recursive route.</p> <p>The redundant backup or load balancing mode of multiple recursive next hops is also determined by the <b>ip policy { redundance   load-balance }</b> command.</p> <p>A packet matching the match rules will be forwarded to the recursive next hop specified by <b>set ip next-hop recursive</b> first, no matter whether the route selected for the packet in the routing table is consistent with the next hop specified by PBR.</p> <p> Only when a static or dynamic route has an output interface and a next-hop IP address, the policy-based recursive next hop can take effect.</p> |
|             | <b>set ip default next-hop</b>   | <p>Configures the default next hop of IPv4 packet forwarding.</p> <p>A packet matching the match rules will be forwarded to the default next hop specified by this command if a route fails to be selected or the default route is selected for this packet in the routing table.</p>  |
| IPv6<br>PBR | <b>set ipv6 precedence</b>       | <p>Modifies the <b>precedence</b> field of an IPv6 packet.</p> <p> IPv6 PBR does not support <b>set ipv6 tos</b> or <b>set ipv6 dscp</b>.</p>   |

|  | Command                          | Description  |
|--|----------------------------------|--|
|  | <b>set ipv6 next-hop</b>         | Configures the next hop of IPv6 packet forwarding.<br>An IPv6 packet matching the match rules will be forwarded to the next hop specified by <b>set ipv6 next-hop</b> first, no matter whether the route selected for the IPv6 packet in the routing table is consistent with the next hop specified by PBR.<br>The next hop must be directly connected; otherwise, this command is invalid. |
|  | <b>set ipv6 default next-hop</b> | Configures the default next hop of IPv6 packet forwarding.<br>An IPv6 packet matching the match rules will be forwarded to the default next hop specified by this command if a route fails to be selected or the default route is selected for this packet in the routing table.<br>The next hop must be directly connected; otherwise, this command is invalid.                             |

-  The priority sequence is as follows: **set ip next-hop > set ip next-hop recursive > common route > set ip default next-hop > default route**. The preceding **set** commands can be configured at the same time but only the command with the highest priority takes effect.
-  The priority sequence is as follows: **set ipv6 next-hop > common route > set ipv6 default next-hop > default route**. The preceding **set** commands can be configured at the same time but only the command with the highest priority takes effect.
-  For switches, the **set ipv6 default next-hop** command does not take effect for IPv6 addresses whose mask length exceeds 64.

## 6.3.2 Configuring PBR

### PBR

Apply a route map including policies to interfaces or devices to implement PBR.

- Apply a route map to an interface so that packets received by the interface are routed based on the policy.  
The PBR is often used to control user packets received by a device. This command is effective only for forwarded packets, but not for locally initiated packets.
- Apply a route map to a device so that packets locally initiated are routed based on the policy.  
The PBR is often used to control protocol packets exchanged between devices (such as ping packets sent locally). This command is effective only for locally initiated packets, but not for forwarded packets.

-  By default, PBR is not unavailable on a device and packets are forwarded based on a routing table.
-  On a switch, the interfaces which support PBR are L3 Ethernet interface, SVI interface and L3 AP interface.

### Redundant backup or load balancing

You can set multiple next hops in a policy. Either redundant backup or load balancing can be implemented among multiple next hops. Redundant backup is implemented by default.

**i** Redundant backup or load balancing is only effective for next hops configured in the **set ip next-hop**, **set ip next-hop recursive**, **set ip default next-hop**, **set ipv6 next-hop** and **set ipv6 default next-hop** commands, and only effective among multiple next hops in the same set rule.

- Redundant backup

Based on the configuration sequence, the first accessible next hop takes effect. When the currently effective next hop (R1) is faulty, the traffic automatically switches to the next accessible next hop (R2). When R1 becomes accessible again, the traffic automatically switches back to R1.

A newly added next hop is arranged at the last of the sequence. Assume that the original sequence of multiple next hops is R1 > R2 > R3. After R1 is deleted and added again, the sequence changes to R2 > R3 > R1.

If no next hop is accessible, packets will be discarded.

- Load balancing

When multiple accessible next hops take effect at the same time, the Weighted Cost Multiple Path (WCMP) and Equal Cost Multiple Path (ECMP) are supported. After an accessible next hop loses effect, traffic will be balanced among the other accessible next hops.

## Correlation with BFD

Correlation between PBR and BFD is effective only for next hops configured by the **set ip next-hop** or **set ipv6 next-hop** command.

The **set ip next-hop** and **set ipv6 next-hop** commands carry the **verify-availability** and **bfd [ vrf vrf-name ] interface-type interface-number gateway** parameters, which can establish correlation between PBR and a BFD session and monitor the accessibility of next hops.

Correlation between PBR and BFD helps enhance the PBR's perception about network environment changes. When BFD detects that the current next hop is not accessible, the BFD will immediately notify the PBR to switch the traffic to another accessible next hop (to implement redundant backup) or all the other accessible next hops (to implement load balancing).

**i** For the configuration and related commands for correlation between PBR and BFD, see the "BFD" section.

## Correlation with Track

Correlation between PBR and Track is effective only for next hops configured by the **set ip next-hop** command.

The **set ip next-hop** command carries the **verify-availability** and **track track-obj-number** parameters, which can establish correlation between PBR and a Track session and monitor the accessibility of next hops.

Correlation between PBR and Track helps enhance the PBR's perception about network environment changes. When Track detects that the current next hop is not accessible, the Track will immediately notify the PBR to switch the traffic to another accessible next hop (to implement redundant backup) or all the other accessible next hops (to implement load balancing).

**i** Only IPv4 PBR supports correlation with Track.

**i** For the configuration and related commands for correlation between PBR and Track, see the "RNS" section.

## Source-addressed-based PBR

Run the global configuration commands **ip policy-source in-interface** and **ipv6 policy-source in-interface** to directly generate source-address-based PBR. You do not need to configure a route map.

- If only source IPv4 or Ipv6 addresses need to be matched for packets forwarded by an interface, you can apply the command for source-address-based PBR. The procedure for configuring this command is simpler than that for interface-based PBR.
- If source-address-based PBR is applied to a specified interface, packets received on this interface will be routed based on policies according to the source addresses.  
The PBR is often used to control user packets received by a device. This command is effective only for forwarded packets, but not for locally initiated packets.

**i** Source-address-based PBR has a higher priority than interface-based PBR. If source-address-based PBR and interface-based PBR are applied to the same interface, only interface-based PBR takes effect.

**i** By default, source-address-based routing is not available on devices and packets are forwarded based on the routing table.

## 6.4 Configuration

| Configuration  | Description and Command  |  |
|--|--|--|
| <a href="#">Configuring Basic Functions of PBR</a>         |  (Mandatory) It is used to apply PBR to forward packets.   |  |
|  | <b>ip policy route-map</b>   | Applies PBR for IPv4 packets received by an interface.   |

## 6.4.1 Configuring Basic Functions of PBR

### Configuration Effect

Perform personalized routing management for user data streams by preparing flexible policies.

Perform personalized management for protocol interaction and network topologies by preparing flexible policies.

### Notes

- A route map must be used when PBR is configured; therefore, you must configure a route map on a device.
- If an ACL is used when the route map is configured, you must configure the ACL on the device.

### Configuration Steps

#### ▾ Applying PBR for IPv4 packets received by an interface

- To perform personalized routing management for IPv4 user data streams passing a device, you should perform this configuration.
- Perform this configuration on the input interface for user data streams.
- Run the **ip policy route-map** command to apply a route map to an interface. Then, PBR is executed for IPv4 packets received on this interface.

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>ip policy route-map</b> <i>route-map-name</i>   |
| <b>Parameter</b>    | <i>route-map-name</i> : Indicates the name of a route map.   |
| <b>Description</b>  |  |
| <b>Defaults</b>     | By default, PBR is unavailable on a device and packets are forwarded based on a routing table.   |
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | Only one <b>ip policy route-map</b> command can be configured for an interface. If multiple <b>ip policy route-map</b> commands are configured for an interface, only the last configuration takes effect.<br>If the route map used in PBR is unavailable, the PBR does not take effect. |

#### ▾ Applying PBR for IPv6 packets received by an interface

- To perform personalized routing management for IPv6 user data streams passing a device, you should perform this configuration.
- Perform this configuration on the input interface for user data streams.

- Run the **ipv6 policy route-map** command to apply a route map to an interface. Then, PBR is executed for IPv6 packets received on this interface.

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 policy route-map</b> <i>route-map-name</i>   |
| <b>Parameter Description</b> | <i>route-map-name</i> : Indicates the name of a route map.   |
| <b>Defaults</b>              | By default, PBR is unavailable on a device and packets are forwarded based on a routing table.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | Only one <b>ipv6 policy route-map</b> command can be configured for an interface. If multiple <b>ipv6 policy route-map</b> commands are configured for an interface, only the last configuration takes effect.<br>If the route map used in PBR is unavailable, the PBR does not take effect. |

#### ↘ Applying PBR for IPv4 packets locally initiated

- To perform personalized management for IPv4 protocol interaction and IPv4 network topologies, you should perform this configuration.
- Run the **ip local policy route-map** command to apply a route map to a device. Then, PBR is executed for IPv4 packets locally initiated.

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip local policy route-map</b> <i>route-map-name</i>  |
| <b>Parameter Description</b> | <i>route-map-name</i> : Indicates the name of a route map.  |
| <b>Defaults</b>              | By default, PBR is unavailable on a device and packets are forwarded based on a routing table.  |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | Only one <b>ip local policy route-map</b> command can be configured for a device.<br>If the route map used in PBR is unavailable, the PBR does not take effect. |

#### ↘ Applying PBR for IPv6 packets locally initiated

- To perform personalized management for IPv6 protocol interaction and IPv6 network topologies, you should perform this configuration.
- Run the **ipv6 local policy route-map** command to apply a route map to a device. Then, PBR is executed for IPv6 packets locally initiated.

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 local policy route-map</b> <i>route-map-name</i>  |
| <b>Parameter Description</b> | <i>route-map-name</i> : Indicates the name of a route map.  |
| <b>Defaults</b>              | By default, PBR is unavailable on a device and packets are forwarded based on a routing table.  |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | Only one <b>ipv6 local policy route-map</b> command can be configured for a device.<br>If the route map used in PBR is unavailable, the PBR does not take effect. |

## Verification

- Check the configurations of PBR.
- Check the configurations of the route map used by PBR.
- If an ACL is used when the route map is configured, you should check the configurations of the ACL.

### ▾ Checking the configurations of IPv4 PBR

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ip policy</b> [ <i>route-map-name</i> ]  |
| <b>Parameter Description</b> | <i>route-map-name</i> : Indicates the name of a route map.   |
| <b>Command Mode</b>          | Privilege, global and interface configuration modes  |
| <b>Usage Guide</b>           | <p>Check the interfaces configured with IPv4 PBR according to the output information and the name of the used route map.</p> <pre>Ruijie# show ip policy Banlance mode: redundance  Interface          Route map local              RM_for_PBR_1 GigabitEthernet 0/1  RM_for_PBR_2</pre> <p><b>Local</b> indicates applying policy-based routing for IPv4 packets locally initiated.</p> |

### ▾ Checking the configurations of IPv6 PBR

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 policy</b> [ <i>route-map-name</i> ]   |
| <b>Parameter Description</b> | <i>route-map-name</i> : Indicates the name of a route map.  |
| <b>Command Mode</b>          | Privilege, global and interface configuration modes   |
| <b>Usage Guide</b>           | <p>Check the interfaces configured with IPv6 PBR according to the output information and the name of the used route map.</p> <pre>Ruijie#show ipv6 policy Banlance mode: redundance  Interface          Route map local              RM_for_PBR_1 VLAN 1             RM_for_PBR_2</pre> <p><b>Local</b> indicates applying policy-based routing for IPv6 packets locally initiated.</p> |

### ▾ Checking the configurations of a route map

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>show route-map</b> [ <i>route-map-name</i> ]  |
| <b>Parameter</b>    | <i>route-map-name</i> : Indicates the name of a route map.   |
| <b>Description</b>  |  |
| <b>Command Mode</b> | Privilege, global and interface configuration modes  |
| <b>Usage Guide</b>  | <p>Multiple route maps may be available on a device. Focus on the route map used in PBR and check its policy settings.</p> <pre>Ruijie# show route-map route-map RM_FOR_PBR, permit, sequence 10   Match clauses:     ip address acl1   Set clauses:     ip next-hop 200.24.18.1 route-map RM_FOR_PBR, permit, sequence 20   Match clauses:     ip address acl2   Set clauses:     ip next-hop 200.24.19.1</pre> |

### ↘ Checking the configurations of an ACL

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>show access-lists</b> [ <i>acl-id</i>   <i>acl-name</i> ]   |
| <b>Parameter</b>    | <i>acl-id</i> : Indicates the ACL ID.  |
| <b>Description</b>  | <i>acl-name</i> : Indicates the ACL name.  |
| <b>Command Mode</b> | Privilege, global and interface configuration modes  |
| <b>Usage Guide</b>  | <p>Multiple ACLs may be available on a device. Focus on the ACL used by a route map and check its configurations.</p> <pre>Ruijie# show access-lists 1 ip access-list standard 1   10 permit 200.24.16.0 0.0.0.255 ip access-list standard 2   10 permit 200.24.17.0 0.0.0.255</pre> |

### ↘ Checking the routing information of IPv4 PBR

|                  |   |
|------------------|---|
| <b>Command</b>   | <b>show ip pbr route</b> [ <b>interface</b> <i>if-name</i>   <b>local</b> ] |
| <b>Parameter</b> | <i>if-name</i> : Indicates an interface name.                               |

|                     |   |
|---------------------|---|
| <b>Description</b>  | <b>local:</b> Indicates local.  |
| <b>Command Mode</b> | Privilege, global and interface configuration modes   |
| <b>Usage Guide</b>  | Specify a local interface or device and check the routing information of IPv4 PBR.<br><pre>Ruijie# show ip pbr route PBR IPv4 Route Summay : 1 Interface      : GigabitEthernet 0/1   Sequence     : 10   Min Length   : None   Max Length   : None   VRF ID       : 0   Route Flags  :   Route Type   : PBR   Direct       : Permit   Priority      : High   Tos_Dscp     : None   Precedence   : None   Tos_Dscp     : 0   Precedence   : 0   Mode         : redundance   Nexthop Count : 1   Nexthop[0]  : 192.168.8.100   Weight[0]   : 1   Ifindex[0]  : 2</pre> |

📌 **Checking the routing information of IPv6 PBR**

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>show ipv6 pbr route [ interface <i>if-name</i>   local ]</b>   |
| <b>Parameter</b>    | <i>if-name</i> : Indicates an interface name.   |
| <b>Description</b>  | <b>local:</b> Indicates local.  |
| <b>Command Mode</b> | Privilege, global and interface configuration modes   |
| <b>Usage Guide</b>  | Specify a local interface or device and check the routing information of IPv6 PBR.<br><pre>Ruijie# show ipv6 pbr route PBR IPv6 Route Summary : 1</pre> |

|               |                       |
|---------------|-----------------------|
| Interface     | : GigabitEthernet 0/1 |
| Sequence      | : 10                  |
| ACL[0]        | : 2900                |
| ACL_CLS[0]    | : 5                   |
| Min Length    | : None                |
| Max Length    | : None                |
| VRF ID        | : 0                   |
| Route Flags   | :                     |
| Route Type    | : PBR                 |
| Direct        | : Permit              |
| Priority      | : High                |
| Tos_Dscp      | : None                |
| Precedence    | : None                |
| Tos_Dscp      | : 0                   |
| Precedence    | : 0                   |
| Mode          | : redundance          |
| Nexthop Count | : 1                   |
| Nexthop[0]    | : 10::2               |
| Weight[0]     | : 1                   |
| Ifindex[0]    | : 2                   |

### 📌 Checking a route map used by IPv4 PBR

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ip pbr route-map</b> <i>rmap-name</i>   |
| <b>Parameter Description</b> | <i>rmap-name</i> : Indicates the route map name.  |
| <b>Command Mode</b>          | Privilege, global and interface configuration modes   |
| <b>Usage Guide</b>           | Specify a route map and check the route map used by IPv4 PBR.<br><br><pre>Ruijie# show ip pbr route-map rm PBR VRF: GLOBAL, ID: 0 Forward Mode: redundance Forwarding: On</pre> |

|  |  |
|--|--|
|  | <pre>Route-map rm  Route-map index: Sequence 10, permit  Match rule:    ACL ID :   2900, CLS: 1, Name: acl1  Set rule:    IPv4 nexthop: 192.168.8.100, (VRF name: , ID: 0), Weight: 0    PBR state info ifx: 2, Connected: True, Track state: Up</pre> |
|--|--|

### 📌 Checking a route map used by IPv6 PBR

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>show ipv6 pbr route-map <i>rmap-name</i></b>   |
| <b>Parameter</b>    | <i>rmap-name</i> : Indicates the route map name.  |
| <b>Description</b>  |   |
| <b>Command Mode</b> | Privilege, global and interface configuration modes   |
| <b>Usage Guide</b>  | <p>Specify a route map and check the route map used by IPv6 PBR.</p> <pre>Ruijie# show ipv6 pbr route-map rm6  PBR VRF: GLOBAL, ID: 0  Forward Mode: redundance  Forwarding: On  Route-map rm6  Route-map index: Sequence 10, permit  Match rule:    ACL ID :   2901, CLS: 5, Name: acl6  Set rule:    IPv6 nexthop: 10::2, (VRF name: , ID: 0), Weight: 0    PBR state info ifx: 2, Connected: True, Track state: Up</pre> |

### 📌 Checking the statistics about packets forwarded by IPv4 PBR

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>show ip pbr statistics [ interface <i>if-name</i>   local ]</b> |
| <b>Parameter</b>    | <i>if-name</i> : Indicates an interface name.                      |
| <b>Description</b>  | <b>local</b> : Indicates local.                                    |
| <b>Command Mode</b> | Privilege, global and interface configuration modes                |

|                    |  |
|--------------------|--|
| <b>Usage Guide</b> | <pre>Ruijie# show ip pbr statistics  IPv4 Policy-based route statistic  gigabitEthernet 0/1  statistics : 10</pre> |
|--------------------|--|

↘ **Checking the statistics about packets forwarded by IPv6 PBR**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ipv6 pbr statistics [ interface <i>if-name</i>   local ]</b>   |
| <b>Parameter Description</b> | <i>if-name</i> : Indicates an interface name.<br><b>local</b> : Indicates local.                                     |
| <b>Command Mode</b>          | Privilege, global and interface configuration modes  |
| <b>Usage Guide</b>           | <pre>Ruijie# show ipv6 pbr statistics  IPv6 Policy-based route statistic  gigabitEthernet 0/1  statistics : 20</pre> |

**Configuration Example**

↘ **Configuring IPv4 PBR and selecting an output link based on source addresses of packets**

|                                      |  |
|--------------------------------------|--|
| <b>Scenario</b><br><b>Figure 6-3</b> | <p>The diagram illustrates a network topology. At the top, a cloud labeled 'Internet' is connected to a 'Layer-3 device DEV1' through two interfaces, G 0/1 and G 0/2. The next hop IP addresses for these connections are 200.24.18.1 and 200.24.19.1, respectively. Below DEV1, interface G 0/3 is connected to two separate subnets: 'Subnet 1' (200.24.16.0/24) and 'Subnet 2' (200.24.17.0/24).</p> |
|                                      | <p>The layer-3 device DEV 1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24 whereas the network segment where subnet 2 resides is 200.24.17.0/24.</p> <p>DEV 1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p>   |

|                                   |   |
|-----------------------------------|---|
|                                   | <p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Data streams from subnet 1 for accessing the Internet should pass GE 0/1.</li> <li>● Data streams from subnet 2 for accessing the Internet should pass GE 0/2.</li> <li>● If the GE 0/1 link is disconnected, the data streams on the GE 0/1 interface are switched to the GE 0/2 interface. Vice versa.</li> </ul>  |
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Configure two ACLs to match packets from subnets 1 and 2 respectively.</li> <li>● Set a policy to set the next hops for packets from subnet 1 to GE0/1 and GE0/2. |  |   |
|--|---|
|  | <ul style="list-style-type: none"> <li>● Check the configurations of the route map.</li> <li>● Check the configurations of an ACL.</li> </ul>   |
|  | <pre> DEV1# show ip policy  Interface                Route map GigabitEthernet 0/3      RM_FOR_PBR </pre>   |
|  | <pre> DEV1# show route-map  route-map RM_FOR_PBR, permit, sequence 10    Match clauses:     ip address 1    Set clauses: ip next-hop 200.24.18.1 200.24.19.1  route-map RM_FOR_PBR, permit, sequence 20    Match clauses:     ip address 2    Set clauses:     ip next-hop 200.24.19.1 200.24.18.1 </pre> |
|  | <pre> DEV1# show access-lists  ip access-list standard 1    10 permit 200.24.16.0 0.0.0.255  ip access-list standard 2    10 permit 200.24.17.0 0.0.0.255 </pre>  |

### ➤ Configuring IPv6 PBR and selecting an output link based on source addresses of packets

**Scenario**  
**Figure 6-4**

DEV 1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 2003::/64 whereas the network segment where subnet 2 resides is 2004::/64. DEV1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 2001::1/64 and 2002::1/64.

This LAN has two output interfaces for connecting the Internet. The requirements are as follows:

- Data streams from subnet 1 for accessing the Internet should pass GE 0/1.
- Data streams from subnet 2 for accessing the Internet should pass GE 0/2.
- If the GE 0/1 link is disconnected, the data streams on the GE 0/1 interface are switched to the GE 0/2 interface. Vice versa.

**Configuration Steps**

- Configure two ACLs to match packets from subnets 1 and 2 respectively.
- Set a policy to set the next hops for packets from subnet 1 to GE0/1 and GE0/2. (Pay attention to the configuration sequence.)
- Set a policy to set the next hops for packets from subnet 2 to GE0/2 and GE0/1. (Pay attention to the configuration sequence.)
- Apply the policy to GE 0/3.
- Set PBR to implement redundant backup among multiple next hops.

**i** During redundant backup, based on the configuration sequence, the first next hop takes effect first.

```
DEV1(config)# ipv6 access-list net1
DEV1(config-ipv6-acl)# permit ipv6 2003::/64 any
DEV1(config-ipv6-acl)# exit
DEV1(config)# ipv6 access-list net2
DEV1(config-ipv6-acl)# permit ipv6 2004::/64 any
```

|                     |   |
|---------------------|---|

➤ **Configuring correlation between IPv4 PBR and Track**

|                                       |  |
|---------------------------------------|--|
| <p><b>Scenario</b><br/>Figure 6-5</p> | <p>The diagram illustrates a network topology. At the top, a cloud labeled 'Internet' is connected to a 'Layer-3 device DEV1' through two interfaces: G0/1 (with IP 200.24.18.1) and G0/2 (with IP 200.24.19.1). Below DEV1, interface G0/3 is connected to a switch. This switch is further connected to two subnets: 'Subnet 1' (200.24.16.0/24) and 'Subnet 2' (200.24.17.0/24).</p>                                      |
|                                       | <p>The layer-3 device DEV 1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24 whereas the network segment where subnet 2 resides is 200.24.17.0/24.</p> <p>DEV 1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p>   |
|                                       | <ul style="list-style-type: none"> <li>● DEV1 can fast detect a faulty output link and switch to a backup link.</li> </ul>   |
| <p><b>Configuration Steps</b></p>     | <p>When configuring IPv4 PBR and selecting an output link based on source addresses of the packets, add or modify the following configurations (red fields):</p> <ul style="list-style-type: none"> <li>● Set two Track objects and track the accessibility of the next hops of the two output interfaces.</li> <li>● When configuring a policy, set the correlation between the next hops and the Track objects.</li> </ul> |
| <p><b>DEV1</b></p>                    | <pre>DEV1(config)# ip access-list extended 101  DEV1(config-ip-acl)# permit ip 200.24.16.0 0.0.0.255 any</pre>   |

```

DEV1(config-ip-acl)# exit
DEV1(config)# ip access-list extended 102
DEV1(config-ip-acl)# permit ip 200.24.17.0 0.0.0.255 any
DEV1(config-ip-acl)# exit
DEV1(config)#ip rns 1
DEV1(config-ip-rns)#icmp-echo 200.24.18.1

DEV1(config-ip-rns)#icmp-echo 200.24.19.1
DEV1(config)#ip rns schedule 2 start-time now life forever
DEV1(config)#track 2 rns 2
DEV1(config)# route-map RM_FOR_PBR 10
DEV1(config-route-map)# match ip address 101
DEV1(config-route-map)# set ip next-hop verify-availability 200.24.18.1 track 1
DEV1(config-route-map)# set ip next-hop verify-availability 200.24.19.1 track 2
DEV1(config-route-map)# exit
DEV1(config)# route-map RM_FOR_PBR 20
DEV1(config-route-map)# match ip address 102
DEV1(config-route-map)# set ip next-hop verify-availability 200.24.19.1 track 2
DEV1(config-route-map)# set ip next-hop verify-availability 200.24.18.1 track 1
DEV1(config-route-map)# exit
DEV1(config)# interface GigabitEthernet 0/3
DEV1(config-if-GigabitEthernet 0/3)# ip policy route-map RM_FOR_PBR
DEV1(config-if-GigabitEthernet 0/3)# exit
DEV1(config)# ip policy redundancy

```

**Verification** ● Check whether the Track objects are up.

**DEV1**

```

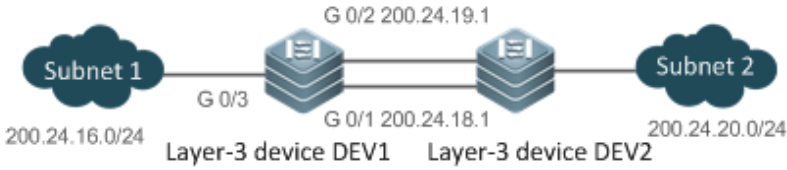

DEV1#show track
Track 1
    Reliable Network Service 1
    The state is Up

```

```

1 change, current state last: 120 secs
Delay up 30 secs, down 50 secs
Track 2
Reliable Network Service 2
The state is Up
1 change, current state last: 130 secs
Delay up 30 secs, down 50 secs
    
```

➤ **Configuring IPv4 recursive PBR, selecting an output link based on source addresses of the packets, and recurring to the output link of a dynamic route**

|                                       |  |
|---------------------------------------|--|
| <p><b>Scenario</b><br/>Figure 6-6</p> |    |
|                                       | <p>The layer-3 device DEV 1 is connected to subnet 1 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24.<br/>DEV 1 is connected to subnet 2 through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p>  |
|                                       | <p>Subnet 1 is connected to subnet 2 through two output interfaces of DEV1. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Configure static or dynamic routes in advance to ensure that static or dynamic routes in the network segment 200.24.20.0 are available in the routing table of DEV1.</li> <li>● Data streams from subnet 1 for accessing the Internet can recur to a dynamic route whose IP address is 200.24.20.1.</li> <li>● If the GE 0/1 link is disconnected, the data streams on GE 0/1 are switched to GE 0/2. Vice versa.</li> </ul> |
| <p><b>Configuration Steps</b></p>     | <ul style="list-style-type: none"> <li>● Configure an ACL to match packets from subnet 1.</li> <li>● Set a policy to set the recursive next hop for packets from subnet 1 to 200.24.20.1.</li> <li>● Apply the policy to GE 0/3.</li> <li>● Set PBR to implement redundant backup among multiple next hops. (The default setting is redundant backup.)</li> </ul> <p><b>i</b> During redundant backup, the sequence for the next hops to take effect is related to the sequence for the static or dynamic routes to take effect.</p>   |
|                                       | <pre>DEV1(config)# access-list 1 permit 200.24.16.0 0.0.0.255</pre>  |

|                     |  |
|---------------------|--|
|                     | <pre> DEV1(config)# route-map RM_FOR_PBR 10  DEV1(config-route-map)# match ip address 1  DEV1(config-route-map)# set ip next-hop recursive 200.24.20.1  DEV1(config-route-map)# exit  DEV1(config)# interface GigabitEthernet 0/3  DEV1(config-if-GigabitEthernet 0/3)# ip policy route-map RM_FOR_PBR  DEV1(config-if-GigabitEthernet 0/3)# exit  DEV1(config)# ip policy redundance </pre> |
| <b>Verification</b> | <ul style="list-style-type: none"> <li>● Check the configurations of IPv4 PBR.</li> <li>● Check the configurations of the route map.</li> <li>● Check the configurations of the ACLs.</li> </ul>   |
|                     | <pre> DEV1# show ip policy  Interface                Route map GigabitEthernet 0/3      RM_FOR_PBR </pre>  |
|                     | <pre> DEV1# show route-map  route-map RM_FOR_PBR, permit, sequence 10    Match clauses:     ip address 1    Set clauses:     ip next-hop recursive 200.24.20.1 </pre>  |
|                     | <pre> DEV1# show access-lists  ip access-list standard 1  10 permit 200.24.16.0 0.0.0.255 </pre>   |

### Common Errors

- A route map is used when PBR is configured but the route map does not exist.
- An ACL is used when a route map is configured but the ACL does not exist.

## 6.4.2 Setting Redundant Backup or Load Balancing

### Configuration Effect

- Using multiple next hops in the mutual backup mode can enhance the network reliability.

- Implementing load balancing among multiple next hops can expand the network bandwidth.

### Notes

- The basic functions of PBR must be configured.
- Redundant backup and load balancing are effective only for the next hops set by the following **set** commands.

| Command                          | Description   |
|----------------------------------|---|
| <b>set ip next-hop</b>           | Configures the next hop of IPv4 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.   |
| <b>set ip default next-hop</b>   | Configures the default next hop of IPv4 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.   |
| <b>set ipv6 next-hop</b>         | Configures the next hop of IPv6 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.   |
| <b>set ipv6 default next-hop</b> | Configures the default next hop of IPv6 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.   |
| <b>set ip next-hop recursive</b> | Configures the recursive next hop of IPv4 packets. Only one command can be configured for a route map and packets can recur to multiple next hops (up to 32 next hops) of a static or dynamic ECMP route. The redundant backup or load balancing mode for recurring to multiple next hops is also determined by the <b>ip policy { redundancy   load-balance }</b> command. |

**i** Up to eight next hops can be set for WCMP whereas up to 32 next hops can be set for ECMP.

### Configuration Steps

#### ⤵ Setting whether IPv4 PBR implements redundant backup or load balancing among multiple next hops

- If load balancing needs to be implemented among multiple next hops, this configuration needs to be performed.
- If load balancing is configured at present, you also need to perform this configuration to reset redundant backup.
- This configuration is effective for all PBRs configured on a device.

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>ip policy { redundancy   load-balance }</b>  |
| <b>Parameter</b>    | redundance: Indicates redundant backup.   |
| <b>Description</b>  | load-balance: Indicates load balancing.   |
| <b>Defaults</b>     | Redundant backup is configured by default.  |
| <b>Command Mode</b> | Global configuration mode   |
| <b>Usage Guide</b>  | If redundant backup is selected, the first next hop takes effect based on the configuration sequence.<br>If load balancing is selected, all next hops take effect at the same time and share traffic by weight. |

#### ⤵ Setting whether Ipv6 PBR implements redundant backup or load balancing among multiple next hops

- If load balancing needs to be implemented among multiple next hops, this configuration needs to be performed.
- If load balancing is configured at present, you also need to perform this configuration to reset redundant backup.
- This configuration is effective for all PBRs configured on a device.

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>ipv6 policy { redundance   load-balance }</b>  |
| <b>Parameter</b>    | redundance: Indicates redundant backup.   |
| <b>Description</b>  | load-balance: Indicates load balancing.   |
| <b>Defaults</b>     | Redundant backup is configured by default.  |
| <b>Command Mode</b> | Global configuration mode   |
| <b>Usage Guide</b>  | If redundant backup is selected, the first next hop takes effect based on the configuration sequence.<br>If load balancing is selected, all next hops take effect at the same time and share traffic by weight. |

## Verification

- Check whether redundant backup or load balancing is implemented among multiple next hops.

### ▾ Checking whether IPv4 PBR implements redundant backup or load balancing among multiple next hops

### 6.4.3 Configuring Source-Address-Based PBR

#### Configuration Effect

Perform personalized routing management for IPv4 or IPv6 addresses of user data streams by preparing flexible policies.

#### Notes

- Source-address-based PBR has a higher priority than interface-based PBR. When they are applied to an interface at the same time, interface-based PBR takes effect whereas source-address-based PBR does not take effect.

## Configuration Steps

### ▾ Applying source-address-based PBR for IPv4 packets received by an interface

- To perform personalized routing management based on source IPv4 addresses for IPv4 user data streams passing a device, you should perform this configuration.
- The global configuration takes effect on the input interface of specified user data streams.
- Run the **ip policy-source in-interface** command to perform source-address-based PBR for IPv4 packets received by a specified interface.

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip policy-source in-interface</b> <i>interface-type</i> <i>sequence</i> { <i>source-address mask</i>   <i>source-address/mask</i> }<br>{ <b>[default]</b> <b>next-hop</b> <i>ip-address</i> [ <i>weight</i> ]}  |
| <b>Parameter Description</b> | <i>interface-type</i> : Specifies the type of an interface to which source-address PBR is applied.<br><i>sequence</i> : Indicates the sequence number of a policy. A smaller sequence number means a higher priority.<br><i>source-address</i> : Indicates the source IPv4 address.<br><i>mask</i> : Indicates the mask of the source IPv4 address.<br><i>ip-address</i> : Indicates the next-hop IPv4 address.<br><i>weight</i> : Indicates the weight of a next hop.   |
| <b>Defaults</b>              | By default, source-address-based PBR is unavailable on a device and packets are forwarded based on a routing table.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | Configure multiple <b>ip policy-source in-interface</b> commands for the same interface. The sequence numbers of different source addresses are different. A smaller sequence number means a higher priority of the source-address-based PBR.<br>When the sequence number is the same, the priorities of next hops are as follows: <b>next-hop ip-address &gt; default next-hop ip-address ;</b><br>Source-address-based PBR has a higher priority than interface-based PBR. When they are applied to an interface at the same time, interface-based PBR takes effect whereas source-address-based PBR does not take effect. |

### ▾ Applying source-address-based PBR for IPv6 packets received by an interface

- To perform personalized routing management based on source IPv6 addresses for IPv6 user data streams passing a device, you should perform this configuration.
- The global configuration takes effect on the input interface of specified user data streams.
- Run the **ipv6 policy-source in-interface** command to perform source-address-based PBR for IPv6 packets received by a specified interface.

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 policy-source in-interface</b> <i>interface-type</i> <i>sequence</i> { <i>source-address/prefix-length</i> } { <b>[default]</b> <b>next-hop</b> <i>ipv6-address</i> [ <i>weight</i> ]}                        |
| <b>Parameter Description</b> | <i>interface-type</i> : Specifies the type of an interface to which source-address PBR is applied.<br><i>sequence</i> : Indicates the sequence number of a policy. A smaller sequence number means a higher priority. |

|                     |  |
|---------------------|--|
|                     | <p><i>source-address</i>: Indicates the source IPv6 address.</p> <p><i>prefix-length</i>: Indicates the prefix length of a source IPv6 address.</p> <p><i>ipv6-address</i>: Indicates the next-hop IPv6 address.</p> <p><i>weight</i>: Indicates the weight of a next hop.</p>   |
| <b>Defaults</b>     | By default, source-address-based PBR is unavailable on a device and packets are forwarded based on a routing table.  |
| <b>Command Mode</b> | Global configuration mode  |
| <b>Usage Guide</b>  | <p>Configure multiple <b>ipv6 policy-source in-interface</b> commands for the same interface. The sequence numbers of different source addresses are different. A smaller sequence number means a higher priority of the source-address-based PBR.</p> <p>When the sequence number is the same, the priorities of next hops are as follows: <b>next-hop ipv6-address &gt; default next-hop ipv6-address e</b>.</p> <p>Source-address-based PBR has a higher priority than interface-based PBR. When they are applied to an interface at the same time, interface-based PBR takes effect whereas source-address-based PBR does not take effect.</p> |

## Verification

### 📌 Checking the routing information of source-address-based IPv4 PBR

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ip pbr source-route [ interface <i>if-name</i> ]</b>   |
| <b>Parameter Description</b> | <i>if-name</i> : Indicates an interface name.  |
| <b>Command Mode</b>          | Privilege, global and interface configuration modes  |
| <b>Usage Guide</b>           | <p>Specify an interface and check the routing information of IPv4 source-address-based PBR.</p> <pre>Ruijie# show ip pbr source-route PBR IPv4 Source Route Interface      : GigabitEthernet 0/1 Sequence      : 10 Source address : 10.1.1.1/24 VRF ID        : 0 Route Flags   : Route Type    : PBR Direct       : Permit Priority      : High Match_ipaddr : Exist Mode         : redundance</pre> |

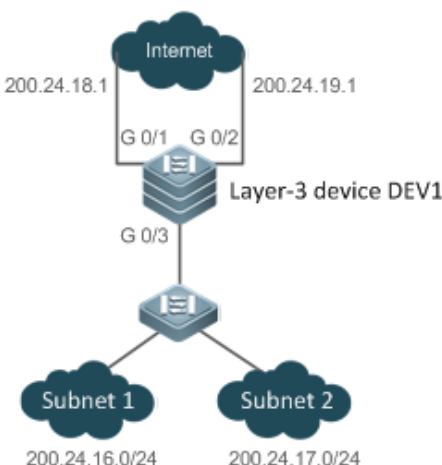

|  |  |
|--|--|
|  | <pre> Nexthop Count : 1 Nexthop[0]    : 192.168.8.100 Weight[0]     : 1 Ifindex[0]    : 2                 </pre> |
|--|--|

↘ **Checking the routing information of IPv6 PBR**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 pbr source-route [ interface <i>if-name</i> ]</b>  |
| <b>Parameter Description</b> | <i>if-name</i> : Indicates an interface name.   |
| <b>Command Mode</b>          | Privilege, global and interface configuration modes   |
| <b>Usage Guide</b>           | <p>Specify an interface and check the routing information of IPv6 PBR.</p> <pre> Ruijie# show ipv6 pbr source-route PBR IPv6 Source Route Interface      : GigabitEthernet 0/1 Sequence      : 10 Source address : 1000::1/64 VRF ID        : 0 Route Flags    : Route Type     : PBR Direct        : Permit Priority       : High Match_ipaddr  : Exist Mode          : redundance Nexthop Count  : 1 Nexthop[0]    : 1001::2 Weight[0]     : 1 Ifindex[0]    : 3                 </pre> |

**Configuration Example**

↘ **Configuring IPv4 source-address-based PBR and selecting an output link based on source addresses of packets**

|  |   |
|--|---|
| <p><b>Scenario</b><br/><b>Figure 6-9</b></p> |    |
|  | <p>The layer-3 device DEV 1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24 whereas the network segment where subnet 2 resides is 200.24.17.0/24.</p> <p>DEV 1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p>  |
|  | <p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Data streams from subnet 1 for accessing the Internet should pass GE 0/1.</li> <li>● Data streams from subnet 2 for accessing the Internet should pass GE 0/2.</li> <li>● If the GE 0/1 link is disconnected, the data streams on GE 0/1 are switched to GE 0/2. Vice versa.</li> </ul>  |
| <p><b>Configuration Steps</b></p>            | <ul style="list-style-type: none"> <li>● Set source-address-based PBR and set the next hops for packets from the GE0/3 subnet 1 to GE0/1 and GE0/2. (Pay attention to the configuration sequence.)</li> <li>● Set source-address-based PBR and set the next hops for packets from the GE0/3 subnet 2 to GE0/2 and GE0/1. (Pay attention to the configuration sequence.)</li> <li>● Set PBR to implement redundant backup among multiple next hops. (The default setting is redundant backup.)</li> </ul> <p><b>i</b> During redundant backup, based on the configuration sequence, the first next hop takes effect first.</p> |
|  | <pre>DEV1(config)# ip policy-source in-interface gigabitEthernet 0/3 1 200.24.16.0/24 next-hop 200.24.18.1 200.24.19.1  DEV1(config)# ip policy-source in-interface gigabitEthernet 0/3 2 200.24.17.0/24 next-hop 200.24.19.1 200.24.18.1  DEV1(config)# ip policy redundancy</pre>   |

## 6.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

| Description  | Command   |
|--|---|
| Clears the statistics about packets forwarded by IPv4 PBR. | <b>clear ip pbr statistics</b> [ interface <i>if-name</i>   local ]   |
| Clears the statistics about packets forwarded by IPv6 PBR. | <b>clear ipv6 pbr statistics</b> [ interface <i>if-name</i>   local ] |

### Displaying

| Description  | Command   |
|--|---|
| Displays the configurations of IPv4 PBR.           | <b>show ip policy</b>   |
| Displays the configurations of IPv6 PBR.           | <b>show ipv6 policy</b>                                       |
| Displays the configurations of a route map.        | <b>show route-map</b> [ <i>name</i> ]                         |
| Displays the configurations of an ACL.             | <b>show access-list</b>                                       |
| Displays the correlation between IPv4 PBR and BFD. | <b>show ip pbr bfd</b>  |
| Displays the correlation between IPv6 PBR and BFD. | <b>show ipv6 pbr bfd</b>                                      |
| Displays the routing information of IPv4 PBR.      | <b>show ip pbr route</b> [ interface <i>if-name</i>   local ] |

| Description  | Command  |
|--|--|
| Displays the routing information of IPv6 PBR.                      | <b>show ipv6 pbr route</b> [ interface <i>if-name</i>   local ]      |
| Displays a route map used by IPv4 PBR.                             | <b>show ip pbr route-map</b> <i>rmap-name</i>                        |
| Displays a route map used by IPv6 PBR.                             | <b>show ipv6 pbr route-map</b> <i>rmap-name</i>                      |
| Displays the routing information of IPv4 source-address-based PBR. | <b>show ip pbr source-route</b> [ interface <i>if-name</i> ]         |
| Displays the routing information of IPv6 source-address-based PBR. | <b>show ipv6 pbr source-route</b> [ interface <i>if-name</i> ]       |
| Displays the statistics about IPv4 PBR.                            | <b>show ip pbr statistics</b> [ interface <i>if-name</i>   local ]   |
| Displays the statistics about IPv6 PBR.                            | <b>show ipv6 pbr statistics</b> [ interface <i>if-name</i>   local ] |

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description                                     | Command                  |
|---|--------------------------|
| Debugs PBR errors.                              | <b>debug pbr error</b>   |
| Debugs PBR events.                              | <b>debug pbr events</b>  |
| Debugs multiple service cards supported by PBR. | <b>debug pbr ms</b>      |
| Debugs PBR message communication.               | <b>debug pbr msg</b>     |
| Debugs interaction between PBR and NSM.         | <b>debug pbr nsm</b>     |
| Debugs packet forwarding of PBR.                | <b>debug pbr packet</b>  |
| Debugs PBR GR.                                  | <b>debug pbr restart</b> |

## 7 Configuring VRF

### 7.1 Overview

A Virtual Private Network (VPN) Routing and Forwarding (VRF) table is used for the forwarding of VPN packets. Each VPN corresponds to a VRF table.

A device that provides the VPN service has multiple routing tables, including a public network routing table and one or multiple VRF tables. The public-network routing table is used for the forwarding of public network packets, and the VRF tables are used for the forwarding of VPN packets. These routing tables are created to separate routes in the public network from those in VPNs and separate routes in different VPNs.

**i** A VPN is a private dedicated network built in the public network. "Virtual" means that the VPN is logically exclusive, instead of physically exclusive.

#### Protocols and Standards

- RFC4364: BGP/MPLS IP Virtual Private Networks (VPNs)

### 7.2 Applications

| Application                                      | Description  |
|--|--|
| <a href="#">Local Inter-VPN Access</a>           | Provide the VPN service on a routing device and enable VPNs to access each other.  |
| <a href="#">VRF only on Provider Edges (PEs)</a> | Provide the VPN service in an IP/Multiprotocol Label Switching (MPLS) network and connect one Customer Edge (CE) to one VPN. |
| <a href="#">VRF on CEs and PEs</a>               | Provide the VPN service in an IP/ MPLS network and connect one CE to multiple VPNs.  |

**i** CE: An edge device in a customer network

**i** PE: An edge device in a Service Provider (SP) network

#### 7.2.1 Local Inter-VPN Access

##### Scenario

Provide the VPN service on a routing device and enable VPNs to access each other.

In Figure 7-1, Sub a runs the Routing Information Protocol (RIP), Sub b runs the Open Shortest Path First (OSPF) protocol, and Servers is a network segment directly connected to C. Provide the VPN service on C to Sub a, Sub b, and Servers, and enable Sub a and Sub b to access Servers.

Figure 7-1

### Related Configuration

- On C, create a VRF table for Sub a, bind the interface directly connected to A, and associate the VRF table with A by using RIP.
- On C, create a VRF table for Sub b, bind the interface directly connected to B, and associate the VRF table with B by using OSPF.
- On C, create a VRF table for Servers and bind the interface directly connected to Servers.
- On C, configure the route targets (RTs) of the VRF tables for Suba, Subb, and Servers. Import the routes in the VRF tables for Sub a and Sub b to the VRF table for Servers, and import the routes in the VRF table for Servers to the VRF tables for Sub a and Sub b.
- Configure the Border Gateway Protocol (BGP) on C. Introduce the RIP routes to the VRF table for Sub a, introduce the OSPF routes to the VRF table for Sub b, and introduce the direct routes to the VRF table for Servers.

## 7.2.2 VRF only on PEs

### Scenario

An Internet Service Provider (ISP) provides the VPN service in an IP/MPLS backbone network.

In Figure 7-2, VPN1 runs RIP, and VPN2 runs OSPF.

- One CE is connected to one VPN, and all routes on the CE are exclusively used by the connected VPN. Therefore, no VRF table needs to be created to separate the routes.
- On each PE, VRF tables must be created to separate the routes in VPN1, those in VPN2, and those in the public network from each other.

Figure 7-2

## Deployment

- On PE1, create a VRF table for VPN1 and bind the interface directly connected to CE1. On PE2, create a VRF table for VPN1 and bind the interface directly connected to CE3.
- On PE1, create a VRF table for VPN2 and bind the interface directly connected to CE2. On PE2, create a VRF table for VPN2 and bind the interface directly connected to CE4.
- On PE1, associate the VRF table for VPN1 with CE1 by using RIP. On PE2, associate the VRF table for VPN1 with CE3 by using RIP.
- On PE1, associate the VRF table for VPN2 with CE2 by using OSPF. On PE2, associate the VRF table for VPN2 with CE4 by using OSPF.
- Create a BGP neighbor (VPNv4 address family) between PE1 and PE2.
- In the VRF instance for VPN1 on PE1, redistribute RIP routes to BGP, and redistribute BGP routes to RIP. The configuration on PE2 is similar.
- In the VRF instance for VPN2 on PE1, redistribute OSPF routes to BGP, and redistribute BGP routes to OSPF. The configuration on PE2 is similar.

 For details about the application scenario, see "Configuration Guide > MPLS > L3 VPN".

## 7.2.3 VRF on CEs and PEs (MCE Application)

### Scenario

An ISP provides the VPN service in an IP/MPLS backbone network.

In Figure 7-3, VPN a runs RIP, VPN b runs OSPF, and PE1 and PE2 are connected to BGP/MPLS VPNs.

- One Multi-VPN-Instance CE (MCE) is connected to multiple VPNs. VRF tables must be created to separate the routes in VPN a from those in VPN b.
- On each PE, VRF tables must be created to separate the routes in VPN a, those in VPN b, and those in the public network from each other.

Figure 7-3

### Deployment

- One MCE1, create VRF tables for VPN a and VPN b respectively, bind the interfaces directly connected to VPN a and VPN b, and bind the VLAN interface connected to PE1. The configuration on MCE2 is similar.

- On PE1, create VRF tables for VPN a and VPN b respectively, and bind the VLAN interface connected to MCE1. The configuration on PE2 is similar.
- On MCE1, associate the VRF table for VPN a with VPN a by using RIP. The configuration on MCE2 is similar.
- On MCE1, associate the VRF table for VPN b with VPN b by using OSPF. The configuration on MCE2 is similar.
- Create a BGP neighbor (VPNv4 address family) between PE1 and PE2.
- In the VRF instance for VPN a on MCE1, redistribute RIP routes to BGP, and redistribute BGP routes to RIP. The configuration on MCE2 is similar.
- In the VRF instance for VPN b on MCE1, redistribute OSPF routes to BGP, and redistribute BGP routes to OSPF. The configuration on MCE2 is similar.

 For details about the application scenario, see "Configuration Guide > MPLS > L3 VPN".

## 7.3 Features

### Overview

| Feature                             | Description  |
|-------------------------------------|--|
| <a href="#">VPN Instance</a>        | A VPN instance is used to provide the VPN service. It is typically represented by a VRF table.                           |
| <a href="#">VPN Route</a>           | A VPN route is used to forward VPN packets.  |
| <a href="#">VPN Route Attribute</a> | Route distinguisher (RD): Identifies the VPN to which a route belongs.<br>RT: Indicates the route trade-off mode of VRF. |

### 7.3.1 VPN Instance

A VPN instance is used to provide the VPN service. On a device that provides the VPN service, a VPN instance consists of the VRF table, interfaces, routing protocol processes, and configuration that belong to the same VPN. A VPN instance is typically represented by a VRF table.

### Working Principle

A PE exchanges routes with a CE by using the related routing protocol in the corresponding VPN instance. A VRF table is bound to a specific interface to generate its interface set. Packets received on these interfaces will be associated with the VRF table and forwarded along corresponding routes.

### Related Configuration

 Single-protocol VRF tables and multiprotocol VRF tables cannot be created at the same time. Single-protocol VRF tables only support IPv4, whereas multiprotocol VRF tables support IPv4 and IPv6.

#### [Configuring a Single-Protocol VRF Table](#)

By default, a device has no VRF table.

Run the **ip vrf** command to create a single-protocol VRF table.

Run the **ip vrf forwarding** command to bind an interface.

Currently, single-protocol VRF tables only support IPv4.

### 📌 **Configuring a Multiprotocol VRF Table**

By default, a device has no VRF table.

Run the **vrf definition** command to create a multiprotocol VRF table.

Run the **address-family ipv4** command to enable the IPv4 address family.

Run the **address-family ipv6** command to enable the IPv6 address family.

Run the **vrf forwarding** command to bind an interface.

Multiprotocol VRF tables support IPv4 and IPv6.

## 7.3.2 VPN Route

A VPN route is only used to forward VPN packets. It comes from:

- Direct route and host route on the bound interface
- Direct route and host route on the configured import interface (not bound)
- Static and dynamic routes (RIP, RIPng, OSPFv2, ISIS, and BGP) in the configured VPN instance

---

**i** For details about the static routes in a VPN instance, see "Configuration Guide > IP Route".

**i** For details about RIP in a VPN instance, see "Configuration Guide > IP Route > RIP".

**i** For details about RIPng in a VPN instance, see "Configuration Guide > IP Route > RIPng".

**i** For details about OSPFv2 in a VPN instance, see "Configuration Guide > IP Route > OSPFv2".

**i** For details about OSPFv3 in a VPN instance, see "Configuration Guide > IP Route > OSPFv3".

**i** For details about ISIS in a VPN instance, see "Configuration Guide > IP Route > ISIS".

**i** For details about BGP in a VPN instance, see "Configuration Guide > IP Route > BGP".

---

## 7.3.3 VPN Route Attribute

The BGP extended attributes include two attributes specific to VPN routes: RD and RT.

### Working Principle

#### 📌 **RD**

Two routes with the same address but different RDs in two VRF tables can be advertised separately between PEs, because the routes are sent together with their RDs through multiprotocol BGP (MP-BGP).

#### 📌 **RT**

RT in essence indicates each VRF table's route trade-off and preferences. It is mainly used to control the advertising and installation policies for VPN routes. RT is divided into the import attribute and export attribute. The import attribute indicates

the route of interest, and the export attribute indicates the advertised route. A PE advertises a route to other PEs based on the RT export rule in the corresponding VRF table. The peer PE checks all received routes against the RT import rule in each VRF table. If a route matches an RT export rule (the export rule contains the import rule), it will be added to the corresponding VRF table.

### Related Configuration

#### RD

By default, no RD is configured in VRF mode.

Run the **rd** command to configure an RD.

#### RT

By default, no RT is configured in VRF mode or address family mode.

Run the **route-target { import | export | both }** command to configure an RT.

## 7.4 Configuration

| Configuration   | Description and Command   |  |
|---|---|--|
| <a href="#">Configuring a Single-Protocol VRF Table</a> |  Single-protocol VRF tables and multiprotocol VRF tables cannot be created at the same time. If IPv6 is supported, configure a multiprotocol VRF table; otherwise, you can configure a single-protocol VRF table or a multiprotocol VRF table. This configuration item creates a VRF table in an IPv4 network. IPv6 is not supported. |  |
|   | <b>ip vrf</b> <i>vrf-name</i>   | Creates a VRF table.   |
|   | <b>rd</b> <i>rd_value</i>   | Configures an RD.  |
|   | <b>route-target { import   export   both }</b> <i>rt_value</i>  | Configures an RT.  |
|   | <b>ip vrf forwarding</b> <i>vrf-name</i>  | Binds an interface and adds the direct route and host route on the interface to a VRF table. |
| <b>ip vrf receive</b> <i>vrf_name</i>                   | Adds the direct route and host route on an interface to a VRF table without binding the interface.  |  |
| <a href="#">Configuring a Multiprotocol VRF Table</a>   |  Single-protocol VRF tables and multiprotocol VRF tables cannot be created at the same time. If IPv6 is supported, configure a multiprotocol VRF table. otherwise, you can configure a single-protocol VRF table or a multiprotocol VRF table. This configuration item creates a VRF table in an IPv4 or IPv6 network.               |  |
|   | <b>vrf definition</b> <i>vrf-name</i>   | Creates a VRF table.   |
|   | <b>description</b> <i>string</i>  | Configures a VRF descriptor.   |
|   | <b>rd</b> <i>rd_value</i>   | Configures an RD.  |
|   | <b>route-target { import   export   both }</b> <i>rt_value</i>  | Configures an RT.  |

| Configuration | Description and Command               |  |
|---------------|---------------------------------------|--|
|               | <b>address-family ipv4</b>            | Enables the IPv4 address family.   |
|               | <b>address-family ipv6</b>            | Enables the IPv6 address family.   |
|               | <b>vrf forwarding</b> <i>vrf-name</i> | Binds an interface and adds the direct route and host route on the interface to a VRF table.       |
|               | <b>vrf receive</b> <i>vrf-name</i>    | Adds the direct route and host route on an interface to a VRF table without binding the interface. |

### 7.4.1 Configuring a Single-Protocol VRF Table

#### Configuration Effect

- Provide the VPN service on a device.
- With BGP assistance, flexibly control the separation and access between VPNs.
- With BGP assistance, provide the VPN service in an IP/MPLS backbone network.
- Only IPv4 is supported.

#### Notes

- No VRF table needs to be created if the device only forwards packets from one VPN or from the public network.
- If the device needs to forward public network packets and VPN packets or forward packets from multiple VPNs, VRF tables must be created to separate routes.
- In many cases, static or dynamic routes (RIP, OSPF, ISIS, and BGP) need to be added to VRF tables.

#### Configuration Steps

##### ↘ Creating a VRF Table

- Mandatory.
- Create a VRF table for each VPN.

##### ↘ Configuring an RD

- Optional.
- When routing information needs to be advertised through BGP in the backbone network, BGP may select the best route for advertising if overlapping network addresses exist in different VPNs, which will make some VPNs fail to obtain corresponding routing information. To solve this problem, you can configure RDs for routes to enable BGP to make routing decisions based on these RDs, thus ensuring that each VPN can obtain corresponding routing information.
- Run the **rd** command in single-protocol VRF mode.

##### ↘ Configuring an RT

- Optional.
- You can run the **route-target export** command to specify the attributes of the route to be advertised, and run the **route-target import** command to specify the attributes of the route to be received. You can also run the **route-target both** command to specify the export and import attributes.
- Run the **route-target** command in single-protocol VRF mode.

#### ↘ Binding an Interface and Adding the Direct Route and Host Route on the Interface to a VRF Table

- Mandatory.
- If the physical link for transmitting VPN packets is exclusively occupied by a VPN, bind the physical interface to the corresponding VRF table.
- If the physical link for transmitting VPN packets is shared by multiple VPNs, you need to create an independent logical link for each VPN, and bind the logical interface to the corresponding VRF table. A logical interface can be a subinterface or a VLAN interface.
- You must bind an interface to the corresponding single-protocol VRF table before you configure the IPv4 address of the interface. If you bind the interface after its IPv4 address is configured, the IPv4 address will be invalid (the IPv6 address of the interface is retained).
- If you bind an interface to the corresponding single-protocol VRF table and enable IPv6 on the interface, the device cannot forward the IPv6 packets received on the interface.

#### ↘ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

- Optional.
- If policy-based routing (PBR) is required for VRF table selection, run the **ip vrf receive** command on the interface to which PBR is applied, and import the direct route and host route on the interface to each VRF table available for choice.

### Verification

- Check whether VRF tables are created correctly on the router.

### Related Commands

#### ↘ Creating a VRF Table

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip vrf</b> <i>vrf-name</i>  |
| <b>Parameter Description</b> | <i>vrf-name</i> : Indicates the name of the VRF table to be created. It cannot exceed 31 characters. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | After you run the command, the system will enter VRF mode.   |

#### ↘ Configuring an RD

|                |                           |
|----------------|---------------------------|
| <b>Command</b> | <b>rd</b> <i>rd_value</i> |
|----------------|---------------------------|

|                              |  |
|------------------------------|--|
| <b>Parameter Description</b> | <p><i>rd_value</i> has the following three different parameter forms:</p> <p>(1) <i>rd_value</i> = <b>as_num: nn</b><br/> <b>as_num</b> indicates the 2-byte number that identifies a public autonomous system (AS). <b>nn</b> is configurable in the range 0..4294967295.</p> <p>(2) <i>rd_value</i> = <b>ip_addr: nn</b><br/> <b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.</p> <p>(3) <i>rd_value</i> = <b>as4_num: nn</b><br/> <b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.</p> |
| <b>Command Mode</b>          | VRF configuration mode   |
| <b>Usage Guide</b>           | <p>You cannot directly change the RD of an existing VRF table. You need to delete the VRF table first and then configure a new RD.</p> <p>A VRF table has only one RD. You cannot configure multiple RDs for one VRF table.</p>  |

### ↘ Configuring an RT

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>route-target { import   export   both } <i>rt_value</i></b>   |
| <b>Parameter Description</b> | <p><i>rt_value</i> has the following three different parameter forms:</p> <p>(1) <i>rt_value</i> = <b>as_num: nn</b><br/> <b>as_num</b> indicates the 2-byte number that identifies a public AS. <b>nn</b> is configurable in the range 0..4294967295.</p> <p>(2) <i>rt_value</i> = <b>ip_addr: nn</b><br/> <b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.</p> <p>(3) <i>rt_value</i> = <b>as4_num: nn</b><br/> <b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.</p> |
| <b>Command Mode</b>          | VRF configuration mode   |
| <b>Usage Guide</b>           | A VRF table can be configured with multiple import and export RT attributes.   |

### ↘ Binding an Interface

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip vrf forwarding <i>vrf-name</i></b>   |
| <b>Parameter Description</b> | <i>vrf-name</i> : Indicates the name of a VRF table.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>By default, an interface does not belong to any VRF table.</p> <p>After an interface is bound to the corresponding VRF table, the direct route and host route on the interface will be automatically added to the VRF table.</p> <p>You must bind an interface to the corresponding single-protocol VRF table before you configure the IPv4 address of the interface. If you bind the interface after its IPv4 address is configured, the IPv4 address will be invalid (the IPv6 address of the interface is retained).</p> |

### Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>ip vrf receive</b> <i>vrf-name</i>  |
| <b>Parameter</b>    | <i>vrf-name</i> : Indicates the name of a VRF table.   |
| <b>Description</b>  |  |
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | This command is used to add the host route and direct route on an interface to a VRF table. If you need to add the host route and direct route on an interface to multiple VRF tables, run the command multiple times. Different from the <b>ip vrf forwarding</b> command, the <b>ip vrf receive</b> command does not bind an interface to the corresponding VRF table. The interface is still a global interface and does not belong to any VRF table. The <b>ip vrf forwarding</b> and <b>ip vrf receive</b> commands are mutually exclusive on the same interface. |

### Displaying the VRF Information on a Device

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>show ip vrf</b> [ <b>brief</b>   <b>detail</b>   <b>interfaces</b> ] [ <i>vrf-name</i> ]   |
| <b>Parameter</b>    | <b>brief</b> : Displays brief information.  |
| <b>Description</b>  | <b>detail</b> : Displays detailed information.<br><b>interfaces</b> : Displays the interface binding information.<br><i>vrf-name</i> : Indicates the name of a VRF table. |
| <b>Command Mode</b> | Privilege, global and interface configuration modes   |
| <b>Usage Guide</b>  | This command is used to display the information of a specified VRF table to check whether the VRF table is bound with the correct interface.                              |

### Displaying the Routes in a VRF Table

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>show ip route vrf</b> <i>vrf-name</i>   |
| <b>Parameter</b>    | <i>vrf-name</i> : Indicates the name of a VRF table.                                       |
| <b>Description</b>  |  |
| <b>Command Mode</b> | Privilege, global and interface configuration modes  |
| <b>Usage Guide</b>  | This command is used to check whether a specified VRF table contains corresponding routes. |

## Configuration Example

### Local Inter-VPN Access

|                               |   |
|-------------------------------|---|
| <b>Scenario</b><br>Figure 7-4 | <p>The diagram illustrates a network topology for local inter-VPN access. It features three VPNs: 'Sub a' (top left), 'Sub b' (bottom left), and 'Servers' (right). Each VPN is represented by a cloud icon. A central router, labeled 'C', is connected to both 'Sub a' and 'Sub b'. Router 'C' is also connected to the 'Servers' cloud. The routers are labeled 'A' and 'B' near their respective VPN clouds, and 'C' near the central router.</p> |
|                               | Sub a, Sub b, and Servers are three VPNs that have separate address spaces.   |

|                                     | Sub a runs RIP, Sub b runs OSPF, and Servers is a network segment directly connected to C.   |                       |                       |                 |           |                               |       |              |                     |                               |       |              |                     |                                     |       |              |                       |                               |       |              |   |                               |       |              |   |
|-------------------------------------|--|-----------------------|-----------------------|-----------------|-----------|-------------------------------|-------|--------------|---------------------|-------------------------------|-------|--------------|---------------------|-------------------------------------|-------|--------------|-----------------------|-------------------------------|-------|--------------|---|-------------------------------|-------|--------------|---|
| <b>Configuration Requirements</b>   | Routes in Sub a are separated from those in Sub b, but both Sub a and Sub b can access Servers.  |                       |                       |                 |           |                               |       |              |                     |                               |       |              |                     |                                     |       |              |                       |                               |       |              |   |                               |       |              |   |
| <b>Configuration Steps</b>          | <ul style="list-style-type: none"> <li>On C, create a VRF table for Sub a, bind the interface directly connected to A, and associate the VRF table with A by using RIP.</li> <li>On C, create a VRF table for Sub b, bind the interface directly connected to B, and associate the VRF table with B by using OSPF.</li> <li>On C, create a VRF table for Servers and bind the interface directly connected to Servers.</li> <li>On C, configure the RTs of the VRF tables for Sub a, Sub b, and Servers. Import the routes in the VRF tables for Sub a and Sub b to the VRF table for Servers, and import the routes in the VRF table for Servers to the VRF tables for Sub a and Sub b.</li> <li>Configure the Border Gateway Protocol (BGP) on C. Introduce the RIP routes to the VRF table for Sub a, introduce the OSPF routes to the VRF table for Sub b (enabled with an address family), and introduce the direct routes to the VRF table for Servers (enabled with an address family).</li> </ul> <p> Planning of interfaces and addresses:</p> <table border="1"> <thead> <tr> <th>Interface Description</th> <th>Interface Name</th> <th>IP Address/Mask</th> <th>VRF Table</th> </tr> </thead> <tbody> <tr> <td>Interface on C connected to A</td> <td>GE0/1</td> <td>10.10.1.1/24</td> <td>VRF table for Sub a</td> </tr> <tr> <td>Interface on C connected to B</td> <td>GE0/2</td> <td>10.10.2.1/24</td> <td>VRF table for Sub b</td> </tr> <tr> <td>Interface on C connected to Servers</td> <td>GE0/3</td> <td>10.10.3.1/24</td> <td>VRF table for Servers</td> </tr> <tr> <td>Interface on A connected to C</td> <td>GE0/1</td> <td>10.10.1.2/24</td> <td>-</td> </tr> <tr> <td>Interface on B connected to C</td> <td>GE0/2</td> <td>10.10.2.2/24</td> <td>-</td> </tr> </tbody> </table> | Interface Description | Interface Name        | IP Address/Mask | VRF Table | Interface on C connected to A | GE0/1 | 10.10.1.1/24 | VRF table for Sub a | Interface on C connected to B | GE0/2 | 10.10.2.1/24 | VRF table for Sub b | Interface on C connected to Servers | GE0/3 | 10.10.3.1/24 | VRF table for Servers | Interface on A connected to C | GE0/1 | 10.10.1.2/24 | - | Interface on B connected to C | GE0/2 | 10.10.2.2/24 | - |

Gateway of last resort is no set
O   10.2.0.0/16 [20/0] via 0.0.0.0, 00:10:46, GigabitEthernet 0/2
O   10.10.2.0/24 [20/0] via 0.0.0.0, 00:10:46, GigabitEthernet 0/2
C   10.10.2.1/32 is local host.
C   10.10.3.0/24 is directly connected, GigabitEthernet 0/3
C   10.10.3.1/32 is local host.

```

## Common Errors

- An interface is bound to a VRF table after the IP interface of the interface is configured.
- When a physical link is used to forward packets from multiple VPNs, the corresponding physical interface is bound to a VRF table.
- VPN routes are not introduced to BGP.

## 7.4.2 Configuring a Multiprotocol VRF Table

### Configuration Effect

- Provide the VPN service on a device.
- With BGP assistance, flexibly control the separation and access between VPNs.
- With BGP assistance, provide the VPN service in an IP/MPLS backbone network.
- Support IPv4 and IPv6 through address family configuration.

### Notes

- No VRF table needs to be created if the device only forwards packets from one VPN or from the public network.
- If the device needs to forward public network packets and VPN packets or forward packets from multiple VPNs, VRF tables must be created to separate routes.
- In many cases, static or dynamic routes (RIP, OSPF, ISIS, and BGP) need to be added to VRF tables.

### Configuration Steps

#### ↳ Creating a VRF Table

- Mandatory.

- Create a VRF table for each VPN.

#### ▾ Configuring an Address Family

- Mandatory.
- Enable the corresponding address family for each created VRF table.

#### ▾ Configuring an RD

- Optional.
- When routing information needs to be advertised through BGP in the backbone network, BGP may select the best route for advertising if overlapping network addresses exist in different VPNs, which will make some VPNs fail to obtain corresponding routing information. To solve this problem, you can configure RDs for routes to enable BGP to make routing decisions based on these RDs, thus ensuring that each VPN can obtain corresponding routing information.

#### ▾ Configuring an RT

- Optional.
- You can run the **route-target export** command to specify the attributes of the route to be advertised, and run the **route-target import** command to specify the attributes of the route to be received. You can also run the **route-target both** command to specify the export and import attributes.
- Run the **route-target** command in multiprotocol VRF mode or multiprotocol VRF address family mode.

#### ▾ Binding an Interface and Adding the Direct Route and Host Route on the Interface to a VRF Table

- Mandatory.
- If the physical link for transmitting VPN packets is exclusively occupied by a VPN, bind the physical interface to the corresponding VRF table.
- If the physical link for transmitting VPN packets is shared by multiple VPNs, you need to create an independent logical link for each VPN, and bind the logical interface to the corresponding VRF table. A logical interface can be a subinterface or a VLAN interface.
- Before you bind an interface to a multiprotocol VRF table, enable an address family for the table. If you do not enable the IPv4 address family in advance, you cannot configure the IPv4 address and VRRP IPv4 address of the bound interface. If you do not enable the IPv6 address family in advance, you cannot configure the IPv6 address and VRRP IPv6 address of the bound interface.
- You must bind an interface to the corresponding multiprotocol VRF table before you configure the IPv4 or IPv6 address of the interface. If you bind the interface after its IPv4 or IPv6 address is configured, the address will be invalid.

#### ▾ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

- Optional.
- If PBR is required for VRF table selection, run the **ip vrf receive** command on the interface to which PBR is applied, and import the direct route and host route on the interface to each VRF table available for choice.

## Verification

- Check whether multiprotocol VRF tables are created correctly on the router and corresponding address families are enabled.

## Related Commands

### Creating a VRF Table

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>vrf definition</b> <i>vrf-name</i>  |
| <b>Parameter Description</b> | <i>vrf-name</i> : Indicates the name of the VRF table to be created. It cannot exceed 31 characters. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | After you run the command, the system will enter VRF mode.   |

### Enabling the IPv4 Address Family

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>address-family ipv4</b>  |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | VRF mode  |
| <b>Usage Guide</b>           | After you run the command, the system will enter VRF IPv4 address family submode. |

### Enabling the IPv6 Address Family

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>address-family ipv6</b>  |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | VRF mode  |
| <b>Usage Guide</b>           | After you run the command, the system will enter VRF IPv6 address family submode. |

### Configuring an RD

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>rd</b> <i>rd_value</i>  |
| <b>Parameter Description</b> | <p><i>rd_value</i> has the following three different parameter forms:</p> <p>(1) <i>rd_value</i> = <b>as_num: nn</b><br/> <b>as_num</b> indicates the 2-byte number that identifies a public AS. <b>nn</b> is configurable in the range 0..4294967295.</p> <p>(2) <i>rd_value</i> = <b>ip_addr: nn</b><br/> <b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.</p> <p>(3) <i>rd_value</i> = <b>as4_num: nn</b><br/> <b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.</p> |

|                     |  |
|---------------------|--|
| <b>Command Mode</b> | VRF configuration mode   |
| <b>Usage Guide</b>  | You cannot directly change the RD of an existing VRF table. You need to delete the VRF table first and then configure a new RD.<br>A VRF table has only one RD. You cannot configure multiple RDs for one VRF table. |

### ↘ Configuring an RT

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <code>route-target { import   export   both } <i>rt_value</i></code>  |
| <b>Parameter Description</b> | <i>rt_value</i> has the following three different parameter forms:<br>(1) <i>rt_value</i> = <b>as_num: nn</b><br><b>as_num</b> indicates the 2-byte number that identifies a public AS. <b>nn</b> is configurable in the range 0..4294967295.<br>(2) <i>rt_value</i> = <b>ip_addr: nn</b><br><b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.<br>(3) <i>rt_value</i> = <b>as4_num: nn</b><br><b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535. |
| <b>Command Mode</b>          | VRF configuration mode or VRF address family submode  |
| <b>Usage Guide</b>           | One VRF table can be configured with multiple import and export RT attributes.  |

### ↘ Binding an Interface

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>vrf forwarding <i>vrf-name</i></code>  |
| <b>Parameter Description</b> | <i>vrf-name</i> : Indicates the name of a VRF table.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | By default, an interface does not belong to any VRF table.<br>After an interface is bound to the corresponding VRF table, the direct route and host route on the interface will be automatically added to the VRF table.<br>Before you bind an interface to a multiprotocol VRF table, enable an address family for the table. If you do not enable the IPv4 address family in advance, you cannot configure the IPv4 address and VRRP IPv4 address of the bound interface. If you do not enable the IPv6 address family in advance, you cannot configure the IPv6 address and VRRP IPv6 address of the bound interface.<br>You must bind an interface to a multiprotocol VRF table before you configure the IPv4, IPv6, VRRP IPv4, and VRRP IPv6 addresses of the interface; otherwise, these addresses will be invalid and the IPv6 protocol on the interface will be disabled.<br>If the IPv4 address family is deleted from the multiprotocol VRF table, the IPv4 and VRRP IPv4 addresses of all interfaces bound to the VRF table will be deleted, and the IPv4 static routes in the VRF table or next-hop routes are also deleted. If the IPv6 address family is deleted from the multiprotocol VRF table, the IPv6 and VRRP IPv6 addresses of all interfaces bound to the VRF table will be deleted, the IPv6 protocol on the interfaces will be disabled, and the IPv6 static routes in the VRF table or next-hop routes are also deleted. |

### ➤ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

|                     |  |
|---------------------|--|
| <b>Command</b>      | <code>vrf receive vrf-name</code>  |
| <b>Parameter</b>    | <i>vrf-name</i> : Indicates the name of a VRF table.   |
| <b>Description</b>  |  |
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | This command is used to add the host route and direct route on an interface to a VRF table. If you need to add the host route and direct route on an interface to multiple VRF tables, run the command multiple times. Different from the <b>vrf forwarding</b> command, the <b>vrf receive</b> command does not bind an interface to the corresponding VRF table. The interface is still a global interface and does not belong to any VRF table. The <b>vrf forwarding</b> and <b>vrf receive</b> commands are mutually exclusive on the same interface. |

### ➤ Displaying the VRF Information on a Device

|                     |  |
|---------------------|--|
| <b>Command</b>      | <code>show vrf [ brief   detail   ipv4   ipv6 ] [ vrf-name ]</code>  |
| <b>Parameter</b>    | <b>brief</b> : Displays brief information.   |
| <b>Description</b>  | <b>detail</b> : Displays detailed information.<br><b>ipv4</b> : Displays the brief information of an IPv4 VRF table.<br><b>ipv6</b> : Displays the brief information of an IPv6 VRF table.<br><i>vrf-name</i> : Indicates the name of a VRF table. |
| <b>Command Mode</b> | Privilege, global and interface configuration modes  |
| <b>Usage Guide</b>  | This command is used to display the information of a specified VRF table to check whether the VRF table is bound with the correct interface.   |

### ➤ Displaying the Routes in a VRF Table

|                     |  |
|---------------------|--|
| <b>Command</b>      | <code>show ip route vrf vrf-name</code>  |
| <b>Parameter</b>    | <i>vrf-name</i> : Indicates the name of a VRF table.                                       |
| <b>Description</b>  |  |
| <b>Command Mode</b> | Privilege, global and interface configuration modes  |
| <b>Usage Guide</b>  | This command is used to check whether a specified VRF table contains corresponding routes. |

## Configuration Example

**i** The following example only describes VRF-related configuration on A1, B1, MCE1, and PE1. The configuration on A2, B2, MCE2, and PE2 is similar.

### ➤ VRF on CEs and PEs (MCE Application)

**Scenario**  
**Figure 7-5**

VPN a and VPN b have independent address spaces.  
VPN a runs RIP and VPN b runs OSPF.

**Configuration Requirements**

The routes in VPN a are separated from those in VPN b. A1 and A2 can access each other, and B1 and B2 can access each other.

**Configuration Steps**

- Connect MCE1 and A1 through RIP. Extend RIP routes on A1. On MCE1, create a VRF table for VPN a, bind the directly connected interface, and configure RIP routes.
- Connect MCE1 and B1 through OSPF. Extend OSPF routes on B1. On MCE1, create a VRF table for VPN b, bind the directly connected interface, and configure OSPF routes.
- Connect MCE1 and PE1 through BGP. On MCE1 and PE1, create a VRF table for each VPN, bind the VLAN interface, and configure BGP routes.
- Configure the physical link between MCE1 and PE1 in Trunk mode.
- In the VRF instance for VPN a on MCE1, redistribute the RIP routes to BGP, and redistribute the BGP routes to RIP.
- In the VRF instance for VPN b on MCE1, redistribute the OSPF routes to BGP, and redistribute the BGP routes to OSPF.

**i** Planning of interfaces and addresses:

| Interface Description                      | Interface Name | IP Address/Mask | VRF Table           |
|--|----------------|-----------------|---------------------|
| Physical interface on A1 connected to MCE1 | GE0/1          | 10.10.1.2/24    | -                   |
| Physical interface on B1 connected to MCE1 | GE0/2          | 10.10.2.2/24    | -                   |
| Physical interface on MCE1 connected to A1 | GE0/1          | 10.10.1.1/24    | VRF table for VPN a |
| Physical interface on MCE1 connected to B1 | GE0/2          | 10.10.2.1/24    | VRF table for VPN b |
| Logical interface on MCE1 connected to PE1 | VLAN10         | 10.10.10.1/24   | VRF table for VPN a |
| Logical interface on MCE1 connected to PE1 | VLAN20         | 10.10.20.1/24   | VRF table for VPN b |
| Logical interface on PE1 connected to MCE1 | VLAN10         | 10.10.10.2/24   | VRF table for VPN a |

|             | Logical interface on PE1<br>connected to MCE1  | VLAN20 | 10.10.20.2/24 | VRF table for VPN b |

## Common Errors

- A multiprotocol VRF table is configured, but no address family is enabled.
- An interface is bound to a VRF table after the IP interface of the interface is configured.
- When a physical link is used to forward packets from multiple VPNs, the corresponding physical interface is bound to a VRF table.
- VPN routes are not introduced to BGP.

## 7.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

| Description                                 | Command                                   |
|---|---|
| Clears the routes in a specified VRF table. | <b>clear ip route vrf</b> <i>vrf-name</i> |

## Displaying

| Description  | Command  |
|--|--|
| Displays the information of a single-protocol VRF table. | <b>show ip vrf</b> [ <b>brief</b>   <b>detail</b>   <b>interfaces</b> ] [ <i>vrf-name</i> ]      |
| Displays the information of a multiprotocol VRF table.   | <b>show vrf</b> [ <b>ipv4</b>   <b>ipv6</b>   <b>brief</b>   <b>detail</b> ] [ <i>vrf-name</i> ] |

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description   | Command                    |
|---|----------------------------|
| Displays the debugging information during the processes where a VRF table is created, an address family is enabled, and an interface is bound to the VRF table. | <b>debug vrf</b>           |
| Prints the information of interface-related VRF operation debugging.  | <b>debug vrf interface</b> |

## 8 Configuring RIPng

### 8.1 Overview

RIP next generation (RIPng) is a unicast routing protocol that applies to IPv6 networks. RIPng-enabled routers exchange routing information to obtain routes to remote networks.

As an Interior Gateway Protocol (IGP), RIPng can run only within the autonomous system (AS) and is applicable to small-sized networks with routes no more than 16 hops.

#### Protocols and Standards

- RFC2080: Defines the RIPng.

### 8.2 Application

RIPng is generally used on some small-sized networks, such as office networks of small companies.

As shown in the following figure, the company builds an IPv6 network, on which all routers support IPv6. The network is small in size, but the workload is still heavy if the network is maintained manually. In this case, RIPng can be configured to adapt to topological changes of the small-sized network, which reduces the workload.

Figure 8-1

### 8.3 Features

#### Basic Concepts

##### ↳ IGP and EGP

IGP runs within an AS. For example, RIPng is a type of IGP.

Exterior Gateway Protocol (EGP) runs between ASs. For example, BGP is a type of EGP.

### Feature

### 8.3.1 RIPng and RIP

RIP applies to IPv4 networks. Two RIP versions are available, including RIPv1 and RIPv2.

RIPng is an extension of RIPv2 on the basis of IPv6. Both are similar in functions and configurations.

#### Working Principle

##### ↳ RIPv2

RIPv2 packets are multicast. The multicast address is 224.0.0.9, and the UDP port ID is 520. RIPv2 can identify the subnet mask.

##### ↳ RIPng

RIPng packets are multicast. The multicast address is FF02::9, the source address is FE80::/10, and the UDP port ID is 521. RIPng can identify the subnet mask.

**i** This chapter describes functions and configurations of RIPng. For details about RIPv2, see "Configuring RIP".

#### Related Configuration

##### ↳ Enabling the RIPng Process

By default, the RIPng process is disabled.

Run the **ipv6 router rip** command to enable the RIPng process.

You must enable the RIPng process on a device; otherwise, all functions related to RIPng cannot take effect.

##### ↳ Running RIPng on an Interface

By default, RIPng does not run on an interface.

Run the **ipv6 rip enable** command to run RIPng on an interface.

After RIPng runs on an interface, RIPng packets can be exchanged on the interface and RIPng can learn routes to the network segments directly connected to the device.

### ↘ Prohibiting an Interface from Sending or Receiving Packets

By default, a RIPng-enabled interface is allowed to send and receive RIPng packets.

Run the **passive-interface** command to prohibit an interface from sending RIPng packets.

## 8.3.2 Exchanging Routing Information

Compared with static routing, the dynamic routing protocol has a significant advantage, that is, by exchanging routing information, devices can automatically obtain routes to a remote network and update the routes in real time.

### Working Principle

#### ↘ Initialization

After RIPng is enabled on a router, the router sends a request packet to its neighbor router, requesting for all routing information, that is, the routing table. After receiving the request message, the neighbor router returns a response packet containing the local routing table. After receiving the response packet, the router updates the local routing table, and sends an update packet to the neighbor router, informing the neighbor router of the route update information. After receiving the update packet, the neighbor router updates the local routing table, and sends the update packet to other adjacent routers. After a series of updates, all routers can obtain and retain the latest routing information.

#### ↘ Periodical Update

By default, periodical update is enabled for RIPng. Adjacent routers exchange complete routing information with each other every 30s (update timer), that is, the entire routing table is sent to neighbor routers.

- i** For every non-local route, if the route is not updated within 180s (invalid timer), the metric of the route is changed to 16 (unreachable). If the route is still not updated in the next 120s (flush timer), the route is deleted from the routing table.

#### ↘ Default Route

In the routing table, a route to the destination network `::/0` is called default route.

The default route can be learned from a neighbor router, or sent to a neighbor router.

#### ↘ Route Redistribution

For RIPng, other types of routes (such as direct routes, static routes, and routes of other routing protocols) are called external routes.

External routes (excluding the default route) can be redistributed to RIPng and advertised to neighbors.

#### ↘ Route Filtering

Filtering conditions can be configured to limit the routing information exchanged between adjacent routers. Only the routing information that meets filtering conditions can be sent or received.

### Related Configuration

#### ↘ RIPng Timers

By default, the update timer is 30s, the invalid timer is 180s, and the flush timer is 120s.

Run the **timers basic** command to modify durations of RIPng timers.

Increasing the duration of the flush timer can reduce the route flapping. Decreasing the duration of the flush timer helps accelerate route convergence.

The durations of RIPng timers must be consistent on adjacent routers. Unless otherwise required, you are advised not to modify the RIPng timers.

#### ↘ Default Route

Run the **ipv6 rip default-information** command to advertise the default route to neighbors on an interface.

#### ↘ Route Redistribution

Run the **redistribute** command to redistribute external routes (excluding the default route) to RIPng and advertise them to neighbors.

#### ↘ Route Filtering

Run the **distribute-list out** command to set filtering rules to limit the routing information sent by the device.

Run the **distribute-list in** command to set filtering rules to limit the routing information received by the device.

### 8.3.3 Routing Algorithm

RIPng is a protocol based on the distance-vector algorithm. It uses the vector addition method to compute the routing information.

#### Working Principle

---

##### ↘ Distance-Vector Algorithm

RIPng is a protocol based on the distance-vector algorithm. The distance-vector algorithm treats a route as a vector that consists of the destination network and distance (metric). The router obtains a route from its neighbor and adds the distance vector from itself to the neighbor to the route to form its own route.

RIPng uses the hop count to evaluate the distance (metric) to the destination network. By default, the hop count from a router to its directly connected network is 0, the hop count from a router to a network that can be reached through a router is 1, and so on. That is, the metric is equal to the number of routers from the local network to the destination network. To restrict the convergence time, RIPng stipulates that the metric must be an integer between 0 and 15. If the metric is equal to or greater than 16, the destination network or host is unreachable. For this reason, RIPng cannot be applied to a large-scale network. As shown in the following figure, Router A is connected to the network 2::/64. Router B obtains the route (2::/64, 0) from Router A and adds the metric 1 to the route to obtain its own route (2::/64, 1), and the next hop points to Router A.

Figure 8-2

↘ **Selecting the Optimum Route**

RIPng selects an optimum route based on the following principle: If multiple routes to the same destination network is available, a router preferentially selects the route with the smallest metric.

As shown in the following figure, Router A is connected to the network 2::/64. Router C obtains the route (2::/64, 0) from Router A and the route (2::/64, 1) from Router B. Router C will select the route that is obtained from Router A and add metric 1 to this route to form its own route (2::/64, 1), and the next hop points to Router A.

Figure 8-3

**i** When routes coming from different sources exist on a router, the route with the smaller distance is preferentially selected.

| Route Source               | Default Distance |
|----------------------------|------------------|
| Directly-connected network | 0                |
| Static route               | 1                |
| OSPF route                 | 110              |
| IS-IS route                | 115              |
| RIPng route                | 120              |
| Unreachable route          | 255              |

**Related Configuration**

↘ **Modifying the Distance**

By default, the distance of a RIPng route is 120.

Run the **distance** command to modify the distance of a RIPng route.

### ✚ Modifying the Metric

For a RIPng route that is proactively discovered by a device, the default metric is equal to the number of hops from the local network to the destination network. The metric offset of the interface is 1.

For a RIPng router that is manually configured (default route or redistributed route), the default metric is 1.

Run the **ipv6 rip metric-offset** command to modify the metric offset of the interface.

Run the **default-metric** command to modify the default metric of an external route (redistributed route).

Run the **redistribute** command to modify the metric of an external route (redistributed route) when advertising this route.

Run the **ipv6 rip default-information** command to modify the metric of a default route when advertising the default route.

## 8.3.4 Avoiding Route Loops

RIPng uses functions, such as split horizon and poison reverse, to avoid route loops.

### Working Principle

#### ✚ Route Loop

A RIPng route loop occurs due to inherent defects of the distance-vector algorithm.

As shown in the following figure, Router A is connected to the network 2::/64, and sends an update packet every 30s. Router B receives the route to 2::/64 from Router A every 30s. If Router A is disconnected from 2::/64, the route to 2::/64 will be deleted from the routing table on Router A. Next time, the update packet sent by Router A no longer contains this route. As Router B does not receive an update packet related to 2::/64, Router B determines that the route to 2::/64 is valid within 180s and uses the update packet to send this route to Router A. As the route to 2::/64 does not exist on Router A, the route learned from Router B is added to the routing table. Router B determines that data can reach 2::/64 through Router A, and Router A determines that data can reach 2::/64 through Router B. In this way, a route loop is formed.

Figure 8-4

#### ✚ Split Horizon

Split horizon can prevent route loops. After split horizon is enabled, a route received on this interface will not be sent out from this interface.

As shown in the following figure, after split horizon is enabled on Router B, Router B will not send the route to 2::/64 back to Router A. Router B will learn 180s later that 2::/64 is not reachable.

Figure 8-5

### ↳ Poison Reverse

Poison reverse can also prevent route loops. Compared with split horizon, poison reverse is more reliable, but brings more protocol packets, which makes network congestion more severe.

After poison reverse is enabled on an interface, a route received from this interface will be sent out from this interface again, but the metric of this router will be changed to 16 (unreachable).

As shown in the following figure, after poison reverse is enabled on Router A, if Router A detects a disconnection from 2::/64, Router A will not delete the route to 2::/64. Instead, Router A changes the number of hops to 16, and advertises the route through the update packet. On receiving the update packet, Router B learns that 2::/64 is not reachable.

Figure 8-6

## Related Configuration

### ↳ Split Horizon

By default, split horizon is enabled.

Run the **no split-horizon** command to disable split horizon.

### ↳ Poison Reverse

By default, poison reverse is disabled.

Run the **split-horizon poisoned-reverse** command to enable poison reverse. (After poison reverse is enabled, split horizon is automatically disabled.)

|  | <b>redistribute</b>   | Redistributes routes and advertising external routes to neighbors.             |
| <a href="#">Setting Route Filtering Rules</a>                    |  Optional.   |  |
|  | <b>distribute-list in</b>   | Filters the received RIPng routing information.                                |
|  | <b>distribute-list out</b>  | Filters the sent RIPng routing information.                                    |
| <a href="#">Modifying Route Selection Parameters</a>             |  Optional.   |  |
|  | <b>distance</b>   | Modifies the administrative distance of a RIPng route.                         |
|  | <b>ipv6 rip metric-offset</b>   | Modifies the metric offset on an interface.                                    |
|  | <b>default-metric</b>   | Configure the default metric for route redistribution.                         |
| <a href="#">Modifying Timers</a>                                 |  Optional.   |  |
|  | <b>timers</b>   | Modifies the update timer, invalid timer, and flush timer of RIPng.            |

### 8.4.1 Configuring RIPng Basic Functions

#### Configuration Effect

- Build a RIPng routing domain on the network.
- Routers in the domain obtain routes to a remote network through RIPng.

#### Notes

- IPv6 addresses must be configured.
- IPv6 unicast routes must be enabled.

#### Configuration Steps

- [Enabling a RIPng Routing Process](#)

- Mandatory.
- Unless otherwise required, perform this configuration on every router in the RIPng routing domain.

### ↳ Running RIPng on an Interface

- Mandatory.
- Unless otherwise required, perform this configuration on every interconnected interface of routers in the RIPng routing domain.

### ↳ Enabling Split Horizon or Poison Reverse

- By default, split horizon is enabled and poison reverse is disabled.
- Unless otherwise required, enable split horizon on every interface connected to the broadcast network, such as the Ethernet. (Retain the default setting.)
- Unless otherwise required, enable split horizon on every interface connected to the point-to-point (P2P) network, such as the PPP and HDLC. (Retain the default setting.)
- It is recommended that split horizon and poison reverse be disabled on an interface connected to a non-broadcast multi-access network, such as FR and X.25; otherwise, some devices cannot learn the complete routing information.
- If the secondary IP address is configured for an interface connected to a non-broadcast, it is recommended that split horizon and poison reverse be disabled.

### ↳ Configuring a Passive Interface

- This configuration is recommended.
- Use the passive interface to set the boundary of the RIPng routing domain. The network segment of the passive interface belongs to the RIPng routing domain, but RIPng packets cannot be sent over the passive interface.
- If RIPng routes need to be exchanged on an interface (such as the router interconnect interface) in the RIPng routing domain, this interface cannot be configured as a passive interface.

## Verification

- Check the routing table on a router to verify that the route to a remote network can be obtained through RIPng.

## Related Commands

### ↳ Enabling a RIPng Routing Process

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>ipv6 router rip</b>   |
| <b>Parameter</b>    | N/A  |
| <b>Description</b>  |  |
| <b>Command Mode</b> | Global configuration mode  |
| <b>Usage Guide</b>  | This command is used to create a RIPng routing process and enter routing process configuration mode. |

### ↳ Running RIPng on an Interface

|                |                        |
|----------------|------------------------|
| <b>Command</b> | <b>ipv6 rip enable</b> |
|----------------|------------------------|

|                              |  |
|------------------------------|--|
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | The configuration for running the RIPng on an interface is different from that of RIPv2. In RIPv2, the <b>network</b> command is configured in routing process configuration mode to define an IP address range. If the IP address of an interface belongs to this IP address range, RIP automatically runs on this interface. |

### ↳ Enabling Split Horizon

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>split-horizon [ poisoned-reverse ]</b>   |
| <b>Parameter Description</b> | <b>poisoned-reverse:</b> Indicates that the split horizon function contains the poison reverse function.  |
| <b>Command Mode</b>          | Routing process configuration mode  |
| <b>Usage Guide</b>           | Run the <b>show ipv6 rip</b> command to check whether split horizon is enabled.<br>The configuration is different from that of RIPv2. In RIPv2, the split horizon function is configured in interface configuration mode. |

### ↳ Configuring a Passive Interface

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>passive-interface { default   interface-type interface-num }</b>   |
| <b>Parameter Description</b> | <b>default:</b> Indicates all interfaces.<br><b>interface-type interface-num:</b> Specifies an interface.   |
| <b>Command Mode</b>          | Routing process configuration mode  |
| <b>Usage Guide</b>           | First, run the <b>passive-interface default</b> command to configure all interfaces as passive interfaces.<br>Then, run the <b>no passive-interface interface-type interface-num</b> command so that the interfaces used for interconnection between routers in the domain are not passive interface. |

### ↳ Displaying the IP Routing Table

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 route</b>  |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Privileged EXEC mode or global configuration mode   |
| <b>Usage Guide</b>           | Check whether the routing table contains any route to a remote network that is learned through RIPng. |

## Configuration Example

### ↳ Building a RIPng Routing Domain

|  |  |
|--|--|
| <p><b>Scenario</b><br/><b>Figure 8-7</b></p> |   |
| <p><b>Configuration Steps</b></p>            | <ul style="list-style-type: none"> <li>● Configure IPv6 addresses on all routers.</li> <li>● Enable RIPng on all routers.</li> </ul>   |

| <b>C</b> | <pre> Ruijie# show ipv6 route  IPv6 routing table name - Default - 9 entries Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area  C    2::/64 via GigabitEthernet 0/1, directly connected L    2::2/128 via GigabitEthernet 0/1, local host C    2001:DB8::/32 via GigabitEthernet 0/0, directly connected L    2001:DB8::3/128 via GigabitEthernet 0/0, local host C    FE80::/10 via ::1, Null0 C    FE80::/64 via GigabitEthernet 0/0, directly connected L    FE80::2D0:F8FF:FEFB:D521/128 via GigabitEthernet 0/0, local host C    FE80::/64 via GigabitEthernet 0/1, directly connected L    FE80::2D0:F8FF:FEFB:D521/128 via GigabitEthernet 0/1, local host </pre> |

## Common Errors

- The IPv6 address is not configured on an interface.
- The interface used for interconnection between devices is configured as a passive interface.

## 8.4.2 Advertising the Default Route or External Routes

### Configuration Effect

- In the RIPng domain, introduce a unicast route of another AS so that the unicast routing service to this AS can be provided for users in the RIPng domain.
- In the RIPng domain, inject a default route to another AS so that the unicast routing service to this AS can be provided for users in the RIPng domain.

### Notes

- The RIPng basic functions must be configured.

### Configuration Steps

#### ▾ Configuring External Route Redistribution

- Optional.
- Perform this configuration if external routes of the RIPng domain should be introduced to the AS border router (ASBR).

#### ▾ Generating a Default Route

- Optional.
- Perform this configuration if the default route should be introduced to an ASBR so that other routers in the RIPng domain access other AS domains through this ASBR by default.

### Verification

- Run the **show ipv6 route rip** command on a non-ASBR to check whether the external routes of the domain and default route have been loaded.

### Related Commands

#### ▾ Advertising the Default Route to Neighbors on an Interface

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>ipv6 rip default-information { only originate } [ metric <i>metric-value</i> ]</code>  |
| <b>Parameter Description</b> | <p><b>only:</b> Advertises only IPv6 default route.</p> <p><b>originate:</b> Advertises the IPv6 default route and other routes.</p> <p><b>metric <i>metric-value</i>:</b> Indicates the metric of the default route. The value ranges from 1 to 15. The default value is 1.</p>   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>After this command is configured on the interface, an IPv6 default route is advertised to the external devices through this interface, but the route itself is not added to the route forwarding table or the device and the RIPng route database.</p> <p>To prevent occurrence of a route loop, once this command is configured on an interface, RIPng refuses to receive the default route updates advertised by neighbors.</p> |

↘ **Redistributing Routes and Advertising External Routes to Neighbors**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>redistribute { bgp   connected   isis [ area-tag ]   ospf process-id   static } [ metric metric-value   route-map route-map-name ]</code>  |
| <b>Parameter Description</b> | <p><b>bgp</b>: Indicates redistribution from BGP.</p> <p><b>Connected</b>: Indicates redistribution from direct routes.</p> <p><b>isis [ area-tag ]</b>: Indicates redistribution from IS-IS. <i>area-tag</i> indicates the IS-IS process ID.</p> <p><b>ospf process-id</b>: Indicates redistribution from OSPF. <i>process-id</i> indicates the OSPF process ID. The value ranges from 1 to 65535.</p> <p><b>static</b>: Indicates redistribution from static routes.</p> <p><b>metric metric-value</b>: Sets the metric of the route redistributed to the RIPng domain.</p> <p><b>route-map route-map-name</b>: Sets the redistribution filtering rules.</p> |
| <b>Command Mode</b>          | Routing process configuration mode   |
| <b>Usage Guide</b>           | During route redistribution, it is not necessary to convert the metric of one routing protocol to the metric of another routing protocol because different routing protocols use completely different metric measurement methods. RIP measures the metric based on the hop count, and OSPF measures the metric based on the bandwidth. Therefore, the computed metrics cannot be compared with each other.   |

**Configuration Example**

|                            |   |
|----------------------------|---|
| <b>Scenario</b>            | <p>The diagram shows two routers, A and B, connected via their GigabitEthernet 0/1 interfaces. Router A has the IPv6 address 2001::1/64 on its GE 0/1 interface, and Router B has the IPv6 address 2001::2/64 on its GE 0/1 interface. Router B is also connected to a static route 3001:10:10::/64 via its GE 0/2 interface.</p>                             |
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. (Omitted)</li> <li>● On Router B, configure redistribution of static routes.</li> <li>● On the GE0/1 interface of Router A, configure advertisement of the default route.</li> </ul> |
| <b>A</b>                   | <pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 rip default-information originate</pre>  |
| <b>B</b>                   | <pre>B# configure terminal B(config)# ipv6 router rip B(config-router)# redistribute static</pre>   |
| <b>Verification</b>        | <ul style="list-style-type: none"> <li>● Check the routing tables on Router A and Router B, and confirm that Router A can learn the route 3001:10:10::/64, and Router B can learn the default route ::/0.</li> </ul>  |

|                 |   |
|-----------------|---|
| <p><b>A</b></p> | <pre>A# show ipv6 route rip  IPv6 routing table name - Default - 17 entries  Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  R      3001:10:10::/64 [120/2] via FE80::2D0:F8FF:FE22:334A, GigabitEthernet 0/1</pre> |
| <p><b>B</b></p> | <pre>B# show ipv6 route rip  IPv6 routing table name - Default - 17 entries  Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  R      ::/0 [120/2] via FE80::21A:A9FF:FE41:5B06, GigabitEthernet 0/1</pre>            |

### 8.4.3 Setting Route Filtering Rules

#### Configuration Effect

- Routes that do not meet filtering criteria cannot be loaded to the routing table, or advertised to neighbors. In this way, users within the network can be prevented from accessing specified destination networks.

#### Notes

- The RIPng basic functions must be configured.

#### Configuration Steps

##### 📌 Filtering the Received RIP Routing Information

- To refuse receiving some specified routes, you can configure the route distribution control list to process all the received route update packets. If no interface is specified, route update packets received on all interfaces will be processed.

### Filtering the Sent RIP Routing Information

- If this command does not contain any optional parameter, route update advertisement control takes effect on all interfaces. If the command contains the interface parameter, route update advertisement control takes effect only on the specified interface. If the command contains other routing process parameters, route update advertisement control takes effect only on the specified routing process.

### Verification

- Run the **show ipv6 route rip** command to check that the routes that have been filtered out are not loaded to the routing table.

### Related Commands

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>distribute-list prefix-list</b> <i>prefix-list-name</i> { <b>in</b>   <b>out</b> } [ <i>interface-type interface-name</i> ]  |
| <b>Parameter</b>    | <b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of the prefix list, which is used to filter routes.   |
| <b>Description</b>  | <b>in</b>   <b>out</b> : Specifies update routes (received or sent routes) that are filtered.<br><i>interface-type interface-name</i> : Indicates that the distribution list is applied to the specified interface. |
| <b>Command Mode</b> | Routing process configuration mode  |
| <b>Usage Guide</b>  | N/A   |

### Configuration Example

|                            |  |
|----------------------------|--|
| <b>Scenario</b>            |  |
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. (Omitted)</li> <li>● On router A, configure route filtering.</li> </ul> |
| <b>A</b>                   | <pre>A# configure terminal A(config)# ipv6 prefix-list hello permit 4001::/64 A(config)# ipv6 router rip A(config-router)# distribute-list prefix-list hello in</pre>  |
| <b>Verification</b>        | <ul style="list-style-type: none"> <li>● Check that Router A can learn only the route to 4001::/64.</li> </ul>   |

|          |   |
|----------|---|
| <b>A</b> | <pre>A# show ipv6 route rip  IPv6 routing table name - Default - 17 entries  Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  R      4001::/64 [120/2] via FE80::2D0:F8FF:FE22:334A, GigabitEthernet 0/1</pre> |
|----------|---|

## 8.4.4 Modifying Route Selection Parameters

### Configuration Effect

- Change the RIPng routes to enable the traffic pass through specified nodes or avoid passing through specified nodes.
- Change the sequence that a router selects various types of routes so as to change the priorities of RIPng routes.

### Notes

- The RIPng basic functions must be configured.

### Configuration Steps

#### ▾ Modifying the Administrative Distance of a RIPng Route

- Optional.
- Perform this configuration if you wish to change the priorities of RIPng routes on a router that runs multiple unicast routing protocols.

#### ▾ Modifying the Metric Offset on an Interface

- Optional.
- Unless otherwise required, perform this configuration on a router where the metrics of routes need to be adjusted.

#### ▾ Configuring the Default Metric of an External Route Redistributed to RIPng

- Optional.
- Unless otherwise required, perform this configuration on an ASBR to which external routes are introduced.

### Verification

- Run the **show ipv6 rip** command to display the administrative distance of RIPng routes.
- Run the **show ipv6 rip data** command to display the metrics of external routes redistributed to RIPng.

## Related Commands

### Modifying the Administrative Distance of a RIPng Route

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <code>distance distance</code>  |
| <b>Parameter Description</b> | <i>distance</i> : Sets the administrative distance of a RIPng route. The value is an integer ranging from 1 to 254. |
| <b>Command Mode</b>          | Routing process configuration mode  |
| <b>Usage Guide</b>           | Run this command to set the administrative distance of a RIPng route.   |

### Modifying the Metric Offset on an Interface

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <code>ipv6 rip metric-offset value</code>   |
| <b>Parameter Description</b> | <i>value</i> : Indicates the interface metric offset. The value ranges from 1 to 16.  |
| <b>Command Mode</b>          | Routing process configuration mode  |
| <b>Usage Guide</b>           | Before a route is added to the routing table, the metric of the route must be added with the metric offset set on the interface. You can control the use of a route by setting the interface metric offset. |

### Configuring the Default Metric of an External Route Redistributed to RIPng

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <code>default-metric metric</code>  |
| <b>Parameter Description</b> | <i>metric</i> : Indicates the default metric. The valid value ranges from 1 to 16. If the value is equal to or greater than 16, the RGOS determines that this route is unreachable.   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | If the metric is not specified during redistribution of a routing protocol process, RIPng uses the metric defined by the <b>default-metric</b> command. If the metric is specified, the metric defined by the <b>default-metric</b> command is overwritten by the specified metric. If this command is not configured, the value of <b>default-metric</b> is 1. |

## Configuration Example

### Modifying the Administrative Distance of a RIPng Route

|                 |   |
|-----------------|---|
| <b>Scenario</b> | <p>The diagram illustrates a network topology with two routers, A and B, connected via their GE 0/1 interfaces. Router A has a loopback interface with address 2001::1/64. Router B has a loopback interface with address 3001::1/64. The link between A and B is labeled with 2001::1/64 and 2001::2/64.</p> |
|-----------------|---|

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. ## 8.4.5 Modifying Timers

### Configuration Effect

- Change the duration of RIPng timers to accelerate or slow down the change of the protocol state or occurrence of an event.

### Notes

- The RIPng basic functions must be configured.
- Modifying the protocol control parameters may result in protocol running failures. Therefore, you are advised not to modify the timers.

### Configuration Steps

#### ✚ Modifying the Update Timer, Invalid Timer, and Flush Timer

- Mandatory.
- Unless otherwise required, perform this configuration on a router where RIPng timers need to be modified.

### Verification

- Run the **show ipv6 rip** command to display settings of timers.

### Related Commands

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>timers update invalid flush</b>   |
| <b>Parameter Description</b> | <p><i>Update</i>: Indicates the route update time in second. It defines the interval at which the device sends the route update packet. Each time an update packet is received, the invalid timer and flush timer are reset. By default, a route update packet is sent every 30s.</p> <p><i>Invalid</i>: Indicates the route invalid time in second, counted from the last time when a valid update packet is received. It defines the time after which the route in the routing list becomes invalid because the route is not</p> |

|                     |   |
|---------------------|---|
|                     | <p>updated. The duration of the invalid timer must be at least three times the duration of the update timer. If no update packet is received before the invalid timer expires, the corresponding route enters the invalid state. If the update packet is received before the invalid timer expires, the timer is reset. The default duration of the invalid timer is 180s.</p> <p><i>Flush</i>: Indicates the route flushing time in second, counted from the time when the RIPng route enters the invalid state. When the flush timer expires, the route in the invalid state will be deleted from the routing table. The default duration of the flush timer is 120s.</p> |
| <b>Command Mode</b> | Routing process configuration mode  |
| <b>Usage Guide</b>  | By default, the update timer is 30s, the invalid timer is 180s, and the flush timer is 120s.  |

### Configuration Example

```

### Common Errors

- Settings of RIPng timers on devices connected to the same network are inconsistent. Consequently, routes cannot be learned properly.

## 8.5 Monitoring

### Displaying

| Description                                   | Command                       |
|---|-------------------------------|
| Displays information about the RIPng process. | <b>show ipv6 rip</b>          |
| Displays the RIPng routing table.             | <b>show ipv6 rip database</b> |

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description   | Command  |
|---------------|--|
| Debugs RIPng. | <b>debug ipv6 rip</b> [interface <i>interface-type interface-num</i>   nsm   restart |

## 9 Managing Routes

### 9.1 Overview

The network service module (NSM) manages the routing table, consolidates routes sent by various routing protocols, and selects and sends preferred routes to the routing table. Routes discovered by various routing protocols are stored in the routing table. These routes are generally classified by source into three types:

- Direct route: It is the route discovered by a link-layer protocol and is also called interface route.
- Static route: It is manually configured by the network administrator. A static route is easy to configure and less demanding on the system, and therefore applicable to a small-sized network that is stable and has a simple topology. However, when the network topology changes, the static route must be manually reconfigured and cannot automatically adapt to the topological changes.
- Dynamic route: It is the route discovered by a dynamic routing protocol.

### 9.2 Applications

| Application   | Description  |
|---|--|
| <a href="#">Basic Functions of the Static Route</a>   | Manually configure a route.  |
| <a href="#">Floating Static Route</a>                 | Configure a standby route in the multipath scenario.   |
| <a href="#">Load Balancing Static Route</a>           | Configure load balancing static routes in the multipath scenario.  |
| <a href="#">Correlation of Static Routes with BFD</a> | Use the Bidirectional Forwarding Detection (BFD) function to test whether the next hop of a static route is reachable. |
| <a href="#">Fast Reroute of Static Routes</a>         | Use the fast reroute function to improve the switching performance in the multipath scenario.                          |

#### 9.2.1 Basic Functions of the Static Route

##### Scenario

On a network with a simple topology, you can configure only static routes to implement network interworking. Appropriate configuration and use of static routes can improve the network performance and guarantee the bandwidth for important network applications.

As shown in Figure 9-1, to implement interworking between PC 1, PC 2, and PC 3, you can configure static routes on R 1, R 2, and R 3.

- On R 1, configure a route to the network segment of PC 2 through R 2, and a route to the network segment of PC 3 through R 3.
- On R 2, configure a route to the network segment of PC 1 through R 1, and a route to the network segment of PC 3 through R 3.

- On R 3, configure a route to the network segment of PC 1 through R 1, and a route to the network segment of PC 2 through R 2.

Figure 9-1

### Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, and R 3.

## 9.2.2 Floating Static Route

### Scenario

If no dynamic routing protocol is configured, you can configure floating static routes to implement dynamic switching of routes to prevent communication interruption caused by the network connection failures.

As shown in Figure 9-2, to prevent communication interruption caused by a line failure between R 1 and R 3, you can configure a floating static route respectively on R 1 and R 3. Normally, packets are forwarded on a path with a small administrative distance. If a link on this path is down, the route is automatically switched to the path with a large administrative distance.

- On R1, configure two routes to the network segment of PC 3, including a route through R 3 (default distance = 1) and a route through R 2 (default distance = 2).
- On R 3, configure two routes to the network segment of PC 1, including a route through R 1 (default distance = 1) and a route through R 2 (default distance = 2).

Figure 9-2

## Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, and R 3.

## 9.2.3 Load Balancing Static Route

### Scenario

If there are multiple paths to the same destination, you can configure load balancing routes. Unlike floating routes, the administrative distances of load balancing routes are the same. Packets are distributed among these routes based on the balanced forwarding policy.

As shown in Figure 9-3, load balancing routes are configured respectively on R 1 and R 3 so that packets sent to the network segment of PC 3 or PC 1 are balanced between two routes, including a route through R 2 and a route through R 4.

- On R 1, configure two routes to the network segment of PC 3, including a route through R 2 and a route through R 4.
- On R 3, configure two routes to the network segment of PC 1, including a route through R 2 and a route through R 4.

Figure 9-3

|                |  |
|----------------|--|
| <b>Remarks</b> | <p>On the switch, the load is balanced based on the source IP address by default. Run the <b>aggregateport load-balance</b> command to configure the load balancing mode of ECMP route.</p> <p>On a router, run the <b>ip ref load-sharing original</b> command to configure the load balancing policy of IPv4 routes, or the <b>ipv6 ref load-sharing original</b> command to configure the load balancing policy of IPv6 routes.</p> |
|----------------|--|

### Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, R 3, and R 4.
- Configure the load balancing policy on R 1 and R 3.

## 9.2.4 Correlation of Static Routes with Track, BFD or ARP

### Scenario

When the floating static routes or load balancing static routes are configured, the static routes may fail to sense the route failures if the line is faulty but the interface status is normal. To resolve this problem, the device needs to check whether the next hop of a static route is reachable. If the next hop is not reachable, the device can switch the traffic to the standby route. You can use the Track, BFD or ARP function to check whether the next hop of a static route is reachable. The following scenario takes BFD as an example.

**!** You can use only one of the Track and BFD functions at a time.

As shown in Figure 9-4, to prevent communication interruption caused by a line failure between R 1 and R 3, you can configure a floating static route respectively on R 1 and R 3, and correlate static routes with BFD.

- On R 1, configure two routes to the network segment of PC 3, including a route through R 3 (default distance = 1) and a route through R 2 (default distance = 2). BFD is enabled on the first route to check whether the next hop 1.1.13.3 is reachable, and on the second route to check whether the next hop 1.1.12.2 is reachable.
- On R 3, configure two routes to the network segment of PC 1, including a route through R 1 (default distance = 1) and a route through R 2 (default distance = 2). BFD is enabled on the first route to check whether the next hop 1.1.13.1 is reachable, and on the second route to check whether the next hop 1.1.23.2 is reachable.

Figure 9-4

### Deployment

- Configure the address and subnet mask of each interface.
- Configure the BFD parameters on each interface.
- Configure static routes and correlate these static routes with BFD on R 1, R 2, and R 3.

## 9.2.5 Fast Reroute of Static Routes

### Scenario

To accelerate route switching and shorten the communication interruption time when no dynamic routing protocol is configured, you can either correlate static routes with Track or BFD to check whether the next hop is reachable. In addition, you can or configure fast reroute to further improve the convergence performance.

As shown in Figure 9-5, to prevent communication interruption caused by a line failure between R 1 and R 3, you can configure static fast reroute respectively on R 1 and R 3. Normally, packets are forwarded on the path between R 1 and R 3. When the link on this route is down, packets are automatically rerouted to R 2.

- On R 1, configure a route with the exit interface set to Gi0/3 and the next hop set to 1.1.13.3, and a standby route with the exit interface set to Gi0/2 and the next hop set to 1.1.12.2.
- On R 3, configure a route with the exit interface set to Gi0/1 and the next hop set to 1.1.13.1, and a standby route with the exit interface set to Gi0/2 and the next hop set to 1.1.23.2.

Figure 9-5

### Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, and R 3.
- Configure static fast reroute on R 1 and R 3.

## 9.3 Features

| Feature                                 | Description  |
|---|--|
| <a href="#">Route Computation</a>       | Generate a valid route on a device.                              |
| <a href="#">Optimal Route Selection</a> | Select an optimal route to forward packets.                      |
| <a href="#">Default Route</a>           | Forward all packets and help reduce the size of a routing table. |
| <a href="#">Route Reliability</a>       | Quickly detect a route failure and recover communication.        |

### 9.3.1 Route Computation

#### Routing Function

Routing functions are classified into IPv4 and IPv6 routing functions. If the routing functions are disabled, a device is equivalent to a host and cannot forward routes.

#### Dynamic Route

A dynamic routing protocol learns remote routes and dynamically updates routes by exchanging routes with neighbors. If a neighbor is the next hop of a route and this neighbor fails, the route fails as well.

#### Static Route

On a network with a simple topology, you can configure only static routes to implement network interworking. Appropriate configuration and use of static routes can improve the network performance and guarantee the bandwidth for important network applications.

Whether a static route is active is computed based on the status of the local interface. When the exit interface of a static route is located at layer 3 (L3) and is in Up status (the link status is Up and the IP address is configured), this route is active and can be used for packet forwarding.

A static route can go across VPN routing & forwarding (VRF) instances. The next hop or exit interface of a static route of VRF 1 can be configured on VRF 2.

## 9.3.2 Optimal Route Selection

### Administrative Distance

When multiple routing protocols generate routes to the same destination, the priorities of these routes can be determined based on the administrative distance. A smaller administrative distance indicates a higher priority.

### Equal-Cost Route

If multiple routes to the same destination have different next hops but the same administrative distance, these routes are mutually equal-cost routes. Packets are distributed among these routes to implement load balancing based on the balanced forwarding policy.

On a specific device, the total number of equal-cost routes is limited. Routes beyond the limit do not participate in packet forwarding.

### Floating Route

If multiple routes to the same destination have different next hops and different administrative distances, these routes are mutually floating routes. The route with the smallest administrative distance will be first selected for packet forwarding. If this route fails, a route with a larger administrative distance is further selected for forwarding, thus preventing communication interruption caused by a network line failure.

## 9.3.3 Default Route

In the forwarding routing table, the route with the destination network segment 0.0.0.0 and the subnet mask 0.0.0.0 is the default route. Packets that cannot be forwarded by other routes will be forwarded by the default route. The default route can be statically configured or generated by a dynamic routing protocol.

### Default Gateway

On a L2 switch, the **ip default gateway** command is configured to generate a default route.

### Static Default Route

On a L3 switch, a static route with the network segment 0.0.0.0 and the subnet mask 0.0.0.0 is configured to generate the default route.

## Default Network

The default network is configured to generate a default route. If the **ip default-network** command is configured to specify a network (a classful network, such as a Class A, B, or C network), and this network exists in the routing table, the router will use this network as the default network and the next hop of this network is the default gateway. As the network specified by the **ip default-network** command is a classful one, if this command is used to identify a subnet in a classful network, the router automatically generates a static route of the classful network instead of any default route.

### 9.3.4 Route Reliability

When a device on a network is faulty, some routes become unreachable, resulting in traffic interruption. If connectivity of the next hop can be detected in real time, the route can be re-computed when a fault occurs, or traffic can be switched over to the standby route.

#### Correlation with Track

A track object is an abstract concept. It can be used to trace whether an IP address is reachable or whether an interface is up. If a dynamic routing protocol or a static route is correlated with the Track function, the dynamic routing protocol or the static route can quickly learn whether the next hop is reachable so as to respond quickly.

#### Correlation with BFD

The BFD protocol provides a light-load and fast method for detecting the connectivity of the forwarding path between two adjacent routers. If a dynamic routing protocol or a static route is correlated with the BFD function, the dynamic routing protocol or the static route can quickly learn whether the next hop is reachable so as to respond quickly.

 The detection performance of BFD is better than that of Track.

#### Fast Reroute

Fast reroute provides a standby route. When a dynamic routing protocol or a static route detects that the next hop is unreachable, it immediately switches traffic over to the standby route to recovery communication.

## 9.4 Configuration

| Configuration Item                          | Description and Command   |  |
|---|---|--|
| <a href="#">Configuring a Static Route</a>  |  (Mandatory) It is used to configure a static route entry. |  |
|   | <b>ip route</b>   | Configures an IPv4 static route.                   |
|   | <b>ipv6 route</b>   | Configures an IPv6 static route.                   |
| <a href="#">Configuring a Default Route</a> |  (Optional) It is used to configure the default gateway.   |  |
|   | <b>ip default gateway</b>   | Configures an IPv4 default gateway on a L2 device. |

| Configuration Item                                  | Description and Command   |   |
|---|---|---|
|   | <b>ipv6 default gateway</b>   | Configures an IPv6 default gateway on a L2 device.                      |
|   | <b>ip route 0.0.0.0 0.0.0.0 gateway</b>   | Configures an IPv4 default gateway on a L3 device.                      |
|   | <b>ipv6 route ::/0 ipv6-gateway</b>   | Configures an IPv6 default gateway on a L3 device.                      |
|   | <b>ip default network</b>   | Configures an IPv4 default network on a L3 device.                      |
| <a href="#">Configuring Route Limitations</a>       |  (Optional) It is used to limit the number of equal-cost routes and number of static routes, or disable routing. |   |
|   | <b>maximum-paths</b>  | Configures the maximum number of equal-cost routes.                     |
|   | <b>ip static route-limit</b>  | Configures the maximum number of IPv4 static routes.                    |
|   | <b>ipv6 static route-limit</b>  | Configures the maximum number of IPv6 static routes.                    |
|   | <b>no ip routing</b>  | Disables IPv4 routing.  |
|   | <b>noipv6 unicast-routing</b>   | Disables IPv6 routing.  |
|   | <b>no ip route static inter-vrf</b>   | Prohibits static routing across VRFs.                                   |
| <a href="#">Correlating a Static Route with BFD</a> |  (Optional) It is used to correlate a static route with BFD.   |   |
|   | <b>ip route static bfd</b>  | Correlates an IPv4 static route with BFD.                               |
|   | <b>ipv6 route static bfd</b>  | Correlates an IPv6 static route with BFD.                               |
| <a href="#">Configure Static Fast Reroute</a>       |  (Optional) It is used to configure static fast reroute.   |   |
|   | <b>route-map</b>  | Configures a route map.   |
|   | <b>set fast-reroute backup-nexthop</b>  | Configures the standby interface and standby next hop for fast reroute. |
|   | <b>ip fast-reroute</b>  | Configures static fast reroute.   |

## 9.4.1 Configuring a Static Route

### Configuration Effect

- Generate a static route in the routing table. Use the static route to forward packets to a remote network.

### Notes

- Static routes cannot be configured on a L2 switch.

- If the **no ip routing** command is configured on a L3 switch, you cannot configure IPv4 static routes on this switch, and existing IPv4 static routes will also be deleted. Before the device is restarted, reconfiguring the **ip routing** command can recover the deleted IPv4 static routes. After the device is restarted, deleted IPv4 static routes cannot be recovered.
- If the **no ipv6 unicast-routing** command is configured on a L3 switch, you cannot configure IPv6 static routes on this switch, and existing IPv6 static routes will also be deleted. Before the device is restarted, reconfiguring the **ipv6 unicast-routing** command can recover the deleted IPv6 static routes. After the device is restarted, deleted IPv6 static routes cannot be recovered.
- To correlate a static route with the Track function, you must run the **track** command to configure a track object.

## Configuration Steps

### ▾ Configuring a Static IPv4 Route

Configure the following command on an IPv4-enabled router.

| Command                      | <b>ip route</b> [vrf <i>vrf_name</i> ] <i>network</i> / <i>net-mask</i> { <i>ip-address</i>   <i>interface</i> [ <i>ip-address</i> ]} [ <i>distance</i> ] [ <b>tag</b> <i>tag</i> ] [ <b>permanent</b>   <b>track</b> <i>object-number</i> ] [ <b>weight</b> <i>number</i> ] [ <b>description</b> <i>description-text</i> ] [ <b>disabled</b>   <b>enabled</b> ] |  |
|------------------------------|--|--|
| <b>Parameter Description</b> | <i>vrf vrf_name</i>  | (Optional) Indicates the routing VRF, which can be a single-protocol IPv4 VRF or a multi-protocol VRF of a configured IPv4 address family. The VRF is a global VRF by default.   |
|                              | <i>network</i>   | Indicates the address of the destination network.  |
|                              | <i>net-mask</i>  | Indicates the mask of the destination network.   |
|                              | <i>ip-address</i>  | (Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>ip-address</i> is not specified, a static direct route is configured.  |
|                              | <i>interface</i>   | (Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table. |
|                              | <i>distance</i>  | (Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.   |
|                              | <i>tag</i>   | (Optional) Indicates the tag of the static route. The tag is 0 by default.   |
|                              | <b>permanent</b>   | (Optional) Indicates the flag of the permanent route. The static route is not a permanent route by default.  |
|                              | <b>track</b> <i>object-number</i>  | (Optional) Indicates correlation with Track. <i>object-number</i> indicates the ID of the track object. By default, the static route is not correlated with the Track function.  |
|                              | <b>weight</b> <i>number</i>  | (Optional) Indicates the weight of the static route. The weight is 1 by default.   |
|                              | <b>description</b> <i>description-text</i>   | (Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.   |
| <b>disabled/enabled</b>      | (Optional) Indicates the enable flag of the static route. The flag is enabled by default.  |  |
| <b>Defaults</b>              | By default, no static route is configured.   |  |
| <b>Command</b>               | Global configuration mode  |  |

|                    |  |
|--------------------|--|
| <b>Mode</b>        |  |
| <b>Usage Guide</b> | <p>The simplest configuration of this command is <b>ip route</b> <i>networknet-maskip-address</i>.</p> <p>If the static route is correlated with Track and the down status of the trace object is detected, the static route is not active and does not participate in packet forwarding.</p> <p>If the static route is correlated with ARP, but no ARP information is detected, the static route is not active and does not participate in packet forwarding.</p> |

### 📌 Configuring an IPv6 Static Route

Configure the following command on an IPv6-enabled router.

|  |  |  |
|--|--|--|
| <b>Command</b>                             | <b>ipv6 route</b> [ <i>vrf vrf-name</i> ] <i>ipv6-prefix/prefix-length</i> { <i>ipv6-address</i> [ <b>nexthop-vrf</b> { <i>vrf-name1</i>   <b>default</b> }]   <i>interface</i> [ <i>ipv6-address</i> [ <b>nexthop-vrf</b> { <i>vrf-name1</i>   <b>default</b> }] ] } [ <i>distance</i> ] [ <b>weight</b> <i>number</i> ] [ <b>description</b> <i>description-text</i> ] |  |
| <b>Parameter Description</b>               | <i>vrf vrf-name</i>  | (Optional) Indicates the routing VRF, which must be a multi-protocol VRF of a configured IPv6 address family. The VRF is a global VRF by default.  |
|  | <i>ipv6-prefix</i>   | Indicates the IPv6 prefix, which must comply with the address expression specified in RFC4291.   |
|  | <i>prefix-length</i>   | Indicates the length of the IPv6 prefix. Note that a slash (/) must be added in front of the length.   |
|  | <i>ipv6-address</i>  | (Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>ipv6-address</i> is not specified, a static direct route is configured.  |
|  | <i>interface</i>   | (Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table.   |
|  | <b>nexthop-vrf</b> <i>vrf-name1</i>  | (Optional) Indicates the routing VRF of the next hop, which must be a multi-protocol VRF of a configured IPv6 address family. By default, the VRF of the next hop is the same as the VRF specified by the VRF name. <b>nexthop-vrf default</b> indicates that the VRF of the next shop is a global VRF.  |
|  | <i>distance</i>  | (Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.   |
|  | <b>weight</b> <i>number</i>  | (Optional) Indicates the weight of the static route, which must be specified when you configure equal-cost routes. The weight ranges from 1 to 8. When the weights of all equal-cost routes of a route are summed up, the sum cannot exceed the maximum number of equal-cost routes that can be configured for the route. Weighting of equal-cost routes of a route indicates the traffic ratio of these routes. The weight is 1 by default. |
| <b>description</b> <i>description-text</i> | (Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.   |  |
| <b>Defaults</b>                            | By default, no static route is configured.   |  |

|                     |  |
|---------------------|--|
| <b>Command Mode</b> | Global configuration mode  |
| <b>Usage Guide</b>  | The simplest configuration of this command is <b>ipv6 route</b> <i>ipv6-prefix / prefix-length</i> <i>ipv6-address</i> . |

### Verification

- Run the **show ip route** command to display the IPv4 routing table and check whether the configured IPv4 static route takes effect.
- Run the **show ipv6 route** command to display the IPv6 routing table and check whether the configured IPv6 static route takes effect.

### Configuration Example

#### Configuring Static Routes to Implement Interworking of the IPv4 Network

|                                       |   |
|---------------------------------------|---|
| <p><b>Scenario</b><br/>Figure 9-6</p> |   |
| <p><b>Configuration Steps</b></p>     | <ul style="list-style-type: none"> <li>● Configure interface addresses on each device.</li> </ul>   |
| <p><b>R1</b></p>                      | <pre>R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/2 R1(config-if-GigabitEthernet 0/2)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/3 R1(config-if-GigabitEthernet 0/3)# ip address 1.1.13.1 255.255.255.0</pre> |

### Common Errors

- The link on the interface is not up.
- No IP address is configured for the interface.
- The static route is correlated with Track, but the track object is not configured.

## 9.4.2 Configuring a Default Route

### Configuration Effect

- Generate a default route in the routing table. The default route is used to forward packets that cannot be forwarded by other routes.

## Notes

- On a L2 switch, run the **ip default gateway** or **ipv6 default gateway** command to configure the default gateway.
- On a L3 switch, run the **ip route 0.0.0.0 0.0.0.0 gateway** or **ipv6 route ::/0 ipv6-gateway** command to configure the default gateway.
- If the **no ip routing** or **no ipv6 unicast-routing** command is configured on a L3 switch, you can run the **ip default gateway** or **ipv6 default gateway** command to configure the default gateway.

## Configuration Steps

### ↳ Configuring the IPv4 Gateway on a L2 Switch

|                              |  |                                     |
|------------------------------|--|-------------------------------------|
| <b>Command</b>               | <b>ip default-gateway</b> <i>gateway</i>           |                                     |
| <b>Parameter Description</b> | <i>gateway</i>                                     | indicates the IPv4 gateway address. |
| <b>Defaults</b>              | By default, no static default route is configured. |                                     |
| <b>Command Mode</b>          | Global configuration mode                          |                                     |
| <b>Usage Guide</b>           | N/A  |                                     |

### ↳ Configuring the IPv6 Gateway on a L2 Switch

|                              |  |                                     |
|------------------------------|--|-------------------------------------|
| <b>Command</b>               | <b>ipv6 default-gateway</b> <i>gateway</i>         |                                     |
| <b>Parameter Description</b> | <i>gateway</i>                                     | indicates the IPv6 gateway address. |
| <b>Defaults</b>              | By default, no static default route is configured. |                                     |
| <b>Command Mode</b>          | Global configuration mode                          |                                     |
| <b>Usage Guide</b>           | N/A  |                                     |

### ↳ Configuring the IPv4 Default Gateway on a L3 Switch

|                              |  |   |
|------------------------------|--|---|
| <b>Command</b>               | <b>ip route [vrf <i>vrf_name</i>]<b>0.0.0.0 0.0.0.0</b>{<i>ip-address</i>   <i>interface</i> [<i>ip-address</i>]} [<i>distance</i>] [<b>tag</b> <i>tag</i>] [<b>permanent</b> ] [<b>weight</b> <i>number</i>] [<b>description</b><i>description-text</i>] [<b>disabled</b>   <b>enabled</b>]</b> |   |
| <b>Parameter Description</b> | <b>vrf</b> <i>vrf_name</i>   | (Optional) Indicates the routing VRF, which can be a single-protocol IPv4 VRF or a multi-protocol VRF of a configured IPv4 address family. The VRF is a global VRF by default.                            |
|                              | <b>0.0.0.0</b>   | Indicates the address of the destination network.   |
|                              | <b>0.0.0.0</b>   | Indicates the mask of the destination network.  |
|                              | <i>ip-address</i>  | (Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>ip-address</i> is not specified, a static |

|                     |   |  |
|---------------------|---|--|
|                     |   | direct route is configured.  |
|                     | <i>interface</i>  | (Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table. |
|                     | <i>distance</i>   | (Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.   |
|                     | <i>tag</i>  | (Optional) Indicates the tag of the static route. The tag is 0 by default.   |
|                     | <b>permanent</b>  | (Optional) Indicates the flag of the permanent route. The static route is not a permanent route by default.  |
|                     | <b>weight number</b>  | (Optional) Indicates the weight of the static route. The weight is 1 by default.   |
|                     | <b>Description</b><br><i>description-text</i>   | (Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.   |
|                     | <b>disabled /enabled</b>  | (Optional) Indicates the enable flag of the static route. The flag is enabled by default.  |
| <b>Defaults</b>     | By default, no static default route is configured.  |  |
| <b>Command Mode</b> | Global configuration mode   |  |
| <b>Usage Guide</b>  | The simplest configuration of this command is <b>ip route0.0.0.0 0.0.0.0 ip-address</b> . |  |

### ▾ Configuring the IPv6 Default Gateway on a L3 Switch

|                              |   |  |
|------------------------------|---|--|
| <b>Command</b>               | <b>ipv6 route [vrf vrf-name] ::0 { ipv6-address [nexthop-vrf {vrf-name1  default}]   interface [ ipv6-address [nexthop-vrf {vrf-name1  default}]] } [distance] [weight number] [description description-text]</b> |  |
| <b>Parameter Description</b> | <b>Vrf</b> <i>vrf-name</i>  | (Optional) Indicates the routing VRF, which must be a multi-protocol VRF of a configured IPv6 address family. The VRF is a global VRF by default.  |
|                              | <b>::</b>   | Indicates the IPv6 prefix, which must comply with the address expression specified in RFC4291.   |
|                              | <b>0</b>  | Indicates the length of the IPv6 prefix. Note that a slash (/) must be added in front of the length.   |
|                              | <i>ipv6-address</i>   | (Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>ipv6-address</i> is not specified, a static direct route is configured.  |
|                              | <i>interface</i>  | (Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table. |
|                              | <b>nexthop-vrf</b><br><i>vrf-name1</i>  | (Optional) Indicates the routing VRF of the next hop, which must be a multi-protocol VRF of a configured IPv6 address family. By default, the VRF of the next hop is the same as the VRF specified by <i>vrf name</i> . <b>nexthop-vrf default</b> indicates that the VRF of the next shop is a global VRF.                  |
|                              | <i>distance</i>   | (Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.   |

|                     |   |  |
|---------------------|---|--|
|                     | <b>weight</b> <i>number</i>   | (Optional) Indicates the weight of the static route, which must be specified when you configure equal-cost routes. The weight ranges from 1 to 8. When the weights of all equal-cost routes of a route are summed up, the sum cannot exceed the maximum number of equal-cost routes that can be configured for the route. Weighting of equal-cost routes of a route indicates the traffic ratio of these routes. The weight is 1 by default. |
|                     | <b>Description</b><br><i>description-text</i>                                       | (Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.   |
| <b>Defaults</b>     | By default, no static default route is configured.                                  |  |
| <b>Command Mode</b> | Global configuration mode   |  |
| <b>Usage Guide</b>  | The simplest configuration of this command is <b>ipv6 route ::/0 ipv6-gateway</b> . |  |

↘ **Configuring the IPv4 Default Network on a L3 Switch**

|                              |   |   |
|------------------------------|---|---|
| <b>Command</b>               | <b>ip default-network</b> <i>network</i>  |   |
| <b>Parameter Description</b> | <i>network</i>  | Indicates the address of the network. (The network must be a Class A, B, or C network.) |
| <b>Defaults</b>              | By default, no default network is configured.   |   |
| <b>Command Mode</b>          | Global configuration mode   |   |
| <b>Usage Guide</b>           | If the network specified by the <b>ip default-network</b> command exists, a default route is generated and the next hop to this network is the default gateway. If the network specified by the <b>ip default-network</b> command does not exist, the default route is not generated. |   |

**Verification**

- On a L2 switch (or a L3 switch where routing is disabled), run the **show ip redirects** or **show ipv6 redirects** command to display the default gateway.
- On a L3 switch where routing is enabled, run the **show ip route** or **show ipv6 route** command to display the default route.

**Configuration Example**

↘ **Configuring IPv4 Default Routes on L3 Switches to Implement Network Interworking**

|                               |   |
|-------------------------------|---|
| <b>Scenario</b><br>Figure 9-9 |   |
| <b>Configuration</b>          | <ul style="list-style-type: none"> <li>● Configure IP addresses on L3 devices.</li> </ul> |

| Steps               |  |
|---------------------|--|
| <b>R1</b>           | <pre>R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/1)# exit</pre>  |
| <b>R2</b>           | <pre>R2#configure terminal R2(config)#interface gigabitEthernet 0/0 R2(config-if-GigabitEthernet 0/0)# ip address 1.1.2.1 255.255.255.0 R2(config-if-GigabitEthernet 0/0)# exit R2(config)#interface gigabitEthernet 0/1 R2(config-if-GigabitEthernet 0/1)# ip address 1.1.12.2 255.255.255.0 R2(config-if-GigabitEthernet 0/1)# exit</pre>  |
| <b>R1</b>           | <ul style="list-style-type: none"> <li>● <b>Configure an IPv6 default gateway on R 1.</b></li> </ul> <pre>R1#configure terminal R1(config)#ip route 0.0.0.0 0.0.0.0 GigabitEthernet 0/1 1.1.12.2</pre>   |
| <b>R2</b>           | <pre>R2#configure terminal R2(config)#ip route 0.0.0.0 0.0.0.0 GigabitEthernet 0/1 1.1.12.1</pre>  |
|                     |  |
| <b>Verification</b> | <ul style="list-style-type: none"> <li>● <b>Display the routing table.</b></li> </ul>  |
| <b>R1</b>           | <pre>R1# show ip route  Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area, * - candidate default  Gateway of last resort is 1.1.12.2</pre> |

|    |  |
|----|--|
| S* | 0.0.0.0/0 [1/0] via 1.1.12.2, GigabitEthernet 0/1      |
| C  | 1.1.1.0/24 is directly connected, GigabitEthernet 0/0  |
| C  | 1.1.1.1/32 is local host.                              |
| C  | 1.1.12.0/24 is directly connected, GigabitEthernet 0/1 |
| C  | 1.1.12.1/32 is local host.                             |

### 9.4.3 Configuring Route Limitations

#### Configuration Effect

- Limit the number of equal-cost routes and number of static routes, or disable routing.

#### Notes

Route limitations cannot be configured on a L2 switch.

#### Configuration Steps

##### ▾ Configuring the Maximum Number of Equal-Cost Routes

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>maximum-paths</b> <i>number</i>   |
| <b>Parameter Description</b> | <i>number</i>   Indicates the maximum number of equal-cost routes. The value ranges from 1 to 64.  |
| <b>Defaults</b>              | The default value varies with the device model.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | Run this command to configure the maximum number of next hops in the equal-cost route. In load balancing mode, the number of routes on which traffic is balanced does not exceed the configured number of equal-cost routes. |

##### ▾ Configuring the Maximum Number of IPv4 Static Routes

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip static route-limit</b> <i>number</i>   |
| <b>Parameter Description</b> | <i>number</i>   Indicates the upper limit of routes. The value ranges from 1 to 10,000.  |
| <b>Defaults</b>              | By default, a maximum of 1,024 IP static routes can be configured.   |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | Run this command to configure the maximum number of IPv4 static routes. If the maximum number of IPv4 static routes is reached, no more IPv4 static route can be configured. |

##### ▾ Configuring the Maximum Number of IPv6 Static Routes

|                |  |
|----------------|--|
| <b>Command</b> | <b>ipv6 static route-limit</b> <i>number</i> |
|----------------|--|

|                    |               |  |
|--------------------|---------------|--|
| <b>Parameter</b>   | <i>number</i> | Indicates the upper limit of routes. The value ranges from 1 to 10,000.  |
| <b>Description</b> |               |  |
| <b>Defaults</b>    |               | By default, a maximum of 1,000 IPv6 static routes can be configured.   |
| <b>Command</b>     |               | Global configuration mode  |
| <b>Mode</b>        |               |  |
| <b>Usage Guide</b> |               | Run this command to configure the maximum number of IPv6 static routes. If the maximum number of IPv6 static routes is reached, no more IPv6 static route can be configured. |

### ↘ Disabling IPv4 Routing

|                    |   |
|--------------------|---|
| <b>Command</b>     | <b>no ip routing</b>  |
| <b>Parameter</b>   | N/A   |
| <b>Description</b> |   |
| <b>Defaults</b>    | By default, IPv4 routing is enabled.  |
| <b>Command</b>     | Global configuration mode   |
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | Run this command to disable IPv4 routing. If the device functions only as a bridge or a voice over IP (VoIP) gateway, the device does not need to use the IPv4 routing function of the RGOS software. In this case, you can disable the IPv4 routing function of the RGOS software. |

### ↘ Disabling IPv6 Routing

|                    |   |
|--------------------|---|
| <b>Command</b>     | <b>no ipv6 unicast-routing</b>  |
| <b>Parameter</b>   | N/A   |
| <b>Description</b> |   |
| <b>Defaults</b>    | By default, IPv6 routing is enabled.  |
| <b>Command</b>     | Global configuration mode   |
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | Run this command to disable IPv6 routing. If the device functions only as a bridge or a VoIP gateway, the device does not need to use the IPv6 routing function of the RGOS software. In this case, you can disable the IPv6 routing function of the RGOS software. |

### ↘ Prohibiting Static Routing Across VRFs

|                    |   |
|--------------------|---|
| <b>Command</b>     | <b>no ip route static inter-vrf</b>   |
| <b>Parameter</b>   | N/A   |
| <b>Description</b> |   |
| <b>Defaults</b>    | By default, static IP or IPv6 routing across VRFs is allowed.   |
| <b>Command</b>     | Global configuration mode   |
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | Run this command to prohibit static IP routing across VRFs. After this command is configured, the static IP route across VRFs is not active and cannot be participate in packet forwarding. |

## Verification

Run the **show run** command to display the configuration file and verify that the preceding configuration commands exist.

### Configuration Example

#### Configuring at Most Two Static Routing Limitations

|  |  |
|--|--|
| <p><b>Scenario</b><br/>Figure 9-10</p> |  |
| <p><b>Configuration Steps</b></p>      | <p>On R 1, configure the IP addresses, static routes, and maximum number of static routes.</p>   |
|  | <pre> R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/2 R1(config-if-GigabitEthernet 0/2)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/3 R1(config-if-GigabitEthernet 0/3)# ip address 1.1.13.1 255.255.255.0 R1(config-if-GigabitEthernet 0/3)# exit R1(config)#ip route 1.1.3.0 255.255.255.0 1.1.13.3 R1(config)#ip route 1.1.4.0 255.255.255.0 1.1.12.2 R1(config)#ip route 1.1.5.0 255.255.255.0 1.1.12.2 R1(config)#ip static route-limit 2 % Exceeding maximum static routes limit.                     </pre> |

|                     |   |
|---------------------|---|
| <b>Verification</b> | <ul style="list-style-type: none"> <li>● Check the static routes that really take effect in the routing table.</li> </ul> <pre> R1(config)# show ip route  Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area, * - candidate default  Gateway of last resort is no set  C    1.1.1.0/24 is directly connected, GigabitEthernet 0/0 C    1.1.1.1/32 is local host. S    1.1.3.0/24 [1/0] via 1.1.13.3 S    1.1.4.0/24 [1/0] via 1.1.12.2 C    1.1.12.0/24 is directly connected, GigabitEthernet 0/2 C    1.1.12.1/32 is local host. C    1.1.13.0/24 is directly connected, GigabitEthernet 0/3 C    1.1.13.1/32 is local host.                 </pre> |
|---------------------|---|

### 9.4.4 Correlating a Static Route with BFD

#### Configuration Effect

- A static route can quickly detect a route failure with the help of BFD.

#### Notes

- BFD correlation cannot be configured on a L2 switch.
- You must configure a static route.
- You must configure the BFD session parameters by running the **bfd interval xmin\_rx xmultiplier x** command.

#### Configuration Steps

##### ↘ Correlating an IPv4 Static Route with BFD

|                  |   |  |
|------------------|---|--|
| <b>Command</b>   | <b>ip route static bfd</b> [ vrf vrf-name ]interface-type interface-number gateway[ sourceip-address] |  |
| <b>Parameter</b> | <b>vrf vrf-name</b>   | (Optional) Indicates the name of the VRF to which the static route belongs. The VRF is |

|                     |  |   |
|---------------------|--|---|
| <b>Description</b>  |  | a global VRF by default.  |
|                     | <i>interface-type</i>  | Indicates the interface type.   |
|                     | <i>interface-number</i>  | Indicates the interface number.   |
|                     | <i>gateway</i>   | Indicates the IP address of the gateway, that is, the neighbor IP address of BFD. If the next hop of the static route is this neighbor, BFD is used to check the connectivity of the forwarding path.         |
|                     | <b>source</b> <i>ip-address</i>  | (Optional) Indicates the source IP address used for the BFD session. This parameter must be configured if the neighbor IP address involves multiple hops. By default, the source IP address is not specified. |
| <b>Defaults</b>     | By default, a static route is not correlated with BFD.   |   |
| <b>Command Mode</b> | Global configuration mode  |   |
| <b>Usage Guide</b>  | Run this command to correlate an IPv4 static route with BFD. If the down status of the BFD session is detected, the IPv4 static route is not active and does not participate in packet forwarding. |   |

### ↘ Correlating an IPv6 Static Route with BFD

|                              |  |  |
|------------------------------|--|--|
| <b>Command</b>               | <b>ipv6 route static bfd</b> [ <b>vrf</b> <i>vrf-name</i> ] <i>interface-type interface-number gateway</i> [ <b>source</b> <i>ipv6-address</i> ]   |  |
| <b>Parameter Description</b> | <b>vrf</b> <i>vrf-name</i>   | (Optional) Indicates the name of the VRF to which the static route belongs. The VRF is a global VRF by default.  |
|                              | <i>interface-type</i>  | Indicates the interface type.  |
|                              | <i>interface-number</i>  | Indicates the interface number.  |
|                              | <i>gateway</i>   | Indicates the IP address of the gateway, that is, the neighbor IP address of BFD. If the next hop of the static route is this neighbor, BFD is used to check the connectivity of the forwarding path.  |
|                              | <b>source</b> <i>ip-address</i>  | (Optional) Indicates the source IP address used for the BFD session. This parameter must be configured if the neighbor IP address involves multiple hops. By default, the neighbor IP address of the BFD session is a single hop, and the source IP address is not used. |
| <b>Defaults</b>              | By default, a static route is not correlated with BFD.   |  |
| <b>Command Mode</b>          | Global configuration mode  |  |
| <b>Usage Guide</b>           | Run this command to correlate an IPv6 static route with BFD. If the down status of the BFD session is detected, the IPv6 static route is not active and does not participate in packet forwarding. |  |

### Verification

- Run the **show bfd neighbors** command to display information about BFD neighbors.
- Run the **show ip route static bfd** or **show ipv6 route static bfd** command to display information about correlation of static routes with BFD.

### Configuration Example

↘ **Correlating an IPv4 Static Route with BFD**

|  |   |
|--|---|
| <p><b>Scenario</b><br/>Figure 9-11</p> |   |
| <p><b>Configuration Steps</b></p>      | <ul style="list-style-type: none"> <li>● Configure a BFD session on the interconnect interface between R 1 and R 2.</li> <li>● Configure static routes on R 1 and R 2, and specify the exit interface or next hop as the interworking interface.</li> <li>● Correlate static routes with BFD on R 1 and R 2, and check the connectivity of the next hops of static routes.</li> </ul>   |
| <p><b>R1</b></p>                       | <pre>R1#configure terminal R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)# no switchport R1(config-if-GigabitEthernet 0/1)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/1)#bfd interval 50 min_rx 50 multiplier 3 R1(config-if-GigabitEthernet 0/1)# exit R1(config)# ip route 1.1.2.0 255.0.0.0 FastEthernet 0/1 1.1.12.2 R1(config)#ip route static bfd gigabitEthernet 0/1 1.1.12.2</pre> |
| <p><b>R2</b></p>                       | <pre>R2#configure terminal R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)# no switchport R1(config-if-GigabitEthernet 0/1)# ip address 1.1.12.2 255.255.255.0 R1(config-if-GigabitEthernet 0/1)#bfd interval 50 min_rx 50 multiplier 3 R1(config-if-GigabitEthernet 0/1)# exit R1(config)# ip route 1.1.1.0 255.0.0.0 FastEthernet 0/1 1.1.12.1 R1(config)#ip route static bfd gigabitEthernet 0/1 1.1.12.1</pre> |
| <p><b>Verification</b></p>             | <ul style="list-style-type: none"> <li>● Display the status of BFD neighbors.</li> <li>● Display the static routes correlated with BFD.</li> </ul>  |
| <p><b>R1</b></p>                       | <pre>R1#show bfd neighbors  OurAddr      NeighAddr    LD/RD    RH/RS    Holdown(mult)  State  Int</pre>   |

```

1.1.12.1    1.1.12.2    8192/0    Up    0(3    )    Up GigabitEthernet 0/1

R1#show ip route static bfd
S    1.1.2.0/24 via 1.1.12.2, GigabitEthernet 0/1, BFD state is Up
    
```

### Common Errors

- The link on the interface is not up.
- No IP address is configured for the interface.
- No BFD session parameters are configured.
- No static route is configured.

## 9.4.5 Configure Static Fast Reroute

### Configuration Effect

- Configure and enable static fast reroute.

### Notes

- Static fast reroute cannot be configured on a L2 switch.
- You must configure a static route.
- You must configure a route map.

### Configuration Steps

#### Defining a Standby Route in the Route Map

|                     |  |                                       |
|---------------------|--|---------------------------------------|
| <b>Command</b>      | <b>set fast-reroute backup-nexthop</b> <i>interface ip-address</i>   |                                       |
| <b>Parameter</b>    | <i>interface</i>   | Indicates the standby exit interface. |
| <b>Description</b>  | <i>ip-address</i>  | Indicates the standby next hop.       |
| <b>Defaults</b>     | N/A  |                                       |
| <b>Command Mode</b> | Global configuration mode  |                                       |
| <b>Usage Guide</b>  | <p>Run the <b>route-map</b> <i>name</i> [ <b>permit</b>   <b>deny</b> ] <i>sequence</i> command to create a road map.</p> <p>Run the <b>match</b> command to define matching conditions.</p> <p>Run the <b>set fast-reroute backup-nexthop</b> <i>interface ip-address</i> command to define the standby exit interface and standby next hop.</p> <p>If a route meets matching conditions, a standby route is generated for this route. If the <b>match</b> command is not configured, standby routes are generated for any static route with the exit interface and next hop.</p> |                                       |

#### Enabling Fast Reroute and Referencing the Route Map

|                              |  |   |
|------------------------------|--|---|
| <b>Command</b>               | <b>ip fast-reroute [ vrf <i>vrf-name</i>] static route-map <i>route-map-name</i></b> |   |
| <b>Parameter Description</b> | <i>vrf-name</i>  | (Optional) Specifies a VRF. If the VRF is not specified, the command is executed on all VRFs. |
|                              | <i>route-map-name</i>  | Indicates the name of the road map for the standby route.                                     |
| <b>Defaults</b>              | By default, static fast reroute is not configured.                                   |   |
| <b>Command Mode</b>          | Global configuration mode  |   |
| <b>Usage Guide</b>           | Run this command to enable fast reroute and reference the route map.                 |   |

### Verification

Run the **show ip route fast-reroute** command to display the active and standby routes that take effect.

### Configuration Example

#### Configuring Fast Re-Routing

|  |   |
|--|---|
| <p><b>Scenario</b><br/>Figure 9-12</p> |   |
| <p><b>Configuration Steps</b></p>      | <p>On R 1, configure a static route to the network segment of PC 3, and the next hop of the exit interface is R 3.<br/>On R 1, configure static fast reroute. The next hop of the exit interface of the standby route is R 2.</p>   |
|  | <pre> R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/2 R1(config-if-GigabitEthernet 0/2)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit                     </pre> |

|                     |  |
|---------------------|--|
|                     | <pre> R1(config)#interface gigabitEthernet 0/3  R1(config-if-GigabitEthernet 0/3)# ip address 1.1.13.1 255.255.255.0  R1(config-if-GigabitEthernet 0/3)# exit  R1(config)# ip route 1.1.3.0 255.255.255.0 GigabitEthernet 0/3 1.1.13.3  R1(config)#route-map fast-reroute  R1(config-route-map)# set fast-reroute backup-interface GigabitEthernet 0/2 backup-nexthop 1.1.12.2  R1(config-route-map)# exit  R1(config)#ip fast-reroute static route-map fast-reroute </pre>  |
|                     |  |
| <b>Verification</b> | <p>Display the active and standby routes on R 1.</p> <pre> R1#show ip route fast-reroute  Codes: C - connected, S - static, R - RIP, B - BGP          O - OSPF, IA - OSPF inter area          N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2          E1 - OSPF external type 1, E2 - OSPF external type 2          i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2          ia - IS-IS inter area, * - candidate default          Status codes: m - main entry, b - backup entry, a - active entry  Gateway of last resort is no set  S    1.1.3.0 /24 [ma] via 1.1.13.3, GigabitEthernet 0/3                          [b] via 1.1.12.2, GigabitEthernet 0/2 </pre> |

### Common Errors

- The link on the interface is not up.
- No static route is configured.
- The matching conditions are not configured or are not properly configured in the road map.

## 9.5 Monitoring

### Displaying

| Description                      | Command               |
|----------------------------------|-----------------------|

| Debugs sending of route management and routing protocol messages.   | <b>debug nsm packet send</b>            |
| Debugs receiving of route management and routing protocol messages. | <b>debug nsm packet recv</b>            |

## 10 Configuring Keys

### 10.1 Overview

Keys are a kind of parameters that are used in algorithms for conversion from plain text to cipher text or from cipher text to plain text.

Plain text and cipher text authentication are supported for packet authentication in a routing protocol, during which keys need to be used.

**i** At present, keys are used only for RIP and ISIS packet authentication.

### 10.2 Applications

| Application                        | Description                              |
|------------------------------------|--|
| <a href="#">RIP Authentication</a> | RIP uses keys for packet authentication. |

#### 10.2.1 RIP Authentication

##### Scenario

Network devices run RIP and use the MD5 authentication mode to increase the protocol security.

Figure 10-1

##### Deployment

- Configure a key chain on A. Configure RIP to enable packet authentication and use the key chain.
- Configure a key chain on B. Configure RIP to enable packet authentication and use the key chain.

### 10.3 Features

##### Overview

| Feature                   | Description  |
|---------------------------|--|
| <a href="#">Key Chain</a> | Provide a tool for authentication in a routing protocol. |

### 10.3.1 Key Chain

#### Working Principle

A key chain may contain multiple different keys. Each key contains the following attributes:

- Key ID: Identifies a key. In the current key chain, keys and IDs are mapped in the one-to-one manner.
- Authentication string: Indicates a set of key characters used for verifying the consistency of authentication strings in a routing protocol.
- Lifetime: Specifies the lifetime of the current key for sending or receiving packets. Different authentication keys can be used in different periods.

#### Related Configuration

##### ↘ [Creating a Key Chain and a Key](#)

In the global configuration mode, run the **key chain** *key-chain-name* command to define a key chain and enter the key chain configuration mode.

In the key chain configuration mode, run the **key** *key-id* command to define a key and enter the key chain key configuration mode.

##### ↘ [Configuring an Authentication String](#)

In the key chain key configuration mode, run the **key-string** **[0|7]** *text* command to specify an authentication string.

- A plain text authentication string is configured by default. The value **0** indicates that a plain text authentication key is configured.
- The value **7** indicates that a cipher text authentication string is configured.
- The encryption authentication service is disabled by default. You can run the **service password-encryption** command to enable the encryption service to forcibly convert plain text authentication into cipher text.

##### ↘ [Configuring Lifetime](#)

In the key chain key configuration mode, you can configure the lifetime of a key chain in the receiving and sending directions.

- **accept-lifetime** *start-time* { **infinite** | *end-time* | **duration** *seconds* }: Configures the lifetime of a key chain in the receiving direction.
- **send-lifetime** *start-time* { **infinite** | *end-time* | **duration** *seconds* }: Configures the lifetime of a key chain in the sending direction.

## 10.4 Configuration

| Configuration | Description and Command |
|---------------|-------------------------|
|---------------|-------------------------|

|   |   |   |
|---|---|---|
| <a href="#">Configuring a Key Chain</a> |  (Mandatory) It is used to create a key. |   |
|   | <b>key chain</b>  | Creates a key chain.                                |
|   | <b>key</b>  | Configures a key ID.                                |
|   | <b>key-string</b>   | Configures a key string.                            |
|   | <b>accept-lifetime</b>  | Configures the lifetime in the receiving direction. |
|   | <b>send-lifetime</b>  | Configures the lifetime in the sending direction.   |

## 10.4.1 Configuring a Key Chain

### Configuration Effect

- Define a key chain to be used by a routing protocol.

### Notes

- A key chain can take effect only after it is associated with a routing protocol.

### Configuration Steps

#### ▾ **Creating a Key Chain**

- This configuration is mandatory if a key chain needs to be used.
- If there is no special requirement, you should perform this configuration on all routers for which routing protocol authentication needs to be performed.

#### ▾ **Configuring a Key ID**

- This configuration is mandatory if a key chain needs to be used.
- If there is no special requirement, you should perform this configuration on all routers for which routing protocol authentication needs to be performed.

#### ▾ **Configuring a Key String**

- This configuration is mandatory if a key chain needs to be used.
- If there is no special requirement, you should perform this configuration on all routers for which routing protocol authentication needs to be performed.

#### ▾ **Configure the Lifetime in the Receiving Direction**

- Optional.
- If the lifetime in the sending direction is not configured, the key chain will be always effective.

#### ▾ **Configure the Lifetime in the Sending Direction**

- Optional.

- If the lifetime in the sending direction is not configured, the key chain will be always effective.

## Verification

- Use keys in a routing protocol and observe the neighborhood established by the routing protocol. If the keys are inconsistent, the neighborhood fails to be established.

|---------------------|--|
|                     | <pre>B(config-router)#version 2 B(config-router)#network 192.168.27.0 B(config-router)#redistribute static</pre>   |
| <b>Verification</b> | Run the <b>show ip route rip</b> command to check whether router A can receive an RIP route from router B.         |
| <b>A</b>            | <pre>A(config)#show ip route rip R    172.168.0.0/16 [120/1] via 192.168.27.2, 00:05:16, GigabitEthernet 0/1</pre> |

### Common Errors

- A key is not correctly associated with a routing protocol, which causes that authentication does not take effect.
- The keys configured on multiple routers are not consistent, which causes authentication failure.

## 10.5 Monitoring

# 11 Configuring Routing Policies

## 11.1 Overview

Routing policies are a policy set for changing the packet forwarding path or routing information and are often implemented by a filtering list and a route map. Routing policies are flexibly and widely applied in the following methods:

- Use a filtering list in a routing protocol to filter or modify routing information.
- Use a route map in a routing protocol to filter or modify routing information. Where, the route map can further use a filtering list.
- Use a route map in policy-based routing (PBR) to control packet forwarding or modify packet fields.

## 11.2 Applications

| Application                           | Description  |
|---------------------------------------|--|
| <a href="#">Route Filtering</a>       | Use a filtering list in a routing protocol to filter the routing information sent or received by the protocol.   |
| <a href="#">Route Re-distribution</a> | Use a route map in a routing protocol to filter or modify routing information and re-distribute RIP routes to OSPF. Only RIP routes with 4 hops can be re-distributed. |
| <a href="#">PBR</a>                   | Use a route map in PBR to control packet forwarding or modify packet fields and specify optimum output interfaces for packets from different subnets.                  |

### 11.2.1 Route Filtering

By default, a routing protocol advertises and learns all routing information. When a filtering list is used, the routing protocol advertises only required routes or receives only required routing information.

#### Scenario

Figure 11-1

As shown in Figure 11-1, router A has routes to 3 networks: 10.0.0.0, 20.0.0.0 and 30.0.0.0.

Configure a filtering list on the routers to achieve the following purposes:

- Filter the sent routing information on router A to filter routes that router A does not need to send.

- Filter the received routing information on router B to filter routes that router B does not need to learn.

## Deployment

- Filter the sent routing information 30.0.0.0 on router A.
- Filter the received routing information 20.0.0.0 on router B to ensure that router B learns only routing information 10.0.0.0.

## 11.2.2 Route Re-distribution

By default, route re-distribution will re-distribute all routing information in a routing protocol to another routing protocol. All routing attributes will also be inherited. You can use a route map to perform conditional control for re-distribution between two routing protocols, including:

- Specify the range for re-distributing routes and re-distribute only routing information that meets certain rules.
- Set the attributes of routes generated by re-distribution.

## Scenario

Figure 11-2

As shown in Figure 11-2, configure route re-distribution on the devices to achieve the following purposes:

- Re-distribute only RIP routes with 4 hops to OSPF.
- In the OSPF routing domain, the initial metric of this route is 40, the route type is the external route type-1 and the route tag value is set to 40.

## Deployment

- Configure a route with 4 hops in the route map `rip_to_ospf`: match, and set the initial metric of this route to 40, the route type to the external route type-1 and the route tag value to 40.
- Configure route re-distribution to re-distribute RIP routes to OSPF and use the route map `rip_to_ospf`.

## 11.2.3 PBR

PBR is implemented by applying a route map including policies to interfaces and devices.

Similar to static routing, PBR is also manually configured, where recursive routing supports automatic update with network changes. As compared with static and dynamic routing, PBR is more flexible. Static and dynamic routing can forward packets only based on destination addresses. PBR can forward packets based on the source and destination addresses, packet length and input interface.

## Scenario

Figure 11-3

Configure PBR on the layer-3 device DEV1 to achieve the following purposes:

- Packets from subnet 1 (200.24.16.0/24) are sent from GE0/1 first.
- Packets from subnet 2 (200.24.17.0/24) are sent from GE0/2 first.

### Deployment

- Configure two different ACLs to match packets from subnets 1 and 2 respectively.
- Configure the route map RM\_FOR\_PBR: policy 10 is used to ensure that "packets from subnet 1 are sent from GE0/1 first"; policy 20 is used to ensure that "packets from subnet 2 are sent from GE0/2 first".
- Perform PBR for packets received from GE0/3 and use the route map RM\_FOR\_PBR.

## 11.3 Features

### Overview

| Feature                        | Description  |
|--------------------------------|--|
| <a href="#">Filtering List</a> | Define a group of lists based on a route attribute, which can be used by a routing protocol for route filtering. |
| <a href="#">Route Map</a>      | A policy defines "if certain conditions are matched, you can perform certain processing actions".                |

#### 11.3.1 Filtering List

Filtering lists are a group of lists defined based on a routing attribute and are a tool for filtering routing policies. Independent filtering lists are meaningless and can be used to filter routes only when they are applied in a routing protocol.

### Working Principle

Based on different routing attributes, filtering lists are classified into the following types:

### ↘ Access Control List (ACL)

ACLs comprise IPv4 and IPv6 ACLs. When defining ACLs, you can specify IPv4/IPv6 addresses and masks to match the destination network segment or next-hop addresses of routing information.

For description about ACLs, see the *ACL Configuration Guide*.

### ↘ Address Prefix List (prefix-list)

Similar to ACLs, prefix-lists, including IPv4 prefix-lists and IPv6 prefix-lists, are used to match destination network segments of routing information during route filtering.

### ↘ AS-Path List

AS-path lists are used only for BGP. They are used to match AS paths during BGP route filtering.

### ↘ Community Attribute Filtering List (Community-List)

Community-lists are used only for BGP. They are used to match community attributes during BGP route filtering.

### ↘ Extended Community Attribute Filtering List (Extcommunity-List)

Extcommunity-lists are used only for BGP. They are used to match extended community attributes during BGP route filtering.

## Related Configuration

### ↘ Creating an ACL

By default, no ACL is configured and no policy is set.

In the global configuration mode, run the **ip access-list { extended | standard } { id | name }** command to create an IPv4 ACL.

You can set multiple policies in an ACL, sorted by their sequence numbers. Policies have two working modes: permit and deny.

### ↘ Creating a Prefix-List

By default, no prefix-list is configured and no entry is set.

In the global configuration mode, run the **ip prefix-list prefix-list-name [ seq seq-number ] { deny | permit } ip-prefix [ ge minimum-prefix-length ] [ le maximum-prefix-length ]** command to create an IPv4 prefix-list and add a prefix entry to the list.

You can set multiple entries in the prefix-list, sorted by their sequence numbers. Entries have two working modes: permit and deny.

Run the **ip prefix-list prefix-list-name description description-text** command to add description to the prefix-list.

Run the **ip prefix-list sequence-number** command to enable the sorting function for the prefix-list.

### ↘ Creating an AS-Path List

By default, no AS-path list is configured and no entry is set.

In the global configuration mode, run the **ip as-path access-list** *path-list-num* { **permit** | **deny** } *regular-expression* command to create an AS-path list and add an entry to the list.

You can set multiple entries in the AS-path list. Entries have two working modes: permit and deny.

### 📌 Creating a Community-List

By default, no community-list is configured and no entry is set.

In the global configuration mode, run the **ip community-list** { { **standard** | **expanded** } *community-list-name* | *community-list-number* } { **permit** | **deny** } [ *community-number..* ] command to create a community-list and add an entry to the list.

You can set multiple entries in the community-list. Entries have two working modes: permit and deny.

### 📌 Creating an Extcommunity-List

By default, no extcommunity-list is configured and no entry is set.

In the global configuration mode, run the **ip extcommunity-list** { *standard-list* | **standard** *list-name* } { **permit** | **deny** } [ *rt value* ] [ *soo value* ] command to create a standard extcommunity list and add an entry to the list.

Run the **ip extcommunity-list** { *expanded-list* | **expanded** *list-name* } { **permit** | **deny** } [ *regular-expression* ] command to create an extcommunity list and add an entry to the list.

You can also run the **ip extcommunity-list** { *expanded-list* | **expanded** *list-name* | *standard-list* | **standard** *list-name* } command to create an extcommunity list and enter the configuration mode of **ip extcommunity-list** to add entries.

You can set multiple entries in the extcommunity-list. Entries have two working modes: permit and deny.

## 11.3.2 Route Map

A policy is a "match ..., set..." statement, which indicates that "if certain conditions are matched, you can perform some processing actions".

### Working Principle

#### 📌 Executing policies

A route map may contain multiple policies. Each policy has a corresponding sequence number. A smaller sequence number means a higher priority. Policies are executed based on their sequence numbers. Once the matching condition of a policy is met, the processing action for this policy needs to be performed and the route map exits. If no matching condition of any policy is met, no processing action will be performed.

#### 📌 Working Modes Of Policies

Policies have two working modes:

- **permit**: When the matching condition of a policy is met, the processing action for this policy will be performed and the route map will exit.
- **deny**: When the matching condition of a policy is met, the processing action for this policy will not be performed and the route map will exit.

## ↘ Matching Conditions Of Policies

The matching condition of a policy may contain 0, 1 or more match rules.

- If the matching condition contains 0 match rule, no packet will be matched.
- If the matching condition contains one or more match rules, all rules must be matched.

## ↘ Processing Action for a Policy

The processing action of a policy may contain 0, 1 or more set rules.

- If the processing action contains 0 set rule, no processing action will be performed and the route map will directly exit.
- If the processing action contains one or more set rules, all processing actions will be performed and then the route map will exit.

 If set rules have different priorities, the set rule with the highest priority will take effect.

## Related Configuration

### ↘ Creating a Route Map (Policy)

By default, no route map is configured and no policy is set.

In the global configuration mode, you can run the **route-map** *route-map-name* [ **permit** | **deny** ] [ *sequence-number* ] command to create a route map and add a policy to the route map.

You can set multiple policies in a route map. Each policy uses different sequence numbers.

### ↘ Setting Matching Conditions of a Policy

By default, no match rule is set (that is, the matching condition of a policy contains 0 match rule).

In the route map mode, run the **match** command to set match rules. One **match** command is mapped to one match rule.

RGOS provides abundant **match** commands for setting flexible matching conditions.

| Command                        | Description   |
|--------------------------------|---|
| <b>match as-path</b>           | Uses the AS_PATH attribute of a BGP route as the matching condition.            |
| <b>match community</b>         | Uses the community attribute of a BGP route as the matching condition.          |
| <b>match extcommunity</b>      | Uses the extended community attribute of a BGP route as the matching condition. |
| <b>match interface</b>         | Uses the output interface of a route as the matching condition.                 |
| <b>match ip address</b>        | Uses the destination IPv4 address of a route as the matching condition.         |
| <b>match ip next-hop</b>       | Uses the next-hop IPv4 address of a route as the matching condition.            |
| <b>match ip route-source</b>   | Uses the source IPv4 address of a route as the matching condition.              |
| <b>match ipv6 address</b>      | Uses the destination IPv6 address of a route as the matching condition.         |
| <b>match ipv6 next-hop</b>     | Uses the next-hop IPv6 address of a route as the matching condition.            |
| <b>match ipv6 route-source</b> | Uses the source IPv6 address of a route as the matching condition.              |
| <b>match metric</b>            | Uses the metric of a route as the matching condition.                           |
| <b>match mpls-label</b>        | Uses whether a route has label information as the matching condition.           |

| Command                 | Description  |
|-------------------------|--|
| <b>match origin</b>     | Uses the source of a route as the matching condition.    |
| <b>match route-type</b> | Uses the type of a route as the matching condition.      |
| <b>match tag</b>        | Uses the tag value of a route as the matching condition. |

### ▾ Setting the Processing Actions of a Policy

By default, no set rule is configured (that is, the processing action of a policy contains 0 set rule).

In the route map mode, run the **set** command to configure set rules. One **set** command is mapped to one set rule.

RGOS provides abundant **set** commands for setting flexible processing actions.

| Command                                      | Description  |
|--|--|
| <b>set aggregator as</b>                     | Modifies the AS attribute value of a route aggregator.   |
| <b>set as-path prepend</b>                   | Adds a specified as-path attribute value.  |
| <b>set as-path replace</b>                   | Replace the specified as-path attribute value.   |
| <b>set atomic-aggregate</b>                  | Sets the <b>atomic-aggregate</b> attribute of a route.   |
| <b>set comm-list delete</b>                  | Deletes all community attribute values from the community attribute list for a route matching the match rules.   |
| <b>set community</b>                         | Sets the community attribute value of a route.   |
| <b>set dampening</b>                         | Sets the flapping parameters of a route.   |
| <b>set extcomm-list delete</b>               | Deletes all extended community attribute values from the extcommunity attribute list for a route matching the match rules.                                 |
| <b>set extcommunity</b>                      | Sets the extended community attribute value of a route.  |
| <b>set fast-reroute</b>                      | Sets the backup output interface and next hop of a fast reroute.   |
| <b>set ip default nexthop</b>                | Specifies the default next hop of a route. This command has a lower priority than a common route and a higher priority than <b>set default interface</b> . |
| <b>set ip dscp</b>                           | Modifies the <b>dscp</b> field of an IP packet.  |
| <b>set ip nexthop</b>                        | Specifies the next hop of a route. This command has a higher priority than <b>set interface</b> .  |
| <b>set ip next-hop recursive</b>             | Specifies the recursive next-hop IP address of a route.  |
| <b>set ip next-hop verify-availability</b>   | Specifies the next-hop IP address of a route and checks the accessibility of the next hop by using a third-party protocol.                                 |
| <b>set ip precedence</b>                     | Modifies the <b>precedence</b> field of an IP packet.  |
| <b>set ip tos</b>                            | Modifies the <b>tos</b> field of an IP packet.   |
| <b>set ipv6 default next-hop</b>             | Specifies the default next hop of a route. This command has a lower priority than a common route and a higher priority than the default route.             |
| <b>set ipv6 next-hop</b>                     | Specifies the IPv6 next hop of a route. This command has a higher priority than a common route.  |
| <b>set ipv6 next-hop verify-availability</b> | Specifies the next-hop IP address of a route and checks the accessibility of the next hop by using a third-party protocol.                                 |
| <b>set ipv6 precedence</b>                   | Sets the priority of an IPv6 packet header.  |

| Command                     | Description   |
|-----------------------------|---|
| <b>set level</b>            | Sets the destination area type to which a route will be directed. |
| <b>set local-preference</b> | Sets the local-preference attribute value of a route.             |
| <b>set metric</b>           | Modifies the metric value of a route.                             |
| <b>set metric-type</b>      | Sets the metric type of a route.                                  |
| <b>set mpls-label</b>       | Sets the MPLS label.  |
| <b>set next-hop</b>         | Sets the next-hop IP address of a route.                          |
| <b>set origin</b>           | Sets the source attribute of a route.                             |
| <b>set originator-id</b>    | Sets the originator IP address of a route.                        |
| <b>set tag</b>              | Sets the tag value of a route.                                    |
| <b>set weight</b>           | Sets the weight value of a route.                                 |

## 11.4 Configuration

| Configuration                                | Description and Command   |   |
|--|---|---|
| <a href="#">Configuring a Route Map</a>      |  (Optional) It is used to define a policy.           |   |
|  | <b>route-map</b>  | Creates a policy (route map).                   |
|  | <b>match</b>  | Sets the matching conditions of the policy.     |
|  | <b>set</b>  | Sets the processing actions of the policy.      |
| <a href="#">Configuring a Filtering List</a> |  (Optional) It is used to define a filtering list. |   |
|  | <b>ip as-path</b>   | Defines AS path filtering rules.                |
|  | <b>ip community-list</b>  | Defines a community list.                       |
|  | <b>ip extcommunity-list</b>   | Defines an extcommunity list.                   |
|  | <b>ip prefix-list</b>   | Creates a prefix-list.                          |
|  | <b>ip prefix-list description</b>   | Adds description to a prefix-list.              |
|  | <b>ip prefix-list sequence-number</b>   | Enables the sorting function for a prefix-list. |
|  | <b>ipv6 prefix-list</b>   | Creates an IPv6 prefix-list.                    |
| <b>ipv6 prefix-list description</b>          | Adds description to an IPv6 prefix-list.  |   |
| <b>ipv6 prefix-list sequence-number</b>      | Enables the sorting function for an IPv6 prefix-list.   |   |

### 11.4.1 Configuring a Route Map

#### Configuration Effect

- Define a set of routing policies to be used by routing protocols or PBR.

#### Notes

- If a **match** command uses an ACL to define packet matching conditions, the ACL must be configured.

- The following **match** commands cannot be configured at the same time:

| The Following match Commands   | Cannot Be Configured with the Following match Commands At the Same Time |
|--------------------------------|---|
| <b>match ip address</b>        | <b>match ip prefix-list</b>   |
| <b>match ipv6 address</b>      | <b>match ipv6 prefix-list</b>   |
| <b>match ip next-hop</b>       | <b>match ip next-hop prefix-list</b>                                    |
| <b>match ipv6 next-hop</b>     | <b>match ipv6 next-hop prefix-list</b>                                  |
| <b>match ip route-source</b>   | <b>match ip route-source prefix-list</b>                                |
| <b>match ipv6 route-source</b> | <b>match ipv6 route-source prefix-list</b>                              |

- The following **set** commands cannot be configured at the same time:

| The Following set Commands | Cannot Be Configured with the Following set Commands At the Same Time |
|----------------------------|---|
| <b>set next-hop</b>        | <b>set vrf</b>  |
| <b>set ip next-hop</b>     | <b>set ip next-hop verify-availability</b>                            |
| <b>set ip dscp</b>         | <b>set ip tos</b>   |
| <b>set ip dscp</b>         | <b>set ip precedence</b>  |

## Configuration Steps

### ↳ Creating a Policy (Route Map)

- Mandatory.
- Perform this configuration on a device to which a policy needs to be applied.

### ↳ Setting Matching Conditions of a Policy

- Optional.
- If no match rule is configured, no packet will be matched.
- If multiple match rules are configured, all the match rules must be matched.
- Perform this configuration on a device to which a policy needs to be applied.

### ↳ Setting the Processing Actions of a Policy

- Optional.
- If no set rule is configured, no processing action will be performed.
- If multiple set rules are configured, all set rules must be executed (if the set rules have different priorities, the set rule with the highest priority takes effect).
- Perform this configuration on a device to which a policy needs to be applied.

## Verification

- Check the configurations of the route map.

## Related Commands

### ↳ Creating a Policy (Route Map)

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>route-map</b> <i>route-map-name</i> [ { <b>permit</b>   <b>deny</b> } <i>sequence</i> ]   |
| <b>Parameter Description</b> | <i>route-map-name</i> : Indicates the name of a route map, comprising not more than 32 characters.<br><b>permit</b> : Specifies the working mode of this policy as permit, which is the default mode.<br><b>deny</b> : Specifies the working mode of this policy as deny. The default mode is permit.<br><i>sequence</i> : Specifies the sequence number of this policy. A smaller value means a higher priority. The default value is 10. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | If this route map is unavailable, this command will create a route map and add a policy to the route map.<br>If this route map is available, this command will add a policy to the route map.  |

### ↳ Setting Matching Conditions of a Policy

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>match as-path</b> <i>as-path-acl-list-number</i> [ <i>as-path-acl-list-number</i> .... ]   |
| <b>Parameter Description</b> | <i>as-path-acl-list-number</i> : Indicates the AS-PATH list number, ranging from 1 to 500.  |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This match rule is used to match the AS-PATH attribute of a BGP route.<br>Run the <b>ip as-path access-list</b> <i>path-list-num</i> { <b>permit</b>   <b>deny</b> } <i>regular-expression</i> command to configure the AS-PATH list. |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>match community</b> { <i>community-list-number</i>   <i>community-list-name</i> } [ <b>exact-match</b> ]<br>[ { <i>community-list-number</i>   <i>community-list-name</i> } [ <b>exact-match</b> ] ... ]  |
| <b>Parameter Description</b> | <i>community-list-number</i> : Indicates the community list number. For a standard community list, the value ranges from 1 to 99. For an extcommunity list, the value ranges from 100 to 199.<br><i>community-list-name</i> : Indicates the community list name, comprising not more than 80 characters.<br><b>exact-match</b> : Indicates the exact match list. It is a non-exact match list by default, that is, the match rule is met as long as the routing attributes contain the attributes specified by a community list. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This match rule is used to match the community attribute specified in a community list.  |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>match extcommunity</b> { <i>standard-list-number</i>   <i>standard-list-name</i>   <i>expanded-list-num</i>   <i>expanded-list-name</i> }  |
| <b>Parameter Description</b> | <i>standard-list-number</i> : Indicates an ID, ranging from 1 to 99. It is used to identify a standard extcommunity list. One extcommunity list may contain multiple extcommunity values.<br><i>standard-list-name</i> : Indicates the name of a standard extcommunity list. It is used to identify the name of a standard extcommunity list. One extcommunity list may contain multiple extcommunity values. |

|                     |   |
|---------------------|---|
|                     | <p><i>expanded-list-num</i>: Indicates an ID, ranging from 100 to 199. It is used to identify an extcommunity list. One extcommunity list may contain multiple extcommunity values.</p> <p><i>expanded-list-name</i>: Indicates the name of an extcommunity. It is used to identify the name of an extcommunity list. One extcommunity list may contain multiple extcommunity values.</p> |
| <b>Command Mode</b> | Route map configuration mode  |
| <b>Usage Guide</b>  | This match rule is used to match the extended community attribute specified in an extcommunity list.  |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>match interface</b> <i>interface-type interface-number</i> [ <i>...interface-type interface-number</i> ] |
| <b>Parameter Description</b> | <i>interface-type interface-number</i> : Indicates the interface type and interface number.                 |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This match rule is used to match the next-hop output interface of a route or a packet.                      |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>match ip address</b> { <i>access-list-number</i> [ <i>access-list-number...</i>   <i>access-list-name...</i> ]   <i>access-list-name</i> [ <i>access-list-number...</i>   <i>access-list-name</i> ]   <b>prefix-list</b> <i>prefix-list-name</i> [ <i>prefix-list-name...</i> ] }  |
| <b>Parameter Description</b> | <p><i>access-list-number</i>: Indicates the access list number. For a standard access list, the value ranges are 1 to 99 and 1300 to 1999. For an extended access list, the value ranges are 100 to 199 and 2000 to 2699.</p> <p><i>access-list-name</i>: Indicates the access list name.</p> <p><b>prefix-list</b> <i>prefix-list-name</i>: Indicates the name of a prefix-list to be matched.</p> |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This match rule matches the destination IPv4 address of a packet or route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.   |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>match ip next-hop</b> { <i>access-list-number</i> [ <i>access-list-number...</i>   <i>access-list-name...</i> ]   <i>access-list-name</i> [ <i>access-list-number...</i>   <i>access-list-name</i> ]   <b>prefix-list</b> <i>prefix-list-name</i> [ <i>prefix-list-name...</i> ] }   |
| <b>Parameter Description</b> | <p><i>access-list-number</i>: Indicates the access list number. For a standard access list, the value ranges are 1 to 99 and 1300 to 1999. For an extended access list, the value ranges are 100 to 199 and 2000 to 2699.</p> <p><i>access-list-name</i>: Indicates the access list name.</p> <p><b>prefix-list</b> <i>prefix-list-name</i>: Indicates the name of a prefix-list to be matched.</p> |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This match rule matches the next-hop IPv4 address of a route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.  |

|                |   |
|----------------|---|
| <b>Command</b> | <b>match ip route-source</b> { <i>access-list-number</i> [ <i>access-list-number...</i>   <i>access-list-name...</i> ]   <i>access-list-name</i> [ <i>access-list-number...</i>   <i>access-list-name</i> ]   <b>prefix-list</b> <i>prefix-list-name</i> [ <i>prefix-list-name...</i> ] } |
|----------------|---|

|                              |   |
|------------------------------|---|
| <b>Parameter Description</b> | <i>access-list-number</i> : Indicates the access list number. For a standard access list, the value ranges are 1 to 99 and 1300 to 1999. For an extended access list, the value ranges are 100 to 199 and 2000 to 2699.<br><i>access-list-name</i> : Indicates the access list name.<br><b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of a prefix-list to be matched. |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This match rule matches the source IPv4 address of a route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.  |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>match ipv6 address</b> { <i>access-list-name</i>   <b>prefix-list</b> <i>prefix-list-name</i> }  |
| <b>Parameter Description</b> | <i>access-list-name</i> : Indicates the access list name.<br><b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of an IPv6 prefix-list to be matched.          |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This match rule matches the destination IPv6 address of a packet or route by using an ACL or a prefix-list. An ACL and a prefix list cannot be configured at the same time. |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>match ipv6 next-hop</b> { <i>access-list-name</i>   <b>prefix-list</b> <i>prefix-list-name</i> }  |
| <b>Parameter Description</b> | <i>access-list-name</i> : Indicates the access list name.<br><b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of an IPv6 prefix-list to be matched. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This match rule matches the next-hop IPv6 address of a route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.     |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>match ipv6 route-source</b> { <i>access-list-name</i>   <b>prefix-list</b> <i>prefix-list-name</i> }  |
| <b>Parameter Description</b> | <i>access-list-name</i> : Indicates the access list name.<br><b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of an IPv6 prefix-list to be matched. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This match rule matches the source IPv6 address of a route by using an ACL or a prefix-list. An ACL and a prefix-list cannot be configured at the same time.       |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>match metric</b> <i>metric</i>   |
| <b>Parameter Description</b> | <i>metric</i> : Indicates the metric value of a route, ranging from 0 to 4,294,967,295. |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This match rule is used to match the metric value of a route.                           |

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>match mpls-label</b>   |
| <b>Parameter</b>    | -   |
| <b>Description</b>  |   |
| <b>Command Mode</b> | Route map configuration mode                                      |
| <b>Usage Guide</b>  | This match rule is used to match routing information with labels. |

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>match origin { egp   igp   incomplete }</b>  |
| <b>Parameter</b>    | <b>egp:</b> Indicates the source is remote EGP.   |
| <b>Description</b>  | <b>igp:</b> Indicates the source is local IGP.<br><b>incomplete:</b> Indicates that the source is an incomplete type. |
| <b>Command Mode</b> | Route map configuration mode  |
| <b>Usage Guide</b>  | This match rule is used to match the source of a route.   |

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>match route-type { local   internal   external [ type-1   type-2 ]   level-1   level-2}}</b>  |
| <b>Parameter</b>    | <b>local:</b> Indicates a route locally generated.   |
| <b>Description</b>  | <b>Internal:</b> Indicates an internal OSPF route.<br><b>external:</b> Indicates an external route (that of BGP or OSPF).<br><b>type-1   type-2:</b> Indicates type-1 or type-2 external route of OSPF.<br><b>level-1   level-2:</b> Indicates level-1 or level-2 route of ISIS. |
| <b>Command Mode</b> | Route map configuration mode   |
| <b>Usage Guide</b>  | This match rule is used to match the type of a route.  |

|                     |  |
|---------------------|--|
| <b>Command</b>      | <b>match tag tag [ ...tag ]</b>                            |
| <b>Parameter</b>    | <b>tag:</b> Indicates the tag value of a route.            |
| <b>Description</b>  |  |
| <b>Command Mode</b> | Route map configuration mode                               |
| <b>Usage Guide</b>  | This match rule is used to match the tag value of a route. |

### 📌 Setting the Processing Actions of a Policy

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>set aggregator as as-number ip-address</b>   |
| <b>Parameter</b>    | <b>as-number:</b> Indicates the AS number of an aggregator. The AS number ranges from 1 to 4,294,967,295, which can be indicated by 1 to 65535.65535 in the dot mode. |
| <b>Description</b>  | <b>ip-address:</b> Indicates the address of an aggregator.  |
| <b>Command Mode</b> | Route map configuration mode  |

|                    |   |
|--------------------|---|
| <b>Usage Guide</b> | This set rule is used to modify the AS attribute value of a route's aggregator. |
|--------------------|---|

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set as-path prepend</b> <i>as-number</i>  |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates the AS number to be added to the AS_PATH attribute. The AS number ranges from 1 to 4,294,967,295, which can be indicated by 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This set rule is used to add a specified as-path attribute value.  |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set as-path replace</b> <i>as-number</i>  |
| <b>Parameter Description</b> | <i>as-number</i> : Indicates the AS number which will replace the AS_PATH attribute. The AS number ranges from 1 to 4,294,967,295, which can be indicated by 1 to 65535.65535 in the dot mode. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This set rule is used to replace the specified as-path attribute value.  |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set atomic-aggregate</b>   |
| <b>Parameter Description</b> | -   |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to set the atomic-aggregate attribute of a route. |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set comm-list</b> { <i>community-list-number</i>   <i>community-list-name</i> } <b>delete</b>   |
| <b>Parameter Description</b> | <i>community-list-number</i> : Indicates the community list number. For a standard community list, the value ranges from 1 to 99. For an extcommunity list, the value ranges from 100 to 199.<br><i>community-list-name</i> : Indicates the community list name, comprising not more than 80 characters. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This rule is used to delete all community attribute values from the community list for a route matching the match rules.   |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set community</b> { <i>community-number</i> [ <i>community-number</i> ... ] <b>additive</b>   <b>none</b> }   |
| <b>Parameter Description</b> | <i>community-number</i> : Indicates the community attribute value.<br><b>additive</b> : Adds a number based on the original community attribute.<br><b>none</b> : Keeps the community attribute empty. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This set rule is used to set the community attribute value of a route.   |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set dampening</b> <i>half-life reuse suppress max-suppress-time</i>   |
| <b>Parameter Description</b> | <p><i>half-life</i>: half-life when a route is accessible or not accessible, ranging from 1 to 45 minutes. The default value is 15 minutes.</p> <p><i>reuse</i>: When the penalty value of a route is smaller than this value, route suppression will be canceled. The value ranges from 1 to 20,000 and the default value is 750.</p> <p><i>suppress</i>: When the penalty value of a route is greater than this value, the route will be suppressed. The value ranges from 1 to 20,000 and the default value is 2,000.</p> <p><i>max-suppress-time</i>: Indicates the longest time that a route can be suppressed, ranging from 1 to 255 minutes. The default value is 4 x <b>half-life</b>.</p> |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This set rule is used to set the flapping parameters of a route.   |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set extcomm-list</b> { <i>extcommunity-list-number</i>   <i>extcommunity-list-name</i> } <b>delete</b>   |
| <b>Parameter Description</b> | <p><i>extcommunity-list-number</i>: Indicates the extcommunity list number. For a standard extcommunity list, the value ranges from 1 to 99. For an extended extcommunity list, the value ranges from 100 to 199.</p> <p><i>extcommunity-list-name</i>: Indicates the extcommunity list name, comprising not more than 80 characters.</p> |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to delete all extended community attribute values from the extcommunity attribute list for a route matching the match rules.  |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set extcommunity</b> { <i>rt extend-community-value</i>   <b>soo</b> <i>extend-community-value</i> }   |
| <b>Parameter Description</b> | <p><b>rt</b>: Sets the RT attribute value of a route.</p> <p><b>soo</b>: Sets the SOO attribute value of a route.</p> <p><i>extend-community-value</i>: Indicates the value of an extended community.</p> |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to set the extended community attribute value of a route.   |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set fast-reroute backup-interface</b> <i>interface-type interface-number</i> [ <b>backup-nexthop</b> <i>ip-address</i> ]   |
| <b>Parameter Description</b> | <p><i>interface-type interface-number</i>: Specifies a backup output interface.</p> <p><b>backup-nexthop</b> <i>ip-address</i>: Specifies a backup next hop. For a non-point-to-point interface, a backup next hop must be specified.</p> |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to set the backup output interface and next hop of a fast reroute.  |

|                |  |
|----------------|--|
| <b>Command</b> | <b>set ip default next-hop</b> <i>ip-address</i> [ <i>weight</i> ] [ ... <i>ip-address</i> [ <i>weight</i> ] ] |
|----------------|--|

|                    |   |
|--------------------|---|
| <b>Parameter</b>   | <i>ip-address</i> : Indicates the next-hop IP address.            |
| <b>Description</b> | <i>weight</i> : Indicates the weight of this next hop.            |
| <b>Command</b>     | Route map configuration mode                                      |
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | This set rule is used to specify the default next hop of a route. |

|                    |   |
|--------------------|---|
| <b>Command</b>     | <b>set ip dscp</b> <i>dscp_value</i>                                      |
| <b>Parameter</b>   | <i>dscp_value</i> : Sets the DSCP value in the IP header of an IP packet. |
| <b>Description</b> |   |
| <b>Command</b>     | Route map configuration mode  |
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | This set rule is used to modify the dscp field of an IP packet.           |

|                    |  |
|--------------------|--|
| <b>Command</b>     | <b>set ip next-hop</b> <i>ip-address</i> [ <i>weight</i> ] [ ... <i>ip-address</i> [ <i>weight</i> ] ] |
| <b>Parameter</b>   | <i>ip-address</i> : Indicates the next-hop IP address.   |
| <b>Description</b> | <i>weight</i> : Indicates the weight of this next hop.   |
| <b>Command</b>     | Route map configuration mode   |
| <b>Mode</b>        |  |
| <b>Usage Guide</b> | This set rule is used to specify the next hop of a route.  |

|                    |  |
|--------------------|--|
| <b>Command</b>     | <b>set ip next-hop recursive</b> <i>ip-address</i>   |
| <b>Parameter</b>   | <i>ip-address</i> : Indicates the recursive next-hop IP address.   |
| <b>Description</b> |  |
| <b>Command</b>     | Route map configuration mode   |
| <b>Mode</b>        |  |
| <b>Usage Guide</b> | This command is used only for PBR configuration.<br>This set rule is used to specify the recursive next hop of a route. An IP address can recur to a static or dynamic route that has an output interface and a next-hop IP address. A maximum of 32 next hops are supported. If a recursive route is a static route, only one next hop is supported for the static recursive route. |

|                    |   |
|--------------------|---|
| <b>Command</b>     | <b>set ip next-hop verify-availability</b> <i>ip-address</i> [ <b>bfd</b> <i>interface-type interface-number gateway</i> ]  |
| <b>Parameter</b>   | <i>ip-address</i> : Indicates the next-hop IP address.  |
| <b>Description</b> | <b>bfd</b> : Indicates that BFD is used for neighbor detection.<br><i>interface-type</i> : Configures the interface type.<br><i>interface-number</i> : Configures the interface number.<br><i>gateway</i> : Configures the gateway IP address, which is the neighbor IP address of BFD. If the next hop is configured as the neighbor, BFD will be used to detect the accessibility of the forwarding path. |
| <b>Command</b>     | Route map configuration mode  |
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | This set rule is used to specify the next hop of a route and BFD or Track is used to fast detect the  |

|  |                                |
|--|--------------------------------|
|  | effectiveness of the next hop. |
|--|--------------------------------|

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set ip precedence</b> { <i>number</i>   <b>critical</b>   <b>flash</b>   <b>flash-override</b>   <b>immediate</b>   <b>internet</b>   <b>network</b>   <b>priority</b>   <b>routine</b> }   |
| <b>Parameter Description</b> | <i>number</i> : Indicates the priority of the IP header with a number, ranging from 0 to 7.<br>7: critical<br>6: flash<br>5: flash-override<br>4: immediate<br>3: internet<br>2: network<br>1: priority<br>0: routine<br><b>critical</b>   <b>flash</b>   <b>flash-override</b>   <b>immediate</b>   <b>internet</b>   <b>network</b>   <b>priority</b>   <b>routine</b> : priority of an IP header. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This set rule is used to modify the <b>precedence</b> field of an IP packet header.  |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set ip tos</b> { <i>number</i>   <b>max-reliability</b>   <b>max-throughput</b>   <b>min-delay</b>   <b>min-monetary-cost</b>   <b>normal</b> }  |
| <b>Parameter Description</b> | <i>number</i> : Indicates the TOS value of an IP header with a number, ranging from 0 to 15.<br>2: <b>max-reliability</b><br>4: <b>max-throughput</b><br>8: <b>min-delay</b><br>1: <b>min-monetary-cost</b><br>0: <b>normal</b><br><b>max-reliability</b>   <b>max-throughput</b>   <b>min-delay</b>   <b>min-monetary-cost</b>   <b>normal</b> : priority of an IP header. |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to modify the <b>tos</b> field of an IP packet.   |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set ipv6 default next-hop</b> <i>global-ipv6-address</i> [ <i>weight</i> ] [ <i>global-ipv6-address</i> [ <i>weight</i> ] ... ]   |
| <b>Parameter Description</b> | <i>global-ipv6-address</i> : Indicates the next-hop IPv6 address for packet forwarding. The next-hop router must be a neighbor router.<br><i>weight</i> : Indicates the weight in the load balancing mode, ranging from 1 to 8. A larger value means larger packet traffic to be shared by the next hop. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This set rule is used to specify the default next hop IPv6 address of a route.   |

|                |  |
|----------------|--|
| <b>Command</b> | <b>set ipv6 next-hop</b> <i>global-ipv6-address</i> [ <i>weight</i> ] [ <i>global-ipv6-address</i> [ <i>weight</i> ] ... ] |
|----------------|--|

|                              |   |
|------------------------------|---|
| <b>Parameter Description</b> | <p><i>global-ipv6-address</i>: Indicates the next-hop IPv6 address for packet forwarding. The next-hop router must be a neighbor router.</p> <p><i>weight</i>: Indicates the weight in the load balancing mode, ranging from 1 to 8. A larger value means larger packet traffic to be shared by the next hop.</p> |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to specify the next hop IPv6 address of a route.  |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set ipv6 next-hop verify-availability</b> <i>global-ipv6-address</i> <b>bfd</b> <i>interface-type</i> <i>interface-number</i> <i>gateway</i>  |
| <b>Parameter Description</b> | <p><b>global-ipv6-address</b>: Indicates the next-hop IPv6 address.</p> <p><b>bfd</b>: Indicates that BFD is used for neighbor detection.</p> <p><i>interface-type</i>: Configures the interface type.</p> <p><i>interface-number</i>: Configures the interface number.</p> <p><i>gateway</i>: Configures the gateway IPv6 address, which is the neighbor IPv6 address of BFD. If the next hop is configured as the neighbor, BFD will be used to detect the accessibility of the forwarding path.</p> |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This set rule is used to specify the next hop of a route and BFD is used to fast detect the effectiveness of the next hop.   |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set ipv6 precedence</b> { <i>number</i>   <b>critical</b>   <b>flash</b>   <b>flash-override</b>   <b>immediate</b>   <b>internet</b>   <b>network</b>   <b>priority</b>   <b>routine</b> }  |
| <b>Parameter Description</b> | <p><i>number</i>: Indicates the priority of the IP header with a number, ranging from 0 to 7.</p> <p>7: critical</p> <p>6: flash</p> <p>5: flash-override</p> <p>4: immediate</p> <p>3: internet</p> <p>2: network</p> <p>1: priority</p> <p>0: routine</p> <p><b>critical</b>   <b>flash</b>   <b>flash-override</b>   <b>immediate</b>   <b>internet</b>   <b>network</b>   <b>priority</b>   <b>routine</b>: priority of an IP header.</p> |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to set the priority of an IPv6 packet header.   |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set level</b> { <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b>   <b>stub-area</b>   <b>backbone</b> }  |
| <b>Parameter Description</b> | <p><b>level-1</b>: Indicates that the re-distribution route is advertised to ISIS Level 1.</p> <p><b>level-2</b>: Indicates that the re-distribution route is advertised to ISIS Level 2.</p> |

|                     |   |
|---------------------|---|
|                     | <p><b>level-1-2:</b> Indicates that the re-distribution route is advertised to ISIS Level 1 and Level 2.</p> <p><b>stub-area:</b> Indicates that the re-distribution route is advertised to OSPF Stub Area.</p> <p><b>backbone:</b> Indicates that the re-distribution route is advertised to the OSPF backbone area.</p> |
| <b>Command Mode</b> | Route map configuration mode  |
| <b>Usage Guide</b>  | This set rule is used to set the destination area type to which a route will be redirected.   |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set local-preference</b> <i>number</i>   |
| <b>Parameter Description</b> | <i>number:</i> Indicates the metric value of a local priority, ranging from 0 to 4,294,967,295. A larger value means a higher priority. |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to set the local-preference attribute value of a route.   |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set metric</b> [ + <i>metric-value</i>   - <i>metric-value</i>   <i>metric-value</i> ]   |
| <b>Parameter Description</b> | + : Increases (based on the metric value of the original route).<br>- : Decreases (based on the metric value of the original route).<br><i>metric-value:</i> Sets the metric value of a re-distribution route. A larger value means a lower priority. |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to modify the metric value of a route.  |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set metric-type</b> <i>type</i>  |
| <b>Parameter Description</b> | <i>type:</i> Sets the type of a re-distribution route. The default type of an OSPF re-distribution route is type-2. |
| <b>Command Mode</b>          | Route map configuration mode  |
| <b>Usage Guide</b>           | This set rule is used to set the metric type.   |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set mpls-label</b>                        |
| <b>Parameter Description</b> | -  |
| <b>Command Mode</b>          | Route map configuration mode                 |
| <b>Usage Guide</b>           | This set rule is used to set the MPLS label. |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>set next-hop</b> <i>ip-address</i>                 |
| <b>Parameter Description</b> | <i>ip-address:</i> Indicates the next-hop IP address. |
| <b>Command</b>               | Route map configuration mode                          |

|                    |   |
|--------------------|---|
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | This set rule is used to set the next-hop IP address. |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set origin { egp   igp   incomplete }</b>   |
| <b>Parameter Description</b> | <b>egp:</b> Indicates the source is remote EGP.<br><b>igp:</b> Indicates the source is local IGP.<br><b>incomplete:</b> Indicates that the source is the incomplete type and generally refers to a route generated due to re-distribution. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This set rule is used to set the source attribute of a route.  |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set originator-id <i>ip-address</i></b>                         |
| <b>Parameter Description</b> | <i>ip-address:</i> Indicates the address of an originator.         |
| <b>Command Mode</b>          | Route map configuration mode                                       |
| <b>Usage Guide</b>           | This set rule is used to set the originator IP address of a route. |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set tag <i>tag</i></b>                              |
| <b>Parameter Description</b> | <i>tag:</i> Sets the tag of a re-distribution route.   |
| <b>Command Mode</b>          | Route map configuration mode                           |
| <b>Usage Guide</b>           | This set rule is used to set the tag value of a route. |

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>set weight <i>number</i></b>  |
| <b>Parameter Description</b> | <i>number:</i> Sets the weight of a route, ranging from 0 to 65,535. A larger value means a higher priority. |
| <b>Command Mode</b>          | Route map configuration mode   |
| <b>Usage Guide</b>           | This set rule is used to set the weight of a route.  |

### 📄 Displaying the Configurations of a Route Map

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show route-map [ <i>name</i> ]</b>   |
| <b>Parameter Description</b> | <i>name:</i> Specifies a route map.   |
| <b>Command Mode</b>          | Privilege, global and interface configuration modes                                 |
| <b>Usage Guide</b>           | Run the <b>show route-map</b> command to display the configurations of a route map. |

|  |   |
|--|---|
|  | If an ACL is used when a route map is configured, you can run the <b>show access-list</b> command to display the configurations of the ACL. |
|--|---|

### Configuration Example

#### Using a Route Map in Route Re-distribution to Filter and Modify Routing Information

|                                |  |
|--------------------------------|--|
| <b>Scenario</b><br>Figure 11-4 | <p>As shown in Figure 11-4, a device is connected to both an OSPF routing domain and RIP routing domain.</p>    |
|                                | <ul style="list-style-type: none"> <li>Re-distribute only RIP routes with 4 hops to OSPF. In the OSPF route domain, if the route type is the external route type-1, set the tag value of the route to 40.</li> <li>Re-distribute only OSPF routes with the tag value 10 to RIP. In the RIP route domain, set the initial metric value of this route to 10.</li> </ul>  |
| <b>Configuration Steps</b>     | <ul style="list-style-type: none"> <li>Configure the route map redrip: Match a route with 4 hops, set the initial metric value of the route to 40, set the route type to the external route type-1, and set the tag value of the route to 40.</li> <li>Configure the route map redospf: match a route with the tag value 10 and set the initial metric value of the route to 10.</li> <li>Configure re-distribution of the RIP route to OSPF and apply the route map redrip.</li> <li>Configure re-distribution of the OSPF route to RIP and apply the route map redospf.</li> </ul>   |
|                                | <pre>Ruijie(config)# route-map redrip permit 10 Ruijie(config-route-map)# match metric 4 Ruijie(config-route-map)# set metric-type type-1 Ruijie(config-route-map)# set tag 40 Ruijie(config-route-map)# exit Ruijie(config)# route-map redospf permit 10 Ruijie(config-route-map)# match tag 10 Ruijie(config-route-map)# set metric 10 Ruijie(config-route-map)# exit Ruijie(config)# router ospf 1 Ruijie(config-router)# redistribute rip subnets route-map redrip Ruijie(config-router)# exit Ruijie(config)# router rip Ruijie(config-router)# redistribute ospf 1 route-map redospf Ruijie(config-router)# exit</pre> |
| <b>Verification</b>            | <ul style="list-style-type: none"> <li>Check the configurations of the route map to verify the policy rules.</li> </ul>  |

|  |  |
|--|--|
|  | <ul style="list-style-type: none"> <li>● Check the OSPF routing information library to verify that the rules matching the policy rules are re-distributed.</li> </ul>  |
|  | <pre>Ruijie# show route-map route-map redrip, permit, sequence 10    Match clauses:     metric 4    Set clauses:     metric 40     metric-type type-1     tag 40  route-map redospf, permit, sequence 10    Match clauses:     tag 10    Set clauses:     metric 10</pre>  |
|  | <pre>Ruijie# show ip ospf database external            OSPF Router with ID (192.100.1.9) (Process ID 1)            AS External Link States  LS age: 5 Options: 0x2 (- - - - - E -) LS Type: AS-external-LSA Link State ID: 192.168.199.0 (External Network Number) Advertising Router: 192.100.1.9 LS Seq Number: 80000001 Checksum: 0x554d Length: 36 Network Mask: /24      Metric Type: 1      TOS: 0</pre> |

📌 Applying a Route Map in PBR

|  |  |
|--|--|
| <p><b>Scenario</b></p> <p><b>Figure 11-5</b></p> |  |
|  | <p>Configure PBR on the device DEV1 to achieve the following purposes:</p> <ul style="list-style-type: none"> <li>● Packets from subnet 1 (200.24.16.0/24) are sent from GE0/1 first.</li> <li>● Packets from subnet 2 (200.24.17.0/24) are sent from GE0/2 first.</li> <li>● The two output links work in the mutual backup mode.</li> </ul>  |
| <p><b>Configuration Steps</b></p>                | <ul style="list-style-type: none"> <li>● Configure two different ACLs to match packets from subnets 1 and 2 respectively.</li> <li>● Configure the route map RM_FOR_PBR: policy 10 is used to ensure that "packets from subnet 1 are sent from GE0/1 first"; policy 20 is used to ensure that "packets from subnet 2 are sent from GE0/2 first".</li> <li>● Configure PBR for packets received from GE0/3 and apply the route map RM_FOR_PBR.</li> <li>● Set PBR to implement redundant backup among multiple next hops.</li> </ul> <p>⚠ In the redundant backup mode, the sequence of multiple set next hops is the sequence of the priorities for taking effect.</p> |

```

Ruijie(config)# access-list 1 permit 200.24.16.0 0.0.0.255
Ruijie(config)# access-list 2 permit 200.24.17.0 0.0.0.255
Ruijie(config)# route-map RM_FOR_PBR 10
Ruijie(config-route-map)# match ip address 1
Ruijie(config-route-map)# set ip next-hop 200.24.18.1
Ruijie(config-route-map)# set ip next-hop 200.24.19.1
Ruijie(config-route-map)# exit
Ruijie(config)# route-map RM_FOR_PBR 20
Ruijie(config-route-map)# match ip address 2
Ruijie(config-route-map)# set ip next-hop 200.24.19.1
Ruijie(config-route-map)# set ip next-hop 200.24.18.1
Ruijie(config-route-map)# exit
Ruijie(config)# interface GigabitEthernet 0/3
Ruijie(config-if)# ip policy route-map RM_FOR_PBR
Ruijie(config)# ip policy redundance

```

**Verification**

- Check the configurations of PBR to verify that the route map is applied to the interfaces.
- Check the configurations of the route map to verify the policy rules.
- Check the ACL configurations to verify the packet filtering rules.

```

Ruijie# show ip policy
Balance mode: redundance

Interface                               Route map
GigabitEthernet 0/3                     RM_FOR_PBR
!

```

```

Ruijie# show route-map
route-map RM_FOR_PBR, permit, sequence 10

  Match clauses:
    ip address 1

  Set clauses:
    ip next-hop 200.24.18.1
    ip next-hop 200.24.19.1

route-map RM_FOR_PBR, permit, sequence 20

```

|  |  |
|--|--|
|  | <pre>Match clauses:   ip address 2  Set clauses:   ip next-hop 200.24.19.1   ip next-hop 200.24.18.1</pre>   |
|  | <pre>Ruijie# show access-lists ip access-list standard 1 10 permit 200.24.16.0 0.0.0.255 10 permit 200.24.16.0 0.0.0.255 ip access-list standard 2 10 permit 200.24.17.0 0.0.0.255</pre> |

## Common Errors

- After matching of ACLs and prefix-lists is configured, the corresponding ACLs and prefix lists are not defined.

## 11.4.2 Configuring a Filtering List

### Configuration Effect

- Define a set of route filtering rules to be used by routing protocols.

### Notes

- A configured filtering list can take effect only after it is associated with a routing protocol.

### Configuration Steps

#### ▾ Configuring a Prefix-List

- To filter address prefixes, you should perform this configuration.
- If there is no special requirement, you should perform this configuration on a route for which filtering based on a prefix-list needs to be performed.

#### ▾ Configuring an AS Path List

- To filter address prefixes, you should perform this configuration.
- If there is no special requirement, you should perform this configuration on a route for which filtering based on an AS path needs to be performed.

#### ▾ Configuring a Community List

- To filter community attributes, you should perform this configuration.

- If there is no special requirement, you should perform this configuration on a route for which community attributes need to be filtered.

### ↘ **Configuring an Extcommunity List**

- To filter extended community attributes, you should perform this configuration.
- If there is no special requirement, you should perform this configuration on a route for which extended community attributes need to be filtered.

### Verification

- Check whether the filtering list is correctly configured.
- Check the routing table to verify that routes can be correctly filtered.

### Related Commands

#### ↘ **Defining AS Path Filtering Rules**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>ip as-path access-list path-list-num { permit   deny } regular-expression</code>   |
| <b>Parameter Description</b> | <p><i>path-list-num</i>: Indicates an AS-path ACL name based on a regular expression and is an AS path list identifier, ranging from 1 to 500.</p> <p><b>permit</b>: Permits access.</p> <p><b>deny</b>: Denies access.</p> <p><i>regular-expression</i>: Indicates a regular expression, ranging from 1 to 255.</p> |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | -  |

#### ↘ **Defining a Community List**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>ip community-list { { standard   expanded } community-list-name   community-list-number } { permit   deny } [ community-number.. ]</code>  |
| <b>Parameter Description</b> | <p><b>standard</b>: Indicates a standard community list.</p> <p><b>expanded</b>: Indicates an extended community list.</p> <p><i>community-list-name</i>: Indicates the community list name, comprising not more than 80 characters.</p> <p><i>community-list-number</i>: Indicates the community list number. For a standard community list, the value ranges from 1 to 99. For an extended community list, the value ranges from 100 to 199.</p> <p><b>permit</b>: Permits access.</p> <p><b>deny</b>: Denies access.</p> <p><i>community-number</i>: Indicates the community attribute value.</p> |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | Use this command to define a community list used for BGP.  |

#### ↘ **Defining an Extcommunity List**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip extcommunity-list</b> { <i>expanded-list</i>   <b>expanded</b> <i>list-name</i> } { <b>permit</b>   <b>deny</b> } [ <i>regular-expression</i> ]  |
| <b>Parameter Description</b> | <p><i>expand-list</i>: Indicates an extended extcommunity list, ranging from 100 to 199. One extcommunity list may contain multiple rules.</p> <p><i>standard-list</i>: Indicates a standard extcommunity list, ranging from 1 to 99. One extcommunity list may contain multiple rules.</p> <p><i>expanded list-name</i>: Indicates the name of an extended extcommunity, comprising not more than 32 characters. When using this parameter, you enter the extcommunity list configuration mode.</p> <p><i>standard list-name</i>: Indicates the name of a standard extcommunity list, comprising not more than 32 characters. When using this parameter, you enter the extcommunity list configuration mode.</p> <p><b>permit</b>: Defines an extcommunity rule for permitting.</p> <p><b>deny</b>: Defines an extcommunity rule for denying.</p> <p><i>regular-expression</i>: (optional) Defines a matching template that is used to match an extcommunity.</p> <p><i>sequence-number</i>: (Optional) Defines the sequence number of a rule, ranging from 1 to 2,147,483,647. If no sequence number is specified, the sequence number automatically increases by 10 when a rule is added by default. The initial number is 10.</p> <p><b>rt</b>: (Optional) Sets the RT attribute value. This command can be used only for the standard extcommunity configuration, but not for the extended extcommunity configuration.</p> <p><b>soo</b>: (Optional) Sets the SOO attribute value. This command can be used only for the standard extcommunity configuration, but not for the extended extcommunity configuration.</p> <p><i>value</i>: Indicates the value of an extended community (<i>extend_community_value</i>).</p> |
| <b>Command Mode</b>          | Global configuration mode and ip extcommunity-list configuration mode  |
| <b>Usage Guide</b>           | -  |

### 📄 Creating a Prefix-List

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip prefix-list</b> <i>prefix-list-name</i> [ <b>seq</b> <i>seq-number</i> ] { <b>deny</b>   <b>permit</b> } <i>ip-prefix</i> [ <b>ge</b> <i>minimum-prefix-length</i> ] [ <b>le</b> <i>maximum-prefix-length</i> ]  |
| <b>Parameter Description</b> | <p><i>prefix-list-name</i>: Indicates the prefix-list name.</p> <p><i>seq-number</i>: Assigns a sequence number to an prefix-list entry, ranging from 1 to 2,147,483,647. If this command does not contain the sequence number, the system will assign a default sequence number to the prefix-list entry. The default sequence number of the first entry is 5. Subsequently, the default sequence number of each entry not assigned with a value is the first multiple of 5 greater than the previous sequence number.</p> <p><b>deny</b>: Denies access when certain conditions are matched.</p> <p><b>permit</b>: Permits access when certain conditions are matched.</p> <p><i>ip-prefix</i>: Configures the IP address and mask, ranging from 0 to 32 digits.</p> <p><i>minimum-prefix-length</i>: Specifies the minimum range (namely, the start length of a range).</p> <p><i>maximum-prefix-length</i>: Specifies the maximum range (namely, the end length of a range).</p> |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | -  |

### ▾ Adding Description to a Prefix-List

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>ip prefix-list</b> <i>prefix-list-name</i> <b>description</b> <i>descripton-text</i> |
| <b>Parameter</b>    | <b><i>prefix-list-name</i></b> : Indicates the prefix-list name.                        |
| <b>Description</b>  | <b><i>descripton-text</i></b> : Describes the prefix-list.                              |
| <b>Command Mode</b> | Global configuration mode   |
| <b>Usage Guide</b>  | -   |

### ▾ Enabling the Sorting Function for a Prefix-List

|                     |                                       |
|---------------------|---------------------------------------|
| <b>Command</b>      | <b>ip prefix-list sequence-number</b> |
| <b>Parameter</b>    | -                                     |
| <b>Description</b>  |                                       |
| <b>Command Mode</b> | Global configuration mode             |
| <b>Usage Guide</b>  | -                                     |

### ▾ Creating an IPv6 Prefix-List

|                     |   |
|---------------------|---|
| <b>Command</b>      | <b>ipv6 prefix-list</b> <i>prefix-list-name</i> [ <b>seq</b> <i>seq-number</i> ] { <b>deny</b>   <b>permit</b> } <i>ipv6-prefix</i> [ <b>ge</b> <i>minimum-prefix-length</i> ] [ <b>le</b> <i>maximum-prefix-length</i> ]   |
| <b>Parameter</b>    | <b><i>prefix-list-name</i></b> : Indicates the prefix-list name.  |
| <b>Description</b>  | <p><b><i>seq-number</i></b>: Assigns a sequence number to an prefix-list entry, ranging from 1 to 2,147,483,647. If this command does not contain the sequence number, the system will assign a default sequence number to the prefix-list entry. The default sequence number of the first entry is 5. Subsequently, the default sequence number of each entry not assigned with a value is the first multiple of 5 greater than the previous sequence number.</p> <p><b>deny</b>: Denies access when certain conditions are matched.</p> <p><b>permit</b>: Permits access when certain conditions are matched.</p> <p><b><i>ipv6-prefix</i></b>: Configures the IP address and mask, ranging from 0 to 128 digits.</p> <p><b><i>minimum-prefix-length</i></b>: Specifies the minimum range (namely, the start length of a range).</p> <p><b><i>maximum-prefix-length</i></b>: Specifies the maximum range (namely, the end length of a range).</p> |
| <b>Command Mode</b> | Global configuration mode   |
| <b>Usage Guide</b>  | -   |

### ▾ Adding Description to an IPv6 Prefix List

# 1 Configuring IP Multicast

## 1.1 Overview

IP multicast is abstracted hardware multicasting and an extended multicast routing protocol on the standard IP network layer. In traditional IP transmission, only one host can send packets to a single host (unicast communication) or all hosts (broadcast communication). However, the multicast technology provides the third choice: a host can send packets to certain specified hosts.

IP multicast is applicable to one-to-many multimedia applications.

## 1.2 Applications

| Application                         | Description   |
|-------------------------------------|---|
| <a href="#">PIM-DM Applications</a> | The PIM-DM multicast service is provided on the same network. |
| <a href="#">PIM-SM Applications</a> | The PIM-SM multicast service is provided on the same network. |

### 1.2.1 PIM-DM Applications

#### Scenario

The PIM-DM multicast service is provided on the same network.

As shown in Figure 1-1:

- A multicast source sends a multicast packet, and receiver A and receiver B on the same network receive the multicast packet.

Figure 1-1

|                |  |
|----------------|--|
| <b>Remarks</b> | A and B are layer-3 devices and C is a layer-2 access device.<br>Source is connected to the Gi 0/1 interface of A, and receiver A and receiver B are connected to the Gi 0/2 and Gi 0/3 interfaces of C. |
|----------------|--|

## Deployment

- Run the Open Shortest Path First (OSPF) protocol on the same network to implement unicast routing.
- Run PIM-DM on the same network to implement multicast routing.
- Run the Internet Group Membership Protocol (IGMP) in a user host network segment to implement group member management.

### 1.2.2 PIM-SM Applications

#### Scenario

The PIM-SM multicast service is provided on the same network.

As shown in Figure 1-2:

- A multicast source sends a multicast packet, and receiver A and receiver B on the same network receive the multicast packet.

Figure 1-2

|                |   |
|----------------|---|
| <b>Remarks</b> | A, B, and C are layer-3 routers.<br>The multicast source is connected to the Gi 0/1 interface of A, receiver B is connected to the Gi 0/1 interface of B, and receiver B is connected to the Gi 0/1 interface of C. |
|----------------|---|

## Deployment

- Run OSPF on the same network to implement unicast routing.
- Run PIM-SM on the same network to implement multicast routing.
- Run IGMP in a user host network segment to implement group member management.

## 1.3 Features

### Basic Concepts

---

#### ↘ PIM Routers and PIM Interfaces

Routers enabled with PIM are called PIM routers. Interfaces enabled with PIM protocol are called PIM interfaces.

Multicast packets are forwarded on PIM routers. The PIM interfaces for receiving multicast packets are called upstream interfaces, and the PIM interfaces for sending multicast packets are called downstream interfaces.

The network segments where upstream interfaces are located are called upstream network segments. The network segments where downstream interfaces are located are called downstream network segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On certain PIM interfaces, borders are configured to divide a large PIM network into multiple PIM domains. Borders may reject specified multicast packets or limit transmission of PIM messages.

#### ↘ Multicast Distribution Tree, DR and RP

Multicast packets are transmitted from one point to multiple points. The forwarding path is in a tree structure. This forwarding path is called a multicast distribution tree (MDT) and has the following types:

- Rendezvous Point Tree (RPT): The RP is regarded as the root and the designated router (DR) that connects group members is regarded as a leaf.
- Shortest Path Tree (SPT): The DR that connects multicast sources is regarded as the root, and RP or DR that connects group members is regarded as a leaf.

The DR and RP are functional roles for a PIM router.

- The RP collects multicast sources and group member information on the network.
- The DR that connects multicast sources reports multicast source information to the RP. The DR that connects group members reports group member information to the RP.

#### ↘ (\*,G) and (S,G)

- (\*,G): Packets sent from any source to group G, routing entries corresponding to the packets, and forwarding path (RPT) corresponding to the packets.
- (S,G): Packets sent from source S to group G, routing entries corresponding to the packets, and forwarding path (SPT) corresponding to the packets.

#### ↘ ASM and SSM

PIM-SM supports the following multicast models that are applicable to different multicast address segments:

- Any-Source Multicast (ASM): In the ASM model, user hosts cannot select multicast sources. User hosts join a group and receive packets sent from all sources to the group.
- Source-Specific Multicast (SSM): In the SSM model, user hosts can select multicast sources. User hosts specify source addresses when joining a group and receive only packets sent from specified sources to the group.

**i** SSM model requirements: User hosts must know the multicast source address in advance using other network services so that the hosts can select multicast sources.

## Overview

| Feature  | Description   |
|--|---|
| <a href="#">Configuring Basic Functions of IP Multicast</a>  | Creates a PIM network and provides data sources and user terminals on the network with the IPv4 multicast service.  |
| <a href="#">Configuring a TTL Threshold</a>  | Configures a TTL threshold for an interface, that is, the minimum TTL value of multicast packets allowed on an interface.   |
| <a href="#">Configuring the Number of Entries That Can Be Added to the Multicast Routing Table</a> | Limits the number of entries that can be added to the multicast routing table.  |
| <a href="#">Configuring an IP Multicasting Border</a>  | Configures an interface as a multicast border for a specified group.  |
| <a href="#">Configuring an IP Multicasting Static Route</a>  | Allows the multicast forwarding path to be different from the unicast path.   |
| <a href="#">Configuring Layer-2 Direction Control for Multicast Streams</a>                        | Allows a specified multicast stream to be configured with multiple commands, that is, to be configured with multiple ports that can forward the stream. Once direction control is configured for a multicast stream, the stream can be forwarded only by these configured interfaces. Other interfaces are not permitted to forward the stream. |
| <a href="#">Configuring RPF Route Selection Based on the Longest Match Rule</a>                    | Selects an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table according to RPF rules. Among these three routes, the one with the longest match mask is selected as the RPF route.  |

| Feature   | Description  |
|---|--|
| <a href="#">Configuring Multicast Non-Stop Forwarding Parameters</a>  | During normal running, SSP synchronizes the hardware multicast forwarding table to the management board in real time. After the management board is switched, the command for configuring the multicast control plane of the original slave management board is loaded, and the multicast protocol (such as PIM-SM or IGMP Snooping) re-converges. The multicast non-stop forwarding function ensures continuous forwarding of multicast data streams during re-convergence of the multicast protocol. |
| <a href="#">Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries</a> | Deletes the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries.  |

### 1.3.1 Configuring Basic Functions of IP Multicast

Create a PIM network and provide data sources and user terminals on the network with the IPv4 multicast service.

#### Working Principle

A device maintains the routing table for forwarding multicast packets through multicast routing protocols (such as PIM-DM or PIM-SM) and learns the states of group members in the directly connected network segment through IGMP. A host sends IGMP Report messages to join a specified IGMP group.

#### Related Configuration

##### ▾ [Enabling IPv4 Multicast Routing](#)

By default, IPv4 multicast routing is disabled.

Run **ip multicast-routing** to enable IPv4 multicast routing.

##### ▾ [Configuring IP Multicast on an Interface](#)

By default, IP multicast is disabled on an interface.

Run **ip pim sparse-mode** or **ip pim dense-mode** to enable IP multicast on an interface.

### 1.3.2 Configuring a TTL Threshold

Configure a TTL threshold for an interface, that is, the minimum TTL value of multicast packets allowed on an interface.

## Working Principle

Configure a TTL threshold for an interface and check the TTL values of multicast packets. Multicast packets whose TTL values are larger than the TTL threshold of the interface are forwarded and those whose TTL values are smaller are discarded.

## Related Configuration

### ▾ Configuring a TTL Threshold

By default, the TTL threshold of an interface is 0.

Run **ip multicast ttl-threshold** *ttl-value* to change the TTL threshold of an interface. The value ranges from 0 to 255.

A larger value of *ttl-value* means a larger TTL value of multicast packets to be forwarded.

## 1.3.3 Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

Each multicast data packet received on the device maintains a corresponding IP multicast route forwarding entry. However, excess multicast routing entries may exhaust device memory and deteriorate device performance. You can limit the number of entries in the IP multicast routing table based on the actual network and service performance requirements.

## Working Principle

The number of entries in the IP multicast routing table is limited based on the actual network and service performance requirements to ensure device performance.

## Related Configuration

### ▾ Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

By default, a maximum of 1024 entries can be added to an IP multicast routing table.

Run **ip multicast route-limit** *limit* [ *threshold* ] to change the number of entries that can be added to the IP multicast routing table. The value ranges from 1 to 65536.

A larger value of *limit* means a larger number of entries that can be added to the IP multicast routing table.

## 1.3.4 Configuring an IP Multicasting Border

Configure an IP multicasting border to specify the transmission range of multicast packets.

## Working Principle

An IP multicasting border is configured to specify the transmission range of multicast packets. When an IP multicasting border is configured on an interface, this interface cannot forward or receive multicast packets, including those sent from the local host.

## Related Configuration

---

### ↘ Configuring an IP Multicasting Border

By default, no IP multicasting border is configured.

Run **ip multicast boundary** *access-list* [ **in** | **out** ] to configure an IP multicasting border.

## 1.3.5 Configuring an IP Multicasting Static Route

Configure an IP multicasting static route to specify an RPF interface or RPF neighbor for multicast packets from specified multicast sources.

### Working Principle

---

An RPF check is performed once multicast packets are forwarded. An IP multicasting static route can be configured to specify an RPF interface or RPF neighbor for multicast packets from specified multicast sources.

## Related Configuration

---

### ↘ Configuring an IP Multicasting Static Route

By default, no IP multicasting static route is configured.

Run **ip mroute** *source-address mask* { [ **bgp** | **isis** | **ospf** | **rip** | **static** ] { *v4rpf-address* | *interface-type interface-number* } } [ *distance* ] to configure an IP multicasting static route.

## 1.3.6 Configuring Layer-2 Direction Control for Multicast Streams

Configure layer-2 direction control for multicast streams to control the forwarding of multicast streams on an interface.

### Working Principle

---

Configure layer-2 direction control for multicast streams and a forwarding interface so that multicast streams can be forwarded only through configured interfaces. In this case, layer-2 forwarding of multicast streams can be controlled.

## Related Configuration

---

### ↘ Configuring Layer-2 Direction Control for Multicast Streams

By default, layer-2 direction control for multicast streams is disabled.

Run **ip multicast static** *source-address group-address interface-type interface-number* to configure layer-2 direction control for multicast streams.

## 1.3.7 Configuring RPF Route Selection Based on the Longest Match Rule

Select an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table and select the one with the longest match mask as the RPF route from the three optimal routes.

## Working Principle

A multicast static route, an MBGP route, and a unicast route that can be used for RPF check are selected respectively from the multicast static routing table, MBGP routing table, and unicast routing table according to RPF rules.

- If the longest match rule is used, the route with the longest match mask is selected as the RPF route. If the three routes have the same mask, the one with the highest priority is selected as the RPF route. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.
- Otherwise, the one with the highest priority is selected as the RPF route. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.

## Related Configuration

### 📄 Configuring RPF Route Selection Based on the Longest Match Rule

By default, the route with the highest priority is selected as the RPF route. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.

Run **ip multicast rpf longest-match** to configure RPF route selection based on the longest match rule.

## 1.3.8 Configuring Multicast Non-Stop Forwarding Parameters

The non-stop forwarding function ensures continuous forwarding of multicast data streams during the re-convergence of multicast protocols.

## Working Principle

During normal running, SSP synchronizes the hardware multicast forwarding table to the management board in real time. After the management board is switched, the command for configuring the multicast control plane of the original slave management board is loaded, and the multicast protocol (such as PIM-SM or IGMP Snooping) re-converges. The multicast non-stop forwarding function ensures continuous forwarding of multicast data streams during re-convergence of multicast protocols.

After the configured protocol convergence period times out, all multicast forwarding table entries that are not updated during the convergence period are deleted.

## Related Configuration

### 📄 Configuring the Maximum Period for Multicast Protocol Convergence

By default, the maximum period for multicast protocol convergence is 20s.

Run **msf nsf convergence-time *time*** to configure the maximum period for multicast protocol convergence. The value ranges from 0 to 3600s.

A larger value of *time* means a longer maximum period for multicast protocol convergence.

### 📄 Configuring the Multicast Packet Leakage Period

By default, the multicast packet leakage period is 30s.

Run **msf nsf leak interval** to configure the multicast packet leakage period. The value ranges from 0 to 3600s.

A larger value of *interval* means a longer leakage period.

### 1.3.9 Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries

Delete the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries.

#### Working Principle

Delete the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries .

#### Related Configuration

##### ▾ [Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries](#)

By default, the overwriting mechanism upon the overflow of multicast hardware forwarding entries is disabled.

Run **msf ipmc-overflow override** to configure the overwriting mechanism upon overflow of multicast hardware forwarding entries.

## 1.4 Configuration

| Configuration  | Description and Command   |  |
|--|---|--|
| <a href="#">Configuring Basic Functions of IP Multicast</a>  |  (Mandatory) It is used to configure the multicast service.  |  |
|  | <b>ip multicast-routing</b>   | Enables the IPv4 multicast routing function.                                   |
| <a href="#">Configuring a TTL Threshold</a>  |  Optional.   |  |
|  | <b>ip multicast ttl-threshold</b> <i>ttl-value</i>  | Configures a TTL threshold for an interface.                                   |
| <a href="#">Configuring the Number of Entries That Can Be Added to the Multicast Routing Table</a> | <b>ip multicast route-limit</b> <i>limit</i> [ <i>threshold</i> ]   | Limits the number of entries that can be added to the multicast routing table. |
| <a href="#">Configuring an IP Multicasting Border</a>  | <b>ip multicast boundary</b> <i>access-list</i> [ <b>in</b>   <b>out</b> ]  | Configures an interface as a multicast border for a specified group.           |
| <a href="#">Configuring an IP Multicasting Static Route</a>  | <b>ip mroute</b> <i>source-address mask</i> { [ <b>bgp</b>   <b>isis</b>   <b>ospf</b>   <b>rip</b>   <b>static</b> ] { <i>v4rpf-address</i>   <i>interface-type interface-number</i> } } [ <i>distance</i> ] | Configures an IP multicasting static route.                                    |

|   |   |  |
|---|---|--|
| <a href="#">Configuring Layer-2 Direction Control for Multicast Streams</a>                                 | <b>ip multicast static</b> <i>source-address</i><br><i>group-address</i> <i>interface-type</i><br><i>interface-number</i> | Controls the direction of data streams on layer-2 interfaces.                                |
| <a href="#">Configuring RPF Route Selection Based on the Longest Match Rule</a>                             | <b>ip multicast rpf longest-match</b>   | Configures RPF route selection based on the longest match rule.                              |
| <a href="#">Configuring Multicast Non-Stop Forwarding Parameters</a>  | <b>msf nsf convergence-time</b> <i>time</i>   | Configures the maximum period for multicast protocol convergence.                            |
|   | <b>msf nsf leak</b> <i>time</i>   | Configures the multicast packet leakage period.  |
| <a href="#">Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries</a> | <b>msf ipmc-overflow override</b>   | Configures the overwriting mechanism upon overflow of multicast hardware forwarding entries. |

## 1.4.1 Configuring Basic Functions of IP Multicast

### Configuration Effect

- Create a PIM network and provide data sources and user terminals on the network with the IPv4 multicast service.

### Notes

- A PIM network needs to use existing unicast routes on the network. Therefore, IPv4 routes must be configured on the network.

### Configuration Steps

#### ▾ Enabling IPv4 Multicast Routing

- Mandatory.
- IPv4 multicast routing should be enabled on each router unless otherwise specified.

#### ▾ Enabling IP Multicast for an Interface

- Mandatory.
- IP multicast protocol should be enabled on interfaces unless otherwise specified:

### Verification

Enable multicast sources to send multicast packets and user hosts to join the groups.

- Check whether the user hosts can successfully receive packets from each group.

## Configuration Example

### Creating the IP Multicast Service on the IPv4 Network and Supporting PIM-DM

|  |   |
|--|---|
| <p><b>Scenario</b><br/><b>Figure 1-3</b></p> |  <p>The diagram illustrates a network topology for IP multicast. On the left, a 'Multicast Source' (server icon) is connected to Router A via interface Gi0/1. Router A is connected to Router B via interface Gi0/2 on both ends. Router B is connected to 'Receiver A' (server and laptop icon) via interface Gi0/1.</p> |
| <p><b>Configuration Steps</b></p>            | <ul style="list-style-type: none"> <li>● Configure an IPv4 unicast routing protocol (such as OSPF) on a router.</li> <li>● Enable IPv4 multicast routing on all routers.</li> <li>● Enable PIM-DM on device interconnection interfaces and interfaces for connecting user hosts and multicast sources.</li> </ul>   |
| <p><b>A</b></p>                              | <pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if)# ip pim dense-mode A(config-if)# exit A(config)# interface GigabitEthernet 0/2 A(config-if)# ip pim dense-mode A(config-if)# exit</pre>  |
| <p><b>B</b></p>                              | <pre>B# configure terminal B(config)# ip multicast-routing B(config)# interface GigabitEthernet 0/1 B(config-if)# ip pim dense-mode B(config-if)# exit B(config)# interface GigabitEthernet 0/2 B(config-if)# ip pim dense-mode B(config-if)# exit</pre>  |
| <p><b>Verification</b></p>                   | <p>Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.3). Enable receiver A to join G.</p>   |

|          |  |
|----------|--|
|          | <ul style="list-style-type: none"> <li>● Check multicast packets received by receiver A. Receiver A should be able to receive multicast packets from G.</li> <li>● Check multicast forwarding tables on A and B.</li> </ul>  |
| <b>A</b> | <pre>A# show ip mroute  IP Multicast Routing Table  Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group  Timers: Uptime/Stat Expiry  Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.3), uptime 00:01:55, stat expires 00:02:19  Owner PIMDM, Flags: TFS    Incoming interface: GigabitEthernet 0/1    Outgoing interface list:      GigabitEthernet 0/2 (1)</pre> |
| <b>B</b> | <pre>B# show ip mroute  IP Multicast Routing Table  Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group  Timers: Uptime/Stat Expiry  Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.3), uptime 00:00:35, stat expires 00:02:55  Owner PIMDM, Flags: TFS    Incoming interface: GigabitEthernet 0/2    Outgoing interface list:      GigabitEthernet 0/1 (1)</pre> |

## Common Errors

- An IPv4 unicast route is incorrectly configured.

- IPv4 multicast routing is not enabled on a router.
- IP multicast is not enabled on an interface.

## 1.4.2 Configuring a TTL Threshold

### Configuration Effect

- Configure a TTL threshold for an interface and check the TTL values of multicast packets. Multicast packets whose TTL values are larger than the TTL threshold of the interface are forwarded and those whose TTL values are smaller are discarded.

### Notes

- The basic functions of IP multicast must be configured.

### Configuration Steps

- Set a TTL threshold on PIM router interfaces unless otherwise specified.

### Verification

Enable multicast sources to send multicast packets and user hosts to join the groups.

- Set a TTL threshold to a value that is larger than the TTL value of the multicast packet on the PIM router interface directly connected to the user host and check whether the user can receive the multicast packet.

### Related Commands

#### ↘ Configuring a TTL Threshold

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>ip multicast ttl-threshold <i>ttl-value</i></code>   |
| <b>Parameter Description</b> | <i>ttl-value</i> : Specifies a TTL threshold for an interface. The value ranges from 0 to 255. The default value is 0.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | A multicast-enabled device can retain a TTL threshold for each interface. Multicast packets whose TTL values are larger than the TTL threshold of the interface are forwarded and those whose TTL values are smaller are discarded. A TTL threshold takes effect only for multicast frames and must be configured on layer-3 interfaces. |

### Configuration Example

### 1.4.3 Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

#### Configuration Effect

- Each multicast data packet received on the device maintains a corresponding IP multicast route forwarding entry. However, excess multicast routing entries may exhaust device memory and deteriorate device performance. You can limit the number of entries in the IP multicast routing table based on the actual network and service performance requirements.

#### Notes

- The basic functions of IP multicast must be configured.

#### Configuration Steps

- Limit the number of entries in the IP multicast routing table based on the actual network and service performance requirements.

#### Verification

Send N groups of multicast packets from the multicast source on the network, configure user hosts to join the groups, configure the number of entries that can be added to the IP multicast routing table as N-1, and check whether the multicast packet received by the user host is that of the N-1 group.

## Related Commands

## Common Errors

- An IPv4 unicast route is incorrectly configured.

## 1.4.4 Configuring an IP Multicasting Border

### Configuration Effect

- Configure an IP multicasting border to specify the transmission range of multicast packets.

### Notes

- The basic functions of IP multicasting must be configured.

### Configuration Steps

- Configure an IP multicasting border on PIM router interfaces unless otherwise specified.

### Verification

Enable multicast sources to send multicast packets and user hosts to join the groups. Configure an IP multicasting border on the PIM router interface connected to the user host and check whether the user can receive the multicast packet.

|------------------------------|---|
| <b>Command</b>               | <code>ip multicast boundary access-list [ in   out ]</code>   |
| <b>Parameter Description</b> | <i>access-list</i> : Indicates the group address range defined by ACL.<br><i>in</i> : Indicates that the IP multicasting border takes effect in the incoming direction of the multicast stream.<br><i>out</i> : Indicates that the IP multicasting border takes effect in the outgoing direction of the multicast stream.   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | After this command is executed, IGMP and PIM-SM packets in the group range are filtered on this interface and multicast data streams are not going in and out through this interface.<br>The ACL associated with this command can be a standard ACL or an extended ACL. For extended ACLs, only the destination address is matched and the source address is matched. |

## Configuration Example

### ▾ Creating the IP Multicast Service on the IPv4 Network and Configuring an IP Multicasting Border

|                               |   |
|-------------------------------|---|
| <b>Scenario</b><br>Figure 1-6 |   |
| <b>Configuration Steps</b>    | <ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicast. (Omitted)</li> <li>● Configure an ACL on device A.</li> <li>● Configure an IP multicasting border on the Gi 0/1 interface of device A.</li> </ul>   |
| <b>A</b>                      | <pre>A# configure terminal A(config)#ip access-list standard ip_multicast A(config-std-nacl)#deny any A(config-std-nacl)#exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ip multicast boundary ip_multicast A A(config-if-GigabitEthernet 0/1)# exit</pre> |

|                     |  |
|---------------------|--|
|                     |  |
| <b>Verification</b> | Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.3). Enable receiver A to join G. <ul style="list-style-type: none"> <li>● Run <b>debug ip pim sparse-mode events</b>.</li> </ul>   |
| <b>A</b>            | <pre> A# debug ip pim sparse-mode events  Jan  1 20:58:34: %7: VRF(0): No cache message: src 192.168.1.100 for 233.3.3.3 vif 2  *Jan  1 20:58:34: %7: VRF(0): Ignore No cache message: src 192.168.1.100 for 233.3.3.3 vif 2 in PIM_BOUNDARY_FLT_BOTH range                 </pre> |

**Common Errors**

- An IPv4 unicast route is incorrectly configured.

**1.4.5 Configuring an IP Multicasting Static Route**

**Configuration Effect**

- Configure an IP multicasting static route to specify an RPF interface or RPF neighbor for multicast packets from specified multicast sources.

**Notes**

- The basic functions of IP multicast must be configured.

**Configuration Steps**

- An IP multicasting static route can be configured on each device unless otherwise specified.

**Verification**

Run **show ip rpf source-address** to check the RPF information of a specified source.

**Related Commands**

↘ **Configuring Basic Functions of IP Multicast**

|                              |  |
|------------------------------|--|

### Common Errors

- An IPv4 unicast route is incorrectly configured.
- IPv4 multicast routing is not enabled on a router.

## 1.4.6 Configuring Layer-2 Direction Control for Multicast Streams

### Configuration Effect

Configure layer-2 direction control for multicast streams to control the forwarding of multicast streams on an interface.

### Notes

- The basic functions of IP multicast must be configured.

## Configuration Steps

- Layer-2 direction control for multicast streams can be configured on layer-2 devices unless otherwise specified.

## Verification

Send multicast packets on the network containing layer-2 device A, connect multiple user hosts to VLAN 1 of layer-2 device A to receive the group, configure layer-2 direction control for multicast streams on device A, and check whether multicast packets are sent to the configured layer-2 interface.

## Related Commands

### Configuring Layer-2 Direction Control for Multicast Streams

|------------------------------|--|
| <b>Command</b>               | <b>ip multicast static</b> <i>source-address group-address interface-type interface-number</i>   |
| <b>Parameter Description</b> | <i>source -address</i> : Specifies the multicast source address.<br><i>group-address</i> : Specifies the multicast group address.<br><i>interface-type interface-number</i> : Specifies a layer-2 interface that is allowed to forward the multicast flow.   |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | Allow a specified multicast flow to be configured with multiple commands, that is, to be configured with multiple interfaces. Once direction control is configured for a multicast stream, the stream can be forwarded only by these configured interfaces. Other interfaces are not permitted to forward the stream.<br><br>This command controls only the forwarding of multicast streams on the interface, but does not directly affect the processing of multicast protocols on the protocol packets. However, since certain features of the multicast protocol are driven by multicast data streams, behaviors of the multicast routing protocols may also be affected. |

## Configuration Example

### Creating the IP Multicast Service on the IPv4 Network and Configuring Layer-2 Direction Control for Multicast Streams

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>Configure the basic functions of IP multicast. (Omitted)</li> <li>Configure layer-2 direction control for multicast streams on device B so that the streams are sent only to the Gi 0/2 interface.</li> </ul>  |
| <b>B</b>                   | <pre>A# configure terminal A(config)# ip multicast static 192.168.1.100 233.3.3.3 gigabitEthernet0/2</pre>  |
| <b>Verification</b>        | <p>Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.1). Enable receivers A and B to join G.</p> <ul style="list-style-type: none"> <li>Check multicast packets received by receiver A. Receiver B should not be able to receive multicast packets from G.</li> </ul> |

### Common Errors

- An IPv4 unicast route is incorrectly configured.

## 1.4.7 Configuring RPF Route Selection Based on the Longest Match Rule

### Configuration Effect

- Select an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table and select the one with the longest match mask as the RPF route from the three optimal routes.

### Notes

- The basic functions of IP multicast must be configured.

### Configuration Steps

- Configure RPF route selection based on the longest match rule on each device unless otherwise specified.

### Verification

Configure a multicast static route and a unicast static route to have the same priority and configure the unicast static route to have a longer mask length.

- Run **show ip rpf source-address** to check the RPF information of a specified source.

## 1.4.9 Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries

### Configuration Effect

- Delete the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries.

### Notes

- The basic functions of IP multicast must be configured.

### Configuration Steps

- The overwriting mechanism upon overflow of multicast hardware forwarding entries can be configured on each device unless otherwise specified.

### Verification

Run **show running-config** to check whether the overwriting mechanism upon overflow of multicast hardware forwarding entries is configured.

### Related Commands

## 1.5 Monitoring

### Displaying

| Description   | Command             |
|---|---------------------|
| Displays the IPv4 multi-layer multicast forwarding table. | <b>show msf msc</b> |

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description  | Command                     |
|--|-----------------------------|
| Debugs the processing of IPv4 multi-layer multicast packet forwarding.                       | <b>debug msf forwarding</b> |
| Debugs the operation on multi-layer multicast forwarding entries on an IPv4 network.         | <b>debug msf mfc</b>        |
| Debugs the bottom-layer hardware processing of IPv4 multi-layer multicast packet forwarding. | <b>debug msf ssp</b>        |
| Debugs the invocation of API interfaces provided by IPv4 multi-layer multicast forwarding.   | <b>debug msf api</b>        |
| Debugs the processing of multi-layer multicast forwarding events on an IPv4 network.         | <b>debug msf event</b>      |

## 2 Configuring IPv6 Multicast

### 2.1 Overview

IPv6 multicast is enrichment and enhancement of IPv4 multicast. In comparison with IPv4 multicast, the IPv6 multicast address mechanism is greatly enriched.

In traditional IP transmission, a host is allowed to send packets only to a single host (unicast communication) or all hosts (broadcast communication). The multicast technology provides a third choice: A host is allowed to send packets to certain hosts.

The IP multicast technology is applicable to one-to-many multimedia applications.

#### Protocols and Standards

IPv6 multicast covers the following protocols:

- Multicast Listener Discovery (MLD): Runs between a multicast device and a host, and tracks and learns relationships of group members.
- Protocol Independent Multicast – Sparse Mode for IPv6 (PIM-SMv6): Runs between devices and implements multicast packet forwarding by establishing a multicast routing table.

### 2.2 Applications

| Application                                     | Description   |
|---|---|
| <a href="#">Typical Application of PIM-SMv6</a> | The PIM-SMv6 multicast service is provided in the same network. |

#### 2.2.1 Typical Application of PIM-SMv6

##### Scenario

The PIM-SMv6 multicast service is provided in the same network.

As shown in the following figure:

- R1 and the multicast source are in the same network, R2 is configured as a rendezvous point (RP), R3 is in the same network as Receiver A, and R4 is in the same network as Receiver B. Assume that devices and hosts are correctly connected, IPv6 is enabled on each interface, and IPv6 unicast is enabled on each device.

Figure 2-1

|                |   |
|----------------|---|
| <b>Remarks</b> | <p>R1, R2, R3, and R4 are Layer-3 devices and R2 functions as an RP.</p> <p>The multicast source is directly connected to R1, Receiver A is directly connected to R3, and Receiver B is directly connected to R4.</p> |
|----------------|---|

### Deployment

- Run the Open Shortest Path First for IPv6 (OSPFv6) protocol in the same network to implement unicast routing.
- Run the PIM-SMv6 protocol in the same network to implement multicast routing.

## 2.3 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

Routers where the PIM protocol is enabled are called PIM routers. Interfaces where the PIM protocol is enabled are called PIM interfaces.

Multicast packets are forwarded by PIM routers. The PIM interfaces for receiving multicast packets are called upstream interfaces, and the PIM interfaces for transmitting multicast packets are called downstream interfaces.

Network segments where upstream interfaces are located are called upstream network segments. Network segments where downstream interfaces are located are called downstream network segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On some PIM interfaces, borders are set to divide a large PIM network into multiple PIM domains. The borders may reject specific multicast packets or limit transmission of PIM messages.

#### ↘ Multicast Distribution Tree, DR, RP

Multicast packets are transmitted from one point to multiple points. The forwarding path presents a tree structure. This forwarding path is called a multicast distribution tree (MDT). MDTs are classified into two types:

- Rendezvous point tree (RPT): Uses the rendezvous point (RP) as the root and designated routers (DRs) connected to group members as leaves.
- Shortest path tree (SPT): Use the DR connected to a multicast source as the root and the RPs or DRs connected to group members as leaves.

DRs and RPs are function roles of PIM routers.

- RPs collect information about multicast sources and group members in the network.
- The DR connected to a multicast source reports multicast source information to the RP and the DRs connected to group members report the group member information to the RP.

### ↘ (\*,G), (S,G)

- (\*,G): Indicates the packets transmitted from any source to Group G, routing entries corresponding to the packets, and forwarding path (RPT) corresponding to the packets.
- (S,G): Indicates the packets transmitted from Source S to Group G, routing entries corresponding to the packets, and forwarding path (SPT) corresponding to the packets.

### ↘ ASM, SSM

PIM-SM supports two multicast service models: any-source multicast (ASM) and source-specific multicast (SSM), which are applicable to different multicast address segments.

- ASM: In the ASM model, a user host cannot select a multicast source. The user host joins a multicast group and receives all packets sent from all sources to the multicast group.
- SSM: In the SSM model, a user host can select a multicast source. The user host specifies the source address when joining a multicast group, and then receives packets only from the specified source to the multicast group.

**i** SSM model requirement: Other network services must be used to enable a user host to know the position of a multicast source in advance so that the user host selects the multicast source.

## Overview

| Feature   | Description   |
|---|---|
| <a href="#">Configuring IPv6 Multicast Basic Functions</a>  | Creates a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network. |
| <a href="#">Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table</a> | Restricts the number of entries that can be added to the multicast routing table.                               |

| Feature   | Description  |
|---|--|
| <a href="#">Configuring the IPv6 Multicast Border</a>                                       | Sets an interface as the multicast border of a specific group range.   |
| <a href="#">Configuring IPv6 Multicast Static Routing</a>                                   | Configures multicast static routing to adopt multicast forwarding paths different from unicast forwarding paths.   |
| <a href="#">Configuring Layer-2 Flow Direction Control for Multicast Streams</a>            | Multiple commands can be configured for a multicast stream, that is, multiple ports can be allowed to forward the multicast stream. If flow direction control is configured for a multicast stream, the multicast stream can be forwarded only by the configured ports. Other ports are not allowed to forward the multicast stream. |
| <a href="#">Configuring RPF Route Selection According to the Longest Matching Principle</a> | One optimal route is selected from each of the multicast static routing table, MBGP routing table, and unicast routing table according to RPF rules. Among the three optimal routes, the route with the longest subnet mask matching is selected as the RPF route.   |

### 2.3.1 Configuring IPv6 Multicast Basic Functions

Create a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.

#### Working Principle

A device maintains the routing table used for multicast packet forwarding over an IPv6 multicast routing protocol (such as PIM-SMv6), and learns information about the status of group members in the directly-connected network segments over the MLDv1/v2 protocol. A host joins a specific IPv6 multicast group by transmitting the MLD REPORT message.

#### Related Configuration

##### ↘ Enabling the IPv6 Multicast Routing Function

The IPv6 multicast routing function is disabled by default.

Run the **ipv6 multicast-routing** command to enable the IPv6 multicast routing function.

##### ↘ Configuring an IP Multicast Protocol on an Interface

The IPv6 multicast protocol is disabled on an interface by default.

Run the **ipv6 pim dense-mode** command to enable the IPv6 multicast protocol on an interface.

### 2.3.2 Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table

Every multicast data packet received by the device is used to maintain relevant IPv6 multicast routing entries. Excessive multicast routing entries, however, may deplete the device memory and degrade the device performance. Users can restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements.

## Working Principle

Restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements, so as to sustain the device performance.

## Related Configuration

### ▾ [Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table](#)

By default, 1,024 entries can be added to the IP multicast routing table.

Run the **ipv6 multicast route-limit** *limit* [ *threshold* ] command to adjust the number of entries that can be added to the IPv6 multicast routing table. The value ranges from 1 to 65,536.

A larger value of *limit* means that more entries can be added to the IPv6 multicast routing table, and a smaller value of *limit* means that fewer entries can be added to the IPv6 multicast routing table.

## 2.3.3 Configuring the IPv6 Multicast Border

Configure the IPv6 multicast border to restrict the transmission scope of multicast packets.

### Working Principle

Configure the multicast border to specify the transmission scope of multicast packets. When the multicast forwarding border is configured on an interface, multicast packets including multicast packets sent by the local device cannot be forwarded or received by this interface.

### Related Configuration

#### ▾ [Configuring the IPv6 Multicast Border](#)

No multicast border is configured by default.

Run the **ipv6 multicast boundary** *access-list-name* [ *in* | *out* ] command to configure the multicast border.

## 2.3.4 Configuring IPv6 Multicast Static Routing

Configure IPv6 multicast static routing to specify a reverse path forwarding (RPF) interface or RPF neighbor for multicast packets from a specific multicast source.

### Working Principle

The RPF check is conducted during forwarding of multicast packets. IPv6 multicast static routing can be configured to specify an RPF interface or RPF neighbor for multicast packets from a specific multicast source.

### Related Configuration

#### ▾ [Configuring IPv6 Multicast Static Routing](#)

No multicast static routing is configured by default.

Run the **ipv6 mroute** *ipv6-prefix/prefix-length* [ **bgp** | **isis** | **ospfv3** | **ripng** | **static** ] { *ipv6-prefix* | *interface-type interface-number* } [ *distance* ] command to configure IPv6 multicast static routing.

### 2.3.5 Configuring Layer-2 Flow Direction Control for Multicast Streams

Configure Layer-2 flow direction control for multicast streams to control the forwarding behavior of multicast streams on ports.

#### Working Principle

Configure Layer-2 flow direction control for multicast streams to configure the ports that are allowed to forward multicast streams. Then, multicast streams are forwarded only by the configured ports, thereby controlling Layer-2 forwarding of multicast streams.

#### Related Configuration

##### ↳ Configuring Layer-2 Flow Direction Control for Multicast Streams

Layer-2 flow direction control is disabled for multicast streams by default.

Run the **ipv6 multicast static** *source-address group-address interface-type interface-number* command to configure the Layer-2 flow direction control for multicast streams.

### 2.3.6 Configuring RPF Route Selection According to the Longest Matching Principle

Among the three optimal routes selected from the multicast static routing table, Multiprotocol Border Gateway Protocol (MBGP) routing table, and unicast routing table, select the optimal route with the longest subnet mask matching as the RPF route.

#### Working Principle

According to RPF rules, select a multicast static route, MBGP route, and unicast route used for the RPF check respectively from the multicast static routing table, MBGP routing table, and unicast routing table.

- If route selection according to the longest matching principle is configured, the route with the longest subnet mask matching is selected out of the three routes as the RPF route. If the three routes share the same subnet mask, the route with the highest priority is selected. If the three routes have the same priority, the RPF route is selected according to the sequence of multicast static route, MBGP route, and unicast route.
- If route selection according to the longest matching principle is not configured, the route with the highest priority is selected. If the three routes have the same priority, the RPF route is selected according to the sequence of multicast static route, MBGP route, and unicast route.

#### Related Configuration

##### ↳ Configuring RPF Route Selection According to the Longest Matching Principle

A route with the highest priority is selected as the RPF route by default. If the routes have the same priority, the RPF route is selected according to the sequence of multicast static route, MBGP route, and unicast route.

Run the **ipv6 multicast rpf longest-match** command to configure RPF route selection according to the longest matching principle.

## 2.4 Configuration

| Configuration   | Description and Command  |   |
|---|--|---|
| <a href="#">Configuring IPv6 Multicast Basic Functions</a>  | ⚠ (Mandatory) It is used to create a multicast service.  |   |
|   | <b>ipv6 multicast-routing</b>  | Enables the IPv6 multicast routing function.                                      |
| <a href="#">Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table</a> | ⚠ Optional.  |   |
|   | <b>ipv6 multicast route-limit limit [ threshold ]</b>  | Restricts the number of entries that can be added to the multicast routing table. |
| <a href="#">Configuring the IPv6 Multicast Border</a>   | <b>ipv6 multicast boundary access-list-name [ in   out ]</b>   | Sets an interface as the multicast border of a specific group range.              |
| <a href="#">Configuring IPv6 Multicast Static Routing</a>   | <b>ipv6 mroute ipv6-prefix/prefix-length [ protocol ] { v6rpf-address   interface-type interface-number } [ distance ]</b> | Configures IPv6 multicast static routing.   |
| <a href="#">Configuring Layer-2 Flow Direction Control for Multicast Streams</a>                        | <b>ipv6 multicast static source-address group-address interface-type interface-number</b>                                  | Controls the flow direction of data streams on Layer-2 ports.                     |
| <a href="#">Configuring RPF Route Selection According to the Longest Matching Principle</a>             | <b>ipv6 multicast rpf longest-match</b>  | Configures RPF route selection according to the longest matching principle.       |

### 2.4.1 Configuring IPv6 Multicast Basic Functions

#### Configuration Effect

- Create a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.

#### Notes

- The PIM network needs to use existing unicast routing in the network. Therefore, IPv6 unicast routing must be configured in the network.

#### Configuration Steps

##### ↳ Enabling the IPv6 Multicast Routing Function

- Mandatory.
- Enable the IPv6 multicast routing function on each router unless otherwise specified.

## ▾ Enabling an IP Multicast Protocol on Interfaces

- Mandatory.
- Enable the IPv6 multicast protocol function on interfaces unless otherwise specified.

## Verification

Make multicast sources in the network send multicast packets and make a user host join the groups.

- Check whether the user host can successfully receive packets from each group.

Metric: 1

```

### Common Errors

- IPv6 unicast routing is incorrectly configured.
- IPv6 multicast routing is not enabled on a router.

## 2.4.5 Configuring Layer-2 Flow Direction Control for Multicast Streams

### Configuration Effect

Configure Layer-2 flow direction control for multicast streams to control the forwarding behavior of multicast streams on ports.

### Notes

- The IPv6 multicast basic functions must be configured.

### Configuration Steps

- Configure Layer-2 flow direction control for multicast streams on devices unless otherwise specified.

### Verification

Make Device A send multicast packets to multicast groups in the network. Multiple user hosts connected to VLAN 1 of Device A receive multicast packets from these multicast groups. Configure Layer-2 flow direction control for multicast streams on Device A so that multicast packets are sent to configured ports.

### Related Commands

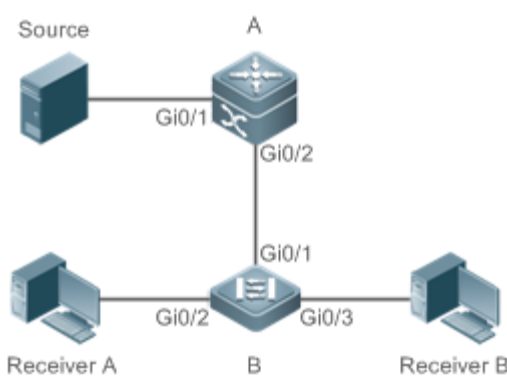

#### 📄 Configuring Layer-2 Flow Direction Control for Multicast Streams

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 multicast static</b> <i>source-address group-address interface-type interface-number</i>   |
| <b>Parameter Description</b> | <i>source -address</i> : Indicates the multicast source address.<br><i>group-address</i> : Indicates the multicast group address.<br><i>interface-type interface-number</i> : Indicates a Layer-2 port that is allowed to forward multicast streams. |
| <b>Command Mode</b>          | Global configuration mode  |

|                    |   |
|--------------------|---|
| <b>Usage Guide</b> | <p>Multiple commands can be configured for a multicast stream, that is, multiple ports can be allowed to forward the multicast stream. If flow direction control is configured for a multicast stream, the multicast stream can be forwarded only by the configured ports. Other ports are not allowed to forward the multicast stream.</p> <p>This command controls only the forwarding behavior of multicast streams on ports. It does not directly affect processing of protocol packets by multicast protocols. Some features of multicast protocols (such as PIM-SMv6) are driven by multicast data streams, and therefore, the behavior of the multicast routing protocols may still be affected.</p> |
|--------------------|---|

## Configuration Example

### Creating the IPv6 Multicast Service on an IPv6 Network and Configuring Layer-2 Flow Direction Control for Multicast Streams

| <b>B</b>                             | <pre>A# configure terminal A(config)# ipv6 multicast static 2001::1 ff16::16 gigabitEthernet 0/2</pre>  |
| <b>Verification</b>                  | <p>Make Multicast Source (2001: : 1) send packets to G (ff16::16) and make Receiver A and Receive B join G.</p> <ul style="list-style-type: none"> <li>Receiver A should be able to receive multicast packets from G but Receiver B cannot receive multicast packets from G.</li> </ul> |

## Common Errors

- IPv6 unicast routing is incorrectly configured.

## 2.4.6 Configuring RPF Route Selection According to the Longest Matching Principle

### Configuration Effect

Among the three optimal routes selected from the multicast static routing table, MBGP routing table, and unicast routing table, select the optimal route with the longest subnet mask matching as the RPF route.

### Notes

- The IP multicast basic functions must be configured.

### Configuration Steps

- Configure RPF route selection according to the longest matching principle on each device unless otherwise specified.

### Verification

Configure a multicast static route and a unicast static route with the same priority and configure the unicast static route to have the longest subnet mask matching.

- Run the **show ipv6 rpf v6source-address** command to check RPF information about a specific source.

Doing distance-preferred lookups across tables
Distance: 110
Metric: 1

```

## Common Errors

- IPv6 unicast routing is incorrectly configured.
- IPv6 multicast routing is not enabled on a router.

## 2.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

| Description   | Command  |
|---|--|
| Clears the IPv6 multicast forwarding table.                   | <b>clear ipv6 mroute</b> { *   <i>v6group-address</i> [ <i>v6source-address</i> ] }            |
| Clears the statistics in the IPv6 multicast forwarding table. | <b>clear ipv6 mroute statistics</b> { *   <i>v6group-address</i> [ <i>v6source-address</i> ] } |

### Displaying

| Description   | Command   |
|---|---|
| Displays the IPv6 multicast forwarding table information.                             | <b>show ipv6 mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>sparse</b> ] [ <b>summary</b>   <b>count</b> ] |
| Displays RPF information about a specific IPv6 source address.                        | <b>show ipv6 rpf</b> <i>v6source-address</i>  |
| Displays information the IPv6 static multicast route.                                 | <b>show ipv6 mroute static</b>  |
| Displays information about the configured IPv6 multicast interface that takes effect. | <b>show ipv6 mvif</b> [ <i>interface-type interface-number</i> ]  |
| Displays the IPv6 Layer-3 multicast forwarding table.                                 | <b>show ipv6 mrf mfc</b>  |

|   |                      |
|---|----------------------|
| Displays the IPv6 multi-layer multicast forwarding table. | <b>show msf6 msc</b> |
|---|----------------------|

## Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description  | Command                          |
|--|----------------------------------|
| Debugs all running processes of the IPv6 multicast.                                | <b>debug nsm mcast6 all</b>      |
| Debugs the communication between the IPv6 multicast and the protocol module.       | <b>debug nsm mcast6 fib-msg</b>  |
| Debugs the interface running of the IPv6 multicast.                                | <b>debug nsm mcast6 mif</b>      |
| Debugs the processing of interfaces and behavior statistics of the IPv6 multicast. | <b>debug nsm mcast6 stats</b>    |
| Debugs the Layer-3 multicast forwarding of IPv6.                                   | <b>debug ipv6 mrf forwarding</b> |
| Debugs the operation process of IPv6 Layer-3 multicast forwarding entries.         | <b>debug ipv6 mrf mfc</b>        |
| Debugs the processing of IPv6 Layer-3 multicast forwarding events.                 | <b>debug ipv6 mrf event</b>      |
| Debugs the forwarding of IPv6 multi-layer multicast packets.                       | <b>debug msf6 forwarding</b>     |
| Debugs the operation process of IPv6 multi-layer multicast forwarding entries.     | <b>debug msf6 mfc</b>            |
| Debugs the underlying hardware for IPv6 multi-layer multicast forwarding.          | <b>debug msf6 ssp</b>            |
| Debugs the APIs for IPv6 multi-layer multicast forwarding.                         | <b>debug msf6 api</b>            |
| Debugs the processing of IPv6 multi-layer multicast forwarding events.             | <b>debug msf6 event</b>          |

## 3 Configuring IGMP

### 3.1 Overview

The Internet Group Management Protocol (IGMP) is a member of TCP/IP protocol family. It manages IP multicast members and is used to establish and maintain multicast group membership between hosts and directly neighboring multicast routers. IGMP behaviors are classified into host behaviors and device behaviors.

- At present, three IGMP versions are available, which are IGMPv1, IGMPv2 and IGMPv3.
- All IGMP versions support the Any-Source Multicast (ASM) model.
- IGMPv3 can be directly used for the Source-Specific Multicast (SSM) model.
- IGMPv1 and IGMPv2 can be used for the SSM model only when the IGMP SSM Mapping technology is supported.

#### Protocols and Standards

- RFC 1112: Host Extensions for IP Multicasting
- RFC 2236: Internet Group Management Protocol, Version 2
- RFC 3376: Internet Group Management Protocol, Version 3
- RFC 4605: Internet Group Management Protocol (IGMP) / Multicast Listener Discovery (MLD)-Based Multicast Forwarding ("IGMP/MLD Proxying")

### 3.2 Applications

| Application                        | Description   |
|------------------------------------|---|
| <a href="#">Local IGMP Service</a> | Implements the IGMP service in a local network.   |
| <a href="#">IGMP Proxy Service</a> | In a simple tree network topology, use the IGMP proxy service instead of the PIM service. |

#### 3.2.1 Local IGMP Service

##### Scenario

As shown in Figure 3-1, receivers 1 and 2 and routers A and B form a local network.

Query packets sent by router A or B are valid in the LAN, whereas Report packets sent by receivers 1 and 2 are also valid locally.

Figure 3-1

|                |   |
|----------------|---|
| <b>Remarks</b> | C is the egress gateway (EG) device.<br>A and B are core routers. |
|----------------|---|

### Deployment

- Routers A, B and C run OSPF.
- The interfaces of A, B and C run multicast protocols (PIM-SM or PIM-DM).

## 3.2.2 IGMP Proxy Service

### Scenario

As shown in Figure 3-2, router A implements the proxy function working as a host and forms a local network group with router B. Router A forwards Report packets sent by receivers 1 and 2.

Figure 3-2

|                |   |
|----------------|---|
| <b>Remarks</b> | Router A implements the proxy function.<br>Router B provides the PIM service. |
|----------------|---|

### Deployment

- Routers A and B run OSPF.
- The interfaces of A and B run multicast protocols (PIM-SM or PIM-DM).
- The multicast proxy function is implemented on the interfaces Gi0/0 and Gi0/1 of router A.

## 3.3 Features

### Basic Concepts

#### Host Behavior and Device Behavior

- Layer-3 multicast devices that run multicast management protocols are called devices and their behaviors are called device behaviors.
- PCs or simulated PCs that run multicast management protocols are called hosts and their behaviors are called host behaviors.

#### Querier

- Devices compete against each other by comparing IP addresses. Devices with lower IP addresses become queriers and send Query packets regularly.

#### IGMP Proxy-Service Interface

- This interface performs host behaviors, receives Query packets sent by upstream devices (hence also called uplink interface), and sends Report information collected by the router proxy.

#### IGMP Mroute-Proxy Interface

- This interface implements the router functions, sends packets received by the IGMP PROXY-SERVICE interface (hence also called downlink interface), and collects host information and sends the host information to the IGMP PROXY-SERVICE interface.

#### IGMP SSM Mapping

- Mapping of the SSM model. IGMPv1 and IGMPv2 do not support the SSM model, but can enable the SSM-MAP function to support the SSM model.

### Overview

| Feature  | Description  |
|--|--|
| <a href="#">IGMP Router</a>                          | Sends Query packets and obtains local member information.  |
| <a href="#">IGMP Group Filtering</a>                 | Filters group members and limit the number of group members.   |
| <a href="#">Static IGMP Group</a>                    | Static group information is available on a router; therefore, it is unnecessary for the host to send a Report packet to obtain the static group information. |
| <a href="#">Simulating Hosts to Join IGMP Groups</a> | Simulates the host behavior to directly join a multicast group on an interface.  |
| <a href="#">IGMP Proxy</a>                           | Use this function in a simple tree network topology where no complex multicast route protocols (such as PIM) need to be executed.                            |

| Feature                             | Description   |
|-------------------------------------|---|
| <a href="#">IGMP SSM Mapping</a>    | Provides the SSM model support for IGMPv1 and IGMPv2. When a host joins a group, you can specify a source to save bandwidth and prevent unwanted and invalid multicast data streams from occupying network bandwidth, especially in a network environment where multiple multicast sources share one multicast address. |
| <a href="#">Router Alert Option</a> | Checks whether IGMP packets contain the Router Alert option and discards the packets without the Router Alert option.<br><br>Sends IGMP packets with the Router Alert option.   |

### 3.3.1 IGMP Router

- This function is used to send Query packets and obtain local member information.

#### Working Principle

- In a multicast network running the IGMP, a multicast device periodically sends IGMP Query packets and confirms information about local members based on responses.
- Only one multicast device sends IGMP Query packets in one network segment and this device is called querier. The querier is determined by means of selection. Initially, all multicast devices are in the Querier state. When a device receives a membership query from a device with a lower IP address, the device changes from the Querier state to the Non-querier state. Therefore, only one device is in the Querier state finally. This device has the lowest IP address among all multicast devices in the network.
- The querier sends IGMP packets of different versions based on the IGMP version settings. In addition, the following querier parameters can be modified: frequency for the querier to send IGMP Query packets, query times and query interval for the last member, maximum response time of IGMP Query packets, and keepalive time of the existing querier.

#### Related Configuration

##### ↘ Enabling IGMP

IGMP is disabled on an interface by default.

You can run the **ip pim { sparse-mode| dense-mode }** command to enable or disable IGMP for an interface.

IGMP can be enabled only when Sparse Mode (SM) or Dense Mode (DM) is configured on the interface.

##### ↘ Specifying the IGMP Version

IGMPv2 is enabled by default.

You can run the **ip igmp version { 1 | 2 | 3 }** command to set or reset the IGMP version.

##### ↘ Configuring the Last-Member Query Interval

The interval for sending the last-member Query packets is 1s by default.

You can run the **ip igmp last-member-query-interval** *interval* command to set or reset the interval for an interface to send Query packets.

*A larger value means a larger interval; a smaller value means a smaller interval.*

#### ↘ **Configuring the Last-Member Query Times**

The number of the last-member query times is 2 by default.

You can run the **ip igmp last-member-query-count** *count* command to set or reset the number of the last-member query times.

A larger value means more last-member query times; a smaller value means fewer last-member query times.

#### ↘ **Configuring the Common Member Query Interval**

The common member query interval is 125s by default.

You can run the **ip igmp query-interval** *seconds* command to set or reset the common member query interval.

*A larger value means a larger common query interval; a smaller value means a smaller common query interval.*

#### ↘ **Configuring the Maximum Response Time**

The maximum response time is 10s by default.

You can run the **ip igmp query-max-response-time** *seconds* command to set or reset the maximum response time.

A larger value means longer response time; a smaller value means shorter response time.

#### ↘ **Configuring the Querier Timeout**

The querier timeout is 255s by default.

You can run the **ip igmp query-timeout** *seconds* command to set the querier timeout.

A larger value means longer survival time; a smaller value means shorter survival time.

### 3.3.2 IGMP Group Filtering

Filter group members and limit the number of group members.

#### Working Principle

To prevent hosts in a network segment where an interface resides from joining a multicast group, you can configure an ACL on this interface as a filter. The interface will filter the received IGMP membership Report packets based on this ACL, maintain group membership only for multicast groups allowed by this ACL and set the maximum number of router members.

#### Related Configuration

#### ↘ **Configuring the IGMP Group ACL**

By default, no ACL is used and any group is allowed to join.

You can run the **ip igmp access-group** *access-list-name* command to set or reset the multicast group ACL.

After the ACL is configured, a router receives only packets set in the ACL.

### ↘ [Configuring the Maximum Number of IGMP Group Members](#)

The maximum number of IGMP group members is 1,024 by default.

You can run the **ip igmp limit *number*** command to set or reset the maximum number of multicast group members.

A larger value means more members; a smaller value means fewer members.

## 3.3.3 Static IGMP Group

When static IGMP groups are available on a router, it is unnecessary for the host to send a Report packet to obtain the static group information. The router can directly exchange group information with a PIM router.

### [Working Principle](#)

You need to set static group information manually.

### [Related Configuration](#)

#### ↘ [Configuring a Static Group](#)

No static group is configured by default.

You can run the **ip igmp static-group *group-address*** command to configure a static group.

## 3.3.4 Simulating Hosts to Join IGMP Groups

Simulate the host behavior to directly join a multicast group on an interface.

### [Related Configuration](#)

#### ↘ [Configuring the Join-Group function](#)

No join-group information is set by default.

You can run the **ip igmp join-group *group-address*** command to configure the address of the multicast group to be joined by the simulated host.

## 3.3.5 IGMP Proxy

Use this function in a simple tree network topology where no complex multicast route protocols (such as PIM) need to be executed. In this way, a downstream proxy host can send IGMP packets and maintain the membership.

### [Working Principle](#)

When an upstream router is configured as an IGMP proxy-service interface, it is equal to a host that can receive Query packets sent by upstream routers or forward group information sent by downstream hosts. When a downstream router is configured as an IGMP multicast proxy interface, it is equal to a router that can forward Query packets sent by upstream routers or receive Report packets sent by downstream routers.

## Related Configuration

---

### ▾ Configuring the IGMP Proxy Service

The IGMP proxy service function is disabled by default.

You can run the **ip igmp proxy-service** command to enable the IGMP proxy service.

This function is mandatory when a proxy is to be used.

### ▾ Configuring the IGMP Mroute Proxy

The IGMP mroute proxy function is disabled by default.

You can run the **ip igmp mroute-proxy** *interfacename* command to enable the IGMP mroute proxy.

This function is mandatory when a proxy is to be used.

## 3.3.6 IGMP SSM Mapping

Provide the SSM model support for IGMPv1 and IGMPv2. When a host joins a group, you can specify a source to save bandwidth and prevent unwanted and invalid multicast data streams from occupying network bandwidth, especially in a network environment where multiple multicast sources share one multicast address.

### Working Principle

---

Based on IGMP v1/v2, IGMPv3 provides an extra function, namely, the multicast source filter function. In IGMPv1/v2, a host determines to join a group only based on the group address and then receive multicast streams sent to this group address from any source. A host using IGMPv3 advertises the multicast group that the host wants to join and the addresses of multicast sources from which this host wants to receive packets. IGMPv1 and IGMPv2 also implement "source address filtering" in some sense; however, they implement this function on the multicast receivers by enabling the SSM mapping function and configuring the static SSM mapping group.

## Related Configuration

---

### ▾ Enabling IGMP SSM Mapping

The SSM mapping function is disabled by default.

You can run the **ip igmp ssm-map enable** command to enable the function.

### ▾ Configuring Static IGMP SSM Mapping

No static SSM mapping is set by default.

You can run the **ip igmp ssm-map static** *access-list-num A.B.C.D* command to configure static SSM mapping.

## 3.3.7 Router Alert Option

Check whether IGMP packets contain the Router Alert option and discard packets without the Router Alert option.

Support sending IGMP packets containing the Router Alert option.

## Working Principle

If a packet contains the Router Alert option, the device needs to check the packet in depth and updates the control data accordingly. If the packet does not contain the option, the device does not check the packet.

After Router Alert option check is enabled, the IGMP packets not containing the Router Alert option are discarded.

After enabled with the function of sending packets with Router Alert option, the device sends IGMP packets with Router Alert option encapsulated.

## Related Configuration

### ▾ Checking Router Alert Option

Router Alert option check is disabled by default.

You can run the **ip igmp enforce-router-alert** command to enable the function.

### ▾ Sending IGMP Packets with Router Alert Option Encapsulated

Packets are sent without the Router Alert option by default.

You can run the **ip igmp send-router-alert** command to enable the function.

## 3.4 Configuration

| Configuration                                    | Description and Command   |  |
|--|---|--|
| <a href="#">Configuring IGMP Basic Functions</a> |  (Mandatory) It is used to set up the multicast service. |  |
|  | <b>ip multicast-routing</b>   | Enables the IPv4 multicast routing function.         |
|  | <b>ip pim { sparse-mode   dense-mode }</b>  | Enables the PIM-SM or PIM-DM function.               |
| <a href="#">Configuring IGMP Routers</a>         | <b>ip igmp version { 1   2   3 }</b>  | Specifies the IGMP version.                          |
|  | <b>ip igmp last-member-query-interval interval</b>  | Configures the last-member query interval.           |
|  | <b>ip igmp last-member-query-count count</b>  | Configures the last-member query times.              |
|  | <b>ip igmp query-interval seconds</b>   | Configures the membership query interval.            |
|  | <b>ip igmp query-max-response-time seconds</b>  | Configures the maximum response time.                |
| <a href="#">Configuring IGMP Group Filtering</a> | <b>ip igmp query-timeout seconds</b>  | Configures the querier timeout.                      |

### 3.4.1 Configuring IGMP Basic Functions

#### Configuration Effect

- Enable the multicast routing function of a local network and collect group information of the local network.

#### Notes

- An interface must be enabled with the PIM-SM or PIM-DM function.

#### Configuration Steps

##### ▾ Enabling the IPv4 Multicast Routing Function

- Mandatory.
- If there is no special requirement, the IPv4 multicast routing function should be enabled on each router in the local network.

##### ▾ Enabling the PIM-SM or PIM-DM Function

- Mandatory.
- If there is no special requirement, the PIM-SM or PIM-DM function should be directly enabled on an interface of the local network.

#### Verification

Run the **show ip igmp interface** *interface-type interface-number* command to check whether IGMP is enabled on the interface.

#### Related Commands

| <b>Usage Guide</b>           | PIM interfaces must be layer-3 interfaces, including routing interfaces, L3AP, SVI and loopback interfaces.<br>All PIM interfaces should be accessible to IPv4 unicast routes. |

## Configuration Example

### ▾ Enabling IGMP for a Local Network

|                     |  |
|---------------------|--|
| <b>Scenario</b>     | <ul style="list-style-type: none"> <li>● Configure an IPv4 unicast routing protocol (such as OSPF) on a router and ensure that the loopback interface is accessible to a unicast route.</li> <li>● Enable the IPv4 multicast route function on all routers.</li> <li>● Enable the PIM-SM or PIM-DM function on interfaces interconnecting devices and interfaces connecting user hosts and multicast sources.</li> </ul> |
|                     | <pre>VSU(config)#ip multicast-routing VSU(config)#int gi 0/5 VSU(config-if-GigabitEthernet 0/5)#ip add 192.168.1.90 255.255.255.0 VSU(config-if-GigabitEthernet 0/5)#ip pim sparse-mode</pre>  |
| <b>Verification</b> | Run the <b>show ip igmp interface interface-type interface-number</b> command to check whether IGMP is enabled on the interface.   |
|                     | <pre>VSU#show ip igmp interface gigabitEthernet 0/5 Interface GigabitEthernet 0/5 (Index 5) IGMP Active, Querier, Version 2 (default) Internet address is 192.168.1.90 IGMP interface limit is 1024 IGMP interface has 1 group-record states IGMP interface has 0 static-group records</pre>   |

```
IGMP activity: 3 joins, 0 leaves
IGMP query interval is 125 seconds
IGMP querier timeout is 255 seconds
IGMP max query response time is 10 seconds
Last member query response interval is 10
Last member query count is 2
Group Membership interval is 260 seconds
Robustness Variable is 2
```

### Common Errors

- Routers in the network are not enabled with the multicast routing function.
- No multicast interface is available in the network.

## 3.4.2 Configuring IGMP Routers

### Configuration Effect

- Modify the querier timeout and IGMP router parameters will affect the type of packets to be sent and the sending method.

### Notes

- The basic functions of IGMP must be configured.

### Configuration Steps

#### 📄 Specifying the IGMP Version

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### 📄 Configuring the Last-Member Query Interval

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### 📄 Configuring the Last-Member Query Times

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

### ↘ Configuring the Common Member Query Interval

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

### ↘ Configuring the Maximum Response Time

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

## Verification

Run the **show ip igmp interface** *interface-type interface-number* command to display the interface configurations.

## Related Commands

### ↘ Specifying the IGMP Version

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp version { 1   2   3 }</b>                                    |
| <b>Parameter Description</b> | 1: Indicates IGMPv 1.<br>2: Indicates IGMPv 2.<br>3: Indicates IGMPv 3. |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | After this command is configured, IGMP will automatically restart.      |

### ↘ Configuring the Last-Member Query Interval

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp last-member-query-interval</b> <i>interval</i>   |
| <b>Parameter Description</b> | <i>Interval</i> : Indicates the interval for sending the Query packets of a specific group. The value ranges from 1 to 255 in the unit of 0.1s, and the default value is 10 (namely, 1s).   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | This command applies only to IGMPv2 or IGMPv3.<br>When an interface receives a Leave packet, the interface sends Query packets of the group continually and waits for a response from the host. After timeout occurs, the IGMP router assumes that the group member does not exist in the directly connected network segment and deletes the interface from the IGMP group. The timeout duration is equal to the value of <b>last-member-query-interval</b> multiplied by <b>last-member-query-count</b> plus 1/2 of <b>query-max-response-time</b> . |

### ↘ Configuring the Last-Member Query Times

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp last-member-query-count</b> <i>count</i>   |
| <b>Parameter Description</b> | <i>count</i> : Indicates the times for sending the Query packets of a specific group, ranging from 2 to 7. The default value is 2.  |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | This command applies only to IGMPv2 or IGMPv3.<br>When an interface receives a Leave packet, the interface sends Query packets of the group continually and waits for a response from the host. After timeout occurs, the IGMP router assumes that the group member does not exist in the directly connected network segment and deletes the interface from the IGMP group. The timeout duration is equal to the value of <b>last-member-query-interval</b> multiplied by <b>last-member-query-count</b> plus 1/2 of <b>query-max-response-time</b> . |

### ↘ Configuring the Common Member Query Interval

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp query-interval</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the common member query interval, ranging from 1 to 18,000s. The default value is 125. |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | N/A   |

### ↘ Configuring the Maximum Response Time

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp query-max-response-time</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the maximum response time, ranging from 1 to 25s. The default value is 10.   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | After sending Query packets, the interface waits for a response. If timeout occurs, the IGMP router assumes that the group member does not exist in the directly connected network segment and deletes the group information. |

### ↘ Configuring the Querier Timeout

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp query-timeout</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the keepalive time of the querier, ranging from 60s to 300s. The default value is 255s. |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | After sending Query packets, an interface waits for Query packets sent by other devices. If timeout occurs,        |

|  |   |
|--|---|
|  | the IGMP router assumes that the querier is unique in the directly connected network segment. |
|--|---|

## Configuration Example

### 📌 Configuring Basic Router Parameters

|                     |  |
|---------------------|--|
| <b>Scenario</b>     | <ul style="list-style-type: none"> <li>● Configure basic functions of IGMP.</li> <li>● Specify the IGMPv3.</li> <li>● Configure the last-member query interval to 15 (1.5s).</li> <li>● Configure the number of the last-member queries to 3.</li> <li>● Configure the common member query interval to 130s.</li> <li>● Configure the maximum response time to 15s.</li> <li>● Configure the querier timeout to 280s.</li> </ul> |
|                     | <pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp version 3 VSU(config-if-GigabitEthernet 0/5)#ip igmp last-member-query-count 3 VSU(config-if-GigabitEthernet 0/5)#ip igmp last-member-query-interval 15 VSU(config-if-GigabitEthernet 0/5)#ip igmp query-interval 130 VSU(config-if-GigabitEthernet 0/5)#ip igmp query-max-response-time 15 VSU(config-if-GigabitEthernet 0/5)#ip igmp query-timeout 280</pre>                   |
| <b>Verification</b> | Run the <b>show ip igmp interface <i>interface-type interface-number</i></b> command to check the IGMP functions of the interface.   |

```
VSU#show ip igmp interface gigabitEthernet 0/5

Interface GigabitEthernet 0/5 (Index 5)

  IGMP Enabled, Active, Querier, Version 3

  Internet address is 192.168.1.90

  IGMP interface limit is 1024

  IGMP interface has 1 group-record states

  IGMP interface has 0 static-group records

  IGMP activity: 3 joins, 0 leaves

  IGMP query interval is 130 seconds

  IGMP querier timeout is 280 seconds

  IGMP max query response time is 15 seconds

  Last member query response interval is 15

  Last member query count is 3

  Group Membership interval is 275 seconds

  Robustness Variable is 2

VSU#
```

### Common Errors

- The basic functions of IGMP are not enabled.

## 3.4.3 Configuring IGMP Group Filtering

### Configuration Effect

- A router filters IGMP group members.

### Notes

- The basic functions of IGMP must be configured.

### Configuration Steps

#### ↘ **Configuring the IGMP Group ACL**

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### ↘ **Configuring the Maximum Number of IGMP Group Members**

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

## Verification

### IGMP Group ACL

- Configure an interface to allow only groups in ACL 1 to join. The access addresses of ACL 1 are 225.0.0.1~225.0.0.255.
- Configure the interface to join a group whose address is 225.0.0.5.
- Configure the interface to join a group whose address is 236.0.0.5.
- View the group information of the current interface.

### Maximum Number of IGMP Group Members

- Set the maximum member quantity to 5 on an interface.
- Configure the interface to join a group whose address is from 225.0.0.5 to 225.0.0.10.
- View the group information of the interface.

## Related Commands

### Configuring the IGMP Group ACL

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp access-group</b> <i>access-list</i>   |
| <b>Parameter Description</b> | <i>access-list</i> : Defines a group address range by using a standard IP ACL or an extended ACL. The value ranges from 1 to 199, 1300 to 2699 and characters.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | Configure this command on an interface to control the groups that hosts in a directly connected network segment can join. Use an ACL to limit the group address range. If Report packets denied by the ACL are received, the packets will be discarded.<br><br>When IGMPv3 is enabled, this command supports an extended ACL. If the received IGMP Report information is (S1,S2,S3...Sn,G), this command will apply the corresponding ACL to the (0,G) information for matching. Therefore, you must configure a (0,G) record explicitly for the extended ACL in order to normally filter (S1,S2,S3...Sn,G). |

### Configuring the Maximum Number of IGMP Group Members

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp limit</b> <i>number</i> [ <b>except</b> <i>access-list</i> ]   |
| <b>Parameter Description</b> | <i>number</i> : Indicates the maximum number of IGMP group members, whose value range varies with devices. The default value is 1,024 for an interface and 65,536 globally.<br><br><b>except</b> <i>access-list</i> : Indicates that the groups in the ACL are not counted. |

|                     |  |
|---------------------|--|
|                     | <b>access-list</b> indicates a standard IP ACL. The value ranges from 1 to 99, 1300 to 1999 and words.   |
| <b>Command Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>  | <p>Global configuration mode: Limits the maximum quantity of the IGMP group members in a system.</p> <p>Interface configuration mode: limits the maximum quantity of IGMP group members on an interface.</p> <p>If the quantity of group members exceeds the interface or global limit, the Report packets received subsequently will be ignored.</p> <p>If an Except ACL is configured, Report packets within a specified range can be normally processed; therefore, the generated group members are not counted.</p> <p>The interface and global configurations can be performed independently. If the global quantity limit is smaller than that for an interface, the global configuration shall be used.</p> |

## Common Errors

- The basic functions of IGMP are not enabled.

### 3.4.4 Configuring IGMP Proxy

#### Configuration Effect

- Configure the router proxy function and collect local member information.

#### Notes

- The basic functions of IGMP must be configured.

#### Configuration Steps

##### ▾ Configuring the IGMP Proxy Service

- Optional.

- If there is no special requirement, you can perform this configuration on directly connected upstream router interfaces.

### ↘ Configuring the IGMP Mroute Proxy

- Optional.
- If there is no special requirement, you can perform this configuration on directly connected downstream host interfaces.

### Verification

- Set interface 7 for directly connecting to an upstream router as a multicast proxy server.
- Set interface 1 for directly connecting to a downstream host as a multicast proxy.
- Set interface 1 to be joined by groups whose addresses are 225.0.0.6 and 225.5.5.5.
- View the current group information.

## Common Errors

- The basic functions of IGMP are not enabled.

### 3.4.5 Configuring IGMP SSM Mapping

#### Configuration Effect

- IGMPv3 supports source filtering; however, IGMPv1 and IGMPv2 do not support source filtering, but provides the SSM mapping function to filter sources.

#### Notes

- The basic functions of IGMP must be configured.

#### Configuration Steps

##### ▾ Enabling SSM Mapping

(Mandatory) Enable the SSM mapping function.

Enable the SSM mapping function on a router.

##### ▾ Configuring Static SSM Mapping

Optional.

Configure this function on routers enabled with SSM mapping.

#### Verification

Run the **show ip igmp ssm-mapping** [ *group-address* ] command to display SSM mapping information.

| Debugs IGMP state machine.                  | <b>debug ip igmp tib</b>     |
| Debugs IGMP warning.                        | <b>debug ip igmp warning</b> |

## 4 Configuring MLD

### 4.1 Overview

Multicast Listener Discovery (MLD) is a protocol used in the multicast technology.

This protocol receives the multicast member relationship between hosts and routers to determine multicast flow forwarding. Using information obtained from MLD, a device maintains an interface-based multicast listener status table. The multicast listener status table is activated only when at least one host in the link of the interface is a group member.

Currently, MLD has two versions: MLDv1 and MLDv2.

- MLD of both versions supports the Any-Source Multicast (ASM) model.
- MLDv2 can be directly applied to the Source-Specific Multicast (SSM) model.
- MLDv1 can be applied to the SSM model only when MLD SSM mapping is configured.

#### Protocols and Standards

- RFC2710: Multicast Listener Discovery (MLDv1) for IPv6
- RFC3810: Multicast Listener Discovery Version 2 (MLDv2) for IPv6

### 4.2 Applications

| Application  | Description  |
|--|--|
| <a href="#">Configuring the MLD Service on the Local Network</a> | Implements the MLD service on the local network.   |
| <a href="#">Configuring the MLD Proxy Service</a>                | In the simple tree topology, the MLD proxy service, instead of the PIM service, is used. |

#### 4.2.1 Configuring the MLD Service on the Local Network

##### Scenario

As shown in Figure 4-1, the local network consists of receiver 1, receiver 2, router A, and router B.

Query messages sent by router A or router B are valid on the local network, and Report messages sent by receiver A and receiver B are also valid on the local network.

Figure 4-1

|                |   |
|----------------|---|
| <b>Remarks</b> | Router C is the egress gateway.<br>Routers A and B are local routers. |
|----------------|---|

### Deployment

- Routers A, B, and C run the OSPFv6 protocol.
- Interfaces on routers A, B, and C run the multicast protocol (PIM SMv6 or PIM DMv6).

## 4.2.2 Configuring the MLD Proxy Service

### Scenario

As shown Figure 4-2, the proxy function is enabled on router A. Router A functions as a host and forms a local management group with router B. Router A forwards Report messages from receivers 1 and 2.

Figure 4-2

|                |  |
|----------------|--|
| <b>Remarks</b> | Router A functions as the proxy.<br>Router B provides the PIM service. |
|----------------|--|

### Deployment

- Routers A and B run the OSPFv6 protocol.

- Interfaces on routers A and B run the multicast protocol (PIM SMv6 or PIM DMv6).
- The multicast proxy service is enabled on Gi 0/0 and Gi 0/1 of router A.

## 4.3 Features

### Basic Concepts

#### Host Behaviors and Device Behaviors

Layer-3 multicast devices running multicast management protocols are referred to as devices and their behaviors are device behaviors.

PCs or simulated PCs running multicast management protocols are referred to as hosts and their behaviors are host behaviors.

#### Querier

Devices interact and compete with each other. After IP address comparison, the device with a lower IP address becomes the querier and periodically sends Query messages.

#### MLD PROXY-SERVICE Interface

This interface, also called uplink interface, implements host behaviors. It receives Query messages sent by upstream devices and sends Report messages collected by the router proxy.

#### MLD MROUTE-PROXY Interface

This interface, also called downlink interface, implements router functions. It sends messages received by the proxy service interface and collects and sends host information to the proxy service interface.

#### MLD SSM-MAP

SSM mapping refers to mapping of source-specific multicast. MLDv1 does not support the SSM model until the SSM-MAP function is enabled.

### Overview

| Feature  | Description  |
|--|--|
| <a href="#">Setting MLD Router Parameters</a>                  | Sends Query messages to obtain local member information.   |
| <a href="#">Querier Selection Process or Timeout Mechanism</a> | Selects the unique querier in the current network segment.   |
| <a href="#">Filtering MLD Groups</a>                           | Filters group members and limits the number of group members.  |
| <a href="#">Supporting Static MLD Groups</a>                   | Stores static group information on the local router instead of obtaining group information by sending Report messages. |

| Feature  | Description   |
|--|---|
| <a href="#">Configuring Simulated Host Group Information</a> | Simulates host behaviors to directly configure group joining information.   |
| <a href="#">Supporting MLD Proxy</a>                         | Uses this function in the simple tree topology instead of complex multicast routing protocols, such as the PIM.   |
| <a href="#">Supporting SSM-MAP</a>                           | Provides the SSM model for MLDv1. When a host is added to a group, a specific source can be specified to avoid network bandwidth occupation by unnecessary and invalid multicast data streams. This function is especially useful on a network where multiple multicast sources share the same multicast address. |

### 4.3.1 Setting MLD Router Parameters

Sends Query messages to obtain local member information.

#### Working Principle

A device periodically sends Query messages to ensure that a group has at least one host. If no host is available in a group, the group will be deleted.

#### Related Configuration

##### 📌 Enabling MLD

By default, MLD is disabled on an interface.

Run the **ipv6 pim { sparse-mode | dense-mode }** command to enable or disable MLD on an interface.

MLD can be enabled only after PIM SM or PIM DM is enabled on the interface.

##### 📌 Configuring MLD Version

By default, the MLD version is 2.

Run the **ipv6 mld version { 1 | 2 }** command to configure or restore the MLD version of an interface.

##### 📌 Configuring the Query Interval of the Last Member

By default, the interval for sending Query messages is 1s.

Run the **ipv6 mld last-member-query-interval interval** command to configure or restore the interval for sending Query messages.

A larger value means a longer interval for sending Query messages.

##### 📌 Configuring the Number of Times for Querying the Last Member

By default, the number of times for querying the last member is 2.

Run the **ipv6 mld last-member-query-count count** command to configure or restore the number of times for querying the last member.

A larger value means a larger number of times for querying the last member.

#### 📌 Configuring the Interval for Querying a Common Member

By default, the interval for querying a common member is 125s.

Run the **ipv6 mld query-interval** *seconds* command to configure or restore the interval for querying a common member.

A larger value means a longer interval for querying a common member.

#### 📌 Configuring the Maximum Response Time

By default, the maximum response time is 10s.

Run the **ipv6 mld query-max-response-time** *seconds* command to configure or restore the maximum response time.

A larger value means a longer maximum response time.

### 4.3.2 Querier Selection Process or Timeout Mechanism

Selects the unique querier in the current network segment. The querier sends a Query message to obtain group information on the local network.

#### Working Principle

On a multicast network running MLD, a multicast device dedicated to query sends MLD Query messages. The device is determined by election. Initially, all devices are in the querier state. When receiving member relationship Query messages from devices with lower IP addresses, the devices switch from the receiver state to non-querier state. Therefore, there is only one device in the query state in the end. This device has the lowest IP address among all multicast devices on the network. When the querier device does not work, MLD also works. Non-querier devices maintain the keepalive interval timer for other queriers. The timer is reset once the device receives a member relationship query message. If the timer times out, the device starts to send Query messages and a new querier election starts.

#### Related Configuration

#### 📌 Configuring the Keepalive Interval of the Querier

By default, the keepalive interval of the querier is 255s.

Run the **ipv6 mld querier-timeout** *seconds* command to configure or restore the keepalive interval of the querier.

A larger value means a longer keepalive interval of the querier.

### 4.3.3 Filtering MLD Groups

Filters group members and limits the number of group members.

#### Working Principle

If you do not want hosts in the network segment where an interface resides to be added to certain multicast groups, you can configure ACL rules on the interface as a filter. The interface will filter received MLD member relationship Report messages

based on the ACL rules and maintain member relationships only for multicast groups permitted by the rules. The largest number of router members can also be set.

### Related Configuration

#### ↳ [Configuring Access Control for Multicast Groups](#)

By default, no access control is configured and hosts can be added to any groups.

Run the **ipv6 mld access-group** *access-list-name* command to configure or restore access control for multicast groups.

After the configuration, the router can receive messages only from hosts in groups specified in the access list.

#### ↳ [Configuring the Maximum Number of MLD Group Members](#)

By default, an MLD group has a maximum of 1024 members.

Run the **ipv6 mld limit** *number* command to configure or restore the maximum number of MLD group members.

A larger value means a larger number of group members.

## 4.3.4 Supporting Static MLD Groups

Stores static group information on a local router instead of obtaining group information by sending Report messages. The local router can directly exchange group information with the PIM router.

### Working Principle

Manually configure static group information.

### Related Configuration

#### ↳ [Configuring Static-Group](#)

By default, no static group information is configured.

Run the **ipv6 mld static-group** *group-address* command to configure or cancel static group information.

## 4.3.5 Configuring Simulated Host Group Information

Simulates host behaviors to directly configure group joining information.

### Related Configuration

#### ↳ [Configuring Join-Group](#)

By default, no join-group information is configured.

Run the **ipv6 mld join-group** *group-address* command to configure or cancel join-group information.

### 4.3.6 Supporting MLD Proxy

In the simply tree topology, it is not necessary to run complex multicast routing protocols (such as PIM). In this case, MLD proxy can be used to send MLD messages for downstream hosts and maintain member relationships.

#### Working Principle

When an upstream router is configured as an MLD proxy service interface, it functions as a host and can receive Query messages from upstream routers as well as forward group information of downstream hosts. When a downstream router is configured as an MLD multicast proxy interface, it functions as a router and can forward Query messages of upstream routers as well as receive Report messages from downstream routers.

#### Related Configuration

##### ▾ **Configuring MLD PROXY-SERVICE**

By default, the MLD proxy service is disabled on an interface.

Run the **ipv6 mld proxy-service** command to configure or cancel the MLD proxy function on an interface.

This function must be configured when proxy is used.

##### ▾ **Configuring MLD MROUTE-PROXY**

By default, the multicast proxy service is disabled on an interface.

Run the **ipv6 mld mroute-proxy** interfacename command to configure or cancel the multicast proxy function on an interface.

This function must be configured when proxy is used.

### 4.3.7 Supporting SSM-MAP

This function provides the SSM model for MLDv1. When a host is added to a group, a specific source can be specified to avoid network bandwidth occupation by unnecessary and invalid multicast data streams. This function is especially useful on a network where multiple multicast sources share the same multicast address.

#### Working Principle

Based on MLDv1, MLDv2 provides an extra function, that is, source filtering multicast. In MLDv1, a host determines to join a group only based on the group address and receives multicast streams sent to the group address from any source. However, an MLDv2 host advertises the multicast group that the host wants to join and the address of the multicast source that it wants to receive. In MLDv1, source address filtering can be implemented to some extent, but filtering is implemented by enabling SSM-MAP and configuring SSM-MAP static groups on multicast flow receivers.

#### Related Configuration

##### ▾ **Enabling MLD SSM-MAP**

By default, SSM-MAP is disabled.

Run the **ipv6 mld ssm-map enable** command to enable or disable the SSM-MAP function.

This function must be enabled when SSM-MAP is used.

### ✚ [Configuring MLD SSM-MAP STATIC](#)

By default, no SSM-MAP static link table is configured.

Run the **ipv6 mld ssm-map static access-list-num A.B.C.D** command to enable or disable the SSM-MAP static link table.

## 4.4 Configuration

| Configuration  | Description and Command  |  |
|--|--|--|
| <a href="#">Configuring Basic Functions of MLD</a>             |  (Mandatory) It is used to configure the multicast service. |  |
|  | <b>ipv6 multicast-routing</b>  | Enables the IPv6 multicast routing function.                 |
|  | <b>ipv6 pim sparse-mode</b>  | Enables the PIM-SM function.                                 |
| <a href="#">Configuring MLD Router Parameters</a>              | <b>ipv6 mld version { 1   2 }</b>  | Configures the MLD version.                                  |
|  | <b>ipv6 mld last-member-query-interval</b><br><i>interval</i>  | Configures the interval for querying the last member.        |
|  | <b>ipv6 mld last-member-query-count</b> <i>count</i>   | Configures the number of times for querying the last member. |
|  | <b>ipv6 mld query-interval</b> <i>seconds</i>  | Configures the interval for querying a common member.        |
|  | <b>ipv6 mld query-max-response-time</b><br><i>seconds</i>  | Configures the maximum response interval.                    |
| <a href="#">Querier Selection Process or Timeout Mechanism</a> | <b>ipv6 mld querier-timeout</b> <i>seconds</i>   | Configures the keepalive interval of the querier.            |
| <a href="#">Filtering MLD Groups</a>                           | <b>ipv6 mld access-group</b> <i>access-list</i>  | Filters MLD group members.                                   |
| <a href="#">MLD Proxy</a>                                      | <b>ipv6 mld proxy-service</b>  | Configures the MLD PROXY-SERVICE.                            |
|  | <b>ipv6 mld mroute-proxy</b><br><i>interface-type interface-number</i>   | Configures the MLD MROUTE-PROXY.                             |
| <a href="#">Supporting SSM-MAP</a>                             | <b>ipv6 mld ssm-map enable</b>   | Enables the SSM-MAP function.                                |
|  | <b>ipv6 mld ssm-map static</b> <i>access-list</i><br><i>source-address</i>   | Configures the SSM-MAP static link table.                    |

### 4.4.1 Configuring Basic Functions of MLD

#### [Configuration Effect](#)

- Enable the multicast routing function and collect group information on the local network.

## Notes

- The PIM SM or PIM DM function must be enabled on an interface.

## Configuration Steps

### ↳ Enabling the IPv6 Multicast Routing Function

- Mandatory.
- The IPv6 multicast routing function should be enabled on all routers on the local network unless otherwise specified.

### ↳ Enabling the PIM SM or PIM DM Function

- Mandatory.
- The PIM SM or PIM DM function should be directly enabled on an interface on the local network unless otherwise specified.

## Verification

Run the **show ipv6 mld interface *interface-type* *interface-number*** command to check whether MLD is enabled on the interface.

### Common Errors

- Multicast routing is disabled on routers on the network.
- No multicast interface is available on the network.

## 4.4.2 Configuring MLD Router Parameters

### Configuration Effect

- Modify MLD router parameters to change the message type or sending mode.

### Notes

- The basic functions of MLD must be configured.

### Configuration Steps

#### ▾ Configuring MLD Version

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

#### ▾ Configuring the Interval for Querying the Last Member

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

#### ▾ Configuring the Number of Times for Querying the Last Member

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

#### ▾ Configuring the Interval for Querying a Common Member

Optional.

**This parameter can be configured on all router interfaces directly connected to the local network** unless otherwise specified.

#### ▾ Configuring the Maximum Response Interval

Optional.

**This parameter can be configured on all router interfaces directly connected to the local network** unless otherwise specified.

### Verification

Run the **show ipv6 mld interface *interface-type* *interface-number*** command to view the configuration information.

### Related Commands

#### ▾ Configuring the MLD Version

|                  |                                   |
|------------------|-----------------------------------|
| <b>Command</b>   | <b>ipv6 mld version { 1   2 }</b> |
| <b>Parameter</b> | 1: Indicates version 1.           |

|                     |   |
|---------------------|---|
| <b>Description</b>  | 2: Indicates version 2.   |
| <b>Command Mode</b> | Interface configuration mode                                    |
| <b>Usage Guide</b>  | After this command is executed, MLD will automatically restart. |

#### ↘ Configuring the Interval for Querying the Last Member

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld last-member-query-interval</b> <i>interval</i>   |
| <b>Parameter Description</b> | <i>Interval</i> : Specifies the interval for sending Query messages of a specified group. The unit is 0.1s, the value ranges from 1 to 255, and the default value is 10 (1s).  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | After receiving the Done message, the interface will continuously send Query messages of a specified group and wait for responses from the host. After timeout, it is considered that the no group member exists in the directly-connected network segment and the interface is deleted from the MLD group member record. The timeout interval is calculated as follows:<br>Timeout interval = last-member-query-interval x last-member-query-count + query-max-response-time/2. |

#### ↘ Configuring the Number of Times for Querying the Last Member

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 mld last-member-query-count</b> <i>count</i>  |
| <b>Parameter Description</b> | <i>count</i> : Specifies the number of times for sending Query messages of a specified group. The value ranges from 2 to 7. The default value is 2.   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | After receiving the Done message, the interface will continuously send Query messages of a specified group and wait for responses from the host. After timeout, it is considered that the no group member exists in the directly-connected network segment and the interface is deleted from the MLD group member record. The timeout interval is calculated as follows:<br>Timeout interval = last-member-query-interval x last-member-query-count + query-max-response-time/2 |

#### ↘ Configuring the Interval for Querying a Common Member

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld query-interval</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>seconds</i> : Specifies the interval for querying a common member. The unit is s, the value ranges from 1 to 18000, and the default value is 125. |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | -  |

#### ↘ Configuring the Maximum Response Interval

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld query-max-response-time</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Specifies the maximum response time. The unit is s, the value ranges from 1 to 25, and the default value is 10.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | After sending Query messages, the interface waits for responses. After timeout, it is considered that no group member exists in the directly-connected network segment and group information is deleted. |

## Configuration Example

### ▾ Configuring Basic Router Parameters

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic functions of MLD. (Omitted)</li> <li>● Configure MLD version 2.</li> <li>● Configure the interval for querying the last member as 15 (1.5s).</li> <li>● Configure the number of times for querying the last member as 3.</li> <li>● Configure the interval for querying the common member as 130s.</li> <li>● Configure the maximum response time as 15s.</li> </ul> |
|                            | <pre>VSU(config-if-GigabitEthernet 0/1)#ipv6 mld version 2 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld last-member-query-count 3 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld last-member-query-interval 15 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld query-interval 130 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld query-max-response-time 15</pre>  |
| <b>Verification</b>        | Run the <b>show ipv6 mld interface <i>interface-type</i> <i>interface-number</i></b> command to check whether MLD is enabled on the interface.  |

```
VSU(config-if-GigabitEthernet 0/1)# show ipv6 mld interface gi 0/1

Interface GigabitEthernet 0/1 (Index 1)

MLD Enabled, Active, Querier, Version 2 (default)

Internet address is fe80::2d0:f8ff:fe22:33b1

MLD interface limit is 1024

MLD interface has 0 group-record states

MLD interface has 0 join-group records

MLD interface has 0 static-group records

MLD activity: 0 joins, 0 leaves

MLD query interval is 130 seconds

MLD querier timeout is 267 seconds

MLD max query response time is 15 seconds

Last member query response interval is 15 (1/10s)

Last member query count is 3

Group Membership interval is 275

Robustness Variable is 2
```

### Common Errors

- Basic functions of MLD are not enabled.

### 4.4.3 Querier Selection Process or Timeout Mechanism

#### Configuration Effect

- Select the unique querier on the local network.

#### Notes

- The basic functions of MLD must be configured.

#### Configuration Steps

- This function must be configured if the querier keepalive interval needs to be configured.
- This function can be configured on all MLD-enabled interfaces on the local network.

#### Verification

Run the **show ipv6 mld interface *interface-type* *interface-number*** command to view the configuration information of the interface.

## Related Commands

  Last member query response interval is 15 (1/10s)

  Last member query count is 3

  Group Membership interval is 275

  Robustness Variable is 2
```

## Common Errors

- The basic functions of MLD are not enabled.

### 4.4.4 Filtering MLD Groups

#### Configuration Effect

- A router filters MLD group information.

#### Notes

- The basic functions of MLD must be configured.

#### Configuration Steps

##### 📄 Configuring Access Control for Multicast Groups

Optional.

This function can be configured on all router interfaces directly connected to the local network unless otherwise specified.

##### 📄 Configuring the Maximum Number of MLD Group Members

Optional.

This function can be configured on all router interfaces directly connected to the local network unless otherwise specified.

## Verification

### Filtering MLD Groups

Configure the interface to allow for only groups in link table 1. The access address of link table 1 is (FF66::100/64).

Configure the interface to add a group FF66::05.

Configure the interface to add a group FF65::05.

Check group information on the interface.

### Configuring the Maximum Number of MLD Group Members

Configure the number of group members as 5 on the interface.

Configure the interface to add a group (FF66::05 ~ FF65::0B).

Check group information on the interface.

## Related Commands

### Configuring Access Control for Multicast Groups

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>ipv6 mld access-group <i>access-list</i></code>  |
| <b>Parameter Description</b> | <i>access-list</i> : Specifies the group address range by using IP standard ACLs or IP extended ACLs. The value ranges from 1 to 199, 1300 to 2699, and WORD.  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>After running this command on the interface, you can control the groups that hosts in the directly-connected network segment can join. Use ACLs to limit the group address range. Report messages denied by the ACLs will be discarded.</p> <p>When MLDv2 is enabled, this command supports extended ACLs to precisely filter source record information in MLDv2 messages. When the received MLD Report message is (S1,S2,S3...Sn,G), this command will match (0,G) using the corresponding ACLs. Therefore, to normally use this command, you must explicitly configure a (0, G) in the extended ACLs to filter (S1,S2,S3...Sn,G).</p> |

### Configuring the Maximum Number of MLD Group Members

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>ipv6 mld limit <i>number</i> [ <b>except</b> <i>access-list</i> ]</code>   |
| <b>Parameter Description</b> | <p><i>number</i>: Specifies the maximum number of MLD group members. The value range depends on the specific device. The interface default value is 1024 and the global one is 65536.</p> <p><b>except</b> <i>access-list</i>: Groups in the access list are not counted.</p> <p>The access list is an IP standard ACL. The value ranges from 1 to 99, 1300 to 1999, and WORD.</p> |
| <b>Command Mode</b>          | Interface configuration mode   |

|                    |  |
|--------------------|--|
| <b>Usage Guide</b> | <p>Global configuration mode: Limits the number of MLD group members on the whole device.</p> <p>Interface configuration mode: Limits the number of MLD group members of the interface.</p> <p>If the number of group members exceeds the interface limit or global limit, subsequent Report messages will be ignored.</p> <p>If an except list is configured, Report messages in a specified range can be normally processed. Therefore, the group members are not counted.</p> <p>Interface and global limits can be configured separately. If the global limit is smaller than the interface limit, use the global limit.</p> |
|--------------------|--|

### Common Errors

- The basic functions of MLD are not enabled.

## 4.4.5 MLD Proxy

### Configuration Effect

- Configure the router proxy function and collect local member information.

## Notes

- The basic functions of MLD must be configured.

## Configuration Steps

### ▾ Configuring MLD PROXY-SERVICE

Optional.

This function can be configured on the interface of routers directly connected to the upstream devices unless otherwise specified.

### ▾ Configuring MLD MROUTE-PROXY

Optional

This function can be configured on the interface of hosts directly connected to the downstream devices unless otherwise specified.

## Verification

- Configure the interface that directly connects interface 7 and upstream router as the multicast proxy service.
- Configure the interface that directly connects interface 1 and downstream host as the multicast proxy.
- Configure groups FF66::05 and FF66::06 to be added to interface 1.
- Check information of the current group.

### Common Errors

- The basic functions of MLD are not enabled.

## 4.4.6 Supporting SSM-MAP

### Configuration Effect

- MLDv2 supports source filtering while MLDv1 does not. However, MLDv1 provides the SSM-MAP function to implement source filtering.

### Notes

- The basic functions of MLD must be configured.

### Configuration Steps

#### ▾ Enabling SSM-MAP

This function must be configured if SSM-MAP.

This function must be enabled on a router where SSM-MAP is enabled.

#### ▾ Configuring an SSM-MAP Static Link Table

Optional.

This function must be enabled on a router where SSM-MAP is enabled.

### Verification

Run the **show ipv6 mld ssm-mapping** [ *group-address* ] command to display SSM-MAP information.

## 5 Configuring PIM-DM

### 5.1 Overview

Protocol Independent Multicast (PIM) is an intra-domain multicast routing protocol.

A multicast source sends a packet to a group address. The packet is forwarded by network devices hop by hop and finally reaches the group members. On layer-3 network devices, PIM is used to create and maintain multicast routing entries, so as to support multicast forwarding.

PIM works in two modes: Protocol Independent Multicast - Sparse Mode (PIM-SM) and Protocol Independent Multicast - Dense Mode (PIM-DM).

- PIM-SM is applicable to large-scale networks where group members are sparsely distributed in a wide scope.
- PIM-DM is applicable to small networks where group members are densely distributed.

#### Protocols and Standards

- RFC3973: Protocol Independent Multicast - Dense Mode (PIM-DM)
- RFC2715: Interoperability Rules for Multicast Routing Protocols

### 5.2 Applications

| Application   | Description   |
|---|---|
| <a href="#">Providing the Multicast Service in the Same Network</a> | The multicast service is provided in the same network.          |
| <a href="#">PIM-DM Application in a Hot Backup Environment</a>      | The multicast PIM-DM protocol runs in a hot backup environment. |

#### 5.2.1 Providing the Multicast Service in the Same Network

##### Scenario

The multicast service is provided in the same network.

The following figure is taken as an example:

- A multicast source sends a multicast packet, and Receiver A and Receiver B in the same network receive the multicast packet.

Figure 5-1

|                |   |
|----------------|---|
| <b>Remarks</b> | <p>A, B, and C are Layer-3 routers.</p> <p>The multicast source is connected to the Gi0/1 interface of A, Receiver A is connected to the Gi0/1 interface of B, and Receiver B is connected to Gi0/1 of C.</p> |
|----------------|---|

## Deployment

- Run the Open Shortest Path First (OSPF) protocol in the same network to implement unicast routing.
- Run the PIM-DM protocol in the same network to implement multicast routing.
- Run the Internet Group Management Protocol (IGMP) in a user host network segment to implement group member management.

## 5.2.2 PIM-DM Application in a Hot Backup Environment

### Scenario

In a hot backup environment, run PIM-DM. A device performs hot backup switching to ensure that traffic is not interrupted.

Figure 5-2

|                |  |
|----------------|--|
| <b>Remarks</b> | R1 is connected to the video server, R2 is directly connected to the receiver, and R2 runs in hot backup mode. A Layer-3 multicast protocol runs on R1 and R2. |
|----------------|--|

### Deployment

- Run OSPF on R1 and R2 to implement unicast routing.
- Run PIM-DM on R1 and R2 to implement multicast routing.
- Make R2 run in a hot backup environment.

|                |   |
|----------------|---|
| <b>Remarks</b> | R2 may perform hot backup switching in the hot backup environment. In this case, the query interval of PIM Hello packets (the default value is 30 seconds) needs to be adjusted on R2 because the keepalive timer of the neighbor in PIM Hello packets of R1 may have expired (the default value is 3.5 times the query interval, that is, 105 seconds). The multicast function relies on the unicast function currently, and the multicast function starts convergence after the unicast function convergence is complete. For example, the default graceful restart (GR) convergence time of the unicast function is 120 seconds. It is recommended that the query interval of PIM Hello packets be set to 60 seconds. The keepalive time of the neighbor in PIM Hello packets is 210 seconds. In this scenario, the query interval of PIM Hello packets need to be set with a reference to the GR convergence time of the unicast function and the value of 3.5 times the query interval of PIM Hello packets must be larger than the GR convergence time of the unicast function. In a hot backup environment, it is recommended that the query interval of PIM Hello packets be larger than the default value (30 seconds). Otherwise, the keepalive timer of the neighbor in PIM Hello packets of the peer end times out during hot backup switching. |
|----------------|---|

## 5.3 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

Routers where the PIM protocol is enabled are called PIM Routers. Interfaces where the PIM protocol is enabled are called PIM interfaces.

Multicast packets are forwarded on PIM routers. The PIM interfaces where multicast packets are received are called Upstream Interfaces, and the PIM interfaces where multicast packets are sent are called Downstream Interfaces.

The network segments where upstream interfaces are located are called Upstream Network Segments. The network segments where downstream interfaces are located are called Downstream Network Segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On some PIM interfaces, borders can be set to divide a large PIM network into multiple PIM domains. The borders are able to reject specified multicast packets or limit the transmission of PIM messages.

#### ↘ Multicast Distribution Tree

Multicast packets are packets transmitted from one point to multiple points. The forwarding path is in a tree structure. This forwarding path is called the Multicast Distribution Tree (MDT).

#### ↘ (\*,G), (S,G)

- (\*,G): Packets sent from any source to Group G, the corresponding routing entries, and the forwarding path called Rendezvous Point Tree (RPT).
- (S,G): Packets sent from Source S to Group G, the corresponding routing entries, and the forwarding path called Shortest Path Tree (SPT).

### Overview

| Feature                         | Description   |
|---------------------------------|---|
| <a href="#">PIM-DM Neighbor</a> | Neighbor relationships are established between PIM routers to form a PIM network. |
| <a href="#">PIM-DM SRM</a>      | PIM-DM uses a State Refresh Message (SRM) to update the network state.            |

#### 5.3.1 PIM-DM Neighbor

Neighbor relationships are established between PIM routers to form a PIM network. Neighbor relationships must be established between PIM routers before PIM control messages can be exchanged or multicast packets can be forwarded.

## Working Principle

A Hello message is sent from a PIM interface. For the IPv4 multicast packet with the Hello message encapsulated, the destination address is 224.0.0.13 (indicating all PIM routers in the same network segment), the source address is the IP address of the PIM interface, and the Time To Live (TTL) value is 1. For the IPv6 multicast packet with the Hello message encapsulated, the destination address is ff02::d.

Function of a Hello message: It is used to discover neighbors, coordinate protocol parameters, and maintain neighbor relationships.

### Discovering Neighbors

PIM routers in the same network segment receive multicast packets from the destination address 224.0.0.13 or ff02::d. In this way, the PIM routers obtain neighbor information and establish neighbor relationships.

When a PIM interface is enabled or detects a new neighbor, a Triggered-Hello-Delay message is used to generate a random time. Within the time, the interface sends Hello packets.

### Coordinating Protocol Parameters

A Hello message includes multiple protocol parameters, which are described as follows:

- DR\_Priority: Router interfaces contend for the designated router (DR) based on their DR priorities. A higher priority means a higher chance of winning.
- Holdtime: Time in which a neighbor is held in the reachable state
- LAN\_Delay: LAN delay for transmitting a Prune message in a shared network segment
- Override-Interval: Prune override time carried in a Hello message.

When a PIM router receives a Prune message from an upstream interface, it indicates that downstream interfaces exist in the shared network segment. If the PIM router still needs to receive multicast data, the PIM router must send a Prune Override message to the upstream interface within the Override-Interval.

$\text{LAN\_Delay} + \text{Override-Interval} = \text{PPT}$  (Prune-Pending Timer). After a PIM router receives a Prune message from a downstream interface, the PIM router will not immediately perform pruning until PPT times out. Within the time of PPT, if the PIM router receives a Prune rejection message from the downstream interface, the PIM router cancels pruning.

### Maintaining Neighbor Relationships

A Hello message is sent periodically between PIM routers. If a Hello packet is not received from a PIM neighbor within Holdtime, the neighbor is considered unreachable and is deleted from the neighbor list. Any change of PIM neighbors will cause change of the multicast topology in the network. If an upstream or downstream neighbor in an MDT is unreachable, multicast routes converge again and the MDT is reshaped.

## Related Configuration

### Enabling PIM-DM on an Interface

By default, PIM-DM is disabled on an interface.

Use the **ip pim dense-mode** command to enable or disable PIM-DM on an interface.

PIM-DM must be enabled on an interface to involve the interface in the PIM protocol.

### 📌 Setting the Interval of Hello Messages on an Interface

By default, a Hello message is sent at an interval of 30 seconds.

The **ip pim query-interval** *interval-seconds* command is used to adjust the interval of Hello messages. The value of the interval ranges from 1 to 65,535.

A Hello message is transmitted less frequently when the value of *interval-seconds* is larger.

## 5.3.2 PIM-DM MDT

The three basic mechanisms dense-mode PIM uses to build multicast forwarding trees are: flood, prune, and graft.

### Working Principle

When a multicast source sends multicast packets, the system forwards them to the outgoing interfaces of multicast neighbors and local members. The Reverse Path Forwarding (RPF) check needs to be conducted on all packets received through the upstream interface of the device. Packets that fail the RPF check will be discarded. Multicast packets that pass the RPF check are further forwarded if there is an outgoing interface. If no outgoing interface is available, the device sends a prune packet to the upstream interface. After receiving the prune packet, the upstream interface identifies the source interface of the prune packet as the Pruned state and sets the Pruned Timer (PI). In this way, a multicast forwarding tree with the multicast source as the root is created.

When the system receives a Join message from a local member, if a downstream device in the Pruned state sends a Graft message to the upstream device, the upstream device returns a Graft-Ack message and resumes forwarding of multicast data to the interface of the downstream device after receiving the Graft message.

- 
- 📘 In environment deployment, when multiple PIM-DM neighbors are created through multiple links between devices and downstream devices need to receive no or few packets, the CPU usage may be high. In this scenario, PIM-SM is recommended for the environment deployment
- 

### Related Configuration

#### 📌 Configuring the Prune Override Interval on an Interface

By default, the prune override interval is 500 ms.

Run the **ip pim override-interval** *interval-milliseconds* command to change the prune override interval.

## 5.3.3 PIM-DM SRM

PIM-DM uses an SRM to refresh the network state.

## Working Principle

Devices connected to a multicast source periodically send SRMs to downstream devices to notify changes of the network topology. After receiving the SRMs, the adjacent devices receiving the SRMs add the local topology state information to the messages by modifying some fields in SRMs, and send the messages to downstream devices. When the messages reach leaf devices, the state information of the entire network is updated.

## Related Configuration

### Disabling the Processing and Forwarding of SRMs

By default, the processing and forwarding of SRMs are enabled.

The **ip pim state-refresh disable** command is used to disable the processing and forwarding of SRMs.

- Disabling the SRM function may cause the converged PIM-DM MDT to re-converge, which leads to unnecessary bandwidth waste and multicast routing table flapping. Therefore, it is recommended not to disable SRM in general conditions.

### Setting the Interval of SRMs

By default, an SRM is sent at an interval of 60 seconds.

The **ip pim state-refresh origination-interval *interval-seconds*** command is used to adjust the interval of SRMs. The value of the interval ranges from 1 to 100.

SRMs are transmitted less frequently when the value of *interval-seconds* is larger.

- Only devices that are directly connected to a multicast source will periodically send a PIM SRM to downstream interfaces. For a device not directly connected to the multicast source, the interval of SRMs on its downstream interfaces is invalid.

## 5.3.4 MIB

Connected to other agents, the Simple Network Management Protocol (SNMP) manager uses information in the Management Information Base (MIB) to directly manage the PIM-DM function.

## Working Principle

The MIB specifies variables (namely information that can be queried and set by the management process) maintained by network elements and directly manages the PIM-DM function.

## Related Configuration

### Enabling PIM-DM MIB

By default, the PIM-DM MIB function is enabled.

The **ip pim mib dense-mode** command is used to enable the PIM-DM MIB function.

## 5.4 Configuration

| Configuration                                      | Description and Command   |  |

|  | <b>ip pim state-refresh origination-interval</b> <i>interval-seconds</i>  | Sets the Interval of SRMs on an interface.           |
| <a href="#">Configuring PIM-DM MIB</a>             | <b>ip pim mib dense-mode</b>  | Enables PIM-DM MIB.                                  |

### 5.4.1 Configuring PIM-DM Basic Functions

#### Configuration Effect

- Create a PIM-DM network and provide data sources and user terminals in the network with the IPv4 multicast service.

#### Notes

- PIM-DM needs to use the unicast routes existing in the network. Therefore, IPv4 unicast routing must be configured in the network.

#### Configuration Steps

##### ↘ Enabling IPv4 Multicast Routing

- Mandatory
- IPv4 multicast routing should be enabled on each router unless otherwise specified.

##### ↘ Enabling PIM-DM

- Mandatory
- PIM-DM should be enabled on the following interfaces unless otherwise specified: interconnected interfaces on routers and interfaces connecting multicast sources and user hosts.

## Verification

Make multicast sources send multicast packets and make user hosts join the groups.

- Check whether the user hosts can successfully receive packets from each group.
- Check whether correct PIM-DM routing entries are created on routers.

### Common Errors

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- PIM-DM is not enabled on a certain interface.

## 5.4.2 Configuring PIM-DM Neighbors

### Configuration Effect

- Coordinate protocol parameters and adjust parameters in the Hello packet.
- Enable neighbor filtering to improve network security.

### Notes

- Basic functions of PIM-DM must be configured.

### Configuration Steps

- Set parameters on PIM router interfaces unless otherwise specified.

### Verification

- Set parameters in a Hello packet on an interface and run the **debug ip pim dense-mode encode** command to check parameters.
- Enable neighbor filtering and run the **show ip pim dense-mode decode** command to display neighbor filtering information.
- Run the **show running-config interface** [ *interface-type interface-number* ] command to display configurations on an interface.

#### ▾ Setting the Interval of Hello Messages

|   |  |
|---|--|
| <b>Command</b>  | <b>ip pim query-interval</b> <i>interval-seconds</i>                                 |
| <b>Parameter Description</b>  | <i>interval-seconds</i> : The value ranges from 1 to 65,535 in the unit of seconds.  |
| <b>Command Mode</b>   | Interface configuration mode   |
| <b>Usage Guide</b>  | When the Hello interval is set, the holdtime value will be updated as its 3.5 times. |
| <p><b>i</b> Every time when the interval of Hello messages is updated, the holdtime value is automatically updated as 3.5 times of the interval. If the result of the interval of Hello messages multiplied by 3.5 is greater than 65,535, the holdtime value is updated as 65,535.</p> |  |

#### ▾ Setting the Prune Propagation Delay

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim propagation-delay</b> <i>interval-milliseconds</i>                                  |
| <b>Parameter Description</b> | <i>interval-milliseconds</i> : The value ranges from 1 to 32,767 in the unit of milliseconds. |
| <b>Command</b>               | Interface configuration mode  |

|                    |   |
|--------------------|---|
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | Set <b>propagation-delay</b> of an interface, that is, configure the prune propagation delay of an interface. |

### Setting the Prune Override Interval

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim override-interval</b> <i>interval-milliseconds</i>  |
| <b>Parameter Description</b> | <i>interval-milliseconds</i> : The value ranges from 1 to 32,767 in the unit of milliseconds.             |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | Set <b>override-interval</b> of an interface, that is, configure the prune override time of an interface. |

### Configuring PIM-DM Neighbor Filtering

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip pim neighbor-filter</b> <i>access-list</i>   |
| <b>Parameter Description</b> | <i>access-list</i> : The supported ACL ranges from 1 to 99. Naming an ACL is also supported.   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>Only addresses that meet ACL filtering conditions can be used as PIM neighbors of the current interface. Otherwise, the addresses filtered out cannot be neighbors.</p> <p>Peering refers to exchange of protocol packets between PIM neighbors. If peering with a PIM device is suspended, the neighbor relationship with it cannot be formed so that PIM protocol packets will not be received from the device.</p> |

## Configuration Example

### Configuring PIM-DM Neighbors on the IPv4 Network

### Common Errors

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- PIM-DM is not enabled on a certain interface.

### 5.4.3 Configuring PIM-DM SRMs

#### Configuration Effect

- Enable or disable the PIM-DM SRM function.
- Adjust the interval of SRMs.

## Notes

- Basic functions of PIM-DM must be configured.

## Configuration Steps

- The interval of SRMs is only applicable only to the PIM router interfaces that are directly connected to the multicast source.

## Verification

- Configure the PIM-DM SRMs and run the **show running-config** command to display the SRM status.
- Run the **show ip pim dense-mode track** command to display the SRM number.
- Run the **show running-config interface** [ *interface-type interface-number* ] command to display interface configurations.

## 6 Configuring PIM-SM

### 6.1 Overview

Protocol Independent Multicast (PIM) is an intra-domain multicast routing protocol.

A multicast source sends a packet to a group address. The packet is forwarded by network devices hop by hop and finally reaches the group members. On Layer-3 network devices, PIM is used to create and maintain multicast routing entries, so as to support multicast forwarding.

PIM works in two modes: Protocol Independent Multicast - Sparse Mode (PIM-SM) and Protocol Independent Multicast - Dense Mode (PIM-DM).

- PIM-SM is applicable to large-scale networks where group members are sparsely distributed in a wide scope.
- PIM-DM is applicable to small networks where group members are densely distributed.

#### Protocols and Standards

- RFC4601: Protocol Independent Multicast -Sparse Mode (PIM-SM)
- RFC5059: Bootstrap Router (BSR) Mechanism for Protocol Independent Multicast (PIM)
- RFC3962: Protocol Independent Multicast - Dense Mode protocol
- RFC4607: Source-Specific Multicast for IP

### 6.2 Applications

| Application                             | Description   |
|---|---|
| <a href="#">Enabling ASM for PIM-SM</a> | The receiver receives any multicast source.             |
| <a href="#">Enabling SSM for PIM-SM</a> | The receiver receives only a specific multicast source. |

#### 6.2.1 Enabling ASM for PIM-SM

##### Scenario

Provide multicast services within only one domain.

For example, in the following figure, the receiver receives any multicast source.

Figure 6-1

|                |  |
|----------------|--|
| <b>Remarks</b> | R 1 is connected directly to the multicast source.<br>R 2 serves as the rendezvous point (RP).<br>R 3 is connected directly to Receiver A.<br>R 4 is connected directly to Receiver B. |
|----------------|--|

**Deployment**

- Run the Open Shortest Path First (OSPF) protocol to realize unicast routing.
- Run PIM-SM to realize multicast routing.
- Run the Internet Group Management Protocol (IGMP) in the network segment of the user host to manage group members.

**6.2.2 Enabling SSM for PIM-SM**

**Scenario**

Provide multicast services within only one domain.

For example, in the following figure, the receiver receives a specific multicast source.

Figure 6-2

|                |   |
|----------------|---|
| <b>Remarks</b> | R 1 is connected directly to the multicast source.<br>R 2 serves as the RP. |
|----------------|---|

|  |
|--|
| R 2 is connected directly to Receiver A.<br>R 2 is connected directly to Receiver B. |
|--|

## Deployment

- Run the OSPF protocol to realize unicast routing.
- Run PIM-SM to realize multicast routing.
- Run the source-specific multicast (SSM) of PIM-SM within the domain.
- Run IGMPv3 in the network segment of the user host to manage group members.

## 6.3 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

A router running PIM is called a PIM router. An interfaces running PIM is called a PIM interface.

Multicast packets are forwarded on PIM routers. The PIM interfaces where multicast packets are received are called upstream interfaces, and the PIM interfaces where multicast packets are sent are called downstream interfaces.

The network segments where upstream interfaces are located are called upstream network segments, and the network segments where downstream interfaces are located are called downstream network segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces to form a PIM network.

On some PIM interfaces, borders can be set to divide a large PIM network into multiple PIM domains. The borders can reject the passage of specific multicast packets or limit the transmission of PIM packets.

#### ↘ Multicast Distribution Tree, DR, and RP

Multicast packets are transmitted from one point to multiple points, forming a tree-shaped forwarding path. Such forwarding path is called the multicast distribution tree (MDT), which includes the following two types:

- RP Tree (RPT): It is rooted at an RP, and uses the designated router (DR) of the member groups connected to it as its leaves.
- Shortest path tree (SPT): It is rooted at a DR that is connected to the multicast source, and uses the RP or the DR of the member groups connected to it as its leaves.

Both the DR and RP are the functions of a PIM router.

- An RP collects the information of a multicast source or multicast member on the network.
- The DR connected to the multicast source advertises the multicast source information to the RP; the DR connected to multicast group members advertises the information of multicast group members to the RP.

#### ↘ (\*, G), (S, G)

- (\*, G): Indicates the packets sent from any source to a group (G), the corresponding route entries, and the RPT.
- (S, G): Indicates the packets sent from the source (S) to a group (G), the corresponding routing entries, and the SPT.

### 📌 ASM, SSM

PIM-SM supports both any-source multicast (ASM) and SSM, and it is applicable to different multicast group address segments.

- ASM: In this model, a user is not allowed to select a multicast source. The user host joins a group, and receives the packets sent from all sources.
- SSM: In this model, a user can select a multicast source. The user host joins a group and specifies the source address. Then only the packets sent from this source address is received.

**i** Requirements for using an SSM model: Before selecting a multicast source, you need to learn the address of the multicast source using other network services.

## Overview

| Feature  | Description  |
|--|--|
| <a href="#">PIM-SM Neighbor</a>                              | Establishes neighbor relationships between RIM routers to form a PIM network.  |
| <a href="#">DR Election</a>                                  | In the network segment where group member hosts are located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the group members.<br>In the network segment where the multicast source is located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the multicast source. |
| <a href="#">BSR Mechanism</a>                                | On a PIM network, the BSR generates periodic candidate RPs and bootstrap packets of corresponding group addresses.   |
| <a href="#">RP Mechanism</a>                                 | On a PIM network, through static RP configuration or dynamic RP election, the location of the RP can be learned by each PIM router.  |
| <a href="#">Register Information of the Multicast Source</a> | When the multicast source is detected on the network, the source DR sends a register packet to the RP, which obtains the source information and multicast packet.  |
| <a href="#">Creating an RPT</a>                              | When a group member is detected on the network, the DR connecting to the group members send packets toward the RP to form an RPT. If the multicast source already exists on the network, the packets arrived at the RP can be sent to the group members along the RPT.   |
| <a href="#">Creating an SPT</a>                              | When data packets arrive at the DR connecting to group members, the DR sends these packets toward the multicast source to form an SPT, and multicast packets are sent to group members along the SPT.  |
| <a href="#">ASM and SSM</a>                                  | A PIM router can provide multicast services of both ASM model and SSM model at the same time. SSM model applies to the groups whose addresses are within the range of the SSM addresses. For other groups, use ASM model.  |

### 6.3.1 PIM-SM Neighbor

Neighbor relationships are established between PIM routers to form a PIM network. Neighbor relationships must be established between PIM routers before PIM control packets can be exchanged or multicast packets can be forwarded.

#### Working Principle

A PIM interface sends a Hello packet. For the IPv4 multicast packet whose Hello packet is encapsulated, the destination address is 224.0.0.13 (indicating all PIM routers in the same network segment), the source address is the IP address of the PIM interface, and the Time To Live (TTL) value is 1. For the IPv6 multicast packet whose Hello packet is encapsulated, the destination address is ff02::d.

A Hello packet is used to discover neighbors, coordinate protocol parameters, and maintain neighbor relationships.

#### ↘ Discovering Neighbors

PIM routers in the same network segment receive multicast packets from the destination address 224.0.0.13. In this way, the PIM routers obtain neighbor information and establish neighbor relationships.

When a PIM interface is enabled or detects a new neighbor, a triggered-hello-delay packet is used to generate a random time. Within the time, the interface sends Hello packets.

#### ↘ Coordinating Protocol Parameters

A Hello packet includes multiple protocol parameters, which are described as follows:

- DR\_Priority: indicates the priority of a router interface for competing for the DR. A higher priority means a higher chance of winning.
- Holdtime: Indicates the time in which a neighbor is held in the reachable state
- LAN\_Delay: Indicates the LAN delay for transmitting a Prune packet in a shared network segment.
- Override-Interval: Indicates the prune override time carried in a Hello packet.

When a PIM router receives a Prune packet from an upstream interface, it indicates that downstream interfaces exist in the shared network segment. If the PIM router still needs to receive multicast data, the PIM router must send a Prune Override packet to the upstream interface within the override interval.

$\text{LAN\_Delay} + \text{Override Interval} = \text{PPT}$  (Prune-Pending Timer). After a PIM router receives a Prune packet from a downstream interface, the PIM router will not immediately perform pruning until PPT times out. Within the time of PPT, if the PIM router receives a Prune rejection packet from the downstream interface, the PIM router cancels pruning.

#### ↘ Maintaining Neighbor Relationships

A Hello packet is sent periodically between PIM routers. If a Hello packet is not received from a PIM neighbor within Holdtime, the neighbor is considered unreachable and is deleted from the neighbor list. Any change of PIM neighbors will cause change of the multicast topology in the network. If an upstream or downstream neighbor in an MDT is unreachable, multicast routes converge again and the MDT is reshaped.

## Related Configuration

---

### ↳ Enabling PIM-SM on an Interface

By default, PIM-SM is disabled on an interface.

Run **ip pim sparse-mode** to enable or disable PIM-SM on an interface.

PIM-SM must be enabled on an interface to involve the interface in the PIM protocol. If PIM-SM is not enabled for the interface of a DR, static RP, candidate RP (C-RP), or candidate BSR (C-BSR), corresponding roles of the PIM protocol cannot be run.

### ↳ Setting the Interval of Hello Packets on an Interface

By default, a Hello packet is sent every 30s.

Run **ip pim query-interval** *interval-seconds* to adjust the interval of Hello packets. The value ranges from 1 to 65,535.

A Hello packet is transmitted less frequently when the value of *interval-seconds* is greater.

## 6.3.2 DR Election

In the network segment where group member hosts are located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the group members.

In the network segment where the multicast source is located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the multicast source.

The DR sends Join/Prune packets toward the MDT, or sends the multicast source data to the MDT.

## Working Principle

---

When creating a PIM neighbor, you can send a Hello packet to obtain the IP address and DR priority of the neighbor to elect a DR.

Two parameters play a key role in winning the DR election: the DR priority of an interface and the IP address of the interface.

### ↳ DR Priority of an Interface

During the DR election, the RIM router with the highest DR priority will be elected as the DR.

### ↳ Interface IP Address

During the DR election, if the priority of interfaces is the same, then interface IP addresses will be compared. The interface with the maximum IP address will be elected as the DR.

## Related Configuration

---

### ↳ Enabling PIM-SM on an Interface

By default, PIM-SM is disabled on an interface.

Run **ip pim sparse-mode** to enable or disable PIM-SM on an interface.

PIM-SM must be enabled on an interface to involve the interface in the PIM protocol. If PIM-SM is not enabled for the interface of a DR, static RP, C-RP, or C-BSR, corresponding protocols cannot be run.

### ↘ Adjusting the DR Priority of an Interface

By default, the DR priority is 1.

Run **ip pim dr-priority** *priority-value* to adjust the DR priority of the interface. The value ranges from 0 to 4,294,967,294.

The DR priority is used in the DR election in the network segment directly connected the interface. A greater value indicates a higher priority.

## 6.3.3 BSR Mechanism

On a PIM network, the BSR generates periodic candidate RPs and bootstrap packets of corresponding group addresses. These bootstrap packets are sent hop by hop in the domain. All the routers on the entire network will receive these bootstrap packets, and record these candidate RPs and their corresponding group addresses.

### Working Principle

One or multiple candidate BSRs are configured in a PIM-SM domain. You need to apply a certain algorithm to select the BSR from these candidate BSRs.

### Related Configuration

#### ↘ Configuring Candidate BSRs

By default, candidate BSRs are not configured.

Run **ip pim bsr-candidate** *interface-type interface-number* [ *hash-mask-length* [ *priority-value* ] ] to configure or cancel the configuration of candidate BSRs.

Through bootstrap packet (BSM) learning and competition of candidate BSRs, a unique BSR is generated for the PIM-SM domain.

#### ↘ Configuring BSR Borders

By default, BSR borders are not configured.

Run **ip pim bsr-border** to configure or cancel the configuration of BSR borders.

After this command is configured, BSMs received by the interface will be discarded and will not be forwarded by this interface, preventing BSM flooding.

#### ↘ Filtering BSMs

By default, BSMs from the BSR are not filtered.

Run **ip pim accept-bsr list** { <1-99> | <1300-1999> | *WORD* } to configure whether to filter BSMs.

If this function is enabled, only legible BSMs are received by the interface; if this function is disabled, all the external BSMs will be received by the device running PIM-SM.

### ↘ Configuring Legible C-RP Addresses and the Multicast Groups They Serve for a Candidate BSR

By default, Candidate-RP-Advertisement (C-RP-Adv) packets are not filtered by a candidate BSR.

Run **ip pim accept-crp list** { <100-199> | <2000-2699> | *WORD* } to configure whether to filter C-RP-Adv packets.

If this function is enabled, C-RP addresses and corresponding multicast groups are filtered by a candidate BSR. If this function is disabled, all external C-RP-Adv packets are received by a candidate BSR.

### ↘ Allowing a C-BSR to Receive a C-RP-ADV Packet Whose Prefix-Count Is 0

By default, a candidate BSR cannot receive a C-RP-ADV packet whose prefix-count is 0.

Run **ip pim accept-crp-with-null-group** to configure whether to receive a C-RP-ADV packet whose prefix-count is 0.

If this function is enabled, a C-RP-ADV packet whose prefix-count is 0 can be received by a candidate BSR. If this function is disabled, a C-RP-ADV packet whose prefix-count is 0 cannot be received by a candidate BSR.

## 6.3.4 RP Mechanism

On a PIM network, through static RP configuration or dynamic RP election, the location of the RP can be learned by each PIM router. The RP as the root of the RPT, is the point where the RPT is rooted at and RPT data traffic is forwarded from.

### Working Principle

All PIM routers in the same PIM domain must be mapped to the same RP as a specific multicast group address. On a PIM network, an RP can be configured as static or dynamic.

#### ↘ Static RP

In static RP configuration, RP addresses are configured directly on PIM routers and these addresses are learnt by the entire PIM network.

#### ↘ Dynamic RP

In a PIM-SM domain, there are candidate RPs that send unicast packets (including RP addresses and the multicast groups they serve) to the BSR, which generates periodic candidate RPs and bootstrap packets of corresponding group addresses. These bootstrap packets are sent hop by hop in the domain, and received and saved by PIM routers, which apply a hash function to map the group addresses to the candidate RP that can provide services. Then the RP corresponds to these multicast group addresses can be confirmed.

### Related Configuration

#### ↘ Configuring Static RP Addresses

By default, no RP address is configured.

Run **ip pim rp-address** *rp-address* [ *access-list* ] to configure a static RP address for a PIM router.

To use static RP addresses, the static RP address of all routers in the PIM-SM domain must be the same, so that the PIM SM multicast routing remains consistent.

### ✚ Configuring Candidate C-RP Addresses

By default, no C-RP address is configured.

Run **ip pim rp-candidate** *interface-type interface-number* [ **priority** *priority-value* ] [ **interval** *interval-seconds* ] [ **group-list** *access-list* ] to configure or cancel a PIM router as a candidate C-RP.

After a candidate RP is configured, it can send periodic C-RP-Adv packets to the BSR, and the information carried by these C-RP-Adv packets will be advertized to all PIM-SMs in the domain, ensuring the uniqueness of RP mapping.

### ✚ Ignoring the RP Priority in RP-Set

By default, C-RP of the highest priority is configured.

Run **ip pim ignore-rp-set-priority** to select or deselect the RP priority when selecting the corresponding RP of a multicast group.

If you want to select an RP from multiples RPs that serve the same multicast group address, you can run this command to ignore the RP priority. If this command is not configured, RP priority will be considered when two RPs are compared.

## 6.3.5 Register Information of the Multicast Source

When the multicast source is detected on the network, the source DR sends a register packet to the RP, which obtains the source information and multicast packet.

### Working Principle

When a source DR receives a multicast packet from the host directly connected to it, the source DR encapsulates the multicast packet into the register packet, and sends the unicast packet to RP to form an (S, G) entry.

If the RP has an outgoing interface for the forwarding entry, it encapsulates the data packet and forwards the packet to the outgoing interface.

If the RP does not have the forwarding entry of the present group, it generates the (S, G) entry and enables the timer. If the timer times out, the RP sends a Register-Stop packet to the DR to delete the entry. The source DR sends an inspection packet before timeout after it receives the Register-Stop packet.

If no Register-Stop packet is received by the DR, the DR on the timeout data source will encapsulate the multicast data in the register packet and send the unicast packet to the RP.

If a Register-Stop packet is received by the DR, time-delay will be performed once again, and an inspection packet will be sent before time delay.

### Related Configuration

#### ✚ Detecting the Reachability of a Register Packet

By default, the reachability of an RP is not detected.

Run **ip pim register-rp-reachability** to configure or cancel the detection of the reachability of an RP.

You can enable this function if you want to detect whether an RP is reachable for a register packet sent from a DR. After this function is enabled, the DR will detect the reachability of a register packet before it is sent to an RP, namely, the DR will check whether a route to the RP exists in the unicast routing entry and static multicast routing entry. If the route does not exist, the register packet will not be sent.

### ▾ Configuring an RP to Filter the Addresses of Register Packets

By default, all register packets are received an RP.

Run **ip pim accept-register** { **list** *access-list* [**route-map** *map-name* ] | **route-map** *map-name* [**list** *access-list* ] } to configure an RP to filter or cancel the filtering of the source addresses of received register packets.

You can run this command if you want to filter the source addresses of received register packets. If this function is not enabled, all register packets will be received by the RP. If this function is disabled, only the register packets whose source addresses and multicast group addresses included in access control lists (ACLs) are processed; otherwise, the packets will be filtered.

### ▾ Limiting the Speed for Sending a Register Packet

By default, the speed for sending a register packet is not limited.

Run **ip pim register-rate-limit** *rate* to limit or cancel the limitation of the speed for sending a register packet.

If the **no** form of this command is configured, the speed is not limited. This command takes effect for only the register packet of each (S, G) packet, but not all the register packets in the entire system.

### ▾ Calculating the Checksum of the Entire Register Packet Length

By default, the checksum of a register packet is calculated as stipulated by the protocol.

Run **ip pim register-checksum-wholepkt** [ **group-list** *access-list* ] to configure the checksum of the register packet length.

You can enable this function if you want to include the length of encapsulated multicast packets into the checksum of the register packet length. If this function is disabled, the checksum of a register packet is calculated as stipulated by the protocol.

### ▾ Configuring an RP to Forward Multicast Data Packets to Downstream Interfaces After Decapsulating Register Packets

By default, register packets are not decapsulated and multicast packet are not forwarded to interfaces.

Run **ip pim register-decapsulate-forward** to forward or cancel the forwarding of data packets to downstream interfaces.

You can run this command if you want to decapsulate a register packet and forward the multicast packet. If this function is disabled, the multicast packet will not be forwarded.

### ▾ Configuring the Source IP Address of a Register Packet

By default, the source IP address of a register packet is the same as the interface address of the DR connected to the multicast source.

Run **ip pim register-source** { *local\_address* | *Interface-type interface-number* } to configure the source IP address.

You can run this command if you want to configure the source IP address of the register packet sent by a DR. If this function is disabled or the **no** form of this command is used, the source address of the register packet will be the same as the interface address of the DR connected to the multicast source. If you want to configure *local\_address*, the configured address must be reachable for a unicast route. *Interface-type interface-number* can be a typical loopback interface or an interface of other types. The interface address must have been advertised by a unicast route.

### ✚ Configuring the Suppression Time of a Register Packet

By default, the suppression time of a register packet is 60s.

Run **ip pim register-suppression** *seconds* to configure the suppression time.

If you run this command on a DR, you can change the suppression time of the register packets sent from the DR. If you run this command but does not run **ip pim rp-register-kat** on an RP, the keepalive period of the RP will be changed.

### ✚ Configuring the Inspection Time of a Null Register Packet

By default, the inspection time is 5s.

Run **ip pim probe-interval** *interval-seconds* to configure the inspection time.

In the time interval before the timeout of register packet suppression, the source DR can send a null register packet to an RP. This time interval is called the inspection time, which is 5s by default.

### ✚ Configuring the Time of a RP KAT

By default, the default value of a keepalive timer (KAT) is used. The default value is calculated as follows: Suppression time of a register packet x 3 + Inspection time of a null register packet.

Run **ip pim rp-register-kat** *seconds* to configure the KAT time.

You can run this command if you want to configure the keepalive time of (S, G) of a register packet sent from an RP.

## 6.3.6 Creating an RPT

When a group member is detected on the network, the DR connecting to the group members send packets toward the RP to form an RPT. If the multicast source already exists on the network, the packets arrived at the RP can be sent to the group members along the RPT.

### Working Principle

To create an RPT, perform the following steps:

A receiver DR receives an IGMP (\*, G) include report packet from the receiving end.

If the DR is not the RP of this group (G), the DR will send a (\*, G) Join packet toward the RP. The router receiving this (\*, G) Join packet will send the packet hop by hop until it is received by the RP, which means that the RP has joined the RPT.

When the data source host sends the multicast data to a group, the source data is encapsulated in the register packet, and sent from the source DR to the RP in unicast mode. Then the RP decapsulates the register packet, takes the data packets out, and forwards these packets to each group member along the RPT.

The RP sends the (S, G) Join packets along the data source to join the SPT of this source.

After the SPT between the RPs to the source DR is created, the data packets from the data source will be sent decapsulated to the RPs along the SPT.

When the first multicast data packet arrives at an RP along the SPT, the RP sends a Register-Stop packet to the source DR to stop sending a register packet. After the source DR receives the Register-Stop packet, it stops encapsulating a register packet and sends the packet along the SPT to the RP, which will forwards the packet to each group member.

## Related Configuration

### ↘ Configuring the Interval for Sending a Join/Prune Packet

By default, the interval for sending a Join/Prune packet is 60s.

Run **ip pim jp-timer *seconds*** to configure the interval for sending a Join/Prune packet.

You can run this command to configure the interval for sending a Join/Prune packet. If not configured, the value will be a default 60s.

## 6.3.7 Creating an SPT

When data packets arrive at the DR connecting to group members, the DR sends these packets toward the multicast source to form an SPT, and multicast packets are sent to group members along the SPT. In this way, the burden on RP in the RPT is reduced, and the source DR will arrive at the receiver DR with less hops.

## Working Principle

To create an SPT, perform the following steps:

The receiver DR sends (\*, G) Join packets toward the source DR along the SPT, and (\*, G) Join packets are then send hop by hop until they are received by the source DR, forming an SPT.

## Related Configuration

By default, SPT switchover is not enabled.

Run **ip pim spt-threshold [ *group-list access-list* ]** to configure whether to switch to an SPT.

If this function is enabled, upon the reception of the first (S, G) packet, a PIM Join packet is triggered, and an SPT is created. If **group-list** is specified, all the specified groups will be switched to the SPT. If the **no** form of this command is used and **group-list** is not specified, an RPT will not be switched to an SPT, and the DR will remain in the RPT and send a Prune packet toward the source DR; if the **no** form of this command is used and **group-list** is specified, and that the ACLs have been configured, it means that the association between **group-list** and the ACLs is canceled, and all the groups are allowed to switch from an RPT to an SPT.

## 6.3.8 ASM and SSM

A PIM router can provide multicast services of both ASM model and SSM model at the same time. SSM model applies to the groups whose addresses are within the range of the SSM addresses. For other groups, use ASM model. In an ASM model,

only the multicast group (G) is specified for a multicast receiver, and the multicast source (S) is not specified. In an SSM model, both the multicast source (S) and multicast group (G) can be specified for a multicast receiver.

## Working Principle

**!** To realize SSM in an IPv4 router, IGMPv3 needs to be applied for managing membership between the host and devices, and PIM-SM needs to be applied to connect to devices.

In an SSM model, as a multicast receiver has learnt the (S, G) of the multicast source through a certain channel (for example, by visiting the server or receiving an advertisement), when a multicast receiver needs to request a multicast service, the multicast receiver can send the IGMP (S, G) Join packet toward the router of last hop. For example, as shown in Figure 6-3, the multicast receiver A sends the IGMP (S, G) Join packet to request the multicast service (S, G). After the router of last hop receives the IGMP (S, G) Join packet, it sends the PIM (S, G) Join packet to the multicast source hop by hop. As shown in Figure 6-3, when R 1 receives the IGMP (S, G) Join packet sent from multicast Receiver 1, R 1 sends the PIM (S, G) Join packet to R 3, which then sends the packet to R 4, thereby forming an SPT connecting the multicast receiver and multicast source.

Figure 6-3 SSM Model

To create an SSM model, the following requirements need to be met:

- A multicast receiver needs to learn the (S, G) of the multicast source in advance, and an IGMP (S, G) Join packet needs to be sent if the receiver needs to request a multicast service.
- IGMPv3 must be run on the interface of the last hop router connecting to the multicast receiver. IGMPv1 and IGMPv2 does not support SSM.
- PIM-SM and SSM must be run on the devices connecting the multicast receiver and multicast source.

**!** The default range of SSM groups is 232/8. You can run a command to change the value.

An SSM has the following features:

- A multicast receiver can learn the information of the multicast source through a certain channel (for example, by visiting the server or receiving an advertisement) in advance.

- An SSM model is a specific subnet of PIM-SM. It handles only the PIM (S, G) Join and PIM (S, G) Prune packets and discards the RPT-related packets, for example, PIM (\*, G) Join/Prune packets, that are within the scope the SSM. If the SSM detects a register packet within the scope, it will respond immediately with a Register-Stop packet.
- If an RP is not required, the election and distribution of RP information are not performed. The MDTs in an SSM are all SPTs.

## Related Configuration

ASM is enabled by default.

Run `ip pim ssm { default | range access-list }` to configure whether to switch to SSM.

In SSM, multicast packets can be received by the multicast source directly but not along the RP tree.

## 6.4 Configuration

| Configuration                                      | Description and Command   |
|--|---|
| <a href="#">Configuring Basic PIM-SM Functions</a> |  (Mandatory) It is used to configure the multicast service.            |
|  | <code>ip multicast-routing</code>   Enables IPv4 multicast routing.   |
|  | <code>ip pim sparse-mode</code>   Enables PIM-SM.   |
|  | <code>ip pim rp-address</code>   Configures a static RP.  |
|  | <code>ip pim rp-candidate</code>   Configures a C-RP.   |
|  | <code>ip pim bsr-candidate</code>   Configures a C-BSR.   |
|  | <code>ip pim ssm</code>   Enables SSM.  |
| <a href="#">Configuring BSR Parameters</a>         |  (Optional) It is used to configure a BSR.                           |
|  | <code>ip pim bsr-border</code>   Configures BSR borders.  |
|  | <code>ip pim accept-bsr list { &lt;1-99&gt;   &lt;1300-1999&gt;   WORD }</code>   Configures BSM packets limit on a PIM router.                         |
|  | <code>ip pim accept-crp list access-list</code>   Configures a C-BSR to inspect the address range of a C-PR.  |
| <a href="#">Configuring RP and DR Parameters</a>   |  (Optional) It is used to configure the parameters of an RP or a DR. |
|  | <code>ip pim ignore-rp-set-priority</code>   Ignores the C-RP priority.   |
|  | <code>ip pim register-rp-reachability</code>   Enables the source DR to detect the RP reachability.   |
|  | <code>ip pim accept-register list access-list</code>   Configures the range of source register (S, G) addresses.  |

| Configuration   | Description and Command  |   |
|---|--|---|
|   | <b>ip pim register-rate-limit</b> <i>rate</i>  | Limits the speed for sending register packets.  |
|   | <b>ip pim register-checksum-wholepkt</b> [ <b>group-list</b> <i>access-list</i> ]  | Calculates the checksum of the entire register packet.  |
|   | <b>ip pim register-decapsulate-forward</b>   | Enables an RP to decapsulate a register packet and forwards the multicast packet to interfaces. |
|   | <b>ip pim register-source</b><br>{ <i>local_address</i>   <i>Interface-type interface-number</i> }   | Configures the source IP address of a register packet.  |
|   | <b>ip pim register-suppression</b> <i>seconds</i>  | Configures the suppression time of a register packet.   |
|   | <b>ip pim probe-interval</b> <i>seconds</i>  | Configures the inspection time of a null register packet.                                       |
|   | <b>ip pim rp-register-kat</b> <i>seconds</i>   | Configures the interval of KATs on an RP.   |
| <a href="#">Configuring the Interval for Sending a Join/Prune Packet</a>        |  (Optional) It is used to specify the interval for sending a Join/Prune packet. |   |
|   | <b>ip pim jp-timer</b> <i>seconds</i>  | Configures the interval for sending a Join/Prune packet.  |
| <a href="#">Configuring the Router of Last Hop to Switch from an RPT to SPT</a> |  (Optional) It is used to switch from SPT to RPT.                             |   |
|   | <b>ip pim spt-threshold</b> [ <b>group-list</b> <i>access-list</i> ]   | Enables SPT switchover.   |

## 6.4.1 Configuring Basic PIM-SM Functions

### Configuration Effect

- Create a PIM-SM network and provide data sources and user terminals on the network with the IPv4 multicast service.
- Any of ASM or SSM or both models can be configured.

### Notes

- PIM-SM needs to use existing unicast routes on the network. Therefore, IPv4 unicast routes must be configured on the network.
- If the PIM network needs to support SSM multicast services, IGMPv3 or SSM mapping must be configured.

### Configuration Steps

#### ▾ Enabling IPv4 Multicast Routing

- Mandatory.

- If not specified, IPv4 multicast routing must be enabled on each router.

### ↳ Enabling PIM-SM

- Mandatory.
- If not specified, PIM-SM must be enabled on the following interfaces: interconnecting router interfaces, interfaces of static RPs, C-RPs, and C-BSRs, and the interfaces connecting to the multicast source and user hosts.

### ↳ Configuring an RP

- An RP must be configured if ASM multicast services need to be provided on a PIM network.
- An RP can be configured in three models: configuring only a static RP, configuring only a dynamic RP, and configuring both a static RP and dynamic RP. If both a static RP and dynamic RP are configured, the dynamic RP takes precedence over the static RP.
- Configuring a static RP: If not specified, a static RP should be configured on each router.
- Configuring a dynamic RP: If not specified, a C-RP and C-BSR should be configured on one or multiple routers.

### ↳ Enabling SSM

- SSM must be enabled if SSM multicast services need to be provided on a PIM network.
- If not specified, SSM must be enabled on every router.

## Verification

Send multicast packets from the multicast source to the groups within the address rang of ASM and SSM, and join user hosts to these groups.

- Check whether the user hosts can successfully receive packets from each group.
- Check whether PIM-SM routing entries are created on routers correctly.

| <b>Usage Guide</b>           | <p>This command is used to locate a static RP.</p> <p>A static RP should be one with good routing performance. It is recommended that the address of the loopback interface be used as the static RP address.</p> <p>The static RP of all routers must be the same (including the RP address and the range of multicast group addresses it serves). It is recommended that the address of the loopback interface be used as the static RP address.</p> <p>The load can be shared if you configure multiple static RPs to serve different multicast group addresses. It is recommended that the address of the loopback interface be used as the static RP address.</p> |

### ▾ Configuring a C-RP

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim rp-candidate</b> <i>interface-type interface-number</i> [ <b>priority</b> <i>priority-value</i> ] [ <b>interval</b> <i>seconds</i> ] [ <b>group-list</b> <i>access_list</i> ]   |
| <b>Parameter Description</b> | <p><i>interface-type interface-number</i>: Uses the address of this interface as the address of the C-RP.</p> <p><b>priority</b> <i>priority-value</i>: Competes for the RP priority. A greater value indicates a higher priority. The value ranges from 0 to 255 (192 by default).</p> <p><b>interval</b> <i>seconds</i>: Indicates the interval for sending a C-RP packet to a BSR. The value ranges from 1 to 16,383 (60 by default).</p> <p><b>group-list</b> <i>access_list</i>: Specifies the range of multicast group addresses served by a C-RP using an ACL. By default, a C-RP services all multicast groups.</p> |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | <p>This command is used to configure a router as a C-RP.</p> <p>A C-RP should be one with good routing performance. A C-RP and C-BSR can be on the same router or different routers.</p>  |

|  |  |
|--|--|
|  | <p>It is recommended that the address of the loopback interface be used as the C-RP address.</p> <p>If multiple C-RPs serve the same group, redundancy can be realized.</p> <p>If multiple C-RPs serve the different groups, load can be shared.</p> |
|--|--|

### ↘ Configuring a C-BSR

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip pim bsr-candidate</b> <i>interface-type interface-number</i> [ <i>hash-mask-length</i> [ <i>priority-value</i> ] ]   |
| <b>Parameter Description</b> | <p><i>interface-type interface-number</i>: Uses the address of this interface as the address of the C-BSR.</p> <p><i>hash-mask-length</i>: Indicates the length of hash mask used to competing for the RP. The value ranges from 0 to 32 (10 by default).</p> <p><i>priority-value</i>: Indicates the priority for competing for the BSR. A greater value indicates a higher priority. The value ranges from 0 to 255 (64 by default).</p> |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | <p>This command is used to configure a router as a C-BSR.</p> <p>A C-BSR should be one with good routing performance. A C-RP and C-BSR can be on the same router or different routers.</p> <p>It is recommended that the address of the loopback interface be used as the C-BSR address.</p> <p>Configuring multiple C-BSRs can realize redundancy.</p>  |

### ↘ Enabling SSM

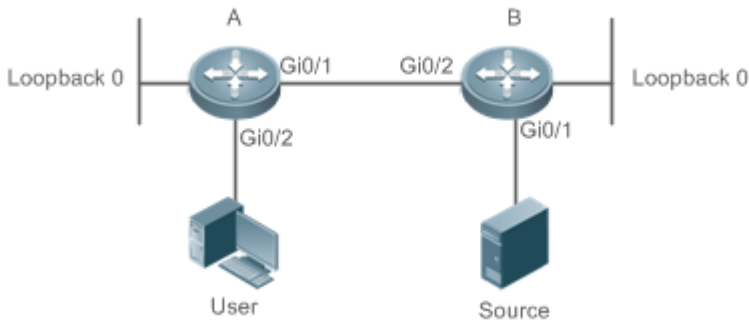

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim ssm</b> { <b>default</b> / <b>range</b> <i>access_list</i> }  |
| <b>Parameter Description</b> | <p><b>default</b>: Indicates the default range of SSM group addresses, which is 232.0.0.0/8.</p> <p><b>range</b> <i>access_list</i>: Specifies the range of SSM group addresses using an ACL.</p> |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | The SSM group addresses configured on all routers must be the same.   |

### ↘ Displaying the PIM-SM Routing Entry

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ip pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>proxy</b> ]  |
| <b>Parameter Description</b> | <p><i>group-or-source-address</i>: Indicates a multicast group address or source address (the two addresses cannot be multicast group addresses or source addresses at the same time).</p> <p><b>proxy</b>: Indicates the RPF vector carried by an entry.</p> |
| <b>Command Mode</b>          | Privileged EXEC mode/Global configuration mode/Interface configuration mode   |
| <b>Usage Guide</b>           | <p>Check whether sufficient routing entries are provided.</p> <p>Check the upstream and downstream interface lists and ensure that a correct SPT tree is created.</p>   |

## Configuration Example

### ▾ Enabling IPv4 Multicast Routing to Support ASM and SSM

|   |  |
|---|--|
| <p><b>Scenario</b></p> <p><b>Figure 6-4</b></p> |    |
| <p><b>Configuration Steps</b></p>               | <ul style="list-style-type: none"> <li>● Configure a IPv4 unicast routing protocol (such as OSPF) on a router, and the router is reachable for the unicast route of a loopback interface. (Omitted)</li> <li>● Enable IPv4 multicast routing on all the routers.</li> <li>● Enable PIM-SM on all the interconnected interfaces of the routers, Source, and Receiver.</li> <li>● Configure C-RP and C-BSR on the loopback interfaces of Router A and Router B, and enable PIM-SM on the loopback interfaces.</li> <li>● Enable SSM on all routers.</li> <li>● Enable IGMPv3 on the router interfaces connecting to user terminals. (Omitted)</li> </ul> |
| <p><b>A</b></p>                                 | <pre> A# configure terminal A(config)# ip multicast-routing A(config)# ip pim ssm default A(config)# interface GigabitEthernet 0/1 A(config-if)# ip pim sparse-mode A(config-if)# exit A(config)# interface GigabitEthernet 0/2 A(config-if)# ip pim sparse-mode A(config-if)# exit A(config)# interface loopback 0 A(config-if)# ip pim sparse-mode A(config-if)# exit A(config)# ip pim rp-candidate loopback 0 </pre>   |

|                     |   |
|---------------------|---|
| <b>B</b>            | <pre> B# configure terminal B(config)# ip multicast-routing B(config)# ip pim ssm default B(config)# interface GigabitEthernet 0/1 B(config-if)# ip pim sparse-mode B(config-if)# exit B(config)# interface GigabitEthernet 0/2 B(config-if)# ip pim sparse-mode B(config-if)# exit B(config)# interface loopback 0 B(config-if)# ip pim sparse-mode B(config-if)# exit B(config)# ip pim bsr-candidate loopback 0 </pre>   |
| <b>Verification</b> | <p>Send packets from S (192.168.1.10) to G 1 (229.1.1.1) and G2 (232.1.1.1). Add the user to G 1 and G 2, and specify the source when the user joins G 2.</p> <ul style="list-style-type: none"> <li>● Check that multicast packets from S (192.168.1.10) to G 1 and G 2 are received by the user.</li> <li>● Check the PIM-SM routing entries on Router A and Router B. Entries (*, 229.1.1.1), (192.168.1.10, 229.1.1.1), and (192.168.1.10, 232.1.1.1) should be displayed.</li> </ul> |

```

**Common Errors**

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- SSM is not enabled on a router or the SSM group address is different from that of the others'.
- PIM-SM is not enabled on an interface (for example, the interface is configured as a C-RP or C-BSR interface, or is used to connecting to the user host or used as an interface of the multicast source).
- IGMPv3 is not enabled on an interface connecting to the used host.
- RP is not configured on the network.
- A static RP is not configured on a router, or the configured static RP is different from that on other routers.
- C-RPs are configured on the network, but C-BSRs are not.
- Static RPs, C-RPs or C-BSRs are unreachable for unicast routes.

**6.4.2 Configuring PIM-SM Neighbors**

**Configuration Effect**

- Coordinate protocol parameters and adjust parameters in the Hello packet.
- A RIM router is used to discover neighbors, coordinate protocol parameters, and maintain neighbor relationships.
- Maintain neighbor relationships and filter the neighbors.

**Notes**

- Basic PIM-SM functions must be configured.

**Configuration Steps**

- Configure parameters on PIM router interfaces If not specified.

## Verification

Configure the parameters of a Hello packet sent from an interface and run **debug ip pim sparse-mode packet** to display the parameters.

Enable neighbor filtering and run **show ip pim sparse-mode neighbor** to display neighbor information.

## Related Commands

### ↘ Configuring the Interval for Sending Hello Packets

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim query-interval</b> <i>interval-seconds</i>  |
| <b>Parameter Description</b> | Indicates the interval for sending Hello packets,<br>Indicates the suppression time of a register packet in the unit of seconds. The value ranges from 1 to 65,535 (30 by default).   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | Every time when the interval for sending Hello packets is updated, the holdtime value is automatically updated as 3.5 times of the interval. If the result of the interval for sending Hello packets multiplied by 3.5 is greater than 65, 535, the holdtime value is forcibly updated as 18,725. |

### ↘ Configuring the Prune Propagation Delay

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim propagation-delay</b> <i>milliseconds</i>   |
| <b>Parameter Description</b> | <i>milliseconds</i> : The unit is ms. The value ranges from 1 to 32,767 (500 by default).   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | Once the prune propagation delay or prune override interval is changed, the Join/Prune packet override interval will be changed.<br><br>As specified by the protocol, the Join/Prune packet override interval must be smaller than the holdtime of a Join/Prune packet; otherwise, short break-up of traffic may be caused. The administrator should maintain such configuration. |

### ↘ Configuring the Prune Override Interval

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip pim override-interval</b> <i>milliseconds</i>  |
| <b>Parameter Description</b> | <i>milliseconds</i> : The unit is ms. The value ranges from 1 to 65,535 (2,500 by default).                                      |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | Once the prune propagation delay or prune override interval is changed, the Join/Prune packet override interval will be changed. |

|  |   |
|--|---|
|  | As specified by the protocol, the Join/Prune packet override interval must be smaller than the holdtime of a Join/Prune packet; otherwise, short break-up of traffic may be caused. The administrator should maintain such configuration. |
|--|---|

### ▾ Enabling Suppression Capability of an Interface for Sending Join Packets

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim neighbor-tracking</b>   |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | Once Join packets suppression of an interface is enabled, when the present router is to send a Join packet to the upstream neighbor, which has sent a Join packet to its own upstream neighbor, the present router will not send the Join packet; if Join packets suppression is disabled, the Join packet will be sent. When Join packets suppression from downstream receivers are disabled, upstream neighbors will learn how many downstream neighbors are there by counting the Join packets it received, which is called neighbor tracking. |

### ▾ Configuring the Delay for Sending Hello Packets

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip pim triggered-hello-delay <i>interval-seconds</i></b>  |
| <b>Parameter Description</b> | <i>Seconds</i> : The unit is second. The value ranges from 1 to 5 (5 by default).  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | When a PIM interface is enabled or detects a new neighbor, a triggered-hello-delay packet is used to generate a random time. Within the time, the interface sends Hello packets. |

### ▾ Configuring the DR Priority of a Hello Packet

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip pim dr-priority <i>priority-value</i></b>  |
| <b>Parameter Description</b> | <i>priority-value</i> : Indicates the priority. A greater value indicates a higher priority. The value ranges from 0 to 4,294,967,294 (1 by default).  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | <p>A DR may be selected based on the following principles:</p> <p>If all the Hello packets sent from the routers on a local area network (LAN) are configured with priorities, when selecting a DR, the priorities will be compared, and the router with the highest priority will be selected as the DR. If the priority of all routers is the same, their IP addresses will be compared, and the router with the maximum IP address will be selected as the DR.</p> <p>If the priority of the Hello packets sent from a certain router is not configured, the IP addresses of the routers will be compared, and the router with the maximum IP address will be selected as the DR.</p> |

### ▾ Configuring Neighbor Filtering

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <code>ip pim neighbor-filter <i>access_list</i></code>   |
| <b>Parameter Description</b> | <i>access_list</i> : Configures the range of neighbor addresses using a standard IP ACL. The value can be set from 1 to 99 or a string.  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | Enabling neighbor filtering can enhance the security of the PIM network and limit the range of legible neighbor addresses. Once a neighbor is filtered out, PIM-SM will not establish peering with it or stop the peering with it. |

### ▾ Displaying the Neighbor Information of an Interface

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <code>show ip pim sparse-mode neighbor [ detail ]</code>                    |
| <b>Parameter Description</b> | <b>detail</b> : Displays detailed information.                              |
| <b>Command Mode</b>          | Privileged EXEC mode/Global configuration mode/Interface configuration mode |

**Common Errors**

- Basic PIM-SM functions are not configured or the configuration is not successful.

**6.4.3 Configuring BSR Parameters**

**Configuration Effect**

- Configure the address range of BSM packets.

## Notes

---

- Basic PIM-SM functions must be configured.
- C-RPs and C-BSRs must be configured.
- Borders must be configured on the interfaces between domains.

## Configuration Steps

---

### ↘ Configuring Borders

- Borders must be configured if there are multiple domains.
- Borders are configured on the interfaces separating two domains.

### ↘ Configuring BSM Packets Limit on a PIM Router

- Optional.
- If not specified, BSM packets limit can be configured on all PIM routers.

### ↘ Configuring a C-BSR to Inspect the Address Range of a C-PR

- Optional.
- If not specified, C-PR range inspection can be configured on all C-BSRs.

### ↘ Allowing a C-BSR to Receive a C-RP-ADV Packet Whose Prefix-Count Is 0

- Optional.
- If not specified, this function can be configured on all C-BSRs.

## Verification

---

### ↘ Border Inspection

Enable basic PIM-SM functions. Configure two routers to be in different domains, configure Router B as the C-BSR, and Router A to receive BSM packets.

Configure the junction of Router A and Router B as the border so that Router A does not receive BSM packets.

### ↘ Configuring to Inspect BSM Packets Limit on a PIM Router

When basic PIM-SM functions are enabled, and Router B is set as the C-BSR, Router A can receive BSM packets. When the address range of C-BSRs are limited on Router A, BSM packets will not be received by Router A.

### ↘ Configuring a C-BSR to Inspect the Address Range of a C-PR

When basic PIM-SM functions are enabled, Router B is set as the C-BSR, and Router A as the C-RP, if the address range of the C-RPs is limited on C-BSR, Router B will not receive the packets sent from the C-RPs.

## Common Errors

- Basic PIM-SM functions are not configured or the configuration is not successful.
- C-BSRs are not configured.
- The BSR border is not configured on the interfaces of different domains.

## 6.4.4 Configuring RP and DR Parameters

### Configuration Effect

- Ignore the C-RP priority and reselect an RP.
- Detect the reachability of an RP for the source DR.
- Configure the range of (S, G) addresses of source register packets, and allow the ASM to serve only the multicast packets within the range.
- Limit the speed of the source DR for sending register packets.
- Configure the checksum of the register packet length.
- Configure an RP to decapsulate register packets and forward the multicast packets to downstream interfaces.
- Configure the source IP address of a register packet.
- Configure the suppression time of a register packet.
- Configure the inspection time of a null register packet.
- Configure the (S, G) lifetime based on the register packet received by an RP.

### Notes

- Basic PIM-SM functions must be configured.

### Configuration Steps

#### ↘ Ignoring the C-RP Priority and Reselecting an RP

- Optional.
- If not specified, the C-RP priority can be disabled on every router.

#### ↘ Detecting the Reachability of an RP for the Source DR

- Optional.
- If not specified, this function can be enabled on the DR connected directly to the data source.

#### ↘ Configuring the Range of Source Register (S, G) Addresses

- Optional.

- If not specified, source register address filtering can be enabled on all C-RPs or static RPs.
- **Limiting the Speed of the Source DR for Sending Register Packets**
- Optional.
- If not specified, this function can be enabled on the source DR.
- **Configuring the Checksum of the Register Packet Length**
- Optional.
- If not specified, this function can be enabled on all C-RPs or static RPs.
- **Configuring Whether to Forward the Multicast Packet After Decapsulating a Register Packet**
- Optional.
- If not specified, this function can be enabled on all C-RPs or static RPs.
- **Configuring the Source IP Address of a Register Packet**
- Optional.
- If not specified, the source IP address of a register packet can be configured on the DR connected directly to the data source.
- **Configuring the Suppression Time of a Register Packet**
- Optional.
- If not specified, the suppression time of a register packet can be configured on the DR connected directly to the data source.
- **Configuring the Inspection Time of a Null Register Packet**
- Optional.
- If not specified, the inspection time of a null register packet can be configured on the DR connected directly to the data source.
- **Configuring the (S, G) Lifetime Based on the Register Packet Received by an RP**
- Optional.
- If not specified, the (S, G) lifetime can be configured on all C-RPs or static RPs.

## Verification

---

### ➤ Ignoring the C-RP priority

On Router A, configure the C-RP address as 192.168.8.8, and default priority as 192. On Router B, configure the C-RP address as 192.168.5.5, priority as 200, and C-BSR address as 192.168.6.6.

- Run **show ip pim sparse-mode rp 233.3.3.3** to display the RPs of the present group.

### ↘ Enabling the Source DR to Detect RP Reachability

On Router A, configure the C-RP address as 192.168.8.8, and default priority as 192. On Router B, configure the C-RP address as 192.168.5.5, priority as 192, and C-BSR address as 192.168.6.6. Enable Router B to detect RP reachability.

- Run **show running-config** to check whether the preceding configurations take effect.

### ↘ Configuring the Range of Source Register (S, G) Addresses

On Router A, configure the C-RP address as 192.168.8.8, and default priority as 192. On Router B, configure the address of the C-BSR as 192.168.6.6. Configure the source address a 192.168.1.100 and the multicast group address as 233.3.3.3. On Router A, configure the range of allowed source multicast group addresses to 192.168.2.0 to 192.168.2.255.

- Run **show ip pim sparse-mode mroute** to display the (S, G) entry.

### ↘ Limiting the Speed of the Source DR for Sending Register Packets

Configure the speed of Router B for sending register packets, and run **show ip pim sparse-mode track** to display the number of packets that has been sent.

### ↘ Configuring the Checksum of the Register Packet Length

On Router A, configure to calculate the checksum of the entire register packet length but not just the packet header. Run **show running-config** to check the configuration.

### ↘ Forwarding an RP Register Packet After It Is Decapsulated

On Router A, configure to forward a register packet after it is decapsulated. Run **show running-config** to display the configuration.

### ↘ Configuring the Source IP Address of a Register Packet

Configure the source address of a register packet on Router B, and run **show running-config** to display the configuration.

### ↘ Configuring the Suppression Time of a Register Packet and the Inspection Time of a Null Register Packet

On Router B, configure the suppression time and inspection time of a register packet, and run **show ip pim sparse-mode track** to display the configuration.

### ↘ Configuring an RP to Receive Register Packets and the (S, G) Lifetime

On Router A, configuring an RP to receive register packets and the (S, G) lifetime, and run **show ip pim sparse-mode mroute** to display the maximum (S, G) lifetime.

| <b>Usage Guide</b> | You can specify either a multicast group address or source address, or both a multicast group address and source address; or you can specify neither a multicast group address nor source address. The two addresses cannot be multicast group addresses or source addresses at the same time. |

#### ↘ Limiting the Speed of the Source DR for Sending Register Packets

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim register-rate-limit</b> <i>rate</i>   |
| <b>Parameter Description</b> | <i>Rate</i> : Indicates the maximum number of register packets that can be sent each second. The value ranges from 1 to 65,535.   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | This command takes effect for only the register packet of each (S, G) packet, but not all the register packets in the entire system. Enabling this command can reduce the burden on the source DR and RPs. Only the packets within the speed limit can be sent. |

#### ↘ Displaying the Counters of PIM-SM Packets

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ip pim sparse-mode track</b>   |
| <b>Parameter Description</b> | -  |
| <b>Command Mode</b>          | Privileged EXEC mode/Global configuration mode/Interface configuration mode  |
| <b>Usage Guide</b>           | The start time for counting PIM-SM packets is automatically enabled upon system startup. Run <b>clear ip pim sparse-mode track</b> to reset the start time and clear the PIM-SM packet counters. |

#### ↘ Calculating the Checksum of the Entire Register Packet Length

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip pim register-checksum-wholepkt</b> [ <b>group-list</b> <i>access-list</i> ]  |
| <b>Parameter Description</b> | <b>group-list</b> <i>access-list</i> : Configures the multicast group addresses applicable to this configuration using an ACL.<br><i>access-list</i> : The value can be set to 1 to 99, and 1300 to 1999. It also supports the naming of the ACL.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | You can enable this function if you want to calculate the length of the entire PIM-SM packet, including that of the multicast packet encapsulated in the register packet, but not just the length of the PIM-SM packet header.<br>If <b>group-list</b> <i>access-list</i> is specified, this configuration takes effect for all multicast group addresses. |

#### ↘ Enabling an RP to Decapsulate a Register Packet and Forward the Multicast Packet to Interfaces

|                |  |
|----------------|--|
| <b>Command</b> | <b>ip pim register-decapsulate-forward</b> |
|----------------|--|

|                              |   |
|------------------------------|---|
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | This command is configured on a static RP or a C-RP. It is used to decapsulate a register packet with multicast packet and forward the multicast packet to interfaces.<br><br>If there are too many register packets to be decapsulated, the CPU will be greatly burdened. In this case, this function is recommended to be disabled. |

### ↘ Configuring the Source IP Address of a Register Packet

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim register-source</b> { <i>local_address</i>   <i>Interface-type interface-number</i> }   |
| <b>Parameter Description</b> | <i>local_address</i> : Specifies the source IP address of a register packet.<br><i>interface-type interface-number</i> : Specifies the IP address of this interface as the source IP address of the register packet.  |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | The specified address must be reachable. When an RP sends a Register-Stop packet, the PIM router corresponds to this address need to respond. Therefore, it is recommended that a loopback address (or other physical addresses) be used.<br><br>This configuration does not require the enabling of PIM. |

### ↘ Configuring the Suppression Time of a Register Packet

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim register-suppression</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>Seconds</i> : Indicates the suppression time of a register packet in the unit of seconds. The value ranges from 1 to 65,535 (60 by default).   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | If you configure this parameter on a DR, the suppression time of a register packet sent from the DR will be changed. If <b>ip pim rp-register-kat</b> is not configured and if you configure this parameter on an RP, the RP keepalive will be changed. |

### ↘ Configuring the Inspection Time of a Null Register Packet

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip pim probe-interval</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>vrf vid</i> : Specifies VRF.<br><i>Seconds</i> : Indicates the inspection time of a null register packet in the unit of seconds. The value ranges from 1 to 65,535 (5 by default). |
| <b>Command Mode</b>          | Global configuration mode   |

|                    |   |
|--------------------|---|
| <b>Usage Guide</b> | <p>The inspection time of a null register packet indicates the period of time for sending a null register packet to an RP before the timeout of suppression time.</p> <p>The inspection time cannot exceed half of the suppression time; otherwise, the configuration will not take effect, and a warning message will be displayed. Meanwhile, the result of suppression time multiplied by 3 plus the inspection time cannot exceed 65,535, otherwise, a warning will be displayed.</p> |
|--------------------|---|

### ▾ Configuring the Interval of KATs on an RP

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <code>ip pim rp-register-kat seconds</code>   |
| <b>Parameter Description</b> | <i>Seconds</i> : Indicates the interval of a KAT in the unit of second. The value ranges from 1 to 65,535 (210 by default). |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | N/A   |

## Configuration Example

### ▾ Configuring the RPs of Corresponding Multicast Group Addresses When the C-RP Priority is Considered or Not Considered

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● On Router A, configure the address of the C-RP as 192.168.8.8.</li> <li>● On Router B, configure the address of the C-RP as 192.168.5.5, priority as 200, and the address of the C-BSR as 192.168.6.6.</li> <li>● Display the group corresponding to 233.3.3.3.</li> <li>● Configure to ignore the C-RP priority on Router B.</li> </ul> |
|                            | <pre>Ruijie# configure terminal Ruijie(config)# ip pim ignore-rp-set-priority</pre>  |
| <b>Verification</b>        | Display the information before you configure to ignore the C-RP priority.  |
|                            | <pre>Ruijie# show ip pim sparse-mode rp-hash 233.3.3.3 RP: 192.168.8.8 Info source: 192.168.8.8, via bootstrap  PIMv2 Hash Value 10(mask 255.192.0.0) RP 192.168.8.8, via bootstrap, priority 192, hash value 1084558102 RP 192.168.5.5, via bootstrap, priority 200, hash value 1094656709</pre>  |
|                            | Display the information after you configure to ignore the C-RP priority.   |

```
Ruijie# show ip pim sparse-mode rp-hash 233.3.3.3
RP: 192.168.5.5
Info source: 192.168.6.6, via bootstrap
PIMv2 Hash Value 10(mask 255.192.0.0)
RP 192.168.8.8, via bootstrap, priority 192, hash value 1084558102
RP 192.168.5.5, via bootstrap, priority 200, hash value 1094656709
```

↘ **Configuring to Inspect the Reachability of a Source RP**

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure to inspect the reachability of a source RP.</li> </ul> |
|                            | <pre>Ruijie(config)# ip pim register-rp-reachability</pre>   |
| <b>Verification</b>        | Run <b>show running-config</b> to check whether the following information is displayed.  |
|                            | <pre>Ruijie(config)#show running-config ip pim register-rp-reachability</pre>  |

↘ **Configuring the Range of Source Register (S, G) Addresses**

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure source address filtering on Router A. The allowed address range is from 192.168.2.0 to 192.168.2.255.</li> </ul>           |
|                            | <pre>Ruijie#show ip pim sparse-mode mroute Ruijie(config)#ip pim accept-register list 101 % access-list 101 not exist Ruijie(config)#access-list 101 permit ip 192.168.2.0 0.0.0.255 any Ruijie#show ip pim sparse-mode mroute</pre> |
| <b>Verification</b>        | Before enabling source address filtering, run <b>show ip pim sparse-mode mroute</b> to display the multicast entry, and check whether the (S, G) entry and (S, G, RPT) entry exist.  |
|                            | <pre>Ruijie#show ip pim sparse-mode mroute IP Multicast Routing Table  (*, *, RP) Entries: 0 (*, G) Entries: 1</pre>   |

📌 Limiting the Speed of the Source DR for Sending Register Packets

|                                   |  |
|-----------------------------------|--|
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Check the number of PIM-SM packets sent by Router B.</li> <li>● Check the number of PIM-SM packets sent by Router B in 1s.</li> <li>● Configure the speed of Router B for sending register packets.</li> <li>● Check the number of PIM-SM packets sent by Router B in 1s.</li> </ul> |
|                                   | <pre>Ruijie (config)#ip pim register-rate-limit 1</pre>  |
| <p><b>Verification</b></p>        | <p>Display the number of PIM-SM packets sent by Router B before you configure the speed. The information should be displayed as follows:</p>   |
|                                   | <pre>Ruijie#show ip pim sparse-mode track</pre>  |

|   |
|---|
| <pre> PIM packet counters track  Elapsed time since counters cleared: 04d01h01m                  received                sent Valid PIM packets:    18754                29771 Hello:                11149                17842 Join-Prune:           0                    3234 Register:             0                    3211 Register-Stop:       3192                    0 Assert:              0                    0 BSM:                  0                    5484 C-RP-ADV:            4413                    0 PIMDM-Graft:         0 PIMDM-Graft-Ack:     0 PIMDM-State-Refresh: 0 Unknown PIM Type:    0  Errors: Malformed packets:           0 Bad checksums:               0 Send errors:                  0 Packets received with unknown PIM version: 0  Ruijie#                 </pre> |
| <p>Display the number of PIM-SM packets sent by Router B in 1s before the speed is configured. The information should be displayed as follows:</p>  |
| <pre> Ruijie #show ip pim sparse-mode track  PIM packet counters track  Elapsed time since counters cleared: 04d01h04ms                  received                sent Valid PIM packets:    18765                29789 Hello:                11154                17852                 </pre>  |

|--|---|

↘ **Configuring the Checksum of the Register Packet Length**

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Calculate the checksum of the entire register packet length.</li> <li>● Run <b>show running-config</b> to check whether the preceding configurations take effect.</li> </ul> |
|                            | <pre>Ruijie(config)#ip pim register-checksum-wholepkt</pre>  |
| <b>Verification</b>        | Display the configurations on Router A, which should be as follows:  |
|                            | <pre> Ruijie#show running-config ... ! ip pim register-checksum-wholepkt ip pim rp-candidate Loopback 0 ! ...                 </pre>   |

↘ **Enabling an RP to Decapsulate a Register Packet and Forward the Multicast Packet to Interfaces**

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Enable Router A to forward a register packet.</li> <li>● Run <b>show running-config</b> to check whether the preceding configurations take effect.</li> </ul> |
|                            | <pre>Ruijie(config)#ip pim register-decapsulate-forward</pre>   |
| <b>Verification</b>        | Display the configurations on Router A, which should be as follows:   |

```
Ruijie#show running-config
...
!
!
ip pim register-decapsulate-forward
ip pim register-checksum-wholepkt
ip pim rp-candidate Loopback 0
!
!
!
...
```

📌 **Configuring the Source IP Address of a Register Packet**

|                                   |   |
|-----------------------------------|---|
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure the source address of Loop 2 as 192.168.2.2.</li> <li>● Configure source address interface for the register packet of Router B as Loop 2.</li> <li>● Run <b>show running-config</b> to check whether the preceding configurations take effect.</li> </ul> |
| <p><b>Verification</b></p>        | <p>Display the configurations on Router B, which should be as follows:</p>  |
|                                   | <pre>Ruijie#show running-config ! ! ! ip pim register-source Loopback 1 ip pim bsr-candidate Loopback 0 ! ! ! !</pre>   |

📌 **Configuring the Suppression Time of a Register Packet and the Inspection Time of a Null Register Packet**

|                                   |  |
|-----------------------------------|--|
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure the suppression time of a register packet on Router B to 20s.</li> </ul> |
|-----------------------------------|--|

## Common Errors

- Basic PIM-SM functions are not configured or the configuration is not successful.
- The (S, G) of register packets is not configured on a C-RP or static RP, or the configuration is not successful.
- The ACL for limiting the (S, G) of register packets is not configured or the range of (S, G) in this ACL is not correctly configured.
- The range of (S, G) of register packets on each C-RP or static RP is not the same.

## 6.4.5 Configuring the Interval for Sending a Join/Prune Packet

### Configuration Effect

- Change the interval for sending a Join/Prune packet to form an RPT or SPT.

### Notes

- Basic PIM-SM functions must be configured.

### Configuration Steps

- Configure the interval for sending a Join/Prune packet.

### Verification

On Router B, configure the interval for sending a Join/Prune packet as 120s. Run **show ip pim sparse-mode mroute** to display the lifetime of the entry.

### Common Errors

- Basic PIM-SM functions are not configured or the configuration is not successful.

## 6.4.6 Configuring the Router of Last Hop to Switch from an RPT to SPT

### Configuration Effect

- Switch from an RPT to SPT

### Notes

- Basic PIM-SM functions must be configured.

### Configuration Steps

- Configure the router of last hop to switch from an RPT to SPT.

## Verification

Configure basic PIM-SM functions first. Configure the source DR to send the data traffic (\*, 233.3.3.3), and the receiving end to join group 233.3.3.3 forcibly to form an RPT. Configure the receiver DR to switch from the RPT to SPT forcibly. Run **show running-config** to display the result.

## 6.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

| Description                               | Command  |
|---|--|
| Clears multicast routing entries.         | <b>clear ip mroute</b> { *   <i>group-address</i> [ <i>source-address</i> ] }            |
| Clears the counters of multicast routes.  | <b>clear ip mroute statistics</b> { *   <i>group-address</i> [ <i>source-address</i> ] } |
| Clears the information about dynamic RPs. | <b>clear ip pim sparse-mode bsr rp-set *</b>   |
| Clears the counters of PIM-SM packets.    | <b>clear ip pim sparse-mode track</b>  |

### Displaying

| Description   | Command   |
|---|---|
| Displays the details of BSR information.  | <b>show ip pim sparse-mode bsr-router</b>   |
| Displays the PIM-SM information of an interface.  | <b>show ip pim sparse-mode interface</b> [ <i>interface-type interface-number</i> ] [ <b>detail</b> ]       |
| Displays the local IGMP information about a PIM-SM interface.   | <b>show ip pim sparse-mode local-members</b> [ <i>interface-type interface-number</i> ]                     |
| Displays the information about a PIM-SM multicast routing entry, and displays the RPF vector of a PIM-SM entry using <b>proxy</b> . | <b>show ip pim sparse-mode mroute</b> [ <i>group-or-source-address</i> ] [ <i>group-or-source-address</i> ] |
| Displays the information about PIM-SM neighbors.  | <b>show ip pim sparse-mode neighbor</b> [ <b>detail</b> ]   |
| Displays the information about the next hop of PIM-SM obtained from the NSM.  | <b>show ip pim sparse-mode nexthop</b>  |
| Displays the information about the RP corresponding the multicast group address <i>group-address</i> .                              | <b>show ip pim sparse-mode rp-hash</b> <i>group-address</i>   |
| Displays the information about all the RPs and the groups they serve.   | <b>show ip pim sparse-mode rp mapping</b>   |

---

| Description   | Command                              |
|---|--------------------------------------|
| Displays the number of PIM-SM packets sent and received since the statistic start time. | <b>show ip pim sparse-mode track</b> |

## 7 Configuring PIM-SMv6

### 7.1 Overview

Protocol Independent Multicast (PIM) is a multicast routing protocol.

PIM does not rely on a specific unicast routing protocol. It uses the unicast routing table established by any unicast routing protocol to complete the reverse path forwarding (RPF) check and establish multicast routes. PIM does not need to transmit and receive multicast route updates. Therefore, the overhead of PIM is much lower than that of other multicast routing protocols.

PIM defines two modes: dense mode and sparse mode. Protocol Independent Multicast Sparse Mode (PIM-SM) is applicable to various network environments.

 PIM-SM running on IPv6 is called PIM-SMv6.

#### Protocols and Standards

- RFC4601: Protocol Independent Multicast -Sparse Mode (PIM-SM)
- RFC5059: Bootstrap Router (BSR) Mechanism for Protocol Independent Multicast (PIM)
- RFC3962: Protocol Independent Multicast - Dense Mode protocol
- RFC4607: Source-Specific Multicast for IP

### 7.2 Applications

| Application  | Description   |
|--|---|
| <a href="#">ASM Implementation by Using PIM-SMv6</a>             | A receiver receives packets from any multicast source.                        |
| <a href="#">SSM Implementation by Using PIM-SMv6</a>             | A receiver selects a multicast source.  |
| <a href="#">Application Example of an Embedded RP</a>            | An embedded RP address is configured within the IPv6 multicast group address. |
| <a href="#">PIM-SMv6 Application in a Hot Backup Environment</a> | The multicast PIM-SMv6 protocol runs in a hot backup environment.             |

#### 7.2.1 ASM Implementation by Using PIM-SMv6

##### Scenario

The multicast service is provided only in one domain.

As shown in the following figure, receivers receive packets from any multicast source.

Figure 7-1

|                |  |
|----------------|--|
| <b>Remarks</b> | <p>R1 is directly connected to the multicast source.</p> <p>R2 is configured as a rendezvous point (RP).</p> <p>R3 is directly connected to Receiver A.</p> <p>R4 is directly connected to Receiver B.</p> |
|----------------|--|

### Deployment

- Run the Open Shortest Path First for IPv6 (OSPFv6) protocol in the domain to implement unicast routing.
- Run the PIM-SMv6 protocol in the domain to implement multicast routing.
- Run the Internet Group Management Protocol version 6 (IGMPv6) protocol in a user host network segment to implement group member management.

## 7.2.2 SSM Implementation by Using PIM-SMv6

### Scenario

The multicast service is provided only in one domain.

As shown in the following figure, receivers receive packets from a specific multicast source.

Figure 7-2

|                |  |
|----------------|--|
| <b>Remarks</b> | <p>R1 is directly connected to the multicast source.</p> |
|----------------|--|

|  |   |
|--|---|
|  | <p>R2 is configured as an RP.</p> <p>R2 is directly connected to Receiver A.</p> <p>R2 is directly connected to Receiver B.</p> |
|--|---|

## Deployment

- Run the OSPFv6 protocol in the domain to implement unicast routing.
- Run the PIM-SMv6 protocol in the domain to implement multicast routing.
- Enable the source-specific multicast (SSM) function of the PIM-SMv6 protocol to implement the SSM function.
- Run the Internet Group Management Protocol version 3 (IGMPv3) in a user host network segment to implement group member management.

## 7.2.3 Application Example of an Embedded RP

### Scenario

The multicast service is provided only in one domain.

As shown in the following figure, an RP address is configured for R2 to make the router become an embedded RP.

Figure 7-3

|                |   |
|----------------|---|
| <b>Remarks</b> | <p>R1 is directly connected to the multicast source.</p> <p>R2 is configured as an RP.</p> <p>R2 is directly connected to Receiver A.</p> <p>R2 is directly connected to Receiver B.</p> <p>R2 is configured as an embedded RP.</p> |
|----------------|---|

## Deployment

- Run the OSPFv6 protocol in the domain to implement unicast routing.
- Run the PIM-SMv6 protocol in the domain to implement multicast routing.
- Enable the SSM function of the PIM-SMv6 protocol to implement the SSM function.
- Run the IGMPv3 protocol in a user host network segment to implement group member management.
- Configure the RP address and embedded RP on R2.

## 7.2.4 PIM-SMv6 Application in a Hot Backup Environment

### Scenario

In a hot backup environment, run PIM-SMv6. A device performs hot backup switching to ensure that traffic is not interrupted.

Figure 7-4

|                |   |
|----------------|---|
| <b>Remarks</b> | R1 is connected to the video server, R2 is directly connected to the receiver, and R2 runs in hot backup mode.<br>A Layer-3 multicast protocol runs on R1 and R2. |
|----------------|---|

### Deployment

- Run OSPF on R1 and R2 to implement unicast routing.
- Run PIM-SMv6 on R1 and R2 to implement multicast routing.
- Make R2 run in two-node cluster hot backup mode.

|                |  |
|----------------|--|
| <b>Remarks</b> | R2 may perform hot backup switching in the hot backup environment. In this case, the query interval of PIM Hello packets (the default value is 30 seconds) needs to be adjusted on R2 because the keepalive timer of the neighbor in PIM Hello packets of R1 may have expired (the default value is 3.5 times the query interval, that is, 105 seconds). The multicast function relies on the unicast function currently, and the multicast function starts convergence after the unicast function convergence is complete. For example, the default graceful restart (GR) convergence time of the unicast function is 120 seconds. It is recommended that the query interval of PIM Hello packets be set to 60 seconds. The keepalive time of the neighbor in PIM Hello packets is 210 seconds. In this scenario, the query interval of PIM Hello packets need to be set with a reference to the GR convergence time of the unicast function and the value of 3.5 times the query interval of PIM Hello packets must be larger than the GR convergence time of the unicast function. In addition, if the convergence time of the unicast function is long, the transmission interval of PIM Join/Prune packets also need to be adjusted, because the keepalive time of PIM Join/Prune packets is 3.5 times the transmission interval of PIM Join/Prune packets. The default keepalive time of |
|----------------|--|

PIM Join/Prune packets is 210 seconds. If R2 is configured as a dynamic RP, the interval for a candidate RP (C-RP) to transmit C-RP notifications also needs to be adjusted. The default transmission interval is 60 seconds and the keepalive time is 2.5 times the transmission interval of C-RP notifications. For example, if the convergence time of the unicast function is longer than 150 seconds, the transmission interval of C-RP notifications needs to be adjusted. In a hot backup environment, it is recommended that the query interval of PIM Hello packets be larger than the default value (30 seconds). Otherwise, the keepalive timer of the neighbor in PIM Hello packets of the peer end times out during hot backup switching.

## 7.3 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

Routers where the PIM protocol is enabled are called PIM routers. Interfaces where the PIM protocol is enabled are called PIM interfaces.

Multicast packets are forwarded by PIM routers. The PIM interfaces for receiving multicast packets are called upstream interfaces, and the PIM interfaces for transmitting multicast packets are called downstream interfaces.

Network segments where upstream interfaces are located are called upstream network segments. Network segments where downstream interfaces are located are called downstream network segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On some PIM interfaces, borders are set to divide a large PIM network into multiple PIM domains. The borders may reject specific multicast packets or limit transmission of PIM messages.

#### ↘ Multicast Distribution Tree, DR, RP

Multicast packets are transmitted from one point to multiple points. The forwarding path presents a tree structure. This forwarding path is called a multicast distribution tree (MDT). MDTs are classified into two types:

- Rendezvous point tree (RPT): Uses the rendezvous point (RP) as the root and designated routers (DRs) connected to group members as leaves.
- Shortest path tree (SPT): Use the DR connected to a multicast source as the root and the RPs or DRs connected to group members as leaves.

DRs and RPs are function roles of PIM routers.

- RPs collect information about multicast sources and group members in the network.
- The DR connected to a multicast source reports multicast source information to the RP and the DRs connected to group members report the group member information to the RP.

#### ↘ (\*,G), (S,G)

- (\*,G): Indicates the packets transmitted from any source to Group G, routing entries corresponding to the packets, and forwarding path (RPT) corresponding to the packets.
- (S,G): Indicates the packets transmitted from Source S to Group G, routing entries corresponding to the packets, and forwarding path (SPT) corresponding to the packets.

## ▾ ASM, SSM

PIM-SM supports two multicast service models: any-source multicast (ASM) and source-specific multicast (SSM), which are applicable to different multicast address segments.

- ASM: In the ASM model, a user host cannot select a multicast source. The user host joins a multicast group and receives all packets sent from all sources to the multicast group.
- SSM: In the SSM model, a user host can select a multicast source. The user host specifies the source address when joining a multicast group, and then receives packets only from the specified source to the multicast group.

**i** SSM model requirement: Other network services must be used to enable a user host to know the position of a multicast source in advance so that the user host selects the multicast source.

| <a href="#">ASM and SSM Models</a>                                | PIM routers provide multicast services of the ASM model and SSM model. The SSM model is used for groups within the SSM address range, and the ASM model is used for other groups.  |

### 7.3.1 Establishment of PIM Neighbor Relationships

Neighbor relationships are established between PIM routers to form a PIM network. Neighbor relationships must be established between PIM routers before other PIM control messages are exchanged or multicast packets are forwarded.

#### Working Principle

A Hello message is sent by a PIM interface. For the multicast packet for encapsulating the Hello message, the destination address is ff02::d (indicating all PIM routers in the same network segment), the source address is the IP address of the PIM interface, and the time to live (TTL) value is 1.

Hello messages are used to discover neighbors, negotiate about protocol parameters, and maintain neighbor relationships.

#### ↘ Discovering PIM Neighbors

PIM routers in the same network segment receive multicast packets with the destination address of ff02::d. In this way, the PIM routers obtain neighbor information and establish neighbor relationships.

When a PIM interface is enabled or detects a new neighbor, the Triggered-Hello-Delay message is used to generate a random time period. Within the time period, the interface sends Hello packets.

#### ↘ Negotiating About Protocol Parameters

A Hello message contains multiple protocol parameters, which are described as follows:

- DR\_Priority: Indicates the priority of each router interface for DR election. A higher priority means a higher possibility of being elected as the DR.
- Holdtime: Indicates the timeout time in which a neighbor is held in the reachable state.
- LAN\_Delay: Indicates the delay for transmitting a Prune message in a shared network segment.
- Override-Interval: Indicates the prune override time carried in a Hello message.

When a PIM router receives a Prune message from an upstream interface, it indicates that other downstream interfaces exist in the shared network segment. If the PIM router still needs to receive multicast data, it must send a Prune Override message to the upstream interface within the time of **Override-Interval**.

$\text{LAN\_Delay} + \text{Override-Interval} = \text{PPT}$  (Prune-Pending Timer). After a PIM router receives a Prune message from a downstream interface, it does not immediately perform pruning but waits for PPT timeout. After the PPT times out, the PIM router performs pruning. Within the time of PPT, if the PIM router receives a Prune Override message from the downstream interface, it cancels pruning.

#### ↘ Maintaining Neighbor Relationships

A Hello message is sent periodically between PIM routers. If a Hello packet is not received from a PIM neighbor within Holdtime, the neighbor is considered unreachable and is deleted from the neighbor list. Any changes in PIM neighbors will cause multicast topology changes in the network. If an upstream neighbor or a downstream neighbor in an MDT is unreachable, multicast routing re-convergence is performed again and the MDT is migrated.

## Related Configuration

### ↳ Enabling the PIM-SMv6 Function on an Interface

By default, the PIM-SMv6 function is disabled on an interface.

Run the **ipv6 pim sparse-mode** command to enable or disable the PIM-SMv6 function on an interface.

The PIM-SMv6 function must be enabled on an interface so that the interface participates in the operation of PIM protocols. If the PIM-SMv6 function is disabled on an interface that functions as a DR, static RP, candidate - rendezvous point (C-RP), or candidate – bootstrap router (C-BSR), the corresponding protocol role does not take effect.

### ↳ Adjusting the Transmission Interval of Hello Messages on an Interface

By default, Hello messages are transmitted at an interval of 30 seconds.

Run the **ipv6 pim query-interval** *seconds* command to adjust the transmission interval of Hello messages on an interface. The value ranges from 1 to 65,535.

A larger value of *interval-seconds* means a larger transmission interval of Hello messages and a smaller value of *interval-seconds* means a smaller transmission interval of Hello messages.

## 7.3.2 DR Election

In the shared network segment connected to group members, DR election is conducted among PIM neighbors to elect the DR connected to the group members.

In the shared network segment connected to a multicast source, DR election is conducted among PIM neighbors to elect the DR connected to the multicast source.

The DR transmits the Join/Prune message in the MDT root node direction for the directly connected group members, or transmits data of the directly connected multicast source to the MDT.

## Working Principle

The neighbor IP address and DR priority are obtained from Hello packets of neighbors during establishment of PIM neighbor relationships, so as to elect the DR.

The key of DR election is the DR priorities and IP addresses of interfaces.

### ↳ Interface DR Priority

A higher interface DR priority means a higher probability that a PIM router is successfully elected as the DR during the DR election.

### ↳ Interface IP Address

If interfaces of PIM routers share the same DR priority during DR election, IP addresses of neighbors are compared. A larger IP address means a higher probability that a PIM router is successfully elected as the DR.

## Related Configuration

### Setting IP Addresses of Interfaces

By default, no IP addresses are configured for interfaces.

Run the **ipv6 address** command to set an IP address for an interface.

When PIM routers share the same DR priority, the PIM router with a larger IP address is elected as the DR.

### Enabling the PIM-SMv6 Function on an Interface

By default, the PIM-SMv6 function is disabled on an interface.

Run the **ipv6 pim sparse-mode** command to enable or disable the PIM-SMv6 function on an interface.

The PIM-SMv6 function must be enabled on an interface so that the interface participates in the operation of PIM protocols. If the PIM-SMv6 function is disabled on an interface that functions as a DR, static RP, C-RP, or C-BSR, the corresponding protocol role does not take effect.

### Adjusting the DR Priority of an Interface

By default, the DR priority is 1.

Run the **ipv6 pim dr-priority** *priority-value* command to adjust the DR priority of an interface. The priority value ranges from 0 to 4,294,967,294.

The DR priority of an interface is used to elect the DR in the directly connected network segment of the interface. A larger priority value means a higher probability that a PIM router is elected as the DR.

## 7.3.3 BSR Mechanism

In a PIM network, the bootstrap router (BSR) periodically generates bootstrap messages (BSMs) including information about a series of C-RPs and relevant group addresses. BSMs are transmitted hop by hop in the entire domain. PIM routers throughout the network receive BSMs and record information about C-RPs and the relevant group addresses.

### Working Principle

One or more C-BSRs are configured in the PIM-SMv6 domain and the BSR is elected from the candidate BSRs according to certain rules.

## Related Configuration

### Configuring a C-BSR

By default, no C-BSR is configured.

Run the **ipv6 pim bsr-candidate** *interface-type interface-number* [ *hash-mask-length* [ *priority-value* ] ] command to configure or cancel a C-BSR.

C-BSRs elect the globally unique BSR in the PIM-SM domain by means of BSM learning and election. The BSR transmits BSMs.

### ↘ Configuring the BSR Border

By default, no BSR border is configured.

Run the **ipv6 pim bsr-border** command to configure or cancel the BSR border.

After this command is configured for an interface, the interface immediately discards the received BSMs and does not forward BSMs, thereby preventing BSM flooding. No BSR border is configured if this command is not configured.

### ↘ Defining the Valid BSR Range

By default, the BSMs of BSRs are not filtered.

Run the **ipv6 pim accept-bsr list** *ipv6\_access-list* command to define or cancel the BSR range.

After this command is configured, the valid BSR range is defined. If this command is not configured, the device with the PIM-SMv6 function enabled will receive all BSMs.

### ↘ Configuring a C-BSR to Restrict the Address Range of Valid C-RPs and the Range of Multicast Groups Served by the C-RPs

A C-BSR receives notifications from all C-RPs.

Run the **ipv6 pim accept-crp list** *ipv6\_access-list* command to configure whether to filter notifications from C-RPs.

After this command is configured, the C-BSR restricts the address range of valid C-RPs and the range of multicast groups served by the C-RPs. If this command is not configured, the C-BSR receives notifications from all C-RPs.

### ↘ Configuring a C-BSR to Receive C-RP-ADV Packets with prefix-count of 0

By default, a C-BSR does not receive C-RP-ADV packets with prefix-count of 0.

Run the **ipv6 pim accept-crp-with-null-group** command to configure whether to receive C-RP-ADV packets with prefix-count of 0.

After this command is configured, the C-BSR can receive C-RP-ADV packets with prefix-count of 0. If this command is not configured, the C-BSR does not process C-RP-ADV packets with prefix-count of 0.

## 7.3.4 RP Mechanism

In a PIM network, the RP is statically configured or dynamically elected so that each PIM router knows the position of the RP. The RP serves as the root of the RPT. The RPT establishment and the forwarding of RPT data streams must use the RP as the forwarding point.

### Working Principle

All PIM routers in a PIM domain must be able to be mapped to the same RP through a specific multicast group address. RPs are classified into static RPs and dynamic RPs in a PIM network.

#### ↘ Static RP

In static RP configuration, the RP address is directly configured on each PIM router so that all PIM routers in the PIM network know the RP address.

## Dynamic RP

C-RPs are also configured in the PIM-SMv6 domain. These C-RPs transmit data packets that contain their addresses and information about multicast groups served by them to the BSR in unicast mode. The BSR periodically generates BSMs that contain information about a series of C-RPs and their group addresses. BSMs are transmitted hop by hop in the entire domain. Devices receive and store these BSMs. The DR at the receive end uses a hash algorithm to map a group address to the C-RP that can serve the group. Then, the RP corresponding to the group address can be determined.

## Related Configuration

### Setting a Static RP Address

By default, no RP address is configured.

Run the **ipv6 pim rp-address** *ipv6\_rp-address* [ *ipv6\_access-list* ] command to configure or cancel a static RP address for a PIM router.

An RP must be configured so as to implement ASM in a PIM-SMv6 network. You can configure a static RP or dynamic RP.

If a static RP is configured in a PIM-SMv6 network, the static RP configuration on all devices in the PIM-SMv6 domain must be consistent to prevent multicast route ambiguity in the PIM-SMv6 domain.

### Configuring a C-RP Address

By default, no C-RP address is configured.

Run the **ipv6 pim rp-candidate** *interface-type interface-number* [ **priority** *priority-value* ] [ **interval** *interval-seconds* ] [ **group-list** *ipv6\_access-list* ] command to configure or cancel a PIM router as a C-RP.

C-RPs periodically transmit C-RP notifications to the BSR. Information contained in these C-RP notifications is dispersed to all PIM-SMv6 devices in the domain, thereby ensuring the uniqueness of RP mapping.

### Ignoring the RP Priority in RP Setting

By default, a C-RP with a higher priority is selected preferentially.

Run the **ipv6 pim ignore-rp-set-priority** command to specify or ignore the RP priority when selecting the RP for a group.

When one RP needs to be selected for a multicast address and multiple RPs can serve this multicast address, use this command if the RP priority needs to be ignored during the RP comparison. If this command is not configured, the RP priority will be considered during the RP comparison.

### Configuring the Static RP First

By default, a dynamic C-RP is adopted preferentially.

Run the **ipv6 pim static-rp-preferred** command to select the static RP first during RP selection.

After this command is configured, the static RP is adopted first. If this command is not configured, a C-RP is adopted first.

### Configuring the Embedded RP Function

By default, the embedded RP function is enabled for all IPv6 multicast group addresses where the RP address is embedded.

Run the **ipv6 pim rp embedded [ group-list *ipv6\_acl\_name* ]** command to enable the embedded RP function.

The embedded RP function is the peculiar RP discovery mechanism of IPv6 PIM. This mechanism uses the IPv6 multicast address where the RP address is embedded, to enable a multicast device to directly extract the RP address from the multicast address. By default, the embedded RP function is enabled for all IPv6 multicast group addresses where the RP address is embedded.

### 7.3.5 Registration Information About a Multicast Source

When a multicast source arises in a network, the DR connected to the multicast source transmits the Register packet to the RP so that the RP obtains information about the multicast source and multicast packets.

#### Working Principle

The DR at the data source end receives a multicast data packet from the directly connected host, and encapsulates the multicast data into a Register message. Then, it transmits the Register message to the RP in unicast mode. The RP generates the (S,G) entry.

If the forwarding entry contains an outgoing interface on the RP, the RP forwards the encapsulated data packet to the outgoing interface.

If the RP does not have the forwarding entry of the current group, it starts the (S,G) entry start timer. After the timer expires, the RP transmits the Register-Stop message to the DR and deletes the entry. After the DR at the data source end receives the Register-Stop message, the DR transmits the probing packet before the Register-Stop message timer expires.

If the DR does not receive the Register-Stop message, after the timer expires, the DR at the data source end encapsulates the multicast data into the Register message and transmits it to the RP in unicast mode.

If the DR receives the Register-Stop message, it re-starts the delay and re-transmits the probing packet before the delay expires.

#### Related Configuration

##### ▾ Configuring Reachability Detection of RP Register Packets

By default, the RP reachability is not detected.

Run the **ipv6 pim register-rp-reachability** command to set or cancel the RP reachability detection.

If the RP reachability needs to be detected for the Register packet transmitted from the DR to the RP, you can configure this command. After this command is configured, the RP reachability is detected before the DR transmits the Register packet to the RP. That is, the DR queries the unicast routing table and static multicast routing table to check whether a route reachable to the RP exists. If no, the DR does not transmit the Register packet.

##### ▾ Configuring the RP to Filter Register Packets

By default, the RP allows every received Register packet.

Run the **ipv6 pim accept-register { list *ipv6\_access-list* [route-map *map-name* ] | route-map *map-name* [list *ipv6\_access-list* ] }** command to enable or disable the RP to filter received Register packets.

To filter received Register packets on the RP, configure this command. If this command is not configured, the RP allows every received Register packet. If this command is configured, only Register packets whose source addresses and group addresses are allowed by the ACL are processed. Otherwise, the Register packets are filtered out.

### ▾ Configuring the Transmission Rate Limit for Register Packets

By default, the transmission rate of Register packets is not limited.

Run the **ipv6 pim register-rate-limit** *rate* command to configure whether to limit the transmission rate of Register packets.

If **no** is set in this command, the transmission rate is not limited. This command is used to configure the transmission rate of Register packets from the (S,G) multicast group address rather than the transmission rate of Register packets of the entire system.

### ▾ Configuring the Checksum Calculation of a Register Packet Based on the Entire Register Packet

By default, the checksum in a Register packet is calculated in default mode specified in the protocol.

Run the **ipv6 pim register-checksum-wholepkt** [ **group-list** *ipv6\_access-list* ] command to set the packet length for checksum calculation.

If the entire PIM protocol packet including the encapsulated multicast data packet is used for checksum calculation of a Register packet, use this command. If this command is not configured, the checksum in a Register packet is calculated in default mode specified in the protocol.

### ▾ Configuring the Source Address of Register Packets

By default, the source address of Register packets uses the address of the DR interface connected to a multicast source.

Run the **ipv6 pim register-source** { *ipv6\_local\_address* | *interface-type interface-number* } command to configure the source address of Register packets.

To configure the source address of Register packets transmitted from the DR, use this command. If this command is not configured or **no** is set in this command, the source address of Register packets uses the address of the DR interface connected to a multicast source. If the address parameter of this command is used, the configured address must be a reachable unicast route. If the interface parameter of this command is used, this interface may be a loopback interface or an interface of other types and the interface address must be an advertised unicast route.

### ▾ Configuring the Suppression Time of Register Packets

The default suppression time of Register packets is 60 seconds.

Run the **ipv6 pim register-suppression** *seconds* command to configure the suppression time.

If this command is used to configure the suppression time of Register packets, configuring the value on the DR will change the suppression time of Register packets on the DR. If the **ipv6 pim rp-register-kat** *seconds* command is not configured, defining the value on the RP will change the keepalive time on the RP.

### ▾ Configuring the Probing Time of NULL Register Packets

The default probing time is 5 seconds.

Run the **ipv6 pim probe-interval** *interval-seconds* command to set the probing time.

The source DR transmits the NULL-Register packet to the RP within a certain interval prior to the timeout of the suppression time of the Register packet. This interval is the probing time. The default probing time is 5 seconds.

### ✚ Configuring the Time Value of the RP KAT Timer

By default, the KAT default value is used. KAT default value = Registration suppression time x 3 + Registration detection time.

Run the **ipv6 pim rp-register-kat** *seconds* command to set time of the KAT timer.

To configure the keepalive time of Register packets from the (S,G) multicast group address on the RP, use this command.

## 7.3.6 RPT Establishment

When a group member arises in a network, the DR connected to the group member transmits the Join packet in the RP direction to establish an RPT. If there is a multicast source in the network, the multicast packet transmitted to the RP can reach the group member along the RPT.

### Working Principle

The RPT establishment process is as follows:

1. The DR at the receive end receives an MLD (\*,G)Include report packet from a receiver.
2. If the DR at the receive end is not the RP of Group G, the DR at the receive end transmits one (\*,G)join packet in the RP direction. The upstream device that receives the (\*,G)join packet transmits the (\*,G)join packet in the RP direction. The (\*,G)join packet is transmitted hop by hop till the RP of Group G receives the (\*,G)join packet, indicating that the DR at the receive end joins the RPT.
3. When the data source host transmits multicast data to a group, the source data is encapsulated into the Register message and is transmitted to the RP in unicast mode by the DR at the data source end. The RP decapsulates the Register message, retrieves the data packet, and then forwards it to each group member along the RPT.
4. The RP transmits the (S,G)join packet to the DR at the data source end to join the SPT of this data source.
5. After the SPT from the RP to the DR at the data source end is established, data packets from the data source are transmitted to the RP along the SPT without encapsulation.
6. When the first multicast data packet reaches the RP along the SPT, the RP transmits the Register-Stop message to the DR at the data source end to enable the DR to stop the encapsulation of Register packets. After the DR at the data source end receives the Register-Stop message, it does not encapsulate the Register packets but transmits the Register packets to the RP along the SPT of the data source. The RP forwards the Register packets to each group member along the RPT.

### Related Configuration

#### ✚ Configuring the Transmission Interval of Join/Prune Packets

The default transmission interval of Join/Prune packets is 60 seconds.

Run the **ipv6 pim jp-timer** *seconds* command to set the transmission interval of Join/Prune packets.

To change the default transmission interval of Join/Prune packets, configure this command. If this command is not configured, the default transmission interval of Join/Prune packets is 60 seconds.

### 7.3.7 SPT Establishment

When a data packet reaches the DR connected to a group member, the DR connected to the group member transmits the Join packet in the multicast source direction to establish an SPT. Then, multicast packets are forwarded along the SPT, thereby relieving the load of the RP in the RPT and reducing the number of hops from the DR at the data source end to the receive end.

#### Working Principle

The SPT establishment process is as follows:

The DR at the receive end transmits the (\*,G)join packet to the DR at the source end along the SPT. The (\*,G)join packet is transmitted hop by hop till the DR at the source end receives the (\*,G)join packet, forming an SPT.

#### Related Configuration

By default, SPT switching is disabled.

Run the **ipv6 pim spt-threshold [ group-list ipv6\_access-list ]** command to configure whether to start SPT switching.

After this command is configured, when the DR receives the (S,G) packet from the first group member, one PIM Join message is generated and forwarded to the RP to establish a SPT tree. If **group-list** is defined, the defined group is switched from the RPT to the SPT. If **no** is set in this command and **group-list** is not defined, the switching from the RPT to the SPT is disabled and the device redirects to the RPT and transmits one Prune packet to the source. If **no** is set in this command, **group-list** is defined, and the defined ACL is a configured ACL, the ACL associated with **group-list** is cancelled and all groups are allowed to switch from the RPT to the SPT.

### 7.3.8 ASM and SSM Models

PIM-SM supports two multicast models: ASM and SSM. In the ASM model, a multicast data receiver specifies only to join a multicast group G but does not specify the multicast source S. In the SSM model, a multicast data receiver can specify both the multicast source S and multicast group G.

- 
- i** When the SSM model is implemented over IPv6, MLDv2 needs to be used to manage the member relationship between hosts and devices and PIM-SMv6 needs to be used to connect devices.
- 

In the SSM model, a multicast receiver learns about the multicast source (S,G) information by means of some channels (such as accessing the server or receiving advertisements) in advance. When the multicast receiver needs to order a multicast service, it directly transmits the MLD(S,G) Join packet to the last-hop device, for example, as shown in the following figure, Multicast Receiver 1 transmits the MLD(S,G) Join packet to order the multicast service (S,G). After receiving the MLD(S,G) Join packet from the multicast receiver, the last-hop device transmits the PIM(S,G) Join packet to the multicast source hop by hop, for example, as shown in the following figure, after receiving the MLD(S,G) Join packet from Multicast Receiver 1, R1 transmits the PIM(S,G) Join packet to R3, which transmits the PIM (S,G) Join packet to R4. As a result, the SPT from the multicast receiver to the multicast source is established.

Figure 7-5

The following conditions need to be met for the implementation of the SSM model:

- A multicast receiver learns about the multicast source (S,G) information beforehand by means of some channels. The multicast receiver initiates the MLD(S,G) Join packet to the desired multicast service.
- MLDv2 must be enabled on the interface of the last-hop device connected to the multicast receiver. MLDv1 does not support SSM.
- PIM-SM and SSM must be enabled on the intermediate devices between the multicast receiver and the multicast source.

**i** After the SSM function is enabled, the default group range of SSM is FF3x::/32. You can run a command to change the group range of SSM.

The SSM model has the following features:

- In the SSM model, a multicast receiver can learn about the multicast source information in advance by means of some channels (for example, receiving advertisements or accessing a specified server).
- The SSM model is a specific subset of PIM-SM and processes only PIM(S,G) Join and PIM(S,G) Prune messages. It discards RPT-relevant messages within the SSM range, for example, PIM(\*,G) Join/Prune messages. For Register packets within the SSM range, it immediately responds with the Register-Stop packet.
- In the SSM model, no RP is required and the election and distribution of RP messages are not required. The established MDT is the SPT in SSM.

## 7.4 Configuration

### 7.4.1 Configuring Basic Functions of PIM-SMv6

#### Configuration Effect

- Create a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.
- Both or either of the two multicast service models (ASM and SSM) can be supported.

#### Notes

- PIM-SMv6 needs to use the IPv6 unicast routing function.
- If the PIM network needs to support the multicast service of the SSM model, MLDv3 or SSM Mapping needs to be configured.

#### Configuration Steps

##### ▾ Enabling the IPv6 Multicast Routing Function

- Mandatory.
- The IPv6 multicast routing function should be enabled on each router unless otherwise specified.

##### ▾ Enabling the PIM-SMv6 Function

- Mandatory.
- The PIM-SMv6 function should be enabled on the following interfaces unless otherwise specified: router interconnection interfaces, interface that function as a static RP, C-RP, or C-BSR, interface for connecting to a multicast source, and interface for connecting to a user host.

##### ▾ Configuring an RP

- If a PIM network needs to support the multicast service of the ASM model, an RP must be configured.
- There are three methods of configuring an RP: configuring only a static RP, configuring only a dynamic RP, and configuring both a static RP and a dynamic RP. If both a static RP and a dynamic RP are configured, the dynamic RP is preferred.
- Configuring a static RP: A static RP should be configured on each router unless otherwise specified.
- Configuring a dynamic RP: A C-RP or C-BSR should be configured on one or more routers unless otherwise specified.

##### ▾ Enabling the SSM

- If a PIM network needs to support the multicast service of the SSM model, the SSM must be enabled.
- The SSM should be enabled on each router unless otherwise specified.

## Verification

Make a multicast source in the network send packets to groups within the range of ASM and SSM and make a user host join the groups.

- Check whether the user host can successfully receive packets from each group.
- Check whether correct PIM-SMv6 routing entries are created on routers.

Otherwise, multicast data packets cannot be forwarded even if the PIM-SMv6 function is enabled.</p> <p>When the PIM-SMv6 function is enabled, MLD is automatically enabled on each interface without manual configuration.</p> <p>If the message "Failed to enable PIM-SMv6 on &lt;interface name&gt;, resource temporarily unavailable, please try again" is displayed during the configuration of this command, try to configure this command again.</p> <p>If the message "PIM-SMv6 Configure failed! VIF limit exceeded in NSM!!!" is displayed during the configuration of this command, the configured number of multicast interfaces reaches the upper limit of multicast interfaces that can be configured on the device. If the PIM-SMv6 function still needs to be enabled on an interface, delete some unnecessary PIM-SMv6 or PIM-DMv6 interfaces.</p> <p>If an interface is of the tunnel type, only the 6Over4 configuration tunnel, 6Over4 GRE tunnel, 6Over6 configuration tunnel, and 6Over6 GRE tunnel support the IPv6 multicast function. The multicast function can also be enabled on tunnel interfaces that do not support the multicast function but no prompts are displayed and multicast packets are neither received nor transmitted.</p> <p>Multicast tunnels can be established only on Ethernet ports. Embedded tunnels and QoS/ACL of multicast</p> |

|--|-------------------------|
|  | data are not supported. |
|--|-------------------------|

### ▾ Configuring a Static RP

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim rp-address</b> <i>ipv6_rp-address</i> [ <i>ipv6_access-list</i> ]  |
| <b>Parameter Description</b> | <i>ipv6_rp-address</i> : Indicates the IPv6 address of an RP.<br><i>ipv6_access_list</i> : References an IPv6 ACL to restrict the group address range served by the static RP. A named ACL is supported.   |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | <p>Multicast static RPs can be configured. A static RP and a C-RP can coexist.</p> <p>Notes:</p> <ol style="list-style-type: none"> <li>1. If both the BSR mechanism and RP static configuration are effective, the dynamic configuration is preferred.</li> <li>2. A control list can be used to statically configure the address of an RP for multiple multicast groups (using the ACL) or all multicast groups (without using the ACL), but one static RP address cannot be used multiple times.</li> <li>3. If multiple static RPs serve the same group, the static RP with a larger IPv6 address is used preferentially.</li> <li>4. Only multicast groups with the addresses allowed by the ACL are effective. By default, all multicast groups are allowed.</li> <li>5. After the configuration is complete, the static RP source address will be inserted into the group range-based static RP group tree structure. The multicast static group in each group range maintains the linked list structure of one static RP group. This linked list is arranged in descending order by IPv6 address. When an RP is selected for a group range, the RP with the largest IPv6 address will be selected.</li> <li>6. When a static RP address is deleted, this address is deleted from all existing groups and an address is selected from the existing static RP tree structure as the RP address.</li> </ol> |

### ▾ Configuring a C-RP

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim rp-candidate</b> <i>interface-type interface-number</i> [ <b>priority</b> <i>priority-value</i> ] [ <b>interval</b> <i>interval-seconds</i> ] [ <b>group-list</b> <i>ipv6_access-list</i> ]   |
| <b>Parameter Description</b> | <p><i>interface-type interface-number</i>: Indicates an interface name. This interface address is used as the C-RP address.</p> <p><b>priority</b> <i>priority-value</i>: Specifies the priority of the C-RP. The value ranges from 0 to 255 and the default value is <b>192</b>.</p> <p><b>interval</b> <i>seconds</i>: Indicates the interval for transmitting C-RP messages to the BSR, with the unit of seconds. The value ranges from 1 to 16,383 and the default value is <b>60</b>.</p> <p><b>group-list</b> <i>ipv6_access-list</i>: References an IPv6 ACL to restrict the group address range served by the C-RP. A named ACL is supported.</p> |
| <b>Command</b>               | Global configuration mode   |

|                    |   |
|--------------------|---|
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | <p>In the PIM-SMv6 protocol, the RPT created by the multicast routing uses an RP as the root node. After the BSR is elected, all C-RPs periodically transmit C-RP messages to the BSR in unicast mode and then the BSR disperses the messages in the entire PIM domain.</p> <p>To specify an interface as the C-RP of a specific group range, contain the ACL option in this command. Note that the calculation of the group range is based only on the permitted access control entries (ACEs) and denied ACEs are not involved in the calculation.</p> <p>If <b>group-list</b> ipv6_access-list is not carried in the command, all groups are served.</p> |

### ↘ Configuring a C-BSR

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim bsr-candidate</b> <i>interface-type interface-number</i> [ <i>hash-mask-length</i> [ <i>priority-value</i> ] ]  |
| <b>Parameter Description</b> | <p><i>interface-type interface-number</i>: Indicates an interface name. This interface address is used as the C-BSR address.</p> <p><i>hash-mask-length</i>: Indicates the hash mask length. The value ranges from 0 to 128 and the default value is <b>126</b>.</p> <p><i>priority-value</i>: Indicates the priority. The value ranges from 0 to 255 and the default value is <b>64</b>.</p>   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | <p>A unique BSR must exist in a PIM-SMv6 domain. The BSR collects and advertises RP information. The unique well-known BSR is elected from multiple C-BSRs by means of BSMs. All C-BSRs consider that they are the BSR before knowing the BSR information. They periodically transmit BSMs that contain the BSR address and priority in the PIM-SMv6 domain.</p> <p>This command can be used to enable a device to transmit one BSM to all PIM neighbors by using the allocated BSR address. Each neighbor compares the original BSR address with the address in the received BSM. If the IPv6 address in the received BSM is equal to or larger than its BSR address, the neighbor stores this address as the BSR address and forwards the BSM. Otherwise, the neighbor discards the BSM.</p> <p>The current device deems that it is the BSR till it receives a BSM from another C-BSR and learns that the C-BSR has a higher priority (or the same priority but a larger IPv6 address).</p> |

### ↘ Enabling the SSM

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim ssm</b> { <b>default</b> / <b>range</b> <i>ipv6_access-list</i> }  |
| <b>Parameter Description</b> | <p><b>default</b>: The default group address range of SSM is FF3x::/32.</p> <p><b>range</b> <i>ipv6_access-list</i>: References an IPv6 ACL to restrict the SSM group address range. A named ACL is supported.</p> |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | To apply SSM in a PIM-SMv6 network, you must configure this command.   |

### ↘ Displaying the PIM-SM Routing Table

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ipv6 pim sparse-mode mroute [ group-or-source-address [ group-or-source-address ] ]</b>  |
| <b>Parameter Description</b> | <i>group-or-source-address</i> : Indicates the group address or source address. The two addresses cannot be group addresses or source addresses at the same time.  |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, and interface configuration mode  |
| <b>Usage Guide</b>           | A group address, a source address, or both group address and source address can be specified each time. You can also not specify a specific group address or source address but you cannot specify two group addresses or two source addresses at the same time. |

## Configuration Example

### Creating the IPv6 Multicast Service on an IPv6 Network to Support ASM and SSM

|                                      |   |
|--------------------------------------|---|
| <b>Scenario</b><br><b>Figure 7-6</b> |   |
| <b>Configuration Steps</b>           | <ul style="list-style-type: none"> <li>● Configure an IPv6 unicast routing protocol (such as OSPFv6) on the routers and ensure that the unicast routes of the loopback interfaces are reachable. (Omitted)</li> <li>● Enable the IPv6 multicast routing function on all routers.</li> <li>● Enable the PIM-SMv6 function on device interconnection interfaces, interface for connecting to the user host, and interface for connecting to the multicast source.</li> <li>● Configure a C-RP and a C-BSR on the loopback interfaces of Router A and Router B. Enable the PIM-SMv6 function on the loopback interfaces.</li> <li>● Enable SSM on all routers.</li> <li>● Enable MLDv3 on the router interface for connecting to the user host. (Omitted)</li> </ul> |
| <b>A</b>                             | <pre>switch(config)#ipv6 multicast-routing switch(config)#ipv6 pim ssm default switch(config)#int gi 0/2 switch(config-if-GigabitEthernet 0/2)#ipv6 add 2000::2/64 switch(config-if-GigabitEthernet 0/2)#ipv6 pim sparse-mode</pre>   |

|                     |  |
|---------------------|--|
|                     | <pre> switch(config-if-GigabitEthernet 0/2)#exit switch(config)#int gi 0/1 switch(config-if-GigabitEthernet 0/1)#ipv6 add 1000::1/64 switch(config-if-GigabitEthernet 0/1)#ipv6 pim sparse-mode switch(config-if-GigabitEthernet 0/1)#exit switch(config)#int Loopback 0 switch(config-if-Loopback 0)#ipv6 add 3000::5/64 switch(config-if-Loopback 0)#ipv6 pim sparse-mode switch(config-if-Loopback 0)#exit switch(config)#ipv6 pim rp-candidate Loopback 0 </pre>   |
| <b>B</b>            | <pre> ruijie(config)#ipv6 multicast-routing ruijie(config)#ipv6 pim ssm default ruijie(config)#int gi 0/2 ruijie(config-if-GigabitEthernet 0/2)#ipv6 add 2000::1/64 ruijie(config-if-GigabitEthernet 0/2)#ipv6 pim sparse-mode ruijie(config-if-GigabitEthernet 0/2)#exit ruijie(config)#int gi 0/1 ruijie(config-if-GigabitEthernet 0/1)#ipv6 add 1100::1/64 ruijie(config-if-GigabitEthernet 0/1)#ipv6 pim sparse-mode ruijie(config-if-GigabitEthernet 0/1)#exit ruijie(config)#int Loopback 0 ruijie(config-if-Loopback 0)#ipv6 add 5000::5/64 ruijie(config-if-Loopback 0)#ipv6 pim sparse-mode ruijie(config-if-Loopback 0)#exit ruijie(config)#ipv6 pim bsr-candidate Loopback 0 </pre> |
| <b>Verification</b> | <p>Make Source(2000::2/64) send packets to G1(ff16::1) and make User join G1.</p> <ul style="list-style-type: none"> <li>● Check the multicast packets received by the User. The User should be able to receive multicast packets from G1.</li> <li>● Check PIM-SMv6 routing tables on Router A and Router B. Entries should exist on the PIM-SMv6 routing tables.</li> </ul>  |

### Common Errors

- IPv6 unicast routing is incorrectly configured.
- IPv6 multicast routing is not enabled on a router.
- SSM is not enabled on a router or the SSM group address range of the router is different from that of other routers.
- PIM-SMv6 is not enabled on an interface (for example, interface that is specified as a C-RP or C-BSR, or interface that functions as the gateway of a user host or multicast source).
- MLDv3 is not enabled on an interface connected to a user host.
- No RP is configured in the network.
- No static RP is configured on a router or the configured static RP is different from that on other routers.
- A C-RP is configured but no C-BSR is configured in the network.
- The unicast route to the static RP, C-RP, or C-BSR is unreachable.

## 7.4.2 Configuring PIM Neighbor Parameters

### Configuration Effect

- Negotiate about protocol parameters and adjust parameters in a Hello packet.
- PIM routers discover neighbors, negotiate about protocol parameters, and maintain neighbor relationships.
- Protect neighbor relationships to restrict neighbors.

### Notes

- The basic functions of PIM-SMv6 must be configured.

### Configuration Steps

- Set parameters on each PIM router interface unless otherwise specified.

### Verification

Set parameters in a Hello packet on an interface and run the **debug ipv6 pim sparse-mode packet** command to check parameters in the Hello packet.

Set neighbor filtering and run the **show ipv6 pim sparse-mode neighbor** command to check the neighbor relationship.

## Related Commands

### ▾ Configuring the Transmission Interval of Hello Messages

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim query-interval</b> <i>seconds</i>   |
| <b>Parameter Description</b> | Indicates the transmission interval of Hello packets.<br>The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>30</b> .  |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | Each time the transmission interval of Hello messages is updated, the Holdtime of Hello messages is accordingly updated according to the following rule: The Holdtime of Hello messages is updated to 3.5 times transmission interval of Hello messages. If the transmission interval of Hello messages multiplied by 3.5 is larger than 65,535, the transmission interval of Hello messages is forcibly updated to 18,725. |

### ▾ Configuring the Propagation Delay for Hello Messages

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim propagation-delay</b> <i>milliseconds</i>  |
| <b>Parameter Description</b> | <i>milliseconds</i> : The unit is milliseconds. The value ranges from 1 to 32,767 and the default value is <b>500</b> .  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | Changing the propagation delay or prune override delay will affect J/P-override-interval. According to the protocol, J/P-override-interval must be smaller than the Holdtime of Join-Prune packets. Otherwise, short flow interruption will be incurred. This must be maintained and guaranteed by network administrators. |

### ▾ Configuring the Prune Override Interval for Hello Messages

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim override-interval</b> <i>milliseconds</i>  |
| <b>Parameter Description</b> | <i>milliseconds</i> : The unit is milliseconds. The value ranges from 1 to 65,535 and the default value is <b>2500</b> .   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | Changing the propagation delay or prune override delay will affect J/P-override-interval. According to the protocol, J/P-override-interval must be smaller than the Holdtime of Join-Prune packets. Otherwise, short flow interruption will be incurred. |

### ▾ Configuring the Interface Joining Suppression Capability for Hello Messages

|                              |                                   |
|------------------------------|-----------------------------------|
| <b>Command</b>               | <b>ipv6 pim neighbor-tracking</b> |
| <b>Parameter Description</b> | N/A                               |
| <b>Command</b>               | Interface configuration mode      |

|                    |   |
|--------------------|---|
| <b>Mode</b>        |   |
| <b>Usage Guide</b> | When the joining suppression capability of an interface is enabled and the local router needs to transmit a Join packet to an upstream neighbor, the Join packet of the local router is suppressed and is not transmitted if the local router receives a Join packet from a neighbor to the upstream router. If the joining suppression capability of the interface is disabled, the local router transmits the Join packet. When the joining suppression capability of a downstream receiver is disabled, the upstream neighbor can accurately know the number of receivers connected to the downstream neighbor through the received Join packet, thereby implementing neighbor tracking. |

### 📌 Configuring the Delay of Sending Out Hello Messages

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim triggered-hello-delay</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>Seconds</i> : The unit is seconds. The value ranges from 1 to 5 and the default value is <b>5</b> .   |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | When an interface is enabled or detects a new neighbor, the Triggered-Hello-Delay message is used to generate a random time period. Within the time period, the interface sends Hello packets. |

### 📌 Configuring the DR Priority for Hello Messages

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim dr-priority</b> <i>priority-value</i>   |
| <b>Parameter Description</b> | <i>priority-value</i> : Indicates the priority. A larger value means a higher priority. The value ranges from 0 to 4,294,967,294 and the default value is <b>1</b> .  |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | The process of selecting a DR is as follows:<br>The priority parameter is set for Hello packets of devices in the same LAN. The priority is compared for the selection of a DR. The device with a higher priority is the DR. If multiple devices share the same priority, the device with a larger IP address is the DR.<br>When the priority parameter is not set for Hello packets of a device in a LAN, the device with a larger IP address is elected as the DR in the LAN. |

### 📌 Configuring Neighbor filtering

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim neighbor-filter</b> <i>ipv6_access-list</i>   |
| <b>Parameter Description</b> | <i>ipv6_access-list</i> : References an IPv6 ACL to restrict the neighbor address range.                    |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | This command can be used to filter neighbors to strengthen the security of the PIM network and restrict the |

address range of legitimate neighbors. If a neighbor is rejected by an ACL, PIM-SMv6 will not establish a peering relationship with this neighbor or suspend the peering relationship with this neighbor.

### ▾ Displaying Neighbor Information About an Interface

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 pim sparse-mode neighbor [ detail ]</b>                              |
| <b>Parameter Description</b> | <b>detail:</b> Displays details.  |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, and interface configuration mode |
| <b>Usage Guide</b>           | N/A   |

### Configuration Example

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set the transmission interval of Hello packets of PIM-SMv6 to 50 seconds.</li> <li>● Set the propagation delay of Hello packets of PIM-SMv6 to 400 milliseconds.</li> <li>● Set the prune override interval of Hello packets of PIM-SMv6 to 3,000 milliseconds.</li> <li>● Configure the interface joining suppression capability for Hello messages of PIM-SMv6.</li> <li>● Set the delay of sending out Hello messages of PIM-SMv6 to 3 seconds.</li> <li>● Set the DR priority of Hello messages of PIM-SMv6 to 5.</li> </ul> |
|                            | <pre> switch # configure terminal switch (config)#int gi 0/1 switch (config-if-GigabitEthernet 0/1)#ipv6 pim query-interval 50 switch (config-if-GigabitEthernet 0/1)#ipv6 pim propagation-delay 400 switch (config-if-GigabitEthernet 0/1)#ipv6 pim override-interval 3000 switch (config-if-GigabitEthernet 0/1)#ipv6 pim triggered-hello-delay 3 switch (config-if-GigabitEthernet 0/1)# ipv6 pim dr-priority 5 </pre>   |
| <b>Verification</b>        | Run the <b>debug ipv6 pim sparse-mode packet</b> command to check parameters in a Hello packet.   |

|                            |   |
|----------------------------|---|
|                            | <pre>switch # debug ipv6 pim sparse-mode packet  *Jan 2 02:37:55: %7: Hello send to GigabitEthernet 0/2 *Jan 2 02:37:55: %7: Send Hello message *Jan 2 02:37:55: %7: Holdtime: 175 *Jan 2 02:37:55: %7: T-bit: off *Jan 2 02:37:55: %7: Propagation delay: 400 *Jan 2 02:37:55: %7: Override interval: 3000 *Jan 2 02:37:55: %7: DR priority: 5 *Jan 2 02:37:55: %7: Gen ID: 99572792 *Jan 2 02:37:55: %7: Secondary Addresses: *Jan 2 02:37:55: %7:    2000::2</pre> |
|                            |   |
| <b>Configuration Steps</b> | Configure neighbor filtering on an interface to receive neighbor packets with the address of (8000::1/64).  |
|                            | <pre>switch(config-if-GigabitEthernet 0/2)#ipv6 pim neighbor-filter acl  % access-list acl not exist  switch(config-if-GigabitEthernet 0/2)#exit  switch(config)#ipv6 access-list acl  switch(config-ipv6-acl)#permit ipv6 8000::1/64 any</pre>   |
| <b>Verification</b>        | Before neighbor filtering is configured, display the neighbor information.  |
|                            | <pre>switch#show ipv6 pim sparse-mode neighbor  Neighbor Address                Interface                Uptime/Expires            DR                                 Pri/Mode fe80::21a:a9ff:fe3a:6355        GigabitEthernet 0/2    00:32:29/00:01:16        1 /</pre>  |
| <b>Verification</b>        | After neighbor filtering is configured, the neighbor information is blank.  |
|                            | <pre>switch#show ipv6 pim sparse-mode neighbor</pre>  |

### Common Errors

- The basic functions of PIM-SMv6 are not configured or fail to be configured.

## 7.4.3 Configuring BSR Parameters

### Configuration Effect

- Restrict the range of BSMs.

### Notes

- The basic functions of PIM-SMv6 must be configured.
- A C-RP and a C-BSR must be configured.
- The border must be configured on the interface between domains.

### Configuration Steps

#### ↘ Configuring the Border

- The border must be configured if there are multiple domains.
- Configure the border the interface between two domains.

#### ↘ Configuring a PIM Router to Restrict BSMs

- Optional.
- This configuration can be performed on a PIM router unless otherwise specified.

#### ↘ Configuring a C-BSR to Restrict the C-PR Range

- Optional.
- This configuration can be performed on all C-BSRs unless otherwise specified.

#### ↘ Configuring a C-BSR to Receive C-RP-ADV Packets with prefix-count of 0

- Optional.
- This configuration can be performed on all C-BSRs unless otherwise specified.

### Verification

#### ↘ Verifying the Border

Enable the basic functions of PIM-SMv6, set two routers in different domains, and set Router B as a C-BSR. Router A can normally receive BSMs.

Set the common border between Router A and Router B as a border interface. Router A cannot receive BSMs.

#### ↘ Verifying a PIM Router to Restrict BSMs

Enable the basic functions of PIM-SMv6 and set Router B as a C-BSR. Router A can normally receive BSMs. Restrict the C-BSR range on Router A. Router A cannot receive BSMs.

#### ↘ Verifying a C-BSR to Restrict the C-PR Range

Enable the basic functions of PIM-SMv6, set Router B as a C-BSR, set Router A as a C-RP, and restrict the C-RP range on the C-BSR. Router B cannot receive packets from the C-RP.

## Related Commands

### ▾ Configuring the BSR Border

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim bsr-border</b>   |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | The BSR border can be configured on an interface to restrict flooding of BSMs. When this interface receives BSMs, it immediately discards them and BSMs are not forwarded by this interface. |

### ▾ Configuring a PIM Router to Restrict BSMs

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim accept-bsr list</b> <i>ipv6_access-list</i>   |
| <b>Parameter Description</b> | <b>list</b> <i>ipv6_access-list</i> : References an IPv6 ACL to restrict the BSR address range. A named ACL is supported. |

|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 pim sparse-mode bsr-router</b>                                       |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, and interface configuration mode |
| <b>Usage Guide</b>           | N/A   |

➤ **Displaying All RPs Configured on the Local Device and the Multicast Groups Served by the RPs**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 pim sparse-mode rp mapping</b>                                       |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, and interface configuration mode |
| <b>Usage Guide</b>           | N/A   |

**Configuration Example**

➤ **Configuring the BSR Border**

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure the BSR border on the juncture interface between Router B and Router A.</li> </ul>  |
|                            | <pre>Ruijie(config-if-GigabitEthernet 0/2)#ipv6 pim bsr-border</pre>   |
| <b>Verification</b>        | Before the BSR border is configured, the BSM information of Router A is displayed as follows:  |
|                            | <pre>switch#show ipv6 pim sparse-mode bsr-router PIMv2 Bootstrap information   BSR address: 5000::5   Uptime:      00:05:42, BSR Priority: 64, Hash mask length: 126   Expires:     00:01:28   Role: Non-candidate BSR Priority: 0, Hash mask length: 126   State: Accept Preferred  Candidate RP: 3000::5(Loopback 0)   Advertisement interval 60 seconds   Next Cand_RP_advertisement in 00:00:24  switch#</pre> |
|                            |  <b>Candidate RP:</b> Indicates all C-RPs configured on the local router, excluding other routers.  |
|                            | After the BSR border is configured, the BSM information of Router A is displayed as follows:   |

```
switch#show ipv6 pim sparse-mode bsr-router

Candidate RP: 3000::5(Loopback 0)

Advertisement interval 60 seconds

Next Cand_RP_advertisement in 00:00:53
```

📌 **Configuring a PIM Router to Restrict the Source Address Range of BSMs to (8000::5/64)**

|                                   |  |
|-----------------------------------|--|
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure PIM Router A to restrict BSMs. The restricted source address range is (8000::5/64).</li> </ul>  |
|                                   | <pre>switch(config)#ipv6 access-list acl switch(config-ipv6-acl)#permit ipv6 8000::5/64 any switch(config-ipv6-acl)#exit switch(config)#ipv6 pim accept-crp list acl</pre>   |
| <p><b>Verification</b></p>        | <p>Before the BSM restriction is configured, the BSM information of Router A is displayed as follows:</p>  |
|                                   | <pre>switch#show ipv6 pim sparse-mode bsr-router  PIMv2 Bootstrap information  BSR address: 5000::5  Uptime:      00:05:42, BSR Priority: 64, Hash mask length: 126  Expires:     00:01:28  Role: Non-candidate BSR Priority: 0, Hash mask length: 126  State: Accept Preferred  Candidate RP: 3000::5(Loopback 0)  Advertisement interval 60 seconds  Next Cand_RP_advertisement in 00:00:24  switch#</pre> |
|                                   | <p>After the BSM restriction is configured, the BSM information of Router A is displayed as follows:</p>   |

```
switch#show ipv6 pim sparse-mode bsr-router

Candidate RP: 3000::5(Loopback 0)

Advertisement interval 60 seconds

Next Cand_RP_advertisement in 00:00:34
```

📌 **Configuring a C-BSR to Restrict the Source Address Range of C-PR Packets to (9000::5/64)**

|                                   |  |
|-----------------------------------|--|
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure Router B to restrict C-RP packets. The restricted source address range is (9000::5/64).</li> </ul>  |
|                                   | <pre>Ruijie(config)#ipv6 access-list acl Ruijie(config-ipv6-acl)#permit ipv6 9000::5/64 any Ruijie(config-ipv6-acl)#exit Ruijie(config)#ipv6 pim accept-crp list acl</pre>   |
| <p><b>Verification</b></p>        | <p>Before C-RP packet filtering is configured, information about all RP groups on Router B is displayed as follows:</p>  |
|                                   | <pre>Ruijie#show ipv6 pim sparse-mode rp mapping PIM Group-to-RP Mappings This system is the Bootstrap Router (v2) Group(s): ff00::/8 RP: 3000::5(Not self) Info source: 3000::5, via bootstrap, priority 192 Uptime: 00:02:26, expires: 00:02:08  Ruijie#</pre> |
|                                   | <p>After C-RP packet filtering is configured, information about all RP groups on Router B is displayed as follows:</p>   |
|                                   | <pre>Ruijie#show ipv6 pim sparse-mode rp mapping PIM Group-to-RP Mappings This system is the Bootstrap Router (v2)</pre>   |

📌 **Configuring the Static RP First**

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set the address of Interface Loopback0 of Router A to 3000::5. (Omitted)</li> <li>● Set the address of Interface Loopback1 of Router A to 4000::5. (Omitted)</li> <li>● Set the static address of Router A to 3300::5. (Omitted)</li> <li>● Set the static address of Router B to 3300::5.</li> <li>● Configure the static RP first on Router A.</li> </ul> |
|                            | <pre>switch(config)#ipv6 pim rp-address 3300::5 switch(config)#ipv6 pim static-rp-preferred</pre>  |
| <b>Verification</b>        | Before static RP first is configured, display information about the RP corresponding to FF16::1.   |
|                            | <pre>switch#show ipv6 pim sparse-mode rp ff16::1  RP: 4000::5  Info source: 5000::5, via bootstrap  PIMv2 Hash Value 126  RP 4000::5, via bootstrap, priority 56, hash value 892666309  RP 3000::5, via bootstrap, priority 200, hash value 1161101765  RP 3300::5, static (hash value 204800453 not used)</pre>   |
| <b>Verification</b>        | After static RP first is configured, display information about the RP corresponding to FF16::1.  |
|                            | <pre>switch(config)#show ipv6 pim sparse-mode rp ff16::1  RP: 3300::5 (Static)  PIMv2 STATIC RP PREFERRED  PIMv2 Hash Value 126  RP 4000::5, via bootstrap, priority 56, hash value 892666309  RP 3000::5, via bootstrap, priority 200, hash value 1161101765  RP 3300::5, static (hash value 204800453 not used)  switch(config)#</pre>   |

## Common Errors

- The basic functions of PIM-SMv6 are not configured or fail to be configured.
- No C-BSR is configured.

- The BSR border is not configured on an interface between different domains.

## 7.4.4 Configuring RP and DR Parameters

### Configuration Effect

- Configure the ignorance of the C-RP priority for the RP reselection.
- Configure the DR at the data source end to detect the RP reachability.
- Restrict the (S,G) multicast group address of the data source so that the ASM model provides the multicast service only for multicast packets within the allowable range.
- Configure the rate limit for the DR at the data source end to transmit Register packets.
- Configure the checksum length of Register packets.
- Configure the source address of Register packets.
- Configure the suppression time of Register packets.
- Configure the probing time of NULL packets.
- Configure the TTL of Register packets received by the RP from the (S,G) multicast group address.
- Configure the static RP first.

### Notes

- The basic functions of PIM-SMv6 must be configured.

### Configuration Steps

#### ▾ **Configuring the Ignorance of the C-RP Priority for the RP Reselection**

- Optional.
- The ignorance of the C-RP priority can be enabled on each router unless otherwise specified.

#### ▾ **Configuring the DR at the Data Source End to Detect the RP Reachability**

- Optional.
- The reachability detection can be enabled on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ **Restricting the (S,G) Address Range of Register Packets at the Data Source End**

- Optional.
- The (S,G) address range of Register packets at the data source end can be restricted on all routers that function as C-RPs or static RPs unless otherwise specified.

#### ▾ **Restricting the Rate for the DR at the Data Source End to Transmit Register Packets**

- Optional.

- The transmission rate limit of Register packets can be enabled on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ **Configuring the Checksum Length of Register Packets**

- Optional.
- The checksum length of Register packets can be configured on all C-RPs or static RPs unless otherwise specified.

#### ▾ **Configuring the Source Address of Register Packets**

- Optional.
- The source address of Register packets can be configured on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ **Configuring the Suppression Time of Register Packets**

- Optional.
- The suppression time of Register packets can be configured on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ **Configuring the Probing Time of NULL Packets**

- Optional.
- The probing time of NULL packets can be configured on the DR that is directly connected to the data source unless otherwise specified.

#### ▾ **Configuring the TTL of Register Packets Received by the RP from the (S,G) Multicast Group Address**

- Optional.
- The TTL of Register packets from the (S,G) multicast group address can be configured on all routers that function as C-RPs or static RPs unless otherwise specified.

#### ▾ **Configuring the Static RP First**

- Optional.
- The static RP first can be configured on all routers unless otherwise specified.

### **Verification**

---

#### ▾ **Verifying the Ignorance of the C-RP Priority**

Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. Set the address to 4000::5 and priority to 56 for Interface Loopback1 on Router A. Set the C-BSR address to 5000::5 on Router B.

- Run the **show ipv6 pim sparse-mode rp ff16::2** command to display information about the RP that serves the current group.

#### ▾ **Verifying the DR at the Data Source End to Detect the RP Reachability**

Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. Set the address to 4000: : 5 and priority to 56 for Interface Loopback1 on Router A. Set the C-BSR address to 5000: : 5 on Router B. Configure the RP reachability detection on Router B.

- Run the **show running-config** command to check whether the RP reachability detection is configured.

#### ↘ Verifying the Restriction of the (S,G) Address Range of Register Packets at the Data Source End

Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. Set the address to 4000: : 5 and priority to 56 for Interface Loopback1 on Router A. Set the C-BSR address to 5000: : 5 on Router B. The address of the multicast group is FF16::2. Set Router A to receive packets only from the multicast source with the source address of (1300::1/64).

- Run the **show ip pim sparse-mode mroute** command to display the (S,G) entries.

#### ↘ Verifying the Rate Limit for the DR at the Data Source End to Transmit Register Packets

- Set the rate of transmitting Register packets for Router B and then run the **show ip pim sparse-mode track** command to check the number of transmitted Register packets for confirmation.

#### ↘ Verifying the Checksum Length of Register Packets

- Set Router A to check a Register packet based on the entire packet rather than based only on the packet header and Register packet header. Run the **show running-config** command to check the configuration.

#### ↘ Verifying the Source Address of Register Packets

- Configure the source address of Register packets on Router B and run the **show running-config** command to check the configuration on Router A.

#### ↘ Verifying the Suppression Time and Probing Time of Register Packets

- Configure the suppression time and probing time of Register packets on Router B and run the **show running-config** command to check the configuration.

#### ↘ Verifying the TTL of Register Packets Received by the RP from the (S,G) Multicast Group Address

- Configure the TTL of Register packets from the (S,G) multicast group address on Router A and run the **show ip pim sparse-mode mroute** command to display the maximum (S,G) TTL.

#### ↘ Verifying the Static RP First

- Configure a static RP and a C-RP on Router A, configure the static RP first, and then run the **show ipv6 pim sparse-mode rp ff16::2** command to display information about the current RP.

### Related Commands

#### ↘ Ignoring the C-RP Priority

|           |  |
|-----------|--|
| Command   | <b>ipv6 pim ignore-rp-set-priority</b> |
| Parameter | N/A                                    |

|                     |                           |
|---------------------|---------------------------|
| <b>Description</b>  |                           |
| <b>Command Mode</b> | Global configuration mode |
| <b>Usage Guide</b>  | N/A                       |

### ▾ Displaying Information About the RP That Serves a Group

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 pim sparse-mode rp-hash</b> <i>group-address</i>                     |
| <b>Parameter Description</b> | <i>group-address</i> : Indicates the parsed group address.                        |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, and interface configuration mode |
| <b>Usage Guide</b>           | N/A   |

### ▾ Configuring the DR Directly Connected to the Data Source to Detect RP Reachability

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim register-rp-reachability</b>   |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | After this command is configured, the RP reachability is detected before Register packets are transmitted. If the RP is reachable, Register packets are transmitted. If the RP is unreachable, Register packets are not transmitted. |

### ▾ Restricting the (S,G) Address Range of Register Packets at the Data Source End

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim accept-register</b> { <b>list</b> <i>ipv6_access-list</i> [ <b>route-map</b> <i>map-name</i> ]   <b>route-map</b> <i>map-name</i> [ <b>list</b> <i>ipv6_access-list</i> ] }   |
| <b>Parameter Description</b> | <b>list</b> <i>ipv6_access-list</i> : References an IP extended ACL to restrict the (S,G) address range. The value range is 100-199, 2000-2699, and Word.<br><b>route-map</b> <i>map-name</i> : Uses a route map to restrict the (S,G) address range. |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | After this command is configured, when receiving a Register packet from an unauthorized source, the RP immediately returns the Register-Stop packet.  |

### ▾ Displaying Multicast Routing Entries

|                  |   |
|------------------|---|
| <b>Command</b>   | <b>show ipv6 pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] |
| <b>Parameter</b> | <i>group-or-source-address</i> : Indicates the group address or source address. The two addresses cannot be   |

|                     |   |
|---------------------|---|
| <b>Description</b>  | group addresses or source addresses at the same time.   |
| <b>Command Mode</b> | Privileged EXEC mode, global configuration mode, and interface configuration mode   |
| <b>Usage Guide</b>  | A group address, a source address, or both addresses can be specified each time. You can also not specify a specific group address or source address but you cannot specify two group addresses or two source addresses at the same time. |

#### ▾ Configuring the Rate Limit for the DR to Transmit Register Packets

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim register-rate-limit</b> <i>rate</i>  |
| <b>Parameter Description</b> | <i>Rate</i> : Indicates the number of Register packets that are allowed to be transmitted per second. The value ranges from 1 to 65,535.   |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | This command is used to configure the transmission rate of Register packets from the (S,G) multicast group address rather than the Register packets of the entire system. After this command is configured, the load of the source DR and RP will be relieved and Register packets whose rate does not exceed the limit will be transmitted. |

#### ▾ Displaying the Statistics on PIM Packets

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ipv6 pim sparse-mode track</b>   |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, and interface configuration mode  |
| <b>Usage Guide</b>           | When the system is started, the statistics start time point is first set. Each time <b>clear ip pim sparse-mode track</b> is called, the statistics start time point is set again and the PIM packet counter is cleared. |

#### ▾ Configuring the Checksum Calculation of a Register Packet Based on the Entire Packet

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim register-checksum-wholepkt</b> [ <b>group-list</b> <i>ipv6_access-list</i> ]   |
| <b>Parameter Description</b> | <b>group-list</b> <i>access-list</i> : Uses an ACL to restrict the group addresses that use this configuration.<br><i>access-list</i> : Supports digits <1,99> and <1300,1999>. A named ACL is supported.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | The device calculates the checksum of a Register packet based on the entire PIM protocol packet including the encapsulated multicast data packet, rather than the PIM header of the Register packet.<br>If <b>group-list</b> <i>ipv6_access-list</i> is not carried in this command, all group addresses apply this configuration. |

#### ▾ Configuring the Source Address of Register Packets

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim register-source</b> { <i>ipv6_local_address</i>   <i>interface-type interface-number</i> }  |
| <b>Parameter Description</b> | <i>local_address</i> : Specifies an IPv6 address as the source address of Register packets.<br><i>interface-type interface-number</i> : Specifies the IPv6 address of an interface as the source address of Register packets.   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | The configured address must be reachable. When the RP receives a Register packet, it transmits the Register-Stop packet with the source IPv6 address of the Register packet as the destination address.<br>PIM-SMv6 does not need to be enabled on associated interfaces. |

### ↘ Configuring the Suppression Time of Register Packets

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim register-suppression</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>Seconds</i> : Indicates the suppression time of Register packets. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>60</b> .  |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | Configuring this value on the DR will change the suppression time of Register packets defined on the DR. If the <b>ipv6 pim rp-register-kat</b> command is not configured, configuring this value on the RP will change the keepalive time of the RP. |

### ↘ Configuring the Probing Time of Register Packets

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 pim probe-interval</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>Seconds</i> : Indicates the probing time of Register packets. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>5</b> .  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | Probing time of Register packets is the interval for the source DR to transmit the NULL-Register packet to the RP prior to the timeout of the suppression time of Register packets.<br>The probing time of Register packets cannot be larger than half of the suppression time of Register packets. Otherwise, the configuration fails and a warning is displayed. In addition, the suppression time of Register packets multiplied by three plus the probing time of Register packets cannot be larger than 65,535. Otherwise, a warning will be displayed. |

### ↘ Configuring the KAT Interval on the RP

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim rp-register-kat</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>Seconds</i> : Indicates the time of the KAT timer.<br>The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>210</b> . |

|                     |                           |
|---------------------|---------------------------|
| <b>Command Mode</b> | Global configuration mode |
| <b>Usage Guide</b>  | N/A                       |

### ▾ Configuring the Static RP First

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 pim static-rp-preferred</b>   |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | After this command is configured, the priority of the static RP is higher than that of the RP elected by using the BSR mechanism. |

## Configuration Example

### ▾ Configuring Whether the C-RP Priority Is Considered for the Group-to-RP Mapping

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. (Omitted)</li> <li>● Set the address to 4000: : 5 and priority to 56 for Interface Loopback1 on Router A. (Omitted)</li> <li>● Set the C-BSR address to 5000: : 5 on Router B. (Omitted)</li> <li>● Display the group corresponding to FF16::1.</li> <li>● Configure the ignorance of C-RP priority on Router B.</li> </ul> |
|                            | <pre>switch#configure terminal Ruijie(config)# ipv6 pim ignore-rp-set-priority</pre>   |
| <b>Verification</b>        | Before the ignorance of the C-RP priority is configured, the following information is displayed:   |
|                            | <pre>switch(config)#show ipv6 pim sparse-mode rp FF16::1 RP: 4000::5 Info source: 5000::5, via bootstrap  PIMv2 Hash Value 126 RP 4000::5, via bootstrap, priority 56, hash value 892666309 RP 3000::5, via bootstrap, priority 200, hash value 1161101765</pre>   |
|                            | After the ignorance of the C-RP priority is configured, the following information is displayed:  |
|                            | <pre>switch(config)#show ipv6 pim sparse-mode rp FF16::1 RP: 3000::5</pre>   |

```
Info source: 5000::5, via bootstrap
```

### ▾ Configuring the Reachability Detection of the RP Directly Connected to the Data Source

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure the reachability detection of the RP directly connected to the data source.</li> </ul> |
|                            | <pre>Ruijie(config)#ipv6 pim register-rp-reachability</pre>   |
| <b>Verification</b>        | Run the <b>show running-config</b> command to check the configuration. The following information is displayed:  |
|                            | <pre>Ruijie(config)#show running-config ! ! ! ipv6 pim register-rp-reachability ipv6 pim bsr-candidate Loopback 0 ! !</pre>   |

### ▾ Restricting the (S,G) Address Range of Register Packets at the Data Source End

|                            |   |
|----------------------------|---|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set Router A to filter packets by source address and receive packets only from the source address (1300::1/64).</li> </ul> |
|                            | <pre>switch(config)#ipv6 pim accept-register list acl % access-list 101 not exist switch(config)#ipv6 access-list acl switch(config-ipv6-acl)#permit ipv6 1300::1/64 any switch(config-ipv6-acl)#exit</pre>                     |
| <b>Verification</b>        | Before the (S,G) address range of Register packets at the data source end is restricted, run the <b>show ipv6 pim sparse-mode mroute</b> command to display multicast entries. The (S,G) entry and (S,G,RPT) entry exist.       |
|                            | <pre>switch#show ipv6 pim sparse-mode mroute IPv6 Multicast Routing Table  (*, *, RP) Entries: 0</pre>  |

**Common Errors**

- The basic functions of PIM-SMv6 are not configured or fail to be configured.
- The (S,G) address range of Register packets at the data source end is not restricted or fails to be configured on a C-RP or static RP.
- When the (S,G) address range of Register packets at the data source end is restricted, the referenced ACL is not configured or the source/group address range allowed by the ACL is configured incorrectly.
- The source/group address ranges allowed by C-RPs or static RPs are inconsistent.

**7.4.5 Configuring the Transmission Interval of Join/Prune Packets**

**Configuration Effect**

- Change the transmission interval of Join/Prune packets to form an RPT or SPT.

**Notes**

- The basic functions of PIM-SMv6 must be configured.

**Configuration Steps**

- Configure the transmission interval of Join/Prune packets.

**Verification**

Set the transmission interval of Join/Prune packets to 120 seconds on Router B. Run the **show ipv6 pim sparse-mode mroute** command to check the entry TTL.

## 8 Configuring IGMP Snooping

### 8.1 Overview

Internet Group Management Protocol (IGMP) snooping is a mechanism of listening to IP multicast. It is used to manage and control the forwarding of IP multicast traffic within VLANs, realizing Layer-2 multicasting.

As shown in the following figure, when a Layer-2 device is not running IGMP snooping, IP multicast packets are broadcasted within the VLAN; when the Layer-2 device is running IGMP snooping, IP multicast packets are transmitted only to profile members.

Figure 8-1 Networking Topology of IP Multicast Forwarding within the VLAN Before and After IGMP Snooping Is Run on the Layer-2 Device

#### Protocols and Standards

- RFC4541: Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches

## 8.2 Applications

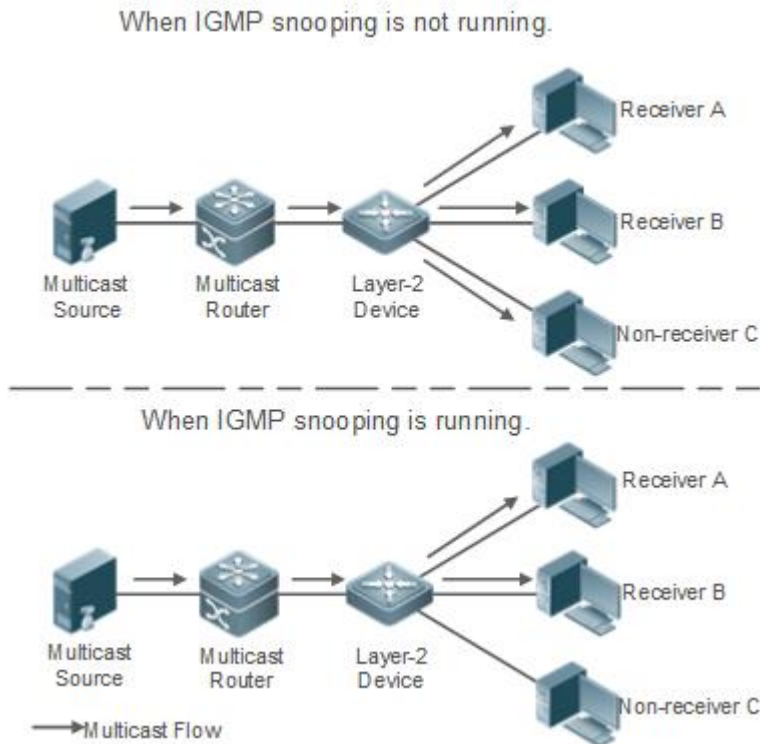

| Application  | Description   |
|--|---|
| <a href="#">Layer-2 Multicast Control</a>                  | Enables precise forwarding of Layer-2 multicast packets to avoid flooding at this layer.  |
| <a href="#">Shared Multicast Services (Multicast VLAN)</a> | Multiple users can share the multicast traffic of the same VLAN.  |
| <a href="#">Premium Channels and Preview</a>               | Controls the range of multicast addresses that allow user demanding and allows preview for profiles who are inhibited from demanding. |

### 8.2.1 Layer-2 Multicast Control

#### Scenario

As shown in the following figure, multicast packets are transmitted to users through a Layer-2 switch. When Layer-2 multicast control is not performed, namely, when IGMP snooping is not implemented, multicast packets are flooded to all the users including those who are not expected to receive these packets. After IGMP snooping is implemented, the multicast packets from an IP multicast profile will no longer be broadcast within the VLAN but transmitted to designated receivers.

Figure 8-2 Networking Topology of Implementing Layer-2 Multicast Control (Multicast VLAN)

#### Deployment

- Configure basic IGMP snooping functions.

## 8.2.2 Shared Multicast Services (Multicast VLAN)

### Scenario

In Shared VLAN Group Learning (SVGL) mode or IVGL-SVGL mode (IVGL: Independent VLAN Group Learning), a device running IGMP snooping can provide shared multicast services (or multicast VLAN services) to the VLAN users. Typically, this function is used to provide the same video-on-demand (VOD) services to multiple VLAN users.

The following figure shows the operation of a Layer-2 multicast device in SVGL mode of IGMP snooping. The multicast router sends a multicast packet to VLAN 1, and the Layer-2 multicast device automatically transfers the packet to VLAN 1, VLAN 2, and VLAN 3. In this way, the multicast services of VLAN 1 are shared by VLAN 2 and VLAN 3.

Figure 8-3 Networking Topology of Shared Multicast Services (Multicast VLAN)

- i If the Layer-2 multicast device operates in IVGL mode, the router must send a packet to each VLAN, which wastes bandwidth and burdens the Layer-2 multicast device.

### Deployment

- Configure basic IGMP snooping functions (in SVGL mode or IVGL-SVG mode).

## 8.2.3 Premium Channels and Preview

### Scenario

In VOD application, by limiting the range of the multicast addresses that a user host can access, unpaid users will not be able to watch the premium channels. Thereafter, the preview service is offered to unpaid users before they decide whether to pay for it.

The users can preview a premium channel for a certain period of time (for example 1 minute) after demanding it.

### Deployment

- Configure basic IGMP snooping functions (in any working mode).
- Configure the range of multicast addresses that a user can access.
- Enable the preview function for VOD profiles that are denied access.

## 8.3 Features

### Basic Concepts

#### ↳ Multicast Router Ports and Member Ports

**i** IGMP snooping is VLAN-based. The ports involved refer to the member ports within the VLAN.

The device running IGMP snooping identifies the ports within the VLAN as a multicast router port or member port so as to manage and control the forwarding of IP multicast traffic within the VLAN. As shown in the following figure, when IGMP snooping is run on a Layer-2 device, multicast traffic enters the multicast router port and exits from the member ports.

Figure 8-4 Networking Topology of Two IGMP Snooping Ports

- Multicast router port: The location of the multicast source is directed by the port on the Layer-2 multicast device which is connected to the multicast router (Layer-3 multicast device): By listening to IGMP packets, the Layer-2 multicast device can automatically detect the multicast router port and maintain the port dynamically. It also allows users to configure a static router port.
- Member port: The port is on a Layer-2 multicast device and is connected to member hosts. It directs the profile members. It is also called the Listener Port. By listening to IGMP packets, the Layer-2 multicast device can automatically detect the member port and maintain the port dynamically. It also allows users to configure a static member port.

### Overview

| Feature                                     | Description  |
|---|--|
| <a href="#">Listening to IGMP Packets</a>   | Discovers and identifies the router port and member port to establish and maintain the IGMP snooping forwarding entries. : |
| <a href="#">IGMP Snooping Working Modes</a> | Provides independent or shared multicast services to the user VLAN.  |
| <a href="#">Multicast Security Control</a>  | Controls the multicast service scope and load to prevent illegal multicast traffic.  |
| <a href="#">Profile</a>                     | Defines the range of multicast addresses that permit or deny user requests for reference of other functions.               |

|                               |  |
|-------------------------------|--|
| <a href="#">Handling QinQ</a> | Sets the forwarding mode of multicast packets on the QinQ interface.                                   |
| <a href="#">IGMP Querier</a>  | On a network without a Layer-3 multicast device, the Layer-2 multicast device acts as an IGMP querier. |

### 8.3.1 Listening to IGMP Packets

A device running IGMP snooping analyzes IGMP packets received, and finds and identifies the router port and member port using these packets, thereby creating and maintaining an IGMP snooping entry.

#### Working Principle

A device running IGMP snooping can identify and handle the following types of IGMP packets:

##### Query Packets

- An IGMP querier periodically sends General Query packets. When the IGMP querier receives Leave packets, it sends Group-Specific Query packets.

When the device running IGMP snooping receives the Query packets, it performs the following operations within the VLAN:

- Forward the IGMP Query packets to all the ports (except the receiving port of these packets).
- If the receiving port is a dynamic router port, reset the aging timer. If the timer expires, the port will no longer be used as the dynamic router port.
- If the receiving port is not a dynamic router port, use it as a dynamic router port and enable the aging timer. If the timer expires, the port will no longer be used as the dynamic router port.
- For general queries, reset the aging timer for all the dynamic member ports. If the timer expires, the port will no longer be used as the dynamic member port for the general group. By default, the maximum response time carried by the IGMP query packets is used as the timeout time of the aging timer. If **ip igmp snooping query-max-response-time** is run, the time displayed is used as the timeout time of the aging timer.
- For designated query packets, reset the aging timer for all the dynamic member ports of the designated profile. If the timer expires, the port will no longer be used as the dynamic member port of the designated profile. By default, the maximum response time carried by the IGMP query packets is used as the timeout time of the aging timer. If **ip igmp snooping query-max-response-time** is run, the time displayed is used as the timeout time of the aging timer.
- If dynamic router port learning is disabled, IGMP snooping will not learn the dynamic router port.

##### Report Packets

- When a member host receives a query, it responds to the query with a Report packet. If a host requests to join a profile, it will also send a report.
- By default, IGMP Snooping is capable of processing IGMPv1 and IGMPv2 packets. For IGMPv3 Report packets, it processes profile information but does not process carried source information. IGMP Snooping v3 can be configured to process all information in IGMPv1, IGMPv2, and IGMPv3 packets.

When the device running IGMP snooping receives the Report packets, it performs the following operations within the VLAN:

- Forward the Report packets from all the router ports. After the **ip igmp snooping suppression enable** command is run in one IGMP query cycle, only the first report received by each profile will be forwarded.
- If the port on which Report packets are received is a dynamic member port, reset the aging timer. If the timer expires, the port will no longer be used as the dynamic member port of the designated profile.
- If the port on which Report packets are received is not a dynamic member port, use it as a dynamic member port and enable the aging timer. If the timer expires, the port will no longer be used as the dynamic member port of the designated profile.

#### ↳ Leave Packets

- ❗ If a host requests to leave a profile, it will send a Leave packet.

When the device running IGMP snooping receives the Leave packets, it performs the following operations within the VLAN:

- Forward the leave packets from all the router ports.
- If the port on which leave packets are received is a dynamic member port and the Leave function is enabled, the port will be immediately deleted from the IGMP snooping forwarding entry of the designated profile and will no longer be used as the dynamic member port.
- If the port on which the leave packets are received is a dynamic member port and the Leave function is disabled, the port state should be maintained.

### Related Configuration

#### ↳ Configuring a Static Router Port

Run the **ip igmp snooping vlan mrouter interface** command to configure a static router port.

#### ↳ Configuring a Static Member Port

Run the **ip igmp snooping vlan static interface** command to configure a static member port.

#### ↳ Enabling Report Suppression

Report suppression is disabled by default.

Run the **ip igmp snooping suppression enable** command to enable report suppression.

After report suppression is enabled, in one IGMP query cycle, only the first Report packet received by each profile will be forwarded. The source media access control (MAC) address of the forwarded report will be changed to the MAC address of the device.

#### ↳ Enabling Immediate Leave

Immediate leave is disabled by default.

Run the **ip igmp snooping fast-leave enable** command to enable immediate leave.

#### ↳ Enabling Dynamic Router Port Learning

Dynamic router port learning is enabled by default.

Run the **no ip igmp snooping mrouter learn pim-dvmrp** command to disable dynamic router port learning.

Run the **no ip igmp snooping vlan *vid* mrouter learn pim-dvmrp** command to disable dynamic router port learning for designated VLANs.

### 📌 Configuring the Aging Time of a Dynamic Router Port

The default aging time is 300s.

When a dynamic router port receives a query packet, the aging timer of the port is enabled or reset; if the aging time is not configured, the maximum response time carried by the query packet is used as the aging time.

Run **ip igmp snooping dyn-mr-aging-time** to configure the aging time of the dynamic router port.

### 📌 Configuring the Aging Time of a Dynamic Member Port

The default aging time is 260s.

When a dynamic member port receives a query packet, the aging timer of the port is enabled or reset, and the aging time is the maximum response time carried by the query packet.

When a dynamic member port receives a Report packet, the aging timer of the port is enabled or reset, and the aging time is the maximum response time of the dynamic member port.

Run **ip igmp snooping host-aging-time** to configure the aging time of the dynamic member port.

### 📌 Configuring the Maximum Response Time of a Query Packet

The maximum response time of a query packet is not configured by default and the maximum response time carries by the query packet is used.

Run **ip igmp snooping query-max-response-time** to configure the maximum response time of a query packet.

## 8.3.2 IGMP Snooping Working Modes

A device running in the three modes (IVGL, SVGL, and IVGL-SVGL) of IGMP snooping can provide independent multicast services or shared multicast services to the user VLAN.

### Working Principle

#### 📌 IVGL

In IVGL mode, a device running IGMP snooping can provide independent multicast services to each user VLAN.

Independent multicast services indicate that multicast traffic can be forwarded only within the VLAN it belongs to, and a user host can subscribe to the multicast traffic within the VLAN that the host belongs to.

#### 📌 SVGL

In SVGL mode, a device running IGMP snooping can provide shared multicast services to the user VLAN.

Shared multicast services can be provided only on shared VLANs and sub VLANs and SVGL multicast addresses are used. In a shared VLAN, the multicast traffic within the range of SVGL multicast addresses is forwarded to a sub VLAN, and the user hosts within the sub VLAN subscribe to such multicast traffic from the shared VLAN.

- In a shared VLAN and sub VLAN, shared multicast services will be provided to the multicast traffic within the range of SVGL multicast addresses. Other multicast traffic will be discarded.
  - Other VLANs (except shared VLANs and sub VLANs) apply to independent multicast services.
- 
- i** When the user VLAN is set to a shared VLAN or sub VLAN, shared multicast services are provided; when a user VLAN is set to other VLANs, independent multicast services are provided.
- 

### IVGL-SVGL

IVGL-SVGL mode is also called the hybrid mode. In this mode, a device running IGMP snooping can provide both shared and independent multicast services to the user VLAN.

- In a shared VLAN and sub VLAN, multicast services will be provided to the multicast traffic within an SVGL profile. For other multicast traffic, independent multicast services will be provided.
  - Other VLANs (except shared VLANs and sub VLANs) apply to independent multicast services.
- 
- i** When a user VLAN is configured as a shared VLAN or sub VLAN, both public multicast services and independent multicast services are available. When a user VLAN is configured as a VLAN other than shared VLAN and sub VLAN, only the independent multicast services are available.
- 

## Related Configuration

### Enabling IGMP Snooping and Selecting a Working Mode

IGMP snooping is disabled by default.

Run the **ip igmp snooping ivgl** command to enable IGMP snooping in IVGL mode.

Run the **ip igmp snooping svgl** command to enable IGMP snooping in SVGL mode.

Run the **ip igmp snooping ivgl-svgl** command to enable IGMP snooping in IVGL-SVGL mode.

A working mode must be designated when enabling IGMP snooping, namely, one of the preceding working modes must be selected.

### Configuring Shared VLAN

The shared VLAN is VLAN 1 by default.

Run the **ip igmp snooping svgl vlan** command to designate a VLAN as the shared VLAN.

In SVGL mode and IVGL-SVGL mode, only one VLAN can be configured as the shared VLAN.

### Configuring Sub VLAN

By default, a sub VLAN is any VLAN except the shared VLAN.

Run the **ip igmp snooping svgl subvlan** command to designate a VLAN as the sub VLAN.

In SVGL mode and IVGL-SVGL mode, the number of sub VLANs is not limited.

### ↘ Configuring an SVGL Profile

No default setting.

Run the **ip igmp snooping svgl profile** *profile\_num* command to configure the address range of an SVGL profile.

 In SVGL mode and IVGL-SVGL mode, the SVGL profile range must be configured; otherwise, shared multicast services cannot be provided.

## 8.3.3 IGMP Security Control

A device running IGMP snooping can control the multicast service scope and load, and effectively prevents illegal multicast traffic.

### Working Principle

#### ↘ Configuring the Profile Filtering for User Demanding

By configuring the profile list that a user can access, you can customize the multicast service scope to guarantee the interest of operators and prevent illegal multicast traffic.

To enable this function, you should use a profile to define the range of multicast addresses that a user is allowed to access.

- When the profile is applied on a VLAN, you can define the multicast addresses that a user is allowed to access within the VLAN.
- When the profile is applied on an interface, you can define the multicast addresses that a user is allowed to access under the port.

#### ↘ Multicast Preview

If the service provider wants to allow the users to preview some multicast video traffic that denies the users' access, and stop the multicast video traffic after the preview duration is reached, the user-based multicast preview function should be provided. The multicast preview function is used together with multicast permission control. For example, in the application of videos, the administrator controls some premium channels by running the **ip igmp profile** command on a port or VLAN. In this way, unsubscribed users will not be able to watch these channels on demand. If users want to preview the channels before they decide whether to pay for watching or not, the multicast preview function can be enabled, allowing the premium channels to be previewed by unpaid users for a certain period of time (for example 1 minute).

#### ↘ Controlling the Maximum Number of Profiles Allowed for Concurrent Request

If there is too much multicast traffic requested at the same time, the device will be severely burdened. Configuring the maximum number of profiles allowed for concurrent request can guarantee the bandwidth.

- You can limit the number of profiles allowed for concurrent request globally.
- You can also limit the number of profiles allowed for concurrent request on a port.

#### ↘ Controlling the Entry of Multicast Traffic

By running the **ip igmp snooping source-check port** command to enable source port inspection, you can restrict the entry of multicast traffic to prevent illegal traffic.

- When source port inspection is enabled, only the multicast traffic entered from the router port is considered as legal; the traffic from other ports is considered as illegal and will be discarded.
- When source port inspection is disabled, the traffic entered from any port is considered as legal.

### ↘ **Configuring the Source IP Inspection for Multicast Traffic**

By enabling source IP inspection, you can restrict the IP address of multicast traffic to prevent illegal traffic.

Source IP inspection includes the inspection of the source IP addresses of specific profiles and of default profiles.

- Inspection of the source IP addresses of default profiles (also called source-check default-server): Specifies the source IP addresses for all the multicast profiles within all VLANs. Only the multicast traffic whose source IP address is the same as the set one is considered as legal.
- Inspection of the source IP addresses of specific profiles (also called limit-ipmc): Specifies the source IP addresses for specific multicast profiles within specific VLANs. Among the multicast traffic received from the specific multicast profiles within the VLANs, only the one with the same source IP address as the set one is considered as legal and will be forwarded by the multicast device; other traffic will be discarded.

## Related Configuration

### ↘ **Configuring the Profile Filtering**

By default, profiles are not filtered and allow user access.

To filter multicast profiles, run the **ip igmp snooping filter** command in interface configuration mode or global configuration mode.

### ↘ **Enabling Preview**

Preview is not enabled by default.

Run the **ip igmp snooping preview** command to enable preview and restrict the range of the profiles permitted for multicast preview.

Run the **ip igmp snooping preview interval** to set the multicast preview duration.

### ↘ **Configuring the Maximum Number of Profiles Allowed for Concurrent Request on a Port**

By default, the number of profiles allowed for concurrent request is not limited.

Run the **ip igmp snooping max-groups** command to configure the maximum number of profiles allowed for concurrent request.

### ↘ **Configuring the Maximum Number of Multicast Profiles Allowed Globally**

By default, the maximum number of multicast profiles allowed globally is 65,536.

Run the **ip igmp snooping l2-entry-limit** command to configure the maximum number of multicast profiles allowed globally.

### ↘ **Enabling Source Port Inspection**

By default, source port inspection is not configured.

Run the **ip igmp snooping source-check port** command to enable source port inspection.

### ↳ Enabling Source IP Inspection

By default, source IP inspection is disabled.

- Run the **ip igmp snooping source-check default-server** *address* command to enable source IP inspection and specify the default source IP address (applicable to any profile of any VLAN).
- (Optional) Run the **ip igmp snooping limit-ipmc vlan** *vid address group-address server source-address* command to specify a specific source IP address for a specific profile of specific VLAN (applicable to a specific profile of specific VLAN).

First, you must enable source IP inspection to specify default source address, and then a specific source address can be specified for a specific profile of specific VLAN. If a source address is specified for a specific profile of specific VLAN, the multicast traffic of the specific profile will perform inspection for the source address specified by this command. Other multicast traffic will perform inspection for default source addresses.

## 8.3.4 IGMP Profile

A multicast profile is used to define the range of multicast addresses that permit or deny user demanding request for reference of other functions.

### Working Principle

The profile is used to define the range of multicast addresses.

When SVGL mode is enabled, an SVGL profile is used to define the range of SVGL multicast addresses.

When the multicast filter is configured on an interface, a profile is used to define the range of multicast addresses that permit or deny user request under the interface.

When a VLAN filter is configured, a profile is used to define the range of multicast addresses that permit or deny user request under within the VLAN.

When the preview function is enabled, a profile is used to define the range of multicast address allowed for preview.

### Related Configuration

#### ↳ Configuring a Profile

Default configuration:

- Create a profile, which is **deny** by default.

Configuration steps:

- Run the **ip igmp profile** *profile-number* command to create a profile.
- Run the **range** *low-address high-address* command to define the range of multicast addresses. Multiple address ranges are configured for each profile.

- (Optional) Run the **permit** or **deny** command to permit or deny user request (**deny** by default). Only one **permit** or **deny** command can be configured for each profile.

### 8.3.5 IGMP QinQ

#### Working Principle

On a device with IGMP snooping enabled and dot1q-tunnel (QinQ) port configured, IGMP snooping will handle the IGMP packets received by the QinQ port using the following two approaches:

- Approach 1: Create a multicast entry on the VLAN where IGMP packets are located. The forwarding of IGMP packets on the VLAN where these packets are located is called transparent transmission. For example, presume that IGMP snooping is enabled for a device, Port A is designated as the QinQ port, the default VLAN of this port is VLAN 1, and it allows the passage of VLAN 1 and VLAN 10 packets. When a multicast Query packet is sent by VLAN 10 to Port A, IGMP snooping establishes a multicast entry for VLAN 10 and forwards the multicast Query packet to the router port of VLAN 10.
- Approach 2: Create a multicast entry on the default VLAN of the QinQ port. Encapsulate the multicast packet with the VLAN tag of the default VLAN where the QinQ port is located and forward the packet within the default VLAN. For example, presume that IGMP snooping is enabled for a device, Port A is designated as the QinQ port, the default VLAN of this port is VLAN 1, and it allows the passage of VLAN 1 and VLAN 10 packets. When a multicast Query packet is sent by VLAN 10 to Port A, IGMP snooping establishes a multicast entry for VLAN 1, encapsulates the multicast query packet with the tag of VLAN 1, and forward the packet to VLAN 1 router port.

#### Related Configuration

##### Configuring QinQ

By default, IGMP snooping works in the mode specified in Approach 2.

Run the **ip igmp snooping tunnel** command to implement Approach 1.

### 8.3.6 IGMP Querier

On a network with a Layer-3 multicast device, the Layer-3 multicast device acts as an IGMP querier. In this case, a Layer-2 device needs only to listen to IGMP packets to establish and maintain the forwarding entry, realizing Layer-2 multicast.

On a network without a Layer-3 multicast device, the Layer-2 multicast device must be configured with the IGMP querier function so that the device can listen to IGMP packets. In this case, a Layer-2 device needs to act as an IGMP querier as well as listen to IGMP packets to establish and maintain the forwarding entry to realize Layer-2 multicast.

#### Working Principle

A Layer-2 device acts as an IGMP querier to periodically send IGMP Query packets, listen to and maintain the IGMP Report packets replied by a user, and create a Layer-2 multicast forwarding entry. You can adjust relevant parameters of the Query packets sent by the IGMP querier through configuration.

When the device receives a Protocol-Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP) packet, it considers that a multicast router, which will act as an IGMP querier, exists on the network and disables the querier function. In this way, IGMP routing will not be affected.

When the device receives the IGMP Query packets from other devices, it will compete with other devices for the IGMP querier.

### ↳ Enabling the Querier Function

You can enable the querier for a specific VLAN or all VLANs.

Only when the global querier function is enabled can the queriers for specific VLANs take effect.

### ↳ Specifying the IGMP Version for a Querier

The version of IGMP used for sending Query packets can be configured as IGMPv1, IGMPv2, or IGMPv3.

### ↳ Configuring the Source IP Address of a Querier

You can configure the source IP address of a query packet sent by the querier based on VLANs.

When the source IP address of the querier is not configured, the querier will not take effect.

### ↳ Configuring the Query Interval of a Querier

You can configure the intervals for sending global Query packets based on different queriers on different VLANs.

### ↳ Configuring the Maximum Response Time of a Query Packet

You can configure the maximum response time carried by a Query packet that is sent by a querier. As IGMPv1 does not support the carrying of maximum response time by a Query packet, this configuration does not take effect when the querier is running IGMPv1. You can configure different maximum response time for queriers on different VLANs.

### ↳ Configuring the Aging Time of a Querier

When other IGMP queriers exist on a network, the existing device will compete with other queriers. If the existing device fails to be elected and is in the non-querier state, the aging timer of a querier will be enabled. After the timer expires, other queriers on the network are considered as expired and the existing device will be resumed as the querier.

## Related Configuration

### ↳ Enabling the Querier Function

By default, the querier function of a device is disabled.

Run the **ip igmp snooping querier** command to enable the global querier function.

Run the **ip igmp snooping vlan num querier** command to enable the querier function for specific VLANs.

### ↳ Specifying the IGMP Version for a Querier

By default, a querier runs IGMPv2.

Run the **ip igmp snooping querier version** command to configure the global querier version.

Run the **ip igmp snooping vlan querier version** command to specify the querier version for specific VLANs.

#### ↘ **Configuring the Source IP Address of a Querier**

By default, the source IP address of a querier is 0.

Run the **ip igmp snooping querier address** command to enable global source IP addresses of queriers.

Run the **ip igmp snooping vlan querier address** command to specify the source IP addresses of the queriers on specific VLANs.

#### ↘ **Configuring the Query Interval of a Querier**

By default, the query interval of a querier is 60s.

Run the **ip igmp snooping querier query-interval** command to enable the global query interval of queriers.

Run **ip igmp snooping vlan querier query-interval** to specify the global query interval of the queriers on specific VLANs.

#### ↘ **Configuring the Maximum Response Time of a Query Packet**

By default, the maximum response time of a query packet is 10s.

Run the **ip igmp snooping querier max-response-time** command to configure the maximum response time of the query packets sent by global queriers.

Run the **ip igmp snooping vlan querier max-response-time** command to specify the maximum response time of the query packets sent by the queriers on specific VLANs.

#### ↘ **Configuring the Aging Time of a Querier**

By default, the aging time of a querier is 125s.

Run the **ip igmp snooping querier max-response-time** command to configure the aging time of global queriers.

Run the **ip igmp snooping vlan querier max-response-time** command to configure the aging time of queriers on specific VLANs.

## 8.4 Configuration

| Configuration   | Description and Command  |
|---|--|
| <a href="#">Configuring Basic IGMP Snooping Functions (IVGL Mode)</a> |  Any of IVGL mode, SVGL mode, and IVGL-SVGL mode must be selected.  |
|   | <b>ip igmp snooping ivgl</b> Enables global IGMP snooping in IVGL mode.  |
|   | <b>no ip igmp snooping vlan <i>num</i></b> Disables IGMP snooping for a VLAN.  |
| <a href="#">Configuring Basic IGMP Snooping Functions (SVGL Mode)</a> |  Any of IVGL mode, SVGL mode, and IVGL-SVGL mode must be selected. It is used to enable IGMP snooping in SVGL mode. |

|   |  |  |

| <p><a href="#">Configuring IGMP Security Control</a></p>                          | <p> (Optional) It used to guarantee the security when a user requests a multicast profile.</p>                                |  |
|   | <p><b>ip igmp snooping filter <i>profile-number</i></b></p>  | <p>Configures the profile filtering for user access.</p>               |

|   |  |  |
|---|--|--|
|   | <b>ip igmp snooping vlan num filter</b><br><i>profile-number</i>   | Configures the per-VLAN profile filtering for user access.   |
|   | <b>ip igmp snooping l2-entry-limit</b> <i>number</i>   | Configures the maximum number of profiles globally for user access.  |
|   | <b>ip igmp snooping max-groups</b> <i>number</i>   | Configures the maximum number of dynamic profiles for user access.   |
|   | <b>ip igmp snooping source-check port</b>  | Enables source IP inspection, which ensures the multicast traffic from the router port is legal.   |
|   | <b>ip igmp snooping source-check default-server</b> <i>address</i>   | Enables source IP inspection. The multicast traffic whose source IP address matches the specified source IP address is considered as legal traffic.                        |
|   | <b>ip igmp snooping limit-ipmc vlan vid address</b><br><i>group-address server source-address</i>  | Specifies a VLAN. In the multicast traffic of multicast addresses, the one whose source IP address matches the specified source IP address is considered as legal traffic. |
|   | <b>ip igmp snooping preview</b> <i>profile-number</i>  | Enables the preview function for a specified profile.  |
|   | <b>ip igmp snooping preview interval</b> <i>num</i>  | Configures the preview duration.   |
| <a href="#">Configuring an IGMP Profile</a> |  (Optional) It is used to define the range of multicast addresses that permits or denies the access of a user host.                 |  |
|   | <b>ip igmp profile</b> <i>profile-number</i>   | Creates a profile.   |
|   | <b>range</b> <i>low-address high_address</i>   | Configures the profile range.  |
|   | <b>permit</b>  | Permits the access of a user host.   |
|   | <b>deny</b>  | Denies the access of a user host.  |
| <a href="#">Configuring IGMP QinQ</a>       |  (Optional) It is used to configure QinQ interface to forward multicast packets using the VLAN identifier (VID) carried by packets. |  |
|   | <b>ip igmp snooping tunnel</b>   | Configures QinQ to transmit IGMP packets transparently.  |
| <a href="#">Configuring an IGMP Querier</a> |  (Optional) It is used to enable IGMP querier function on a network without a Layer-3 multicast device.                             |  |
|   | <b>ip igmp snooping querier</b>  | Enables global querier function.   |
|   | <b>ip igmp snooping vlan num querier</b>   | Enables the querier for a VLAN.  |

|   |   |
|---|---|
| <b>ip igmp snooping querier version</b> <i>num</i>                                  | Specifies the IGMP version for queriers globally.                 |
| <b>ip igmp snooping vlan</b> <i>num</i> <b>querier version</b> <i>num</i>           | Specifies the IGMP version for a querier of a VLAN.               |
| <b>ip igmp snooping querier address</b> a.b.c.d                                     | Configures the source IP address of queriers globally.            |
| <b>ip igmp snooping vlan</b> <i>num</i> <b>querier address</b> a.b.c.d              | Configures the source IP address for a querier of a VLAN.         |
| <b>ip igmp snooping querier query-interval</b> <i>num</i>                           | Configures the query interval of queriers globally.               |
| <b>ip igmp snooping vlan</b> <i>num</i> <b>querier query-interval</b> <i>num</i>    | Configures the query interval for a querier of a VLAN.            |
| <b>ip igmp snooping querier max-response-time</b> <i>num</i>                        | Configures the maximum response time for query packets globally.  |
| <b>ip igmp snooping vlan</b> <i>num</i> <b>querier max-response-time</b> <i>num</i> | Configures the maximum response time of query packets for a VLAN. |
| <b>ip igmp snooping querier timer expiry</b> <i>num</i>                             | Configures the aging timer for queriers globally.                 |
| <b>ip igmp snooping vlan</b> <i>num</i> <b>querier timer expiry</b> <i>num</i>      | Configures the aging timer for a querier of a VLAN.               |

### 8.4.1 Configuring Basic IGMP Snooping Functions (IVGL Mode)

#### Configuration Effect

- Enable IGMP snooping to realize Layer-2 multicast.
- Provide independent multicast services to each VLAN.

#### Notes

- IP multicast cannot be realized in SVGL mode. If IP multicast must be used, select the IVGL mode.

#### Configuration Steps

##### 📌 Enabling Global IGMP Snooping in IVGL Mode

Mandatory.

After IGMP snooping is enabled globally, this function will be enabled for all VLANs.

If not specified, it is advised to run global IGMP snooping on all the devices connected user hosts.

##### 📌 Disabling IGMP Snooping for a VLAN

(Optional) You can use this function if you wish to disable IGMP snooping on specified VLANs.

Only when global IGMP snooping is enabled can it be disabled on specified VLANs.

In IVGL mode, each VLAN can enjoy independent multicast services. Disabling any VLAN multicast services will not interfere in the services provided to the others.

## Verification

- Run the **show ip igmp snooping gda-table** command to display the IGMP snooping forwarding table and verify that the member ports include only those connecting member hosts.
- Run the **show ip igmp snooping** command to display the basic IGMP snooping information and verify that IGMP snooping is working in IVGL mode.

## Related Commands

### ↳ Enabling Global IGMP Snooping in IVGL Mode

### Configuration Example

#### ▾ Providing Layer-2 Multicast Services for the Subnet Hosts

|   |   |
|---|---|
| <p><b>Scenario</b></p> <p><b>Figure 8-5</b></p> |   |
|   | <p>A is the multicast router and is connected directly to the multicast source.</p> <p>B is the Layer-2 device and is connected directly to the user host.</p> <p>Receiver 1, Receiver 2, and Receiver 3 belong to VLAN 1.</p>  |
| <p><b>Configuration Steps</b></p>               | <ul style="list-style-type: none"> <li>● Configure the IP address and VLAN.</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> <li>● Enable IGMP snooping on B and select IVGL mode.</li> </ul> |
| <p><b>A</b></p>                                 | <pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip pim sparse-mode A(config-if-GigabitEthernet 0/1)# exit</pre>   |

|                     |  |
|---------------------|--|
|                     | <pre>A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode A(config-if-VLAN 1)# exit</pre>   |
| <b>B</b>            | <pre>B# configure terminal B(config)# ip igmp snooping ivgl</pre>  |
| <b>Verification</b> | <p>Send packets from the source (10.1.1.1) to G (229.1.1.1) to add Receiver 1 to G.</p> <ul style="list-style-type: none"> <li>● Confirm that the packets (10.1.1.1 and 229.1.1.1) are received by Receiver 1.</li> <li>● Display the IGMP snooping forwarding entry on B and ensure that the port (10.1.1.1, 229.1.1.1, 1) includes only Fa0/2.</li> <li>● Check whether the IGMP snooping working mode is IVGL.</li> </ul>   |
| <b>B</b>            | <pre>B# show ip igmp snooping gda-table Multicast Switching Cache Table  D: DYNAMIC S: STATIC M: MROUTE  (*, 224.1.1.1, 1): VLAN(1) 2 OPORTS: FastEthernet 0/1(M) FastEthernet 0/2(D)  B# show ip igmp snooping IGMP Snooping running mode: IVGL IGMP Snooping L2-entry-limit: 65536 Source port check: Disable Source ip check: Disable IGMP Fast-Leave: Disable IGMP Report suppress: Disable IGMP Global Querier: Disable IGMP Preview: Disable IGMP Tunnel: Disable IGMP Preview group aging time : 60(Seconds) Dynamic Mroute Aging Time : 300(Seconds)</pre> |

```
Dynamic Host Aging Time : 260(Seconds)

vlan 1
-----

IGMP Snooping state: Enable
Multicast router learning mode: pim-dvmrp
IGMP Fast-Leave: Disabled
IGMP VLAN querier: Disable
IGMP VLAN Mode: STATIC
```

### Common Errors

- The working mode of IGMP snooping is improper.

## 8.4.2 Configuring Basic IGMP Snooping Functions (SVGL Mode)

### Configuration Effect

- Enable IGMP snooping and select SVGL mode to realize Layer-2 multicast.
- Share the VLAN multicast services.

### Configuration Steps

#### ▾ Enabling Global IGMP Snooping in SVGL Mode

Mandatory.

Enable global IGMP snooping in SVGL mode.

Configure the range of associated SVGL profiles.

#### ▾ Specifying the SVGL Shared VLAN

(Optional) By default, VLAN 1 is used as the shared VLAN. You can adjust this configuration for other options.

#### ▾ Specifying the SVGL Sub VLAN

(Optional) By default, all the VLANs are used as the sub VLANs of SVGL and can share the multicast services of the shared VLAN. You can adjust this configuration for other options.

### Verification

- Run the `show ip igmp snooping` command to display the basic IGMP snooping information and verify that IGMP snooping is working in SVGL mode.
- Run the `show ip igmp snooping gda-table` command to check whether inter-VLAN multicast entries are properly formed.

### Common Errors

- The SVGL profile is not configured.
- The sent multicast traffic is not within the SVGL profile.

## 8.4.3 Configuring Basic IGMP Snooping Functions (IVGL-SVGL Mode)

### Configuration Effect

- Enable IGMP snooping and select IVGL-SVGL mode to realize Layer-2 multicast.
- The SVGL profiles can share the multicast services.
- The non-SVGL profiles run in IVGL mode.

### Configuration Steps

#### 📌 Enabling Global IGMP Snooping in IVGL-SVGL Mode

Mandatory.

Enable global IGMP snooping in IVGL-SVGL mode.

Configure the range of associated SVGL profiles.

#### 📌 Specifying the SVGL Shared VLAN

(Optional) By default, VLAN 1 is used as the shared VLAN. You can adjust this configuration for other options.

#### 📌 Specifying the SVGL Sub VLAN

(Optional) By default, all the VLANs are used as the sub VLANs of SVGL and can share the multicast services of the shared VLAN. You can adjust this configuration for other options.

## Verification

- Run the **show ip igmp snooping** command to display the basic IGMP snooping information and verify that IGMP snooping is working in IVGL-SVGL mode.
- Run the **show ip igmp snooping gda-table** command to check whether inter-VLAN multicast entries are properly formed for the SVGL profiles.
- Run the **show ip igmp snooping gda-table** command to check whether intra-VLAN multicast entries are properly formed for the SVGL profiles.

### Common Errors

- The SVGL profile is not configured.
- The sent multicast traffic is not within the SVGL profile.
- The IVGL multicast traffic cannot be forwarded within the SVGL profile.

## 8.4.4 Configuring the Packet Processing

### Configuration Effect

- Configure specified ports as the static router ports to receive the multicast traffic from all profiles.
- Configure specified ports as the static member ports to receive the multicast traffic from specified profiles
- Enable Report packets suppression to forward only the first Report packet from a specified VLAN or profile to the router port within a query interval, and the following Report packets will not be forwarded to the router port, thereby reducing the quantity of packets on the network.
- Configure the immediate-leave function to delete a port from the entry of member ports when a leave packet is received by the port.
- Disable dynamic router port learning to disable the learning of any router port.
- Based on network load and configuration of a multicast device, you can adjust the aging time of a router port and member port as well as the maximum response time of a query packet.

## Notes

---

- Only when basic IGMP snooping is configured can relevant configurations take effect.

## Configuration Steps

---

### ▾ Configuring a Static Router Port

- Optional.
- You can perform this configuration if you want to specify a static port to receive all the multicast traffic within the VLAN.

### ▾ Configuring a Static Member Port

- Optional.
- You can perform this configuration if you want to specify a static port to receive specific multicast traffic within the VLAN.

### ▾ Enabling Report Packet Suppression

- Optional.
- When there are numerous receivers to receive the packets from the same multicast profile, you can enable Report packets suppression to suppress the number of Report packets to be sent.

### ▾ Enabling the Immediate-Leave Function

- Optional.
- When there is only one receiver on a port, you can enable Leave to speed up the convergence of protocol upon leave.

### ▾ Disabling Dynamic Router Port Learning

- Optional.
- This function is used when multicast traffic needs to be forwarded only within the Layer-2 topology but not to a Layer-3 router.

### ▾ Configuring the Aging Time of a Dynamic Router Port

- Optional.
- You can configure the aging time based on network load.

### ▾ Configuring the Aging Time of a Dynamic Member Port

- Optional.
- You can configure the aging time based on the interval for sending IGMP query packets by the connected multicast router. Typically, the aging time is calculated as follows: Interval for sending IGMP query packets x 2 + Maximum response time of IGMP packets

### ▾ Configuring the Maximum Response Time of a Query Packet

- Optional.
- You can configure the aging time based on network load.

## Verification

- Run the **show ip igmp snooping mrouter** command to check whether the configured static router port has an "S" in the displayed configuration information.
- Run the **show ip igmp snooping gda** command to check whether the configured static member port is marked with an S.
- Run the **show ip igmp snooping** command to check whether Report packets suppression, immediate leave, router port learning, router port aging time, member port aging time, and the maximum response time of the Query packet take effect.

| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | In SVGL mode, if a sub VLAN is not configured, only the configurations for the static router port within the shared VLAN can take effect, and the others can be configured but cannot take effect. If a sub VLAN is configured, only the configurations for the static router port within the shared VLAN or a non-sub VLAN can take effect, and the others can be configured but cannot take effect.<br><br>In IVGL-SVGL mode, if a sub VLAN is not configured, the configurations for the static router ports within all the VLANs can take effect; if a sub VLAN is configured, only the configurations for the static router port within the shared VLAN or a non-sub VLAN can take effect, and the others can be configured but cannot take effect.<br><br>In IVGL mode, the configurations for the static router ports within all the VLANs can take effect. |

### ▾ Configuring a Static Member Port

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping vlan</b> <i>vid</i> <b>static</b> <i>group-address</i> <b>interface</b> <i>interface-type interface-number</i>   |
| <b>Parameter Description</b> | <i>vid</i> : Indicates a VLAN. The value ranges from 1 to 4,094.<br><i>group-address</i> : Indicates a profile address.<br><i>interface-type interface-number</i> : Indicates an interface name. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | By default, no static member port is configured.   |

### ▾ Enabling Report Packet Suppression

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping suppression enable</b>  |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | <p>When Report packets suppression is enabled, only the first Report packet from a specified VLAN or profile is forwarded to the router port within a Query interval, and the following Report packets will not be forwarded to the router port, thereby reducing the quantity of packets on the network.</p> <p>Only the IGMPv1 and IGMPv2 Report packets can be suppressed, and the IGMPv3 Report packets cannot be suppressed.</p> |

#### ▾ Enabling the Immediate-Leave Function

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping fast-leave enable</b>  |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | <p>When this function is enabled, a port will be deleted from the entry of the member port when the port receives a leave packet. After that, the packets will no longer be forwarded to this port when it receives the query packets of specified profiles. Leave packets include the IGMPv2 Leave packets as well as the IGMPv3 Report packets that include types but carry no source address.</p> <p>The immediate-leave function applies only to the scenario where only one host is connected to a device port. It is used to conserve bandwidth and resources.</p> |

#### ▾ Enabling Dynamic Router Port Learning

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping [ vlan <i>vid</i> ] mrouter learn pim-dvmrp</b>  |
| <b>Parameter Description</b> | <b>vlan <i>vid</i></b> : Specifies a VLAN. This configuration applies to all VLANs by default.   |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | A router port is the port that is connected directly to a multicast device running IGMP snooping and a multicast neighbor device running multicast routing protocol. By default, dynamic router port learning is enabled and the device automatically listens to IGMP Query packets, DVMRP packets, and PIM Hello packets. |

#### ▾ Configuring the Aging Time of a Dynamic Router Port

|                  |  |
|------------------|--|
| <b>Command</b>   | <b>ip igmp snooping dyn-mr-aging-time <i>seconds</i></b>   |
| <b>Parameter</b> | <b><i>seconds</i></b> : Indicates the aging time of a dynamic router port in the unit of seconds. The value ranges from 1 to |

|                     |  |
|---------------------|--|
| <b>Description</b>  | 3,600.   |
| <b>Command Mode</b> | Global configuration mode  |
| <b>Usage Guide</b>  | <p>If a dynamic router port does not receive an IGMP general query packet or a PIM Hello packet before the aging timer expires, the device will delete this port from the router port entry.</p> <p>When dynamic router port learning is enabled, you can run this command to adjust the aging time of the dynamic router port. If the aging time is too short, the multicast device may frequently add or delete a router port.</p> |

#### ↘ Configuring the Aging Time of a Dynamic Member Port

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping host-aging-time</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the aging time.   |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | <p>The aging time of a dynamic member port indicates the time when a device port receives the IGMP join packet sent from host for subscribing to an IP multicast profile.</p> <p>When the IGMP join packet is received, the aging time of the dynamic member port will be reset. The value of the timer time is host-aging-time. If the timer expires, the multicast device deems that no user host for receiving the multicast packet exists under the port, and will delete the port from the entry of IGMP snooping member port. After the aging time is configured, the aging time of following received IGMP join packets will be host-aging-time. This configuration takes effect after the next IGMP join packet is received, and the timer of the port in use will not be refreshed.</p> |

#### ↘ Configuring the Maximum Response Time of a Query Packet

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping query-max-response-time</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the maximum response time.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | <p>When an IGMP general Query packet is received, the multicast device will reset the aging time of all the dynamic member ports, which is query-max-response-time. If the timer expires, the multicast device deems that no user host for receiving the multicast packet exists under the port, and will delete the port from the entry of IGMP snooping member port.</p> <p>When an IGMP profile-specific Query packet is received, the multicast device will reset the aging time of all the dynamic member ports of the specific profile, which is query-max-response-time. If the timer expires, the multicast device deems that no user host for receiving the multicast packet exists under the port, and will delete the port from the entry of IGMP snooping member port.</p> |

This configuration takes effect after the next Query packet is received, and the timer in use will not be refreshed. The timer of an IGMPv3 profile-specific Query packet is not refreshed.

### ↘ Displaying Router Ports

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ip igmp snooping mroute</b>  |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, or interface configuration mode   |
| <b>Usage Guide</b>           | <p>If the router port is successfully configured, an "S" will be displayed in the port information.</p> <pre>Ruijie(config)#show ip igmp snooping mrouter Multicast Switching Mroute Port   D: DYNAMIC   S: STATIC (*, *, 1):   VLAN(1)  1 MROUTES:     GigabitEthernet 0/1(S)</pre> |

### ↘ Displaying the Information of Dynamic Router Port Learning

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ip igmp snooping</b>  |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, or interface configuration mode  |
| <b>Usage Guide</b>           | <p>Run the <b>show ip igmp snooping</b> command to display the aging time and learning status of the dynamic router port.</p> <pre>Dynamic Mroute Aging Time : 300(Seconds) Multicast router learning mode: pim-dvmrp</pre> |

### ↘ Displaying the Information of a Member Port

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ip igmp snooping gda-table</b>   |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, or interface configuration mode |

|                           |  |
|---------------------------|--|
| <p><b>Usage Guide</b></p> | <p>If the member port is successfully configured, an "S" will be displayed in the port information.</p> <pre>Ruijie(config)#show ip igmp snooping gda-table Multicast Switching Cache Table D: DYNAMIC S: STATIC M: MROUTE (*, 224.1.1.1, 1): VLAN(1) 1 OPORTS: GigabitEthernet 0/1(S)</pre> |
|---------------------------|--|

▾ **Displaying Other Parameters**

|                                     |   |
|-------------------------------------|---|
| <p><b>Command</b></p>               | <p><b>show ip igmp snooping</b></p>   |
| <p><b>Parameter Description</b></p> | <p>N/A</p>  |
| <p><b>Command Mode</b></p>          | <p>Privileged EXEC mode, global configuration mode, or interface configuration mode</p>   |
| <p><b>Usage Guide</b></p>           | <p>Run the <b>show ip igmp snooping</b> command to display the aging time of the router port, aging time of the dynamic member port, response time of the query packet, and Report packets suppression, and immediate leave.</p> <pre>IGMP Fast-Leave: Enable IGMP Report suppress: Enable Query Max Response Time: 20(Seconds) Dynamic Mroute Aging Time : 300(Seconds) Dynamic Host Aging Time : 260(Seconds)</pre> |

**Configuration Example**

▾ **Configuring a Static Router Port and Static Member Port**

|                                   |  |
|-----------------------------------|--|
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● Configure basic IGMP snooping functions.</li> <li>● Configure a static router port and static member port.</li> </ul>   |
|                                   | <pre>Ruijie# configure terminal Ruijie(config)# ip igmp snooping vlan 1 mrouter interface GigabitEthernet 0/0 Ruijie(config)# ip igmp snooping vlan 1 static 224.1.1.1 interface GigabitEthernet 0/0 Ruijie(config)# end</pre> |

|                            |  |
|----------------------------|--|
| <p><b>Verification</b></p> | <p>Run the <b>show ip igmp snooping mrouter</b> and <b>show ip igmp snooping gda-table</b> commands to check whether the configuration takes effect.</p>   |
|                            | <pre> Ruijie#show ip igmp snooping mrouter  Multicast Switching Mroute Port    D: DYNAMIC    S: STATIC  (*, *, 1):    VLAN(1)  1 MROUTES:  GigabitEthernet 0/0(S)  Ruijie#show ip igmp snooping gda-table  Multicast Switching Cache Table    D: DYNAMIC    S: STATIC    M: MROUTE  (*, 224.1.1.1, 1):    VLAN(1)  1 OPORTS:    GigabitEthernet 0/0(SM)                     </pre> |

➤ **Enabling Report Packet Suppression**

|   |  |
|---|--|
| <p><b>Scenario</b></p> <p><b>Figure 8-8</b></p> | <p>The diagram illustrates a network topology for IGMP snooping. A central switch, Device A, is connected to a Source 1 (IP 10.1.1.1/24) via its GigabitEthernet 0/1 interface. Device A's GigabitEthernet 0/2 interface is connected to Device B's GigabitEthernet 0/1 interface, which is configured for VLAN 1. Device A's VLAN 1 interface has the IP address 192.168.1.1. Device B's GigabitEthernet 0/2, 0/3, and 0/4 interfaces are connected to three receivers: Receiver 1, Receiver 2, and Receiver 3, respectively.</p> |
|   | <p>A is the multicast router and is connected directly to multicast Source 1.</p>  |

|                            |   |
|----------------------------|---|
|                            | <p>B is a Layer-2 device and is connected directly to the user host and multicast Source 2.</p> <p>Receiver 1, Receiver 2, and Receiver 3 are connected to VLAN 1.</p>  |
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure the IP address and VLAN. (Omitted)</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> <li>● Enable IGMP snooping on B and select IVGL mode.</li> <li>● Enable Report packets suppression on B.</li> </ul>  |
| <b>A</b>                   | <pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip pim sparse-mode A(config-if-GigabitEthernet 0/1)# exit A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode A(config-if-VLAN 1)# exit</pre>   |
| <b>B</b>                   | <pre>B# configure terminal B(config)# ip igmp snooping ivgl B(config)# ip igmp snooping suppression enable</pre>  |
| <b>Verification</b>        | <p>Check whether Receiver 1 and Receiver 2 are added to profile 239.1.1.1, and only the IGMP Report packets of profile 239.1.1.1 are forwarded from interface Gi0/1 of B.</p>   |
| <b>B</b>                   | <pre>B# show ip igmp snooping IGMP Snooping running mode: IVGL IGMP Snooping L2-entry-limit: 65536 Source port check: Disable Source ip check: Disable IGMP Fast-Leave: Disable IGMP Report suppress: Enable IGMP Globle Querier: Disable IGMP Preview: Disable IGMP Tunnel: Disable IGMP Snooping version: 2IGMP Preview group aging time : 60(Seconds) Dynamic Mroute Aging Time : 300(Seconds)</pre> |

### ▾ Configuring Other Parameters

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Configure basic IGMP snooping functions.</li> <li>● Enable Immediate-leave function.</li> <li>● Disable router port learning.</li> <li>● Configure the aging time of a router port.</li> <li>● Configuring the aging time of a member port.</li> <li>● Configure the response time of a Query packet.</li> </ul>  |
|                            | <pre>Ruijie# configure terminal Ruijie(config)# ip igmp snooping fast-leave enable Ruijie(config)# no ip igmp snooping mrouter learn pim-dvmrp Ruijie(config)#ip igmp snooping dyn-mr-aging-time 200 Ruijie(config)#ip igmp snooping host-aging-time 100 Ruijie(config)#ip igmp snooping query-max-response-time 60 Ruijie(config)# end</pre>  |
| <b>Verification</b>        | Run the <b>show ip igmp snooping</b> command to check whether the configuration is successful.   |
|                            | <pre>Ruijie#show ip igmp snooping IGMP Snooping running mode: IVGL IGMP Snooping L2-entry-limit: 65536 Source port check: Disable Source ip check: Disable IGMP Fast-Leave: Enable IGMP Report suppress: Enable IGMP Globle Querier: Disable IGMP Preview: Disable IGMP Tunnel: Disable IGMP Snooping version: 2Query Max Response Time: 60(Seconds) IGMP Preview group aging time : 60(Seconds) Dynamic Mroute Aging Time : 200(Seconds) Dynamic Host Aging Time : 100(Seconds)</pre> |

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.

## 8.4.5 Configuring IGMP Security Control

### Configuration Effect

---

- Configure the range of multicast addresses that a user can access.
- Configure to allow a user from an unauthorized profile to preview a multicast channel.
- Configure the number of multicast addresses that a user can access.
- Configure to limit a user to receive only the multicast traffic from a router port to prevent illegal multicast traffic sent by the end user.
- Configure to limit a user to receive only the multicast traffic from designated source IP addresses to prevent illegal multicast traffic.

### Notes

---

- Basic IGMP snooping functions must be configured.

### Configuration Steps

---

#### ▾ Configuring the Profile Filtering

- Optional.
- If you want to limit the profile packets to be received by a port, you can configure the profile filtering on the port.
- If you want to limit the multicast packets to be received by a VLAN, you can configure the per-VLAN profile filtering.

#### ▾ Enabling Multicast Preview

- Optional.
- You can enable multicast preview for a user from an unauthorized profile.

#### ▾ Configuring the Maximum Number of Profiles

- Optional.
- If you want to limit the number of multicast profiles that a port is allowed to receive, you can configure the maximum number of multicast profiles allowed for this port.
- If you want to limit the number of multicast profiles that global ports are allowed to receive, you can configure the maximum number of multicast profiles allowed for these ports.

#### ▾ Configuring Source Port Inspection

- Optional.
- You can perform this configuration if you want to allow a port to receive only the multicast traffic from the router port.

#### ▾ Configuring Source IP Inspection

- Optional.

- You can perform this configuration to specify the source IP address for all the multicast profiles of all VLANs. Only the multicast traffic whose source IP address is the same as the set one is considered as legal.
- You can also specify the source IP addresses for specific multicast profiles within specific VLANs. Among the multicast traffic received from the specific multicast profiles within the VLANs, only the one with the same source IP address as the set one is considered as legal and will be forwarded by the multicast device; other traffic will be discarded.

## Verification

- Run the **show ip igmp snooping interfaces** command to display the profile filtering and the maximum number of multicast profiles for a port.
- Run the **show ip igmp snooping vlan** command to display the per-VLAN profile filtering.
- Run the **show ip igmp snooping** command to check whether the maximum number of global multicast profiles, preview function, source port inspection, and source IP address inspection take effect.

## Related Commands

### ▾ Configuring the Profile Filtering

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping filter</b> <i>profile-number</i> |
| <b>Parameter Description</b> | <i>profile-number</i> : Indicates a profile number.  |
| <b>Command Mode</b>          | Interface configuration mode                         |
| <b>Usage Guide</b>           | N/A  |

### ▾ Configuring the Per-VLAN Profile Filtering

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping vlan</b> <i>vid filter profile-number</i>   |
| <b>Parameter Description</b> | <i>vid</i> : Indicates a VLAN. The value ranges from 1 to 4,094.<br><i>profile-number</i> : Indicates a profile number. |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | N/A   |

### ▾ Configuring the Maximum Number of Profiles on a Port

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping max-groups</b> <i>number</i>   |
| <b>Parameter Description</b> | <i>number</i> : Indicates the maximum number of multicast profiles.  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | This value indicates only the number of dynamic multicast profiles, and the number of static profiles is not |

included. The counter of multicast profiles is based on the VLAN that the port belongs to. For example, if a port belongs to three VLANs, and all three of them receive a request packet from multicast profile 224.1.1.1 simultaneously, then the counter of multicast profiles will be 3 but not 1.

### ↘ Configuring the Maximum Number of Global Profiles

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping l2-entry-limit</b> <i>number</i>                                |
| <b>Parameter Description</b> | <i>number</i> : Indicates the maximum number of multicast profiles.                 |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | This value includes the number of both dynamic profiles as well as static profiles. |

### ↘ Configuring Source Port Inspection

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping source-check port</b>   |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | After source port inspection is enabled, the multicast traffic received by a device will be discarded if no router port is detected in the network environment. |

### ↘ Configuring Source IP Inspection

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping source-check default-server</b> <i>source-address</i> |
| <b>Parameter Description</b> | <i>source-address</i> : Indicates the source IP address.                  |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | N/A   |

### ↘ Enabling Source IP Inspection for a Specific Profile

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping limit-ipmc vlan</b> <i>vid</i> <b>address</b> <i>group-address</i> <b>server</b> <i>source-address</i>            |
| <b>Parameter Description</b> | <i>vid</i> vlan id<br><i>group-address</i> : Indicates a profile address.<br><i>source-address</i> : Indicates the source IP address. |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | N/A   |

### ▾ Enabling Preview

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping preview</b> <i>profile-number</i>   |
| <b>Parameter Description</b> | <i>profile number</i> : Indicates the range of multicast addresses allowed for preview. The value ranges from 1 to 1,024. |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | N/A   |

### ▾ Configuring the Preview Duration

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping preview interval</b> <i>num</i>  |
| <b>Parameter Description</b> | <i>num</i> : Specifies the preview duration which ranges from 1s to 300s (60s by default).   |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | This configuration allows unauthorized users to receive multicast traffic within the preview duration. After the duration is met, the preview will be stopped; the preview can be resumed in 300s. |

### ▾ Displaying the Per-Port Profile Filtering

| <b>Command</b>               | <b>show ip igmp snooping interface</b>  |           |                       |           |                     |   |  |
|------------------------------|---|-----------|-----------------------|-----------|---------------------|---|--|
| <b>Parameter Description</b> | N/A   |           |                       |           |                     |   |  |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, or interface configuration mode  |           |                       |           |                     |   |  |
| <b>Usage Guide</b>           | <p>If the function is configured, the profile will be displayed, for example:</p> <pre>Ruijie#show ip igmp snooping interfaces gigabitEthernet 0/1</pre> <table border="1"> <thead> <tr> <th>Interface</th> <th>Filter profile number</th> <th>max-group</th> </tr> </thead> <tbody> <tr> <td>GigabitEthernet 0/1</td> <td>1</td> <td></td> </tr> </tbody> </table> | Interface | Filter profile number | max-group | GigabitEthernet 0/1 | 1 |  |

## ↘ Configuring Source IP Inspection

**Scenario**  
**Figure 8-11**

A is the multicast router and is connected directly to multicast Source 1.  
 B is a Layer-2 device and is connected directly to the user host and multicast Source 2.  
 Receiver 1, Receiver 2, and Receiver 3 are connected to VLAN 1.  
 Source 1 sends the multicast address traffic from profiles 10.1.1.1 and 224.1.1.1, Source 2 sends the multicast address traffic from profiles 192.168.1.3 and 225.1.1.1, and Source 3 sends the multicast address traffic from profiles 192.168.1.3 and 226.1.1.1.  
 Receiver 1 can request profiles 224.1.1.1, 225.1.1.1, and 226.1.1.1 respectively.  
 The default IP address for source IP inspection is 10.1.1.1.  
 Configure limit-ipmc and the multicast traffic of profile 225.1.1.1, and set the legal source address as 192.168.1.3.

**Configuration Steps**

- Configure the IP address and VLAN.
- Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).
- Enable IGMP snooping on B and select IVGL mode.
- Enable source port inspection on B.

**A**

```
A# configure terminal
A(config)# ip multicast-routing
A(config)# interface GigabitEthernet 0/1
A(config-if-GigabitEthernet 0/1)# ip pim sparse-mode
A(config-if-GigabitEthernet 0/1)# exit
A(config)# interface vlan 1
A(config-if-VLAN 1)# ip pim sparse-mode
A(config-if-VLAN 1)# exit
```

|                     |   |
|---------------------|---|
| <b>B</b>            | <pre>B# configure terminal B(config)#ip igmp snooping ivgl B(config)# ip igmp snooping source-check default-server 10.1.1.1 B(config)# ip igmp snooping limit-ipmc vlan 1 address 225.1.1.1 server 192.168.1.3</pre>  |
| <b>Verification</b> | <ul style="list-style-type: none"> <li>● Run the <b>show ip igmp snooping</b> command to check whether source IP inspection is enabled.</li> <li>● Check whether Receiver 1 can request the multicast traffic of profile 224.1.1 and 225.1.1.1 and cannot request that of profile 226.1.1.1.</li> </ul>   |
| <b>B</b>            | <pre>B#show ip igmp snooping IGMP Snooping running mode: IVGL IGMP Snooping L2-entry-limit: 65536 Source port check: Disable Source ip check: Enable IGMP Fast-Leave: Disable IGMP Report suppress: Disable IGMP Globle Querier: Disable IGMP Preview: Disable IGMP Tunnel: Disable IGMP Preview group aging time : 60(Seconds) Dynamic Mroute Aging Time : 300(Seconds) Dynamic Host Aging Time : 260(Seconds)</pre> |

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.
- The multicast router port is not learned, leading to failure to receive the multicast traffic.
- The IP address for source IP inspection is inconsistent with the multicast IP address, leading to failure to receive the multicast traffic.

## 8.4.6 Configuring an IGMP Profile

### Configuration Effect

- Create an IGMP filtering profile.

### Configuration Steps

#### ↳ Creating a Profile

- (Optional) Create an IGMP filtering profile.
- **Configuring the Profile Range**
- (Optional) Configure the range of multicast profile addresses.
- **Configuring the Profile Filtering**
- (Optional) Configure the filtering mode of profile to **permit** or **deny**.

## Verification

- Run the **show running-config** command to check whether the preceding configurations take effect.

## Related Commands

### ➤ Creating a Profile

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp profile</b> <i>profile-number</i>               |
| <b>Parameter Description</b> | <i>profile-number</i> : Indicates the number of a profile. |
| <b>Command Mode</b>          | Global configuration mode                                  |
| <b>Usage Guide</b>           |  |

### ➤ Configuring the Profile Range

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>range</b> <i>low-ip-address</i> [ <i>high-ip-address</i> ]  |
| <b>Parameter Description</b> | <i>low-ip-address</i> : Specifies the start address.<br><i>high-ip-address</i> : Specifies the end address. Only one address is configured by default. |
| <b>Command Mode</b>          | Profile configuration mode   |
| <b>Usage Guide</b>           | You can configure multiple addresses. If the IP addresses of different ranges are consecutive, the addresses will be combined.                         |

### ➤ Configuring the Profile Filtering

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>deny</b>  |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Profile configuration mode   |
| <b>Usage Guide</b>           | If the filtering mode of profile is set to <b>deny</b> while the range of multicast profiles is not specified, no profile is to be denied, which means to permit all profiles. |

### ↘ Configuring the Profile Filtering

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>permit</b>   |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Profile configuration mode  |
| <b>Usage Guide</b>           | If the filtering mode of profile is set to <b>permit</b> while the range of multicast profiles is not specified, no profile is to be permitted, which means to deny all profiles. |

### Configuration Example

#### ↘ Creating a Filtering Profile

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Create a filtering profile.</li> </ul>  |
|                            | <pre>B(config)#ip igmp profile 1 B(config-profile)#permit B(config-profile)#range B(config-profile)#range 224.1.1.1 235.1.1.1 B(config-profile)#</pre> |
| <b>Verification</b>        | Run the <b>show running-config</b> command to check whether the configuration is successful.   |
|                            | <pre>ip igmp profile 1   permit   range 224.1.1.1 235.1.1.1 !</pre>  |

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.
- The mode of profile is set to **permit** while the range of multicast profiles is not specified, leading to the denial of all profiles.

## 8.4.7 Configuring IGMP QinQ

### Configuration Effect

- Create a multicast entry on the VLAN where IGMP packets are located. Forward IGMP packets on the VLAN where these packets are located, realizing transparent transmission.

## Notes

- Basic IGMP snooping functions must be configured.

## Configuration Steps

### Configuring QinQ Transparent Transmission

- If the QinQ interface needs to forward multicast packets on the VLANs where the VIDs of the packets specify, enable QinQ to realize transparent transmission.

## Verification

- Run the **show ip igmp snooping** command to check whether the configuration takes effect.

## Related Commands

### Configuring QinQ Transparent Transmission

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping tunnel</b>                                   |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | Enable QinQ to realize transparent transmission of IGMP packets. |

### Displaying QinQ Configuration

|------------------------------|---|
| <b>Command</b>               | <b>show ip igmp snooping</b>  |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, or interface configuration mode          |
| <b>Usage Guide</b>           | If QinQ is enabled, the following content is displayed.<br><pre>IGMP Tunnel: Enable</pre> |

## Configuration Example

### Configuring QinQ Transparent Transmission

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>Configure basic IGMP snooping functions.</li> <li>Configure QinQ transparent transmission.</li> </ul> |
|                            | <pre>Ruijie# configure terminal Ruijie(config)# ip igmp snooping tunnel</pre>  |

|                     |  |
|---------------------|--|
|                     | Ruijie(config)# Ruijie(config)# end  |
| <b>Verification</b> | Run the <b>show ip igmp snooping</b> command to check whether the configuration is successful. |
|                     | IGMP Tunnel: Enable  |

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.

## 8.4.8 Configuring an IGMP Querier

### Configuration Effect

- Configure the device as an IGMP querier, which will send IGMP Query packets periodically and collect user demanding information.

### Notes

- Basic IGMP snooping functions must be configured.

### Configuration Steps

#### ▾ Enabling the Querier Function

- (Optional) Enable IGMP querier function globally or for a specified VLAN.
- (Optional) Disable the IGMP querier function for a specified VLAN.

#### ▾ Configuring the Source IP Address of a Querier

- (Optional) You can configure the source IP address of a Query packet sent by the querier based on VLANs.
- After a querier is enabled, a source IP address must be specified for the querier; otherwise, the configuration will not take effect.

#### ▾ Configuring the Maximum Response Time of a Query Packet

- (Optional) Adjust the maximum response time carried by an IGMP Query packet. As IGMPv1 does not support the carrying of maximum response time by a Query packet, this configuration does not take effect when the querier is running IGMPv1.

#### ▾ Configuring the Query Interval of a Querier

- (Optional) Adjust the interval of the IGMP querier for sending query packets.

#### ▾ Configuring the Aging Timer of a Querier

- (Optional) Configure the aging timer of other IGMP queriers on the network.

#### ▾ Specifying the IGMP Version for a Querier

- (Optional) Specify the IGMP version for a querier (IGMPv2 by default).

## Verification

- Run the **show ip igmp snooping querier detail** command to check whether the configuration takes effect.

## Related Commands

### ↳ Enabling the IGMP Querier Function

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping [ vlan <i>vid</i> ] querier</b>   |
| <b>Parameter Description</b> | <b>vlan <i>vid</i></b> : Specifies a VLAN. This configuration applies to all VLANs by default.  |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | IGMP querier for a specified VLAN will take effect only after global IGMP querier is enabled.<br>If global IGMP querier is disabled, IGMP querier for all the VLANs will be disabled. |

### ↳ Configuring the Source IP Address of a Querier

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping [ vlan <i>vid</i> ] querier address <i>a.b.c.d</i></b>   |
| <b>Parameter Description</b> | <b>vlan <i>vid</i></b> : Specifies a VLAN. This configuration applies to all VLANs by default.<br><b><i>a.b.c.d</i></b> : Indicates the source IP address.   |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | After a querier is enabled, a source IP address must be specified for the querier; otherwise, the configuration will not take effect.<br>If the source IP address is specified by a VLAN, the address will be used preferentially. |

### ↳ Configuring the Maximum Response Time of a Querier

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping [ vlan <i>vid</i> ] querier max-response-time <i>seconds</i></b>  |
| <b>Parameter Description</b> | <b>vlan <i>vid</i></b> : Specifies a VLAN. This configuration applies to all VLANs by default.<br><b><i>seconds</i></b> : Indicates the maximum response time. in the unit of seconds. The value ranges from 1 to 25. |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | If the query interval is specified by a VLAN, the value will be used preferentially.  |

### ↳ Configuring the Query Interval of a Querier

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping [ vlan <i>vid</i> ] querier address <i>a.b.c.d</i></b>  |
| <b>Parameter Description</b> | <b>vlan <i>vid</i></b> : Specifies a VLAN. This configuration applies to all VLANs by default.<br><b><i>seconds</i></b> : Indicates the query interval in the unit of seconds. The value ranges from 1 to 18,000. |
| <b>Command</b>               | Global configuration mode   |

|                    |  |
|--------------------|--|
| <b>Mode</b>        |  |
| <b>Usage Guide</b> | If the query interval is specified by a VLAN, the value will be used preferentially. |

### 📌 Configuring the Aging Timer of a Querier

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ip igmp snooping [ vlan vid ] querier timer expiry seconds</b>  |
| <b>Parameter Description</b> | <b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default.<br><b>seconds:</b> Indicates the timeout time in the unit of seconds. The value ranges from 60 to 300.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | A device may fail to be elected as the querier even when its querier function is enabled. If a device that fails to be elected does not receive the Query packet sent by the querier in the aging time, the querier in use is considered as expired, and a new round of election will be raised.<br><br>If the aging time is specified by a VLAN, the value will be used preferentially. |

### 📌 Specifying the IGMP Version for a Querier

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ip igmp snooping [ vlan vid ] querier version 1</b>  |
| <b>Parameter Description</b> | <b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default.  |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | A querier can be run in IGMPv1 and IGMPv2 (IGMPv2 by default). You can also run a command to configure the version to IGMPv1.<br><br>If the IGMP version for a querier is specified by a VLAN, the version will be used preferentially. |

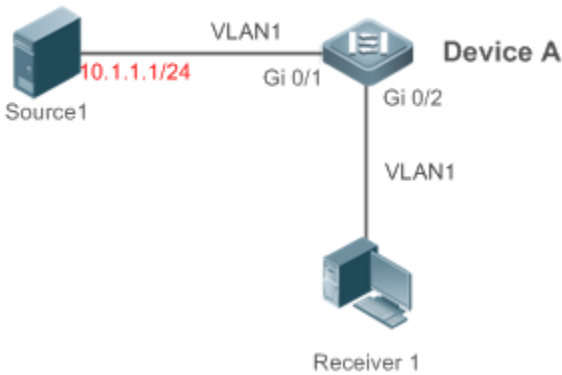

### 📌 Displaying the IGMP Querier Configuration

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ip igmp snooping querier detail</b>  |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, or interface configuration mode   |
| <b>Usage Guide</b>           | If QinQ is enabled, the following content is displayed.<br><br><pre>Ruijie(config)#show ip igmp snooping querier detail Vlan      IP Address      IGMP Version      Port ----- Global IGMP switch querier status</pre> |

|                                    |           |
|------------------------------------|-----------|
| -----                              |           |
| admin state                        | : Enable  |
| admin version                      | : 2       |

| query-interval (sec)               | : 60      |
| max-response-time (sec)            | : 10      |
| querier-timeout (sec)              | : 125     |
| Vlan 1: IGMP switch querier status |           |
| -----                              |           |
| admin state                        | : Disable |
| admin version                      | : 2       |
| source IP address                  | : 1.1.1.1 |
| query-interval (sec)               | : 60      |
| max-response-time (sec)            | : 10      |
| querier-timeout (sec)              | : 125     |
| operational state                  | : Disable |
| operational version                | : 2       |

### Configuration Example

#### ↳ Enabling the IGMP Querier Function

|  |   |
|--|---|
| <p><b>Scenario</b></p> <p><b>Figure 8-12</b></p> |  <p>The diagram illustrates a Layer-2 network topology. On the left, a server icon labeled 'Source1' is connected to a central switch icon labeled 'Device A'. The connection is labeled 'VLAN1' and 'Gi 0/1'. The IP address '10.1.1.1/24' is shown next to Source1. On the right, 'Device A' is connected to a laptop icon labeled 'Receiver 1'. This connection is also labeled 'VLAN1' and 'Gi 0/2'.</p> |
|  | <p>In the scenario without Layer-3 multicast equipment, the multicast traffic can be forwarded only on the Layer-2 network.</p> <p>A acts as a Layer-2 device to connect to the multicast source and receiver.</p>  |

|                            |  |
|----------------------------|--|
| <b>Configuration Steps</b> | <ul style="list-style-type: none"> <li>● Enable global IGMP snooping on A in IVGL mode.</li> <li>● Enable IGMP querier for VLAN 1 on A.</li> </ul>   |
| <b>A</b>                   | <pre>A(config)#ip igmp snooping ivgl A(config)#ip igmp snooping querier A(config)#ip igmp snooping querier address 10.1.1.1 A(config)#ip igmp snooping vlan 1 querier</pre>  |
| <b>Verification</b>        | Run the <b>show ip igmp snooping querier</b> command to check whether the querier of VLAN 1 takes effect.  |
| <b>A</b>                   | <pre>A(config)#show ip igmp snooping querier Vlan      IP Address      IGMP Version      Port ----- 1         10.1.1.1        2                  switch  A(config)#show ip igmp snooping querier vlan 1  Vlan 1:  IGMP switch querier status ----- elected querier is 10.1.1.1      (this switch querier) -----  admin state           : Enable admin version         : 2 source IP address     : 10.1.1.1 query-interval (sec)  : 60 max-response-time (sec) : 10 querier-timeout (sec) : 125 operational state     : Querier operational version   : 2</pre> |

### Common Errors

- The source IP address is not configured for the querier and the querier does not take effect.

## 8.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

| Description                                       | Command                                  |
|---|--|
| Clears the statistics on IGMP snooping.           | <b>clear ip igmp snooping statistics</b> |
| Clears the dynamic router ports and member ports. | <b>clear ip igmp snooping gda-table</b>  |

### Displaying

| Description  | Command   |
|--|---|
| Displays basic IGMP snooping configurations.               | <b>show ip igmp snooping [ vlan <i>vlan-id</i> ]</b>            |
| Displays the statistics on IGMP snooping.                  | <b>show ip igmp snooping statistics [ vlan <i>vlan-id</i> ]</b> |
| Displays the router ports.                                 | <b>show ip igmp snooping mrouter</b>                            |
| Displays the IGMP snooping entries.                        | <b>show ip igmp snooping gda-table</b>                          |
| Displays the profile.                                      | <b>show ip igmp profile [ <i>profile-number</i> ]</b>           |
| Displays the IGMP snooping configurations on an interface. | <b>show ip igmp snooping interface <i>interface-name</i></b>    |
| Displays the IGMP querier.                                 | <b>show ip igmp snooping querier [ detail ]</b>                 |

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description  | Command                       |
|--|-------------------------------|
| Debugs all IGMP Snooping functions.                      | <b>debug igmp-snp</b>         |
| Debugs the IGMP snooping events.                         | <b>debug igmp-snp event</b>   |
| Debugs the IGMP snooping packets.                        | <b>debug igmp-snp packet</b>  |
| Debugs the communications between IGMP snooping and MSF. | <b>debug igmp-snp msf</b>     |
| Debugs the IGMP snooping alarms.                         | <b>debug igmp-snp warning</b> |

## 9 Configuring MLD Snooping

### 9.1 Overview

Multicast Listener Discovery (MLD) Snooping is used to control and manage the forwarding behaviors of IPv6 multicast packets at Layer 2.

The device running MLD Snooping analyzes MLD packets received by a port to create a mapping between the port and the MAC multicast address and forwards IPv6 multicast data at Layer 2 based on the mapping. When MLD Snooping is disabled, IPv6 multicast data packets are broadcasted at Layer 2. When MLD Snooping is enabled, multicast data packets of a known IPv6 multicast group are forwarded to a specified receiver at Layer 2 instead of being broadcasted at Layer 2.

#### Protocols and Standards

RFC4541: Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches

#### 9.1.1 Two Types of MLD Snooping Ports

As shown in Figure 9-1, the Layer-3 multicast device is connected to the multicast source. MLD Snooping is enabled on the access device. Host A and Host B are receivers (that is, members of the IPv6 multicast group).

Figure 9-1 Two Types of MLD Snooping Ports

- Multicast router port: Indicates the port on the access device for connecting to the Layer-3 multicast device, for example, Port Eth0/1 of the access device.
- Member port: Is short for IPv6 multicast group member port, also called listener port, and indicates the port on the access device for connecting to an IPv6 multicast group member, for example, Port Eth0/2 and Port Eth0/3 on the access device.

### 9.1.2 Work Mode of MLD Snooping

- **DISABLE mode:** MLD Snooping does not take effect in this mode. That is, the Layer-2 multicast device does not "snoop" MLD packets between the host and the router, and multicast streams are broadcasted within VLANs.
- **Independent VLAN Group Learn (IVGL) mode:** In this mode, multicast streams between VLANs are mutually independent. A host can request only the multicast router port in the same VLAN as the host to receive multicast packets, and can forward the received multicast data packets of any VLAN only to the member port and multicast router port in the same VLAN as the host.
- **Shared VLAN Group Learn (SVGL) mode:** In this mode, hosts of VLANs share the same multicast stream. A host in one VLAN can request multicast streams of another VLAN. When a shared VLAN is specified, only the multicast data streams of this VLAN can be forwarded to hosts of other VLANs. Multicast data streams of a shared VLAN, can be forwarded to the member ports of this multicast address, even though some member ports do not belong to the shared VLAN. In SVGL mode, MLD profiles must be used to allocate a batch of multicast address ranges to SVGL. Within the multicast address ranges, member ports in the multicast forwarding entries support trans-VLAN packet forwarding. By default, all the group ranges are not within the SVGL application ranges, and all the multicast packets are discarded.
- **IVGL-SVGL mode:** In this mode, IVGL and SVGL coexist. You can use MLD profiles to allocate a batch of multicast address ranges to SVGL. Within the multicast address ranges, member ports in the multicast forwarding entries support trans-VLAN packet forwarding. Member ports in the multicast forward entries corresponding to other multicast address ranges must belong to the same VLAN.

### 9.1.3 Working Principle of MLD Snooping

The device running MLD Snooping processes different MLD packets as follows:

#### MLD QUERY

The Layer-3 multicast device regularly sends an MLD General Query packet to all hosts and routers (with the address of FF02::1) in the local network segment, to query the IPv6 multicast group members in this network segment. When receiving the MLD General Query packet, the device running MLD Snooping forwards the packet all ports in the VLAN except the one receiving the packet, and processes the port receiving the packet as follows:

- If the port is already in the router multicast port list, its aging timer is reset.
- If the port is not contained in the router multicast port list, the port is added to the router multicast port list and its aging timer is started.
- Each time the Layer-2 multicast device receives an MLD General Query packet, it starts the aging timer for each member port, and updates the timer time to the configured maximum response time of MLD query packet. When the aging timer time of a port is reduced to 0, it is deemed that no member receives multicast streams through this port, and therefore, the Layer-2 multicast device deletes the port from the MLD Snooping forwarding table.
- Each time the Layer 2 multicast device receives a MLD Group-Specific Query packet, it starts the aging timer for each member port in the specific group, and updates the timer time to the configured maximum response time of MLD query packet. When the aging timer time of a port is reduced to 0, it is deemed that no member receives multicast streams through this port, and therefore, the Layer-2 multicast device deletes the port from the MLD Snooping forwarding table.

- When the Layer-2 multicast device receives a MLD Group-Specific Query packet, it no longer updates the preceding two types of timers.

## MLD REPORT

In either of the following cases, the host sends an MLD Membership Report packet to the MLD querier.

- After receiving an MLD query (General Query or Group-Specific Query) packet, an IPv6 multicast group member host responds with an MLD Membership Report packet.
- If a host needs to join an IPv6 multicast group, it actively sends an MLD Membership Report packet to MLD querier to request to join this IPv6 multicast group.

When receiving an MLD Membership Report packet, the device running MLD Snooping forwards it to all multicast router ports in the VLAN, retrieves, from the packet, the address of the IPv6 multicast group that the host needs to join, and processes the port receiving the packet as follows:

- If there is no forwarding entry corresponding to the IPv6 multicast group, the forwarding entry is created, the port is added to the egress port list as a dynamic member port, and its aging timer is started.
- If there is a forwarding entry corresponding to the IPv6 multicast group but the port is not contained in the egress port list, the port is added to the egress port list as a dynamic member port, and its aging timer is started.
- If there is a forwarding entry corresponding to the IPv6 multicast group and dynamic member port is contained in the egress port list, its aging timer is reset.

## MLD LEAVE

When a host leaves an IPv6 multicast group, it sends an MLD Leave packet (with the address of FF02::2) to notify the multicast router that it has left the IPv6 multicast group. When receiving an MLD Leave packet from a member port, the device running MLD Snooping directly forwards it to the multicast router port. If the fast leave function is enabled, the device directly deletes the port from the forwarding port list of the relevant multicast group.

### 9.1.4 Source Port Check

The source port check function of MLD Snooping improves the network security.

This function strictly limits the ingress ports of MLD multicast streams. When this function is disabled, multicast streams from any port are valid and the Layer-2 multicast device forwards them to registered member ports according to the forwarding list of MLD Snooping. When this function is enabled, multicast streams only from the multicast router ports are valid and the Layer-2 multicast device forwards them to registered ports. Multicast data streams from non-multicast router ports are invalid and discarded.

## 9.2 Applications

| Application                                  | Description                     |
|--|---------------------------------|
| <a href="#">MLD Snooping SVGL Trans-VLAN</a> | MLD Snooping works in SVGL mode |

| Application                           | Description  |
|---------------------------------------|--|
| <a href="#">Multicast On demand</a>   |  |
| <a href="#">Source Port Filtering</a> | Multicast streams only from multicast router ports are received. |

### 9.2.1 MLD Snooping SVGL Trans-VLAN Multicast On demand

#### Scenario

As shown in Figure 9-2, Host A of VLAN 3 and Host B of VLAN 4 order a video. The video streams are in VLAN 2.

- Enable the SVGL mode on the access device and set a shared VLAN 2.

Figure 9-2

|                |  |
|----------------|--|
| <b>Remarks</b> | VLAN 2 is a shared VLAN.<br>VLAN 3 and VLAN 4 are the VLANs through which the video on-demand service is output. |
|----------------|--|

#### Deployment

- Enable the Layer-3 multicast protocol on the Layer-3 multicast device.
- Enable the SVGL mode on the Layer-2 device.

### 9.2.2 Source Port Filtering

#### Scenario

As shown in Figure 9-3, when the source port check function is configured, video streams can be received only from the source multicast router port. Multicast video streams from other ports are invalid and discarded. Note that when the source port check function is configured, there shall be at least one multicast router port. Otherwise, packet filtering is not performed on the multicast router port even though the source port filtering is enabled. When the source port check function is not configured, multicast video streams from all ports are received by default.

- Enable the IVGL mode on the access device.

Figure 9-3

|                |  |
|----------------|--|
| <b>Remarks</b> | <p>Port Eth0/1 is a multicast router port and Port Eth0/2 is a non-multicast router port.</p> <p>Video servers send same multicast video streams.</p> <p>Hosts A and B can receive multicast streams only from Video Server A.</p> |
|----------------|--|

## Deployment

- Enable the source port check function and configure a static multicast router port.
- Enable the IVGL mode on the Layer-2 device.

## 9.3 Features

### Basic Concepts

#### ▾ Multicast Router Port and Member Port

Multicast router ports are classified into dynamic multicast router ports and static multicast router ports. If MLD Snooping is enabled, when the dynamic multicast router port learning function is enabled on a port, after receiving an MLD Query or PIMv6-Hello packet, the port learns the dynamic multicast router port and starts the aging timer of the dynamic multicast router port. A static multicast router port can be added by configuring the **ipv6 mld snooping vlan mrouter** command.

Member ports are classified into dynamic member ports and static member ports. If MLD Snooping is enabled, after receiving an MLD Report packet, a port learns the dynamic member router port and starts the aging timer of the dynamic member port. A static member port can be added by configuring the **ipv6 mld snooping vlan static interface** command.

#### ▾ Fast Leave and Packet Suppression

When the fast leave function is enabled, a port is directly deleted after receiving an MLD Leave packet. The fast leave function is applicable only to scenarios in which only one user is connected to a port, and helps save the bandwidth. When multiple users are connected to a port, if the fast leave function is enabled, other users wanting to receive packets fail to receive any packets.

When the packet suppression function is enabled, only the first MLD Report packet is forwarded within one query period.

## Overview

| Feature  | Description  |
|--|--|
| <a href="#">Globally Enabling MLD Snooping</a>                         | Globally enables MLD Snooping and configures the work mode.  |
| <a href="#">VLAN-based MLD Snooping</a>                                | Enables or disables MLD Snooping for a single VLAN when MLD Snooping is globally enabled.  |
| <a href="#">Aging Time of Multicast Router Ports</a>                   | Adjusts the aging time of dynamic multicast router ports. The default aging time is 300s.  |
| <a href="#">Dynamic Multicast Router Port Learning</a>                 | After receiving an MLD query packet or a PIMv6 Hello packet, the port is learnt as a dynamic multicast router port.                                  |
| <a href="#">Fast Leave of Multicast Group Member Ports</a>             | A member port can be quickly deleted, instead of being aged and deleted after the query interval of a Group-Specific Query expires.                  |
| <a href="#">MLD Report Packet Suppression</a>                          | Only the first Report packet is processed within one query period, reducing the work load of the module.   |
| <a href="#">Source Port Check</a>                                      | Multicast streams received only from a multicast router port can be forwarded. Packets received from non-multicast router ports cannot be forwarded. |
| <a href="#">Port-based Specific Multicast Group Filtering</a>          | Only multicast group packets that meet the filter conditions can be received.  |
| <a href="#">Maximum Number of Multicast Groups Supported by a Port</a> | Limits the maximum number of multicast groups that a port can join.  |

### 9.3.1 Globally Enabling MLD Snooping

Globally enable MLD Snooping and configure the work mode. Multicast forwarding entries can be learnt and multicast streams are forwarded to a specified port.

#### Working Principle

Enable MLD Snooping. When an MLD Report packet with the time to live (TTL) of 1 is received, a multicast forwarding entry is created and the forwarding egress is this port.

### ↳ Learning a Dynamic Member Port

After a valid MLD Report packet is received, a dynamic member port is learnt and a forwarding entry is generated. The forwarding egress of this entry is the member port.

### ↳ Coordinating Parameters

Configure the MLD Report packet suppression function.

#### Related Configuration

Configure the MLD Report packet suppression function so that only the first Report is processed within one query period, thereby reducing the number of packets in the network.

## 9.3.2 VLAN-based MLD Snooping

Enable or disable MLD Snooping for a single VLAN. By default, if MLD Snooping is globally enabled, the MLD Snooping function of each VLAN is enabled.

#### Related Configuration

Globally configure MLD Snooping. Then configure MLD Snooping for a single VLAN.

## 9.3.3 Aging Time of Multicast Router Ports

Multicast router ports are classified into dynamic multicast router ports and static multicast router ports. By default, the aging time of a dynamic multicast router port is 300s. Static multicast router ports are not aged.

#### Related Configuration

Ability of learning from dynamic multicast router port learning function

## 9.3.4 Dynamic Multicast Router Port Learning

By default, all ports support the dynamic multicast router port learning function.

#### Working Principle

When a port supports the dynamic multicast router port learning function, after receiving an MLD query packet or a PIMv6 Hello packet, the port is learnt as a dynamic multicast router port.

#### Related Configuration

Configure a port as a static multicast router port.

## 9.3.5 Aging Time of Dynamic Member Ports

Member ports are classified into dynamic member ports and static member ports. By default, the aging time of a dynamic member port is 260s. Static member ports are not aged.

### 9.3.6 Fast Leave of Multicast Group Member Ports

By default, the fast leave function of multicast group member ports are disabled. If the fast leave function is enabled, the port is directly deleted after receiving a done packet.

### 9.3.7 MLD Report Packet Suppression

By default, the MLD report packet suppression function is disabled. If the function is enabled, only the first Report packet is processed within one query interval, thereby reducing the number of packets in the network.

### 9.3.8 Source Port Check

The source port check function is disabled by default.

#### Working Principle

When the source port check function is enabled, packets only from multicast router ports are valid and packets from non-multicast router ports are invalid.

#### Related Configuration

Configure a port as a static multicast router port.

### 9.3.9 Port-based Specific Multicast Group Filtering

Under certain circumstances, you may use the port filtering function to control a port to forward multicast packets only of a certain range.

### 9.3.10 Maximum Number of Multicast Groups Supported by a Port

The maximum number of multicast groups that a port is allowed to join can control the maximum number of multicast groups supported by the port.

## 9.4 Configuration

| Configuration   | Description and Command  |   |
|---|--|---|
| <a href="#">Configuring Basic Functions of MLD Snooping</a> | <b>ipv6 mld snooping</b>   | Enables MLD Snooping and specifies the work mode. |
|   | <b>ipv6 mld snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b>               | Configures the static multicast router port.      |
|   | <b>ipv6 mld snooping vlan <i>vlan-id</i> static <i>ip-addr</i> interface <i>interface-id</i></b> | Configures a static member port.                  |
|   | <b>ipv6 mld profile <i>profile-num</i></b>   | Configures a profile.                             |
|   | <b>ipv6 mld snooping source-check port</b>   | Configures source port check.                     |

|  |  |   |
|--|--|---|
|  | <b>ipv6 mld snooping filter</b> <i>profile-num</i> | Configures multicast group filtering for a port.                        |
|  | <b>ipv6 mld snooping max-groups</b> <i>num</i>     | Configures the maximum number of multicast groups that a port can join. |

### 9.4.1 Configuring Basic Functions of MLD Snooping

#### Configuration Effect

- Enable MLD Snooping and configure the work mode.

#### Notes

- Enable MLD Snooping and set the work mode to SVGL. The MLD Snooping SVGL mode cannot coexist with IPv4 or IPv6 Layer-3 multicasting.
- When the work mode is SVGL or IVGL-SVGL, a profile must be associated to specify the multicast group range in which the SVGL mode applies.

#### Configuration Steps

##### ↳ Enabling IPv6 MLD Snooping

- Mandatory.

#### Verification

Run the **show ipv6 mld snooping** command to check whether MLD Snooping is enabled.

- Check whether the device can create correct multicast forwarding entries.

#### Related Commands

##### ↳ Enabling IPv6 MLD Snooping

|                              |                                       |
|------------------------------|---------------------------------------|
| <b>Command</b>               | <b>ipv6 mld snooping</b> <i>mode</i>  |
| <b>Parameter Description</b> | <b>mode:</b> Specifies the work mode. |

| <b>Usage Guide</b>           | N/A   |

#### ↘ Configuring Source Port Check

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld snooping source-check port</b> |
| <b>Parameter Description</b> |  |
| <b>Command Mode</b>          | Global configuration mode                  |
| <b>Usage Guide</b>           | -  |

#### ↘ Configuring Port-based Multicast Group Filtering

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld snooping filter</b> <i>profile-num</i> |
| <b>Parameter Description</b> | <b>profile-num:</b> Indicates the profile number.  |
| <b>Command Mode</b>          | Interface configuration port                       |
| <b>Usage Guide</b>           | N/A  |

#### ↘ Configuring the Maximum Number of Multicast Groups Supported by a Port

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld snooping max-groups <i>num</i></b> |
| <b>Parameter Description</b> | <i>num</i> : Indicates the number of groups.   |
| <b>Command Mode</b>          | Interface configuration port                   |
| <b>Usage Guide</b>           | N/A  |

### ▾ Configuring Report Packet Suppression

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld snooping suppression enable</b>  |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | When the Report packet suppression function is enabled, only the first Report packet of a specific VLAN and group is forwarded to a multicast router port within one query interval. The subsequent Report packets are forwarded to the multicast router port, so as to reduce the number of packets in the network.<br><br>This function can only suppress the Report packets of MLDv1. It is invalid on the Report packets of MLDv2. |

### ▾ Configuring Port Fast Leave

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 mld snooping fast-leave enable</b>  |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | When the port fast leave function is enabled, after receiving a Leave packet, the port is directly deleted from the member ports in the corresponding forwarding entries. Later, when receiving a relevant Group-Specific Query packet, the device does not forward the packet to this port. The Leaver packet includes the Leave packet of MLDv1, include type of MLDv2, and Report packet containing no source address.<br><br>This function is applicable only to scenarios in which only one user is connected to a port, and helps save bandwidth and resources. |

### ▾ Configuring Dynamic Multicast Router Port Learning

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld snooping [ <i>vlan vid</i> ] mrouter learn</b>   |
| <b>Parameter Description</b> | <i>vlan-id</i> : Specifies a VLAN ID. This function is applicable to all VLANs by default.             |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | A multicast router port is a port that directly connects an MLD Snooping-enabled multicast device to a |

|  |   |
|--|---|
|  | neighbor multicast device in which a multicast routing protocol is enabled. By default, when the dynamic multicast router port learning function is enabled, the device automatically listens to the MLD Query/PIM Hello packet and dynamically identifies a multicast router port. |
|--|---|

### 📌 Configuring Aging Time of Dynamic Multicast Router Ports

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>ipv6 mld snooping dyn-mr-aging-time</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <b>seconds:</b> Indicates the aging time of dynamic multicast router ports. The unit is second and the value ranges from 1 to 3,600.  |
| <b>Command Mode</b>          | Global configuration mode   |
| <b>Usage Guide</b>           | If a dynamic multicast router port does not receive an MLD General Query packet or a PIM Hello packet before the timeout of its aging time, the device deletes the port from the multicast router port list.<br>When the dynamic multicast router learning function is enabled, you can use this command to adjust the aging time of dynamic multicast router ports. If the aging time is too short, a multicast router port may be added and deleted frequently. |

### 📌 Configuring Aging Time of Dynamic Member Ports

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld snooping host-aging-time</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <b>seconds:</b> Indicates the aging time.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | The aging time of a dynamic member port refers to the aging time set when a dynamic member port of a device receives from the host an MLD packet of joining a certain IPv6 multicast group.<br>After receiving an MLD Join packet from a dynamic member port, the device resets the aging timer of the dynamic member port and sets the timer time to host-aging-time. If the timer times out, it is deemed that no user host receives multicast packets through this port, and then the multicast device deletes the port from the MLD Snooping member port list. After this command is configured, the aging timer value of dynamic member ports when MLD Join packets are received subsequently is host-aging-time. The aging time takes effect immediately after configuration and the timers of started member ports are updated. |

### 📌 Configuring Response Time of Query Packets

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ipv6 mld snooping query-max-response-time</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <b>seconds:</b> Indicates the response time.   |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | After receiving an MLD General Query packet from a port, the multicast device resets the aging timers of all |

|  |  |
|--|--|
|  | <p>dynamic member ports and sets the timer time to query-max-response-time. If the timer times out, it is deemed that no user host receives multicast packets through the port, and then the multicast device deletes the port from the MLD Snooping member port list.</p> <p>After receiving an MLD Group-Specific Query packet from a port, the multicast device resets the aging timers of all dynamic member ports in the specific group and sets the timer time to query-max-response-time. If the timer times out, it is deemed that no user host receives multicast packets through the port, and then the multicast device deletes the port from the MLD Snooping member port list.</p> <p>The configuration takes effect when the a query packet is received next time, and the configuration of currently started timers are not updated. For Group-Specific Query packets of MLDv2, timers are not updated.</p> |
|--|--|

↘ **Checking Multicast Router Ports**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 mld snooping mroute</b>  |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, interface configuration mode   |
| <b>Usage Guide</b>           | <p>If a multicast router port is successfully configured, the mark "S" is shown in the interface information displayed. For example:</p> <pre style="background-color: #f0f0f0; padding: 5px;"> Ruijie(config)#show ipv6 mld snooping mrouter Multicast Switching Mroute Port   D: DYNAMIC   S: STATIC (*, *, 1):   VLAN(1)  1 MROUTES:     GigabitEthernet 0/1(S)                     </pre> |

↘ **Checking Dynamic Multicast Router Port Learning**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 mld snooping</b>   |
| <b>Parameter Description</b> | N/A   |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, interface configuration mode   |
| <b>Usage Guide</b>           | <p>Run the <b>show ip igmp snooping</b> command to check the aging time and learning status of dynamic multicast router ports.</p> <pre style="background-color: #f0f0f0; padding: 5px;"> Dynamic Mroute Aging Time : 300(Seconds)                     </pre> |

```
Multicast router learning mode: Enable
```

### ▾ Checking Member Ports

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>show ipv6 mld snooping gda-table</b>  |
| <b>Parameter Description</b> | -  |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, interface configuration mode  |
| <b>Usage Guide</b>           | <p>If a member port is successfully configured, the mark "S" is shown in the interface information displayed. For example:</p> <pre>Ruijie(config)#show ipv6 mld snooping gda-table Multicast Switching Cache Table   D: DYNAMIC   S: STATIC   M: MROUTE (*, FF15::100, 1):   VLAN(1) 2 OPORTS:     GigabitEthernet 3/7(S)</pre> |

### ▾ Checking Other Parameters

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>show ipv6 mld snooping</b>   |
| <b>Parameter Description</b> | -   |
| <b>Command Mode</b>          | Privileged EXEC mode, global configuration mode, interface configuration mode   |
| <b>Usage Guide</b>           | <p>Run the <b>show ipv6 mld snooping</b> command to check the aging time of multicast router ports, aging time of dynamic member ports, response time of query packet, and Report packet suppression, and fast leave parameters.</p> <pre>MLD-snooping mode: IVGL Source port check: Disable MLD Fast-Leave: Disable MLD Report suppress: Disable Query Max Response Time: 10 (Seconds) Dynamic Mroute Aging Time: 300(Seconds)</pre> |

|                                       |
|---------------------------------------|
| Dynamic Host Aging Time: 260(Seconds) |
|---------------------------------------|

## 9.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

| Description                                       | Command                                   |
|---|---|
| Clears MLD Snooping multicast forwarding entries. | <b>clear ipv6 mld snooping gda-table</b>  |
| Clears MLD Snooping statistics.                   | <b>clear ipv6 mld snooping statistics</b> |

### Displaying

| Description  | Command   |
|--|---|
| Displays the current MLD Snooping mode.  | <b>show ipv6 mld snooping</b>   |
| Displays MLD Snooping forwarding entries.  | <b>show ipv6 mld snooping gda-table</b>                                       |
| Displays MLD Snooping statistics.  | <b>show ipv6 mld snooping statistics</b>                                      |
| Displays MLD Snooping multicast router ports.  | <b>show ipv6 mld snooping mrouter</b>   |
| Displays MLD Snooping interface information, interface filtering profiles and maximum number of groups that a port can join. | <b>show ipv6 mld snooping interfaces</b> <i>interface-type interface-name</i> |
| Displays multicast information about a single VLAN, on which MLD Snooping is configured.                                     | <b>show ipv6 mld snooping vlan</b> <i>vid</i>                                 |
| Displays an MLD Profile.   | <b>show ipv6 mld profile</b> <i>profile-number</i>                            |

## MPLS Configuration

---

1. Configuring MPLS
2. Configuring BGP/MPLS IP VPN
3. Configuring MPLS GR
4. Configuring MPLS BFD

# 1 Configuring MPLS

**i** The routers and router icons described in this chapter refer to general routers as well as Layer-3 switches running routing protocols.

## 1.1 Overview

Multiprotocol Label Switching (MPLS) supports multiple network layer protocols, for example, Internet Protocol (IP), IP version 6 (Ipv6), and Internetwork Packet Exchange (IPX). It is compatible with multiple link layer technologies, for example, asynchronous transfer mode (ATM), frame relay, Ethernet, and Point to Point Protocol (PPP). Labels are attached to packets, and packets are forwarded based on labels. MPLS uses connectionless control plane and connection-oriented data plane, which adds connection-oriented attributes to connectionless IP networks. MPLS was originally intended to make routers forward data faster. With the development of hardware technologies and network processors, this advantage has faded. However, as MPLS integrates the Layer-2 switching technology with Layer-3 routing technology, it outperforms other technologies in solving problems of virtual private networks (VPNs) and traffic engineering (TE). MPLS VPNs get increasingly popular among carriers in regard to enterprise interconnection and new services, becoming an important means by which carriers provide value-added services on IP networks. MPLS TE also has become an important means of managing network traffic, reducing congestion, and ensuring the QoS of IP networks. Therefore, MPLS is attracting more and more attention and increasingly applied to VPNs and TE.

### Protocols and Standards

RFC3032: MPLS Label Stack Encoding

RFC3036: LDP Specification

RFC4182: Removing a Restriction on the use of MPLS Explicit NULL

RFC 5283: LDP Extension for Inter-Area Label Switched Paths (LSPs)

## 1.2 Applications

| Application                                    | Description   |
|--|---|
| <a href="#">Providing the MPLS VPN Service</a> | The geographically different branches of a private network are connected through label switched paths (LSPs) to form a unified network. |

### 1.2.1 Providing the MPLS VPN Service

#### Scenario

MPLS Layer-3 VPN can be implemented through Multiprotocol Label Switching (MPLS).

Figure 1-1 shows the application scenario of MPLS Layer-3 VPN.

Figure 1-1 Application scenario of MPLS Layer-3 VPN

## Deployment

- Public tunnels are established in a backbone network through the Label Distribution Protocol (LDP).
- Multiple VPN routing and forwarding (VRF) tables are created to maintain VPN routing information.
- Multiprotocol Extensions for BGP (MP-BGP) and Border Gateway Protocol (BGP) extended attributes are configured to transmit VPN routing information and carry VPN attributes and labels.

## 1.3 Features

### Basic Concepts

#### ➤ MPLS Node

An MPLS node can identify the MPLS signaling protocol (control protocol), run one or more Layer-3 routing protocols (including static routing protocols), and forwards packets based on MPLS labels. Generally, an MPLS node is capable of forwarding original Layer-3 packets (for example, IP packets).

#### ➤ Forwarding Equivalence Class (FEC)

FEC refers to the packets forwarded equivalently, for example, packets sharing the same destination address or prefix. Packets can be classified in different ways in different application scenarios. In an IP unicast routing scenario, packets can be classified by address prefix; that is, a route corresponds to an FEC. Packets of the same FEC will be processed equivalently on an MPLS network.

#### ➤ Label

A label is a short identifier of a fixed length that takes effect locally. Labels are transmitted only between two adjacent label switching routers (LSRs) and thereby are valid only between the LSRs. One label categorizes one FEC. When arriving at the MPLS network ingress, packets will be classified into different FECs based on rules. Labels are encapsulated in packets, and the packets are forwarded based on labels on the MPLS network.

#### ➤ LSR

As the core of an MPLS network, LSRs switch and distribute labels. As described in RFC3031, an LSR is also an MPLS node capable of forwarding original Layer-3 packets (for example, IP packets or IPv6 packets), which means LSRs are capable of forwarding IP packets on IP networks.

### ↳ Label Switching Edge Router (LER)

On the MPLS network edge, an LER classifies data flows entering the network into different FECs and requests labels. When data flows exit the network, the LER pops the labels to restore original packets. Therefore, an LER classifies data flows, maps labels, and removes labels.

### ↳ LSP

Data flows of an FEC are given definite labels on different nodes. Labels are switched on all nodes during data forwarding. Data flows pass through an LSP, which is a collection of LSRs. An LSP can be considered as a tunnel that passes through the core MPLS network.

### ↳ Next Hop Label Forwarding Entry (NHLFE)

An NHLFE is used to forward the data on the next hop of MPLS packets. An NHLFE includes the following content:

- The next hop of packets.
- Link layer encapsulation used to forward packets.
- Coding mode used to forward packet label stacks.
- Operations on packet label stacks.

### ↳ Incoming Label Map (ILM)

An ILM table is a label forwarding table. It maps each incoming label to a series of NHLFEs (multiple NHLFEs indicate multiple paths). ILM is used when an LSR forwards labeled MPLS packets.

### ↳ FEC-to-NHLFE (FTN)

Different from ILM, FTN maps each FEC to a series of NHLFEs (multiple NHLFEs indicate multiple paths). FTN is used when an LER receives unlabeled packets. The LER encapsulates labels into the packets and then forwards them.

### ↳ LDP Peers

The LDP instances on two label switching routers (LSRs) that exchange label binding messages are called LDP peers.

### ↳ LDP Sessions

An LDP session is established through the Transmission Control Protocol (TCP) between two LDP peers to exchange label binding messages.

## Overview

| Feature                                    | Description   |

### 1.3.1 MPLS Labels and Forwarding

#### Working Principle

##### Label Structure

Figure 1-2 Coding structure of MPLS labels

As shown in the figure, a label contains four domains. The following describes the domains.

- Label domain

The label domain stores label values and contains 20 bits. A label value is the index value of the label forwarding table. The Internet Engineering Task Force (IETF) specifies 0 to 15 as retained label values and predefines them.

| Retained label value | Definition  |
|----------------------|---|
| 0                    | It indicates IPv4 explicit null labels. According to RFC3032, Labels 0 must appear on the stack bottom; routers pop the labels and then forward packets based on IP addresses. According to RFC4182, routers pop Labels 0 and then forward packets based on what follows the labels: if labels follow, routers forward packets based on labels; if IPv4 packets follow, routers forward them based on IP addresses.   |
| 1                    | It indicates router alert labels, which must not appear on the stack bottom. Packets with router alert labels must be processed by the local software module and forwarded based on the labels following router alert labels. However, before the packets are forwarded, router alert labels must be pushed into the stack again, which is similar to the <b>Router Alert</b> option of an IP packet. After this option is selected, the LSR will check the MPLS packets every hop. |
| 2                    | It indicates IPv6 explicit null labels. According to RFC3032, Labels 2 must appear on the stack bottom; routers pop the labels and then forward packets based on IP addresses. According to RFC4182, routers pop Labels 2 and then forward packets based on what follows the labels: if labels follow, routers forward packets based on labels; if IPv6 packets follow, routers forward them based on IP addresses.   |
| 3                    | It indicates implicit null labels, which can be distributed through the label distribution protocol but never appear in the label stack of MPLS packets. When an LSR switches labels of MPLS packets, Labels 3 on the stack top will be popped rather than replaced. These labels will be used for "penultimate-hop popping (PHP)".   |

| Retained label value | Definition  |
|----------------------|---|
| 4 to 15              | They will be retained by the IETF for future use. |

- Exp domain

The Exp domain stores MPLS QoS information and contains three bits.

- S flag

It is a flag on the stack bottom and contains one bit. If there are multiple labels, the S flag of labels on the stack bottom will be set to 0 and others 1.

- Time To Live (TTL)

The TTL contains 8 bits, similar to that of IP packet headers. It can be copied from the TTL domain of IP packet headers (or IPv6 hop limit) when IP packets are labeled for the first time. The TTL value of outer (top) labels is decreased by 1 when labels are switched. The MPLS packets running on an ATM link are coded in a different way because they don't have a TTL domain. For more details, see RFC3032.

### ↘ Label Stack

One MPLS packet may have multiple labels, which constitute a label stack. Labels close to the link layer header are called stack-top labels, and labels close to the IP header are called stack-bottom labels. LSRs always switch labels based on stack-top labels. Each label contains 32 bits. The label stack allows one MPLS packet to have multi-layer labels, which allows MPLS to support the layered network system as well as LSP tunnels.

### ↘ Operations on Labels

The following describes the basic operations on labels by an MPLS node:

- Push (adding labels)

On the ingress LER, the node inserts labels between link layer header and network layer header; or transit LSRs add labels to the top of the label stack.

- Pop (popping labels)

On the egress LER, the node removes all labels to restore packets to IP packets; or transit LSRs remove stack-top labels to reduce label stack layers.

- Swap (switching labels)

The node replaces stack-top labels based on the ILM table during packet forwarding.

### ↘ Label Distribution Protocol

As a new network system, MPLS has its signaling protocol or "routing protocol". In the MPLS system, two LSRs must reach an agreement upon the meanings of labels attached to the data transmitted between them through LDP. An LSR notifies label binding to the other through LDP. MPLS has more than one LDP. MPLS uses independent distribution protocols, for example, LDP defined by IETF in RFC3036, and extends existing protocols through piggybacking to support label distribution, for example, MP-BGP and Resource Reservation Protocol (RSVP). In a simple topology, you can manually assign labels to LSRs and establish static LSPs. You can choose label distribution protocols based on scenarios.

➤ **MPLS Network**

Figure 1-3

An MPLS network consists of two basic elements: LSR and LER. As the core of an MPLS network, LSRs run the MPLS signaling protocol LDP and forward labeled packets. When packets enter the MPLS network, LERs classify them into different FECs, label them, encapsulate them into MPLS packets, and forward them. When packets exit the network, LERs remove the labels to restore original packets. On an MPLS network, labeled packets will be forwarded through the LSP established through LDP.

The MPLS system consists of forwarding unit (data plane) and control unit (control plane). The forwarding unit searches the label forwarding information base and then forwards packets. The control unit creates a label forwarding information base between connected MPLS device nodes and maintains the base. Each MPLS node must run one or more routing protocols (including static routing protocols) to exchange routing information with other nodes. From the perspective of the control plane, each MPLS node is an IP router. Similar to traditional IP routers, MPLS nodes use unicast routing protocols (including static routing protocols) to establish and maintain routing tables. However, traditional routers use routing tables to establish forwarding tables, while MPLS nodes use routing tables to exchange label binding messages with adjacent nodes for destination subnets. A protocol used to exchange label binding messages is called LDP.

➤ **MPLS Forwarding**

Figure 1-4 Process of forwarding penultimate-hop popping MPLS packets

The following uses the example of traditional IP routing to describe MPLS forwarding.

- All LSRs (including LERs) use traditional routing protocols, for example, Open Shortest Path First (OSPF) and Intermediate System to Intermediate System (IS-IS), to establish IP routing tables.
- LSPs are established through LDP based on IP routing tables.

- The ingress LER receives an IP packet, analyzes the IP packet header and maps it into an FEC, attaches L1 to the packet, and forwards the labeled packet to the next-hop LSR through the LSP.
- The LSR receives the labeled packet and finds the LSP based on the label on the stack top, replaces the label, and forwards the packet to the next-hop LSR through the LSP.
- Transit LSRs repeat the previous step.
- The penultimate-hop LSR receives the labeled packet and checks the label forwarding table. If the outgoing label is an implicit null label (3), the LSR pops the label and forwards the original IP packet to the LSR of the last hop. If the label is an explicit null label, the LSR replaces the outermost label with a Label 0 and forwards the packet to the LSR of the last hop.
- If the penultimate-hop LSR pops the label, the egress LER of the last hop will receive an original IP packet and forward the packet based on the IP routing table. If the penultimate-hop LSR does not pop off the label because it is an explicit null label, the last-hop label edge router (LER) will receive the packet with the label value of 0 and pop off the label before forwarding the packet through a lookup into the IP routing table.

### ▾ MPLS TTL Mode

After MPLS encapsulation and decapsulation, IP (or MPLS) packets can be processed in two TTL modes.

- TTL replication mode: It is a default mode. When Push operation is performed, the TTL of the pushed label is copied from the TTL domain of the existing IP or MPLS packet header to the TTL domain of the pushed label. When Pop operation is performed, the inner IP or MPLS packet TTL is copied back from the TTL domain of outer labels. When TTL replication is enabled, if the inner header TTL is smaller than the outer header TTL, the inner header TTL will not be copied or changed.
- TTL non-replication mode: The TTL will not be copied. **When Push operation is performed, the TTL of the pushed label is set to 255. When Pop operation is performed, the inner IP or MPLS packet TTL will not change.**

In TTL replication mode, LSRs that pass through the MPLS domain can be tracked by using Tracert on the Customer Edge (CE). In TTL non-replication mode, LSPs will be processed as one hop.

## Related Configuration

### ▾ Enabling MPLS Forwarding Globally

- By default, MPLS forwarding is disabled globally.
- Run the **mpls ip** command in global configuration mode to enable devices to support MPLS forwarding. After MPLS forwarding is enabled, the devices implement label switching preferentially; when label switching fails, the devices switch to IP forwarding.

### ▾ Enabling Label Forwarding on an Interface

- By default, label forwarding is disabled on interfaces.
- Run the **label-switching** command to enable MPLS forwarding on the specified interface. When you enable label forwarding on an interface, adjust the interface's maximum transmission unit (MTU) based on the service type; otherwise, the transmission of large packets may be affected.

### ↘ Configuring the MPLS MTU of an Interface

- The MPLS MTU determines whether an MPLS packet needs to be fragmented before being sent. The length defined by the MPLS MTU includes the total length of the MPLS encapsulation layer and encapsulated layer (such as IP).
- By default, the MPLS MTU of an interface is the same as its MTU.
- Run the **mpls mtu** command to configure the MPLS MTU of an interface.

### ↘ Configuring MPLS Packet Fragmentation

- You can configure the processing mode for MPLS packets whose sizes exceed the MPLS MTU.
- By default, IP fragmentation is implemented. The IP packet fragments are encapsulated with the original label and forwarded along the LSP associated with this label.
- Run the **mpls ip fragment** command to configure MPLS packet fragmentation.

### ↘ Configuring the ICMP Error Packet Processing Mode

- Configure the processing mode for ICMP error packets that are generated during MPLS packet forwarding. ICMP error packets include those generated when MPLS time to live (TTL) times out.
- By default, ICMP error packets are forwarded along the LSP associated with the label stack.
- Run the **mpls ip icmp-error pop labels** command to configure packet processing based on the label quantity. If the number of labels on the stack is smaller than or equal to the specified label quantity, the ICMP error packet will be forwarded through a lookup into the IP routing table that contains the forwarding equivalence class (FEC) of the topmost label. If the number of labels on the stack is greater than the specified label quantity, the ICMP error packet will be forwarded along the LSP associated with the label stack.

### ↘ Configuring MPLS TTL Replication

- By default, TTL replication is applied to the packets that the local device sends and forwards.
- Run the **mpls ip ttl propagate { public | vpn }** command to control TTL replication on the local device when sending and forwarding packets.

## 1.3.2 Static MPLS LSP

You can enable MPLS forwarding through static configuration without LDP.

- i** As LDP is not required for static configuration, IPv4 routes are not required. Even if no IPv4 route is available, static LSPs will take effect if the physical network is accessible.

### Working Principle

#### ↘ Configuring Static FTN on the Ingress LSR

At the LSP ingress, you need to establish FTN entries for FECs; that is, you need to bind FECs with labels.

#### ↘ Configuring Static ILM on Transit LSRs

On transit LSRs, you need to configure ILM forwarding entries to map incoming labels to outgoing labels.

#### ↘ **Configuring Static ILM on the Penultimate-hop LSR**

As PHP will be enabled on the penultimate hop, ILM entries on the penultimate hop must be different from those on transit LSRs; that is, the outgoing label of ILM on the penultimate-hop LSR must be an implicit null label (3).

---

**i** For information on PHP, see related materials.

---

### **Related Configuration**

#### ↘ **Configuring Static FTN on the Ingress LSR**

- In global configuration mode, run the **mpls static ftn** command to configure static FTN.
- The ingress LSR must be configured with FEC to NHLFE (FTN) to forward IP traffic to an LSP.
- If you configure FTN with the outgoing label value of 3, you must configure IP routes with the same prefix to make FTN effective.

#### ↘ **Configuring Static ILM on Transit LSRs**

- In global configuration mode, run the **mpls static ilm in-label** command to configure static ILM.
- Transit LSRs must be configured with incoming label map (ILM) to forward MPLS packets.
- It is recommended that the outgoing label value of 3 be configured on the penultimate-hop LSR so that the egress LSR can directly receive IP packets; otherwise, you need to configure ILM on the egress LSR.

## **1.3.3 LDP and Session**

LDP is mainly used to exchange label binding messages between IP unicast routes and Martini Layer-2 VPN.

---

**i** This section describes how to establish LSPs on unicast routes.

---

LDP peer discovery and LDP session establishment are the prerequisites of LSP establishment.

### **Working Principle**

#### ↘ **LDP Router ID**

An LDP Router ID uniquely identifies an LSR in a domain. It is in the IPv4 address format. By default, the LDP Router ID is the same as the Router ID (LSR ID) and must be globally unique.

#### ↘ **LDP Peer Discovery and Maintenance**

LDP periodically sends User Datagram Protocol (UDP) Hello packets to advertise its state and listens to Hello packets to discover LDP peers.

If LDP discovers an LDP peer but has not received a Hello packet from this peer for a period of time, LDP determines that the LDP peer is invalid. This period is called the Hello packet keep-alive period.

#### ↘ **LDP Session Establishment and Maintenance**

When LDP receives a Hello packet from an LDP peer, it uses the transport address advertised by the Hello packet to set up a TCP connection and initializes message exchange through the connection to negotiate LDP session parameters, in order to establish an LDP session.

After the LDP session is established, the two LDP peers periodically send keepalive packets to monitor the TCP connection. If a peer has not received a keepalive packet from the other peer for a period of time, it determines that the TCP connection is invalid and closes the LDP session. This period is called the keepalive packet keep-alive period.

## Related Configuration

### ↳ Enabling LDP Globally

- By default, LDP is disabled globally.
- Run the **mpls router ldp [ vrf-name ]** command in global configuration mode to enable LDP for a VRF instance and enter LDP configuration mode.

### ↳ Enabling LDP on an Interface

- By default, LDP is disabled on interfaces.
- Run the **mpls ip** command in interface configuration mode to enable LDP on an interface.

### ↳ Configuring an LDP Router ID

- By default, the LDP Router ID is the same as the Router ID.
- Run the **ldp router-id** command to modify the LDP Router ID.

### ↳ Configuring a Transport Address

By default, the transport address used by an LDP session is the same as the LDP Router ID.

Run the **transport-address** command to specify the primary address of an interface or an IP address as the transport address used by the LDP session on the interface.

You can configure the transport address in either of the following modes:

- Run the **mpls ldp transport-address** command in interface configuration mode.
- Run the **transport-address** command in LDP configuration mode to globally configure the transport address used by all LDP sessions.

### ↳ Configuring the Hello Packet Interval

- The default Hello packet interval used by the basic LDP discovery mechanism is 5s.
- You can change the Hello packet interval in the range from 1s to 65,535s in interface configuration mode.

### ↳ Configuring the Hello Packet Keep-Alive Period

- By default, the default Hello packet keep-alive period used by the basic LDP discovery mechanism is 15s.
- You can change the Hello packet keep-alive period in the range from 1s to 65,535s in interface configuration mode. If it is set to 65,535s, the keep-alive period is infinitely long.

### ↘ Configuring the Keepalive Packet Keep-Alive Period

- By default, the keep-alive period of keepalive packets sent through an interface is 45s.
- You can change the keep-alive period in the range from 15s to 65,535s. The keepalive packet interval is one-third of its keep-alive period.

### ↘ Configuring the Maximum PDU Size

- LDP entities exchange messages as protocol data units (PDUs). By default, the maximum PDU size is 4,096. You can change it in the range from 256 to 4,096.

### ↘ Configuring LDP MD5 Authentication

- You can configure MD5 authentication of TCP connections to improve LDP session security.
- By default, LDP MD5 authentication is not configured.
- Run the **neighbor ip-address password [ 0 | 7 ] pwd-string** command to configure MD5 authentication of the TCP connection with the specified address.

## 1.3.4 LDP Session Protection

Faulty links will seriously affect network convergence and aggregation because the Hello adjacency between associated interfaces for LDP sessions will be disconnected when links fail and thereby LDP sessions will be closed. When links recover from failures, LSRs need to establish LDP sessions and exchange label binding messages again, which reduces the efficiency of LDP convergence.

LDP session protection can protect LDP sessions between two directly connected LSRs and LDP over TE sessions, and accelerate LDP convergence in case of link failures, especially when failures last for only a short time.

### Working Principle

After LDP sessions between two LSRs are protected, a target Hello adjacency will be established between the LSRs. When the link between them fails, if alternative paths exist, the target Hello adjacency will be maintained. When the link fails, the link Hello adjacency will be disconnected, but the target Hello adjacency will maintain LDP sessions. When the link recovers from failures, LSRs do not need to establish LDP sessions again, which improves the efficiency of LDP convergence.

Figure 1-5 LDP session protection

As shown in the figure, R1, R2, and R3 are interconnected with each other at the link layer with OSPF enabled. LDP is enabled between R1 and R2. A link Hello adjacency will be established between R1 and R2 so that LDP sessions will be established. To protect LDP sessions between R1 and R2, you can enable LDP session protection on R1 and R2. In this way, a target Hello adjacency will be established between R1 and R2.

When the link between R1 and R2 fails, the link Hello adjacency will be disconnected. However, the target Hello adjacency will be maintained because of another path R1-R3-R2. Therefore, LDP sessions will not be closed.

When the link recovers from failures, R1 and R2 do not need to establish LDP sessions or exchange label binding messages again.

### Related Configuration

#### Configuring LDP Session Protection

- By default, LDP instance session protection is disabled.
- Run the **session protection** command to enable or disable LDP session protection.
- You can enable LDP session protection on the two LSRs engaged in an LDP session. If only one LSR supports LDP session protection, you can configure this function on this LSR and run the **discovery targeted-hello accept** command on the other LSR to receive and reply to target Hello packets (or run the **neighbor ip-address** command to specify the remote peer).

### 1.3.5 LDP LSP

The LDP LSPs described in this section are the LSPs that LDP establishes on IP unicast routes.

#### Working Principle

##### Process of Establishing an LSP

Establishing an LSP means binding FECs with labels and notifying the operation to the adjacent LSR. This process is implemented through LDP based on RFC3036.

After LDP sessions are established, two LSRs can exchange label messages to bind labels and establish LSPs for FECs.

Labels can be distributed in Downstream on Demand (DOD) mode and Downstream Unsolicited (DU) mode. In DOD mode, an LSR replies to a label binding message only when receiving a label request from the adjacent LSR. In DU mode, an LSR distributes labels to the adjacent LSR without receiving requests.

Labels can be controlled in independent mode and ordered mode. In independent mode, each LSR can notify its adjacent LSR of label-FEC binding. In independent DOD mode, an LSR can immediately reply to label mapping requests from an upstream LSR rather than wait for label mapping messages from the next hop. In independent DU mode, an LSR can notify label mapping whenever it is ready to switch labels for an FEC.

In ordered mode, an LSR distributes upstream the label bound with an FEC only when it receives the label mapping message from the next hop or when it is the egress for the FEC; otherwise, the LSR must wait for the label mapping message from a downstream LSR. In ordered DU mode, an LSR notifies label mapping to an upstream LSR only when it is the egress for an FEC or when it receives the label from a downstream LSR. If downstream LDP session labels are distributed in DOD mode, the LSR will send downstream the label request from an upstream LSR.

If a label mapping message is not from the next hop of an FEC or if the message does not match any FEC, the message can be processed based on the label retention mode.

In liberal label retention mode, FEC label binding learned from the neighbor is retained; in conservative label retention mode, FEC label binding learned from the neighbor is not retained.

In conservative label retention mode, there are only a few labels to be used and maintained; however, when routes change, label values need to be obtained again, which increases the response time. In liberal label retention mode, LSRs respond to route changes quickly; however, unnecessary labels need to be distributed and maintained.

### ↘ LSP Loop Control

A loop detection mechanism is required. Two methods are available to prevent a loop: maximum hop count and path vector.

Maximum hop count: The number of LSRs is included in a label binding message. It is increased by 1 when an LSR passes. When the number exceeds the specified maximum, it indicates that a loop occurs, and LSP establishment will be stopped.

Path vector: The LSR ID is recorded in the vector list of a label binding message when an LSR passes. When receiving a label binding message, an LSR checks whether its ID is recorded in the vector list. If the ID is not recorded, the LSR will add it to the list. If the ID is recorded, it indicates that a loop occurs, and LSP establishment will be stopped.

### ↘ Policy-Based Label Distribution Control

By default, LDP distributes labels to all valid Interior Gateway Protocol (IGP) routes, except BGP routes. In special cases, you may want to distribute labels only to specified routes or LDP peers to reduce labels and LSPs used, in order to alleviate device and network burden. To do this, you can configure label distribution policies to achieve either or both of the following effects:

- Distribute Label Mapping messages with corresponding FECs only to specified IP routes.
- Distribute Label Mapping messages only to specified LDP peers.

### ↘ Policy-Based Label Reception Control

By default, LDP receives all Label Mapping messages over LDP sessions in DU mode and DOD mode. If an LDP session is in DOD mode, LDP sends the peer Label Request messages with FECs indicating the peer as the next hop. You can configure reception policies to achieve the following effects:

- Only receive the Label Mapping messages with FECs mapped to the specified IP route from the specified peer.
- Only send the Label Request messages with the specified FEC to the specified LDP peer.
- Do not receive Label Mapping messages from the specified peer.
- Do not send Label Request messages to the specified peer.

## Related Configuration

### ▾ Configuring the Label Distribution Control Mode

- By default, label distribution is controlled in independent mode.
- Run the **lsp-control-mode** command to configure the LDP label distribution control mode.

### ▾ Configuring the Label Distribution Mode

- By default, labels are distributed in DU mode.
- Run the **mpls ldp distribution-mode** command in interface configuration mode to configure the LDP label distribution mode on an interface.

### ▾ Configuring the Label Retention Mode

- By default, labels are retained in liberal mode.
- Run the **label-retention-mode** command to configure the label retention mode.

### ▾ Configuring Loop Detection

- By default, loop detection is disabled.
- Run the **loop-detection** command to configure loop detection.

### ▾ Configuring the Maximum Number of Hops

- Run the **mpls ldp max-hop-count** command in interface configuration mode to configure the maximum number of hops in loop detection. The value ranges from 1 to 255. The default value is 254.
- After loop detection is enabled, loop occurs if the number of hops traversed by an LDP message exceeds the threshold.

### ▾ Configuring the Maximum Number of LSRs in the Path Vector List

- Run the **mpls ldp max-path-vector** command to configure the maximum number of LSRs in the path vector list used for loop detection. After loop detection is enabled, loop occurs if an LSR detects that its LSR ID is contained in the path vector list or the number of LSR IDs in the path vector list exceeds the threshold. The default value is 254.
- Run the **mpls ldp max-path-vector** command in interface configuration mode to configure the maximum number of LSRs in the path vector list.

### ↘ Configuring the Label Release Message Propagation Mode

- When an FEC is invalid, LDP will send a label release message from upstream to downstream to revoke the label bound to the FEC. The label release message propagation mode determines whether each receiving LDP entity on an LSP propagates the label release message to the downstream.
- By default, the receiving LDP entity does not propagate the label release message to the downstream.
- Run the **propagate-release** command to configure the label release message propagation mode.

### ↘ Configuring Label Distribution Policies

- Run the **advertise-labels for host-routes** command to distribute labels only to the host routes with a 32-bit mask in VRF tables. By default, labels are distributed to host routes with various mask lengths.
- Run the **advertise-labels for bgp-routes** [ **acl** *acl-name* ] command to distribute labels to BGP routes. By default, LDP does not distribute labels to BGP routes.
- Run the **advertise-labels for default-route** command to distribute labels to default routes. By default, LDP distributes implicit null labels with the value of 3 to default routes.
- Run the **advertise-labels for acl** *prefix-access-list* [ **to** *peer-access-list* ] command to distribute labels only to FECs and LDP peers that meet access control list (ACL) rules.

### ↘ Configuring Label Reception Policies

- Run the **neighbor** *ip-address* **labels accept** *acl-name* command to configure label reception policies. By default, LDP receives label binding messages over all sessions.

### ↘ Configuring Explicit Null Label Distribution

- By default, LDP distributes implicit null labels to FECs with local devices as the egress (for example, direct routes).
- Run the **explicit-null** command to distribute explicit null labels to all direct routes or direct routes that meet specified ACL rules.

## 1.3.6 Inter-Domain LDP LSP

When an autonomous system (AS) is divided into multiple IGP areas, to downsize the routing table and improve the efficiency, you need to configure host route aggregation on area border routers (ABRs). You can establish an LSP across multiple IGP areas for the route through the inter-area LDP LSP technology.

Such LSP is established by extending the longest route match.

### Working Principle

#### ↘ Inter-area LSP

An inter-area LSP crosses multiple IGP areas of an AS.

#### ↘ ABR

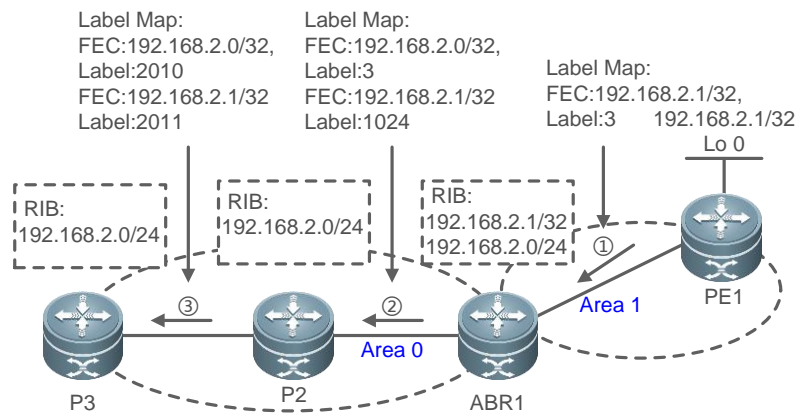

For OSPF, an ABR is a node connecting backbone areas to other areas; for IS-IS, an ABR is a node between Level 1 and Level 2.

- When an AS is divided into multiple IGP areas and host routes are aggregated on ABRs, you can enable the inter-area LDP LSP function to establish an LSP across multiple IGP areas for the host routes.

When the inter-area LDP LSP function is disabled, LDP forwards labels only to accurately matched routes and distributes label mapping messages to all LDP neighbors. When the function is enabled, if there is a route with the longest mask that is matched to the FEC in a label mapping message and the neighbor sending the label mapping message corresponds to the next hop of the route, LDP will add forwarding entries and distributes label mapping messages to LDP neighbors (based on FECs in received label mapping messages rather than FECs matched to the route with the longest mask in the routing table).

The following figure shows the process of establishing an inter-area LDP LSP.

Figure 1-6

Based on the figure, the following describes the process of establishing an inter-area LDP LSP.

- On ABR1, aggregated routes are notified to backbone areas. Both aggregated route (192.168.2.0/24) and host route (192.168.2.1/32) are available in the routing table of ABR1.
- PE1 sends ABR1 a label mapping message of the FEC 192.168.2.1/32.
- ABR1 sends P2 label mapping messages of FECs 192.168.2.0/24 and 192.168.2.1/32, respectively.
- Only the aggregated route 192.168.2.0/24 is available in the routing table of P2. P2 sends P3 the label mapping message of the FEC 192.168.2.0/24. As there is a route with the longest mask (192.168.2.0/24) that is matched to the FEC 192.168.2.1/32 and ABR1 corresponds to the next hop of the route, P2 also sends P3 the label mapping message of the FEC 192.168.2.1/32.
- P3 repeats the actions of P2.
- An inter-area LSP across P3, P2, ABR1, and PE1 (192.168.2.1/32) is established between Area 0 and Area 1.

This process is similar to the process in ordered DU mode (as only aggregate routes are available upstream, the inter-area LDP LSP technology is inapplicable to the DOD mode). The LSP established in this way is the shortest IGP path.

If the MPLS forwarding entries added based on the longest match principle need to be deleted because of label cancellation messages from a downstream device or deletion of the matched route with the longest mask, the label cancellation messages need to be sent upstream (whether label distribution is controlled in ordered or independent mode). The following figure shows the process of canceling an inter-area LSP.

Figure 1-7

If the matched route with the longest mask changes (a better route is available or the route is deleted), the routing platform will notify LDP to update or delete the MPLS forwarding entries added based on the longest match principle to improve the accuracy of LSPs.

### Related Configuration

#### Configuring the Inter-Domain LDP LSP Feature

- By default, the inter-area LDP LSP function is disabled.
- Run the **inter-area-lsp** command to enable or disable the inter-domain LDP LSP feature.
- The inter-domain LDP LSP feature only takes effect for aggregated host routes. If a longest match ACL rule is configured for aggregated non-host routes, this rule will be invalid.

## 1.4 Configuration

| Configuration                               | Description and Command  |  |
|---|--|--|
| <a href="#">Configuring MPLS Forwarding</a> | (Mandatory) It is used to enable MPLS.                         |  |
|   | <b>mpls ip</b>   | Enables MPLS forwarding globally.        |
|   | <b>label-switching</b>   | Enables MPLS forwarding on an interface. |
|   | (Optional) It is used to configure MPLS forwarding parameters. |  |
|   | <b>mpls mtu</b>  | Configures the MPLS MTU of an interface. |
|   | <b>mpls ip fragment</b>  | Configures MPLS packet fragmentation.    |

| Configuration                                 | Description and Command  |   |
|---|--|---|
|   | <b>mpls ip icmp-error pop</b>  | Configures the processing mode for ICMP error packets that are generated during MPLS packet forwarding. |
|   | <b>mpls ip ttl propagate public</b>  | Configures MPLS TTL replication.  |
| <a href="#">Configuring a Static MPLS LSP</a> |  (Mandatory) It is used to enable MPLS.                     |   |
|   | <b>mpls static ftn out-label nexthop</b>   | Configures static FTN.  |
|   | <b>mpls static ilm in-label forward-action swap-label nexthop fec</b>  | Configures static ILM.  |
| <a href="#">Configuring an LDP Session</a>    |  (Mandatory) It is used to establish an LDP session.        |   |
|   | <b>mpls router ldp</b>   | Enables LDP.  |
|   | <b>mpls ip</b>   | Enables LDP on an interface.  |
|   | <b>neighbor</b>  | Creates a remote LDP peer.  |
|   | <b>discovery targeted-hello accept</b>   | Configures the reception of target LDP Hello packets.   |
|   |  (Optional) It is used to configure LDP session parameters. |   |
|   | <b>ldp router-id interface loopback</b>  | Configures an LDP Router ID.  |
|   | <b>mpls ldp transport-address</b>  | Configures the transport address used by the local LDP session on an interface.                         |
|   | <b>transport-address</b>   | Configures the transport address used by the local LDP session in global configuration mode.            |
|   | <b>mpls ldp hello-interval</b>   | Configures the Hello packet interval on every interface.  |
|   | <b>discovery targeted-hello</b>  | Configures the Hello packet interval or keep-alive period used by the extended LDP discovery mechanism. |
|   | <b>mpls ldp hello-holdtime</b>   | Configures the Hello packet keep-alive period on every interface.                                       |
|   | <b>mpls ldp keepalive-holdtime</b>   | Configures the keepalive packet keep-alive period on an interface.                                      |
|   | <b>targeted-session holdtime</b>   | Configures the keepalive packet keep-alive period used by the remote LDP session.                       |
| <b>mpls ldp max-pdu</b>                       | Configures the maximum length of every LDP message.  |   |
| <b>neighbor ip-address password</b>           | Enables LDP MD5 authentication.  |   |
| <b>route wait label-mapping seconds</b>       | Configures the waiting time for label mapping during route updating.   |   |

| Configuration  | Description and Command   |  |
|--|---|--|
| <a href="#">Configuring LDP Session Protection</a>           |  (Mandatory) It is used to enable LDP session protection.  |  |
|  | <b>session protection</b>   | Configures LDP session protection.   |
| <a href="#">Configuring an LDP LSP</a>                       |  (Optional) It is used to establish an LDP LSP.  |  |
|  | <b>loop-detection</b>   | Enables loop detection.  |
|  | <b>mpls ldp max-hop-count</b>   | Configures the maximum number of hops in loop detection on an interface.                                   |
|  | <b>mpls ldp max-path-vector</b>   | Configures the maximum number of LSRs in the path vector list used for loop detection on an interface.     |
|  | <b>propagate-release</b>  | Enables label release message propagation.   |
|  | <b>lsp-control-mode</b>   | Configures the LDP control mode globally.  |
|  | <b>mpls ldp distribution-mode</b>   | Configures the LDP label distribution mode on every interface.   |
|  | <b>label-retention-mode</b>   | Configures the label retention mode.   |
|  | <b>advertise-labels</b>   | Configures label distribution policies for FECs mapped to IP routes.                                       |
|  | <b>neighbor <i>ip-address</i> labels accept <i>acl-name</i></b>   | Configures LSRs to filter Label Mapping messages sent by specified LDP peers based on specified ACL rules. |
| <b>explicit-null</b>   | Configures distribution of explicit null labels to all direct routes or direct routes that meet specified ACL rules, or configures distribution of explicit null labels to neighbors that meet specified ACL rules and implicit null labels to other neighbors. |  |
| <a href="#">Configuring the Inter-Domain LDP LSP Feature</a> |  (Mandatory) It is used to enable the inter-domain LDP LSP feature.  |  |
|  | <b>inter-area-lsp</b>   | Configures the inter-domain LDP LSP feature.   |

### 1.4.1 Configuring MPLS Forwarding

#### Configuration Effect

- Enable MPLS forwarding on all LSRs and corresponding interfaces traversed by an LSP. The device forwards packet labels first rather than IP packets. When label forwarding fails, the device forwards IP packets.

#### Notes

- Enable MPLS forwarding in global configuration mode and interface configuration mode.

## Configuration

### ↘ Enabling MPLS Forwarding Globally

- (Mandatory) Perform this configuration in global configuration mode.
- (Mandatory) Perform this configuration in global configuration mode on every LSR traversed by an LSP, unless otherwise specified.

### ↘ Enabling MPLS Forwarding on an Interface

- (Mandatory) Perform this configuration in interface configuration mode.
- (Mandatory) Perform this configuration in interface configuration mode on every interface traversed by an LSP, unless otherwise specified.

### ↘ Configuring the MPLS MTU of an Interface

- (Optional) Perform this configuration in interface configuration mode.
- This configuration is required only in special cases.

### ↘ Configuring MPLS Packet Fragmentation

- (Optional) Perform this configuration in global configuration mode.
- Perform this configuration on every LSR traversed by an LSP, unless otherwise specified. If MPLS packet fragmentation is not enabled, LSRs cannot forward large packets that exceed the MTU size. By default, MPLS packet fragmentation is enabled.

### ↘ Configuring the ICMP Error Packet Processing Mode

- (Optional) Perform this configuration in global configuration mode.
- This configuration is required only in special cases.

### ↘ Configuring MPLS TTL Replication

- (Optional) Perform this configuration in global configuration mode.
- Disable MPLS TTL replication on every LSR traversed by an LSP if you want to hide the MPLS network topology.

## Verification

Run the **show mpls summary** command to display the list of interfaces enabled with MPLS forwarding.

Run the **show run** command to check whether the configuration takes effect.

## Related Commands

### ↘ Enabling MPLS Forwarding Globally

|           |                |
|-----------|----------------|
| Command   | <b>mpls ip</b> |
| Parameter | N/A            |

|                     |                           |
|---------------------|---------------------------|
| <b>Description</b>  |                           |
| <b>Command Mode</b> | Global configuration mode |
| <b>Usage Guide</b>  | N/A                       |

### ↳ Enabling MPLS Forwarding on an Interface

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>label-switching</b>   |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Interface configuration mode   |
| <b>Usage Guide</b>           | MPLS interface commands can be run only on Layer-3 interfaces. Therefore, non-Layer-3 interfaces need to be converted into Layer-3 interfaces. |

### ↳ Configuring the MPLS MTU of an Interface

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>mpls mtu bytes</b>   |
| <b>Parameter Description</b> | bytes: Indicates the length of an MPLS packet, which ranges from 64 to 1,500 bytes by default.  |
| <b>Command Mode</b>          | Interface configuration mode  |
| <b>Usage Guide</b>           | <ol style="list-style-type: none"> <li>1. The MPLS MTU must not exceed the size of transmitted packets. You can run the <b>mpls mtu</b> command to adjust the MTU in interface configuration mode.</li> <li>2. After encapsulating MPLS packets, devices that support MPLS packet fragmentation will fragment the packets whose length exceeds the MPLS MTU based on the MPLS MTU. Devices that do not support MPLS packet fragmentation will discard the packets whose length exceeds the MPLS MTU.</li> </ol> |

### ↳ Fragmenting MPLS Packets

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>mpls ip fragment</b>  |
| <b>Parameter Description</b> | N/A  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | <ol style="list-style-type: none"> <li>1. This command is valid for IP packets only.</li> <li>2. On devices that support MPLS packet fragmentation, you can use the <b>no</b> form of this command to disable MPLS packet fragmentation. On devices that do not support MPLS packet fragmentation, this command is invalid.</li> </ol> |

### ↳ Processing ICMP Error Packet

|                  |  |
|------------------|--|
| <b>Command</b>   | <b>mpls ip icmp-error pop labels</b>                                       |
| <b>Parameter</b> | <i>labels</i> : Indicates the number of labels of packets to be processed. |

|                     |   |
|---------------------|---|
| <b>Description</b>  |   |
| <b>Command Mode</b> | Global configuration mode   |
| <b>Usage Guide</b>  | You can run this command to have packets processed based on the number of labels. If the number of labels exceeds the configured value, the device will forward the packets through the LSP of the label stack. If the number of labels is below or equal to the configured value, the device will forward the ICMP error packets based on the IP routing table of the FEC corresponding to stack-top labels. |

↘ **Configuring MPLS TTL Replication**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>mpls ip ttl propagate public</b>  |
| <b>Parameter Description</b> | <b>public:</b> Enables or disables TTL replication for sent packets.<br><b>vpn:</b> Enables or disables TTL replication for forwarded packets.     |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | When TTL replication is enabled, if the inner header TTL is smaller than the outer header TTL, the inner header TTL will not be copied or changed. |

|--|--|

### Common Errors

- MPLS forwarding is not enabled globally.
- LDP is not enabled in interface configuration mode.

## 1.4.2 Configuring a Static MPLS LSP

### Configuration Effect

Establish a static LSP

### Notes

- Enable MPLS forwarding in global configuration mode and interface configuration mode.
- When you configure static TFN with the label value of 3, configure IP routes with the same next hop for forwarding.

### Configuration

#### ↘ Configuring MPLS Forwarding on All LSRs

- Perform this configuration according to section 1.4.1 "Configuring MPLS Forwarding."

#### ↘ Configuring Static FTN on the Ingress LSR

- (Mandatory) Perform this configuration in global configuration mode.

#### ↘ Configuring Static ILM on Transit LSRs

- (Mandatory) Perform this configuration in global configuration mode.

### Verification

Run the **show mpls forwarding-table** command to display MPLS entries.

### Related Commands

#### ↘ Configuring Static FTN on the Ingress LSR

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>mpls static ftn</b> <i>ip-address/mask</i> <b>out-label</b> <i>label</i> <b>nexthop</b> <i>interface nexthop-ip</i>   |
| <b>Parameter Description</b> | <i>ip-address/mask</i> : Indicates the address of an FEC, namely the destination address.<br><b>out-label</b> <i>label</i> : Indicates the outgoing label of the FEC. The value ranges from 16 to 1048575, or is 3.<br><b>nexthop</b> <i>interface-name nexthop-ip</i> : Indicates the next hop of the FEC, including the next-hop outgoing interface and IP address.  |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | You can run this command to add an FTN entry to the global FTN table. Upon receipt of an IP packet, the device on which MPLS is enabled finds the next hop based on the destination address of the IP packet by following the longest match principle, and then forwards the label of the IP packet. This command is valid for FTN entries whose destination address and mask are 0 only when the default route is available in the IP routing forwarding table. |

### ▾ Configuring Static ILM on Transit LSRs

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>mpls static ilm</b> <b>in-label</b> <i>in_label</i> <b>forward-action</b> <b>swap-label</b> <i>swap_label</i> <b>nexthop</b> <i>interface nexthop-ip</i> <b>fec</b> <i>ip-address/mask</i>  |
| <b>Parameter Description</b> | <i>in_label</i> : Indicates the incoming label of an ILM entry. The value ranges from 16 to 1025.<br><b>forward-action</b> : Specifies the forwarding action of the ILM entry.<br><i>label</i> : Specifies the value of the outgoing label when swap-label action is performed. The value ranges from 16 to 1048575, or is 0 or 3.<br><i>vrf-name</i> : Specifies the VPN for the ILM entry (namely VRF) when pop-l3vpn-nexthop action is performed.<br><i>interface-name</i> : Specifies the egress when pop-l2vc-destport action is performed.<br><b>nexthop</b> <i>interface-name nexthop-ip</i> : Specifies the next hop, including the next-hop egress and IP address.<br><b>fec</b> : Indicates the FEC for which the ILM entry is created.<br><i>ip-address/mask</i> : Specifies a destination network based on the FEC format of global or Layer-3 VPN application.<br><i>vc_id</i> : Specifies a virtual circuit (VC) instance based on the FEC format of Layer-2 VPN application. <i>The value ranges from 1 to 2147483647.</i><br><i>vc-peer-addr</i> : Indicates the address of a VC peer. |
| <b>Command Mode</b>          | Global configuration mode  |
| <b>Usage Guide</b>           | You can run this command to add an ILM entry to the ILM table. Upon receipt of an IP packet, the device on which MPLS is enabled finds the next hop based on the IP packet label value by following the longest match principle, and then forwards the label.  |

## Configuration Example

### ▾ Configuring a Static MPLS LSP Network

**Common Errors**

- MPLS forwarding is not enabled globally.
- MPLS forwarding is not enabled in interface configuration mode.

## 1.4.3 Configuring an LDP Session

### Configuration Effect

- Establish an LDP session between two LSRs to exchange label binding messages.

### Notes

- A reachable IP route to the transport address used by the peer to establish an LDP session must exist.

### Configuration

#### ▾ Configuring IP Routes

- (Mandatory) Configure static routes in global configuration mode or configure routes through OSPF or other IGP protocols.
- For details, see the *Configuring IP Routes*.

#### ▾ Configuring LDP

- (Mandatory) Perform this configuration on the two LSRs engaged in an LDP session.

#### ▾ Configuring an LDP Router ID

- (Optional) Perform this configuration in config-mpls-router configuration mode.
- It is recommended that an LDP Router ID be configured on each of the two LSRs engaged in an LDP session to ensure stable and reliable LDP.

---

 You must configure the LDP Router ID in actual application; otherwise, if the Router ID is changed during protocol restart, some functions (such as LDP MD5 authentication using the Router ID) may fail.

---

#### ▾ Configuring the LDP Capability on an Interface or Configuring the Remote Peer

- Enable the LDP capability in interface configuration mode if a local LDP session needs to be established.
- Configure the remote peer in config-mpls-router configuration mode if a remote LDP session needs to be established.

#### ▾ Configuring a Transport Address

- (Optional) If no transport address is configured, the LDP Router ID is used as the transport address.
- Configure a global transport address in config-mpls-router configuration mode if a local LDP session needs to be established. If a neighbor requires a specified transport address, configure this address on the interface connected to the neighbor.
- This configuration is not required if a remote LDP session needs to be established.

#### ▾ Configuring the Hello Packet Interval

- This configuration is required only in special cases.
- Perform this configuration in interface configuration mode if a local LDP session needs to be established.

- Perform this configuration in config-mpls-router configuration mode if a remote LDP session needs to be established.

#### ▾ Configuring the Hello Packet Keep-Alive Period

- This configuration is required only in special cases.
- Perform this configuration in interface configuration mode if a local LDP session needs to be established.
- Perform this configuration in config-mpls-router configuration mode if a remote LDP session needs to be established.

#### ▾ Configuring the Keepalive Packet Keep-Alive Period

- This configuration is required only in special cases.
- Perform this configuration in interface configuration mode if a local LDP session needs to be established.
- Perform this configuration in config-mpls-router configuration mode if a remote LDP session needs to be established.

#### ▾ Configuring the Maximum PDU Size

- This configuration is required only in special cases.
- Perform this configuration in interface configuration mode.

#### ▾ Configuring LDP MD5 Authentication

- You can configure LDP MD5 authentication on the two LSRs engaged in an LDP session to improve session security.
- (Optional) Perform this configuration in config-mpls-router configuration mode.

#### ▾ Configuring the Waiting Time for Label Mapping During Route Updating

- This configuration is required only in special cases.
- (Optional) It is performed in global configuration mode.

### Verification

- Run the **show mpls ldp discovery** command to display the LDP peer discovery state.
- Run the **show mpls ldp neighbor** command to display the LDP session state.
- Run the **show mpls ldp bindings** command to display the LDP label binding state.
- Run the **show run** command to check whether the configuration takes effect.

### Related Commands

#### ▾ Enabling LDP Globally

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>mpls router ldp [ vrf-name ]</b>                                    |
| <b>Parameter Description</b> | <i>vrf-name</i> : Enables or disables LDP of a specified VRF instance. |
| <b>Command Mode</b>          | Global configuration mode  |

|                    |   |
|--------------------|---|
| <b>Usage Guide</b> | The number of LDP instances is limited by the number of VRF instances. Each VRF instance can enable one LDP instance.<br>By default, LDP instances of global VRF instances are enabled (or disabled). |
|--------------------|---|

### ↘ Configuring an LDP Router ID

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>ldp router-id</b> { <i>ip-address</i>   <b>interface</b> <i>interface-name</i> [ <b>force</b> ] }   |
| <b>Parameter Description</b> | <i>ip-address</i> : Specifies a static IP address as the LDP router ID. The ID takes effect immediately.<br><i>interface-name</i> [ <b>force</b> ]: Specifies the primary address of a specified interface as the LDP router ID. If <b>force</b> is specified, the ID must be forced to take effect immediately. |
| <b>Configuration Mode</b>    | config-mpls-router mode  |
| <b>Usage Guide</b>           | Configures an LDP router ID.   |

### ↘ Enabling LDP on an Interface

|                              |                              |
|------------------------------|------------------------------|
| <b>Command</b>               | <b>mpls ip</b>               |
| <b>Parameter Description</b> | <b>N/A</b>                   |
| <b>Configuration Mode</b>    | Interface configuration mode |
| <b>Usage Guide</b>           | Enables LDP on an interface. |

### ↘ Configuring a Remote LDP Peer

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>neighbor</b> <i>ip-address</i>                     |
| <b>Parameter Description</b> | <i>ip-address</i> : Indicates the ID of the peer LSR. |
| <b>Configuration Mode</b>    | config-mpls-router mode                               |
| <b>Usage Guide</b>           | Creates a remote LDP peer.                            |

### ↘ Receiving Target Hello Packets Through LDP

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>discovery targeted-hello accept</b> [ <b>from</b> <i>acl-name</i> ]  |
| <b>Parameter Description</b> | <i>acl-name</i> : Indicates the name of ACL rules. Only the target Hello packets from neighbors specified by ACL rules can be received.   |
| <b>Configuration Mode</b>    | config-mpls-router mode   |
| <b>Usage Guide</b>           | When remote peers of two devices are established, you can configure a neighbor at one end and enable this function at the other end. To delete a remote peer, you only need to delete the neighbor configuration. |

### ↘ Configuring a Transport Address

|                |  |
|----------------|--|
| <b>Command</b> | <b>mpls ldp transport-address</b> { <b>interface</b>   <i>ip-address</i> } |
|----------------|--|

|                           |  |
|---------------------------|--|
| <b>Parameter</b>          | <b>interface:</b> An LDP session uses the primary address of an interface.   |
| <b>Description</b>        | <i>ip-address:</i> An LDP session uses the specified IP address.   |
| <b>Configuration Mode</b> | Interface configuration mode   |
| <b>Usage Guide</b>        | This command is valid for local LDP sessions established by the basic LDP discovery mechanism and invalid for remote LDP sessions established by the extended LDP discovery mechanism. It is valid for new local LDP sessions and invalid for existing local LDP sessions. |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>transport-address</b> { <b>interface</b>   <i>ip-address</i>   <i>interface-name</i> }   |
| <b>Parameter Description</b> | <b>interface:</b> A local LDP session uses the primary IP address of an interface as a transport address.<br><i>ip-address:</i> All local LDP sessions use a specified IP address as the transport address.<br><i>interface-name:</i> All local LDP sessions use the primary IP address of a specified interface as the transport address.  |
| <b>Configuration Mode</b>    | config-mpls-router mode   |
| <b>Usage Guide</b>           | This command is valid for local LDP sessions established by the basic LDP discovery mechanism and invalid for remote LDP sessions established by the extended LDP discovery mechanism. Remote LDP sessions always use the LDP LSR ID as the transport address. If transport addresses are configured in both global and interface configuration modes, the transport address configured in interface configuration mode is preferred. |

### ▾ Configuring the Hello Packet Interval

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>mpls ldp hello-interval</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds:</i> Indicates the Hello packet interval, which ranges from 1 to 65,535 seconds. |
| <b>Configuration Mode</b>    | Interface configuration mode  |
| <b>Usage Guide</b>           | Configures the LDP link Hello packet interval.  |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>discovery targeted-hello</b> <i>interval seconds</i>                                     |
| <b>Parameter Description</b> | <i>seconds:</i> Indicates the Hello packet interval, which ranges from 1 to 65,535 seconds. |
| <b>Configuration Mode</b>    | config-mpls-router mode   |
| <b>Usage Guide</b>           | Configures the LDP target Hello packet interval.  |

### ▾ Configuring the Hello Packet Keep-Alive Period

|                  |   |
|------------------|---|
| <b>Command</b>   | <b>mpls ldp hello-holdtime</b> <i>seconds</i>   |
| <b>Parameter</b> | <i>seconds:</i> Indicates the Hello packet keep-alive period, which ranges from 1 to 65,535 seconds. 65,535 |

|                           |   |
|---------------------------|---|
| <b>Description</b>        | seconds indicate that a timeout will never occur.   |
| <b>Configuration Mode</b> | Interface configuration mode                        |
| <b>Usage Guide</b>        | Configures the link Hello packet keep-alive period. |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>discovery targeted-hello</b> <i>holdtime seconds</i>   |
| <b>Parameter Description</b> | Indicates the target Hello packet keep-alive period, which ranges from 1 to 65,535 seconds. 65,535 seconds indicate infinite hold time. |
| <b>Configuration Mode</b>    | config-mpls-router mode   |
| <b>Usage Guide</b>           | Configures the target Hello packet keep-alive period.   |

### ↘ Configuring the Keepalive Packet Keep-Alive Period

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>mpls ldp keepalive-holdtime</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the keep-alive packet keep-alive period, which ranges from 15 to 65,535 seconds. |
| <b>Configuration Mode</b>    | Interface configuration mode  |
| <b>Usage Guide</b>           | Configures the keep-alive packet keep-alive period for local LDP sessions in interface configuration mode.  |

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>targeted-session holdtime</b> <i>seconds</i>   |
| <b>Parameter Description</b> | <i>seconds</i> : Indicates the keep-alive packet keep-alive period, which ranges from 15 to 65,535 seconds. |
| <b>Configuration Mode</b>    | config-mpls-router mode   |
| <b>Usage Guide</b>           | The default keep-alive packet keep-alive period is used for restoration of local LDP sessions.              |

### ↘ Configuring the Maximum PDU Size

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>mpls ldp max-pdu</b> <i>max-pdu</i>  |
| <b>Parameter Description</b> | <i>max-pdu</i> : Indicates the maximum PDU length for message exchange, which ranges from 256 to 4,096 bytes. |
| <b>Configuration Mode</b>    | Interface configuration mode  |
| <b>Usage Guide</b>           | Configures the maximum PDU length.  |

### ↘ Configuring LDP MD5 Authentication

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>neighbor</b> <i>ip-address</i> <b>password</b> [ <b>0</b>   <b>7</b> ] <i>pwd-string</i>   |
| <b>Parameter Description</b> | <i>ip-address</i> : Indicates the transport address of the peer LSR.<br>[ <b>0</b>   <b>7</b> ]: (Optional) <b>0</b> indicates a plaintext key; <b>7</b> indicates a cyphertext key. By default, a plaintext key is |

|                           |  |
|---------------------------|--|
|                           | entered.<br><i>pwd-string</i> : Indicates a password string, which is case-sensitive. A plaintext password string contains 1 to 25 characters, while a cyphertext password string contains 1 to 52 characters. |
| <b>Configuration Mode</b> | config-mpls-router mode  |
| <b>Usage Guide</b>        | Configures MD5 authentication of TCP connections to the peer LSR.  |

▾ **Configuring the Waiting Time for Label Mapping**

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>route wait label-mapping</b> <i>seconds</i>  |
| <b>Parameter Description</b> | <i>seconds</i> : Configures the waiting time for label mapping during route updating.   |
| <b>Configuration Mode</b>    | Global configuration mode   |
| <b>Usage Guide</b>           | During IP route updating, an LSP corresponding to the new next hop perhaps is not yet established. However, LDP will delete the LSP corresponding to the old next hop so that the traffic will be interrupted until a new LSP is established. To solve this problem, you can run this command to have LDP delay deleting the old LSP until a new LSP is established. During this period, once a new LSP is established, the traffic will be switched to the new LSP. If a new LSP is not established within this period, the LDP will delete the old LSP. |

**Configuration Example**

▾ **Establishing a Local LDP Session**

|                                       |   |
|---------------------------------------|---|
| <b>Scenario</b><br><b>Figure 1-10</b> |   |
| <b>Configuration Steps</b>            | <ul style="list-style-type: none"> <li>● Configure an IPv4 unicast routing protocol (such as OSPF) on each router and check that a unicast route is reachable to its loopback interface.</li> <li>● Enable LDP globally.</li> <li>● Configure an LDP Router ID.</li> <li>● Enable LDP on an interface.</li> </ul> |

|---|

## Common Errors

- IPv4 unicast routing is incorrectly configured.
- LDP is not enabled globally.
- LDP is not enabled interface configuration mode (or a remote peer is not configured).

## 1.4.4 Configuring LDP Session Protection

### Configuration Effect

Protect LDP sessions between two directly connected LSRs.

### Notes

You can enable LDP session protection on the two LSRs engaged in an LDP session. If only one LSR supports LDP session protection, configure LDP session protection on this LSR and run the **discovery targeted-hello accept** command on the other LSR to enable it to receive and reply to target Hello packets (or run the **neighbor ip-address** command to specify the remote peer).

### Configuration

#### 📌 Configuring an LDP Session

- (Mandatory) Perform this configuration according to section 1.4.3 "Configuring an LDP Session."

#### 📌 Configuring LDP Session Protection

- (Mandatory) Perform this configuration in config-mpls-router configuration mode.
- Enable LDP session protection on the two LSRs engaged in an LDP session (see "Notes"), unless otherwise specified.

## Verification

- Run the **show mpls ldp parameters** command to check whether LDP session protection is enabled.
- Run the **show mpls ldp neighbor** command to check whether LDP session protection takes effect.

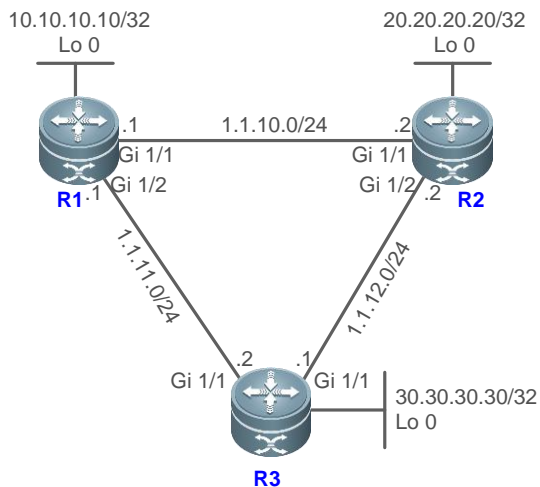

## Related Commands

### Configuring LDP Session Protection

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>session protection [ for acl <i>acl_name</i> ] [ duration { infinite   seconds } ]</b>  |
| <b>Parameter Description</b> | <p><b>for acl <i>acl_name</i></b>: Configures ACL rules. Only the LDP sessions of LDP neighbors whose LSR IDs meet ACL rules are protected.</p> <p><b>duration</b>: Configures the duration of session protection. When links fail and cause a Hello adjacency without associated interfaces, session protection will be enabled, and a target Hello adjacency will maintain LDP sessions.</p> <p><b>infinite</b>: The target Hello adjacency will maintain LDP sessions infinitely.</p> <p><b>seconds</b>: Indicates the duration of session protection, which ranges from 30 to 2,147,483 seconds.</p> |
| <b>Configuration Mode</b>    | config-mpls-router mode  |
| <b>Usage Guide</b>           | Enables LDP protection.  |

## Configuration Example

### Enabling LDP Session Protection Between LSRs

## 1.4.5 Configuring an LDP LSP

### Configuration Effect

Establish an LSP on IP unicast routes through LDP.

### Notes

- LDP needs to use unicast routes existing in the network; therefore, IP unicast routes must be configured.

### Configuration

#### ↘ [Configuring MPLS Forwarding](#)

- (Mandatory) Configure MPLS forwarding according to the section "Configuring Basic PIM-SM Functions 1".

#### ↳ Configuring LDP Sessions

- (Mandatory) Configure LDP sessions according to the section "Configuring LDP Sessions 1".

#### ↳ Configuring Loop Detection

- (Optional) Perform this configuration in config-mpls-router configuration mode.
- If IP routes are statically configured instead of being generated by IGP, you are advised to enable loop detection on every LSR traversed by the LSP to avoid loop caused by misconfiguration.

#### ↳ Configuring the Maximum Number of Hops

- Perform this configuration in interface configuration mode.
- This configuration is required only in special cases.

#### ↳ Configuring the Maximum Number of LSRs in the Path Vector List

- Perform this configuration in interface configuration mode.
- This configuration is required only in special cases.

#### ↳ Configuring the Label Release Message Propagation Mode

- Perform this configuration in config-mpls-router configuration mode.
- This configuration is required only in special cases.

#### ↳ Configuring the LDP Label Distribution Control Mode

- Perform this configuration in config-mpls-router configuration mode.
- This configuration is required only in special cases.

#### ↳ Configuring the LDP Label Distribution Mode

- Perform this configuration in interface configuration mode.
- This configuration is required only in special cases.

#### ↳ Configuring the LDP Label Retention Mode

- Perform this configuration in config-mpls-router configuration mode.
- This configuration is required only in special cases.

#### ↳ Configuring Label Distribution Policies

- (Optional) Perform this configuration in config-mpls-router configuration mode.

---

**i** By default, LDP distributes labels only to IGP routes but not to BGP routes. To distribute labels to BGP routes, run the **advertise-labels for bgp-routes** command.

---

- By default, LDP distributes implicit null labels with the value of 3 to default routes; therefore, an LSP is not established on default routes.

### Configuring Label Reception Policies

- Perform this configuration in config-mpls-router configuration mode.
- This configuration is required only in special cases.

### Configuring Explicit Null Label Distribution Policies

- Perform this configuration in config-mpls-router configuration mode.
- This configuration is required only in special cases.

- Explicit null label distribution policies can be configured only for global LDP instances but not for VRF instances.

## Verification

- Run the **show mpls ldp discovery** command to display the LDP peer discovery state.
- Run the **show mpls ldp neighbor** command to display the LDP session state.
- Run the **show mpls ldp bindings** command to display the LDP label binding state.
- Run the **show mpls forwarding-table** command to display the LSP entry state.

## Related Commands

### Configuring Loop Detection

|                              |                         |
|------------------------------|-------------------------|
| <b>Command</b>               | <b>loop-detection</b>   |
| <b>Parameter Description</b> | N/A                     |
| <b>Configuration Mode</b>    | config-mpls-router mode |
| <b>Usage Guide</b>           | Enables loop detection. |

### Configuring the Maximum Hop Count

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>mpls ldp max-hop-count</b> <i>number</i>   |
| <b>Parameter Description</b> | <i>number</i> : Indicates the maximum hop count allowed for loop detection. The value ranges from 1 to 255. |
| <b>Configuration Mode</b>    | Interface configuration mode  |
| <b>Usage Guide</b>           | Configures the maximum hop count for loop detection.  |

### Configuring the Maximum Number of LSRs in the Path Vector List

|                  |  |
|------------------|--|
| <b>Command</b>   | <b>mpls ldp max-path-vector</b> <i>number</i>  |
| <b>Parameter</b> | <i>number</i> : Indicates the maximum number of of LSRs in the path vector list. The value ranges from 0 to 255. |

|                           |  |
|---------------------------|--|
| <b>Description</b>        |  |
| <b>Configuration Mode</b> | Interface configuration mode                                   |
| <b>Usage Guide</b>        | Configures the maximum number of LSRs in the path vector list. |

### ↘ Propagating Label Release Messages

|                              |   |
|------------------------------|---|
| <b>Command</b>               | <b>propagate-release</b>                      |
| <b>Parameter Description</b> | N/A   |
| <b>Configuration Mode</b>    | config-mpls-router mode                       |
| <b>Usage Guide</b>           | Propagates label release messages downstream. |

### ↘ Configuring the LDP Label Distribution Control Mode

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>lsp-control-mode { independent   orderd }</b>   |
| <b>Parameter Description</b> | <b>independent:</b> Indicates the independent control mode.<br><b>ordered:</b> Indicates the ordered control mode. |
| <b>Configuration Mode</b>    | The independent control mode is used.  |
| <b>Usage Guide</b>           | Configures the label distribution control mode.  |

### ↘ Configuring the LDP Label Distribution Mode

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>mpls ldp distribution-mode { du   dod }</b>   |
| <b>Parameter Description</b> | <b>dod:</b> Indicates the DOD distribution mode.<br><b>du:</b> Indicates the DU distribution mode. |
| <b>Configuration Mode</b>    | Interface configuration mode   |
| <b>Usage Guide</b>           | Configures the label distribution mode.  |

### ↘ Configuring the LDP Label Retention Mode

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>label-retention-mode { liberal   conservation }</b>   |
| <b>Parameter Description</b> | <b>liberal:</b> Indicates the liberal label retention mode.<br><b>conservative:</b> Indicates the conservative label retention mode. |
| <b>Configuration Mode</b>    | config-mpls-router mode  |
| <b>Usage Guide</b>           | Configures the label retention mode.   |

### ↘ Configuring Label Distribution Policies

|                |   |
|----------------|---|
| <b>Command</b> | <b>advertise-labels [ for host-routes   for bgp-routes [ acl <i>acl_name</i> ]   for default-route   for acl <i>prefix-access-list</i> [ to <i>peer-access-list</i> ]</b> |
|----------------|---|

|                              |   |
|------------------------------|---|
| <b>Parameter Description</b> | <p><b>for host-routes:</b> Distributes labels to host routes (with a 32-bit mask) only.</p> <p><b>for bgp-routes [acl acl_ame]:</b> Distributes labels to BGP routes. You can use the <b>acl</b> keyword to have labels distributed to eligible BGP routes only.</p> <p><b>for default-route:</b> Distributes labels whose value is not 3 to default routes.</p> <p><b>for acl prefix-access-list:</b> Specifies the route prefix.</p> <p><b>to peer-access-list:</b> Specifies the neighbors to which label binding messages should be sent.</p> |
| <b>Configuration Mode</b>    | config-mpls-router mode   |
| <b>Usage Guide</b>           | Configures label distribution policies for FECs mapped to IP routes. You can use the <b>no</b> form of this command to recover the default.   |

↘ **Configuring Label Reception Policies**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>neighbor ip-address labels accept acl-name</b>  |
| <b>Parameter Description</b> | <p><i>ip-address:</i> Indicates the ID of the peer LSR.</p> <p><i>acl-name:</i> Specifies the name of ACL rules.</p> |
| <b>Configuration Mode</b>    | config-mpls-router mode  |
| <b>Usage Guide</b>           | Configures label reception policies.   |

↘ **Configuring Explicit Null Label Distribution Policies**

|                              |  |
|------------------------------|--|
| <b>Command</b>               | <b>explicit-null [ for prefix_acl ] [ to peer_acl ]</b>  |
| <b>Parameter Description</b> | <p><b>for prefix_acl:</b> Specifies the address prefix of the direct route for replacing implicit null labels with explicit null labels.</p> <p><b>to peer_acl:</b> Specifies the LDP peer for replacing implicit null labels with explicit null labels.</p> |
| <b>Configuration Mode</b>    | config-mpls-router mode  |
| <b>Usage Guide</b>           | Distributes explicit null labels to all direct routes or to routes meeting ACL rules.  |

**Configuration Example**

## Common Errors

- IPv4 unicast routing is incorrectly configured.
- MPLS forwarding is not enabled globally.
- LDP is not enabled globally.
- LDP is not enabled on an interface.
- Label forwarding is not enabled on an interface.

## 1.4.6 Configuring the Inter-Domain LDP LSP Feature

### Configuration Effect

When an AS is divided into multiple IGP areas and host routes are aggregated on ABRs, establish an LSP across multiple IGP areas for the host routes.

### Notes

- The inter-domain LDP LSP feature takes effect only when the free label retention mode is configured.
- The inter-domain LDP LSP feature is not applicable in DOD label distribution mode.

## Configuration Steps

### Configuring IGP

- (Mandatory) Perform this configuration according to the *Configuring OSPF* or *Configuring IS-IS*.

### Enabling Area Border Routers (ABRs) to Aggregate Host Routes

- (Mandatory) Perform this configuration according to the *Configuring OSPF* or *Configuring IS-IS*.

### Configuring MPLS Forwarding

- (Mandatory) Configure MPLS forwarding according to the section "Configuring Basic PIM-SM Functions 1".

### Configuring LDP Sessions

- (Mandatory) Configure LDP sessions according to the section "Configuring LDP Sessions 1".

### Configuring the Inter-Domain LDP LSP Feature

- (Mandatory) Perform this configuration in config-mpls-router configuration mode.
- After route aggregation, enable the inter-domain LDP LSP feature on every LSR traversed by the corresponding LSP.

## Verification

- Display configurations of LDP instances to check whether the inter-area LDP LSP function is enabled.
- Check whether an MPLS entry is added to the route compliant with the longest match rule on every router.

## 1.5 Monitoring and Maintenance

### Clearing

 Running the **clear** commands may lose vital information and thereby interrupt services.

| Description                   | Command  |
|-------------------------------|--|
| Resets existing LDP sessions. | <b>clear mpls ldp neighbor</b> [ all   vrf <i>vrf-name</i> ] [ *   <i>ip-address</i> ] |

### Displaying

| Description                               | Command   |
|---|---|
| Displays basic MPLS information.          | <b>show mpls summary</b>  |
| Displays the MPLS forwarding table.       | <b>show mpls forwarding-table</b> [ detail ]<br><b>show mpls forwarding-table</b> { <i>ip-address/mask</i>   <i>ipv6-address/mask</i> } [ detail ]<br><b>show mpls forwarding-table label</b> <i>label</i> [ detail ]<br><b>show mpls forwarding-table interface</b> <i>interface-name</i> [ detail ]<br><b>show mpls forwarding-table next-hop</b> { <i>ip-address</i>   <i>ipv6-address</i> } [ detail ]<br><b>show mpls forwarding-table</b> { ftn   ilm } [ ip   ipv6   vc ] [ detail ]<br><b>show mpls forwarding-table</b> { vrf <i>vrf-name</i>   global } [ ftn   ilm ] [ ip   ipv6 ] [ detail ]<br><b>show mpls forwarding-table summary</b> |
| Displays usage of the MPLS label pool.    | <b>show mpls label-pool</b>   |
| Detects LSP connectivity.                 | <b>ping mpls ipv4</b> <i>ip-address/mask</i> [ repeat <i>repeat</i> ] [ ttl <i>time-to-live</i> ] [ timeout <i>timeout</i> ] [ size <i>size</i> ] [ interval <i>mseconds</i> ] [ source <i>ip-address</i> ] [ destination <i>ip-address</i> ] [ force-explicit-null ] [ pad <i>pattern</i> ] [ reply mode { ipv4   router-alert } ] [ dsmap ] [ flags fec ] [ verbose ]   |
| Detects LSR nodes that LSPs pass through. | <b>traceroute mpls ipv4</b> <i>ip-address/mask</i> [ timeout <i>timeout</i> ] [ ttl <i>ttl</i> ] [ source <i>ip-address</i> ] [ destination <i>ip-address</i> ] [ force-explicit-null ] [ reply mode { ipv4   router-alert } ] [ flags fec ] [ verbose ]  |
| Displays FEC-label binding.               | <b>show mpls ldp bindings</b> [ all   vrf <i>vrf-name</i> ] [ <i>ip-address/mask</i>   label <i>label</i> ] [ remote   local ]  |
| Displays discovered LDP neighbors.        | <b>show mpls ldp discovery</b> [ all   vrf <i>vrf-name</i> ] [ detail ]   |
| Displays LDP interfaces.                  | <b>show mpls ldp interface</b> [ all   vrf <i>vrf-name</i>   <i>interface-name</i> ]  |
| Displays LDP neighbors.                   | <b>show mpls ldp neighbor</b> [ all   vrf <i>vrf-name</i> ] [ <i>ip-address</i> ] [ detail ]  |
| Displays LDP attributes.                  | <b>show mpls ldp parameters</b> [ all   vrf <i>vrf-name</i> ]   |

| Description                                  | Command   |
|--|---|
| Displays MPLS express forwarding.            | <b>show mpls ref ftn-ipv4</b> [ <b>global</b>   <b>vrf</b> <i>vrf_name</i> ] [ <i>ip_address / mask</i> [ <b>detail</b> ] ]<br><b>show mpls ref ftn-ipv6</b> [ <b>global</b>   <b>vrf</b> <i>vrf_name</i> ] [ <i>ipv6_address / mask</i> [ <b>detail</b> ] ]<br><b>show mpls ref ilm</b> [ <b>in-label</b> <i>label</i> [ <b>detail</b> ] ]   <b>summary</b> ]<br><b>show mpls ref nhlfe</b> [ [ <i>nhlfe_id</i> [ <b>detail</b> ] ] ]   <b>summary</b> ]<br><b>show mpls ref summary</b> |
| Displays the routing information base (RIB). | <b>show mpls rib</b> [ <b>all</b>   <b>vrf</b> <i>vrf-name</i> ] [ <b>ipv6</b> ]  |

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

| Description   | Command   |
|---|---|
| Debugs LDP session messages.  | <b>debug mpls ldp message</b>                       |
| Debugs LDP label binding.   | <b>debug mpls ldp binding</b>                       |
| Debugs internal processing of MPLS entries.   | <b>debug mpls</b>                                   |
| Debugs MPLS messages.   | <b>debug mpls msg</b> [ <b>send</b>   <b>recv</b> ] |
| Debugs the MPLS express forwarding control plane.   | <b>debug mpls ref control</b>                       |
| Debugs MPLS express forwarding.   | <b>debug mpls ref packet</b>                        |
| Debugs events during execution of the <b>ping mpls</b> or <b>traceroute mpls</b> command.                   | <b>debug mpls lspv event</b>                        |
| Debugs packets during execution of the <b>ping mpls</b> or <b>traceroute mpls</b> command.                  | <b>debug mpls lspv packet</b>                       |
| Debugs packet encapsulation TLV during execution of the <b>ping mpls</b> or <b>traceroute mpls</b> command. | <b>debug mpls lspv tlv</b>                          |
| Debugs errors during execution of the <b>ping mpls</b> or <b>traceroute mpls</b> command.                   | <b>debug mpls lspv error</b>                        |

## 2 Configuring BGP/MPLS IP VPN

### 2.1 Overview

Conventional virtual private networks (VPNs) transmit private network data in public networks over tunneling protocols such as Generic Routing Encapsulation (GRE), Layer 2 Tunneling Protocol (L2TP), and Point-to-Point Tunneling Protocol (PPTP). BGP/MPLS IP VPN is a VPN implementation mode between L2TP and Layer 3 Tunneling Protocol (L3TP). Label Switched Paths (LSPs) are established in public networks over the Label Distribution Protocol (LDP) for Multiprotocol Label Switching (MPLS). MPLS VPN connects the geographically different branches of a private network over LSPs to form a unified network. MPLS VPN supports the interworking between different VPNs.

Carriers implement MPLS in IP backbone networks to provide the VPN service to users' private networks. MPLS allows users to build VPNs using routers instead of dedicated VPN devices. MPLS also allows carriers to scale VPNs easily.

 The router devices and router icons in this document represent general routers and Layer-3 switches that run routing protocols. Specific device forms are indicated by "router series products" or "switch series products".

### 2.2 Applications

| Application                                 | Description  |
|---|--|
| <a href="#">Single-AS VPN Service Model</a> | Carriers provide the VPN service to users' IP networks. Multiple sites of a user's VPN are connected to the same IP/MPLS autonomous system (AS). |
| <a href="#">Inter-AS VPN Service Model</a>  | Carriers provide the VPN service to users' IP networks. Multiple sites of a user's VPN are connected to different IP/MPLS ASs.                   |

#### 2.2.1 Single-AS VPN Service Model

##### Scenario

Carriers provide the MPLS VPN service to users' IP networks. Multiple sites of a user's VPN are connected to the same IP/MPLS AS and communicate with each other by exchanging VPN routes across the AS.

In Figure 2-1, two sites of VPN1 are connected to the same IP/MPLS AS.

Figure 2-1

### Deployment

- Provider edge (PE) 1 and PE2 communicate with the provider (P) device over the Open Shortest Path First (OSPF) and Label Distribution Protocol (LDP), in order to implement the MPLS public network function.
- The customer edge (CE) devices communicate with the PE devices over OSPF, and the PEs communicate with each other over the Border Gateway Protocol (BGP), in order to implement OSPF access to MPLS L3VPN.
- The CEs communicate with the PEs over the Routing Information Protocol (RIP), and the PEs communicate with each other over BGP, in order to implement RIP access to MPLS L3VPN.
- The CEs communicate with the PEs over the Intermediate System to Intermediate System (IS-IS), and the PEs communicate with each other over BGP, in order to implement IS-IS access to MPLS L3VPN.
- The CEs communicate with the PEs over BGP, and the PEs communicate with each other over BGP, in order to implement BGP access to MPLS L3VPN.
- The CEs and the PEs exchange routes based on static configurations, and the PEs communicate with each other over BGP, in order to implement static access to MPLS L3VPN.

## 2.2.2 Inter-AS VPN Service Model

### Scenario

Carriers provide the MPLS VPN service to users' IP networks. Multiple sites of a user's VPN are connected to different IP/MPLS ASs and communicate with each other by exchanging VPN routes across different ASs.

In Figure 2-2, two sites of VPN1 are connected to two IP/MPLS ASs.

Figure 2-2

## Deployment

- The MPLS public network function is implemented between AS1 and AS2.
- Autonomous system boundary routers (ASBRs) 1 and ASBR2 are CEs that implement MPLS L3VPN over inter-AS Option A.
- The PEs communicate with each other over BGP to implement MPLS L3VPN over inter-AS Option B.
- The PEs communicate with each other over BGP to implement MPLS L3VPN over inter-AS Option C.

## 2.3 Features

### Overview

| Feature   | Description  |
|---|--|
| <a href="#">BGP/MPLS IP VPN Basic Functions</a> | Uses legacy IPv4 backbone networks to provide the VPN service to users' IPv4 networks.   |
| <a href="#">Inter-AS VPN Service Model</a>      | Provides the VPN service to users' IPv4 networks across multiple IPv4 backbone networks. |
| <a href="#">OSPF VPN Extended Attributes</a>    | Implements OSPF between PE and CE to simplify CE configuration and management.           |

### 2.3.1 BGP/MPLS IP VPN Basic Functions

#### Network Structure

CE, PE, and P play important roles in the BGP/MPLS VPN network structure, as shown in Figure 2-.

Figure 2-4

- CEs are located on the edge of user networks and belong logically to users' VPNs. A port on each CE is connected directly to a PE. A CE can be a router, switch, or host, and it may or may not support MPLS.
- PEs are located on the edge of the service provider (SP)'s backbone network and belong logically to the SP. A PE can be a router, ATM switch, or frame relay (FR) switch. PEs are connected directly to CEs, and one PE can be connected

to different CEs. PEs receive VPN information from CEs, send VPN information to other PEs, receive VPN information from other PEs, and distribute the received VPN information to corresponding CEs. PEs must support MPLS.

- The P router is the core device of the SP's backbone network. The P router implements routing and fast forwarding. It is not connected to CEs. The P router must support MPLS. It knows the route for any destination in the backbone network, but does not know the routes destined for the VPNs.

## Application Features

- VPN tunnels are established on the SP's PEs, rather than on users' CEs. VPN routes are exchanged between PEs. Users do not need to maintain VPN information.
- Existing routing protocols are used to dynamically establish VPN tunnels and advertise routes, making it easy to scale VPNs.
- The use of overlapping addresses is supported, allowing different VPN users to use the same address space.
- VPN service content is exchanged by label switching rather than route distribution in the SP's network.
- VPNs deliver security comparable to that of leased lines.

## Implementation

### Mechanism

- LSP tunnels are established over LDP in the backbone network. (This process is completed when the SP's network topology is stable.)
- Packets are forwarded according to their labels and the local mapping table.
- MP-BGP and BGP extended attributes are used to transmit VPN routes and carry VPN attributes, labels, and other content.
- VPN routes are managed by creating multiple routing tables, maintaining VPN routes, and other methods.

## VRF

A VPN routing and forwarding (VRF) table is used to solve local route conflicts.

Each PE-CE connection must be associated with a VRF table. A PE may have multiple VRF tables used to exchange routes with CEs. Each VRF table can be considered as a virtual router, which is connected to a CE and receives routes from the CE or advertises VPN routes to the CE. VRF tables allow PEs to support different VPNs that use the same address space without causing local route conflicts.

A VRF table consists of:

- An independent routing table
- A set of interfaces that belong to the VRF table
- A group of routing protocols only used by the VRF table

## RD

A route distinguisher (RD) is an important attribute of VPN routes and used to solve route conflicts during the transmission process.

When routes are advertised over BGP in the backbone network to different VPNs with overlapping addresses, BGP selects the best route among those addresses for advertising; as a result, some VPNs cannot receive corresponding routes. To address this problem, different RDs are added to the overlapping addresses, allowing BGP, when making routing decisions, to distinguish those addresses according to the different RDs carried in VPN routes. In this way, all VPNs receive respective routes. RDs are only used to distinguish identical network addresses, and they are not required when different VPNs do not have overlapping addresses.

A unique RD is assigned to one VPN, so that different VPNs have different RDs to ensure normal transmission of routes over the backbone network. RDs are defined in the format of XX: XX, for example, RD 1: 100, in which 1 is an AS number in the backbone network and 100 is a user-assigned number. A VPN route carries only one RD.

An RD consists of the **Type** field, an Administrator sub-area, and an Assigned Number. Depending on the value of the **Type** field, the RD is encoded in one of the following three formats:

Figure 2-5 RD Structure

- When **Type** is **0**, the Administrator sub-area uses a two-byte public AS number, and the Assigned Number has four bytes and is managed by the SP.
- When **Type** is **1**, the Administrator sub-area uses a four-byte global IPv4 address, and the Assigned Number has two bytes and is managed by the SP.
- When **Type** is **2**, the Administrator sub-area uses a four-byte AS number, and the Assigned Number has two bytes and is managed by the SP.

## Route-Target

The route target (RT) is an important attribute of VPN routes and used to indicate a route selection method.

RT attributes are classified into the export RT attribute and the import RT attribute. When a PE receives a VPN route from a CE, the PE adds the export RT attribute to the VPN route and advertises the route to the peer PE. When receiving a route from the peer PE, the PE determines whether to import the route to a VRF table according to the import RT attribute. The import principle is as follows: The PE imports the incoming VPN route to a VRF table only when the VPN route has an RT

attribute the same as the import RT attribute of the VRF table. In this way, the distribution of VPN routes is controlled flexibly. A VPN route can carry multiple RT values.

The BGP extended community attribute defines the RT encoding structure, as shown in Figure 2-.

Figure 2-5 RT Structure

The RT is defined in a way similar to the RD. The RT with **Type** set to 0x02 or 0x202 must have a public AS number. The RT with **Type** set to 0x102 must have a global IPv4 address.

### MP-BGP

VPN routes are transmitted over BGP in the backbone network, and carry the export RT attribute according to the BGP extended community attribute.

The traditional BGP4 protocol only transmits IPv4 routes. BGP must be extended for transmitting RD-included VPN routes. BGP is highly scalable and supports the definition of new attributes. Multi-Protocol BGP (MP-BGP) introduces new attributes based on BGP to support multiple protocols. MP-BGP can carry VPN routing information in the format of RD+IP address prefix. When receiving IPv4 routes from VPN users, MP-BGP adds RDs to the IPv4 routes to convert the routes into VPN-IPv4 routes, and then transmits the VPN-IPv4 routes between PEs in the backbone network.

## 2.3.2 Inter-AS VPN Service Model

Inter-AS VPN allows different sites of a user's VPN located in different ASs to communicate with each other by exchanging VPN routes across those ASs.

RFC4364 proposes the following three inter-AS VPN solutions:

- Option A: VRF-to-VRF mode
- Option B: single-hop MP-EBGP mode
- Option C: multi-hop MP-EBGP mode

### 2.3.2.1 Option A: VRF-to-VRF Mode

The Option A (VRF-to-VRF) solution is easy to implement. The ASBRs in ASs create a VRF table for every VPN that requires inter-AS communication, and bind an interface to each VRF table. The VRF tables between ASBRs use their bound interfaces to exchange VPN routes.

The purposes of creating VRF tables and binding interfaces are:

- To receive VPN routes in the local AS

- To set up EBGP connections between VRF tables in different ASs to exchange IPv4 routes.

Figure 2-7 VRF-to-VRF Inter-AS VPN

In Figure 2-7, the VRF tables between the two ASBRs establish an EBGP session to exchange IPv4 routes, and the ASBRs and the PEs establish an MP-IBGP session to exchange VPN routes. The VRF tables engaged in the EBGP session consider the peer as a CE. VRF-to-VRF configuration is similar to intra-AS configuration, requiring to establish an MP-IBGP session between ASBR and PE to exchange VPN routes and establish an EBGP session between VRF tables on different ASBRs in BGP VRF address family configuration mode to exchange IPv4 routes.

### Features and Limitations

The Option A (VRF-to-VRF) solution is easy to implement and deploy over MP-IBGP. However, ASBRs must configure and bind an interface (a logical sub-interface) to every VPN that requires inter-AS communication. The number of bound interfaces must be at least equal to the number of the VPNs. In addition, VPNs must be configured one by one on the ASBRs. This causes scalability issues. The creation of sub-interfaces for individual VPNs also poses additional requirements on ASBRs. Therefore, the Option A solution is applicable to networks with few VPNs that require inter-AS communication.

- i** Option A configuration is similar to BGP/MPLS VPN configuration. The configuration process is omitted in this document.

### 2.3.2.2 Option B: Single-hop MP-EBGP Mode

In the Option A solution, ASBRs must configure a VRF table for each VPN and bind an interface to the VRF table. This is because VPN routes can only be carried over MP-IBGP, but cannot be exchanged directly between EBGP peers. VRF configuration on ASBRs is not required if VPN routes can be exchanged directly between EBGP peers. The Option B solution extends MP-IBGP for direct distribution of VPN routes between ASBRs. The solution is also called single-hop MP-EBGP. Figure 2- shows the topology.

Figure 2-8 Option B Inter-AS VPN

### Features and Limitations

The Option B solution removes the need to allocate sub-interfaces to sites of each VPN on ASBRs and the need to establish inter-AS LSPs. Instead, VPN routes are transmitted directly between single-hop MP-EBGP neighbors. Because VPN routes are stored and propagated by ASBRs between ASs, the ASBRs are under great burden when handling a large amount of VPN routes. The ASBRs also need to forward public IP packets. This poses high requirements on ASBRs. Because ASBRs disable the RT filter function for handling incoming VPN routes, the VPN routes on a PE may be propagated to the ASBR in a different AS, which may cause VPN route leakage. To address this problem, SPs that exchange VPN routes must implement a confidence-based routing protocol, enabling ASBRs to trust each other and implement route filtering policies. The Option B solution is applicable to networks with many VPNs that require inter-AS communication.

### Implementation

The Option B solution is implemented by the following methods:

- The ASBR retains the next hop in incoming VPN routes.
- The ASBR changes the next hop in incoming VPN routes.

The two methods are described in the following.

#### Method 1: The ASBR Retains the Next Hop in Incoming VPN Routes

When an ASBR receives a VPN route from the peer ASBR in a different AS, the ASBR sends the VPN route with the next hop unchanged to its MP-IBGP neighbors in the local AS. The PEs and the ASBR in the same AS exchange VPN routes over an MP-IBGP session, and two ASBRs exchange VPN routes directly over an MP-EBGP session. Because the ASBR does not change the next hop in the VPN route received from the MP-EBGP peer, the PEs (MP-IBGP neighbors) in the local AS must have the route destined for the next hop (an ASBR in the other AS). To do this, the ASBR redistributes this route to IGP in the local AS, in order to make the destination ASBR reachable. Then an LSP is established over LDP.

The configuration procedure is as follows:

1. Configure PEs and CEs to exchange routes.
2. Configure IGP and MPLS signaling for ASs.

3. Disable the default RT filter function on ASBRs.
4. Configure the PEs and the ASBR in the same AS to exchange VPN routes.
5. Configure ASBRs to establish an MP-EBGP session.
6. (Optional) Configure a route map for filtering VPN routes.
7. Configure IGP redistribution of the route destined for the ASBR in the other AS.

#### Method 2: The ASBR Changes the Next Hop in Incoming VPN Routes

When an ASBR receives a VPN route from the peer ASBR in a different AS, the ASBR changes the next hop in the incoming VPN route before sending the route to PEs in the local AS. The PEs and the ASBR in the same AS exchange VPN routes over an MP-IBGP session. The two ASBRs in different ASs exchange VPN routes over an MP-EBGP session. When receiving a VPN route from one ASBR, the other ASBR changes the route's next hop to itself before sending the route to MP-IBGP peers in the local AS.

The configuration procedure is as follows:

1. Configure PEs and CEs to exchange routes.
2. Configure IGP and MPLS signaling for ASs.
3. Disable the default RT filter function on ASBRs.
4. Configure the PEs and the ASBR in the same AS to establish an MP-IBGP session and enable the ASBR to change the next hop in incoming VPN routes to itself.
5. Configure ASBRs to establish an MP-EBGP session.
6. (Optional) Configure a route map for filtering VPN routes.

### 2.3.2.3 Option C: Multi-hop MP-EBGP Mode

The Option A and Option B solutions implement inter-AS VPN networking. A common feature of the two solutions is that ASBRs maintain and advertise VPN routes. ASBRs may become a bottleneck of network scalability when the ASBR in each AS needs to advertise a large amount of inter-AS VPN routes. The Option C (multi-hop MP-EBGP) solution is developed to address the scalability issue. The solution allows PEs in different ASs to exchange VPN routes directly over a multi-hop MP-EBGP session, removing the need for ASBRs to maintain and distribute VPN routes.

Figure 2-9 Multi-hop MP-EBGP

### Features and Limitations

In multi-hop MP-EBGP mode, only PEs maintain VPN routes, whereas ASBRs do not store VPN user information. The configuration procedure is relatively complex. The solution is applicable to inter-AS VPN service provision in large scale.

### Implementation

The Option C solution is implemented by the following methods:

- Enable IPv4 label distribution only between EBGP neighbors.
- Enable IPv4 label distribution between EBGP neighbors and between IBGP neighbors.

For Option C scalability, a route reflector (RR) is deployed in each AS, and the RRs between two ASs establish a multi-hop MP-EBGP session to exchange VPN routes. From the deployment perspective, Option C is also called the inter-RR multi-hop MP-EBGP solution.

The configuration of each Option C implementation method is described in the following.

#### Method 1: Enable IPv4 Label Switching Only Between EBGP Neighbors

In this implementation method, BGP routes must be redistributed using the IGP protocol (for example, OSPF or RIP) on ASBRs, so that each device in one AS has the route destined for each PE in the other AS. LSPs are established by distributing labels over LDP to the routes destined for PEs between ASs. IPv4 label switching is enabled between the directly connected inter-AS ASBRs. BGP assumes the role of MPLS signaling to distribute labels to the routes destined for PEs between ASs for LSP establishment.

The configuration procedure is as follows:

1. Configure PEs and CEs in each AS to exchange routes.
2. Configure IGP and MPLS signaling for ASs.
3. Configure ASBRs to establish an EBGP session in order to distribute labels to IPv4 routes.
4. Configure ASBRs to redistribute to IGP the routes of PEs that are learned over EBGP.
5. Configure a multi-hop MP-EBGP session.

#### Method 2: Enable IPv4 Label Switching Between EBGP Neighbors and Between IBGP Neighbors

As Method 1 enables IPv4 label switching only between EBGP neighbors, IGP and LDP in one AS need to maintain the routes destined for PEs in the other AS. That is, the inter-AS routes of PEs must be propagated to all devices between ASs. In actual application, for AS security consideration, the routes of PEs in one AS should not be propagated to each device in the other AS. Rather, the routes must be maintained only by BGP and transparent to IGP and LDP in the same AS. To meet this requirement, you can enable IPv4 label switching between EBGP neighbors and between IBGP neighbors.

Different from Method 1, Method 2 does not require IGP on ASBRs to redistribute BGP routes and does not require LDP to distribute labels to BGP routes. LDP is only responsible for LSP establishment in the local AS. However, IPv4 label switching must be enabled between IBGP neighbors and between EBGP neighbors for inter-AS LSP establishment, and PEs must support stacking of three consecutive labels.

The configuration procedure is as follows:

1. Configure PEs and CEs in each AS to exchange routes.
2. Configure IGP and MPLS signaling for ASs.
3. Configure PEs and ASBRs to establish an IBGP session in order to distribute labels to IPv4 routes.
4. Configure ASBRs to establish an EBGP session in order to distribute labels to IPv4 routes.
5. Configure a multi-hop MP-EBGP session.

### 2.3.3 OSPF VPN Extended Attributes

OSPF is typically used as an IGP internal routing protocol for users' VPNs in many application cases. No other routing protocols are required if OSPF is implemented between PE and CE, thus simplifying CE configuration and management.

The following describes the OSPF extended attributes between PE and CE.

#### Domain ID

A domain ID indicates the OSPF domain to which a route belongs. When an OSPF route for a VPN site that a CE learns is advertised as a type 1, 2, or 3 link-state advertisement (LSA) to a PE and redistributed to BGP to form a VPN route, the domain ID is also redistributed with the route to BGP and advertised as an extended community attribute of the VPN route. When the peer PE receives the VPN route and redistributes it to a VRF OSPF instance, the domain ID is also redistributed with the route to the VRF OSPF instance. If the VRF OSPF instance confirms that the domain ID of the route is the same as its domain ID, it advertises the route as an internal route to a CE. If the VRF OSPF instance confirms that the domain ID of the route is different from its domain ID, it advertises the route as an external route to the CE.

In Figure 2-3, CE1 advertises routes in the local OSPF domain as type 2 LSAs to PE1, which then forms VPN routes and advertises the routes to PE2. PE2 redistributes incoming routes to a VRF OSPF instance. Because the domain IDs of the VPN routes are the same as the domain ID of the VRF OSPF instance, the routes are advertised as internal routes to CE2.

Figure 2-3

### DN Bit

The down-bit (DN bit) is used for loop detection between PE and CE running OSPF. Loops may occur when a PE advertises a learned VPN route to its connected VPN site and the VPN site transmits the route over OSPF to another connected PE, which then propagates the route.

In Figure 2-4, PE1 advertises the route 192.168.10.0/24 to PE2 and PE3. CE2 advertises the route to CE3 over OSPF, which then advertises the route to PE3. In this way, the route is redistributed to BGP on PE3, which preferentially selects OSPF for route redistribution and converts the route into a VPNv4 route before advertising the route. In this case, a loop may occur.

Figure 2-4

To avoid loops, PEs insert the DN bit as an optional field into type 3, 5, or 7 LSAs before advertising the LSAs to CEs. When other PEs receive LSAs containing the DN bit, OSPF on the PEs exclude the LSAs from OSPF route calculation.

## VPN Route Tag

The VPN route tag provides another method of detecting loops between PE and CE running OSPF. When a PE and a CE communicate over OSPF, the corresponding VRF OSPF instance on the PE has a VPN route tag by default. When the VRF OSPF instance imports a VPN route and advertises it as a type 5 or 7 LSA to the CE, the LSA carries the VPN route tag. In an environment where one VPN site is connected to multiple PEs, when a PE receives a type 5 or 7 LSA that carries the same VPN route tag as that of its VRF OSPF instance, the LSA is excluded from OSPF route calculation.

## Area Deployment

In normal cases, the link between a PE and a CE can be any OSPF area. If the PE-CE link is a non-0 area, the OSPF area where the CE is located considers the PE as an area border router (ABR). This may cause problems due to the following characteristics of OSPF with the ABR feature:

- The ABR calculates only type 3 LSAs of the backbone area.
- The ABR forwards only type 3 LSAs from the backbone area to other areas.

In Figure 2-, if the PE-CE link is a non-0 area, the PE redistributes the VPNv4 route advertised over MP-BGP to OSPF and restores the route to a type 3 LSA before advertising it to CE1. Because CE1 does not calculate LSAs of non-backbone areas, the type 3 LSA is not advertised to the router in Area0. As a result, VPN sites may fail to learn routes between each other. Therefore, non-0 areas between PE and CE must be deployed correctly.

Figure 2-16

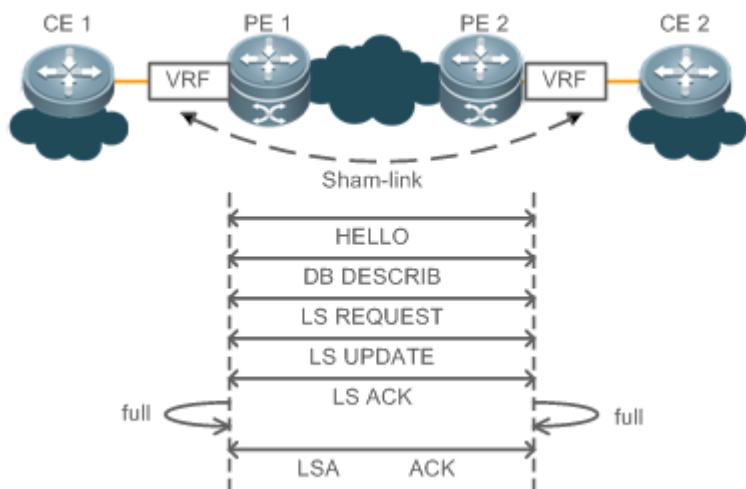

In L3VPN application, if PEs and CEs exchange VPN routes over OSPF, you are advised not to deploy the backbone area at a VPN site. In the actual condition, if the backbone area has PEs as well as routers of a VPN site, at least one router series product of the VPN site must be connected to a PE, and the CE-PE link must belong to Area0. In this way, inter-area routes and external routes can be transmitted between the PEs and the VPN site.

## Sham Link

A sham link is not an actual link, but a virtual link between the VRF tables on two PEs. Like OSPF links, sham links have OSPF interfaces and can be used to send OSPF packets, establish neighbor relationships, and send LSAs. When LSAs are flooded out over sham links, all OSPF route types remain unchanged, as shown in Figure 2-17.

Figure 2-17

The sham link established between VRF OSPF instances on different PEs have the following functions:

- The sham link transmits VPN routes to the peer PE over MP-IBGP, and original OSPF routes are imported on a best-effort basis on the peer PE. The sham link does not support real communication of OSPF topology information. An OSPF link is established over a sham link to connect OSPF instances of various sites and maintain complete topology information.
- Different sites of the same VPN exchange routes over the MPLS backbone network. These sites are connected by a backdoor link to support inter-site communication when the MPLS backbone network is not available. Two sites of a VPN that are located in the same OSPF area and connected by a backdoor link exchange routes over the MPLS backbone network as well as the backdoor link. Because the intra-AS routes exchanged over the backdoor link take precedence over the inter-AS routes exchanged over the MPLS network, routes of the two sites are forwarded preferentially over the backdoor link. This does not comply with the intention of VPN users connecting to the backdoor link. The sham link is introduced to ensure proper use of the backdoor link.

## 2.4 Configuration

**!** Interfaces used by BGP/MPLS IP VPN must be Layer-3 routing interfaces; otherwise, configuration fails.

| Configuration  | Description   |
|--|---|
| <a href="#">Configuring BGP MPLS IP VPN Basic Functions</a>          | (Mandatory) It allows carrier networks to provide the single-AS VPN service.                    |
| <a href="#">Configuring the Inter-AS VPN Service Model: Option A</a> | (Optional) It is applicable to carrier networks with light traffic of the inter-AS VPN service. |
| <a href="#">Configuring an Inter-AS VPN Service Model: Option B</a>  | (Optional) It is applicable to carrier networks with heavy traffic of the inter-AS VPN service. |
| <a href="#">Configuring an Inter-AS VPN Service Model: Option C</a>  | (Optional) It is applicable to carrier networks requiring large-scale VPN service provision.    |

| Configuration  | Description   |
|--|---|
| <a href="#">Configuring OSPF VPN Extended Attributes</a> | (Optional) It is applicable to VPN sites that run OSPF. |

## 2.4.1 Configuring BGP MPLS IP VPN Basic Functions

### Configuration Effect

Build the BGP/MPLS VPN service in a single AS.

Figure 2-17

### Notes

- The LDP router ID must consist of 32 bits.
- The BGP router ID must consist of 32 bits.
- The **mpls ip** and **label-switch** commands must be enabled on PEs' interfaces connected to a public network.

### Configuration Steps

The configuration of BGP/MPLS VPN basic functions includes:

- (Mandatory) Configure an MPLS network.
- (Mandatory) Configure a VPN routing instance.
- (Mandatory) Configure PEs to exchange VPN routes.
- (Mandatory) Configure PEs and CEs to exchange routes.
- (Optional) Configure a method of VPN label distribution.
- (Optional) Configure VPN route import/export policies.
- (Optional) Configure static L3VPN FEC to NHLFE (FTN) and incoming label map (ILM).

#### 📌 Configuring an MPLS Network

Before you implement MPLS in the backbone network, configure MPLS-specific LDP on the P and PE devices for public tunnel establishment. The configuration includes configuring LDP on corresponding MPLS devices and enabling MPLS packet forwarding on every interface.

Perform configuration on the P and PE devices according to the following table.

| Command  | Description  |
|--|--|
| Ruijie# <b>configure terminal</b>  | Enters global configuration mode.  |
| Ruijie(config)# <b>mpls ip</b>   | Enables MPLS globally.   |
| Ruijie(config)# <b>mpls router ldp</b>   | Configures LDP and enters LDP configuration mode.  |
| Ruijie(config-mpls-router)# <b>ldp router-id interface loopback id [force]</b> | Configures the LDP router ID, which typically uses the IP address of a loopback interface. |
| Ruijie(config-mpls-router)# <b>exit</b>  | Exits LDP configuration mode.  |
| Ruijie(config)# <b>interface type ID</b>                                       | Enters interface configuration mode.   |
| Ruijie(config-if-type ID)# <b>ip address ip-address mask</b>                   | Configures the interface IP address.   |
| Ruijie(config-if-type ID)# <b>label-switching</b>                              | Enables MPLS packet forwarding on the interface connected to the public network.           |
| Ruijie(config-if-type ID)# <b>mpls ip</b>                                      | Enables LDP on the interface.  |
| Ruijie(config-if-type ID)# <b>show running-config</b>                          | Displays existing configurations.  |

### ↘ Configuring a VPN Routing Instance

VPN routing instances are also called VRF tables, which are configured on the PEs. The CEs and the P do not have VRF tables.

To configure a VRF table, you need to define the VRF table, configure RD and RT values for the VRF table, and associate the VRF table with an interface.

Perform configuration on the PEs according to the following table.

| Command   | Description  |
|---|--|
| Ruijie# <b>configure terminal</b>   | Enters global configuration mode.                      |
| Ruijie(config)# <b>ip vrf vrf-name</b>                                      | Creates a VRF table and enters VRF configuration mode. |
| Ruijie(config-vrf)# <b>rd rd-value</b>                                      | Configures an RD value.                                |
| Ruijie(config-vrf)# <b>route-target { both   export   import } rt-value</b> | Configures RT values.                                  |
| Ruijie(config-vrf)# <b>exit</b>   | Exits VRF configuration mode.                          |
| Ruijie(config-if-type ID)# <b>interface type ID</b>                         | Enters interface configuration mode.                   |
| Ruijie(config-if-type ID)# <b>ip vrf forwarding vrf-name</b>                | Associates the VRF table with an interface.            |
| Ruijie(config-if-type ID)# <b>ip address address mask</b>                   | Configures the interface IP address.                   |
| Ruijie(config-if-type ID)# <b>show running-config</b>                       | Displays existing configurations.                      |

-  After an RD value is defined or BGP VRF is enabled for a VRF table on a PE, the RD value cannot be modified or deleted. To modify the RD value, delete the VRF table, create a new one, and then set its RD value.
-  The RD values of two different VRF tables on a PE must not be the same.
-  After the **ip vrf forwarding vrf-name** command is executed, the IP address of the specified interface is deleted. You need to configure an IP address again in interface configuration mode.

### ↘ Configuring PEs to Exchange VPN Routes

To configure PEs to exchange VPN routes (not IPv4 routes) over BGP, enter VPN address family configuration mode to enable the capability of transmitting VPN routes to the peer PE.

Perform configuration on the PEs according to the following table.

| Command   | Description  |
|---|--|
| Ruijie# <b>configure terminal</b>   | Enters global configuration mode.  |
| Ruijie(config)# <b>router bgp</b> <i>asn-num</i>  | Creates BGP and enters BGP configuration mode.   |
| Ruijie(config-router)# <b>neighbor</b> <i>ip-address</i> <b>remote-as</b> <i>asn-number</i>         | Configures a BGP session.  |
| Ruijie(config-router)# <b>neighbor</b> <i>ip-address</i> <b>update-source</b> <i>interface-name</i> | Specifies the address of a loopback interface as the source address for the MP-IBGP session. |
| Ruijie(config-router)# <b>address-family vpnv4</b>  | Enters VPN address family configuration mode.  |
| Ruijie(config-router-af)# <b>neighbor</b> <i>ip-address</i> <b>activate</b>                         | Activates the function of exchanging VPN routes over BGP.                                    |
| Ruijie(config-router-af)# <b>show running-config</b>  | Displays existing configurations.  |

### ↘ Configuring PEs and CEs to Exchange Routes

Four methods are available for configuring the VRF tables on PEs and the CEs to exchange routes.

#### ... Method 1: Implement BGP Between PE and CE

After a BGP session is established between PEs, establish a BGP session between PE and CE to connect all CEs over BGP. Redistribute VPN routes between CEs and BGP to build a fully meshed VPN.

Enter VRF address family configuration mode on the PEs and configure a BGP session between PE and CE according to the following table.

| Command  | Description  |
|--|--|
| Ruijie# <b>configure terminal</b>  | Enters global configuration mode.  |
| Ruijie(config)# <b>router bgp</b> <i>pe-asn-num</i>  | Creates BGP and enters BGP configuration mode.                               |
| Ruijie(config-router)# <b>address-family ipv4 vrf</b> <i>vrf-name</i>                          | Performs configuration and enters BGP VRF address family configuration mode. |
| Ruijie(config-router-af)# <b>neighbor</b> <i>ip-address</i> <b>remote-as</b> <i>ce-asn-num</i> | Establishes an EBGP session between PE and CE.                               |

**i** If no RD value is defined for the specified VRF table, the system prompts that the RD value is not configured when you run the **address-family ipv4 vrf vrf-name** command, and you are not allowed to enter address family configuration mode under the VRF table.

Configure PE-CE BGP sessions on the CEs and introduce VPN routes to BGP according to the following table.

| Command   | Description                                    |
|---|--|
| Ruijie# <b>configure terminal</b>   | Enters global configuration mode.              |
| Ruijie(config)# <b>router bgp</b> <i>ce-asn-num</i>                       | Creates BGP and enters BGP configuration mode. |
| Ruijie(config-router)# <b>neighbor</b> <i>ip-address remote-as pe-asn</i> | Establishes an EBGP session between PE and CE. |
| Ruijie(config-router)# <b>redistribute ospf</b> <i>ospf-id</i>            | Redistributes OSPF routes over BGP.            |
| Ruijie(config-router)# <b>exit</b>  | Exits BGP configuration mode.                  |
| Ruijie(config)# <b>router ospf</b> <i>ospf-id</i>                         | Enters OSPF configuration mode.                |
| Ruijie(config-router)# <b>redistribute bgp subnets</b>                    | Redistributes BGP routes over OSPF.            |
| Ruijie(config-router)# <b>exit</b>  | Exits OSPF configuration mode.                 |

 Users' VPNs may run any dynamic protocols or use static routes. OSPF is used as an example.

### ... Method 2: Implement OSPF Between PE and CE

If users' VPNs run OSPF, connect PEs and CEs over OSPF, and no additional configuration is required on the CEs.

On the PEs, configure an OSPF instance for each VRF table connected to a CE, and use the OSPF instance to exchange routes with the CE. By redistributing BGP routes, OSPF transmits VPN routes received from the peer PE to the corresponding CE. By redistributing OSPF routes, BGP transmits to the peer PE the VPN routes that CEs send to the connected PE.

 OSPF must be enabled on the CEs' interfaces connected to the PEs, and no passive port (or other restrictions on route exchange) must be configured.

Perform configuration on the PEs according to the following table.

| Command   | Description  |
|---|--|
| Ruijie# <b>configure terminal</b>                                     | Enters global configuration mode.                            |
| Ruijie(config)# <b>router ospf</b> <i>ospf-id vrf-name</i>            | Creates an OSPF instance and enters OSPF configuration mode. |
| Ruijie(config-router)# <b>network</b> <i>prefix mask area area-id</i> | Configures OSPF links.                                       |
| Ruijie(config-router)# <b>redistribute bgp subnets</b>                | Redistributes BGP routes over OSPF.                          |
| Ruijie(config-router)# <b>exit</b>                                    | Exits OSPF configuration mode.                               |
| Ruijie(config)# <b>router bgp</b> <i>asn</i>                          | Configures BGP and enters BGP configuration mode.            |
| Ruijie(config-router)# <b>address-family ipv4 vrf</b> <i>vrf-name</i> | Enters BGP VRF configuration mode.                           |
| Ruijie(config-router-af)# <b>redistribute ospf</b> <i>ospf-id</i>     | Redistributes OSPF routes.                                   |
| Ruijie(config-router-af)# <b>show running-config</b>                  | Displays existing configurations.                            |

### ... Method 3: Implement RIP Between PE and CE

If users' VPNs run RIP, connect PEs and CEs over RIP, and no additional configuration is required on the CEs.

The VRF tables on PEs exchange routes with the CEs over RIP. By redistributing BGP routes, RIP transmits VPN routes received from the peer PE to the corresponding CE. By redistributing RIP routes, BGP transmits to the peer PE the VPN routes that CEs send to the connected PE.

- i** RIP must be enabled on the CEs' interfaces connected to the PEs, and no restrictions on route exchange must be configured.

Perform configuration on the PEs according to the following table.

| Command  | Description  |
|--|--|
| Ruijie# <b>configure terminal</b>                                  | Enters global configuration mode.                          |
| Ruijie(config)# <b>router rip</b>                                  | Creates an RIP instance and enters RIP configuration mode. |
| Ruijie(config-router)# <b>address-family ipv4 vrf vrf-name</b>     | Enters RIP VRF address family configuration mode.          |
| Ruijie(config-router-af)# <b>version 2</b>                         | Configures the RIP version number.                         |
| Ruijie(config-router-af)# <b>network network-number [wildcard]</b> | Configures RIP for CE-PE communication.                    |
| Ruijie(config-router-af)# <b>redistribute bgp</b>                  | Redistributes BGP routes over RIP.                         |
| Ruijie(config-router-af)# <b>exit</b>                              | Exits address family configuration mode.                   |
| Ruijie(config)# <b>router bgp asn</b>                              | Configures BGP and enters BGP configuration mode.          |
| Ruijie(config-router)# <b>address-family ipv4 vrf vrf-name</b>     | Enters BGP VRF configuration mode.                         |
| Ruijie(config-router-af)# <b>redistribute rip</b>                  | Redistributes RIP routes.                                  |
| Ruijie(config-router-af)# <b>show running-config</b>               | Displays existing configurations.                          |

### ... Method 4: Configure Static Routes Between PE and CE

Static routes are typically used in simple network environments.

Point static routes from PE to CE, and redistribute the static routes to BGP VRF tables. Point static routes from CE to PE, and introduce the static routes to users' VPNs.

Perform configuration on the PEs according to the following table.

| Command  | Description                                       |
|--|---|
| Ruijie# <b>configure terminal</b>  | Enters global configuration mode.                 |
| Ruijie(config)# <b>ip route vrf vrf-name prefix mask interface-name next-hop</b> | Configures static routes.                         |
| Ruijie(config)# <b>router bgp asn</b>  | Enters BGP configuration mode.                    |
| Ruijie(config-router)# <b>address-family ipv4 vrf vrf-name</b>                   | Enters BGP VRF address family configuration mode. |
| Ruijie(config-router-af)# <b>redistribute static</b>                             | Redistributes static routes.                      |
| Ruijie(config-router-af)# <b>show running-config</b>                             | Displays existing configurations.                 |

- i** The configuration on the CEs is omitted.

### ↘ (Optional) Configuring a Method of VPN Label Distribution

The RFC4364 describes two label distribution methods for L3VPN: per-route label distribution and per-VRF label distribution. Per-route label distribution enables fast forwarding, whereby packets are forwarded to the next hop just by querying an ILM table. However, this method requires the maintenance of large-capacity ILM tables. Per-VRF label distribution allows all routes of a VRF table to share a label distributed to the VRF table, thus greatly reducing the ILM table capacity. However, this

method is less efficient at forwarding packets than per-route label distribution, because the former requires two table queries. The first query gets the VRF table to which the packet belongs from the ILM table, and the second query gets the packet forwarding route from the VRF table based on the destination IP address.

By default, L3VPN adopts per-VRF label distribution. You can run the **alloc-label** command in VRF configuration mode to change the default label distribution method, and you can also apply different label distribution methods to different VRF tables.

| Command  | Description  |
|--|--|
| Ruijie# <b>config terminal</b>                   | Enters global configuration mode.  |
| Ruijie(config)# <b>ip vrf vrf-name</b>           | Creates a VRF table and enters VRF configuration mode.   |
| Ruijie(config-vrf)# <b>alloc-label per-vrf</b>   | Distributes a label to all routes of the VRF table. All VPN routes distributed over MP-BGP use the same label.     |
| Ruijie(config-vrf)# <b>alloc-label per-route</b> | Distributes a label to each route of the VRF table. Each VPN route distributed over MP-BGP uses a different label. |
| Ruijie(config-vrf)# <b>show running-config</b>   | Displays existing configurations.  |

-  When you change the label distribution method, MP-BGP cancels all VPN routes that have been advertised and re-advertises the routes.

### (Optional) Configuring VPN Route Import/Export Policies

You need to define the import RT attribute in VRF configuration mode to specify which routes are imported to VRF tables, and define the export RT attribute to specify which RT attributes are carried in distributed routes. The import and export RT attributes take effect for all routes. In special application scenarios, you can control the import and export of VPN routes accurately based on policies.

| Command   | Description  |
|---|--|
| Ruijie# <b>config terminal</b>                      | Enters global configuration mode.  |
| Ruijie(config)# <b>ip vrf vrf-name</b>              | Creates a VRF table and enters VRF configuration mode.   |
| Ruijie(config-vrf)# <b>import map routemap-name</b> | Configures a policy for importing remote VPN routes to local VPN routes based on a route map.                                  |
| Ruijie(config-vrf)# <b>export map routemap-name</b> | Sets the extended community attribute of the VPN routes distributed from the local end to the remote end based on a route map. |
| Ruijie(config-vrf)# <b>show running-config</b>      | Displays existing configurations.  |

-  The rules defined by the **import map** command take effect following the import-specific extended community attribute defined in VRF configuration mode. That is, the VPN routes received from the remote end must have the extended community attribute defined by the **route-target import** command in VRF configuration mode before the routes are filtered based on the rules defined by the **import map** command.

## ➤ (Optional) Configuring Static L3VPN FTN and ILM

In normal cases, labels are distributed to VPN routes over MP-BGP, and public LSP tunnels are established over LDP in public networks. You can configure static LSPs for VPN label distribution and private LSP tunnel establishment.

### ... Configuring L3VPN FTN on PEs

| Command  | Description   |
|--|---|
| Ruijie# <b>config terminal</b>   | Enters global configuration mode.   |
| Ruijie(config)# <b>mpls static l3vpn-ftn</b> <i>vrf-name</i><br><i>ip-address/mask out-label out-label remote-pe ip-address</i>                      | Configures a static private FTN, with the forwarding equivalence class (FEC) egress on the other PE. You need to specify a private label and the egress PE. The address of the egress PE is used for public LSP tunnel matching.  |
| Ruijie(config)# <b>mpls static l3vpn-ftn</b> <i>vrf-name</i><br><i>fec-prefix/fec-mask local-forward nexthop interface-name</i><br><i>nexthop-ip</i> | Configures a static private FTN, with the FEC egress on the local PE. You need to specify the egress for the local PE and the next hop address. (The other VRF table is typically used as the outbound interface and the next hop.) This command is used when multiple VRF tables on the local PE belong to the same VPN. |
| Ruijie# <b>show running-config</b>   | Displays existing configurations.   |

### ... Configuring L3VPN ILM on PEs

| Command  | Description   |
|--|---|
| Ruijie# <b>config terminal</b>   | Enters global configuration mode.   |
| Ruijie(config)# <b>mpls static ilm in-label</b> <i>in-label forward-action</i><br><b>pop-l3vpn-nexthop</b> <i>vrf-name nexthop interface-name</i><br><i>nexthop-ip-address fec ip-address/mask</i> | Configures L3VPN ILM on the PE. You need to specify the incoming label, outbound interface, and next hop address. |
| Ruijie# <b>show running-config</b>   | Displays existing configurations.   |

- i** The static private FTN and ILM configurations take effect after the corresponding public LSP tunnel is established. For how to establish a public LSP tunnel, see "Configuring an MPLS Network" in section 2.4.1 "Configuring BGP MPLS IP VPN Basic Functions." You can establish a public LSP tunnel over LDP or based on static configuration.

## Verification

- Run the **show mpls forwarding-table** command to display the corresponding MPLS entries.
- Check that VPN sites can communicate with each other.

## Configuration Example

### ➤ Intranet Configuration

**Scenario**  
**Figure 2-18**

Requirements: Two VPNs (VPNA and VPNB) exist. VPNA maintains sites at SiteA, SiteB, and SiteC, whereas VPNB maintains sites at SiteB and SiteC. Enable communication between users at different sites of VPNA and between users at different sites of VPNB, and disable communication between VPNA and VPNB.

**Configuration Steps**

- On PE1, configure a loopback interface, create a VRF table, define RD and RT values, and associate VPNA with the corresponding interface. Configure BGP, and establish an MP-IBGP session with PE2 and PE3 respectively. Configure a CE neighbor relationship over EBGP. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.
- On PE2 and PE3, configure a loopback interface, create two VRF tables named VPNA and VPNB, define RD and RT values, and associate the VRF tables with the corresponding interfaces. Configure BGP, and establish an MP-IBGP session with the neighboring PE. Configure a CE neighbor relationship over EBGP. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.
- Configure VPNA-SiteA to establish an EBGP session with PE1. Configure VPNA-SiteB to establish an EBGP session with PE3. Configure VPNA-SiteC to establish an EBGP session with PE2. Configure VPNB-SiteB to establish an EBGP session with PE3. Configure VPNB-SiteC to establish an EBGP session with PE2.
- On P1 and P2, configure a loopback interface, configure backbone MPLS signaling, enable MPLS on the interface connected to the public network, and configure a backbone routing protocol.

**PE1**

```

PE1# configure terminal
PE1(config)# interface loopback 0

Extranet Configuration

|   |   |
|---|---|
| <p><b>Scenario</b><br/><b>Figure 2-19</b></p> | <p>The diagram illustrates a network topology for AS 1. It features five edge routers: PE1, PE2, P1, P2, and PE3. PE1 is connected to VPNA-siteA (192.168.10.0/24) and VPNB-siteB (192.168.10.0/24). PE2 is connected to VPNA-siteC (192.168.40.0/24) and VPNB-siteC (192.168.30.0/24). P1 and P2 are core routers with loopback addresses 172.168.10.0/24 and 172.168.20.0/24 respectively. PE3 is connected to VPNA-siteB (192.168.20.0/24) and VPNB-siteB (192.168.10.0/24). All routers are interconnected within AS 1. The diagram also shows connections to external sites: VPNA-siteA, VPNA-siteB, VPNA-siteC, VPNB-siteB, and VPNB-siteC.</p> |
|   | <p>Requirements: Two VPNs (VPNA and VPNB) exist. Enable communication between users at different sites of VPNA and between users at different sites of VPNB, disable communication between VPNA and VPNB, and allow VPNA and VPNB to access partial shared resources. In Figure 2-, VPNA and VPNB need to access the resources of VPN-SiteA.</p>  |
| <b>Configuration Steps</b>                    | <ul style="list-style-type: none"> <li>On PE1, configure a loopback interface, create a VRF table named VPN_EXTRA, define RD and RT values, and associate the VRF table with the corresponding interface. Configure BGP, and establish</li> </ul>   |

|            |   |
|------------|---|
|            | <p>an MP-IBGP session with PE2 and PE3 respectively. Configure the capability of exchanging routes with the CE over OSPF. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. ➤ **Hub-and-Spoke Configuration**

|                                       |  |
|---------------------------------------|--|
| <b>Scenario</b><br><b>Figure 2-20</b> | <p>Requirements: Intra-VPN data cannot be exchanged directly, but must be exchanged over a control center. Only the control center has the right to know the resources of the VPN. Users of the VPN can access the resources only with the control center's permission. In Figure 2-, VPNA-SiteA must access the resources of VPNA-SiteB over the control center VPNA-SiteC.</p>   |
| <b>Configuration Steps</b>            | <ul style="list-style-type: none"> <li>On PE1, configure a loopback interface, create a VRF table named spoke1, define RD and RT values, and associate VPNA with the corresponding interface. Configure BGP, and establish an MP-IBGP session with PE2. Configure a CE neighbor relationship over EBGP. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.</li> <li>On PE3, configure a loopback interface, create a VRF table named spoke2, define RD and RT values, and associate the VRF table with the corresponding interface. Configure BGP, and establish an MP-IBGP session with PE2. Configure a CE neighbor relationship over EBGP. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.</li> <li>On PE2, configure a loopback interface, create two VRF tables named from-spoke and from-hub, define RD and RT values, and associate the VRF tables with the corresponding interfaces. Configure BGP, and establish an MP-IBGP session with PE1 and PE3 respectively. Configure a CE neighbor relationship over EBGP. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.</li> <li>Configure VPNA-SiteA, VPNA-SiteB, and VPNA-SiteC to establish an EBGP session with PEs.</li> </ul> |

➤ **Centralized Isolation Control at the Internet Egress**

**Scenario**  
**Figure 2-21**

Requirements: Disable inter-VPN communication, and configure VPNs to access the Internet over a single device. In Figure 2-, VPN1 and VPN2 must access the Internet over PE1, but the two VPNs are not allowed to communicate with each other.

Two isolation methods are available: centralized isolation control and distributed isolation control.

In centralized isolation control, to allow new VPN sites to access the Internet over a single egress, you only need to add filter rules on the egress CE, without the need to modify the configurations of other VPN sites.

This method provides good scalability. The disadvantage is that the isolated traffic is discarded only on the

|                                   |   |
|-----------------------------------|---|
|                                   | <p>egress CE, which wastes network bandwidth.</p>   |
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● On PE2, configure a loopback interface, create a VRF table named VPN2, define RD and RT values, and associate the VRF table with the corresponding interface. Configure the capability of exchanging routes with CE2 over OSPF. Configure an IBGP neighbor relationship with PE1 for IP route distribution. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.</li> <li>● On CE2, configure the IP address of the interface connected to PE2, and configure the capability of exchanging routes with PE2 over OSPF.</li> <li>● On PE3, configure a loopback interface and create a VRF table named VPN1. Assume that the export and import RT attributes of VPN1 are both 1: 200. Define RD and RT values, and associate the VRF table with the corresponding interface. Configure the capability of exchanging routes with CE3 over OSPF. Configure an IBGP neighbor relationship with PE1 for IP route distribution. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.</li> <li>● On PE1, configure a loopback interface and create a trunk interface. Create a VRF table named vrf_out, define RD and RT values, and associate the VRF table with the corresponding interface. Configure a default route destined for the Internet. Create a VRF table named vrf_in, define RD and RT values, and associate the VRF table with the corresponding interface. Configure the capability of exchanging routes with CE1 over EBGP. Configure an IBGP neighbor relationship with PE2 and PE3 respectively. Configure the route exchange function of the vrf_out VRF table. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.</li> <li>● On CE1, create sub-interfaces, configure an EBGP neighbor relationship with PE1, create an access control list (ACL), and configure ACL application on the Gi0/1.10 sub-interface.</li> </ul> <p> This example uses the configuration of the switch virtual interface (SVI) and the 802.1Q sub-interface to describe how to connect PE1 and CE1. Some devices may not support the two interfaces. PE1 and CE1 can be connected by any two links (physical or logical) based on two routing adjacencies between them. You can select a suitable connection method according to the actual condition.</p> |

↘ Distributed Isolation Control at the Internet Egress

Figure 2-22

Requirements: Disable inter-VPN communication, and configure VPNs to access the Internet over a single device. In Figure 2-, VPN1 and VPN2 must access the Internet over PE1, but the two VPNs are not allowed to communicate with each other.

Two isolation methods are available: centralized isolation control and distributed isolation control.

In distributed isolation control, to allow new VPN sites to access the Internet over a single egress, you need to add filter rules on the CEs for the original VPN sites that also access the Internet over the same egress. This method has poor scalability. The advantage is that traffic is discarded on the CEs for VPN sites, which saves network bandwidth.

**Configuration Steps**

- On PE1, configure a loopback interface, create a VRF table named vrf\_net, define RD and RT values, and associate the VRF table with the corresponding interface. Configure a default route destined for the Internet. Configure the capability of exchanging routes with CE1 over EBGP. Configure an IBGP neighbor relationship with PE2 and PE3 respectively. Configure the route exchange function of the vrf\_net VRF table. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.
- On CE1, configure an EBGP neighbor relationship with PE1.
- On PE2, configure a loopback interface, create a VRF table named VPN2, define RD and RT values, and associate the VRF table with the corresponding interface. Configure the capability of exchanging routes with CE2 over OSPF. Configure an IBGP neighbor relationship with PE1 for IP route distribution. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.
- On CE2, create an ACL, configure ACL application on a sub-interface, configure the capability of exchanging routes with PE2, and configure a default static route.
- On PE3, configure a loopback interface and create a VRF table named VPN1. Assume that the export and import RT attributes of VPN1 are both 1: 200. Define RD and RT values, and associate the VRF table with the corresponding interface. Configure the capability of exchanging routes with CE3 over OSPF. Configure an IBGP neighbor relationship with PE1 for IP route distribution.

➤ **Multi-role Host Configuration**

**Scenario**  
**Figure 2-23**

Common hosts can only access other hosts of the same VPN site, whereas multi-role hosts can access other hosts of multiple VPNs. In Figure 2-, PC1 and PC2 are located at a site of VPN1. PC2 is a multi-role host able to access the hosts at the sites of VPN1 and VPN2, whereas PC1 can only access hosts at the same site of VPN1.

**Configuration Steps**

- Configure an MPLS backbone network.
- Configure an MPLS L3VPN network.
- Configure a multi-role host to access the VRF tables named VPN\_MR for VPN1 and VPN2 respectively, and advertise the route of the multi-role host to other VPNs.
- Configure policy-based routing (PBR) to redirect the access packets sent by the multi-role host to the VPN\_MR VRF table.
- Configure a default route on CE1.

## ➤ MCE-based Hierarchy VPN Configuration

**Scenario**  
**Figure 2-24**

A multi-VPN-instance customer edge (MCE) is deployed to reconstruct the single-plane MPLS L3VPN network into a hierarchical network. Figure 2- shows the network topology. The MCE stores the routes of the connected VPN sites and the default routes distributed by PE2, but does not store the routes of other VPN sites. This poses relatively low requirements on capacity and performance. PE1 and PE2 must store all VPN routes, which poses relatively high requirements on capacity and performance.

**Configuration Steps**

- (MPLS network configuration) Configure interface addresses and OSPF on PE1 and PE2, and configure the MPLS feature.
- (MPLS L3VPN network configuration) Configure CE-to-PE access on PE1, PE2, CE1, and CE2. Configure MP-IBGP on PE1 and PE2.
- Configure the MCE and the connected CEs.
- Configure default route distribution for the MCE.

**PE1**

```

PE1#configure terminal
PE1(config)#interface loopback 0
PE1(config-if-Loopback 0)#ip address 1.1.1.1 255.255.255.255

```

**Common Errors**

- The router ID does not consist of 32 bits, causing the failure to establish LDP and BGP neighbor relationships.

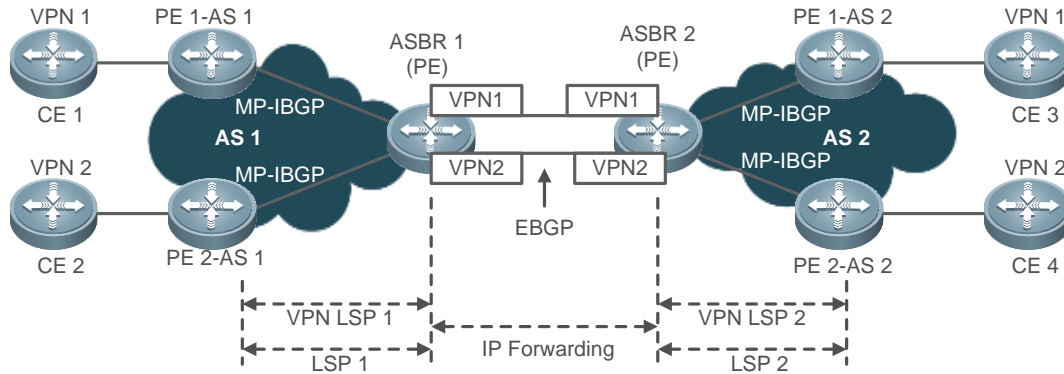

**2.4.2 Configuring an Inter-AS VPN Service Model: Option A**

**Configuration Effect**

Build the BGP/MPLS VPN service across ASs.

In the Option A solution, the ASBR in each AS creates a VRF table for every VPN that requires inter-AS communication and binds an interface to the VRF table. The VRF tables between ASBRs exchange VPN routes over the bound interfaces.

Figure 2-26 VRF-to-VRF Inter-AS VPN

**i** The Option A solution requires that ASBRs configure and bind an interface (a logical sub-interface) to every VPN that requires inter-AS communication. The number of bound interfaces must be at least equal to the number of the VPNs. In addition, VPNs must be configured one by one on the ASBRs. This causes scalability issues. The creation of sub-interfaces for individual VPNs also poses additional requirements on ASBRs. Therefore, the Option A solution is applicable to networks with few VPNs that require inter-AS communication.

**Notes**

- The LDP router ID must consist of 32 bits.
- The BGP router ID must consist of 32 bits.

- ASBRs must configure and bind an interface to every VPN that requires inter-AS communication.

### Verification

- Verify that CE3 is pingable but CE2 and CE4 are unpingable from CE1.
- Verify that CE4 is pingable but CE1 and CE3 are unpingable from CE2.
- Verify that CE1 is pingable but CE2 and CE4 are unpingable from CE3.
- Verify that CE2 is pingable but CE1 and CE3 are unpingable from CE4.

### Configuration Steps

For how to configure the Option A solution, see section 2.4.1 "Configuring BGP MPLS IP VPN Basic Functions."

### Common Errors

No routing protocol is enabled between PE and CE if no VRF table is bound to an interface using the **ip vrf forwarding vrf\_name** command. As a result, the **show ip route vrf vrf\_name** command output does not contain any route at the CE end.

## 2.4.3 Configuring an Inter-AS VPN Service Model: Option B

### Configuration Effect

Build the BGP/MPLS VPN service across ASs.

In the Option B solution, a single-hop MP-EBGP session is established between ASBRs for direct distribution of VPN routes.

Figure 2-27 Option B Inter-AS VPN

- The Option B solution removes the need to allocate sub-interfaces to sites of each VPN and the need to establish inter-AS LSPs. Instead, VPN routes are transmitted directly between single-hop MP-EBGP neighbors. Because VPN routes are stored and propagated by ASBRs between ASs, the ASBRs are under great burden when handling a large amount of VPN routes. The ASBRs also need to forward public IP packets. This poses high requirements on ASBRs. Because ASBRs disable the RT filter function for handling incoming VPN routes, the VPN routes on a PE may be propagated to the ASBR in a different AS, which may cause VPN route leakage. To address this problem, SPs that

exchange VPN routes must implement a confidence-based routing protocol, enabling ASBRs to trust each other and implement route filtering policies. The Option B solution is applicable to networks with many VPNs that require inter-AS communication.

## Notes

- The LDP router ID and BGP router ID must consist of 32 bits.
- ASBRs establish a single-hop EBGP session to exchange VPN routes. ASBRs may or may not change the next hop in VPN routes sent to the peer.

## Implementation

The Option B solution is implemented by the following methods:

- The ASBR retains the next hop in incoming VPN routes.
- The ASBR changes the next hop in incoming VPN routes.

The two methods are described in the following.

### 2.4.3.1 Method 1: The ASBR Retains the Next Hop in Incoming VPN Routes

When an ASBR receives a VPN route from the peer ASBR in a different AS, the ASBR sends the VPN route with the next hop unchanged to its MP-IBGP neighbors in the local AS. The PEs and the ASBR in the same AS exchange VPN routes over an MP-IBGP session, and two ASBRs exchange VPN routes directly over an MP-EBGP session. Because the ASBR does not change the next hop in the VPN route received from the MP-EBGP peer, the PEs (MP-IBGP neighbors) in the local AS must have the route destined for the next hop (an ASBR in the other AS). To do this, the ASBR redistributes this route to IGP in the local AS, in order to make the destination ASBR reachable. Then an LSP is established over LDP.

## Configuration Steps

- (Mandatory) Configure PEs and CEs to exchange routes.
- (Mandatory) Configure IGP and MPLS signaling for ASs.
- (Mandatory) Disable the default RT filter function on ASBRs.
- (Mandatory) Configure the PEs and the ASBR in the same AS to exchange VPN routes.
- (Mandatory) Configure ASBRs to establish an MP-EBGP session.
- (Optional) Configure a route map for filtering VPN routes.
- (Mandatory) Configure IGP redistribution of the route destined for the ASBR in the other AS.

### ↘ Configuring PEs and CEs to Exchange Routes

For details, see "Configuring PEs and CEs to Exchange Routes" in section 2.4.1 "Configuring BGP MPLS IP VPN Basic Functions."

### ↘ Configuring IGP and MPLS Signaling for ASs

For details, see "Configuring an MPLS Network" in section 2.4.1 "Configuring BGP MPLS IP VPN Basic Functions."

### ▾ Disabling the Default RT Filter Function on ASBRs

By default, a PE rejects the VPN route received from the peer PE or an ASBR if the route is not imported to any of its VRF tables. To enable ASBRs to accept all VPN routes from other PEs or ASBRs without checking whether the VPN routes are imported to local VRF tables, you need to disable the RT filter function on ASBRs.

Perform configuration in privileged mode according to the following table.

| Command  | Description                                       |
|--|---|
| Ruijie# <b>configure terminal</b>                                | Enters global configuration mode.                 |
| Ruijie(config)# <b>router bgp</b> <i>asn-number</i>              | Configures BGP and enters BGP configuration mode. |
| Ruijie(config-router)# <b>no bgp default route-target filter</b> | Disables the RT filter function.                  |
| Ruijie(config-router)# <b>show running-config</b>                | Displays existing configurations.                 |

### ▾ Configuring the PEs and the ASBR in the Same AS to Exchange VPN Routes

For details, see "Configuring PEs to Exchange VPN Routes" in section 2.4.1 "Configuring BGP MPLS IP VPN Basic Functions."

### ▾ Configuring ASBRs to Establish an MP-EBGP Session

Configure inter-AS ASBRs to establish a single-hop MP-EBGP session in order to distribute VPN routes.

Perform configuration in privileged mode according to the following table.

| Command  | Description  |
|--|--|
| Ruijie# <b>configure terminal</b>  | Enters global configuration mode.                              |
| Ruijie(config)# <b>router bgp</b> <i>asn-number</i>  | Configures BGP and enters BGP configuration mode.              |
| Ruijie(config-router)# <b>neighbor</b> <i>asbr-address</i> <b>remote-as</b> <i>asbr-asn-number</i> | Configures an EBGP session between ASBRs.                      |
| Ruijie(config-router)# <b>address-family vpnv4</b>   | Enters BGP VPN address family configuration mode.              |
| Ruijie(config-router-af)# <b>neighbor</b> <i>asbr-address</i> <b>activate</b>                      | Enables the capability of exchanging VPN routes between peers. |
| Ruijie(config-router-af)# <b>show running-config</b>   | Displays existing configurations.                              |

- i** To forward MPLS packets over the link between ASBRs, run the **label-switching** command to enable MPLS packet forwarding on the interfaces connected between the ASBRs.
- i** If ASBRs use the loopback interface address with a 32-bit mask (instead of a direct link address) as the source address for establishing an MP-EBGP session, do the following: (1) run the **neighbor ebgp-multi-hop** command to enable multi-hop EGBP; (2) configure a loopback static route destined for the peer end between ASBRs; (3) enable LDP or configure static FTN (set the outgoing label to 3, indicating that the ASBR is the penultimate hop).

### ▾ (Optional) Configuring a Route Map for Filtering VPN Routes

For AS security consideration, ASBRs are configured to send or receive only particular VPN routes based on specified policies. This security mechanism can be implemented using the RT extended community attribute for VPN route filtering. For ASBRs that disable the default RT filter function and therefore store all VPN routes, you can configure VPN routing policies to enable the ASBRs to receive only the inter-AS VPN routes from the PEs in the local AS, thus reducing the capacity burden on the ASBRs.

Configure filter policies in privileged mode according to the following table.

| Command  | Description  |
|--|--|
| Ruijie# <b>configure terminal</b>  | Enters global configuration mode.                              |
| Ruijie(config)# <b>ip extcommunity-list standard</b><br><i>extcommunity-name   extcommunity-number {permit deny} rt</i><br><i>rt-value</i> | Creates an extcommunity attribute list.                        |
| Ruijie(config)# <b>show ip</b> extcommunity-list [ <i>list-number list-name</i> ]  | Verifies the configured extcommunity attribute list.           |
| Ruijie(config)# <b>route-map</b> <i>route-map-name</i> <b>permit</b> [ <i>number</i> ]   | Creates a route map and enters route map configuration mode.   |
| Ruijie(config-route-map)# <b>match extcommunity</b><br><i>extcommunity-name extcommunity-number</i>  | Configures RT matching rules for the route map.                |
| Ruijie(config-route-map)# <b>show route-map</b><br><i>route-map-name</i>   | Displays the route map.  |
| Ruijie(config-route-map)# <b>exit</b>  | Exits route map configuration mode.                            |
| Ruijie(config)# <b>router bgp</b> <i>as-num</i>  | Configures BGP and enters BGP configuration mode.              |
| Ruijie(config-router)# <b>address-family vpnv4</b>   | Enters VPN address family configuration mode.                  |
| Ruijie(config-router-af)# <b>neighbor</b> <i>peer-address</i> <b>route-map</b><br><i>route-map-name in</i>                                 | Filters the VPN routes received from the ASBR in the other AS. |
| Ruijie(config-router-af)# <b>neighbor</b> <i>peer-address</i> <b>route-map</b><br><i>route-map-name out</i>                                | Filters the VPN routes sent to the ASBR in the other AS.       |
| Ruijie(config-router-af)# <b>show running-config</b>   | Displays existing configurations.                              |

### 📌 Configuring IGP Redistribution of the Route Destined for the ASBR in the Other AS

If the ASBR in one AS retains the next hop in incoming VPN routes, the IBGP peers (PEs) in the AS learn the VPN routes with the next hop still being the ASBR in the other AS. Therefore, the PEs must learn the route destined for the next hop. On the ASBRs that establish a single-hop MP-EBGP session enabled with BGP label distribution to IPv4 or VPN routes, MP-BGP automatically generates a direct host route (with a 32-bit mask) destined for the peer ASBR and an FTN entry (the outgoing label is 3), so that the tunnel egress is not terminated on the local ASBR. To allow the PEs to learn the route destined for the ASBR in the other AS, you only need to configure the ASBR in the local AS to redistribute the route to local IGP.

Perform configuration in privileged mode according to the following table.

| Command                                  | Description  |
|--|--|
| Ruijie# <b>configure terminal</b>        | Enters global configuration mode.                    |
| Ruijie(config)# <b>router</b> <i>igp</i> | Enters IGP (OSPF, RIP, or IS-IS) configuration mode. |

|  |   |
|--|---|
| Ruijie(config-router)# <b>redistribute connected subnets</b> | Redistributes the direct segment route. |
| Ruijie(config-router)# <b>show running-config</b>            | Displays existing configurations.       |

### Verification

- Verify that CE3 is pingable but CE2 and CE4 are unpingable from CE1.
- Verify that CE4 is pingable but CE1 and CE3 are unpingable from CE2.
- Verify that CE1 is pingable but CE2 and CE4 are unpingable from CE3.
- Verify that CE2 is pingable but CE1 and CE3 are unpingable from CE4.

### Configuration Example

#### Inter-VPN Option B: Next Hop Unchanged

|                                   |   |
|-----------------------------------|---|
| <p><b>Figure 2-28</b></p>         | <p>Requirements: A VPN has sites in two ASs. Enable inter-AS communication between the sites.</p>   |
| <p><b>Configuration Steps</b></p> | <ul style="list-style-type: none"> <li>● On PE1-AS1, configure a loopback interface, create a VRF table named VPN1, define RD and RT values, and associate the VRF table with the corresponding interface. Configure BGP, and establish an MP-IBGP session with ASBR1. Configure a CE neighbor relationship over EBGP. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.</li> <li>● On PE1-AS2, configure a loopback interface, create a VRF table named VPN1, define RD and RT values, and associate the VRF table with the corresponding interface. Configure BGP, and establish an MP-IBGP session with ASBR2. Configure a CE neighbor relationship over EBGP. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.</li> <li>● On P1-AS1, configure a loopback interface, configure backbone MPLS signaling, enable MPLS on the interface connected to the public network, and configure a backbone routing protocol.</li> <li>● On ASBR1, configure a loopback interface, configure BGP, and disable the BGP RT filter function. Establish a neighbor relationship with P1-AS1 and ASBR2 respectively. Configure MPLS signaling and enable MPLS on the interface connected to the public network. Configure OSPF for the backbone network to transmit routes, and redistribute the direct segment route. Configure the IP</li> </ul> |

|                |  |
|----------------|--|
|                | <p>address of the interface connected to ASBR2, and enable label forwarding on the interface.</p> <ul style="list-style-type: none"><li>● On ASBR2, configure a loopback interface, configure BGP, and disable the BGP RT filter function. ### Common Errors

- LDP sessions fail to be established, or the BGP RT filter function is not disabled. The direct subnet route is not redistributed to OSPF (that is, the **redistribute connected subnets** command is not executed); as a result, sites of CE-VPN1 are unpingable between each other.

#### 2.4.3.2 Method 2: The ASBR Changes the Next Hop in Incoming VPN Routes

When an ASBR receives a VPN route from the peer ASBR in a different AS, the ASBR changes the next hop in the incoming VPN route before sending the route to PEs in the local AS. The PEs and the ASBR in the same AS exchange VPN routes over an MP-IBGP session. The two ASBRs in different ASs exchange VPN routes over an MP-EBGP session. When receiving a VPN route from one ASBR, the other ASBR changes the route's next hop to itself before sending the route to MP-IBGP peers in the local AS.

### Configuration Steps

- (Mandatory) Configure PEs and CEs to exchange routes.
- (Mandatory) Configure IGP and MPLS signaling for ASs.
- (Mandatory) Disable the default RT filter function on ASBRs.
- (Mandatory) Configure the PEs and the ASBR in the same AS to establish an MP-IBGP session and enable the ASBR to change the next hop in incoming VPN routes to itself.
- (Mandatory) Configure ASBRs to establish an MP-EBGP session.
- (Optional) Configure a route map for filtering VPN routes.

### ↘ **Configuring PEs and CEs to Exchange Routes**

For details, see "Configuring PEs and CEs to Exchange Routes" in section 2.4.1 "Configuring BGP MPLS IP VPN Basic Functions."

### ↘ **Configuring IGP and MPLS Signaling for ASs**

For details, see "Configuring an MPLS Network" in section 2.4.1 "Configuring BGP MPLS IP VPN Basic Functions."

### ↘ **Disabling the Default RT Filter Function on ASBRs**

For details, see "Disabling the Default RT Filter Function on ASBRs" in section 2.4.3.1 "Method 1: The ASBR Retains the Next Hop in Incoming VPN Routes."

### ↘ **Configuring the PEs and the ASBR in the Same AS to Establish an MP-IBGP Session and Enabling the ASBR to Change the Next Hop in Incoming VPN Routes to Itself**

By default, when receiving a VPN route from the MP-EBGP peer, an ASBR does not change the next hop in the VPN route but sends the route as it is to MP-IBGP peers. You can configure the ASBR to change the next hop to itself. In this way, the PEs in the local AS do not need to know the address of the ASBR in the other AS. Compared with Method 1, Method 2 requires the additional configuration of next hop change.

Perform configuration in privileged mode according to the following table.

| Command   | Description  |
|---|--|
| Ruijie# <b>configure terminal</b>   | Enters global configuration mode.  |
| Ruijie(config)# <b>router bgp</b> <i>asn-num</i>  | Configures BGP and enters BGP configuration mode.  |
| Ruijie(config-router)# <b>neighbor</b> <i>pe-address</i> <b>remote-as</b> <i>asn-num</i>            | Establishes an IBGP session with PEs.  |
| Ruijie(config-router)# <b>neighbor</b> <i>pe-address</i> <b>update-source</b> <i>interface-name</i> | Specifies the local loopback interface as the source address for the IBGP session.                                   |
| Ruijie(config-router)# <b>address-family vpnv4</b>  | Enters BGP VPN address family configuration mode.  |
| Ruijie(config-router-af)# <b>neighbor</b> <i>pe-address</i> <b>activate</b>                         | Enables the capability of exchanging VPN routes between peers.   |
| Ruijie(config-router-af)# <b>neighbor</b> <i>pe-address</i> <b>next-hop-self</b>                    | Configures the ASBR to change the next hop in incoming VPN routes to itself before sending the routes to IBGP peers. |
| Ruijie(config-router-af)# <b>show running-config</b>  | Displays existing configurations.  |

### ↘ **Configuring ASBRs to Establish an MP-EBGP Session**

For details, see "Configuring ASBRs to Establish an MP-EBGP Session" in section 2.4.3.1 "Method 1: The ASBR Retains the Next Hop in Incoming VPN Routes."

### ↘ **(Optional) Configuring a Route Map for Filtering VPN Routes**

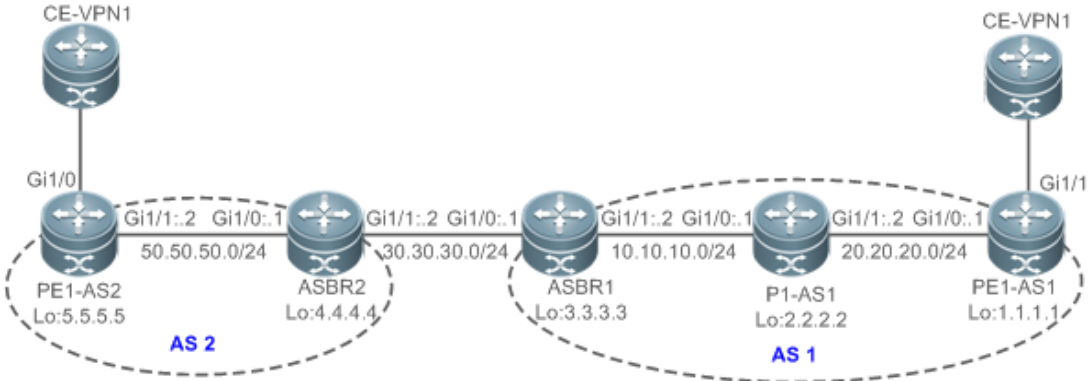

For details, see "Configuring a Route Map for Filtering VPN Routes" in section 2.4.3.1 "Method 1: The ASBR Retains the Next Hop in Incoming VPN Routes."

## Verification

Run the ping command to check the connection between sites of the same VPN.

## Configuration Example

### Inter-VPN Option B: Next Hop Changed

|  |  |
|--|--|
| <p><b>Scenario</b><br/>Figure 2-29</p> |  <p>Requirements: A VPN has sites in two ASs. Enable inter-AS communication between the sites.</p>   |
| <p><b>Configuration Steps</b></p>      | <ul style="list-style-type: none"> <li>On PE1-AS1, configure a loopback interface, create a VRF table named VPN1, define RD and RT values, and associate the VRF table with the corresponding interface. **Common Errors**

- LDP sessions fail to be established, or the BGP RT filter function is not disabled. The ASBRs do not change the next hop in incoming VPN routes to itself before sending the routes to IBGP neighbors; as a result, sites of CE-VPN1 are unpingable between each other.

**2.4.4 Configuring an Inter-AS VPN Service Model: Option C**

**Configuration Effect**

Build the BGP/MPLS VPN service across ASs.

In the Option C solution, PEs in different ASs establish a multi-hop MP-EBGP session to directly exchange VPN routes.

Figure 2-5 Multi-hop MP-EBGP

- 
- i** In multi-hop MP-EBGP mode, only PEs maintain VPN routes, whereas ASBRs do not store VPN user information. The configuration procedure is relatively complex. The solution is applicable to inter-AS VPN service provision in large scale.
- 

## Notes

---

- The LDP router ID must consist of 32 bits.
- The BGP router ID must consist of 32 bits.

## Implementation

---

The Option C solution is implemented by the following methods:

- Enable IPv4 label distribution only between EBGP neighbors.
- Enable IPv4 label distribution between EBGP neighbors and between IBGP neighbors.
- Establish a multi-hop MP-EBGP session between RRs.

- i** For Option C scalability, an RR is deployed in each AS, and the RRs between two ASs establish a multi-hop MP-EBGP session to exchange VPN routes. From the deployment perspective, Option C is also called the inter-RR multi-hop MP-EBGP solution.
- 

The configuration of each Option C implementation method is described in the following.

### 2.4.4.1 Method 1: Enable IPv4 Label Switching Only Between EBGP Neighbors

In this implementation method, BGP routes must be redistributed using the IGP protocol (for example, OSPF or RIP) on ASBRs, so that each device in one AS has the route destined for each PE in the other AS. LSPs are established by distributing labels over LDP to the routes destined for PEs between ASs. IPv4 label switching is enabled between the directly connected inter-AS ASBRs. BGP assumes the role of MPLS signaling to distribute labels to the routes destined for PEs between ASs for LSP establishment.

## Configuration Steps

---

- (Mandatory) Configure PEs and CEs in each AS to exchange routes.
- (Mandatory) Configure IGP and MPLS signaling for ASs.
- (Mandatory) Configure ASBRs to establish an EBGP session in order to distribute labels to IPv4 routes.
- (Mandatory) Configure ASBRs to redistribute to IGP the routes of PEs that are learned over EBGP.
- (Mandatory) Configure a multi-hop MP-EBGP session.

### ↘ Configuring PEs and CEs to Exchange Routes

For details, see "Configuring PEs and CEs to Exchange Routes" in section 2.4.1 "Configuring BGP MPLS IP VPN Basic Functions."

### ↘ Configuring IGP and MPLS Signaling for ASs

For details, see "Configuring an MPLS Network" in section 2.4.1 "Configuring BGP MPLS IP VPN Basic Functions."

### ▾ Configuring ASBRs to Establish an EBGP Session in Order to Distribute Labels to IPv4 Routes

Establish an EBGP session between inter-AS ASBRs, and enable IPv4 label distribution. To introduce the routes of PEs to BGP, you can use the **network** command in BGP IPv4 address family configuration mode or the IGP redistribution command. For AS security consideration, IPv4 route distribution policies must be configured on ASBRs. You can define a route map to specify which routes are distributed to neighbors and whether the outgoing routes carry a label. Route maps can also be configured at the receive end.

Perform configuration in privileged mode according to the following table.

| Command   | Description   |
|---|---|
| Ruijie# <b>configure terminal</b>   | Enters global configuration mode.   |
| Ruijie(config)# <b>router bgp</b> <i>asn-num</i>  | Configures BGP and enters BGP configuration mode.   |
| Ruijie(config-router)# <b>neighbor</b> <i>asbr-address remote-as</i><br><i>asbr-asn-num</i>         | Establishes an EBGP session between ASBRs.  |
| Ruijie(config-router)# <b>address-family ipv4</b>   | Enters BGP IPv4 address family configuration mode.  |
| Ruijie(config-router-af)# <b>neighbor</b><br><i>asbr-address send-label</i>                         | Configures the function of exchanging labeled IPv4 routes with the peer ASBR in the other AS.   |
| Ruijie(config-router-af)# <b>network</b> <i>pe-address mask mask</i>                                | (Optional) Configures the addresses of the PEs in the local AS that require BGP routing table injection, that is, the host routes destined for the PEs in the local AS.           |
| Ruijie(config-router-af)# <b>neighbor</b> <i>asbr-address route-map</i><br><i>routemap-name out</i> | (Optional) Configures route distribution policies. You can define a route map to specify which routes are distributed to neighbors and whether the outgoing routes carry a label. |
| Ruijie(config-router-af)# <b>neighbor</b> <i>asbr-address route-map</i><br><i>routemap-name in</i>  | (Optional) Configures route distribution policies. You can define a route map to specify reception of only labeled routes.  |
| Ruijie(config-router-af)# <b>show running-config</b>  | Displays existing configurations.   |

- i** To forward MPLS packets over the link between ASBRs, run the **label-switching** command to enable MPLS packet forwarding on the interfaces connected between the ASBRs.
- i** If ASBRs use the loopback interface address with a 32-bit mask (instead of a direct link address) as the source address for establishing an MP-EBGP session, do the following: (1) run the **neighbor ebgp-multi-hop** command to enable multi-hop EGBP; (2) configure a loopback static route destined for the peer end between ASBRs; (3) enable LDP or configure static FTN (set the outgoing label to 3, indicating that the ASBR is the penultimate hop).

In actual application, the ASBRs only need to distribute labels to the routes of PEs that carry the inter-AS VPN service. You can use the **set mpls-label** rule to enable such label distribution. This rule means setting a label for routes. You can create a route map to specify sending of only the inter-AS routes of PEs to the peer ASBR and set labels for those routes, and then run the **neighbor peer-address route-map** *rmap\_name out* command in BGP IPv4 address family configuration mode to associate the route map.

The following example creates a route map, whereby MPLS labels are distributed to routes with the 1.1.1.1/32 prefix whereas ordinary IPv4 route updates instead of labels are distributed to routes with the 1.1.1.2/32 prefix. For routes that do not match ACL1 and ACL2, route updates are not sent to neighbors.

```
Router(config)# ip access-list standard acl1
Router(config-std-nacl)# permit host 1.1.1.1
Router(config-std-nacl)# exit
Router(config)# ip access-list standard acl2
Router(config-std-nacl)# permit host 1.1.1.2
Router(config-std-nacl)# exit
Router(config)# route-map out-as permit 10
Router(config-route-map)# match ip address acl1
Router(config-route-map)# set mpls-label
Router(config-std-nacl)# exit
Router(config)# route-map out-as permit 20
Router(config-route-map)# match ip address acl2
Router(config)# router bgp 100
Router(config-router)# neighbor 30.30.30.2 remote-as 100
Router(config-router)# neighbor 30.30.30.2 route-map out-as out
```

You can use the **match mpls-label** rule to specify reception of only labeled IPv4 routes. Configure a route map, and run the **neighbor peer-address route-map rmap\_name in** command to associate the route map.

The following example creates a route map to specify reception of only labeled IPv4 routes from the BGP peer 30.30.30.2 while rejecting other routes.

```
Router(config)# route-map match-mpls
Router(config-route-map)# match mpls-label
Router(config)# router bgp 100
Router(config-router)# neighbor 30.30.30.2 remote-as 100
Router(config-router)# neighbor 30.30.30.2 route-map match-mpls in
```

### 📌 Configuring ASBRs to Redistribute to IGP the Routes of PEs That Are Learned over EBGp

When an ASBR learns from the peer ASBR the routes of PEs in the other AS, it needs to send the routes to the PEs in the local AS and establish an LSP destined for the PEs in the other AS. To do this, configure ASBRs to redistribute to IGP the

routes learned over EBGP, and enable LDP for distributing labels to BGP routes, in order to establish an LSP destined for the PEs in the other AS.

Perform configuration in privileged mode according to the following table.

| Command   | Description  |
|---|--|
| Ruijie# <b>configure terminal</b>   | Enters global configuration mode.  |
| Ruijie(config)# <b>router igp</b>   | Enters IGP configuration mode.   |
| Ruijie(config-router)# <b>redistribute bgp subnets</b><br>[ <b>route-map routemap-name</b> ]  | Configures the protocol for BGP route redistribution. Route-map-based filtering is optional. |
| Ruijie(config-router)# <b>exit</b>  | Exits IGP configuration mode.  |
| Ruijie(config)# <b>mpls router ldp</b>  | Enters LDP configuration mode.   |
| Ruijie(config-mpls-router)# <b>ldp router-id interface loopback 0 force</b>                   | Configures the LDP router ID, which typically uses the IP address of a loopback interface.   |
| Ruijie(config-mpls-router)# <b>advertise-labels for bgp-routes</b><br>[ <b>acl acl-name</b> ] | Distributes labels to BGP routes. ACL-based filtering is optional.                           |
| Ruijie(config-mpls-router)# <b>show running-config</b>  | Displays existing configurations.  |

 By default, LDP only distributes labels to IGP routes but not to BGP routes. To distribute labels to BGP routes, run the **advertise-labels for bgp-routes** command.

In Method 1 of the Option C solution, you can run the **redistribute bgp subnets route-map routemap-name** command in IGP configuration mode to specify which BGP-learned routes are redistributed to IGP. You can run the **advertise-labels for bgp-routes acl acl-name** command in LDP configuration mode to specify which BGP routes are distributed with a label.

### ↘ Configuring a Multi-hop MP-EBGP Session

After an inter-AS LSP is established, establish a multi-hop MP-EBGP session between the two PEs in different ASs that need to carry the inter-AS VPN service, in order to allow the PEs to exchange VPN routes.

Configure the multi-hop MP-EBGP session in privileged mode according to the following table.

| Command   | Description  |
|---|--|
| Ruijie# <b>configure terminal</b>   | Enters global configuration mode.  |
| Ruijie(config)# <b>router bgp asn-num</b>   | Configures BGP and enters BGP configuration mode.  |
| Ruijie(config-router)# <b>neighbor ebgp-peer-address remote-as ebgp-asn-num</b>       | Establishes a multi-hop EBGP session with the PE in the other AS.                              |
| Ruijie(config-router)# <b>neighbor ebgp-peer-address update-source interface-name</b> | Specifies the loopback interface used to establish a neighbor relationship with the EBGP peer. |
| Ruijie(config-router)# <b>neighbor ebgp-peer-address ebgp-multi-hop</b>               | Configures multi-hop attributes.   |
| Ruijie(config-router)# <b>address-family vpnv4</b>                                    | Enters BGP VPN address family configuration mode.  |
| Ruijie(config-router-af)# <b>neighbor ebgp-peer-address activate</b>                  | Enables the capability of exchanging VPN routes between peers.                                 |
| Ruijie(config-router-af)# <b>exit</b>   | Exits BGP VPN address family configuration mode.   |
| Ruijie(config-router)# <b>address-family ipv4</b>                                     | Enters BGP IPv4 address family configuration mode.   |

| Command   | Description  |
|---|--|
| Ruijie(config-router-af)# <b>no neighbor ebgp-peer-address activate</b> | Disables the capability of exchanging IPv4 routes. |
| Ruijie(config-router)# <b>show running-config</b>                       | Displays existing configurations.                  |

**i** Avoid the situation where the multi-hop MP-EBGP peers exchange IPv4 routes or the routes corresponding to the two addresses used for BGP session establishment. If such routes are exchanged over the multi-hop MP-EBGP session, one PE has two routes destined for the PE in the other AS. One route is advertised by the ASBR in the local AS, and the other is advertised over the multi-hop MP-EBGP session. Because EBGP routes take precedence over IBGP routes, BGP preferentially selects the route advertised over the multi-hop MP-EBGP session, causing constant flapping of the route destined for the peer PE. As a result, VPN routes become unreachable.

### Verification

- Check that sites of the same VPN can communicate with each other but sites of different VPNs cannot communicate with each other.

### Configuration Example

#### Inter-AS VPN Option C: Enabling IPv4 Label Switching Between EBGP Neighbors

|  |  |
|--|--|
| <p><b>Scenario</b><br/>Figure 2-31</p> | <p>Requirements: A VPN has sites in two ASs. Enable inter-AS communication between the sites.</p>  |
| <p><b>Configuration Steps</b></p>      | <ul style="list-style-type: none"> <li>● On PE1-AS1, configure a loopback interface, create a VRF table named VPN1, define RD and RT values, and associate the VRF table with the corresponding interface. Configure a multi-hop MP-EBGP session. Disable the capability of exchanging IPv4 routes over EBGP. Configure a CE neighbor relationship over EBGP. Configure backbone MPLS signaling. Enable MPLS on the interface connected to the public network. Configure a backbone routing protocol.</li> <li>● On PE1-AS2, configure a loopback interface, create a VRF table named VPN1, define RD and RT values, and associate the VRF table with the corresponding interface. Configure a multi-hop MP-EBGP session. Disable the capability of exchanging IPv4 routes over EBGP. Configure a CE neighbor relationship over EBGP. Configure backbone MPLS signaling. Enable MPLS on the</li> </ul> |
